The manshafts, which are oval steel tubes, and in the case of the 82-foot leaves, 47 feet long, were shipped from the shop in one piece, and were made sufficiently accurate to be dropped down through holes in the webs of the girders, with a clearance allowance of 1/8 of an inch all around. The original plans contemplated the shafts being assembled and riveted in the field.

The 3½-inch D. E. H. steel pipe for wire rope conduits, sounding well and scuppers, in the gates, were supplied of copper bearing steel in the hope of considerably reducing corrosion.

The sub-contractors for the furnishing of material at the site ready to erect were:—

Hamilton Bridge Company Ltd.	Gate frames and sheathing plates.
Montreal Locomotive Works Ltd.	Castings, forgings, turned bolts, etc.
McGregor, McIntyre, Limited.	Walkways and movable handrails.
Foster Wheeler Company Ltd.	Manshafts and ladders.

Great credit is due all of these firms for the interest which they took in carrying out their part of the work, and for the accuracy with which it was done.

The erection of the gates was commenced in the spring of 1927 under the immediate supervision of Mr. J. O. Childers, with Mr. N. C. Rothgeb as assistant. Mr. Childers had acted as superintendent for the McClintic-Marshall Company in the erection of the Panama canal gates, and Mr. Rothgeb was a foreman on the same work and their experience was exceedingly valuable to the company. Owing to the delays in fabrication, principally of endposts, very little work was done until 1928, so that, as the last of the 64 leaves was completely riveted and placed in position by November 1929, practically the whole of this part of the work was done in two years.

In general, the erection was done with a 25-ton locomotive crane, operating on the lock walls. In some locks,

Figure No. 3.—130-foot Boom and 30-ton Crane at Lock No. 2.

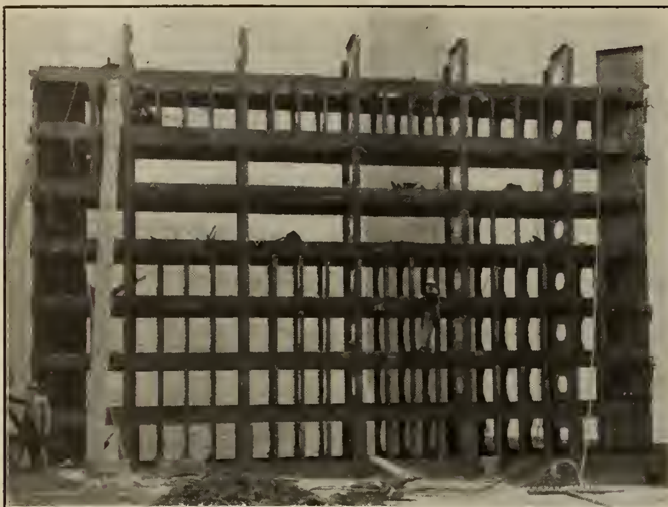

Figure No. 4.—Frame of 82-foot Leaf at Lock No. 1.

however, it was found inadvisable to run tracks on both walls of the lock, and in such cases, a Chicago boom 130 feet long was used to erect the leaf on the far side of the lock. This boom was set and pivoted on the pintle base casting of the opposite leaf and the falls passed through blocks anchored back to the eyebar pins bedded near the top of the lock wall. (Figure No. 3.) The 44-foot 6-inch gates at lock No. 8 were erected by cranes running on tracks in the bottom of the locks.

The bottom girder of each leaf was set on three concrete pedestals, which were carefully set and grouted to the lock floor, in such a position that the leaf, when finished, had to be rolled back about four feet and lowered two and one-half to three inches to its position on the pintle. The final levelling of the girder was made with steel wedges between it and the pedestals. On each girder, before lowering to position, were piled the end diaphragms and the intercostals connecting it to the one next above. The five vertical frames for each tier were strung on one long sling, the first placed, bolted and cast off, then the second, and so on. By this method, the frame of a leaf together with the sheathing plates for one side were set up in from a day to a day and a half. During this process no care was taken to secure accurate alignment, but each girder had to be carefully levelled and the proper shims inserted between the diaphragms, the frames and the girders. (Figure No. 4.)

When the frame of a leaf had been plumbed and bolted the endposts were erected. Owing to their length and flexibility they were the most difficult pieces to handle. In placing them two locomotive cranes were used, one of which was blocked. The post was laid along the lock wall parallel to the track with its upper end next to the blocked crane. Both ends of the slings were attached by angle brackets and pins to the post, each sling having first been rove through a single block, which, in turn, was hooked onto the respective crane falls. The position of the sling attachments to the post was such that about two-thirds of the load came on the blocked crane and one-third on the other.

The two cranes were now placed in position to make the falls vertical and the post was raised off the wall. The forward or blocked crane then raised its end of the post as high as possible, or about 30 feet above the wall, the rear crane advancing at the same time to keep the falls plumb. The booms of the two cranes then swung out so that the post swung clear of the lock wall; the rear crane still advancing. The limit of swing was about 19 feet from centre line of track. The bottom end of the post was then lowered away by the moving crane, which continued advancing until the post was entirely hanging from the blocked crane and within a very short distance of the end of the leaf. The rear crane was cast off and the post was quickly bolted in place. The whole operation took from a half-hour to an hour.

It was during the erection of the fourteenth mitre post that the only serious accident on the work occurred; this was at lock No. 6, one of the locks which have the 82-foot gates about 60 feet apart. In this case the post had been swung out over the lock wall and the rear crane had lowered its end of the post about half-way down, when the crane suddenly toppled over the wall, falling behind the west leaf of the upper gate (already erected) and forcing it over. When the rear crane fell the whole load of the post came suddenly on the forward one, which fortunately held fast, and neither it nor the post were damaged. In this unfortunate accident ten men lost their lives. The cause has never been determined. There is evidence that the boom did not swing out, so either the cranes came too close together, throwing the falls out of plumb and causing the post to sway, or else the rear fall was being let go too rapidly and suddenly stopped, causing impact.

When the endposts were erected the leaf was turned over to the reamers and bolters, who worked from fixed scaffolding (figure No. 5) built up from the lock floor. The specifications called for field holes to be punched or drilled 1/8 of an inch in diameter smaller than the rivet. In most cases the rivets were 7/8-inch, so that the holes were ¾-inch, and 11/16-inch assembly bolts were used.

Owing, however, to the lack of squareness of the angles in the frames it was found nearly impossible to pull the sheathing plates tight to the frames and girders of the first gate, and though the bolts were made of special steel, quite 50 per cent were valueless after their first use. As noted in the next paragraph, the punched size of field holes was increased after the first gate was assembled, and ¾-inch special steel assembly bolts were tried in order to bring the frame angles tight enough to the skin plate to ensure

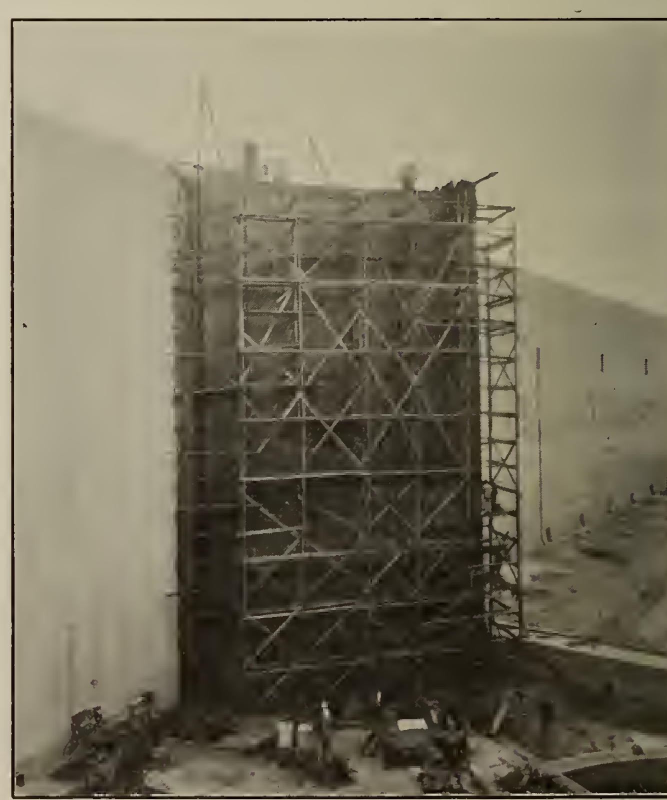

Figure No. 5.—Scaffolding, Downstream Side of Leaf.

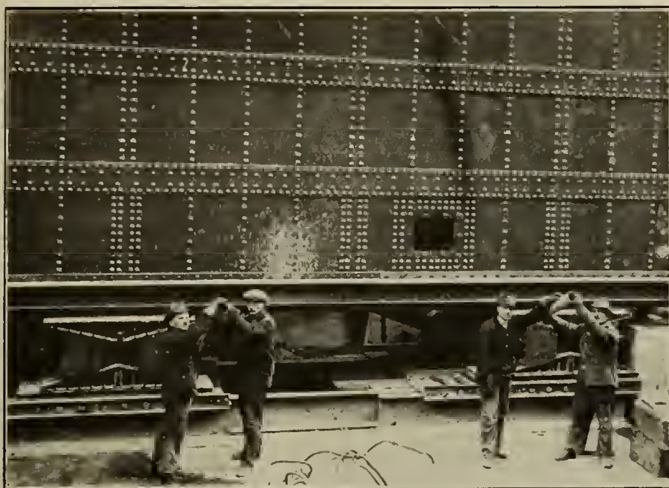

Figure No. 6.—Leaf Resting on Four 200-ton Jacks Ready to Roll Back into Quoin.

watertight riveted work. It was found, however, that so many bolts were spoiled and there were so many loose rivets, that it was better to straighten the angles in the field by hand before assembling. It would, therefore, have been considerably more economical in the end had the frame angles been milled in the shop.

At the same time it was found that the shop work was sufficiently accurate to leave little doubt of the holes cleaning up if punched larger. It was, therefore, permitted to punch 13/16-inch and use ¾-inch bolts; these had an average life of four boltings. In general, every second hole was bolted with ¾-inch bolts, the open holes reamed, and bolted with 7/8-inch bolts, the ¾-inch bolts withdrawn and those holes reamed. The leaf was then turned over to the riveters. When the frame and upstream sheathing plate were riveted the downstream plates were hung and riveted, and finally the up and downstream end doubling plates. Riveting the upstream doubling plates at the same time as the sheathing plates was first tried, but it was found to put a slight wind in the leaf, rendering it very troublesome to line up the end bearing castings.

When the riveting of a leaf was completed the quoin bearing castings were attached and the anchorage pin and quoin sheave pin assembled to the jaw plate and top girder. The holes for the 2-inch turned bolts connecting the bearing castings to the endpost were drilled full size in the castings and 1¾-inch diameter in the post, the original plan being to ream all holes in the post by a reamer operated from the outside and carrying a bronze idler to protect the holes in the castings. There are four vertical rows of these holes, the inside rows coming under the "T" flange of the castings. A special offset reamer was designed for these inside rows, but in operating it proved too slow, and they were reamed from the inside of the leaf by the use of a pilot extension.

The next step in construction covered the setting and aligning of the bearing plates on the hollow quoin, and the quoin end of a leaf. These plates were backed up by steel shims which had to be planed, to correct errors in line and warp in the wall and gate castings and secure a finished bearing surface accurate to within 0.003 inch. Measurements of the castings were taken to piano wires by micrometers equipped with ear phones, readings being taken at the centre and each edge of the bearing plate trough. On plotting these readings it was found that practically all shims required planing to a warped surface. The shims varied from 4 to 5 feet in length. To machine them, a heavy cast slab, carefully finished and having a pedestal at the centre with ball and socket joint, was bolted to a planer and adjusted to the proper angle by means of four screw jacks to allow the plane of the surface to pass through three of the corners of the shim. The shim to be planed was bolted to the slab with countersunk bolts, and where necessary, the fourth corner wedged up on a series of feelers to secure the required warp.

After the bearing plates and shims were bolted in place their alignment was carefully checked, and when necessary, adjustments were made. Temperature changes, both in the concrete of the lock wall and the leaf, were very marked, and it was found impossible to secure a true vertical line in the bearings at all temperatures, so that finally, regular curves were permitted up to about 0.010-inch.

The bearings having been adjusted, the leaf was ready to place in position. The centre concrete pedestal was removed and two rollerpaths, each of three 15-inch 60-pound I-beams were placed on the lock floor, one under each of the sheathings of the leaf, and carefully levelled and grouted. On these were placed four rollernests, and on them wedge-jacks, each operated by a screw and lever. The jacks were of about 200 tons capacity each and were the same as used in placing the Panama gates. (Figure No. 6.)

When the weight of the leaf had been transferred to the jacks, the other concrete pedestals were removed, and the pintle and pintle casting were hung in place under the heel casting. By this means, the distance which the leaves had to be lowered to position was reduced from slightly over 6 inches to 3 inches.

The top of the gate was carefully secured to the east and west lock walls with wire guys having long turnbuckles, and as the gate was rolled back, the guys were kept taut by adjusting the turnbuckles as required. The leaf was moved back by 50-ton horizontal jacks until the pintle casting was in position over the pintle bearing casting, when the wedges on the four supporting jacks were slowly released, until the pintle casting came to its bearing. The top of the leaf was then brought to its proper position

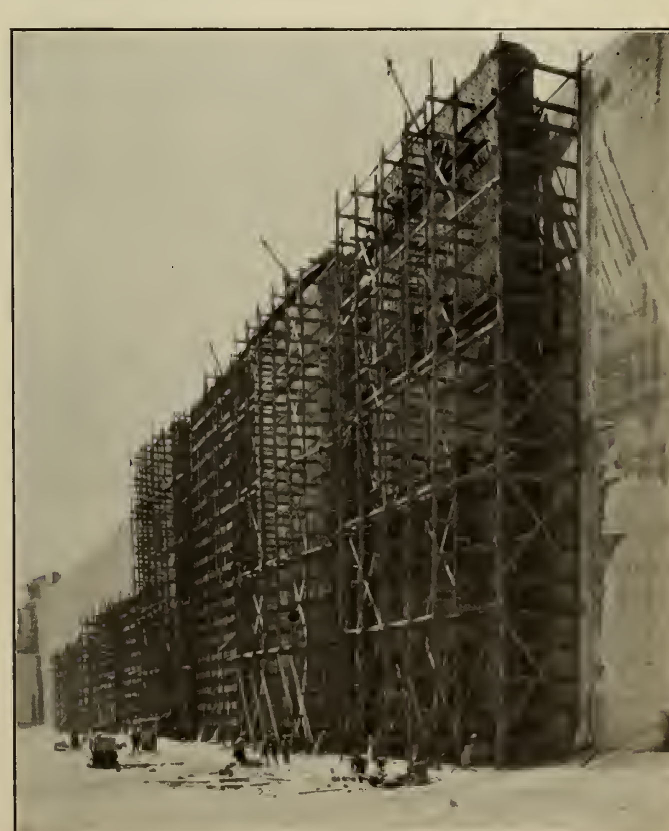

Figure No. 7.—Spare Leaves in the Process of Erection in Lock No. 2.

Figure No. 8.—35-foot 6-inch Leaf with Mitre End Rising as Air is Pumped In.

by adjustment of the four jacks; and the anchorage eyebars, which were pinned to the lock wall, were threaded on the eyebar pin passing through the jaw on the top of the leaf. This operation was the most troublesome of those required to place the leaf, the rolling back taking only a few minutes, while the connecting up of the eyebar sometimes took two hours.

Before any field coatings were applied, the leaves were tested for watertightness, the air chamber being first filled with water and the water level continued up through the manshaft to the top of the leaf. Any leaks in the sheathing, the bottom girder, or the girder between the air and water chambers, were then stopped, and the water let out of the air chamber and pumped into the water chamber, and any leaks found in it were corrected. The gates, as originally built, were tight, and very little work was required in this operation.

The exterior of the gates was specified to have two field coats of oil paint, and for this purpose, a first coat of red lead and a second coat of Gilsonite was adopted. For the interior coating, an asphalt enamel applied hot was called for, but was abandoned and a bituminous enamel applied hot was used on three gates—the 82-foot and 35-foot 6-inch at lock No. 1 and the 82-foot gate at east lock No. 5; the balance of the interior coating was put on with Hydralt, an asphalt emulsion applied cold. As the type of asphalt emulsion used will always remain tacky, all upper horizontal surfaces on which men might have

Figure No. 9.—35-foot 6-inch Leaf Canted Over and Nearly Empty.

to walk in making repairs, or inspecting the gates, were protected with a thin coating of cement sprinkled dry on the emulsion before the latter had set. The asphalt was applied so that its minimum thickness, when set, would be 1/16 of an inch. It is too early to make a definite statement as to the ultimate value of this coating, but some of it has now been on for over a year, and is showing little deterioration, except where exposed to frost or running water before it had set.

Eight spare leaves were furnished under the contract, two of 82 feet, two of 83 feet 4 inches, two of 44 feet 6 inches and two of 35 feet 6 inches, one right and one left of each. It was intended that these leaves should be erected in a gate yard near the lower end of the canal, but owing to a change in the location of this yard, contracts were not let for it until too late to have it in readiness for the building of the gates without undue delay. Permission was therefore received from the engineer in charge to erect these eight leaves vertically in lock No. 2. Concrete

Figure No. 10.—Completed 82-foot Gate.

pedestals were dowelled to the sloping floor of the lock to support the spare leaves in a line, so that the downstream face of the leaves would be about 4 feet away from the lock wall, leaving ample room for a scaffolding all around each leaf. (Figure No. 7.) The erection was carried out in precisely the same way as all the other leaves, and the gate yard being by this time ready to receive them, they were floated down to it, a distance of about 2 miles, and placed in a horizontal position on the skids prepared for them.

To accomplish this last operation, the leaves were filled with water to a sufficient depth to ensure that they would not float from their pedestals when the lock was filled to the level of the top of any leaf; the manhole covers of the manshafts were strengthened to sustain an air or water pressure equivalent to an 80-foot head, and 2-inch pipes were run through the cover down to the bottom of the leaf, one pipe then running along the bottom of the leaf to near the mitre end, and the other to near the quoin end; each pipe was fitted at the top with a shut-off valve; a third 2-inch pipe ran through the manshaft cover, and was connected with an air hose to a compressor on the lock wall. The lock was then filled to a depth of a little over 30 feet, or within a few inches of the level of girder "O" of the 35-foot 6-inch leaves. Air was then run into the first of these leaves at a pressure of approximately 40 pounds, and the water forced out through the two 2-inch pipes until the leaf floated from the pedestals. The leaf was then towed by ropes to near the centre line of the lock, and air again forced in, and the water in the leaf lowered. As the water lowered, the mitre end of the leaf, which had the greater flotation, rose considerably higher than the quoin end (figure No. 8), and as the water continued to be forced out, the waterpipe to the mitre end became dry; as soon as this occurred, its valve was closed, and the balance of the water was forced out through the quoin end pipe.

During this, the leaf gradually leaned over sideways, and by the time the water was entirely removed from the quoin end, it was floating in a horizontal position, with the downstream face towards the bottom. (Figure No. 9.) The leaf was then made fast to the lock wall, and the second 35-foot leaf was floated in the same way. The lock was then filled above the 40-foot level, and the 44-foot 6-inch leaves floated, after which the lock was entirely filled and the 82-foot and 83-foot leaves treated in the same way. This work was commenced about 10 o'clock on a Monday morning, and on the following Wednesday evening all the eight leaves were on their skids in the drydock. It may be said that all were very anxious during the floating of the first leaf, as there was a great difference of opinion both among the government engineers and the contractors as to the danger of floating the leaves in the above manner without the possibility of them being seriously damaged by plunging into one of the lock walls. The credit for evolving this method of handling the gates belongs to Mr. Childers. Another view of the leaves is shown in figure No. 10.

The author wishes to express his thanks and appreciation to A. J. Grant, M.E.I.C., and all the members of his staff with whom he came in contact, for their assistance and courtesy during the carrying out of the work.

The Design, Development and Manufacture of Special Steel Castings for Locomotive and Car Construction

H. R. Bartell,

Sales Engineer, General Steel Castings Corporation, Granite City, Illinois.

Paper read before the Montreal Branch of The Engineering Institute of Canada, October 9th, 1930.

The history of railroad development in North America is an interesting one. From the most meagre beginnings, this method of transportation has grown in less than a century into a system which covers the continent. The last few years particularly have shown remarkable improvement and efficiency in railroad operation, and the cost of maintenance has been steadily decreasing.

One of the most important factors in present day railroad development is the combination of power and speed possessed by our modern locomotives. This has been possible through the joint efforts of the railroad officers and manufacturers of railroad equipment. Among these equipment groups have been the steel founders whose contribution has been more sturdy and substantial foundations for locomotives, tenders, and passenger and freight cars. Modern railroad equipment without the use of cast steel is inconceivable.

Steel as we know it is used in many forms, but the making of steel castings can be said to have originated with the development of the crucible furnace by Benjamin Huntsman, a clock maker of Sheffield, England, in 1740, but the crucible on account of its small size offered serious obstacles to the production of large castings. Henry Bessemer's invention in 1855 of the converter, for transforming iron into steel, removed the limit on size imposed by the crucible. While the principal application of the Bessemer converter has been used in mill practice, it is interesting to know that its origin was brought about through Bessemer's discovery that the cast iron guns used in the Crimean War were not strong enough for the improved projectiles he had himself invented, and his desire was to make guns of cast steel which would be stronger. The development of the open-hearth furnace by Charles William and Frederick Siemens, of Germany, and by P. and E. Martin, French metallurgists, in the sixties made way for much of our modern steel foundry practice.

Although there are a few steel foundries in America using the Tropenas converter for making steel castings, which was a later development, and a number using electric furnaces, the open-hearth process is more generally favoured for the larger foundries.

The electric process is capable of producing an excellent grade of steel, but, due to the limited sizes of the furnaces so far developed in successful operation and to the relatively high cost per ton of this method, it has not been extensively used for large castings. The open-hearth basic process permits large heats at a low cost per ton, and further it is fundamentally a refining process.

A steel castings shop of the early days would show very little resemblance to a modern plant. A large proportion of the arduous manual work previously associated with foundry practice has been eliminated. This has been largely brought about through the use of specially designed equipment for handling material, for cleansing, milling, mixing, and distributing the sand, together with the use of moulding forms, moulding machines, sand slingers, and core-making machinery. Hydraulic washing equipment for cleaning large castings is another improvement which modern engineering skill has devised.

The large locomotives in use today, with large boilers, high steam pressures, great piston thrusts, and heavy rail loads, impose a duty on the machinery foundation and on the trucks which cannot be withstood by a bolted structure, no matter how well the connecting bolts may be initially fitted. A bolt in a built-up locomotive frame or truck is subjected to especially severe tension; and it follows that constant inspection, tightening of nuts, and periodical reaming of the holes and replacement of the bolts are essential if the equipment is to remain serviceable. It is also extremely difficult to apply a rivet in a locomotive or car structure subjected to weaving and have it remain permanent without loosening, even where the hole is reamed true and the rivet properly heated and driven.

Therefore, the ideal mechanical construction can be obtained in a single casting where the metal can be distributed in the most economical manner possible. Increased section moduli can be most efficiently developed in a casting by increasing the depth or width of the sections, or changing metal thickness to suit varying fibre stresses.

Among the earlier uses of steel castings in the construction of railroad equipment was its substitution for cast iron. As there was no precedent at that time to follow except the practice of the iron founder, the results, as in all new industries, left much to be desired. The pioneers who introduced steel castings for railroad service found it necessary not only to overcome an existing prejudice against castings but at the same time to build a foundation on which this new art could rest. They sought every opportunity for improvement and as a result of unremitting effort the steel foundry business occupies an important place today in railroad work which is remarkable considering it is only about thirty-five years since the use of steel castings in this field was begun.

Too much importance cannot be given to the part that good engineering design plays in the production of steel castings. A careful study over a period of years indicates that most of the difficulties encountered either in the manufacture of steel castings or those developed later in service could be eliminated by changes in design. It has also been found that modifications to manufacturing processes could further prevent all but a slight percentage of the remainder. It is believed that too great emphasis has been laid on metallurgical practices and methods. While there is unquestionably an opportunity for betterment along metallurgical lines, experience has definitely shown that, first engineering design, and, second, manufacturing practice, offer the greatest avenues to improvement in the quality of steel castings.

Stringent limitation of weight is often a handicap to the designer of steel castings for moving vehicles.

While the earlier designs of steel castings followed in general outlines the appearance of the fabricated structures which they displaced, it was not long before designing engineers recognized that lightness and strength could be combined with good appearance. Today much attention is given to producing castings that not only possess utility but that are also pleasing to the eye. It can be generally stated that an integral cast steel structure may be made lighter than a built-up one where equal strength is desired. Where equivalent weight is to be met the cast structure will have greater strength.

To appreciate the rapid strides made by the use of cast steel in railroad equipment, it would be interesting to review car and locomotive construction as it was in 1893, just previous to the beginning of the "cast steel era." Freight cars had built-up bar iron trucks and wooden truck bolsters; their underframes were of wood with steel plated wooden body bolsters. Passenger cars had wooden trucks and wooden underframes reinforced with steel plates. There were no steel castings on the locomotives. All railroad couplers were of malleable iron.

The need for heavier cars and locomotives was being agitated. Wood car bolsters deteriorated in service and about 1893 a St. Louis railroad official suggested that these be made of cast steel and after considerable experimentation this was accomplished. It was not long after this that several companies were making cast steel truck bolsters and their use became quite general. Early in 1899 the first cast steel double-body bolster for passenger cars was made and applied to a Pullman sleeping-car.

The first cast steel truck side frame for freight cars was made in 1900. Freight cars built today have cast steel truck side frames and bolsters. The use of built-up freight trucks now would be considered a backward step.

The first steel castings used in locomotives were driving wheel centres. When the movement toward larger and heavier locomotives began in the late nineties, cast iron wheel centres were found to be inadequate, so cast steel was tried and with such success that its use became general. The first record we can find of steel wheel centres was in the latter part of 1895.

The original form of locomotive foundation consisted of two forged wrought-iron bar frames, which carried the boiler and the cylinders, and had a few forged cross ties to keep the axles in a parallel position. Larger locomotives required more substantial frames, and finally the bar frame became the limiting factor to any increase in the size of motive power because of the difficulty and cost of forging it. In the middle nineties, railroad men and locomotive builders who had been observing the progress in steel-making began to consider the possibilities of cast steel main frames. The first made were applied to switch engines, and then began the move toward the modern locomotive as we know it today.

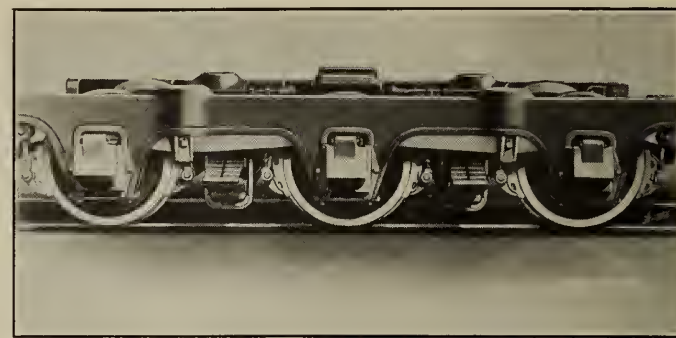

Figure No. 1.—Six-wheel Truck with Pedestals Cast Integral.

The first cast steel trucks to be made for passenger car service were placed under two Santa Fe cars in 1904. They were of the four-wheel type and the entire truck frame was in one piece. They even had integral pedestals and cast steel equalizers, and met the railroad's requirements so well that they are still in service. After this first application, no more trucks were made with integral pedestals until 1918. Previous to that time railroad mechanical officers felt that wrecks or derailments might damage the integral pedestal portion of the truck frames beyond repair, but when modern welding methods came into general use this objection was overcome. All new passenger car trucks today are made of cast steel, and the majority have integral pedestals.

The initial application of cast steel six-wheel trucks to a passenger car was made by the Pullman Company on one of their sleepers in 1905. In recent years a more improved design of truck has been developed (figure No. 1), which has pedestals cast integral, eliminating separate castings and a considerable number of bolts and giving more accurate alignment for journal or oil boxes as the faces of the pedestals are machined by our special slotters. This type of truck under a passenger car looks much better and gives greater accessibility for inspection.

After the general adoption of the integral cast steel passenger truck by steam railroads, its use was extended to electrically propelled cars. Motor and trailer trucks of cast steel have been applied to many street cars and to cars in multiple unit suburban operation as well as interurban electric service. A majority of Diesel engine and gas-electric rail cars, which have been much used in the last few years, have trucks of this type.

About 1905 a demand was made for stronger passenger car equipment and to meet the new requirements the combined double-body bolster and platform casting was designed to form a part of and to strengthen the underframe. This casting in one-piece forms the entire end of the car underframe including the foundation for car platform or vestibule and pockets for the draft gears and buffers. (Figure No. 2.)

This forms an anti-telescoping cast steel end construction which will prevent its being telescoped by an adjacent car in a collision as unfortunately has occurred too often in the past. The cast steel end frame will withstand a blow of approximately three-quarters of a million pounds struck 18 inches above the floor where the greatest strength is needed.

The first cast steel tenderframe or foundation for the locomotive tank was made early in 1907 and the main portion was in three castings. These three pieces included the centre sill, bolsters, needle beam and draft housing. Channel side sills and plate end sills were fastened to these castings, and the castings were connected together at keyed machined joints.

After it had been successfully demonstrated that a tenderframe could be made with three steel castings, the next step forward was in 1908 when the entire structure was made in one piece.

From this modest beginning there has been a gradual development in the size and design of tenderframes to meet the constantly growing demands of the railroads for greater fuel and water capacity. About 1911 water capacities of tenders had reached 7,200 Imperial gallons, but Mr. John Purcell of the Santa Fe Railway believed that operating economies could be effected with larger tenders by eliminating some water stops and thereby avoiding to some extent bad water districts.

It was necessary for some of the western roads to haul water and keep a supply at points where the tenders had to be refilled and where the water was bad. The first step to eliminate this was to use a 9,600 Imperial gallon tender carried on four-wheel trucks, but it was found that the high wheel loads produced considerable wheel wear. It was, therefore, necessary to develop a six-wheel truck with a short wheel base, and in 1912 the six-wheel cast steel tender truck was built. It was not long after this that large tenders with both rectangular and cylindrical tanks became the general practice. The desire to avoid bad water districts prompted this experiment, but it was found that larger tenders would also permit longer locomotive runs and accelerate the movement of trains.

As the length of locomotive and tender was limited by turntables and engine house stalls, the height of the tank was increased to get additional capacity and, therefore, the centre of gravity from rail of larger tenders kept gradually increasing until the limits of safety were being approached. In order to keep pace with the desire for greater capacity with minimum length, the bottom of the tank was cast integral with the bottom of the tenderframe and the space formerly occupied by the depth of the tenderframe used as water storage. This improvement added approximately 15 per cent more water capacity. The development of the water carrying frame introduced a new manufacturing problem as the entire bottom is a thin, continuous plate

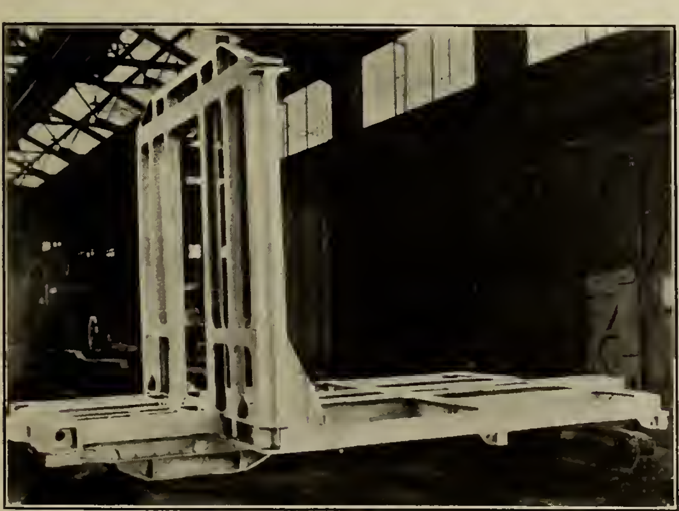

Figure No. 2.—One-piece Casting of End of Car Underframe, including Foundation for Car Platform.

Figure No. 3.—Water Bottom Tender Frame.

making it very difficult to cast. These obstacles were successfully overcome by advances made in the technique of moulding, so that the first water bottom tenderframe was produced in 1925. (Figure No. 3.) About 2,000 tenders of this type are now in service, some with water capacities as high as 18,400 Imperial gallons and with storage space for 30 tons of coal. They are built with tanks, cylindrical in form as well as rectangular. As the water bottom tank is solidly connected to the frame, it cannot shift and telescope the locomotive cab in a collision, which is a safety factor of primary importance.

Some of the latest of the larger water bottom type tenders have all the parts of the tank above the frame welded to each other and to the frame. There are no rivets in this tender other than those required by law for the application of safety appliances.

The cast steel tenderframes after years of service have proven that they will withstand corrosion. This is partly due to the elimination of joints and rivets and partly to the chemical characteristics of cast steel also from the coating of silica which is fused on the surface of the casting in the manufacturing process. This provides a protective skin.

The two- and four-wheel leading trucks of the locomotive operate under severe conditions while performing the important function of guiding the engine around sharp curves at high speeds. Due to the conditions just explained, the built-up engine trucks have always been expensive to maintain. It was, therefore, desirable to make the frames for these trucks in unitary form. At first these trucks had inside axle bearings, but during the past few years outside bearing trucks have been successfully developed and a considerable number are now in service. They have been arranged for friction journal bearings, Brooks floating bushing grease lubrication, the use of which was initiated on the Canadian National Railways, and for various types of roller bearings.

In 1912, because of the heavier loads carried, it was found necessary to greatly improve the design of the trailer truck of the locomotive and this was best accomplished by a one-piece steel casting. The latest development simplifies construction and properly carries an auxiliary engine geared to the trailer axle known as the locomotive booster. The majority of modern locomotives are now equipped with these two devices. Continual increases in the sizes of the locomotive fire-box, the use of stokers, syphons and other improvements finally caused the weight permissible on one pair of trailer wheels to be exceeded, and to eliminate this condition, an additional pair of load-carrying trailer wheels was added. Four-wheel trailer trucks are now used on the latest locomotives.

Successful results experienced in the elimination of maintenance by casting truck parts and underframes in one piece, logically suggested that even greater savings in weight and repair costs could be obtained for the locomotive proper by the application of the same principles. It was

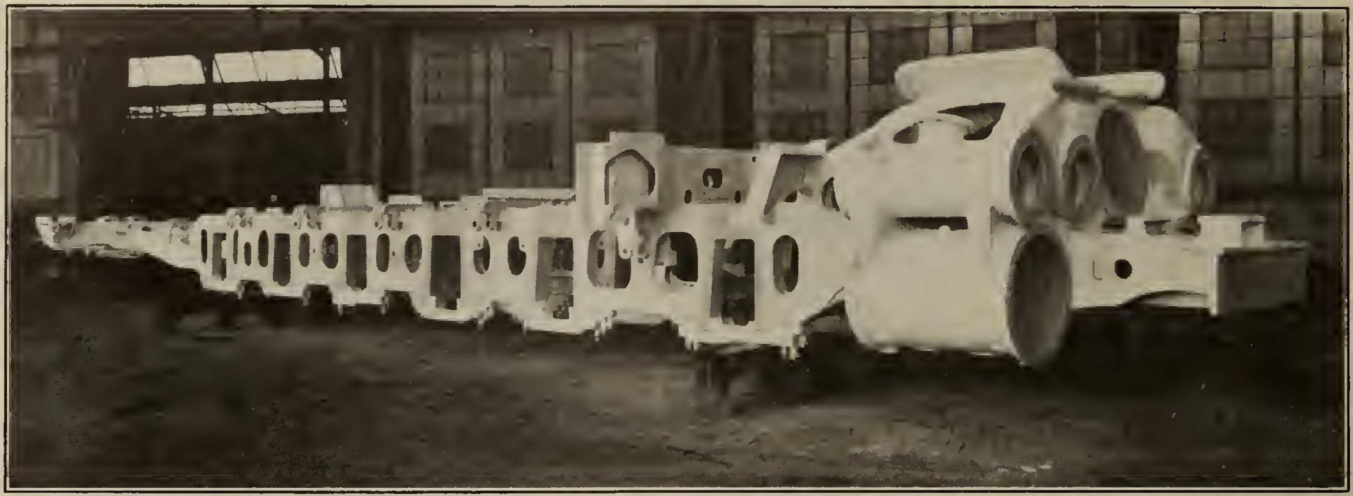

Figure No. 4.—Cast Steel Bed for Locomotive.

also realized that foundry art had progressed so rapidly that the production of larger castings was entirely feasible.

The next improvement was made in 1914 when the locomotive cradle casting was designed to include, in one unit, the parts forming the subframe back of the rear drivers on locomotives equipped with trailing trucks. As this was the buffing and pulling column, the use of the cast steel cradle provided greater strength with less weight and at the same time eliminated the difficulties experienced with loose bolts in the foot plate or draw bar pocket and other parts.

As locomotives were built larger, heavier, and more powerful it became most important to use steel castings in the construction of the foundation, but the severe strains imposed on the bolted connections resulted in high maintenance costs and breakage.

The main frame structure was, therefore, very carefully studied because it was realized that a one-piece bed casting, including all parts, would not only give much greater strength with minimum weight but would also permit improved cross bracing and much better alignment for the reciprocating parts. After a great amount of engineering work extending over a period of several years, a design was developed that embodied all the above improvements. This gave the foundry new problems to solve and special machinery had to be designed and built to take care of the difficult operations involved in machining such a huge unit.

In 1917 a railroad required additional electric passenger locomotives which would be more powerful than their previous engines but it was important that this larger engine should not exceed the weight limitations imposed by a viaduct over which these locomotives would operate. After considerable study it was decided by the locomotive builder and the railroad that the use of an integral bed casting would answer this problem. These bed castings were successfully manufactured, weighing, complete with pedestal binders, 17,100 pounds, and being 32 feet 4 inches long.

The important advantages gained from the use of the bed casting on electric locomotives gave an impetus to the production of a similar structure for steam locomotives where even greater benefits would be attained.

With the demand for high-speed locomotives having a greater horse power than any previously built, locomotive designers found that the larger boilers, increased boiler pressures and corresponding changes in running gear produced much heavier rail loads which exceeded the limits of the track and bridges. Separate cast steel cylinders had already begun to replace those made of cast iron which saved considerable wieght and gave increased strength but only partially solved the problem.

About this time a heavy eight-wheel switching locomotive was built, having the locomotive bed in one piece, and including cylinders, pilot beam, equalizer and brake attachments, and supports for the motion work.

While designs of the one-piece bed with integral cylinders were being developed, the foundry and machine departments had to work out many problems of production, it being obvious that a casting of this size and weight would have to be machined, drilled, and the cylinder barrels and valve chambers bored and hydrostatically tested before it was shipped. Therefore, to perform the many important finishing operations, new buildings were built and especially designed machine tools were installed, so that when the castings were shipped they were ready for assembly.

A bed of the latest design, 55 feet 9 inches long and weighing 66,500 pounds, with cylinders and rear cradle unit cast integral, was made for the Canadian Pacific new 5900 class 2-10-4 type locomotives which are efficiently hauling long heavy trains over the Canadian Rockies. At the time these beds were cast, they were the largest ever made.

The casting of many separate parts in one piece and the resulting benefits are not the only advantages to be obtained by the locomotive bed. Designers of modern locomotives have difficulty in finding a satisfactory place for the air reservoirs. The problem has been answered by making the backbone of the bed cylindrical in form and utilizing this as an air reservoir. This unique improve-

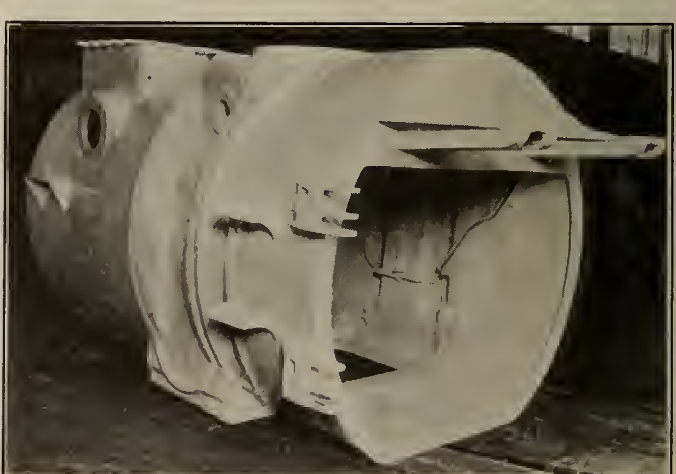

Figure No. 5.—Cast Steel Smoke Box.

Figure No. 6.—Cast Steel Bed for Canadian National Oil-Electric Locomotive.

ment is embodied in the beds furnished for the new high-speed passenger locomotives just completed for the Canadian National Railway.

The largest and heaviest cast steel bed so far manufactured was recently furnished for the Union Pacific 4-12-2 type locomotives, which engines are now in service. (Figure No. 4.) It will be noted that this design incorporates the three-cylinder arrangement with the centre cylinder on an angle, a feature that introduced another interesting machining operation. This casting weighs 82,000 pounds and is 60 feet 4 inches long.

Not only have the majority of railroads on this continent availed themselves of this construction, but likewise the two principal railroads in Australia, and to date there are over one thousand steam locomotives equipped with cast steel beds.

A cast steel smoke-box has also recently been successfully manufactured and applied to a number of Mountain-type locomotives on the New Haven Railroad. (Figure No. 5.)

One of the most complicated castings made to date forms a part of each unit of one of the Canadian National oil-electric locomotives. This casting was 46 feet 1¾ inches long, and 9 feet 11 inches wide, and 5 feet 1 inch deep weighing 40,000 pounds. (Figure No. 6.) The bed includes the entire locomotive foundation below the cab line.

The depressed centre car is a very unusual type of railroad rolling stock as it is used to transport extremely heavy loads concentrated over a small area, such as large machinery and transformers. The cast steel frame solved many practical problems inherent in the construction of a car of this type which occurred through the difficulty of fabricating the heavy rolled steel sections necessary to carry the great loads imposed and to take care of the buffing and pulling stresses magnified by the offset sills. (Figure No. 7.) A considerable saving in weight was also effected by the more economical distribution of metal. The average weight of these castings is 58,000 pounds.

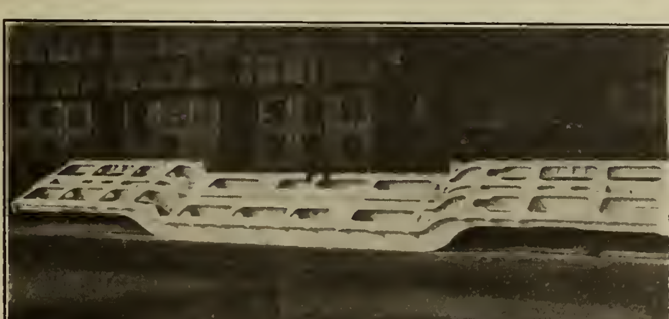

Figure No. 7.—Depressed Centre Car Casting.

A number of railroads have these one-piece underframe cars in service, and five similar cars are now being built by the Canadian Pacific at their Angus shops.

The railroads serving the sulphur deposits in the state of Texas have experienced extremely high maintenance expense on cars engaged in this traffic, as the fabricated steel underframes deteriorate rapidly from corrosion. This brought about the development by the Santa Fe Railway of the 70-ton gondola-type car with a wooden superstructure and a cast steel underframe, which casting included the entire underframe of the car and the stake pockets.

The success of the cylindrical water bottom tender suggested the possibilities which the cast steel bottom offered in tank car construction and a number of these cars have been constructed with a capacity of 12,900 Imperial gallons. About one-fourth of the circumference of the tank is a part of the underframe and forms the tank bottom, while the remainder of the tank is made of tank steel and is riveted to the underframe. In tank car construction it is very desirable to maintain a low centre of gravity to avoid excessive rolling of the loaded car and at the same time to secure the largest possible capacity without unduly increasing the length, as shorter cars are more convenient to shippers. By combining the lower portion of the tank with the underframe, making a strong, simple construction, it was possible to considerably lower the centre of gravity of the car and to reduce the length about one-third.

Figure No. 8.—One-Piece Frame for Ore Car.

Another development utilizing a large steel casting is the high capacity ore car. These cars, carrying approximately 75 tons, are loaded by steam shovels which drop about 15 tons of ore into the cars at a time, and as many as 160 of these loaded cars sometimes operate in one train. On account of these severe service conditions the ore carrying roads some years ago realized the utility and maintenance saving which would result from the use of a cast steel underframe. (Figure No. 8.) This one-piece frame while stronger was actually lighter than the fabricated construction. The weight of this casting was 8,900 pounds.

The success which the use of large steel castings has met in locomotive and car construction very clearly indicates that the freight car underframe of the future will be an integral steel casting.

Cast steel foundations for cars and locomotives while resulting in direct maintenance savings are also the basis for additional savings in repairs to other parts of the equipment. In cars the brake rigging and the superstucture will have longer life when the understructure is not subject to distortion. In locomotives, the bed casting reduces wear of reciprocating parts, maintains alignment of the driving wheels, thereby considerably reducing driver flange wear and minimizing lateral wear on driving boxes.

The advancement which has been made in the steel foundry art in the past decade has been truly remarkable but had anyone attempted to predict in 1920 that such strides as have been made were to be looked for within 10 years, he would have been regarded as an exceptional optimist. In view of this advancement, is it unreasonable to predict that the next 10 years will record a progress which will be even greater than has occurred in all of the 35 years of the industry to date?

This paper has dealt with the development of steel castings for railroad equipment, but it should not be overlooked that similar advantages can also be obtained by the use of integral steel castings in other fields. Many parts are now being assembled that could be cast profitably from molten metal directly into their final form.

A brief explanation of moulding methods may be of interest, particularly after considering that these large castings are necessarily produced by quite a different process than is usually employed in the production of small miscellaneous castings.

On account of the intricate shape and magnitude of the devices like a locomotive bed or water bottom tender-frame, a method of moulding employing essentially a metal form and dry sand cores has been developed. In this process the form consists of a heavy steel frame which roughly outlines the shape of the casting and extends downward into a prepared pit far enough to accommodate the depth of the mould. The mould is formed by hundreds of dry sand baked cores, therefore the word mould is used more descriptively than accurately, as the process does not employ a pattern or a sand mould. The cores are placed against and on top of each other to form the shape of the casting and are supported on I-beam members at the bottom of the form and at the side by the walls of the form. What would ordinarily be termed patterns in the above mentioned process become core boxes from which the cores are made.

The cores are separated where metal is to form, by metallic spools or chaplets, the melting point of which is just high enough above that of the molten steel to permit the free flowing of the metal and low enough so that there will be complete fusion between the chaplets and the parent metal after the casting has cooled.

The cores are baked to a brick-like degree of hardness, so that they will be strong enough to support each other and not crush under the tremendous weight of the casting after the pouring has been completed. Particular attention must be paid in this process to the making and hardening of the cores, as it is essential that a smooth surface be presented to the molten metal, and one which will not fuse with the steel under the terrific heat of some 3,000 degrees F. necessary to satisfactorily pour castings of this size.

Finally, after the cover cores have been placed, the entire mould is securely clamped down to resist any movement or tendency of the cores to float under the tremendous pressure of the steel as it is entering the mould.

The metal is generally poured into one gate and is distributed in a main runner at the bottom of the mould, from which it rises through the different openings between the cores to form the shape of the casting. The completion of the process finds the metal at the top of each riser.

Considering the varying sections and the length of the castings which have been discussed, it will be appreciated with what nicety the moulds, formed out of all these different cores, has to be figured in order to correctly compensate for the tremendous and variable shrinkage which occurs at different points of the casting. The location and number of risers is another part of the moulding technique, which those in charge of that part of the work have learned by long experience.

Finally it might be added, as a matter of interest, that it actually requires only about three minutes to fill the entire mould for one of the largest castings, but following the initial pouring, the metal is fed intermittently for some eight minutes to compensate for the contraction which takes place as the steel cools.

The New Smelter and Concentrator of the International Nickel Company at Copper Cliff, Ontario

L. M. Sheridan,
Chief Engineer, The International Nickel Company of Canada, Ltd., Copper Cliff, Ont.

Paper read before the Montreal Branch of The Engineering Institute of Canada, November 6th, 1930.

The ores of the Sudbury district occur in the walls of an oval basin having a length of about 36 miles and a maximum width of about 16 miles.

The mines of the International Nickel Company are located around the rim of the basin. There are four mines at present in operation, namely, the Creighton, Levack, Garson and Frood, the farthest being 30 and the nearest 5 miles away from the Copper Cliff and Coniston smelters.

The Frood mine is the principal source of ore reserves and is by far the largest. Here a shaft has been sunk to a depth of 3,000 feet. The vertical shaft is one of the largest ever sunk, being 16 feet by 28 feet in horizontal section. Ore is mined underground and hauled in dump cars, by storage battery locomotives. It is crushed underground to about 8-inch cubes, and is then hoisted in 10-ton skips at 3,000 feet per minute. On the surface at the mine, the large pieces of rock are picked out by hand, the ore is recrushed by hand and screened. It is then hauled by electric locomotives in standard gauge 70-ton side-dump cars to Copper Cliff and by steam locomotives to Coniston.

The ore is received in 10,000 ton capacity receiving bins. Here it is crushed to two hundred mesh and sent through a wet concentration to remove the rock. The ores consist of copper, nickel and iron sulphides intimately mixed.

In the concentration process the sulphides are floated, and the lighter rock material sinks to the bottom. This phenomenon is due to the introduction of a very small quantity of oil and other reagents to the pulp of ore and water, and blowing air through the mass. This causes bubbles or balloons of air to attach themselves to the heavy sulphides and float them. By selective flotation a rough separation is made of the copper from the nickel.

The succeeding smelting operations consist of the separation of the iron and silica from the copper and nickel sulphides. It comprises roasting in multiple hearth roasters, where a part of the sulphur is burned away, smelting in reverberatory furnaces, where most of the iron and silica is removed in the form of a slag, and finally blowing in basic lined Bessemer converters, where most of the remaining iron is removed.

The product of the smelter is an 80 per cent copper-nickel matte. At present this is shipped to the Port Colborne nickel refinery or to Huntington, West Virginia.

In the refinery, the copper and nickel sulphides are separated by the modified Orford process. The nickel is refined electrolytically at Port Colborne, and the copper at the Ontario Refining Company plant at Copper Cliff.

At the present time, the No. 1 process, or that of separating the copper and nickel sulphides previous to electrolytic refining, is being transferred to Copper Cliff.

The construction programme carried out during the past three years by The International Nickel Company of Canada, Ltd., includes additions to their refinery at Port Colborne, the underground development and surface plant of their Frood mine, the construction of a new smelting plant at Copper Cliff; also additions and improvements to the Coniston smelter, and a new surface plant at Levack. The smelter and concentrator have now been put in operation, and additional construction is being proceeded with in transferring part of the Port Colborne operations to Copper Cliff. The present paper deals with the smelter and concentrating units at Copper Cliff, especially in regard to the problems of engineering design.

The plant was designed by the staff of The International Nickel Company at Copper Cliff, the structural and mechanical part of the work being under the supervision of the writer. A general flow sheet and plan was submitted by A. G. MacGregor, consulting engineer, and this was, in the main, followed.

The general contractors were the Fraser-Brace Engineering Company, Ltd., Montreal, who built or erected the foundations, brickwork, lumber, piping and most of the machinery. The structural steel work was supplied and erected by the Dominion Bridge Company; the blast piping, and the gas main to the Canadian Industries plant by the Horton Steel Company; the smelter stack by the Custodis Canadian Chimney Company; the powdered coal plant by Heyl & Patterson of Pittsburgh. A number of other contractors installed individual equipmet of various kinds.

The construction work went forward with smoothness and despatch, under difficult winter weather conditions, without delay in brick and concrete construction, and with the most harmonious relations between the contractors and the company's engineering staff.

The plant is designed to crush, concentrate and smelt approximately 8,000 tons of ore per day. The accompanying plan of the works (figure No. 1) shows the general layout of the plant which includes receiving bins and trackage, crushing and screening units, conveying systems, a concentrator in which selective flotation is practised; and a smelter equipped with mechanical roasters, reverberatory furnaces and converters, with the attendant coal pulverizing plant, flue system, stack, water systems, and other auxiliary units.

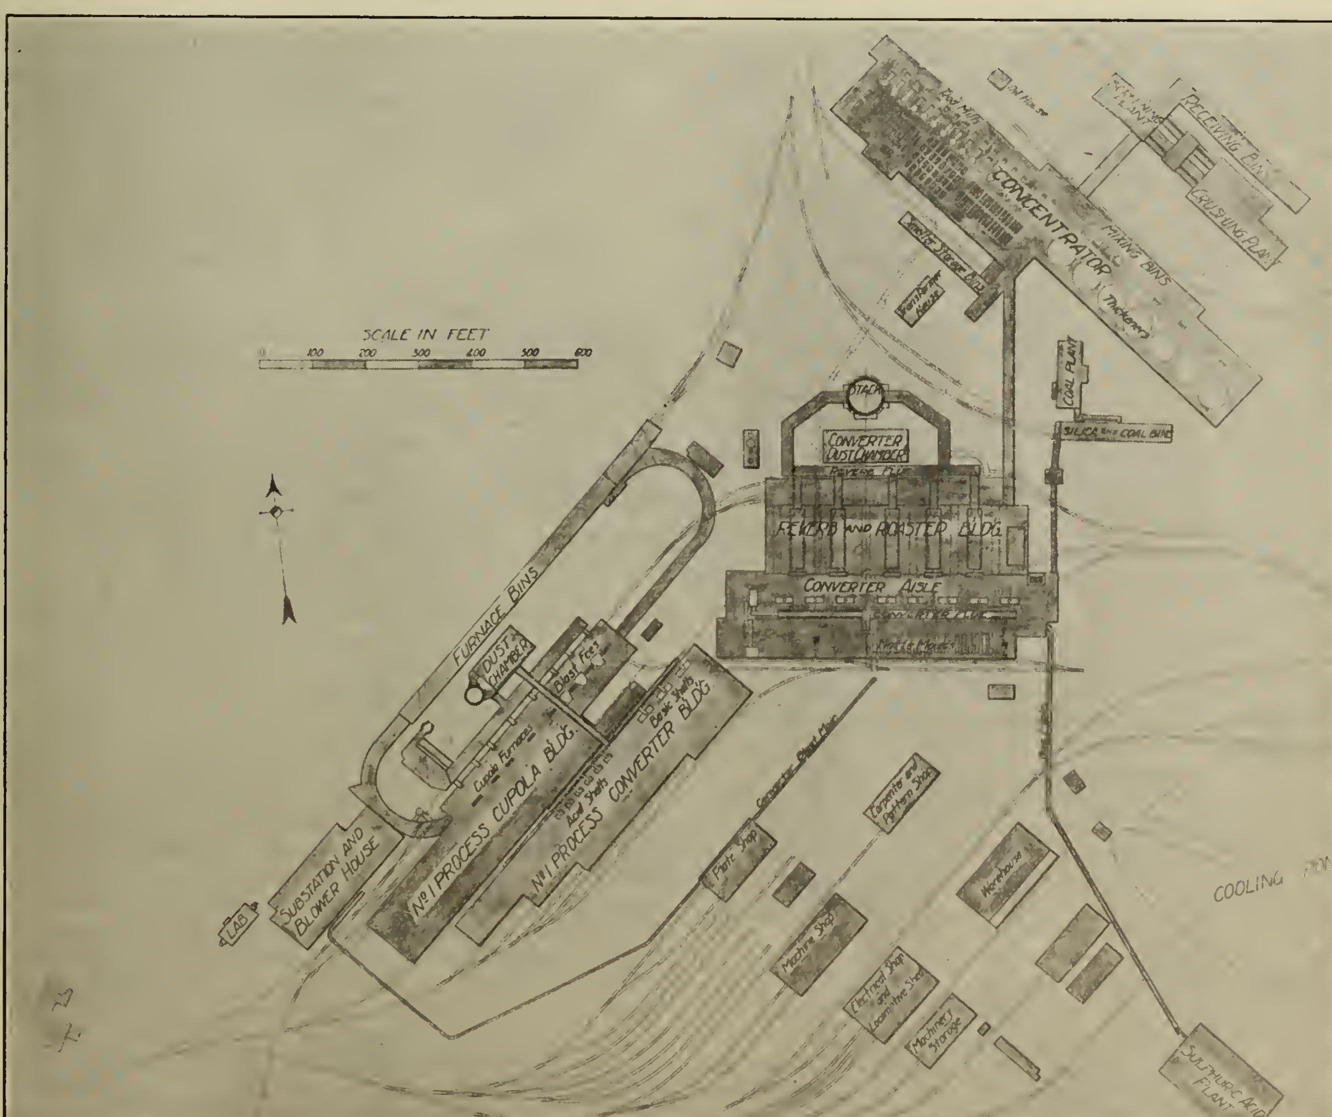

Figure No. 1.—Layout of Smelter and Concentrator.

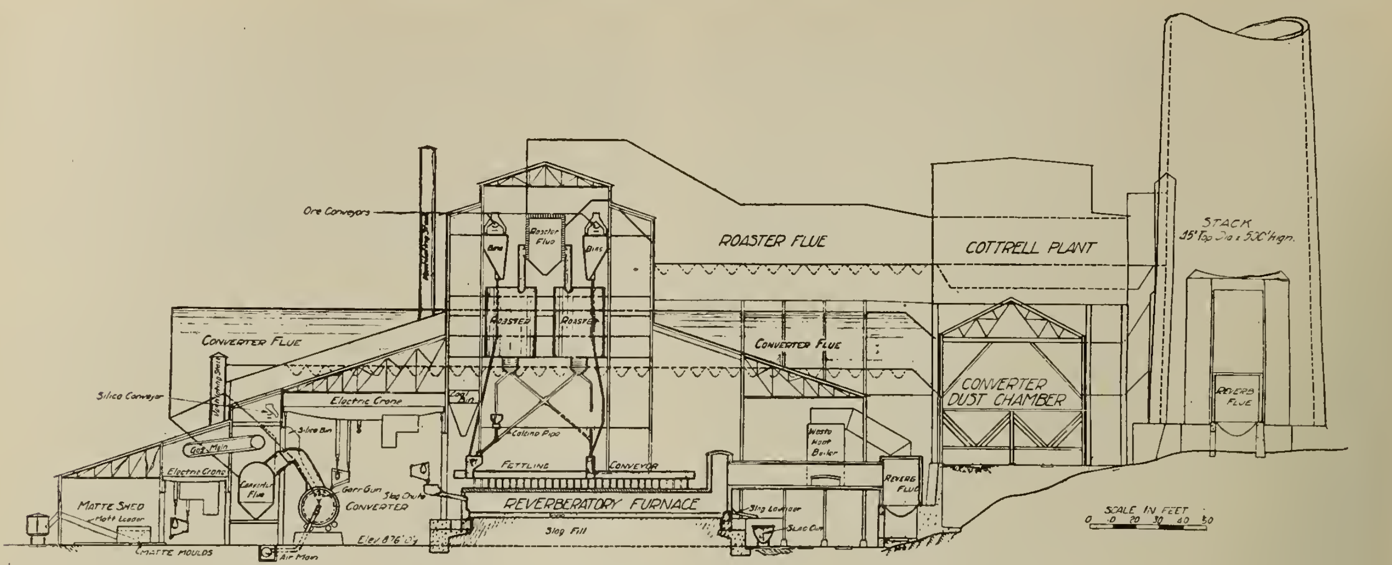

Figure No. 2.

The magnitude of the work is indicated by the following figures:

Tons of structural steel used	35,000
Brick in buildings, flues and furnaces	7,034,000
Hollow tile (interlocking in buildings and flues)	1,250,000
Concrete in foundations and floors, cubic yards	61,000
Combined ground area of all structures, square feet	510,000
" floor " " " " " "	1,000,000
Tons of brick in smelter stack exclusive of foundations	15,000

As shown in figure No. 2, the roasters are placed above the reverberatory furnace plant, which, in turn, has a floor elevation of 12 feet above the converter floor. This requires rather a high furnace building, which is 183 feet from the yard level to highest roof elevation. The main smelter stack is the largest in the British Empire, being 512 feet from the base to the top, or 554 feet above the converter building floor. It has an inside diameter of 45 feet at the top.

Most of the building foundations are carried down to bed-rock, the only exception being part of the smelter building which is built over an old cooling pond. Here the pond site was excavated to a depth of 35 feet and 166,000 tons of molten reverberatory slag were poured in to form a base. Concrete foundations were poured on this base during the coldest winter months; it took about seven months for the mass of slag to cool until there was no evident emission of heat. There was a slight settling of about four-tenths of an inch, due to cooling.

The reverberatory walls were built on the slag. These walls were lined with hollow tile to protect them from heat, and then filled to a depth of 12 feet with molten slag. No appreciable cracking of the concrete walls resulted.

The foundations for the stack are on solid rock. The stack was built near the face of a rock ledge having a slope of approximately 20 per cent. In order to be certain that there would be no slip due to seams in the rock, the stack foundation site was diamond-drilled to a depth of 60 feet and the cores examined for seams and faults.

A difficult problem resulted from the very heavy loads on the reverberatory-and-roaster building columns, in some cases as high as 1,400,000 pounds per column. Past experience in reverberatory buildings has shown that these furnaces will spread, owing to heat expansion and to the impregnation of the base with matte. Over a period of years this spread may amount to several feet, and as a result the building columns are pushed out of plumb, since the columns were close to the sides of the reverberatories. On account of the heavy superimposed loads from the roasters, this condition might endanger the structure; therefore special precautions were taken to guard against this happening (figure No. 3):

(a) The building foundations were separated from the reverberatory furnace foundations, for a depth of 6 feet, by expansion joints about 2 feet wide at the column bases. The resulting holes or spaces were then filled with "Insulex," a very porous gypsum which can be easily crushed under pressure. The top surface of the Insulex was protected by a light concrete slab.

(b) The foundations between furnaces were made in the form of long piers, and heavily reinforced with longitudinal grillages to take end thrust, each pier taking two or more column bases.

(c) The building columns were heavily braced laterally, so that even if pushed out of plumb the bracing will take care of the heavy lateral thrust resulting therefrom.

In the structural steel design the specifications of the American Bridge Company were adopted, with some modifications, using 16,000 pounds net tensile stresses per square inch and $19{,}000 - 100 \frac{L}{R}$ for compression on main members. A wind load of 30 pounds per square foot, and a snow load of 40 pounds per square foot, were assumed. No main members were made less than three-eighths of an inch in thickness, so as to allow for corrosion from the gases resulting from operations. All members were chosen with the idea of preventing the accumulation of moisture or corrosive dust on ledges of the steelwork. The above precautions caused a somewhat heavier steel construction than is met with in ordinary building construction. The structural steelwork was furnished by the Dominion Bridge Company, and the services of their engineers were freely made use of in the detail design.

Roofs on practically all structures are made of slow-burning wood construction, consisting of two by fours on edge. In buildings where furnaces are located, all wood was impregnated with a zinc chloride solution under pressure. The solution completely penetrated the wood and made it fire resistant.

The brick roaster flues are covered with a corrugated-iron roof, with an air space between the brick roof arches and the corrugated roof.

The concentrator roof is of wood with a half-inch insulation of wood fibre board.

Flat roofs are covered with Barrett specification roofing; all sloping roofs are covered with roll slate covered asphalt roofing.

The experience of the company with corrugated-iron sheathing has not been satisfactory, because it requires frequent painting to prevent corrosion, with a consequent heavy cost of upkeep, and the insulating qualities are not sufficient to meet the low winter temperatures prevailing at Copper Cliff. For these reasons a fireproof wall was sought which would meet the requirements, and interlocking tile walls were chosen for practically all structures. They are, in the main, 8 inches thick and non-bearing. The tile chosen has a vitreous burn, making it non-porous, in order to prevent disintegration by frost. In every case the lower 8 feet of the walls were made of brick to prevent damage to the tile by steel bars and heavy tools. Where blasting is apt to occur, such as at the steel ore bins, the tile walls are protected by heavy plank sheathing.

In the smelting group the roasters are above the reverberatory furnaces in a single building, and the converters in an attached structure. Since the buildings are completely enclosed, it was necessary to take extraordinary measures to ensure the escape of the fumes from the converters while turning down, in tapping matte and slag from the reverberatories, from the hot calcines, etc. To take care of this, tile partitions were placed between the roasters and converter aisles, and at other points where gases were to be excluded from working floors. In addition ventilating stacks were placed above the matte-casting aisle, the converter aisle, the roasters, and the reverberatory slag aisles. These stacks are of large diameter and of a sufficient height to cause an induced draft from the warmer air in the building. This arrangement has proved superior to the monitor type of building, and the structures to date have been very free from gas.

The ore is conveyed from the mines to the smelter in standard side bottom-dump Hart-Otis type 60- to 80-ton steel ore cars, and hauled by 500-volt direct-current electric locomotives over the company railway, or by steam over the lines of the Canadian Pacific Railway. These cars are dumped into sloping bottom steel bins having a capacity of 10,000 tons of ore, over which two standard gauge railway tracks run.

The ore is drawn out of the bins through two lines of special gates over belt feeders onto two 36-inch conveyor belts. A system of conveyors then carries the ore to the various processes and will be described later.

From the receiving bins the ore passes to the fine crushing plant bins, below which are three 7-foot Symons cone crushers which reduce the ore from 5-inch lumps to a three-quarter-inch product. This material is then conveyed by two 36-inch wide conveyor belts and passed over eight 54-inch type FB-2 Traylor vibrating screens which remove the minus 6 mesh fines. These fines are carried by belt conveyors direct to the concentrator. The oversize is conveyed to two Traylor rolls, 78 inches by 18 inches, in a closed circuit with Traylor vibrator screens and reduced to a suitable ball or rod mill product. This material is then conveyed over 24 Traylor secondary vibrator screens which are in closed circuit with three Traylor 78-inch by 18-inch secondary crushing rolls and connected thereto by 48-inch conveyor belts. There are bins over the Symons crushers, over the primary screens and over the crushing rolls.

Since the ore is handled entirely by conveyors from the time it leaves the receiving bins until it reaches the roasting furnaces in the smelter, there are, necessarily, a great many conveyors which form an important link in the process. In the smelter conveying system there are 47 belt conveyors, using a total of 24,000 feet of rubber-covered conveyor belt.

The maximum length of any inclined conveyor is 514 feet, with a rise of 98 feet, and a maximum slope of 17 degrees.

All cold material is handled on belt conveyors ranging in width from 24 inches to a maximum of 48 inches. All troughing and return idlers are Timken roller equipped, and made by the Link-Belt Company of Canada, Ltd., Conveyor trippers (made by Stephenson-Adamson Company) with slat type snub pulleys are of the motor propelled type.

The conveyor system includes some novel features. Thus in the transfer of discharge from the conveyors under the receiving bins to either one of two parallel belts at right angles to the line of flow, the head and tail pulleys only are made movable, with troughing idlers attached to spacing rods and a sufficient counterweight to keep the belt tight in all positions. The head pulley is moved forward by means of a "nigger head" on the end of the head pulley shaft. In this manner a conveyor 340 feet long can be easily and quickly moved forward or backward under the power of the conveyor motor. All take-ups are of the counterweighted type.

The drives in general are from lagged head pulleys. There are a few tandem drives on some of the longer belts.

Since the ore is slightly attracted by a magnet, it is not entirely feasible to use magnetic pulleys to remove tramp iron. Stationary magnets have been placed above the belts, adjustable as to distance, for this purpose. All snub pulleys are of the slatted type. Conveyor speeds are, in general, kept under 300 feet per minute. The drives for all conveyors are through totally enclosed gear reducers of the herringbone and worm gear types.

The principal use of fuel in the smelter is for the reverberatory furnaces. For this purpose powdered coal is used and is prepared from run-of-mine or slack coal from eastern United States fields shipped by boat to Little Current, on Georgian Bay, whence it is transported about 80 miles by rail to Copper Cliff.

The coal pulverizing plant has a capacity of 700 tons of coal per 14 hours operation. It consists of the necessary conveying apparatus, three Heyl and Patterson concurrent flow type rotary cylindrical coal dryers, each 7 feet 6 inches in diameter by 50 feet long, and four 4-foot Raymond mills, each having a rating of 15 tons per hour. The coal is conveyed to shooting tanks where it is weighed and then shot by compressed air to a 200-ton bin behind each reverberatory furnace. The filling of these bins and the control valves for switching from one to another are all operated from a central point in the pulverized coal building.

There is one central vent in the coal plant through a cyclone separator to the smelter flue system.

The coal is fed from the reverberatory storage bins by means of screw-type feeders driven by electric motors through variable speed changers. It is blown into each

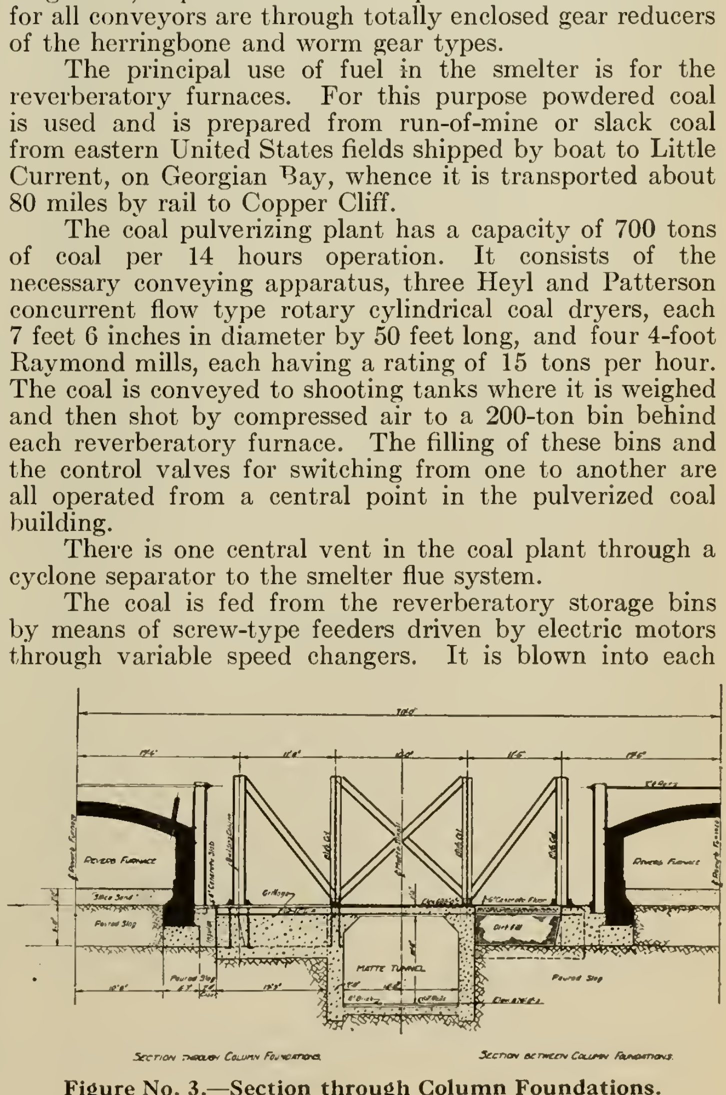

Figure No. 3.—Section through Column Foundations.

reverberatory through four fan-tail burners, by a primary air fan. Each burner has a total maximum capacity of 3,600 pounds per hour of powdered coal, or 170 tons per 24 hours per reverberatory. Secondary air is introduced direct by induced draft around the burners.

The gases from the new smelter are conveyed to a central stack from the various furnaces. The stack is 512 feet in height and 45 feet 2 inches inside diameter at the top. It is constructed of radial brick burned from shale at Cooksville, Ontario. There is a 6-inch lining of special Pennsylvania acid-resisting brick supported on corbels approximately every 35 feet in height. It was built in five months by the Custodis Canadian Chimney Company and was kept heated by steam heat during the cold weather before being put into service.

A tunnel projects under the stack with cleanout gates for removing dust. The floor of the stack is inclined, making a V-hopper, lined with paving brick.

The lightning protection consists of seven-eighths-inch copper rods 7 feet apart around the top of the stack. There are four vertical leads to the ground, which are interconnected by horizontal bands of copper every 50 feet. All are lead covered. Four grounds are connected to the stack and consist of copper plates buried in charcoal 6 feet below the surface.

There are four openings into the base of the stack to receive the three separate flue systems from the roasters, the reverberatories and the converters.

In the roaster flue system, the gases from the roasters pass through cast iron cylindrical risers to a brick and tile flue, which consists of two branches 14 feet wide and 18 feet high, with steel hopper bottoms, which combine into a flue 20 feet wide by 25 feet high. They then pass to a Cottrell treater and on to the smelter stack. The design of this flue system includes two novel features of construction. The side walls consist of 4 inches of fire-brick lining and 8 inches of interlocking tile. The tile is of vitreous burn, laid up in fire clay and cement. Owing to the fact that these flues are supported on structural steel 122 feet above the ground, brick and tile construction was adopted in place of all brick, to save weight; and a considerable saving in the steel supporting structure resulted.

The roof consists of 9-inch fire brick arches against cast iron skewbacks. The skewbacks are cast in short T-sections and bolted to the bottom flanges of structural beams above the flue. It is believed that this construction will be very resistant to corrosion, since only the cast iron and brick arch are in contact with the gas stream. The maximum velocity of gas in this flue system has been calculated to be 30 feet per second for the 30 Herreshoff roasters.

The flue dust from the roaster flues is carried by 730 feet of drag conveyors to the reverberatories.

The Cottrell plant treats the gases from the roasters only, those from the converters and reverberatories going through separate systems. It was built in accordance with plans furnished by the Western Precipitation Company of Los Angeles who also furnished the electrical equipment.

The plant consists of seven units of three sections each—each section of 18 ducts—of the rod-curtain electrode type. It has a capacity of 600,000 cubic feet per minute at a temperature of between 400 and 700 degrees F.

The floor of the precipitator is supported over the converter dust chamber at an elevation of 104 feet 6 inches above the smelter yard level. The use of vitrified interlocking tile as partitions between the treater units is a novel feature of construction.

The Cottrell plant is housed in a steel frame building with interlocking tile walls and wood roof treated with zinc chloride to make it non-inflammable.

The reverberatory flue system includes connecting flues from the reverberatories to a main header flue, and two main branch flues on each end of the smelter from the header flue to the stack, where they enter on opposite sides of the stack. All these are of brick, supported 8 feet above ground on concrete columns and beams with steel hopper bottoms, and cross brick arches supported on 18-inch H-beams at 5-foot centres. There is a track underneath each flue for dust removal.

Lift dampers of special construction are provided to regulate the draft from each reverberatory and also to divert the flow through waste heat boilers. These dampers are of brick of special shapes and are held together with steel rods enclosed in the brick so that no steelwork comes in contact with the hot gases.

The reverberatory flues have five dampers arranged so as to direct the gases of all or part of the furnaces through either branch to the stack. These dampers are lifted and lowered from a steel frame, by chain blocks, and are constructed of a steel frame covered with expanded metal. A solid slab of "Celite" was cast between and over the surfaces of expanded metal. Since the dampers are either entirely out of the gas stream, or else blocking the flow entirely, it was felt that the temperatures would not be sufficient to destroy the cement binder. This construction gave a damper of comparatively light weight with considerable heat resistance. The maximum velocity of gas in this flue system will not exceed 30 feet per second.

The converter flue system takes the gases from eight 13-feet by 35-feet Pierce Smith type converters. The flues are made of steel plate reinforced with external stiffener angles, and have a cross-section with a semi-circular top, straight sides and hopper V-bottom.

The converter dust chamber has brick side walls, steel roof and hopper V-bottom, supported on steel columns and served by tracks for drawing out dust. The gas is distributed by two internal V-flues with adjustable cast iron doors for regulating the width of the slot at the bottom.

In the construction of the concentrator building, to meet the requirements of the flow sheet at first contemplated, it was necessary to elevate the fine-ore bins very high above the ground and to provide an elevated platform free from vibration for the installation of Deister tables. The tops of the bins are therefore 72 feet above the ground on which the bins rest, and the table floor is 33 feet above the ground. A heavy concrete structure was provided, with reinforced columns, beams and floor 33 feet high, upon which the steelwork for the bins was erected.

All floors of the building are concrete except walkways around flotation machines and a few others which are of wood.

The ore from the crushing and screening departments is conveyed by inclined conveyor belts to the concentrator fine-ore storage bins. These are driven by variable speed drives and the rate of the feed can be adjusted very closely to that required by the Marcy mills. There are sixteen of these mills, half of which are at present equipped with balls and half with rods. In closed circuit with each mill is a 12-foot Dorr bowl classifier.

There are in the mill one hundred and forty McIntosh flotation cells in which, by selective flotation, both high copper and nickel concentrates are made.

Practically all the mill pulp is handled by Wilfley pumps, the only bucket elevators being for floor cleanup work. A large part of the mill pulp is transferred from one process to the next, through black iron pipe, where the usual practice is to use launders. By this means it is possible to move the pulp with a very small difference in head. The only precautions taken are to maintain a small gradient in the direction of the flow, and to use large radius bends made either from the pipe or from cast iron fittings.

For distribution to the flotation cells or to the classifiers, centrally located bowl distributors with radially placed distributor pipes are used.

The tailings are pumped by Wilfley pumps to a disposal area about 40 feet above the pumps and at a distance of about 1,500 feet. Wood stave wire-wound pipes are used, and the tailings are wasted through one-and-one quarter inch holes spaced 5 feet apart.

The dewatering equipment consists of seven 55-feet by 18-feet Dorrco tray thickeners, six Dorr classifiers and six 14 feet diameter by 16 feet Dorrco filters.

A 75-ton crane runs over the Marcy mills and the filters. The flotation machines are served by small hand cranes.

Fresh and return water are pumped from storage and settling ponds, by means of De Laval pumps, to elevated tanks in the top of the mill.

The smelter building is equipped with thirty Nichols-Herreshoff roasters, 21 feet 6 inches diameter of shell, ten hearths and a drying hearth. They were built by the Dominion Bridge Company. One special feature of this installation is that the roasters can be driven at any speed between four-tenths revolutions per minute and two revolutions per minute. Each roaster is driven by a separate 20 h.p. slip-ring motor. Cooling of the central shaft and arms is accomplished by means of six 40,000 cubic feet per minute Sturtevant fans discharging into a common header in such a manner that any group of six roasters may be served by any fan, or from the common header.

The calcined material from the roasters is discharged into a brick-lined hopper bin of 10 tons capacity, and from there, through 10-inch pipe gravity chutes, to a drag chain and flight type fettling conveyor on each side of each reverberatory. From the conveyors the material drops, at 6-foot intervals, into the reverberatory furnace, through 4-inch pipes equipped with lift valves. An intermediate floor is provided with tracks and cars, whereby the calcines from any roaster can be transferred to any reverberatory. (See figure No. 2.)

Green ore and flux can be fed to the reverberatories by means of pipe chutes which by-pass the roaster and which run from separate bins above the roasting furnaces.

The reverberatory plant consists of five furnaces, each having a hearth 24 feet wide and 110 feet long, and fired with four pulverized-coal flat-flame burners. The slag is skimmed off directly into steel pots on cars. The cars are moved by car pullers onto the main standard gauge tracks and from there to the slag dump by electric locomotives in trains of eight to ten cars.

The matte from the reverberatories is tapped into 30-ton capacity cast steel ladles. These ladles are mounted on transfer cars located in tunnels between the reverberatories. They are pulled by electric car pullers into the converter aisle, and from there carried by 50-ton cranes to the converters. The reverberatories receive the molten converter slag, which is poured through a launder directly into the furnace between the coal burners at the firing end, by the converter cranes.

The converter equipment consists of eight 13-foot by 35-foot Traylor converters operated by 60 h.p. d.c. motors. In case of power failure the converters are automatically turned off the tuyères by the energy stored in the flywheel sets.

A part of the converter gas is used by Canadian Industries for the manufacture of sulphuric acid. This requires a high concentration of SO_2 delivered from the converters, which is obtained by a special hood which fits tightly over the converter mouth when blowing. The hoods are counterweighted and operated by electric motored hoists. The hoods lift automatically when the power fails, in order to allow the converter shells to turn off the tuyères. The gas to the acid plant is drawn from the top of the hood and from the centre of the gas stream into a separate flue leading to the acid plant.

The converter aisle is served by two Dominion Bridge Company cranes each having two 50-ton main hooks and a 10-ton auxiliary.

The converter slag is poured directly back into the reverberatory furnaces as previously noted. The converter matte is pulled over transfer tracks to the casting aisle which is equipped with crane having a 50-ton main hook and a 10-ton auxiliary hook. The matte is cast into cast iron moulds on the floor of the building in slabs about 4 inches thick. These slabs, when cool, are picked up by 10-ton electric travelling cranes and broken through an elevated grizzly into two pan conveyors which, in turn, discharge the material into box cars for shipment to Port Colborne, Huntington, or the No. 1 process bins at Copper Cliff.

The converter pot skulls are broken on a MacGregor skull breaker and treated in a blast furnace.

The copper concentrates are treated in a separate reverberatory and converters.

The copper converter matte is charged into an oil-fired reverberatory type holding-furnace having a hearth of 12 feet by 32 feet inside and a capacity of approximately 200 tons. The copper is cast into pigs for shipment to the Ontario refinery at Copper Cliff on a straight line casting machine built by the Allis-Chalmers Company at Milwaukee. The copper pigs are discharged into a Bosch tank and elevated to a shipping platform by a drag conveyor.

Air for the converters is furnished by turbo-compressors driven by electric motors. There is one Rateau blower with a capacity of 42,000 cubic feet per minute of free air compressed to 14 pounds pressure, and in addition, two Brown Boveri units of 25,000 cubic feet each and one of 40,000 cubic feet have recently been installed. There are also two Allis-Chalmers piston type machines of 20,000 cubic feet capacity each, the total capacity of 14 pounds air being 172,000 cubic feet per minute for both the basic converters and the No. 1 process to be installed next year.

The water for the concentrator plant is supplied from a lake about two and a half miles from the plant. Water is pumped through 12-and 16-inch cast iron pipe lines about 12,000 feet in length each by means of De Laval two-stage pumps. A storage pond receives the water at the concentrator end, or it can be directly pumped to the head tanks in the top of the mill. Drainage water from the tailings ponds is returned to a settling pond for use in the mill, or wasted, in which case it eventually finds its way back to the lake.

In conclusion, acknowledgment should be made of the work done by the author's aids on the engineering staff in the field and the draughting office. With a comparatively small force of field engineers, draughtsmen and designers, a tremendous amount of work was accomplished in a comparatively short time. Not only were plans made and specifications written, and purchasing requisitions issued for the work described above, but at the same time plans were being worked out for various other projects of considerable magnitude.

Notes on Clay and Burned Clay Products

G. S. Stairs, M.E.I.C.,
Sales Manager and Engineer, L. E. Shaw, Ltd., Avonport, N.S.

Paper read before the Moncton Branch of The Engineering Institute of Canada, April 14th, 1930.

In this paper an endeavour is made to indicate some of the properties of clay as a material and to outline the methods of manufacture of such clay products as are of importance to structural engineers. It is hoped that an interest will thus be aroused which can be satisfied by further individual reading or study.

Clay is a fascinating material. Far back in geological history, before life moved on the earth, the recently cooled granite hills and mountains were washed by torrential rains, broken by alternate heat and cold, buried under seas and torn by passing ice ages. The rocks were thus subjected to chemical change, ground to powder, and carried down to the lakes and seas by streams and rivers. In quiet bays, at the mouths of rivers, or at the bottom of lakes, the eroded material was deposited. Ages later, when continents had been elevated from those ancient waters, many of these deposits are found as beds of clay.

Clay consists essentially of kaolin, usually with quartz grains in the form of sand and various other impurities derived from the weathering of rocks. Take, for instance, the weathering of granite, a notable source of clay. This rock is composed mainly of feldspar ($K_2O \cdot Al_2O_3 \cdot 6SiO_2$) quartz and mica. The rock having been opened up by disintegrative forces, water containing carbon dioxide slowly decomposes the feldspar to kaolin ($Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$) and leaches out the alkalies, resulting finally in a mixture of kaolin, free quartz and mica together with some of the other impurities originally present in the granite. Most of the igneous rocks contain to a considerable extent either a potash, soda or lime feldspar and their decomposition proceeds along somewhat the same lines as in the case of granite. Pure kaolin, which is quite rare, is white in colour and highly refractory. In the process of being transported from their sources, the sedimentary clays may become contaminated with considerable amounts of other materials and thus be very impure. However, so long as sufficient kaolin is present to form a plastic mass when mixed with water the substance is called clay. Kaolin finds an extensive use in the manufacture of porcelain.

Fire clay must necessarily be composed largely of kaolin as the presence of impurities such as iron, lime, magnesia or alkalies, in any appreciable amounts, would greatly lower its refractoriness. True fire clays withstand temperatures of 3,000 degrees F. or more. A clay or shale that will stand up to a temperature of 2,700 degrees F. is defined as No. 2 fire clay.

Fire clays occur frequently beneath coal seams and represent the ancient soil on which the coal plants grew. The fire clays are often hard rocks. We see this in the New Brunswick and Nova Scotia coalfields, as elsewhere.

Shales are clays transformed by great pressure into a rock-like form. When pulverized and mixed with water, shale becomes essentially clay again. The shale product usually has the higher crushing strength and will withstand greater temperatures.

The outstanding properties of clay are its plasticity and imperviousness to water when moist and the ease with which it can be converted into a stone-like mass when heated to a high temperature, or as it is technically known, "fired" or "burned."

Although all clays can be moulded when properly moistened and can be converted into a hardened form by heat, they are not all suitable for burned clay products. The clay may be highly plastic or only feebly so. It may show a very high shrinkage in drying and in burning. It may actually develop a permanent expansion during the burning operations. It may be tough working and liable to produce laminations during the moulding operations. These characteristics are reflected in the quality of the finished product. The modern clayworker has come to realize that he must study the nature of the clay which he has available as raw material so that he may produce a saleable article.

It is not known at just what period in history the properties of burned clay were first taken advantage of by man. Certainly the exploitation of clay constituted one of the earliest industries. The first clay products undoubtedly were receptacles for food, dried and baked in the sun only. In all probability, the first clay ware was produced by accident rather than design. With the realization of the valuable properties of the burned clay, a great impetus was given the crude manufacture of clay products. With advancing civilization, many of the early peoples logically turned to clay as a material on which to record their laws, business transactions, exploits and history. The archaeologist today classifies his discoveries according to the evidence furnished by the pottery finds. Ancient brick, tile and pottery have come down to us unimpaired, preserved for thousands of years, testifying to the fact that burned clay is probably the most enduring of all materials. On that vitally important feature, *durability*, are based those great industries which have been literally built on clay.

The chemical changes which take place when clay is burned are very involved, but the main features, especially when applied to brick burning, are most interesting. Although the variety of colours produced in brick today is brought about largely by manipulation of the fires, nevertheless the presence or absence of the oxides of iron determines the basic colouring both in the raw clay and in the burned products.

The process of manufacturing falls essentially into moulding, drying and burning. The manufacture of two types of clay products, brick and structural tile, is outlined below.

Having found by laboratory tests that the clay or shale does not contain injurious impurities, that the desired plasticity may be developed, that it dries fairly rapidly without excessive shrinkage or cracking, perhaps alone or with the addition of sand, and that it can be burned to the desired texture, strength and colour, it will be assumed that the raw material has been brought to the plant.

If soft clay, it is passed through various grinders and rolls which crush or remove pebbles and other foreign materials and thoroughly break up the laminated texture which usually occurs in the natural clay beds. If shale, it is crushed, ground and screened to the desired fineness. With this preliminary treatment the clay is passed on to a pug mill where the necessary quantities of water, sand, etc., are added. Essentially, the pug mill is a chamber within which rotate one or two horizontal shafts with knives attached which thoroughly 'pug' or mix the materials.

With this preparation the clay may be moulded into the desired shapes by one of the two methods known as the soft mud and the stiff mud processes. If the dry press

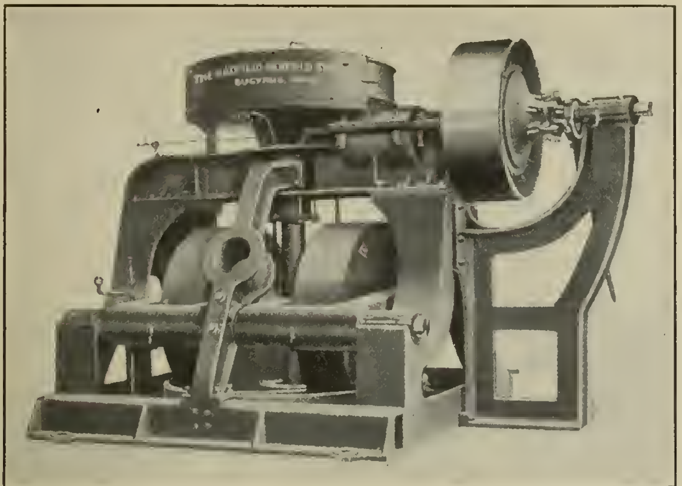

Figure No. 1.—High Speed Grinder for Fine Grinding of Hard Shale.

process is used for moulding, the clay is moistened to a slight extent during the grinding operation when it is then ready for pressing.

The soft mud process is the simplest of the three. The clay is mixed with water to the consistency of soft paste and pressed into wooden moulds. The moulds are usually sanded each time before being filled in order to deliver the brick from the mould more easily. Soft mud bricks are recognized usually by showing five sanded surfaces. Unless repressed, soft mud bricks lack sharp corners. Due to faulty preliminary preparation of the clay the interior is often more pebbly than in bricks made by other processes.

In the stiff mud process, the clay is mixed with just sufficient water to make it plastic but still quite stiff. It is then passed into an auger machine and forced through a rectangular die in the form of a bar and out upon a cutting table. This bar is cut into brick lengths by means of fine wires attached to a hand-operated or automatic cutter. Since the wire makes a somewhat tearing cut, the cut surfaces are always recognizable on the stiff mud bricks.

A characteristic of the stiff mud brick made from clay is that the process of forcing the clay through the die by means of the tapering screw or auger in the machine is apt to intensify the laminated structure of the brick. A shale brick is usually free from laminations. Stiff mud bricks will have four smooth and two roughly cut surfaces.

The soft mud and stiff mud bricks are sometimes repressed shortly after moulding; the repressing straightens the edges and removes the surface roughness.

In the dry press process, the clay is pressed in steel moulds. This process produces bricks with sharp edges and smooth surfaces. Unless the bricks are well vitrified in burning, they are apt to show a granular structure. The grains of clay cannot coalesce nearly so well as when the clay is moulded in a plastic state.

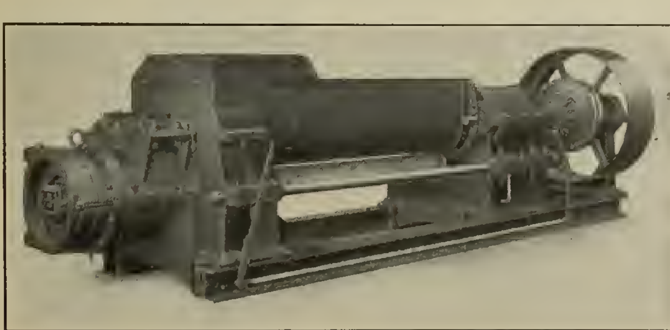

Figure No. 2.—A Brick and Tile Machine as used for moulding Stiff Mud products.

Structural tile is made by the stiff mud process. Various patterns of dies are used on the auger machine to produce the different shapes of tiles. The bar is cut usually in 12-inch lengths with cutting wires in the same manner as are the stiff mud bricks.

The product is now moulded to the finished shape. The next step is to drive off mechanically combined water. This is the drying process.

Originally, bricks were dried on outdoor racks by the action of the wind and sun. Although still prevailing in some rather primitive plants, this process is largely superseded by artificial drying.

In the structure known as the dryer, the ware may be dried either by hot steam pipes, or heat radiated from a metal tunnel in the floor through which are passed the combustion gases from the burning kilns, or from waste heat conducted to the dryer from kilns containing the finished and cooling product. The latter appeals to one as being efficient and is very largely adopted. In a kiln, for instance, containing 60,000 bricks at a white hot temperature, there are approximately three quarters of a billion B.t.u.'s., which must be removed before the brick can be handled. In drying, it is important that the ware be first subjected to a humid atmosphere so that the interior reaches a temperature close to that of the surface of the brick before evaporation is permitted to take place

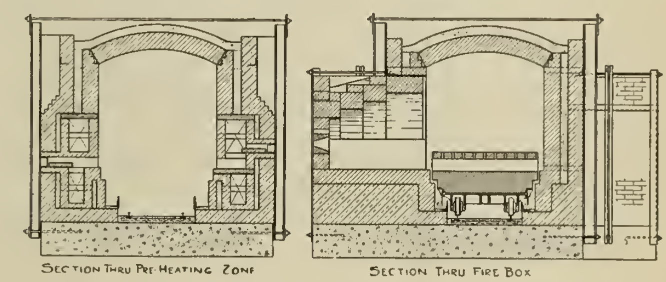

Figure No. 3.—Two Cross Sections through a single-tunnel Kiln.

on the surface. A temperature of about 150 degrees F. is reached in the dryer, although this may vary. The drying period varies from a minimum of perhaps eight hours to several days with different clays.

The ware is now ready for burning and before describing some of the different types of kilns, allusion will be made to some features of the burning process.

Leaving the dryer the clay shapes are placed in the kiln, and may to the casual observer appear dry. However, the ware still contains the chemically combined water in one or more constituents of the clay, as, for instance, the kaolin. With the application of considerable heat, the first process is that termed by the operator as 'water-smoking,' which is the driving off of the chemically combined water. This action is practically completed at about 900 degrees F., a low red heat. The passing off of this water results in a marked decrease in weight between temperatures of 800 and 900 degrees F.

If it were not for certain impurities the completion of the burning would be fairly simple. However, these are often in evidence in clays and shales and must be removed. The principal impurities are usually carbon, sulphur, and carbonate of lime. The oxidation of the impurities is unquestionably the most important part of the burning and the elimination of these substances will be referred to in some detail.

Beginning at about 800 degrees F. oxidation of the impurities commences and may extend, in the case of burning out carbon, up to 1,800 or 2,000 degrees F. At temperatures varying from 1,800 degrees F., to perhaps 2,000 degrees F. in the case of some non-refractory clays or shales, the material has reached its maximum shrinkage, and at that stage the temperature is held long enough to ensure the particles being somewhat vitrified, fused or bonded together. At higher temperatures the material becomes viscous and usually begins to increase in volume.

As previously pointed out, the iron oxides are the important colouring elements in the burned brick. Fe_2O_3, ferric oxide, is red and for red brick we naturally desire to retain the oxide finally in the ferric form. Ferrous oxide, FeO, is more of a fluxing material than the ferric and tends to combine with the silica forming a dark iron silicate. The kiln operator, by admitting an excess of oxygen to the fires, will have the red ferric oxide. On the other hand, by burning the brick with a restricted amount of oxygen, or a reducing atmosphere, the ferric oxide is reduced, and brown or black silicates tend to be formed.

In the case of red burning clays if the reduction is slight, the amount of black iron silicate developed suffices merely to darken the natural red colour to a brown, becoming darker with increased reduction and finally attains the dark gun-metal black in which the iron silicate predominates. If such impurities as sulphides and carbon are not fully burned out or oxidized before the burning of the ware is completed, they will seriously interfere with the finishing process.

Iron pyrites, or iron sulphide, FeS_2, is an objectionable impurity in clay. Gypsum, or $CaSO_4 . 2H_2O$, is also a source of sulphur. Under extreme heat both sulphates and sulphides dissociate at about the finishing temperatures of the clay. The escaping gases swell and bloat the ware and may ruin the product. Sulphur must, therefore, be carefully and deliberately oxidized in the earlier stages of the burning at temperatures of from 700 degrees F. to 1,300 degrees F.

Carbon may be present in clay or shale as coal, lignite, or vegetable matter. Carbon, of course, has a great affinity for oxygen and therefore with carbon present the iron tends to remain in the ferrous state. If the higher temperatures are reached before the carbon is burned out, the whole brick structure will be permeated with the black ferrous silicate. The aim of the kiln operator must be to oxidize the carbon before the finishing temperatures are reached, otherwise red colours will be impossible to obtain.

It is interesting to note here that the Minto shales contain about 3 per cent of coal. The author's first experience with burning this shale was disastrous. Now at one stage the fires are completely withdrawn. The coal in the shale continues to burn for some twenty-four hours. After this carbon has practically burned out the fires are again lighted.

Lime, usually occurring as $CaCO_3$, is often an objectionable impurity in clay. $CaCO_3$ calcines at temperatures of 1650 degrees F. and upwards forming quick-lime, or CaO and CO_2. Should the CaO be present in lumps in the finished brick it will of course slake when subjected to moisture and produce slaked lime or $Ca(OH)_2$. Should lime be present originally in a finely divided form, but in appreciable quantities, buff colours will be produced in clays that would otherwise burn red. In fact, lime is sometimes added to clay to produce buff colours but the product is not well regarded. Lime is a fluxing agent and the smallest percentage in fire clay reduces considerably its value as a refractory.

Fine face colours in brick are sometimes obscured by a gray or yellowish white substance termed 'scum.' This is usually $CaSO_4$ and may be formed either in the dryer or kiln. If sulphur trioxide from the combustion gases in the kiln leaks into a waste heat dryer and meets the moist atmosphere there, sulphuric acid, H_2SO_4, is formed. This acid, acting on $CaCO_3$ in the clay forms $CaSO_4$. The same substance may be formed in the kiln when SO_3 comes in contact with ware that has been improperly dried. The necessity of using fuel low in sulphur for burning brick is evident.

The white coating which often appears on brick after

Figure No. 4.—Round Kilns of Multi-stack and Single-stack type.

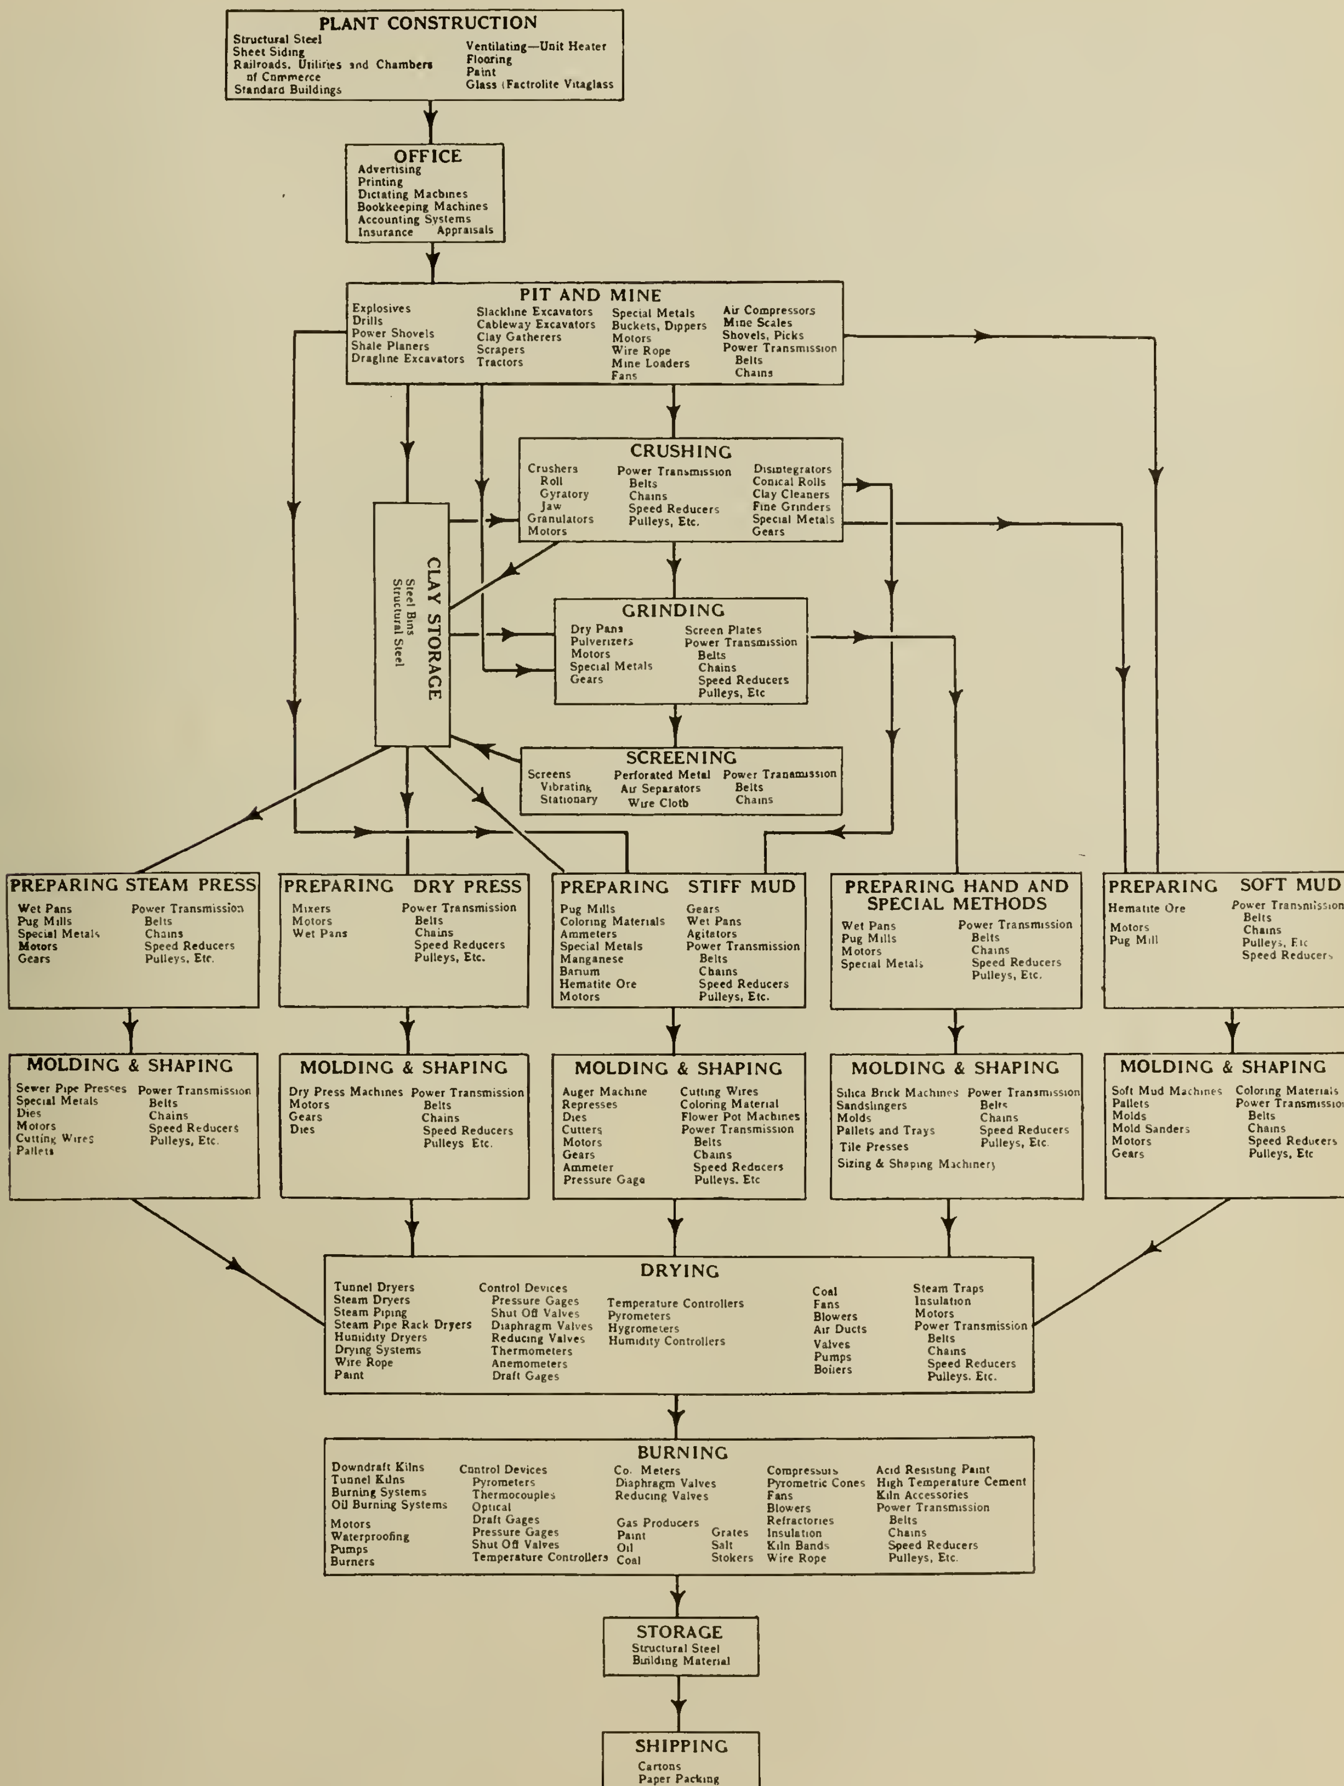

Figure No. 5.—Flow Sheet of Manufacturing Processes in the Clay Products Industry.

exposure to the weather, is known as efflorescence and is usually due to some soluble salt such as magnesium, sodium, or potassium sulphate, and sometimes calcium sulphate. The salt may be present in the brick after burning and on being wet it leaches out and dries white on the surface or it may be derived from the mortar in which the bricks are laid. It will be noted that efflorescence disappears in wet weather and re-appears when dry. Hard burning, which closes the pores, is a remedy for preventing efflorescence. Again, a barium salt, such as barium carbonate, is often added to the clay. This salt, in reaction with $CaSO_4$ produces products which are insoluble, or nearly so, as follows:

$$CaSO_4 + BaCO_3 = CaCO_3 + BaSO_4$$

The addition of barium therefore will largely prevent efflorescence and tend also to prevent scum.

For burning heavy clay products such as brick, structural tile or sewer pipe, the fuel may consist of wood, coal, oil or gas. The electric furnace is used to a considerable extent for fine products, such as porcelains, enamelling, etc. The burning operation may be carried out in a 'Scove' kiln, continuous kiln, car tunnel kiln, periodic down draft kiln or some safe type of battery kiln.

The most elementary type of kiln is the old 'Scove' or periodic up-draft kiln. This kind of kiln is of very ancient origin and is still largely used in the great common brick-making plants near New York and Chicago. It is only suitable for common brick. Low initial cost is its sole redeeming feature. In its simplest form the unburned bricks are set in rows to the desired height with openings properly arranged through the bricks for the passage of the flames. These bricks are enclosed by two parallel walls of previously burned brick, provided with fire openings. The outside is covered with soft clay which seals up the openings. The flames enter at the bottom and the waste gases escape through the top. After burning, the whole structure, including the enclosing walls, is dismantled and all saleable brick disposed of. Clamp kilns with permanent enclosing walls are an improvement over the elementary 'Scove' type. The kiln may be practically any length and its capacity is therefore almost unlimited.

In the continuous kiln the central idea is to utilize as much of the heat of the waste gases and from the cooling ware as is possible. This is accomplished by joining together a number of compartments so that the combustion gases may be carried ahead of the burning chamber through to the next compartment containing green or unburned brick, which are, therefore, preheated to a considerable extent. The air to be utilized for combustion in the firing chamber passes through the chambers containing cooling brick before reaching the burning compartment. In this manner the continuous kiln makes use of a large amount of heat otherwise lost in the combustion gases and, further, utilizes much of the heat given off by the cooling products.

The several types of continuous kilns operated are alike in their essential features. They are built either circular, oval or rectangular in shape and contain a varying number of compartments. Whatever the general shape of the kiln is, there are enough compartments to allow for the setting, preheating, firing, cooling and discharging being carried on simultaneously and continuously.

In all continuous kilns the fire is carried successively around the kiln from one compartment to the next. These compartments in the rear of the burning zone contribute their cooling heat to the entering air and the gases from the burning zone are utilized to prepare the fresh green brick for the advancing fire. Natural draft is usually adopted through the use of a large stack connected to the various compartments by a system of flues.

In the largest plants some type of car tunnel kiln is usually adopted. This is essentially a long tunnel often many hundreds of feet in length. The burning zone is fixed. Brick, or whatever is being burned, is loaded on small cars built with refractory decks and having the under carriage protected from excessive heat. The cars enter at one end and are pushed successively through the water smoking, preheating, burning and cooling sections. Divisions between the various sections are provided by building the division wall on certain of the cars so that a group of cars containing ware in one section of the tunnel will be effectually cut off from the adjoining groups of cars. A system of small auxiliary flues, fans and dampers brings the incoming air required for combustion of the fuel through the cooling ware, through the opening under the car floors, which constitutes a flue, and thence to the furnace grates.

Outstanding advantages of the car tunnel kiln are:

1. Marked fuel economy.
2. Fuel handling centralized.
3. Fixed hot zone reducing kiln absorption losses.
4. Low maintenance on kiln.
5. Two handlings of the ware, setting and drawing, eliminated.

Disadvantages are: (1) relatively large initial investment, both in kiln and car equipment, and (2) high maintenance in car equipment.

Both the round and rectangular types of periodic down-draft kiln are used. A group of these kilns is usually operated, the burning operation in any one kiln, however, being carried on independently of the others in the group.

The round down draft kiln is more widely used than any other type. The firing chambers are spaced at intervals around the kiln walls. The combustion gases pass up towards the crown of the kiln and thence down through the ware and out through openings in the floor. The gases may be conveyed away by natural draft to a stack or may be taken off by fan induced draft. Many kinds of ware may be burned in a down draft kiln. The advantages are:

1. Fairly low initial cost.
2. Simple construction.
3. Low maintenance.

Rather high fuel consumption is a drawback to this type. The kiln is very well suited to burning face brick.

In the 'Minter' system of burning, largely used, a group of down draft kilns are connected by a system of underground tunnels fitted with dampers and so arranged that the ware is water smoked by heat from the cooling kilns. After water smoking the ware is further preheated by the combustion gases from the kilns under fire.

Brief reference may be made to glazes.

Salt glazes are used on certain types of heavy clay products, such as sewer pipe, electrical conduits, and some types of brick and structural tile. Salt glaze is a soda-silica-alumina glass coating the surface of the ware. Salt is used because of its cheapness, also it fuses and volatilizes at a moderate kiln temperature, 1,400 degrees F., and further does not change chemically in fusion or volatilization. It is thrown directly on the fires at the end of the burning period. It is thought that with the sodium, aluminum and silicon oxides there is formed volatile ferric chloride which in turn reacts with hot steam producing ferric oxide and hydrochloric acid.

Glaze to be applied over a clay product body contains a variety of substances, such as feldspar, flint, kaolin, boric acid and certain metallic oxides, such as those of zinc, tin and lead. It is proportioned so that its fusing point is lower than that of the body of the ware on which it is to be applied. The glaze mixture is fused to a glass, ground in water to a creamlike consistency, and then the previously burned ware is dipped in the glaze. It is dried and fired to a temperature not so high as that to which the ware was first burned, but the glaze is brought to the fusing point, filling the pores of the ware, the body and glaze becoming practically a single mass.

Raw glazes, which have not been fused before application to the ware, are also used.

In closing, attention may be drawn to the work carried on at Ottawa in behalf of the Canadian clay products manufacturers by the Department of Mines. This department, under the capable direction of John McLeish, M.E.I.C., director, and Howells Frechette, chief of the Ceramics Division, carries on extensive research work and the time and best effort of their engineers is always at the disposal of those interested in the development of the clay resources of this country.

Discussion on "Notes on Clay and Burned Clay Products" Paper by G. S. Stairs, M.E.I.C.[1]

C. S. G. Rogers, A.M.E.I.C.[2]

In connection with Mr. Stairs' paper on the brick and tile industry, it would appear that his products might help to solve that very serious problem that faces the designers of concrete substructures of bridges, etc., in water, subject to variations in level, viz. erosion at a belt between high and low water. This trouble is particularly acute in tidal waters, partly due to the frequent change of level, partly to the salinity of the water and partly to the grinding and eroding action of ice in winter. Similar erosion, however, occurs on concrete piers in fresh waters, where variations of water level are frequent or where ice and current are the active agents.

On all important structures in tidal waters, it is the custom to protect concrete by a facing of good stone, preferably granite, but this is a very expensive procedure, averaging perhaps $40.00 a square yard of exposed surface. Can the brick and tile industry be of assistance?

Granite facing has to be of considerable thickness and the headers must run fairly far into the heart of the concrete core to ensure proper bond. Could not some form of hard brick or tile be supplied to meet the conditions described and could not the brick be shaped to create a mechanical bond without extreme length of header?

The discussor's suggestion is that the facing could be designed to permit tying back into the heart of a pier, so that the facing could be built up a few tiers at a time and serve in place of forms for pouring the concrete hearting.

G. S. Stairs, M.E.I.C.[3]

This problem is an interesting one to the brick manufacturer. A hard vitrified brick similar to a paving brick would undoubtedly stand up to the severe conditions which have been suggested. The question of getting a durable mortar might present some difficulty.

The brick facing might very well be built 8 or 12 inches thick to serve as a form for the concrete. Steel rod ties from brick to concrete would necessarily have to be provided. In this connection an interesting recent development is that of reinforced brickwork, which has been given extensive study by Japanese engineers. The bricks are designed with openings to allow steel reinforcing to be placed vertically in the brickwork. Apparently this idea is now in use in Japan for much the same purpose as that suggested by Mr. Rogers. It might be profitably followed up by the Canadian brick manufacturers, who would welcome the ideas of members of The Institute on this subject.

The FORTY-FIFTH ANNUAL MEETING

THE FORTY-FIFTH ANNUAL GENERAL *and* GENERAL PROFESSIONAL MEETING

of THE INSTITUTE *will be held*
in MONTREAL *on*

TUESDAY, WEDNESDAY and THURSDAY
FEBRUARY 4th, 5th and 6th, 1931

Headquarters—The Windsor Hotel

Outline of Programme
Subject to change

Wednesday, February 4th:

MORNING - - - -	Registration and Business Session.
NOON - - - - -	Formal Luncheon.
AFTERNOON - - -	Business Session.
EVENING - - - -	Annual Dinner. Smoker. Entertainment for Ladies.

Thursday, February 5th:

MORNING - - - -	Technical Sessions.
NOON - - - - -	Luncheon.
AFTERNOON - - -	Technical Sessions. Ladies' Tea.
EVENING - - - -	Free.

Friday, February 6th:

MORNING - - - -	Technical Sessions.
NOON - - - - -	Luncheon.
AFTERNOON - - -	Visits to engineering works of interest.
EVENING - - - -	Supper Dance.

Chairmen of Committees of Montreal Branch in Charge of Arrangements for Annual Meeting

Montreal South Shore Bridge. *By courtesy of Gladwish and Mitchell, Montreal.*

Aerial View of City of Montreal, including a portion of Harbour.

Among the Papers to be presented at the forthcoming Annual Meeting, the following may be mentioned:—

Construction of the Steel Lock Gates of the Welland Ship Canal.

A number of papers dealing with the engineering of the Welland Ship Canal were given at the Annual Meeting of The Institute in 1928, and the lock gates were described at that time. The paper now presented deals with the difficult mechanical problems encountered during the fabrication and erection of these remarkable gates, whose design was covered in the previous paper.

Train Ferry Landings at Port Mulgrave and Point Tupper, N.S.

This paper, also dealing with structural work, describes the renewal of the train ferry landings of the Canadian National Railways at the Strait of Canso, and is of interest as it treats of the measures and precautions necessary in erecting these complicated structures in tidal waters without interruption to the ferry traffic.

Breakwater Construction in Port Arthur Harbour.

The approaching completion of the extensive programme of breakwater construction carried out in Port Arthur harbour by the Department of Public Works has made it possible to describe the arrangement and construction of this important work, which includes breakwaters of several different types, in a location where special methods of construction were required.

Head Office Building of the Sun Life Assurance Company, Montreal.

A series of papers will deal with this monumental building, treating of the structural work, and the mechanical and electrical equipment required for an office building housing ten thousand people.

Special Features of the Chute-à-Caron Project.

Engineers of the Chute-à-Caron development contribute an account of the methods adopted in dealing with construction problems encountered during the progress of this work, particularly as regards the control of the river and the placing of concrete under difficult conditions.

Automatic Block Signalling on the Canadian Pacific Railway.

This paper treats of the most important recent developments in luminous signals as applied to train control.

Water Supply Problems in Southern Saskatchewan.

Difficulties encountered in obtaining adequate water supply in the southern areas of Saskatchewan are dealt with from a geologist's point of view, and future possibilities are discussed.

Structure and Oil Prospects of the Eastern Foothills Area, Alberta.

This paper, giving the results of a study of the area between the Highwood and Bow rivers, summarizes the present knowledge of the geological structures in southern Alberta from which such important results in oil production are expected.

Power Development at Alexander Landing on the Nipigon River, Ont.

The second large power plant of the Hydro-Electric Power Commission of Ontario at Alexander Landing on the Nipigon river is the subject of an interesting paper. This plant brings the total development of the Nipigon river to 120,000 h.p.

THE ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

VOLUME XIII DECEMBER 1930 No. 12

Forty-fifth Annual Ceneral Meeting

The Annual General Meeting will be convened at Headquarters, 2050 Mansfield street, Montreal, on Thursday, January 22nd, 1931, at 8 o'clock p.m. After the reading of the minutes of the last Annual General Meeting, the appointment of scrutineers to count the Officers' Ballot, and the appointment of auditors for the ensuing year, the meeting will be adjourned to reconvene at the Windsor hotel, Montreal, Que., on February 4th, 5th and 6th, 1931.

Co-operation with The Royal Aeronautical Society

It is fortunate that at a time when aeronautical engineering is coming so rapidly to the front an opportunity has presented itself to co-operate with one of the leading societies devoted to that branch of engineering, a society which is, in fact, the oldest institution of its kind in the world, having been founded in January 1866.

The Royal Aeronautical Society has a considerable and growing number of members in Canada, practically all of whom are trained aeronautical engineers. Its Secretary recently visited Canada and discussed with prominent members of The Institute the possibility of co-operation between that Society and The Engineering Institute of Canada.

The Engineering Institute of Canada is one of the few important engineering societies of the world which includes in its membership all branches of the profession. This circumstance, coupled with the wide geographical area over which our members are scattered, renders it necessary for The Institute to function on a decentralized basis. Our twenty-five branches are, therefore, in themselves the equivalent of local technical societies, and have properly been given powers to form sections devoted to the consideration of the various specialized branches of professional work. Of course it has not been possible or desirable to carry out this sectionalization in all of our branches, or in connection with all the major divisions of engineering, but the arrangement has been put in force where found possible and has been found to work satisfactorily.

On examination it was found that the organization of the Royal Aeronautical Society has many points of similarity with that of The Institute, its various branches, like our own, including in their membership not only corporate members of the society, who are fully qualified as engineers, but also a number of others interested in engineering work, who are less fully qualified and correspond to our branch affiliates. It was therefore possible to work out a scheme, which has now received the approval of the Council of the Royal Aeronautical Society as well as that of The Engineering Institute of Canada, according to which an Aeronautical section formed by a branch of The Engineering Institute in accordance with our by-laws, will also be a Canadian section of the Royal Aeronautical Society. The leading points in this agreement may be indicated as follows:

(1) An Aeronautical section of a Branch of The Engineering Institute of Canada, functioning also as a Canadian section of the Royal Aeronautical Society, will include in its membership:—
  (*a*) Corporate members and Juniors of The Engineering Institute of Canada who apply for membership therein.
  (*b*) Technical members of the Royal Aeronautical Society who apply for membership therein, and
  (*c*) Such other persons as the Executive committee of the Branch may see fit to elect.

(2) It is understood that membership in such an Aeronautical section as such shall confer no technical or professional status whatever, either in The Engineering Institute of Canada or in The Royal Aeronautical Society. Such status can only be obtained by joining one or the other of these bodies as provided in their by-laws.

(3) The officers of such Aeronautical sections shall, as far as possible, be corporate members of The Engineering Institute of Canada or technical members of the Royal Aeronautical Society, and will be appointed annually by the Executive committee of the Branch.

(4) The annual subscription to an Aeronautical section will be decided by the Executive committee of the Branch, and will be payable by all members of the section who are not corporate members or Juniors of The Engineering Institute of Canada or technical members of the Royal Aeronautical Society. Thus membership in an Aeronautical section involves no additional expenditure on those who are already members either of The Institute or the Society.

(5) The object of such Aeronautical sections being the advancement of aeronautical science and engineering, papers and communications on aeronautical subjects will be presented before the sections, and such papers will be published in a special section of The Engineering Journal so far as space permits. The Royal Aeronautical Society will supply copies of the Royal Aeronautical Society Journal for all corporate members and Juniors of The Engineering Institute of Canada who belong to Aeronautical sections, and The Engineering Institute of Canada will forward to the Royal Aeronautical Society the necessary number of copies of the

aeronautical section of The Engineering Journal for distribution to members of that Society.

(6) An Aeronautical section of a Branch of The Engineering Institute of Canada, organized in accordance with the above requirements, will be recognized as a Canadian local section of the Royal Aeronautical Society, and may be referred to either as the Aeronautical section of the Toronto (or Ottawa, etc., as the case may be) Branch of The Engineering Institute of Canada, or as the Toronto (or Ottawa, etc.) section of the Royal Aeronautical Society.

(7) It has been decided that the arrangements outlined in the foregoing clauses will become effective on January 1st, 1931, and they will be subject to annual reconsideration.

The Council of The Institute is entering into this agreement in the full expectation that it will meet with the approval and support of all aeronautical engineers in Canada, whether members of The Institute, members of the Royal Aeronautical Society, or not. With the help of the rapidly growing body of those interested in aeronautics the co-operation of the two bodies cannot fail to benefit the profession. It will enable all aeronautical engineers resident in Canada to get together and take part in the work of the leading aeronautical society of the world.

It is noteworthy that a principal feature of the affiliation proposed is the interchange of publications, a course which will not only be of direct service to The Institute members interested in aviation, but will also have the very desirable result of familiarizing aeronautical engineers in England with the progress and requirements of aeronautical science in Canada.

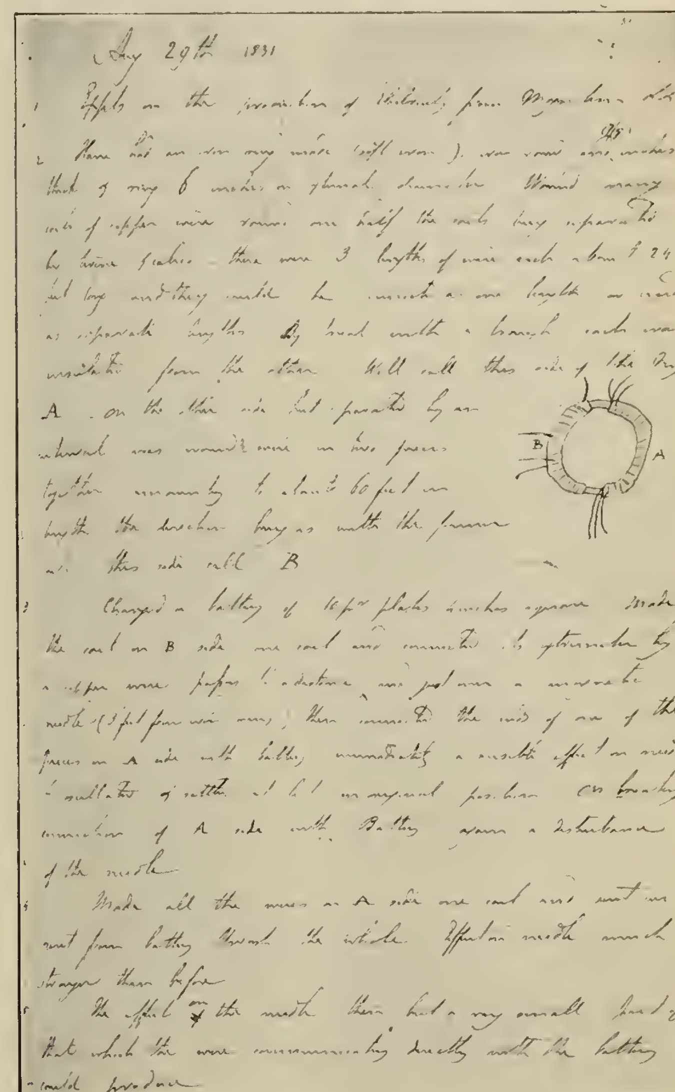
From another point of view the arrangement now outlined is equally striking. It marks an entirely new and very promising development in the policies of The Institute. There appears to be no reason why a relation similar to that between The Engineering Institute and the Royal Aeronautical Society should not be entered into with other important technical organizations dealing with specialized branches of engineering, and it is indeed the hope of the Council, in approving the course now taken, that its action in this case will be followed by equally promising arrangements with other technical societies of like standing.

The Faraday Celebrations 1931

In 1831 Michael Faraday began, or rather resumed, in his laboratory at the Royal Institution, experiments on the induction of electric currents; and on August 29th, 1831, made the discovery in which lies the origin of the dynamo and starting point of the utilization of electric power for the purposes of man. On that day, as his diary shows, he wound two coils of wire on to opposite sides of a soft iron ring, connected one coil to a battery and the other to a galvanometer, and at "make" and "break" of the battery circuit observed deflections of the galvanometer connected in the other circuit. From this simple experiment, and the variations of it made by Faraday in succeeding trials, have grown in the past hundred years the science of electrical engineering and the great electrical industry in all its phases as we know it today. No other experiment in physical science has been more fruitful in benefit for mankind. August 29th, 1931, is then the centenary of one of the great events in the history of the world.

To celebrate this occasion a series of functions will be held in London in September 1931, the lead being taken by the Royal Institution, in whose house in Albemarle street, Faraday lived and worked and gave his famous lectures, and by the Institution of Electrical Engineers, the body representing in England the profession and industry which owe their existence largely to Faraday's great discovery. Other societies and organizations will participate, and a provisional programme has been arranged for September 21st, 22nd and 23rd, 1931.

To mark the forthcoming centenary the Royal Institution is publishing the diary which Faraday wrote with



his own hand of all his experimental work. A facsimile and transcript of the page of the diary recording the discovery of electro-magnetic induction is included with these notes. and is reproduced with the kind permission of the Royal Institution.

Past-Presidents' Prize

Announcement is made by the Council of The Institute that the subject selected for papers to be submitted in competition for the Past-Presidents' Prize for the prize year July 1st, 1930, to June 30th, 1931, is:

"ENGINEERING EDUCATION IN CANADA"

Two years ago the subject of "Engineering Education" was prescribed for the prize and seven papers were submitted. At the last Annual Meeting the committee on the award of this prize reported that while several of the papers were of a high order, it was unable to recommend any one of them for the prize.

It is hoped that the papers in this competition will offer ideas and suggestions, both critical and constructive, which will be of value to Canadian universities and engineering schools, and which will also stimulate interest in the subject among practising engineers and employers of engineers. It is with this idea that the subject has again been chosen, and the following notes have been prepared by a committee of Council to suggest the treatment desired. It is not essential, however, that the arrangement of the papers should conform rigidly to that outlined below:—

(1) Curricula of Applied Science Faculties and Engineering Departments of Canadian Universities.

Pre-requisite admission standards; allocation of time between lecture and laboratory or workshop periods; tendency toward or away from specialization during regular four-year undergraduate course; recognition and guidance of special tendencies and abilities as revealed during the undergraduate course; place of cultural studies as distinguished from more strictly scientific and practical training; need and opportunities for intellectual and moral inspiration deriving from personal contacts with teaching staff; influence of organized recreation and participation in general college activities outside the class-room.

(2) The need and opportunity for organized collaboration by practising engineers and corporate or municipal bodies employing engineers, in the practical training of undergraduates during vacation periods and of young graduates in the early years following graduation.

Meeting of Council

A meeting of Council was held on Tuesday, November 18th, 1930, at 8 o'clock p.m., with President A. J. Grant, M.E.I.C., in the chair, and eight other members of Council present.

The minutes of the meeting held on September 22nd, 23rd and 24th, 1930, and of the meeting held on October 17th, 1930, were taken as read and confirmed.

Considerable discussion took place as to the possibility of so modifying the organization of the Papers committee as to increase its effectiveness as an aid to the various branches in obtaining speakers and papers for their meetings. The matter was held over for further consideration.

After routine business in connection with The Institute's representation on the Council of the International Federation for Housing and Town Planning, the agreement with the Royal Aeronautical Society, and the amendments to the By-laws to be proposed by Council, the report of the Finance committee was considered, and one reinstatement was effected.

The Council next considered the situation as regards arrears of fees, and a number of special cases of members whose illness or other adverse circumstances had led them to lay their cases before Council were also considered.

Council noted with deep regret the death on October 25th, 1930, after a brief illness, of one of The Institute's senior members, Dr. H. M. MacKay, M.E.I.C., Dean of the Faculty of Applied Science, McGill University, and the following resolution was unanimously passed; the Secretary being directed to send a copy to Mrs. MacKay and Dr. MacKay's brothers:

"The Council of The Engineering Institute of Canada has to record the death of Henry Martyn MacKay, whose loss will be keenly felt, not only by the great university in which he occupied such an important post, but also by the profession of which he was a distinguished member. All who knew him deplore the passing of an eminent engineer, a wise administrator, and an educator whose influence will long remain. The Council of The Institute desires to extend most sincere sympathy to his family in their bereavement."

The report of the examinations held on November 4th, 1930, was presented and approved.

A number of applications for admission and for transfer were considered and the following elections and transfers were effected:

Elections		*Transfers*	
Associate Members	2	Junior to Associate Member	2
Juniors	2	Student to Associate Member	4
Students admitted	31	Student to Junior	1

Attention was drawn to the hardship which sometimes exists when an applicant is called upon to take the examinations under Schedule "B" for the class of Junior, and when, after a further period, on applying for transfer he is required to take an examination under Schedule "C" for transfer to the class of Associate Member. It was suggested in such cases that it would be much simpler if applicants took the examinations under both Schedules "B" and "C" when being elected to the class of Junior, in this way avoiding the necessity of working up for an examination at a later date when their professional engagements make a much greater call upon their time. The Secretary was directed to draw such candidates' attention to this difficulty, suggesting to candidates taking Schedule "B" that they should take an early opportunity of passing the further examination under Schedule "C."

The Council rose at eleven forty-five p.m.

Amendments to By-laws

Several proposals for the amendment of By-laws are still under consideration by Council. These will be mailed to members in due course as provided in Section 75.

Membership List

New Issue of List of Members

The Membership List as of October 1st, 1930, has been issued and forwarded to all Corporate Members. It will be sent to Affiliates, Juniors and Students of The Institute on receipt of request.

Publications of Other Engineering Societies

From time to time announcements have appeared in The Engineering Journal regarding the exchange arrangements which exist between The Engineering Institute of Canada and the founder engineering societies of the United States, whereby members of The Institute may secure the publications of the American societies at the same rate as charged to members of those societies. A list of these publications, with the amounts charged, is given below and subscriptions may either be sent direct to New York or through headquarters of The Institute.

	Rate to Members	*Rate to Non-Members*
American Institute of Electrical Engineers		
Journal, single copies	$ 0.50	$ 1.00
" per year	5.50	10.50
Transactions, per year:—		
Paper	5.00	10.00
Cloth	5.00	10.00
Year Book	1.00	2.00
Pamphlets	.25	.50
American Institute of Mining and Metallurgical Engineers		
Magazine, single copies	0.50	1.00
" per year	5.00	10.00
Transactions, per volume, with pamphlets, paper	2.50	5.00
(Other publications, same rate E.I.C. members as to A.I.M.M.E. members)		
American Society of Civil Engineers		
Proceedings, single copies	0.50	1.00

(Other publications, same rate to E.I.C. members as to A.S.M.E. members.)		

OBITUARIES

Robert Armour, M.E.I.C.

In the death of Robert Armour, M.E.I.C., which occurred at Toronto on September 10th, 1930, The Institute loses one of its oldest members.

Mr. Armour was born at Montreal on March 6th, 1850. At the age of sixteen, having moved in the meantime to Windsor, Ont., with his family, he enlisted in the Windsor Garrison Artillery in service against the Fenian raiders. Mr. Armour entered the service of the Great Western Railway (later Canadian National Railways) as draughtsman at Hamilton, in 1870, and was made assistant engineer in 1875. In 1881 he was appointed principal assistant engineer to the late Joseph Hobson, chief engineer, being transferred to Montreal in 1896 as assistant engineer with the Grand Trunk Railway. In 1917 he was masonry engineer, and in 1923 Mr. Armour was located at Toronto

ROBERT ARMOUR, M.E.I.C.

as masonry engineer, central region, Canadian National Railways. On February 1st, 1924, he retired from active service, but was retained in the capacity of consulting masonry engineer until his death.

As a railway man Mr. Armour's chief concern was the substructure of bridges and he had a part in the rebuilding of many for the double track between Chicago and Portland, Me. Some of the more outstanding bridges in which he was interested are those at St. Anne de Bellevue and Vaudreuil, Que., the arch at Niagara Falls and the Victoria bridge at Montreal. He was also interested in the masonry approaches to the St. Clair tunnel.

Mr. Armour joined The Institute as a Member on January 20th, 1887.

Francis Henry Balfour, M.E.I.C.

It is with regret that the death of Francis Henry Balfour, M.E.I.C., which occurred on September 17th, 1930, at St. John's, Nfld., is recorded.

Mr. Balfour was born at St. John's, Nfld., on August 12th, 1860, and was educated in England. Returning to St. John's he became assistant on a geological survey of Newfoundland, in 1882, and in 1883 was transitman and lineman on the Harbour Grace railway. For several years Mr. Balfour was on the engineering staff of the old municipal council of St. John's, being acting engineer for a time. About 1895 he was appointed chief engineer to the Department of Agriculture and Mines, which position he occupied until his death. Mr. Balfour was an unquestioned authority on the natural resources of Newfoundland.

Mr. Balfour joined the Canadian Society of Civil Engineers as a Member on October 24th, 1907, and was placed on the Life Membership List in 1930.

Stratton Harry Osler, M.E.I.C.

It is with deep regret that the death of Colonel Stratton Harry Osler, C.M.G., D.S.O., M.E.I.C., is recorded.

Colonel Osler was born at Cobourg, Ont., on October 18th, 1882, and received his education at the Royal Military College, from which he graduated with honours in 1903, and McGill University, receiving his degree of B.Sc. from that institution in 1904.

From 1904 to 1910, Colonel Osler was with the Survey division of the Department of Militia and Defence, engaged on map work in all its branches, and in 1911 he was occupied with engineering work in connection with the construction and maintenance of the defences at Halifax, N.S., and in 1912-1913 he was in charge of this work. In 1913-1914 Colonel Osler was assistant director, Engineer Services, Headquarters, Department of Militia and Defence, being engaged on administrative and technical work in connection with the construction and maintenance of military buildings and works throughout Canada. From 1915 to 1919, Colonel Osler was on military service, commanding the 6th Field Company, Canadian Engineers (latterly 5th Field Company) in 1915-1916, the Divisional Engineers 2nd Canadian Division in 1917-1918, and the 2nd Engineer Brigade in 1918-1919. Returning to Canada, Colonel Osler resumed the position which he had held in 1914 as assistant director, Engineer Services, and held it until his untimely death.

Colonel Osler joined The Institute as a Member on May 26th, 1925.

Frank Cyril McClory, A.M.E.I.C.

It is with much regret that the untimely death of Frank Cyril McClory, A.M.E.I.C., which occurred on November 9th, 1930, is recorded.

Mr. McClory was born at Lindsay, Ont., on June 20th, 1899, and received the degree of B.Sc. from Queen's University in 1926. Following his graduation, Mr. McClory was for six months assistant district engineer with the Department of Northern Development at North Bay, Ont., and from September 1926 to May 1928 he was acting town engineer at Lindsay, Ont. From May to September, 1928, Mr. McClory was instrumentman with the Department of Public Highways, Toronto Residency, and was then appointed town engineer of Brampton, Ont., which position he held at the time of his death.

Mr. McClory joined The Institute as an Associate Member on April 2nd, 1929.

George Arnold McCarthy, M.E.I.C.

Members of The Institute will learn with regret of the death of George Arnold McCarthy, M.E.I.C., which occurred at Toronto on November 13th, 1930.

Mr. McCarthy was born at Moncton, N.B., on December 19th, 1871, and received his early education in that city, finally graduating from McGill University with the degree of B.Sc., in 1898.

From 1887 Mr. McCarthy was for a number of years junior engineer in the office of the chief engineer of the Intercolonial Railway at Moncton. Following his graduation from the university, he obtained an appointment first with the Canadian Pacific Railway Company in the Lake Superior district, and later with the Algoma Central Railway. From 1901 to 1905 Mr. McCarthy was principal assistant engineer for the Canadian Niagara Power Company, at Niagara Falls, Ont., and from 1905 to 1909 he was chief engineer of the Temiskaming and Northern Ontario Railway commission. From 1909 to 1914 Mr. McCarthy was with Messrs. Smith, Kerry and Chace, first as western manager at Calgary, Alta., and later as resident engineer on the Feather river development for the Oro Development Company, San Francisco. In 1914 he became attached to the Department of Works of the city of Toronto, in which service he remained until his death.

Mr. McCarthy was always active in general engineering matters, and spent much time in the service of his profession in the various societies with which he was connected. He was a member of the American Railway Engineering Association, the American Society of Civil Engineers, the American Institute of Electrical Engineers and also of the Association of Professional Engineers of the province of Ontario.

GEORGE ARNOLD McCARTHY, M.E.I.C.

Mr. McCarthy joined the Canadian Society of Civil Engineers as a Student on May 6th, 1897, becoming an Associate Member on March 16th, 1899, and a Member on October 12th, 1905.

He represented the Toronto Branch of The Institute on the Council during the years 1917, 1918 and 1919, and was for one year chairman of the Toronto Branch.

PERSONALS

W. Schoeni, Jr.E.I.C., has accepted the position of electrical engineer with the Cansfield Electrical Works, Ltd., Toronto.

J. Harvey Westren, Jr.E.I.C., is at present superintendent of the mechanical goods division of the Dunlop Tire and Rubber Goods Company, Ltd., Toronto.

H. W. B. Swabey, M.E.I.C., inspecting engineer with J. T. Donald and Company, Ltd., Montreal, sailed on October 17th for Great Britain, and will be absent for about six weeks on a trip combining business and pleasure.

F. D. Taylor, S.E.I.C., has joined the staff of the Brompton Pulp and Paper Company at East Angus, Que. Mr. Taylor, who is a graduate of McGill University of the year 1928, was formerly with the Canadian International Paper Company at Hawkesbury, Ont.

D. G. Robertson, Jr.E.I.C., is now connected with the Production department of the Coca-Cola Company at Toronto. Mr. Robertson, who is a graduate of Queen's University of the year 1924, was formerly in the office of the city engineer, Hamilton, Ont.

R. H. Reid, A.M.E.I.C., is now on the engineering staff of the Beauharnois Construction Company at Beauharnois, Que. Mr. Reid, who is a graduate of McGill University of the year 1910, was previously with the Gatineau Power Company, at Ottawa, Ont.

P. C. Kirkpatrick, A.M.E.I.C., has joined the staff of the Ontario Power Service Corporation, Ltd., and is located at Fraserdale, Ont. Mr. Kirkpatrick was formerly with the Fraser-Brace Engineering Company, Ltd., at Copper Cliff, Ont.

Martin F. O'Day, S.E.I.C., has joined the staff of the Ontario Refining Company, Ltd., at Copper Cliff, Ont. Mr. O'Day, who graduated from the University of Manitoba in 1926 with the degree of B.Sc., was formerly with the Fraser-Brace Engineering Company at Island Falls, Sask.

J. E. Blanchard, M.E.I.C., has been appointed Director of Public Works of the city of Montreal, Que. Mr. Blanchard graduated from Laval University in 1902 with the degree of C.E. and since 1906 has been in the service of the city of Montreal, having been engineer superintendent of roads prior to receiving his present appointment.

J. Hvilivitzky, A.M.E.I C., formerly structural engineer with the Truscon Steel Company of Canada, Montreal, has been appointed instructor of engineering drawing with the Faculty of Engineering of the University of Toronto, Toronto. Mr. Hvilivitzky graduated from the University of Toronto in 1928 with the degree of B.A.Sc.

T. L. Watt, A.M.E.I.C., is now in the service of the Department of Northern Development, Ontario, and is located at Matheson, Ont. Mr. Watt was formerly locating engineer with the Canadian National Railways, Sudbury district, and in 1929 was with the Trent Valley Lumber Company on the construction of a railway.

H. A. Terreault, M.E.I.C., formerly chief engineer and director of Public Works of the city of Montreal, has resigned from that office, which he has held since 1922. Mr. Terreault, who is a graduate of the Ecole Polytechnique of the year 1899, was at one time superintendent of the municipal aqueduct department, prior to that he was stationed at Sorel, Que., where he was engaged on government work.

A. G. Grant, Jr.E.I.C., has entered the employ of the Ontario Power Service Corporation, Ltd. as draughtsman, and is located at Fraserdale, via Cochrane, Ont. Prior to accepting his present position, Mr. Grant, who is a graduate of the University of Toronto of the year 1927, was field engineer with the construction department of the Canadian International Paper Company, at Temiskaming, Que.

Lieut.-Commander Charles Stephen, A.M.E.I.C., who has, for a number of years, been superintendent engineer at Macdonald College, Ste. Anne de Bellevue, Que , in charge of water works, electric light and power, heating, roads and general construction, has recently been appointed to a newly created office of the Federal government, known as chief engineer and technical adviser, Department of Inland Revenue, Ottawa.

A. G. Tapley, A.M.E.I.C., who since 1928 has been chief engineer of the Halifax Harbour Commission, has returned to the Department of Public Works of Canada as senior assistant engineer, and is attached to the Halifax office. Mr. Tapley's early engineering work was with the Intercolonial Railway, with which he became connected in 1898, and between that date and August 1905, he occupied the positions of draughtsman, transitman and engineer in charge of construction. During the following two years he was with the National Transcontinental Railway as leveller, draughtsman, instrumentman and resident engineer. During 1908 Mr. Tapley again became connected with the Intercolonial Railway. From 1909 until 1928 he was with the Department of Public Works of Canada as assistant engineer. It will be recalled that Mr. Tapley was awarded the Gzowski Medal for his paper on "Concrete in Sea Water" which was published in the November, 1924, issue of The Journal. Mr. Tapley has been most active in the affairs of The Institute.

J. J. Macdonald, M.E.I.C., has been appointed chief engineer of the Halifax Harbour Commission. Mr. Macdonald was formerly associated with Major J. R. Grant, M.E.I.C., consulting engineer for the Burrard street bridge, Vancouver, B.C.

Mr. Macdonald is a graduate of McGill University of the year 1911, when he received his degree of B.Sc. Following graduation he took a post graduate course at McGill in the advanced theory of structures. After graduation Mr. Macdonald entered the employ of Messrs. Waddell and Harrington, consulting bridge engineers, Kansas City, Mo. and specialized in structural design and construction, covering the work in all departments of bridge engineering. He was next appointed office engineer on the staff of The Halifax Ocean Terminals project, and later served as resident engineer on the construction of sections of the above work, and spent some time at the head offices of the Canadian Government Railways at Moncton, N.B., in charge of the preparation of plans and specifications for work going to tender. Early in 1919 Mr. Macdonald accepted an offer to join a firm of engineers and contractors with a view to introducing Canadian or American methods of design and construction in connection with reconstruction work in Great Britain and France, and in 1923 he accepted the position of construction engineer with J. G. White and Company, Ltd., of London, England. In 1925 Mr. Macdonald prepared construction layouts and estimates for the foundation work for the great new bridge across the Tyne river at Newcastle, under Sir Douglas Fox and Partners, for Dorman Long and Company, Ltd., who secured the contract for the work. In 1926 Mr. Macdonald returned to Canada as chief engineer of The Foundation Company of Canada, Ltd., with headquarters in Montreal.

ELECTIONS AND TRANSFERS

At the meeting of Council held on November 18th, 1930, the following elections and transfers were effected:

Assoeiate Members

HUMBLE, Archibald Marshall, (Royal Tech. Coll.), asst. designing engr., Toronto Harbour Commissioners, Toronto, Ont.

MILLER, Harry, B.A.Sc., (Univ. of Toronto), factory planning engr., Northern Electric Co. Ltd., Montreal, Que.

Juniors

FILION, Louis Gerard, B.Sc., C.E., (Ecole Polytech.), asst. engr. for the City of Lachine, Que.

RICHARDSON, William Gordon, B.Sc., (Queen's Univ.), development branch, Northern Electric Co. Ltd., Montreal, Que.

Transferred from the elass of Junior to that of Assoeiate Member

COYNE, Clarance Stanley, asst. divn. engr., London Divn., C.N.R., of 54 Boustead Ave., Toronto, Ont.

ELLIOT, Gerald B., B.Sc., (McGill Univ.), district sales engr. for Canadian territory, Carrier Engineering Corporation, Cleveland, Ohio.

Transferred from the elass of Student to that of Associate Member

BRACKEN, William Donald, B.Sc., (Queen's Univ.), asst. supt., Canadian Niagara Power Company, Niagara Falls, Ont.

St. Lawrence Waterway Project:

Report on International Rapids Section

(Abridged from an article in "The Engineer," Sept. 19th, 1930)

In February, 1929, the Canadian Government, acting on a suggestion made in a report of the National Advisory Committee dealing with the St. Lawrence Waterway project, that a conference should be held between representatives of the Province of Ontario and the Canadian members of the Joint Board of Engineers, nominated, for that purpose, Dr. Frederick A. Gaby, M.E.I.C., chief engineer, and Dr. Thomas H. Hogg, M.E.I.C., chief hydraulic engineer, of the Hydro-Electric Power Commission. The necessity for holding the conference arose from the fact that the Canadian and United States Engineers of the Joint Board had not been able to come to an agreement as to the best method of development of the International Rapids section of the St. Lawrence River. The conference was therefore asked specifically to report respecting the most effective and economical method of developing this section, while at the same time fully safeguarding Canadian territorial and all other Canadian interests in the purely national—that is to say, the Canadian—section of the river.

The members of the Canadian Section of the Joint Board of Engineers, who formed the other party at the Conference, were Messrs. D. W. McLachlan, M.E.I.C., O. Lefebvre, M.E.I.C., and C. H. Mitchell, M.E.I.C.

After numerous investigations, including the making of a large number of borings to rock at critical points in the International Rapids section—which borings were found to supplement and generally confirm the information previously collected by the Joint Board of Engineers—and after recomputing the costs of all the projects which had been put forward, the Conference came to conclusions which may be summarized as follows:—

(*a*) That the International Rapids section of the St. Lawrence river should be improved by means of what is commonly known as a two-stage or double-stage project.

(*b*) That the upper dam and power-houses of such two-stage project should be placed at Crysler island.

(*c*) That the lower dam should be placed at the head of Barnhart island.

(*d*) That the power-houses of the lower development should be placed across the channel between Barnhart island and the Canadian mainland, with Bergen lake, situated north of Sheek island, constituting part of the headrace leading to these power-houses.

The report of the Conference proceeds to state that studies of the various schemes for the improvement of this stretch of the river show that the removal of the natural control at Galops rapids is an economic necessity. The removal of this rock sill, which forms this natural control, would—

(1) Permit of a higher elevation of the water surface at the upper dam, with a consequent increase in head at that point;

(2) Enable an ice-covered river channel, necessary for winter operation, to be secured between Galops rapids and Morrisburg at moderate cost; and

(3) Place the control of the flow at the Crysler island dam. The control of the flow would be secured by the operation of gates and turbines in such a manner as would pass the discharge determined by an approved regulation of Lake Ontario's outflow.

Several projects for improving the Rapids section by means of dams had been put forward from time to time, but most of them, it was found on analysis, would raise the levels in the intervening reaches to such a small extent that ice covers would not be secured. "The frazil ice formation in such projects would," remarks the report, "be very large in winter, and the resulting ice gorging below Barnhart island would cause a reduction in head and much loss of power. Such forms of improvement are therefore not desirable." The problem, it was decided, must be solved on broader lines, and eventually the question was reduced down to a consideration of the relative merits of two-stage or single-stage projects.

The advocates of the single-stage method proposed the construction of a single dam or barrage at Barnhart island low down-river. With regard to it, the report explains that some 2,000,000 h.p. would be developed in a single power-house. "This," it continues, "is not regarded favourably by the down-river interests, since this single plant would serve a large and populous territory, both in Canada and the United States, and operation restrictions would be difficult to impose, in view of the fact that it would be a dominant interest in the territory served. Again, the additional flooding of land and the extent of the embankments, along with some adverse effects at the end of the navigation season, make the single-stage project undesirable."

The relative merits of effecting the desired improvements with a two-stage project with (*a*) Ogden island and (*b*) Crysler island as the upper point of control were then fully considered, and it was decided that the second position offered the greater advantages. "The efficiency of the power plant and the necessity of securing an ice cover in the intervening reaches largely governed the selection of the Crysler island project."

If, it is explained, the water levels below an upper dam were raised to a point where an ice cover would form without general channel enlargement, then the Ogden island-Long Sault reach, would require to be raised to about elevation 224—the present elevation varying from about 215 to 204. A large number of power units would be required at Ogden island to generate the proposed amount of electrical energy, and the total length of the power-house would have to be about a mile. "As the river at Ogden island is relatively narrow and the banks are steep, the cost of improvement by such a project is increased. Moreover, operating characteristics are uncertain because of the very low head available. If, on the other hand, the head on such a project be increased either by placing the power-houses further downstream, or by adopting a programme of extensive channel enlargement, the estimated costs rise to figures materially above those associated with a Crysler island project."

The foregoing considerations, among others, led the members of the Conference to come to the conclusion, referred to above, that the development of the International Rapids section of the river should proceed by the adoption of a two-stage project, one development being at Crysler island and the other at Barnhart island. The following are the general features of the recommended project:—

(*a*) A free open channel south of Galops island for use for navigation, along with a diversion channel, capable of control, through Galops island.

(*b*) Channel enlargement between Lotus island and Morrisburg, designed to give 95,000 square feet of river section at ordinary operating levels.

(*c*) A dam with two power-houses at Crysler island, one power-house on either side of the International boundary.

(*d*) A dam at the head of Barnhart island with two power-houses at the foot of that island, one power-house on either side of the International boundary.

(*e*) A lock for passing 14-foot navigation through the dam at Crysler island, and also a similar structure to give access to the Cornwall canal at the Barnhart island plant.

(*f*) A short side canal with lock on the Canadian side at Crysler island, and a side canal with two locks on the United States side opposite Barnhart island. These works are designed to carry deep-water navigation past the proposed power-houses and dams.

(*g*) Various works designed to protect the interests of the towns and villages affected.

With regard to the works referred to in paragraph (*g*), the report explains that the construction of the work proposed at Crysler island would raise the top water levels opposite the village of Iroquois and the town of Morrisburg to elevations 241 and 245 respectively, which would inundate almost all the village, and the easterly part of the town. Iroquois would, however, be affected in the same manner by any of the forms of improvement discussed, but the country immediately north and west of it is high, and two areas are available as sites for its reconstruction.

"At Morrisburg," the report continues, "a somewhat different treatment of the situation seems advisable with the Crysler project, as only part of the town will be affected by the raised level of the adjacent river. Investigations have led to the conclusion that the area of the town adversely affected should be raised by filling to a suitable elevation, and the reconstruction of the buildings now occupying that part of the town should be brought about by a co-operative plan in which the citizens of the area affected, and the town as a whole, would be inconvenienced as little as possible."

Provision is made in the estimated costs, to which we shall refer immediately, for the reconstruction of the village of Iroquois and, in the case of Morrisburg the estimates provide for the raising of the ground surface, the reconstruction of the buildings, the grading and paving of the streets, as well as the reconstruction of sewers, waterworks. and other facilities, along with provisions for the rehabilitation of the area affected. The excavation of an area in front of the town, so as to give deep water access, is also provided for. The Conference remarks that it "presents the foregoing as a reasonable solution of the problem of caring for these communities, though some variations in detail treatment may be permitted. The estimates are believed to be sufficient to take care of contingencies."

With regard to paragraph (*f*), the report states that the question as to the desirability of placing all the side canals with their locks wholly on the Canadian side was considered, and plans showing what could be done in that direction accompany the report. It is pointed out, however, that the situation of the town of Cornwall and the Cornwall canal, together with the industries along it, make it impossible to provide as economical a route on the Canadian side as is available on the United States side. Moreover, all available routes on the Canadian side would do injury to important local interests. If the canal were to be run at the back of the town of Cornwall, it would, in a measure, separate the town from the surrounding country, as highway and railway bridges would cause delays. If, on the other hand, it were to be constructed between the town and the river, a number of important industries might have to be moved elsewhere, and the usefulness of the 14-foot system of canals would be at an end. The arranging of the canal and locks on the United States side would leave the present Cornwall canal still available on the Canadian side and would retain undisturbed certain industries of Cornwall.

Map showing proposed works in International Rapids Section—St. Lawrence Waterway.

The estimated cost of the works proposed together with an estimate of the cost of a single-stage project are set out in two tables, the first of which is reproduced below. The figures given refer to the two-stage project with the upper development at Crysler island and with the navigation canal and lock on the Canadian side at that point, as shown in the accompanying map.

Table No. I.—*Estimates of Costs: Crysler island Two-Stage Project.*

	Canal on U.S. side at Long Sault, dollars.	Canal on Can. side at Long Sault, dollars.
Upper Pool—		
Works solely for navigation, 25 ft.	8,096,000	8,096,000
" common to navigation and power	75,836,000	75,836,000
" primarily for power, sub-structures, head and tail-race excavation	24,893,000	24,893,000
Machinery and superstructure	30,612,000	30,612,000
Lower Pool—		
Works solely for navigation, 25 ft.	25,370,000	*34,122,000
" common to navigation and power	32,266,000	31,334,000
" primarily for power, sub-structures, head and tail-race excavation	33,698,000	33,821,000
Machinery and superstructure	43,249,000	43,249,000
Total	274,020,000	281,963,000
Additional for 27-ft. depth	722,000	859,000
Average operating heads—		
Winter (215,000 cusecs)	19.6 + 56.4 = 76.0 ft.	
Summer (245,000 cusecs)	24.2 + 60.4 = 84.6 ft.	
Installed capacity—		
Upper plant	592,960 h.p.	
Lower plant	1,607,000 h.p.	
Total	2,199,960 h.p.	
Power available—		
Based on flow available 50 per cent of time (210,000 cusecs for 3 months) (235,000 cusecs for 9 months)	1,890,100 h.p.	

*This amount would be decreased by 2,310,000 dollars if the route between the C.N. Railway and the town of Cornwall were to be adopted. The maintenance cost would, however, be increased to the extent of about 50,000 dollars per year.

We do not give the full details of the estimates for the single-stage projects because their adoption is not recommended in the report, but for the purpose of comparison we have collected certain of the figures in table No. II:—

Table No. II.—*Estimates of Costs: Single-Stage Projects.*

	Canals and locks on U.S. side, dollars.	Canals and locks on Can. side, dollars.
Total cost, 25-ft. navigation	235,824,000	248,753,000
Additional for 27-ft. depth	594,000	603,000
Average operating head—		
Winter (215,000 cusecs)	76.4 ft.	
Summer (245,000 cusecs)	86.1 ft.	
Installed capacity	2,287,700 h.p.	
Power available—		
Based on flow available 50 per cent of time (210,000 cusecs for 3 months) (235,000 cusecs for 9 months)	1,918,600 h.p.	

There are several points in these tables which are noteworthy. The first is that for the project which is recommended for adoption, the initial cost is no less than 274,020,000 dollars. The next point is the comparatively small extra cost entailed by the provision of 2-foot additional navigation depth. Further points are that in the single stage project (*a*) the first cost is 38,196,000 dollars less than that of the two-stage project; (*b*) the 2-foot additional depth is obtainable for 594,000 dollars as compared with 722,000 dollars; (*c*) the average operating heads are greater both in summer and winter, 76.4 feet against 76.0 feet, and 86.1 feet against 84.6 feet; and the energy available is 1,918,600 h.p., as compared with 1,890,100 h.p.

Two further advantages which are possessed by the two-stage project are referred to at the end of the report. They are that (*a*) it would make available a large block of power about three years earlier than would be possible with a single-stage project; and (*b*) it can be proceeded with in two independent stages, the upper being completed, if desired, before work was begun on the lower. Power could also be secured from the upper development to help in the carrying out of the lower development without involving the prosecution of works for deep navigation. It is estimated that power could be made available from Crysler island within five years after the construction of the works there was begun.

The Sugar Refining Industry

J. S. Misener, M.E.I.C.,
Refinery Manager, Acadia Sugar Refining Company, Halifax, N.S.

Paper read before the Halifax Branch of The Engineering Institute of Canada, February 20th, 1930.

For several years sugar has had the distinction of being one of the cheapest food products in the world. While other commodities have advanced to twice or three times pre-war cost, sugar is available to-day at a price very little higher than that paid for it some twenty years ago.

It is an interesting fact too, that refined granulated cane sugar is almost chemically pure, due to the nature of the refining process, and the re-crystallization and washing it undergoes.

It is estimated that during the current year (1930) the total amount of sugar produced will be slightly under 28,000,000 metric tons. Of this amount, it is estimated that 18,500,000 metric tons will be produced from sugar cane, and 9,500,000 metric tons from sugar beets. The island of Cuba is the greatest sugar producing country in the world, producing from four and a half to five million metric tons of cane sugar annually. This is equal to nearly 20 per cent of the world's total output.

The other cane sugar producing countries rank as follows:—

British India	12	per cent of the world's total production
Java	9.5	" " " " " "
South America	6	" " " " " "
Africa and Europe	3	" " " " " "
Australia	2.5	" " " " " "
Hawaii	3	" " " " " "
Porto Rico	2.75	" " " " " "
Philippines	1.75	" " " " " "
Formosa and Japan	2	" " " " " "
Central America and Mexico	1.2	" " " " " "
West India Islands	2.7	" " " " " "

The British West India Islands produce annually about 360,000 metric tons or about 2 per cent of the world's cane sugar production.

The beet sugar countries rank as follows in percentage of the world's production:—

Czecho Slovakia and Austria Hungary	7.2	per cent of the world's total production
Russia and Poland	6.7	" " " " " "
Germany	6.55	" " " " " "
France	3	" " " " " "
United States	3.5	" " " " " "
Other European countries	7	" " " " " "

Canada produces about 35,000 tons of beet sugar annually, or about $\frac{4}{10}$ of 1 per cent of the total amount of beet sugar produced in the world.

Cane sugar is of course grown in countries that are tropical or semi-tropical, while beet sugar is grown in countries of temperate climate.

In Canada the sugar beet meets with more success in southern Ontario and southern Alberta than elsewhere.

The consumption per capita in Canada for the year 1929 was 96.46 pounds. The United States consumption was slightly higher.

With the exception of the 35,000 tons of sugar produced from Canadian grown beets, the raw sugar imported refined and consumed in Canada is all cane sugar.

Due to the preferential tariff which Canada allows Empire raw sugar growers, our own domestic supply of raw sugar is obtained principally from the British West India Islands including Jamaica, with occasional cargoes from Australia and South Africa. Raw sugars imported, other than Empire sugar, after being refined, are mostly exported to other countries, when the duty is refunded by the Canadian government.

The raw sugar is delivered to the refineries in jute bags, each containing from 225 to 325 pounds.

When a cargo arrives, it is sampled and weighed by a customs official for duty purposes and these items are checked by representatives of the seller of the sugar, as well as by representatives of the refinery concerned. While all the Canadian refineries are about the same capacity, viz., from 1,000,000 to 1,250,000 pounds per day, and their equipment and methods of refining are practically the same, the notes in this paper refer more particularly to the Woodside plant of the Acadia Sugar Refining Company, Ltd., and will deal first with the boiler and power plant of this refinery, treating later, when speaking of the process of refining sugar, of the different machines and apparatus used in that work.

The original installation of boilers at the old Woodside refinery consisted of ten horizontal return tube boilers of 100 h.p. each. Hand firing was first employed, and later under-feed stokers were installed.

In course of time these boilers were scrapped, and five Babcock and Wilcox boilers of 325 h.p. fitted with chain grate stokers were substituted. When the chain grates were put in, Port Hood coal was used at first and proved to be an ideal fuel for this type of stoker. When the old Port Hood mine flooded, coal was brought from different mines in Nova Scotia and some of it proved difficult to use on the travelling grates, illustrating the fact that a coal that is suitable for one type of stoker may be entirely unfit for another type.

After the fire in 1912 the capacity of the refinery was increased from 60 tons to 500 tons per day, and three more Babcock and Wilcox boilers, each of 325 h.p., were installed over chain grates.

In 1922 one 640 h.p. and one 430 h.p. Babcock and Wilcox boiler were purchased, and oil fuel was adopted.

Fuel oil is pumped from the Imperial Oil Company's plant at Imperoyal directly into two fuel supply tanks each of a capacity of 3,000 barrels. The daily supply for the furnaces flows by gravity from the storage tanks to two underground concrete supply tanks, which have a combined capacity of 600 barrels of oil.

Thus at the present time there are available for use eight 325 h.p. boilers, each having 3,240 square feet of heating surface, and 25 square feet of superheater surface. Five or six of these boilers are in commission, and supply steam to the turbines at 160 pounds pressure with 100 degrees superheat (total temperature 466 degrees F.). Either the 640 or the 430 h.p. boiler (both of which supply saturated steam at 90 pounds pressure) is connected to the low pressure steam main, for the purpose of making up the deficiency of steam extracted from the impulse element of the turbine, in order to meet the requirements of the vacuum pans. At the point where the low pressure main is connected to the turbine extraction pipe, this steam passes through a reducing valve and is reduced in pressure to 25 pounds. All the boilers are equipped with automatic boiler stop check valves and feed water regulators. Fuel oil for the furnaces is pumped under a pressure of 40 pounds through back shot burners. The atomization of the oil is done by steam pressure of 160 pounds. The oil is heated to about 190 degrees before it is forced through the burners.

The feed water pumps are of the turbine type, two of which are motor driven, and the other two by steam turbines. The motor driven pumps have four stages and the turbine driven three stages. The feed water is metered through the discharge main of the pumps. All steam driven auxiliaries exhaust into either the 25-pound or 8-pound steam mains. The use of these mains will be explained later.

Steam flow meters of the recording and integrating type are installed on the steam distribution lines, and air-flow meters are being installed on the boiler fronts. The plant operates on an average CO_2 content of about 12.5 per cent. This could be increased, but since the furnace volume is somewhat on the small side, the cost of renewing the brick work would more than offset the saving in oil.

The power house equipment consists of two extraction type steam turbines each directly connected to a 940 kv.a. generator. The exciters are directly connected to the shafts. These units run at 3,600 r.p.m. and supply three-phase current at 550 volts and 60 cycles. There is an auxiliary lighting set of 50 kw. driven by a compound engine. The stream pressure at the turbine throttle is 160 pounds with 100 degrees superheat. The steam consumption at full load (800 kw.) is about 60,000 pounds of steam per hour, and of this amount 35,000 pounds is bled or extracted at 25 pounds pressure after the steam passes through the impulse stages of the turbine, and the remainder (25,000 pounds) passes through the reaction blading and is exhausted against a pressure of 8 pounds per square inch.

The question often arises: Why not pass the turbine exhaust into a condenser? The answer is this:—in the sugar refining industry there is so much evaporating of sugar solutions to be done, and water to be heated, that this steam is put to good use; whereas, if the units were operated as condensing units, the heat carried off in the condensing water would be wasted.

The 35,000 pounds of steam per hour at 25 pounds pressure, bled from the turbines, is conveyed through the 25 pounds pressure main to the vacuum pans and is used for boiling the sugar. If sufficient steam is not available from the turbines, the necessary quantity is made up from the low pressure boilers; their steam being reduced from 90 pounds pressure to 25 pounds.

The average analysis of the raw sugar as received shows that it contains 96 per cent sucrose or sugar, roughly about one per cent of water, and the remainder impurities. Enveloping the crystals there is a film of molasses, very dark in colour, which contains about 70 per cent of pure sugar.

At a place in the refinery termed the "cutting in station" the bags are opened, and the sugar is chuted to the crushers for the purpose of breaking the hard lumps. It is then conveyed, elevated and discharged into a receptacle called a "mingler," and is here mixed with the molasses which had been washed off a previous run of raw sugar, so as to form a plastic mass. After being thoroughly mixed, it is discharged from the mingler into a mixer placed directly below it. The mingler is fitted with agitating arms on a revolving shaft, so as to keep the mass in circulation.

The centrifugal machines for washing the raw sugar are mounted about two feet below the mixer, and receive their charges of sugar from the bottom of the mixer through large pipes fitted with cut-off valves. The centrifugals are about 40 inches diameter and 24 inches high with tapered or conical bottoms and have discharge openings about 20 inches diameter. The revolving elements of these machines have brass or copper perforated liners, the perforations being of such a size as to allow the molasses from this plastic mass (due to centrifugal force) to pass through, but not the grains of sugar. The centrifugals are electrically driven, by motors mounted on the tops of the vertical spindles, and connected to the spindles by a friction device. The automatic timing devices can be regulated so as to produce an operating cycle of from one to five minutes, during which time the wash water mechanism is started and stopped and at the time set for the finish of the cycle the motor switch is thrown out and the brake applied. The installation of these devices changed this station from a six-man station to a one-man station. When starting the machines the motors draw 105 amps. and at the end of the cycle (say of three minutes duration) the current drops to 5 amps.

At the beginning of the cycle the operator throws in the switch, opens the mixer valve and charges the machine. Due to centrifugal force the plastic mass of sugar "walls up" the entire depth of the basket. By this time the machine has attained a peripheral speed of about 11,000 feet per minute. The molasses is forced through the perforated liner against the monitor casing, and flows through a pipeline to the storage tanks.

A predetermined quantity of water is then applied to the sugar for the purpose of washing the remainder of the molasses off the grains, and as a consequence of this affination process, the purity of the sugar is increased from 96 to 98.8 per cent. Thus about 80 per cent of the impurities have been driven off by this mechanical process.

When the cycle is completed, the charge of washed sugar drops into a conveyor and passes to a continuous melter, where it is dissolved. The solution is known as "liquor." The melter consists of a round tank fitted with a revolving screen, with agitators mounted on a vertical shaft.

When the washed sugar drops into the continuous melter sufficient hot water is added to make a 60 Brix solution (i.e. a solution containing 60 per cent sugar by weight) and steam of 8 pounds pressure is admitted through a perforated copper coil so as to heat the liquor to 190 degrees.

The unfiltered liquor is next pumped into defecators, which are round steel vats with open tops and are equipped with steam coils and compressed air pipes. The compressed air is used for agitating the liquor. Additional hot water is used in the defecators to reduce the liquor from 60 to 58 Brix or density. Milk of lime is then added for the purpose of neutralizing traces of organic acid present, or to prevent its formation. A certain amount of diatomaceous earth (kieselguhr) is also added which acts as a filtering aid to the liquor as it passes through the filter presses.

Bullocks' blood was at one time the most popular defecant, and was remarkably efficient, but phosphoric acid and its soluble salts are now exclusively used as the agents for producing a defecating precipitate in liquors and syrups for refining purposes where bag filters are used. To-day nearly every refinery is equipped with filter presses, and kieselguhr is the filtering aid mostly used for trapping the suspended matter.

Each filter press consists of 90 circular leaves covered with cotton. The diatoms in the kieselguhr adhere to the cotton and the liquor is filtered as it passes through to the centre of the leaf, from whence it is conducted to storage tanks.

The filtered liquor is then pumped to pressure tanks in the char house. The successful flow of liquor through the char is the most mportant process in sugar refining, because its purpose is to remove the colouring matter and all impurities from the liquor, thus making the production of white sugar possible.

In this department there are a number of char cisterns. They are 9 feet in diameter, and 30 feet high and have a capacity of 30 tons of char. Char is composed of animal bones which have been crushed, carbonized, and sized to different grists. This material has the power of extracting the colouring matter and impurities from sugar solution. At the beginning of this operation, the cisterns are filled with char almost to the top. The man-hole cover is bolted down, the outlet valve from the pressure tank is opened, and the reddish coloured liquor flows to the bottom of the char cistern, then rises through the pores of the grains of char and around its surfaces, until the cistern is filled. The outlet pipe at the bottom of the cistern extends vertically to about 13 feet before it terminates at the receiving tanks. The idea of this vertical pipe is that 13 feet of liquor shall remain all over the char surface, otherwise channeling would take place.

When the process is complete, the outlet valve on the discharge pipe from the char cistern is opened, and the decolourized liquor flows to the receiving tanks. By this operation the char has absorbed the colouring matter and impurities from the liquor and the result is a water-white liquor now increased in purity to 99.2 per cent.

The used char is then washed with about 30,000 gallons of boiling water in order to wash out the colouring matters and impurities absorbed from the liquor. Compressed air at 15 pounds pressure is then admitted to the top of the cistern for the purpose of driving off the water. When this operation is completed the char is discharged into the dryers in order to reduce the moisture content, thence to the char kilns to be revivified. It is then elevated and conveyed back to the char cistern, and is then in condition to extract the colouring matter and impurities from incoming liquors.

The char kilns consist of vertical air tight retorts, through which the char passes while being revivified. The char kilns are fired by fuel oil, and the waste gases used as the heating medium at the driers.

The water-white liquor is next drawn from the receiving tanks into the vacuum pans, where it is boiled under low pressure and evaporated so that crystallization occurs.

A skilled pan-man or sugar boiler can produce grains of sugar of the desired size by manipulating the steam pressure and vacuum carried on the pan as well as regulating the time to draw more liquor into the pan.

Each of the vacuum pans holds about 45 tons of wet crystals or "massecuite." The time required for boiling a pan of sugar is from one and a half to two and a half hours, depending on the purity of the liquor used.

The vacuum pumps are driven by 70 h.p. motors, and the condensing water is supplied by centrifugal pumps of 5,000 gallons per minute capacity, directly connected to 185 h.p. motors. The condensers are of the barometric jet type.

The boiled massecuite is then spun in centrifugal machines where the sugar grains are separated from the syrup, and as a final treatment, the granulated sugar is washed with water. A pan of sugar when boiled will produce about 50 per cent grain and 50 per cent syrup.

The syrup extracted from a boiling or strike of sugar is either mixed with new liquor from the char and boiled into grains, or is boiled by itself into grains. When the purity of the syrup falls too low to make good saleable sugar it is boiled into remelts and these pass through the different processes in the refinery just as the original raw sugar did.

The granulated sugar discharged from the centrifugal machines contains 2 per cent of moisture. In order to extract this moisture the sugar is dried in revolving dryers, termed granulators. The drying medium is either heat supplied by a revolving heaters, or a current of heated air striking the sugar at right angles as the granulators revolve.

The sugar is then sized over vibrating screens and placed into storage hoppers. From the hoppers it flows to automatic weighing machines and thence it drops into bags.

Barrelled sugar is of course filled directly from the storage hoppers into the barrels. Fancy or tablet sugar is the product of special boiling of liquors in the vacuum pan. It is finished in the same way as the granulated sugar, with the exception that it is not dried in the revolving dryers; and after leaving the centrifugal machines is conveyed to a small mixer where it is mixed with a saturated sugar solution. It then passes through a press and is moulded into shape, after which it is finished by being placed in ovens where the moisture is driven off and the sugar baked by coming in contact with heated air.

Pulverized and powdered sugars are obtained by grinding granulated sugar to the required degrees of fineness. Granulated sugar is put up in barrels, half-barrels, 100-pound kegs, 100-pound bags, 50-pound bags, and 20-pound and 10-pound gunnies. Granulated sugar is also put up in 5-pound and 2-pound cartons. The cartons are formed, filled with sugar, weighed and sealed by automatic machines.

Soft sugars are packed in barrels and bags. Bright yellow sugar is also packed in wax-lined cartons. The waxed lining prevents the moisture in the sugar from escaping and as a consequence the sugar will not harden.

Icing, powdered, and tablet sugars are packed in barrels, boxes and cartons. In the case of icing sugar, it is put up in wax-lined cartons filled, weighed, and sealed automatically by machines of a capacity of 30 packages per minute.

The refinery is equipped with barrel and box making machinery to meet its requirements.

The end product in sugar refining is known as "blackstrap" and contains about 90 per cent of the colouring matter found in raw sugar, together with about 20 per cent of water and 30 per cent of sucrose. It is used principally for making cattle feed and industrial alcohol.

When the affination syrup (before it reaches the blackstrap state) is refined by filtering and passing it through char, thereby extracting impurities and colouring matter, it makes an excellent table syrup.

A refinery may be operated in two ways, one of which is to make all granulated sugar and blackstrap. The other is to make granulated and soft sugars, and a certain percentage of blackstrap, depending on the percentage of soft sugar refined.

It is quite possible by press and char filtering all the liquors and making from them about 29 per cent of soft sugar to practically eliminate the "blackstrap" or end product.

One of the great essentials of sugar refining is adequate chemical control. Every refinery has a well equipped laboratory, where chemists are constantly employed making analyses of the raw sugar from the time it enters the refinery until it is packaged.

Link-Belt Limited, 910 South Michigan avenue, Chicago, Ill., have just issued Book No. 1253 describing their new 1930 model travelling water screen. The book contains 24 pages and is copiously illustrated by large wash drawings which make the operation and construction of the water screen unusually clear. Copies will be gladly sent upon request.

Armstrong Cork Company, Lancaster, Pa., have recently published a 48-page booklet entitled "Industrial Applications of Cork," which describes the hundreds of uses for cork in the industrial application field. Copies will be furnished to interested parties upon request to the company.

New Switchboard Building at Peterborough Works is Arc Welded

The new addition to the Peterborough plant of the Canadian General Electric Company should be interesting to all users of structural steel, in that it is the first building in Canada of any appreciable size to be completely fabricated and erected by the electric arc welding method.

For a number of years much experimental work has been done and tests made in the General Electric laboratories to obtain data for use in the design of arc welded structures and this data was available for reference when designing the addition at Peterborough.

The new building has a floor area of 72,000 square feet and all bays are 80 feet wide, the columns being spaced at 25-foot centres. The permanent walls are of brick construction with large window areas, while the temporary walls are metal-covered wood sheathing on steel framework with large areas of window. All temporary side steelwork is bolt-connected to facilitate the removal of these walls when further expansion takes place. When completed, the building will be used for the manufacture and testing of all types of electrical switching apparatus.

The steel frame has a total weight of approximately 960 tons and consists of steel columns of Carnegie beam sections which carry crane girders, welded steel trusses, roof purlins, sway bracing, etc. All trusses have a span of 80 feet centre to centre of columns and have depths of 7 feet and 8 feet 8 inches at the columns and centre panel points respectively. A special truss having top and bottom chords each consisting of one-half of 27 inches at 160 pounds C.B. carries the additional weight of the brickwork of the north wall of the test section. The other thirty-five trusses in the building have top and bottom chords consisting of one-half of 18 inches at 67 pounds C.B. and one-half of 18 inches at 52 pounds C.B. respectively. The flange of the top chord is continuous throughout while the web was notched at the centre to permit the necessary bending to give the required pitch to the roof. This was then butt-welded and further reinforced by a steel plate. Panel points in all trusses are 6-foot 8-inch centres.

Each crane column has a cap plate welded directly to its web and flanges and all columns have a base plate also welded directly to the column sections. Anchor bolts were connected to the column by passing between the column web and a short angle standing vertically with outer edges welded to the column web. In the centre row of columns the column to carry the roof truss is welded between two 18-inch channels which are in turn welded to the two columns carrying the crane girders. In the other rows of columns which support but one crane girder the roof truss column is also carried direct on the foundations.

Horizontal bracing is provided in the plane of the lower truss chords and consists of rows of angles and Carnegie beam sections running the entire length of the building. Diagonal rods are also provided in four bays in the planes of both bottom and top truss chords. These same four bays also have vertical plane longitudinal bracing to resist crane stresses. Longitudinal struts are also provided in the plane of the truss top chords in all skylight bays. Gusset plates are welded to the truss chord flanges and longitudinal struts are bolt-connected to the gussets.

The fillet welds of triangular cross-section with base and altitude generally from one-quarter inch to three-eighths inch each are subjected to longitudinal shear only, the unit shearing stresses used in design being as follows:

$\frac{3}{8}$ inch by $\frac{3}{8}$ inch triangular fillet—3,000 pounds per linear inch.

$\frac{5}{16}$ inch by $\frac{5}{16}$ inch triangular fillet—2,500 pounds per linear inch.

$\frac{1}{4}$ inch by $\frac{1}{4}$ inch triangular fillet—2,000 pounds per linear inch.

From a great number of tests which have been made, it has been determined that the use of the above unit stresses provides a factor of safety of at least four.

A roof load of 56 pounds per square foot was used in the design divided into 40 pounds live load and 16 pounds dead load. This load was considered as applied to the sloping surfaces of the skylights as well as to the flat portions of the roof. A unit stress of 18,000 pounds per square inch was used in the design of the steel.

Provisions are made for two 5-ton 77-foot span bridge cranes and one 25-ton 77-foot span bridge crane with a 5-ton auxiliary hoist.

In the skylight framing, 88 small trusses were required. The lower chords of these trusses are supported on short pedestals at sub-panel points on the main trusses. Top and bottom chords of skylight trusses are of the tee sections with the vertical post of channel section and all other members composed of angles. These skylight trusses are erected at 20-foot centres and are cross-braced with diagonal rods. All purlins both on the inclined and flat portions of the roof are strengthened by two rows of tie rods.

Excellent progress was made in the erection of the steel work, as only three weeks were required from the erection of the first column till the completion of the work. No great difficulties were experienced during erection, though it would appear that erection would be expedited by the more liberal use of bolted connections instead of clamps. While this is especially true on members which would require punching in any case, it would also appear that the time saved in erecting with bolt connections properly designed solely for erecting purposes, would more than justify the punching of the necessary holes even though this work were done by the field forces just prior to the erection of the members

A Holorib steel deck electrically welded to the purlins was used on this building. This deck is made in sheets 18 inches wide and long enough to lap 3 inches over the purlins. These sheets telescope together this 3 inches at the end to provide for expansion while at the other end two ribs per sheet are welded to the building purlin. The erection of approximately 800 squares of this deck required about four weeks' time. The roof deck is covered by two one-half inch layers of insulation on which is laid a 15-year Johns-Manville asbestos felt roof.

The use of welding on this building resulted in a considerable saving in steel, in a steel frame of unusually good appearance due to the almost entire absence of gussets. Due to the final adoption of a lighter roof deck than originally designed for and the early decision to adopt welding methods, no exact costs are available. The welded structure is, theoretically at least, undoubtedly the cheaper, and practically should become so when the fabricating companies have obtained some experience in this type of work. Another outstanding feature of welding and one which, in many locations, will be given more and more consideration in the future, is the absence of the noise usually associated with steel erection.

On the 600 tons of steel which passed through fabricating shops, as many as seven welders were used, each employing a single operator motor-generator welding set. The field work was done on the steel work by two welders while a third welder was employed on the roof deck. All field welding was done with portable welding sets.

In the fabricating shop the trusses were assembled on timber skids, the diagonal and vertical members clamped to the chords in their proper location and all the joints welded. All trusses were assembled and welded lying flat on their sides.

The 88 skylight trusses were assembled by clamping the members together on timber jigs in the field and all welded complete before erection started. These trusses were all nearly alike so that once the jigs were laid out no changes were needed till the completion of the work. No overhead welding was permitted either in shop or field work.

No Canadian General Electric inspector was placed in the fabricating shops during the progress of the work, though all welds were inspected on the arrival of the steelwork on the site. Welds on both the shop and field work were uniformly good and in all cases erred on the side of larger sections and longer welds than called for on the drawings.

Some 360 tons of steel were shipped directly from the rolling mills to the site. This steel was delivered cut to proper lengths and the necessary punching was done by the field forces before starting erection operations. This steel was generally for use as crane girders, purlins, skylight trusses or longitudinal struts. Field forces were engaged on this work about one month before starting erection. The shop fabrication required about six weeks' time.

Great care was taken to have only competent welders both on shop and field work. Each welder before starting work was required to weld test pieces, the breaking strength of which was required to be at least four times the unit stresses used in design. These test pieces were also welded periodically as the work progressed and in addition the welding was subjected to continual inspection. It is interesting to note that the lowest breaking stress obtained by any welder working on this building was 12,250 pounds per linear inch for three-eighths-inch by three-eighths-inch fillets. Other results up to over 14,000 pounds per linear inch were obtained. It is also interesting to note that on the periodical field tests, which were made on tension test pieces only, an average ultimate strength of between 53,000 and 54,000 pounds per square inch was obtained while in several cases the break occurred in the parent metal rather than in the weld.

All work was done under the direct supervision of the Canadian General Electric Company's engineers. To the keen interest taken in the welding work and the close co-operation between the various contractors and the owners' engineers, is due in a large measure the successful completion of this welded structure.

New Underfeed Stoker Catalogue

Combustion Engineering Corporation, 200 Madison avenue, New York, N.Y., has just issued a new 28-page catalogue, describing the type E Underfeed Stoker. It is recommended for burning either coking or non-coking bituminous coals and for various refuse fuels. The type E Stoker is applicable to boilers ranging from 150 h.p. up to 600 h.p. It may be installed in a battery of two or more boilers. It is mechanically simple and easy to operate. Included in the catalogue is a list of representative installations.

The Meetings of the Second World Power Conference and of the International Electrotechnical Commission in Europe in 1930

From Notes By John Murphy, M.E.I.C.,
Vice-Chairman Canadian National Committee.

The meetings of the Second Plenary World Power Conference took place in Berlin from June 16th to 25th, 1930. The first plenary conference was held at Wembley in 1924. The Berlin conference was preceded by a week of meetings of the International Executive Council which embodies representatives of forty-seven countries.

The International Electrotechnical Commission was projected at St. Louis in 1904, and has held many meetings in various parts of the world. The last plenary meeting, prior to the recent Scandinavian meeting, was held in Italy in 1927. Its meetings this year in the capitals of Denmark, Sweden and Norway began on June 27th, immediately after the close of the Berlin Power Conference, and ended on July 9th.

The *World Power Conference* was formed in 1923 for the purpose of considering how the industrial and scientific sources of power may be adjusted nationally and internationally:—

1. By considering the potential resources of each country in hydro-electric power, oil and minerals.
2. By comparing experiences in the development of scientific agriculture, irrigation, and transportation by land, air and water.
3. By conferences of civil, electrical, mechanical, marine and mining engineers, technical experts, and authorities on scientific and industrial research.
4. By conferences on technical education to review the educational methods in different countries, and to consider means by which the existing facilities may be improved.
5. By discussions on the financial and economic aspects of industry, nationally and internationally.
6. By conferences on the possibility of establishing a permanent world bureau for the collection of data, the preparation of inventories of the world's resources, and the exchange of industrial and scientific information through appointed representatives in the various countries.

The *International Electrotechnical Commission* has national committees in twenty-five countries. Its *aims* and *objects* are as follows:—

1. The principal aim of the International Electrotechnical Commission is to bring about a plain and intelligible medium of communication between those who purchase and those who produce electrical machinery and apparatus, so as to enable them to understand each other without long and complicated explanations and to establish an equitable basis for the comparison of tenders from whatever country they emanate.
2. Whilst the scientific foundation of the electrical industry is common to the whole world, the general technical terminology used has unfortunately different meanings according to the practice of the different nations, and the commission is endeavouring to bring about international agreement as to the meaning of electrical terms, particularly those employed in industry. The commission is also engaged in the international unification of electrical symbols, and in the preparation of various recommendations with the object of facilitating international commerce.
3. The commission does not in any way bring pressure to bear on anybody, its recommendations being arrived at by general consent. Moreover, by accepting these recommendations for international purposes, no national committee is under obligation to modify its own national rules except with the general consent of its own industry. The increasing number of International Electrotechnical Commission's recommendations which are being incorporated into the national rules of the various countries is the best proof of the growing recognition of the value of this international work.

In preparing for the Berlin World Power Conference it was decided on the four following "*classes*" of papers:—

A. Sources of Power.
B. Power, Production, Transmission and Storage.
C. Utilization of Power.
D. General.

Three of the above classes were divided into five "divisions" and the fourth was divided into four. The "divisions" were further subdivided into "sections"—one division, relating to steam power plants and fuels, had thirteen sections.

Three hundred and eighty papers were printed in their original texts two months prior to the conference. These papers were analyzed or digested by "general reporters" in Berlin, and, for the purpose of presentation and discussion, the synopses of them were grouped under thirty-four "sections," namely:—

1. Electricity in the Household and in Agriculture.
2. Electricity in Crafts and Industry.
3. Three-Dimensional Load Models and Current Tariffs.
4. Economic Problems of High Temperature Distillation.
5. Gas Markets.

6. Costs and Comparative Efficiency of Different Forms of Energy from the Consumer's Point of View.
7. Construction and Operation of Large Power Plants.
8. Combined Heat and Power Supply Plants.
9. Fuel, Power and Heat Economics in Individual Countries.
10. Steam Turbines, Gas Turbines and Reciprocating Steam Engines.
11. Boilers and Furnaces.
12. Solid Fuels; Production, Trade and Treatment.
13. Rationalization and Technical and Economic Problems of Water Power Utilization.
14. Dams.
15. Economic Problems Relative to Power Storage on a Large Scale.
16. The Water Power Industry in Individual Countries.
17. Co-operation of Different Power Producing Plants.
18. Construction of Large Generators and Transformers and other Electrical Machines.
19. Switchgear including Automatic Control Apparatus for Power Stations, and Remote Metering and Signalling apparatus.
20. Power Transmission and Flow of Energy in Single and Multiple-Connected Networks.
21. Earthing, Lightning Protection and the Effects of Power Lines on Telephone and Telegraph Lines.
22. Individual Problems of Power Supply in Different Countries.
23. World Problems of Power Economics.
24. Problems Relating to Water Rights.
25. The Effect of Legislation and Control by Public Bodies on Gas and Electricity Supply.
26. Steam and Electrically-Operated Railways.
27. Power Supply on Ships.
28. Production of Natural and Synthetic Oils, their Treatment and the Properties of Motor Fuels.
29. Stationary Internal Combustion Engines and Research Work in this connection.
30. Air-Craft and Automobile Engines.
31. Mechanical Transmission of Power on Vehicles and in Workshops.
32. Research Work.
33. Standardization Problems and the Rationalization of Statistics.
34. Education.

Four thousand members and eight hundred guests registered at the Berlin Conference and the committee of Berlin engineers in charge of the conference had an organization which functioned perfectly. Among the innovations at the conference gatherings the "speech transmitting apparatus" deserves special mention. Three halls with 1,500 seats each were equipped with head telephones and by means of selector switches, English, French or German translations of the speakers' statements could be heard as they were being made. When the speakers supplied typewritten copies of their contributions the translating was excellently done and even when the translators were compelled to work without such aid they did very well.

Canadian participation in the World Power Conference was of a fairly representative character. Canadian papers were prepared and presented as follows*:—

1. Water Resources of Canada and Their Development. By J. T. Johnston, M.E.I.C., Director, Dominion Water Power and Reclamation Service, Department of the Interior.
2. Fuel Investigations and Research in Canada. By B. F. Haanel, M.E.I.C., Chief Engineer, Division of Fuels and Fuel Testing, Department of Mines, Ottawa.
3. Recent Trends in Water Power Development in Canada. By T. H. Hogg, M.E.I.C., Chief Hydraulic Engineer, Ontario Hydro-Electric Power Commission.
4. Generation, Transmission and Distribution of Electricity—Recent Practice in Canada. By Julian C. Smith, M.E.I.C., Vice-President and General Manager, Shawinigan Water and Power Company, Limited, and C. V. Christie, M.E.I.C., Professor of Electrical Engineering, McGill University.
5. Storage Reservoirs in Canada. By O. Lefebvre, M.E.I.C., Chief Engineer, Quebec Streams Commission.
6. Economic Aspects of Electrical Supply in the House and on the Farm. By F. A. Gaby, M.E.I.C., Chief Engineer, Ontario Hydro-Electric Power Commission.
7. Some Economic Aspects of the Hydro-Electric Industry in Canada. By G. Gordon Gale, M.E.I.C., Vice-President and General Manager, Gatineau Power Company, Limited.

The following Canadians attended the Conference:—

Charles Camsell, M.E.I.C., Deputy Minister, Department of Mines, Chairman Canadian National Committee.

John Murphy, M.E.I.C., Electrical Engineer, Department of Railways and Canals and Board of Railway Commissioners. Vice-Chairman Canadian National Committee.

F. A. Gaby, M.E.I.C., Chief Engineer, Hydro-Electric Power Commission of Ontario, Toronto.

O. Lefebvre, M.E.I.C., Chief Engineer, Quebec Streams Commission, Montreal.

T. H. Hogg, M.E.I.C., Chief Hydraulic Engineer, Hydro-Electric Power Commission of Ontario, Toronto.

G. Gordon Gale, M.E.I.C., Vice-President and General Manager, Gatineau Power Company, Ottawa.

A. B. Normandin, A.M.E.I.C., Hydraulic Service, Department of Lands and Forests, Quebec.

Hon. F. P. Burden, Minister of Lands, Victoria, B.C.

R. G. Gage, M.E.I.C., Chief Electrical Engineer, Canadian National Railways, Montreal.

G. A. Gaherty, A.M.E.I.C., President, Calgary Power Company, Calgary.

deGaspe Beaubien, M.E.I.C., Consulting Engineer, Montreal.

John Morse, M.E.I.C., Shawinigan Water and Power Company, Montreal.

J. B. McCarthy, Consulting Engineer, Montreal.

J. G. Glassco, General Manager, Winnipeg Hydro System, Winnipeg, Man.

When each of the thirty-four sectional meetings was called to order a "general reporter" presented his synopsis of all the papers belonging to the section in question. The synopsis of the groups of papers embodied, in each case, statements showing the "trend of development" in various countries; they also contained the "concluding observations" of the reporter—his conclusions being based upon the facts and opinions presented in the papers; the reporter's statements finally contained a list of "points for discussion." The authors of papers, as it may be seen from the above remarks, took no part in the actual meetings unless they wished to discuss other author's papers, to add some new material to their own, or to correct or take issue with the contributions of some of the speakers. Nearly every one of the Canadians took a hand in making contributions to the discussions and they were greatly aided in their work through the good services of Mr. L. D. Wilgress, the Canadian Trade Commissioner from Hamburg, who came to Berlin, under directions from his department at Ottawa, and helped to establish a Canadian headquarters at the Adlon hotel. The British delegation was the largest, the United States came next, and then came Japan with 100 delegates. These three countries had large suites of offices and a staff of permanent officials at the Adlon hotel prior to and during the progress of the conference. Lord Derby, Honorary President of the World Power Conference, came to Berlin to open the conference. President Hindenburg, Honorary Patron, sent the German Chancellor to welcome us; the president's message contained the following words:—"By developing the transport of power across the political frontiers engineering is about to exercise greater influence than ever upon the economic life of the peoples and to establish a closer connection than ever before between their economic systems." It may be of interest to note here that statesmen, financiers and engineers in Europe unanimously favour the export of power to other countries during the time when it is not needed at home.

One of the features of the conference was the presentation of an address at noon, daily, in the Kroll opera house by world-famed scientists or important personages. The speakers and their topics were as follows:—

1. The Physical Space and Ether Problem by Dr. Einstein. (German.)
2. The New Forms of Rationalization by Dr. D. Surreys. (French.)
3. Place of Minerals in a Power Sustained World by H. Foster Bain. (English.)
4. Address by United States Ambassador Sackett.
5. European Power Systems by Dr. Ing. Oskar Oliven. (German.)
6. Electricity and Power by Prof. Ing. G. Vallauri, Italy. (German, French and English.)
7. Machine Power as a Factor of Culture by Dr. A. F. Enstrom. (German and English.)

The proceedings and deliberations of the council of the World Power Conference, as well as a number of "resolutions" which were passed, have been turned over to a sub-committee or "commission" of eight members who will digest them and report through the London headquarters to the national committees. The national committees are never asked to subscribe to any proposal regarding the running of the headquarters' office, the operations of future world conferences, the publication of proceedings, etc., before all details are submitted in writing; ample time for consideration is always given.

It is generally agreed that the "transactions" of the World Power Conference, when printed for distribution, are too voluminous. The above mentioned "commission" is to investigate and report upon ways and means to cure that situation.

A striking outcome of the conference, perhaps in direct opposition to popular belief, is the contention that the wider development and use of power must eventually reduce unemployment. Officials of the conference issued the following statement:—"Power, from year to year, multiplies the methods by which raw materials are transformed into finished products. New methods create new possibilities of work. New methods require new products for carrying them out, and the markets for the products of labour are thus increased. During the last one hundred and fifty years, 'the machine age,' the increase in the

These papers were reproduced in full in the July issue of the Engineering Journal.

possibilities of work has been much greater than the reduction of the demand for physical labour—if it were otherwise the population of the civilized world could not have increased as it has."

In regard to the conference itself, conference officials issued the following pronouncement: "The most important result of the conference lies in the fact that so many experienced specialists from all over the world have come into personal contact. Quite apart from the value which this has for the individuals and for the organizations to which they belong, it has served to bring the nations into closer touch."

From Berlin, on June 26th, a train-load of delegates proceeded to Scandinavia for the plenary meetings of the International Electrotechnical Commission. Three hundred and fifty delegates from twenty-five countries took part in these meetings. As it was only electrical and closely allied problems which were to be dealt with in Scandinavia, the number of delegates in attendance there was of course very much less than in Berlin.

At Copenhagen, Stockholm and Oslo, municipal and government buildings were placed at the disposal of the local committees and the state railways of Denmark, Sweden and Norway provided special complimentary trains between the capitals of those countries, and made detours to and stops at several power plants en route.

The bulk of the convention work was done in Stockholm.

The business programme of the International Electrotechnical Commission consisted of an attempt at securing unanimous decisions in regard to the standardization of the following matters, which have been in the hands of the various national committees for many years, namely:—

1.	Nomenclature – – – – – –	United States Committee.
2.	Rating of Machinery – – – –	British "
3.	Symbols – – – – – – – –	Swiss "
5.	Steam Turbines – – – – –	United States "
6.	Lamp Caps and Holders – – –	Central Office.
7.	Aluminum – – – – – – –	Central Office.
8.	Voltages and Insulators – – –	Italian Committee.
9.	Electric Traction Equipment –	French "
10.	Insulating Oils – – – – – –	Central Office.
11.	Overhead Lines – – – – –	Belgian Committee.
12.	Radio-communications – – –	Dutch "
13.	Measuring Instruments – – –	German "
14.	Rating of Rivers – – – – –	United States "
15.	Shellac – – – – – – – – –	British "
16.	Terminal Markings – – – –	Dutch "
17.	Oil Switches – – – – – –	Swedish "
19.	Internal Combustion Engines –	United States "

The work of the Committee on Overhead Lines is of special interest. A comparison of practices throughout the world, which was made at Stockholm, showed that in no country was more being done to further the cause of safety than in Canada. Twenty-five years ago many railwaymen, in Canada, favoured the erection of nets or hammocks between power wires and other wires—the assumption being that the power wires would fall and the nets would catch them and keep them away from the railways' wires. Many other countries have had regulations which insisted upon the employment of nets at crossings, but at Stockholm, in July 1930, there was not left a single advocate, from any country, of the practice which the Canadian railway commission abolished twenty-five years ago.

In the discussions on aluminum, now generally used in Canada for electric power transmission lines, the point was brought out that none of the European manufacturers of aluminum wanted to agree upon as high a "standard" for the conductivity of aluminum as is said to obtain in the aluminum which is regularly produced in Canada.

In the Rating of Rivers committee some proposed amendments forwarded through the Canadian National Committee by the Water Powers Branch of the Department of the Interior were readily accepted.

No traveller in Europe can fail to be impressed with the large number of passenger trains in Scandinavia, Germany, Switzerland, France and Italy which are now being operated electrically. The cleanliness and comfort of them leaves little to be desired. The large initial capital outlay for the electrification of steam railways has been the deterring factor in regard to many proposed changes from one system to the other and, at times, it would appear as though sufficient consideration had perhaps not been given to the saving in operating expenses, to the increased comfort to passengers, to the elimination of smoke nuisances in municipalities as well as on the trains, and to the increased capacity of tracks, terminals and equipment, as well as to the reliability of the latter—all of which are secured by electrification. Italy and Switzerland are the leaders in Europe now, in connection with railway electrification.

Canada has never taken as much interest in the International Electrotechnical Commission, in its work and its meetings, as her position in the power world warrants. Specialists in the many branches enumerated above should take an active part in the commission's meetings, and aid in the work of the Canadian National Committee.

The James Morrison Brass Mfg. Company, Limited, 93-97 Adelaide street, west, Toronto, Ont., have issued bulletins Nos. 120, 121 and 122, illustrating and describing their new three series "Streamline" bronze valves for 125, 200 and 300 pounds working steam pressure, Free copies may be had upon application to the company.

BOOK REVIEWS

The Skyscraper

A Study in the Economic Height of Modern Office Buildings

By W. C. Clark and J. L. Kingston. American Institute of Steel Construction, Inc., New York, 1930, board 6 x 9 in., 164 pp., front., plans, tables, $2.00.

Development of the tall building during the past forty years has given rise to many questions of great interest to the public as well as to the architects and engineers who are responsible for the design and to the owners who are responsible for the promotion of such projects. The public is interested in such questions as the effect of this development on traffic congestion, public health, real estate values, and also, largely as a matter of curiosity, the possible height of such buildings. The owner's interest is primarily that of the financial return to be derived from his investment. The gradual increase in the height of the skyscraper, culminating in the recent completion of two buildings of about seventy-five storeys, and recent talk of other buildings of still greater height, naturally leads to the question of what height will give the maximum financial return on the money invested. This question has been investigated by the authors, with the assistance of several architects, consulting engineers and contractors, all of whom are well qualified to do the portion of work assigned to them.

For the purpose of arriving at a solution of this problem, a specific site was selected in a region of high land values in the city of New York. The lot selected, 200 feet by 405 feet, was such as to permit a building, conforming to the set-back provisions of the New York Building By-laws, with a tower portion of the most economical size. On this site eight different buildings were designed varying from eight to seventy-five storeys in height, each building being an upward extension of the one below. An estimate of the cost of each, including all mechanical equipment, was made. The conclusions arrived at are graphically shown in table No. 1, which gives a summary of investment cost, gross and net income and return upon investment, and by chart No. 2 which shows a curve of costs for buildings of different heights from eight to one hundred and thirty storeys. The height of building giving the maximum return, with the assumed value of land at $200.00 per square foot, is sixty-five storeys. Table No. 3 gives net return on investment for various land values.

The methods of making the estimates with the detailed analyses of the results, the charts and diagrams showing the relationship of cost to height of building for the different component factors, and the many other charts and diagrams are of much interest and can made of great use by any one wishing to make an estimate of the cost of a building.

While the book is supposed to be a study of the economic height of buildings, the authors, who are writing as advocates for the skyscraper, devote the last half of the book to a discussion of the place of the tall building in the economic life of the city, and to a refutation of the various arguments advanced by the opponents of the skyscraper. They maintain that the skyscraper instead of being detrimental to a city from the public standpoint, gives a valuable public service, that there are great advantages in the concentration of the business area of a city in facilitating intercommunication and that traffic congestion is not necessarily the result of the construction of skyscrapers, that their tendency is to reduce rather than increase congestion. They also maintain that transportation facilities and public utilities can be supplied and maintained at a lower cost in the more centralized communities and remedies for the relief of congestion are suggested.

A. H. Harkness, M.E.I.C.,
Harkness & Hertzberg, Toronto.

General Reports—Second World Power Conference

VDI-Verlag, G.m.b.H., Berlin, 1930, three editions (German, English and French), 150 x 238 mm., 271 pp. each ed., price, bound in linen, R. M. 26.

The book can be obtained either in English, French or German, bound in linen, price, R. M. 26.

The great number and variety of the communications dealt with at the Second World Power Conference—376 papers were contributed from 34 countries—made it desirable to provide a condensed account describing the papers which have been classed under some thirty-four headings, and this has been done in the book now issued.

Each division has been treated by a "reporter" specially familiar with that particular phase of engineering work, who has prepared a short notice of each paper in his section, and has added notes on the trend of development and recent progress, with suggestions as to points for discussion. The volume thus forms a valuable résumé of the work of the conference in all its sections.

The complete series of World Power Conference publications comprises, in addition to the General Reports, eighteen technical volumes, each containing the papers relating to one of the conference sections; a volume of the principal addresses and lectures delivered during the conference, and an index volume. The published price of the whole series of twenty volumes, exclusive of the General Reports, is R. M. 350, or in English money, £17-10-0. The English publishers are Percy Lund, Humphries & Co. Ltd., Amen Corner, London, E.C. 4.

Catalogues

Presented by the American Society of Mechanical Engineers:
Mechanical Catalogue, with Directory of Manufacturers of Industrial Equipment, Material and Supplies, 1930-31.

Presented by Canada Wire and Cable Company:
Catalogue of Wire Rope and Fittings.

The Smart-Turner Machine Company, Ltd., Hamilton, Ont., who have been welding steel barrels and steel tanks for fifteen years, have recently met the demand for special pipe connections.

These special pipe connections are made of standard steel pipe throughout with heavy steel flanges welded to the ends, this being done by a very careful process. After the welding is completed, they are faced off and drilled in a similar manner to that employed in the case of cast iron pipe.

The plant of this firm is exceptionally well equipped to deal with this class of work.

Practically any pipe connection can be made by this welding process; and it should be noted that any size, from the smallest to the largest, can be produced by the company.

BRANCH NEWS

Cape Breton Branch

S. C. Mifflen, M.E.I.C., Secretary-Treasurer.
Louis Frost, Branch Affiliate, Branch News Editor.

A joint meeting was held in the official club rooms of the Dominion Coal Company at Glace Bay on Tuesday, October 21st, under the auspices of the Branch and the Mining Society of Nova Scotia. The speaker of the evening was Mr. E. Godfrey, technical representative, explosives division, Canadian Industries Limited, the subject of his address being "The Care and Use of Explosives." A. L. Hay, M.E.I.C., Branch Chairman, presided.

Introducing the speaker, the chairman briefly reviewed the status held by explosives in the pursuit of peaceful occupation and the necessary procreation of measures that would effectively render the use of explosives safe. The chairman declared that the dominating principle in the industrial use of explosives was "Safety, Effectiveness, and again Safety."

During the course of the address, which lasted well over an hour, the speaker pointed out that the development of practically every industrial process has been made possible by the use of explosives. Explosives were almost as indispensable as capital and labour to world productivity and development. Explosives had not only found a place in mining and quarrying operations, but had also been established as a prime factor in pursuit of other industries, among which were notably those of railroad construction, reclamation of farm lands, hydro-electric development, and demolition.

Every year millions of pounds of explosives were used for a great variety of purposes and the number of accidents were surprisingly few in comparison with the real hazard of their use. This was especially noticeable to one who, like the speaker, had a daily opportunity to see the manner in which explosives were used or misused.

Commercial explosives, the speaker indicated, would not explode of their own accord. In the course of manufacture the ingredients were carefully tested and incorporated only in the proper proportions to produce, when exploded, certain predetermined gases of such volume and speed as to produce a tremendous concentrated power.

Therefore the speaker felt that if it was necessary for the manufacturer to exercise such a great degree of care in the manufacture, then it was equally incumbent upon the consumer to handle and store the explosive in a manner to prevent change in the ingredients and thereby affect the characteristic of the explosive. Addition of moisture will affect all explosives, especially the ammonia brands—practically all coal mining explosives are in this class—causing them to become insensitive. Age has a similar effect.

Explosives should therefore be stored in well ventilated and dry magazines and where possible stocks should be regulated to ensure that no explosive more than six months old would be used.

Human direction or mis-direction was fundamentally the cause of most of the blasting accidents, even though such accidents have in a few instances been traced to ground currents, storms and lightning. All these could be guarded against. The greatest cause of blasting accidents was the result of carelessness. The chief causes were:—

1. Not taking proper cover.
2. Playing with blasting caps.
3. Premature blasts.
4. Hang fires.
5. Boring in unexploded charges.
6. Striking explosives in blasted material.
7. Preparing charges.

Accidents from all of these could be prevented by the exercise of ordinary care.

The author dwelt at length on the special requirements of the explosives used in the mining industry, especially in connection with coal mining. Permitted explosives, he declared, must be used in a permitted manner or the fundamental principle is destroyed. An explosive is not used in a permitted manner if any of the following conditions prevail:

1. If a greater weight than specified is used in any one hole.
2. If stored under improper conditions until it undergoes a change in character.
3. If used in a frozen or partially frozen condition.
4. If more than one class, grade, or quality is used in one hole.
5. If fired without stemming.
6. If fired with combustible stemming.
7. If fired in the presence of a dangerous percentage of combustible gas.
8. If fired in a place that is dry and dusty, without first neutralizing this condition by the application of rockdust or water.
9. If shot in a depending hole or the hole is bored in the solid or has a burden so heavy that the shot is liable to blow out.
10. If more than one shot is fired at any one time in any one place other than in tunnels, shafts and slopes driven in rock.
11. If an electric blasting cap of a lesser strength than that specified for use with the particular explosive is used.

In concluding, the author expressed the opinion that workmen should receive special instruction in the use and handling of explosives. This would, he thought, result in a better product and effect a material economy in the consumption of explosives.

Following a spirited discussion of the points raised by the speaker in which a large number of those present took part, a vote of thanks was moved by J. R. Dinn and seconded by J. Moffat.

Hamilton Branch

John R. Dunbar, A.M.E.I.C., Secretary-Treasurer.
J. A. M. Galilee, Affiliate E.I.C., Branch News Editor.

Meeting at Galt with Babcock-Wilcox and Goldie-McCulloch Engineering Society

On Tuesday, November 4th, the members of the Hamilton Branch were invited to Galt by the Engineering Society of the Babcock-Wilcox and Goldie-McCulloch, to hear E. G. Bailey, president of the Fuller Lehigh Company, Fullerton, Pa., speak on "Combustion of Pulverized Fuel."

Mr. Bailey's talk was illustrated by lantern slides and showed different types of coal pulverizers and of the various furnaces in which pulverized coal can be burned. He described in particular the new type "B" pulverizer.

Although embodying the spherical ball and grinding ring principle of pulverizing used in the standard Lehigh mill, type "B" has two rows of balls instead of one, and one rotating and two stationary grinding rings. The two rows of balls, one row mounted above the other, are separated and propelled by the rotating ring which is driven by and floats on the main driving shaft in such a manner that no loading is transmitted to the thrust bearing. The pressure between the balls and the rings, which is an important factor in obtaining fineness and capacity, is obtained independently of the mill speed. This pressure is applied and kept uniform by externally controlled steel springs mounted in the top section.

The main driving shaft runs in two roller bearings and is supported at the lower end by a self-aligning, heavy duty thrust bearing. Bearings are lubricated by an automatic force-feed oiling system, the pump being mounted inside the housing and driven off the horizontal shaft. The bearings and complete driving gear are effectively protected against dust by an air-pressure (2 to 3 pounds) seal and a throw ring mounted on the shaft above the upper shaft bearing. Any leakage of dust at this point is readily observed upon inspection of the annular space between the air inlet chamber and the bearing housing. Raw coal crushed to the required size drops from the feeder, through the spout on to the rotating core inside the upper row of balls, whence it is thrown outward into the path of the balls by centrifugal action. After being ground in the upper row of balls it passes through the annular opening formed by the intermediate grinding rings and the coal basket. Any foreign material such as tramp iron, pyrites and rock, is discharged by the balls to the coal basket. Upon passing through the opening the coarser particles drop to the lower row of grinding balls for further pulverizing while the finer particles are entrained by the air stream.

The separating air, admitted to the grinding zone through cored passages in the base of the mill, moves upward inside and through the lower row of balls, then outward through the cored holes in the intermediate grinding ring. These changes in direction of the air stream tend to cause the coarse particles to readily separate from the fine. Separation is further assisted by an adjustable sleeve at the discharge of the mill, which also prevents the coal stream from short circuiting through the classifier. It was pointed out by the speaker that the new mill is especially well adapted to the use of preheated air as a separating medium. The absence of lubricated bearings within the pulverizing zone precludes the necessity for limitations on the allowable temperature of incoming air; consequently the temperature of the air can be adapted to suit the surface moisture content of the coal.

The meeting was attended by over 175 engineers and others interested in the subject of the combustion of pulverized fuel. Guests of the society were present from Windsor, London, Merriton, Thorold, Waterloo, Hamilton, Toronto, Fergus and Kitchener, and other western Ontario centres.

Weather Reporting to the R 100

"Weather Reporting to the R 100" was the subject of a most interesting lecture given before the Hamilton Branch on November 12th, at the Royal Connaught hotel, by J. Patterson, director of the Dominion Meteorological Service. He explained, at the outset, with considerable clarity, the fundamentals of meteorology, as applied to the guidance and warning of lighter-than-air craft.

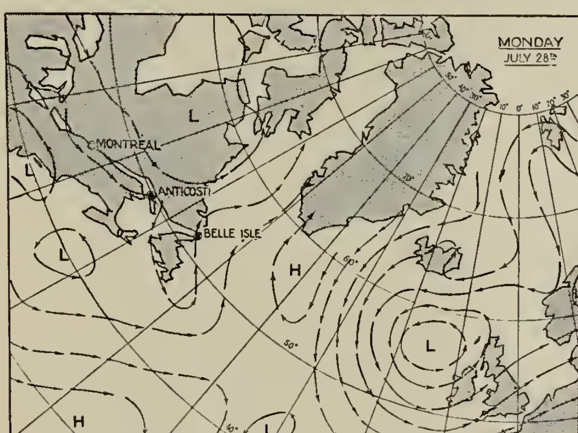
The first part of the lecture dealt with a general consideration of the technical work that is being performed by weather forecasters. A comparison of the first few slides showed how the number of observational points rapidly increased from a few isolated posts on the Great Lakes and the gulf of the St. Lawrence until now the entire Dominion is covered with meteorological posts. The duty of these posts is to send in to headquarters (Toronto) an account of weather conditions at that point giving barometric pressure, air temperature, wind velocity, humidity and cloud appearance. These are co-ordinated by headquarters and maps are plotted which show the exact meteorological condition of the Dominion. From a careful study of these maps, weather predictions can be made 48 hours in advance with considerable accuracy. Variations such as the speed and directional movements of pressure centres sometimes operate to upset these predictions.

"Airship meteorology is a study of growing importance," the speaker said. "We all think of the trip of the R 100 to this country as a decided success, but we cannot forget the later disaster to the R 101. I had the opportunity of going over this ship in England and we all marvelled at the ingenuity of its design at that time. But, after all, something unforeseen went wrong, and we all know of the terrible loss of the greatest airship minds in England. I knew many of the crew well. Some of them were pioneers, and all were firm believers in the future of airships. Lord Thomson, the air minister, was a great backer of lighter-than-air crafts and was largely instrumental in the establishment of the airship meteorological service."

"I have a letter from N. A. Giblett, meteorological officer of the R 101, written shortly before the craft set sail on its fatal journey, probably the last letter that he ever wrote. But it is not for the meteorologist to say whether or not the airship is practical; that is a job for the engineers. The task of the meteorologist is a more difficult one than that of the engineer, for he can have no laboratory to work in and he cannot perform experiments on a small scale."

In 1926, preparations were made in Canada for the development of a service for trans-oceanic flights of dirigible balloons. A central office was located at St. Hubert, and 13 balloon stations were set out in eastern Canada for making regular observations of weather conditions. Views of the intricate apparatus used at St. Hubert to make weather calculations such as temperature at different altitudes, and wind velocities, were shown on the screen.

Airships, in crossing the Atlantic, receive four weather reports daily. In such a trip, the first reports are from England, and as the ship



Map showing weather conditions, July 28th, 1930, prior to flight to Canada of R 100.

crosses the 35th degree of longitude, the Canadian stations take on the task of supplying the necessary information. During a crossing, extra men are put to work and a 24-hour service is maintained at the weather stations.

The R 100 started on its journey heading in a northerly direction to take advantage of favourable wind conditions. As the storm centre shifted shortly after the voyage was begun, the course was swung around to the south and some of the most favourable weather of the voyage was encountered. On reaching the St. Lawrence valley a storm centre was encountered and the passage became more laborious. This, Mr. Patterson explained, was due to the change in air temperature and the unrest of the atmospheric conditions usually prevailing in that part of the country. As Montreal was reached a marked trough of low pressure was struck and the ship experienced the storms that tore the fabric of her rudder and delayed the landing at St. Hubert. These subsided however and the ship was safely moored to the mooring mast. Mr. Patterson then traced out the course of the uneventful return trip.

A most interesting explanation of the danger to which an airship is exposed from line squalls was given by the speaker. This type of storm causes the rapid rise and fall of air which made the R 100 shoot up to an altitude of 4,000 feet near Montreal. The speaker explained that they were most troublesome. When the ship is fixed to the mast the meteorologist must keep a special look-out for line squalls, as they might seriously strain the structure of the dirigible.

R 101 Disaster

The last two slides were of the weather conditions before and after the fatal flight of the R 101. They showed the storm area which gave so much trouble to the unfortunate crew, but Mr. Patterson declined to comment in any way on the probability of bad weather being connected with the disaster.

At the conclusion of Mr. Patterson's lecture, J. J. MacKay, M.E.I.C., moved a hearty vote of thanks to the speaker for his very interesting address. In the discussion which followed, it was brought out that the weather reports are sent by special code to the airships and that only recently has there been a uniform code, called the Copenhagen code, which has been agreed to by all the nations in convention. In the voyage of the Graf Zeppelin, von Eckner had to contend with sixteen different codes.

The meeting was presided over by W. F. McLaren, M.E.I.C., the chairman. Prior to the address by Mr. Patterson, E. H. Darling, M.E.I.C., Hamilton Branch Councillor, gave a short report of the last Plenary Meeting of Council.

Mr. Darling mentioned the fact that the employment bureau of The Institute had turned out to be a great success, placing over eighteen engineers in the month of August. Other matters dealt with were the starting of a branch of the Aeronautical Institute in this country, to be run in conjunction with The Engineering Institute of Canada and the formation of Dominion and Provincial Institutes to do away with the friction at present resulting in some cases among the provincial societies.

There were 35 members in attendance.

Kingston Branch

Major L. F. Grant, M.E.I.C., Secretary-Treasurer.

On Nov. 6th, 1930, the Kingston Branch was addressed by Brig.-General Sir Chas. Delmé-Radcliffe, on the New Granumetric System of Aerial Surveying. Sir Charles, who has had a noted career as a surveyor and soldier, is now chairman of the British Cadastral and Topographical Air Survey Company.

H. H. Richardson, M.Sc., of the Aluminum Company of Canada gave a very interesting talk to a combined meeting of the Kingston Branch of The Institute and the Engineering Society of Queen's University of Friday, November 14th.

The speaker was introduced by Professor D. M. Jemmett, A.M.E.I.C., chairman of the Kingston Branch, who called attention to the fact that 20 per cent of the world's aluminum is produced in Canada, and that Mr. Richardson was the technical adviser to the largest aluminum producing company in the Dominion.

Mr. Richardson pointed out that his time was too short to tell of all the uses of aluminum alloys, and that he would confine himself to describing the more important characteristics of the metal, and its applications.

Pure aluminum has a very light weight, a pleasing appearance, high conductivity, and resists corrosion. Its first use as an industrial material was in connection with cooking utensils, about forty years ago. Its lack of tensile strength prevented its use as a structural material for some years, until the introduction of the modern aluminum alloys. The most common alloy, with about 4 per cent of copper, gives it a tensile strength of some 60,000 pounds. With heat treatment the ductility is raised sufficiently to give about 20 per cent elongation at fracture. Structural shapes are now being rolled for purposes in which saving of weight is important. Aluminum alloys may also be cast, and structural welding is not more difficult than in the case of steel.

In the transportation field, especially in the automobile and aircraft industries, the saving of weight is of so much importance that aluminum alloys have a distinct advantage over steel, sufficient to more than balance the higher cost per pound. In modern aircraft the frame, propeller, crankcase, and gas tanks are frequently of aluminum alloy, and aluminum sheets have been used for wing covering, fastened with small rivets by a contrivance resembling a sewing-machine. It has also been used for the frames of railway cars.

In architectural work an alloy containing 5 per cent of silicon has been used, principally for window sills and for ornamentation. The Chrysler building in New York, now the highest completed building in the world, has numerous ornamental plaques and panels of cast aluminum. A rather outstanding piece of work is the Sphinx on the St. Louis court house, which is an aluminum casting about 12 feet high.

The lecture, which was well illustrated with slides, deserved the hearty vote of thanks which it received.

Lethbridge Branch

Wm. Meldrum, A.M.E.I.C., Secretary-Treasurer.

On October 18th the Lethbridge Branch held a joint meeting with the Association of Professional Engineers of Alberta, on the occasion of the annual district meeting of the latter organization in Lethbridge.

The chair was taken by Dr. John A. Allan, professor of Geology at the University of Alberta, president of the Professional Engineers. Following an excellent dinner, a vigorous round of community singing was enjoyed, interspersed with real music in the form of vocal solos by Miss D. Patterson and Mr. G. Evans. During the dinner music was supplied by the Brown orchestra.

The speaker of the evening, F. N. Rhodes, A.M.E.I.C., of the Institute of Technology and Art, Calgary, was introduced by R. S. Trowsdale, A.M.E.I.C. Mr. Rhodes spoke on "Efficiency," illustrating many of the possibilities for improvement in the electrical and mechanical fields. "Efficiency" he defined, as the endeavour to produce sustenance, shelter and pleasure with the minimum expenditure of our resources. Any changes in the efficiency of one of our many specialized activities is bound to have its effects on other allied activities, and the resultant effort on the whole fabric must be considered. For instance, today we are busily engaged in mechanizing many of our economic processes with a view to lowering production costs. This is often accomplished by a prodigal use of our natural resources, and also results in many cases in widespread unemployment. The speaker mentioned that we have a definite duty to posterity to conserve our natural resources and hand them on in good shape for the use of future generations. Again we have a duty to the present generation, who have to be fed even if there is no work for them. It appears that we may have to turn from mechanization to some extent in order to strike a balance in the use of mechanical power and man power, in order to provide sustenance for the present generation and to conserve our resources.

Following Mr. Rhodes' address, R. A. Brown of Calgary, in a witty and reminiscent vein, extended the thanks of the Professional Engineers to the Lethbridge Branch for the dinner and entertainment which were enjoyed by all of the forty-five who were present.

Dr. Allan announced that the Association of Professional Engineers had conferred a life membership on Charles Raley, A.M.E.I.C., who for many years was connected with the engineering department of the Alberta Railway and Irrigation Company and the Canadian Pacific Railway Company and who has now retired and is living at the coast.

The thanks of those present to Mr. Rhodes for his very able address was offered by W. L. McKenzie, A.M.E.I.C., in well chosen words, and these were heartily accorded by the members.

Montreal Branch

C. K. McLeod, A.M.E.I.C., Secretary-Treasurer.

At the October 16th meeting, held under the auspices of the Aeronautical section, J. A. McCrory, M.E.I.C., announced that affiliation between the Royal Aeronautical Society and The Engineering Institute of Canada had been arranged. Also, R. J. Durley, M.E.I.C., General Secretary of The Institute, read an exchange of telegrams with the Canadian High Commissioner's office in London, conveying the sympathies of The Institute members on the occasion of the loss of the R. 101.

On October 16th, 1930, Flight Lieutenant Alan Ferrier, A.M.E.I.C., A.F.R.Ae.S., addressed the Montreal Branch on the subject "Aeronautics as a Branch of the Engineering Profession." In this connection it was pointed out that the chief engineering problem involved in aeronautics was that of the power plant. This was really a separate branch of the profession, and incidentally had most in common with non-aeronautical activities. The distinctions between aircraft power plants and those on the ground were incidental and with one exception involved none but common factors. This excepted factor is the variation of atmospheric pressure and density with altitude—for example, at a height of 20,000 feet, the atmospheric pressure is roughly one-half as intense as that on the ground. This variation has been responsible for the design of special carburetors as well as the device known as the supercharger.

Apart from the power plant, Lieutenant Ferrier went on to say, that the airplane as a vehicle offered considerable scope for the mechanical engineer in the design of alighting gears and control gears. For instance, the automatic gyroscopic control of aircraft has now been almost perfected and much ingenuity had been displayed in the design of various combination types of undercarriages as well as other accessories.

In conclusion, the speaker stated that the aeronautical engineer had problems common to most other branches of the profession, for example combustion, ventilating, transportation naval design and architecture, hydraulics, structural design and many others. However, insofar as the need for special training, or courses in our engineering schools was concerned, Lieutenant Ferrier expressed the opinion that this was quite unnecessary, except for some instruction in aerodynamics and aerostatics, and that in general the very best training which an aeronautical engineer could get would be a sound course in basic engineering principles.

Following the paper, a number of questions were asked by various members, and in reply to these the speaker stated that the selection of any one type of machine was largely a matter of personal opinion, except when some special condition or requirement of operation gave one or other certain specific advantages over the rest. Lieutenant Ferrier expressed the opinion that most operators were now inclined to favour the single-engined machine, and that further, there was every possibility of the Diesel engine replacing the gasoline motor for aircraft service in the not distant future.

J. L. Busfield, M.E.I.C., occupied the chair.

The October 23rd meeting of the Montreal Branch was addressed by Mr. C. L. Hackett of the General Railway Signal Company. The subject of the paper was, "The Operation of Trains on Single Track by Centralized Traffic Control," and it was illustrated by means of moving pictures.

The first part of the picture showed a train covering the 40-mile stretch of track where the control system was in operation and having been taken from the front of the moving locomotive, gave a very clear idea of the semaphore and other signals as they appeared to the engineer in charge of the train. The second part of the picture showed the control board in the despatcher's cabin. The positions of the trains were indicated by lights on the board while other lights showed the positions of the switches which were opened and closed by means of small levers in front of the despatcher.

Mr. Hackett explained the efficiency of the system and pointed out the economies effected by its installation, whereby a number of trains could be moved safely over a given stretch of single track at high speed without any danger and under the complete control of a single despatcher.

D. Hillman, M.E.I.C., occupied the chair.

Brig.-General Sir Charles Delmé-Radcliffe, K.C.M.G., C.B., C.V.O., spoke before the Montreal Branch on October 30th on the Nistri system of aerial surveying. Sir Charles, who has had a noted career as a surveyor and soldier, is now chairman of the British Cadastral and Topographical Air Survey Company, which controls the rights to the use of the Nistri system within the British Empire.

The system itself involved the use of a number of ground control points fixed in three dimensions. The photography could be done from any aeroplane with sufficient ceiling, according to the speaker, and it was pointed out that no clinometers, tiltmeters, clocks or other fittings were required because all corrections were applied automatically during reconstruction in the photo-cartograph. With reasonable care all work can be done by the pilot alone since the timing and flying are so arranged as to ensure an overlap of 66 per cent of each pair of plates, both in the direction of flight and laterally.

In perfecting his method of survey, Signor Nistri invented a photogrammetric-cartograph or plotter, a special aerial camera and an autochronometer. The cartograph consists of two parts, one carrying two projectors called the projector group while the other or reconstruction group includes the system of ground-glass targets and their holders, the traversing pointer and a mechanism that directs the pencil on the drawing board.

The system was claimed to be satisfactory for carrying out surveys to any scale desired, with contours inserted at the usual vertical intervals corresponding to the map scale or at closer intervals if required and lent itself particularly to all manner of general survey work, especially where the ground was difficult of access.

J. L. Busfield, M.E.I.C., presided.

Niagara Peninsula Branch

R. W. Downie, A.M.E.I.C., Secretary-Treasurer.

On October 24th, the Association of Professional Engineers of Ontario made St. Catharines headquarters for a day of business, sightseeing and a joint dinner meeting with the members of the local Branch of The Engineering Institute.

After a morning devoted to business, the trip along the flight locks of the Ship canal provided a welcome relaxation. Starting at lock No. 7, on the Lake Erie level, they were able to follow a freighter as she dropped down the series of four locks at the escarpment and to note the operation of filling valves, steel mitering gates, as well as the various control desks and interlocking devices whereby the safety of machinery and vessels is secured.

Finally, when the vertical lift bridge at the foot of the locks was raised to allow the freighter to pass, many of the visitors had found their way to the upper platform of the operators' cabin and enjoyed the view.

The evening meeting was presided over by chairman Walter Jackson, M.E.I.C., who had with him at the head table President G. R. Mickle of the A.P.E.O., President A. J. Grant, M.E.I.C., of The Engineering Institute of Canada, and E. T. Sterne, Past-President of the Association.

Naturally the theme of most of the speakers turned upon the relationship between the younger associations and the parent body.

Mr Grant divulged the interesting news that S. G. Porter, M.E.I.C., of Calgary was slated to be the nominee for the next President. Mr. Porter was chairman of the committee which for several years had been studying various possibilities of amalgamation or affiliation between the Provincial Associations and The Engineering Institute. There are nine separate associations, continued Mr. Grant, some of which were fairly strong, but the consequence of the formation of these bodies was a noticeable tendency to sap the strength of The Institute. From either viewpoint, some form of unified action was admittedly desirable and one of the first steps in that direction would seem to be the devising of common standards for admission. Most of the eastern Provincial Associations had already met and discussed with Mr. Porter's committee this phase of the question, but various western provinces had not yet appointed their sub-committees and therefore much work remained to be accomplished. Such a contemplated unification could not but strengthen an engineer's position regardless of whether he belonged to a provincial body or to The Engineering Institute of Canada and no existing right or privilege would, or could, be disturbed.

Mr. Mickle referred briefly to the aspects of the Ship canal which he had viewed during the afternoon, commenting upon the magnitude of the engineering problems which were involved and stating that he was particularly interested in the tree-planting campaign which had been inaugurated. Concerning the proposed affiliation between the various engineering bodies of Canada he believed that any scheme which had for its object the strengthening of the present position was highly desirable. Of course the fields in which the two associations worked were quite different; The Institute was interested in any and every phase of engineering, whereas the provincial corporations acted purely as registering bodies. Just at present, the Ontario Association found itself in a somewhat weak position legally but steps were now being taken to apply to the legislature for a "second set of teeth."

Engineers in this country had not the status to which they were entitled, either from an economic or from a legal point of view. When called in to act as expert witnesses they were seldom given any protection by the court and consequently were subject to all the badgering that a quick-witted lawyer could devise. In other countries professional assistance in the engineering aspects of various technical cases was highly recognized; the admiralty courts in particular are quick to realize the value of such assistance and naval assessors invariably take their seats on the judicial bench, thus being accorded a higher status than that of counsel.

Mr. Sterne said that he thoroughly agreed with the previous speakers and stated that engineers should strive to achieve the superiority complex which was theirs by right. One of the greatest difficulties to surmount was that their work was so complex and called for such a high degree of concentration that it generally absorbed the whole attention of engineers to the disregard of all other matters such as political questions and the training for fluent speaking in public. The Provincial Associations had a very useful part to play in engineering welfare and their relations with The Engineering Institute of Canada would continue as Kipling has so ably phrased it "daughter in her mother's house but mistress in her own." A very close degree of co-operation was nevertheless not only desirable but quite capable of accomplishment.

Following these speakers, J. B. McAndrew, A.M.E.I.C., mechanical engineer of the Ship canal, showed a series of views depicting a few of the more interesting features such as Taintor valves, lock gates, stoney sluice gates with the operating machines, slip frictions, clutches and gears. Most of this mechanism was of original design although standard makes were used when possible. The work however had been on such a large scale and was so much out of the ordinary that but few standard machines were available. As the result of six months' operation, a few changes were being made, but these were all of a minor nature and there had been no delay to traffic due to any failure.

Mr. L. P. Rundle then outlined some of the electrical features, giving the audience a slight conception of the studies which had been made in order to ensure correct lighting for the lock structures and Canal prism, as well as the various interlocking units necessary for the protection of vessels and equipment. Considering the abstruse nature of the subject, Mr. Rundle succeeded in making himself extraordinarily clear and lucid.

Ottawa Branch

F. C. C. Lynch, A.M.E.I.C., Secretary-Treasurer

Luncheon Meeting

The opening meeting of the Ottawa Branch was held at the Chateau Laurier at noon on Thursday, October 23rd, at which about one hundred and fifty members and friends were present. The speaker for the meeting was Major L. T. Burwash, M.E.I.C., who gave an address on the subject "Exploration in Northern Canada." In the absence of the chairman, J. McLeish, M.E.I.C., who has been seriously ill, the chair was occupied by F. H. Peters, M.E.I.C., Surveyor General.

Those present at the head table, in addition to the chairman and speaker, included Honourable Thomas G. Murphy, Minister of the Interior; R. J. Durley, M.E.I.C., General Secretary of The Engineering Institute of Canada; Sir Charles Delmé-Radcliffe, Chairman of the British Cadastral and Topographical Air Survey Company; Dr. Hodgson, Dr. O. D. Skelton, G. J. Desbarats, C.M.G., M.E.I.C., J. L. Busfield, M.E.I.C., Roy A. Gibson, Dr. R. M. Anderson, John Murphy, M.E.I.C., T. L. Simmons, M.E.I.C., J. Mackintosh Bell, O. S. Finnie, M.E.I.C., D. Jenness and G. P. MacKenzie.

Major Burwash had a large map of Canada, showing the northern Arctic regions, from which he illustrated the various points dealt with in his address. He compared the means of transport of only a few years ago with those available to-day. By the old methods it took one year to get in and out whereas now it is a matter of a few days. The high cost of transport is offset by the saving of a year's time. The first aeroplanes reached the Arctic coast just about a year ago but during last summer they were so common in Coronation gulf that the Eskimos would hardly look up to see them. There is also an organized transport system from Vancouver as far east in the Arctic ocean as Cambridge bay. In using aeroplane transport, however, Major Burwash pointed out that the chief credit was undoubtedly due to those in charge of the planes.

The Department of the Interior has been carrying out a plan of exploration of Canada's Arctic lands and as a part of this plan the speaker has spent several years in these regions. He spent the winter of 1928 on King William island and one of the objects assigned him was to investigate the location and behaviour of the north magnetic pole. According to his observations, this pole has a daily swing east and west of about seven miles as observed from readings about one hundred miles south of it. He was unable to ascertain whether it had a similar north and south swing as he could not take the necessary observations from a point to east or west of the pole.

However, the chief interest at the present time was in his work of last year when he was sent to investigate certain stories of the ultimate fate of the Franklin expedition. This expedition left England in two boats in 1845 and that was the last ever seen of it. In 1852 certain traces were collected and natives said these had come from King William island. Additional relief expeditions have been sent out at various times and in 1858 conclusive proof of the loss of the expedition was obtained together with the only written record which has been found. This stated that one hundred and five of the crew including officers and men had abandoned the ships which were frozen in the ice to go south and attempt a passage up the Back river to reach Great Slave lake. Traces indicating the death of about half of this number have been found but the fate of the other fifty men has never been cleared up. During this summer Major Burwash took an aeroplane from Fort Norman about the middle of July to the mouth of the Copper mine river where he spent about a month waiting for open water to proceed further. The party reached King William island early in September, travelling in one day from nine o'clock a.m. to six o-clock p.m. a distance which the speaker had covered in a previous season between May 17th and August 1st. The next day he found an inland lake open on which they could land and commenced their explorations. No evidence was found of the Franklin party in the area in which it had been reported but they did find an old cairn and camp site in another locality. A careful investigation was made of this site and the cairn was taken down to search for records. No records, however, could be found and the speaker was convinced that none exist there. At the camp site a considerable number of fragments of cloth, rope, rusty iron, were found which would indicate that this had probably been used as a base camp by the party seeking to find a southern route to escape. However, evidence has been found before that some, at least, of the men who had attempted this southern route had turned back to the ships. Major Burwash advanced the theory that after an attempt of the southern route and losing about half their number the remainder gave it up as hopeless and turned back to the ships. These had eventually been freed from the ice but must both have been lost later. From stories the Eskimos still repeat one of these was probably wrecked on the mainland south of King William island and the other on the mainland east of the island, perhaps, one or even two years later. The fact that no records could be found would substantiate this theory, as the sailors would undoubtedly take them with them in returning to the ships.

Surveying by a New Photogrammetric Method

At the noon luncheon of the Ottawa branch held at the Chateau Laurier on October 30, the speaker was Sir Charles Delmé-Radcliffe, K.C.M.G., who took as his subject "Surveying by a new photogrammetric method." The chairman of the luncheon, in the absence of John McLeish, M.E.I.C., the regular branch chairman, on account of illness, was F. H. Peters, M.E.I.C., Surveyor General. At the head table in addition to the speaker and the chairman, there were the following guests:—Honourable Dr. Murray McLaren; V. M. Meek, M.E.I.C.; Dr. R. W. Boyle, M.E.I.C. of the National Research Council; Lieut.-Col. H. E. Matthews; Sir William Clark, British High Commissioner to Canada; Major General J. H. MacBrien; G. J. Desbarats, C.M.G., M.E.I.C.; Noulan Cauchon, A.M.E.I.C.; A. M. Narraway, M.E.I.C.; Squadron Leader F. G. Higgins, A.M.E.I.C.; Squadron Leader A. Ferrier, A.M.E.I.C.; Flight Lieut. E. Jellison; and Flight Lieut. N. C. Ogilvie Forbes.

Sir Charles, in his opening remarks, stated that the method which he was about to describe was not to be considered as a rival to existing Canadian methods but rather as a supplement to them. It will enable the work done by the present Canadian methods to be amplified wherever required in much closer detail.

This is called the "Nistri" method of photogrammetric survey. The inventor is a young Italian officer, whose acquaintance Sir Charles made when he was serving as an observer of the Royal Italian Air Force with the batteries of heavy artillery on the Carso in 1917 during the Great War. The speaker paid a glowing tribute to this young inventor, characterizing him as a remarkable mathematician and optician, with that marvellous inventive genius which is so frequently seen among his countrymen.

This young Italian officer has produced a process, and has invented instruments for use therewith, which have proved themselves to be eminently practical. The speaker indicated in a general way the salient points of the Nistri photogrammetric cartograph but stated that he would not attempt to go too deeply into the technical details of the invention. These would be described at length later in the Journal of the Royal Geographical Society and other technical publications.

Instead, by the use of lantern slides he showed views of the instruments used and of the results obtained by their use. The method, stated the speaker, has been fully tried out in such countries as Italy, France, Czecho-Slovakia, Albania, Brazil and Great Britain, and from these practical experiences the exact degree of reliability of the instruments determined.

The principal advantages of the method lie in (*a*) the great speed with which the most elaborate surveys can be completed, a speed which may lie anywhere between one-half and one-twentieth of the time required for corresponding surveys on the ground; (*b*) as a consequence of the speed, the comparative cheapness as compared with ground methods; and (*c*) the completeness and accuracy of the reproduction of the detail of the ground, which is surveyed in the three dimensions simultaneously.

This latter is a most striking feature. The contour lines, stated Sir Charles, giving the complete relief of the ground are absolutely accurate. Though this feature of the work may seem at first glance to be almost miraculous and impossible of belief, it is nevertheless a sober and practical fact. In this connection, the speaker stated that he trusted that before much time had elapsed a Canadian survey company would be in existence operating this method throughout Canada and co-operating with similar organizations all over the British Empire.

The lecturer then showed upon the screen a number of examples of specimens of maps made by this method, together with some of the aerial photographs employed. The first map was sheet No. 14 of the survey of Lundy island in the Bristol channel, one sheet out of seventeen which were issued on the 1:1000 scale with contours at 3-foot vertical intervals. In carrying out this survey the work had to be proceeded with "ab ovo", that is, it had to be commenced right at the beginning. The reason for this was that the points laid down in the Ordnance survey of the island, originally made in 1844 and revised in 1884, had with one exception entirely disappeared. A base was therefore measured, azimuth observations taken, the main triangulation laid out and computations made, and the flights undertaken. After this the secondary and photographic triangulation and control points were selected from the plates and fixed. The calculations for these points took another couple of days making about a week in all for the selection and determination of the control points. The flights took in all about one hour and forty-two minutes, forty-two plates being exposed. The flying was done at an altitude well over 3,000 feet above the sea and on one of the days in the teeth of a fifty-mile-an-hour gale. This did not in any way adversely affect the results of the work and is a tribute to the skill of the pilot in correctly covering this area in spite of the gale.

The time required for drawing the complicated detail with one photocartograph was two days per map sheet or thirty-four days in all. If four photocartographs had been used this part of the work could have been completed in eight or nine days and the whole survey finished in about two and a half weeks. The ordinary ground survey with contours on the same scale would have taken as many years.

The speaker then showed other samples of work done which illustrated similar points to those of the survey of Lundy island. In these various examples specimens of the maps were shown which had scales as follows: 1:2500 with 10-foot vertical interval contours; 1:2000 with one-metre vertical interval contours (this one being at Ariconduva, in Brazil); 1:1000 with one-half metre vertical interval contours (at Ostia in Italy, surveyed under Signor Mussolini's orders); and 1:500 with one-metre vertical interval contours.

Toward the end of his lecture the speaker, by way of comparison, showed a number of slides relating to the maps produced by the British Commission for the determination of the Anglo-German boundary in Uganda between 1902 and 1904. The speaker stated that he did not show this map as a specimen for its own sake, but rather in order to emphasize the difference between the old method and the new. In those days, long weary nights in the tropical rainy season for months on end had to be spent in waiting for glimpses of the stars between the flying clouds in order that by means of astronomical observations the difference in longitude at certain strategic points might be determined. This wearisome procedure entailed hardship such as being severely bitten by the tropical insects and the experiencing of a good deal of tropical fever.

At that time there was no permanent telegraph line which could be made use of and an effort to obtain telegraphic signals over a telephone line ended disastrously when several miles of the wire were carried off into the jungle by an elephant which was found strangled to death some forty miles away. Nowadays, one can obtain with very little effort wireless signals from an observatory in Europe or elsewhere and so the difference in longitude can be very easily and rapidly obtained.

Other difficulties in the work at that time were related by the speaker including his, as he stated, uncomfortable distinction of being the first white man to have a case of spirillum fever in those parts. This was a most distressing and almost disastrous experience. Terrific thunderstorms which occur nearly every afternoon at about four o'clock played havoc with the party, standing camps being burnt down twice and several of the men being struck by lightning, and killed.

In this work the 3,600 square miles of topographical survey on the scale of one to 100,000 with form lines at 100-foot vertical intervals and the insertion of numerous spot heights took nearly two years to complete. By modern methods this same amount of work could have been completed in about one-quarter of the time at one-quarter of the cost with a more accurate result. There would be real contours under modern methods instead of, as before, form lines controlled by spot heights.

The Engineer in the Nation

Dr. R. W. Boyle, M.E.I.C., of the National Research Council, was the speaker at the noon luncheon held on November 6th, 1930. F. H. Peters, M.E.I.C., Surveyor General, acted as chairman in the absence of John McLeish, M.E.I.C., who was unable to be present on account of illness. In addition to the chairman and speaker the guests at the head table included: Honourable H. A. Stewart, Minister of Public Works; Dr. A. H. McDougall, principal of the Ottawa Collegiate Institutes; W. W. Nicholl, principal of the Ottawa Technical School; B. F. Haanel, M.E.I.C.; George Saunders of Fernie, B.C.; John Murphy, M.E.I.C.; D. G. Munro; James Lovett, general superintendent of the Coppers Coke Manufacturing Company of Pittsburgh; Hugh McNair of the Winnipeg Electric Company; J. E. Noulan Cauchon, A.M.E.I.C., and L. L. Bolton, M.E.I.C., assistant Deputy Minister of Mines.

Dr. Boyle dealt with the subject of "The Engineer in the Nation." From his experience as an educationist on the Faculty of Applied Science of the University of Alberta, and later as Dean of that faculty, Dr. Boyle stated that he had been afforded ample opportunity of observing the deportment of students in engineering. He found them uniformly serious-minded, fond of associating with their own kind and rarely given to such things as attendance at or interest in philosophic debating, or literary societies. Individually, they seemed to exhibit an innate shyness and modesty and even, as it were, a sense of inferiority complex to the extent, at least, that they did not care to make any commitment until they were positively sure of the matter at issue.

Dr. Boyle was of the opinion that these qualities, as manifesting themselves in students of engineering, were but a regular result of the processes at work of natural selection. Under these processes their human characteristics, even from infancy, determined their life careers and influenced them in their selection of the professional life which they were undertaking. The regular training which these students had to undergo served also to accentuate these characteristics. Uniformly they exhibited a passion for inquiry into fundamental things, a caution in undertaking this inquiry, and a caution in carrying out the various operations in connection with such inquiry. To them a waste even in their processes of training constituted a sin, and it was their constant effort to keep their efficiency ratio at a high point.

An engineer has been defined as a man who "by art designs construction and attempts to divert the forces of nature toward the benefit of mankind." In remaining true to this definition the engineer will usually be found as a man who is sound, safe, stable and sane, so that, as it has been well stated, "a fool as an engineer cannot survive."

Mankind has been aptly placed into three categories: 1, those with one-storey intellects, intellects which cannot go far beyond the collecting of facts; 2, those with two-storey intellects, intellects which can compare and reason; 3, those with three-storey intellects with skylights. The latter are capable of idealizing, of imagining, and of predicting, and to them the best illumination comes from above. Engineers themselves do not make enough of their three-storey men and the public makes still less.

The country today, stated the speaker, depends for its advances upon pure and applied science, and the findings of science can proceed no further than the capabilities of the engineer to advance them. With the modern tendency of the world to become more and more scientific, the engineering type of man should come into greater prominence. This prominence should extend into every line of endeavour relating to national administration, whether relative to judicial, strategical or executive problems. But no such thing is happening — now, as formerly, the engineer is still the hired man.

Perhaps, in seeking for a reason for this we may find the answer in the workings of nature itself. The very qualities manifested in the individual, of a lack of self-seeking and of absorbing interest in the work on hand precludes any great possibility of his extending himself into what might be called the more human contacts. There might, conceivably, be something inherently wrong in the method of technical education, whereby too much emphasis is placed upon mere training and not enough upon real education. The engineer, indeed, as has been aptly stated, is always subject to the danger of becoming overtrained and under-educated.

Another reason may lie in the nature of his work. Engineers have a habit of staying too much to themselves, a habit resulting from the conditions under which they are forced to carry on their work. Unlike the doctor, the preacher, and the lawyer, their work takes them largely away from human contacts and accustoms them to "carrying on" alone. It is a pity, stated Dr. Boyle, that more engineers do not write for the public journals, do not make public speeches, do not engage in public enterprises, do not stand for parliament—in other words, do not come out of their shell. Who, for instance, is better placed than the engineer to study the effects upon modern society of modern devices due to science, and to observe and put down such observations, than the engineer?

The speaker characterized the average Canadian engineer's contribution to engineering and other learned journals as containing more of description and less of what is new than those, for instance, of Great Britain. Why not, he asked, have more variety? At this point, he mentioned that the new Canadian Journal of Research had found great difficulty in obtaining contributions of original material from engineers, although there was little difficulty with the other scientific professions. There was in prospect, in connection with the National Research Council, the building up of a major division devoted to engineering research and it was to be hoped that such a condition would be remedied.

There is no country in the world, stated Dr. Boyle, that can offer more of romance connected with engineering than can Canada and he hoped, incidentally, that the National Research Council in some readily observable form, could arrange by methods of display or otherwise to indicate something of this romance for the stimulation of Canadian youth and the pride of Canadian people. In this connection he spoke about a visit to the Neues Deutsches Museum of Munich, Germany, where the romance of bridge engineering, for instance, was traced through successive stages from the time of the first rude log flung across a stream to the massive structures of today, and the evolution of a city street presented from its earliest history when it was a mere footpath.

Dr. Boyle hoped that the time would not be long distant when there would be a truly national society of all engineers which would take its place as a first step in the education of the public in the professional status of the engineer such as similar societies do with the professions of law, medicine, etc. The consequences of the formation of such a society would redound to the everlasting credit and prestige of the engineer.

Dial Telephone Systems

A popular meeting, attended by members of the local branch and by the public, was held at the Victoria Memorial museum on the evening of November 14th, 1930. The speaker at this meeting was G. F. Inglis of Montreal, who is the dial system equipment engineer for the eastern area of the Bell Telephone Company of Canada.

Mr. Inglis spoke on the subject of "Dial System Telephony" and a feature of the lecture was a miniature dial system central office in actual operation upon the stage. In addition, a two-reel motion picture and numerous slides were shown. J. L. Rannie, M.E.I.C., acted as chairman at the meeting and at its conclusion a vote of thanks was moved by John McLeish, M.E.I.C.

Inasmuch as the dial system of telephony has not yet been introduced into the city of Ottawa but is intended to be within the course of the next few years, the lecture proved of great interest to the audience.

Dial system telephony has for its fundamental object the mechanical performance of the most common operations performed by operators under the old manual system. To each subscriber's instrument is added a dial, the operation of which causes the central office switching mechanism to establish any desired connection. It is, in fact, a very highly developed system of remote control; instead of calling a number into the telphone as is done at present in Ottawa, the subscriber will perform the operation of turning the dial in conformity with the number which he desires to call.

Two different types of dial system are in use by the Bell Telephone Company, (1) the panel system as developed by theAmericanTelephone and Telegraph Company and used in very large exchange areas, and (2) the step-by-step system invented by A. B. Strowger and developed to a great extent by the Automatic Electric Company of Chicago. The speaker briefly described the panel system but devoted the greater portion of his lecture to the step-by-step system.

The panel system is a power-driven system working on a non-decimal basis under the control of a mechanical operator termed a "sender" which determines the routing of the call through the various switching mechanisms.

The step-by-step system was first patented in 1889. An original installation at Grand Rapids, Michigan, in 1900, is still in operation and giving good service. It must be understood, however, that there are marked differences in the features of the early installations with those of today. The step-by-step system is essentially a system in which the connections are set up one step at a time on a decimal basis under the direct control of a series of electrical impulses originated by the subscriber's dial. Each pull of the dial sends out a series of electrical impulses equal in number to the digit dialed. Each of these series of impulses, on reaching the central office, operates a mechanism termed a "selector." Each selector extends the connection one step further until it finally reaches one of a group of "connector" switches which have access to the particular group of one hundred lines in which the desired number is located. The last two digits dialed cause the connector to make connection to the desired line.

If the line is not already in use the connector rings on it, but if the line is busy the connector will refuse to interfere and will inform the calling party by means of a special audible tone that the line called is in use. In the construction of the dial which is placed upon the subscriber's telephone, the digits from one to zero, 10 in all, are arranged. Distributed amongst the digits 2 to 9 inclusive are the letters of the alphabet with the exception of the letters Q and Z. Thus for each space upon the dial there will be a figure and three letters.

In what is known as a "six digit area," as in Montreal or Toronto, the first two letters of the central office name are capitalized in the directory and are dialed by the subscriber as well as the four digits which are also given. In effect, six digits are actually dialed but it has been found much easier to remember a name and four figures rather than six figures direct. In a "five digit area" the first letter only of the office name is used as well as the four digits.

In exchange areas with both manual and dial central offices, special apparatus is provided in the manual offices to handle calls to and from dial subscribers. The operation of this apparatus is such that the subscriber, in making a call to any other telephone, is not required to distinguish between telephones served from manual or from dial central offices.

During the course of the lecture slides were shown depicting the interiors as well as the exteriors of some of the central offices at various points in Canada and the two-reel motion picture served to show in a popular way the various steps taken in the operation of the step-by-step mechanism when a call is made.

B. Ottewell, A.M.E.I.C., Branch News Editor.

Patents

A regular meeting of the Peterborough Branch was held on the evening of October 23, 1930, B. Ottewell, A.M.E.I.C., chairman, the speaker being L. C. Prittie, A.M.E.I.C., patent attorney, whose subject was "Canadian Patents and the Requisites of a Patentable Invention."

Mr. Prittie is well qualified to address an engineering audience on this subject, being himself a graduate in engineering and having had extensive experience in the Government Patent Office as examiner, and since 1925 in charge of the patent department of the Canadian General Electric Company Ltd.

Going back to the early eras of civilization, the speaker pointed out that with the development of reasoning power in man, and the extension of commerce, the necessity for recognition of invention was realized.

In England the granting by royalty of monopolies resulted in abuses. The Statute of Monopolies abolished such monopolies, with the exception however of patents of invention, which were eventually covered by the Patent Act.

The United States Constitution of 1776 included a patent law. In eastern Canada before Confederation there were patent laws, and in 1869 the first Patent Act was passed. The essentials of patent law are the same in most countries.

As an indication of the number of patents, Mr. Prittie stated that about 10,000 a year are being taken out in Canada, 45,000 in the United States and 19,000 in England. Very large numbers of applications for patents are always awaiting or under examination in all Patent Offices.

After giving some examples of the infinite variety of subject matter in patent specifications, the speaker said that the law read simply that "any person who has invented any new and useful machine, process or art may obtain a patent" for a limited time, in this country 18 years. He stated that the word "invention" has never yet been satisfactorily defined. In discussing what constitutes a patentable invention it is convenient to consider a number of *negative* criteria, briefly summarized below, to many of which however there are exceptions. The following are *not* generally considered patentable:—

(1) Mere skill.
(2) Substitution of materials.
(3) Enlargement of parts.
(4) Change in degree or size.
(5) Aggregation of things.
(6) Duplication of parts.
(7) Omission of parts.
(8) Substitution of equivalents.
(9) Combinations of old devices.
(10) Use of an article for new or analogous purpose.

The concluding portion of the address dealt with patent procedure, explaining that a patent is in the nature of a contract and that full and complete disclosure is essential. A patent can be upset if incomplete. The purpose of the claims is to clearly define the invention, the idea being to draw first the broadest possible claims, then the narrower and more specific ones.

Very active discussion followed the address and Mr. Prittie kindly answered a large number of questions. A cordial vote of thanks was proposed by Mr. W. Sangster, and received with acclamation.

The R 100

On November 13th, 1930, the Branch listened to Councillor R. L. Dobbin, M.E.I.C. and A. L. Killaly, A.M.E.I.C., who showed motion pictures of their visit to the R 100 at St. Hubert airport with a party of Institute members. Mr. Dobbin was also present at the dinner to the ship's officers, tendered by the Council of The Institute.

Chairman W. E. Ross, A.M.E.I.C., tactfully allowed each speaker to introduce the other.

Mr. Killaly began with sympathetic reference to the recent tragedy of the sister ship R 101, and said that on that account and in view of the enquiry now proceeding, this might not be considered an opportune time for such an address. However, as they had been privileged through The Institute to inspect the R 100 he felt that they should pass on the information to the members of the Branch when the Branch directed.

After a brief outline of the history of lighter-than-air craft Mr. Dobbin showed the moving pictures taken by himself at St. Hubert airport which not only gave many good general views of the ship riding at the mast but also included closeups of detail of special interest where pictures could be taken.

Mr. Killaly followed with a description of the details of the interior of the ship which it had been impossible to photograph. He also referred to the intensive study made by the British Air Force upon which the main features of the R 100 and R 101 were based.

The interest of the local Branch in the subject was evidenced by the number of questions asked and the discussion which followed the pictures and description of the ship.

After the customary discussion and questions, R. H. Parsons, M.E.I.C., moved a hearty vote of thanks to both speakers, which was cordially approved.

Preliminary Notice

of Applications for Admission and for Transfer

November 20th, 1930

The By-laws provide that the Council of The Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in January, 1931.

R. J. Durley, *Secretary.*

* The professional requirements are as follows—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the Council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science of engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule P of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of Student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

CARON—WILLIAM ROBERT, of Quebec, Que., Born at Auld's Cove, N.S., Sept. 17th, 1898; Educ., civil engrg. grad., 1921, elect'l. engrg. grad., 1928, I.C.S.; 1913-14, constrn. office clerk, timekeeper and rodman, Canadian Stewart Co., grain elevator constrn., Quebec Harbour; 1914 to date, with the Quebec Harbour Commission, as follows: 1914-22, secretary to chief engr. and gen. supt., engrg. office work, specifications, estimates, dfting and field engrg. work; 1922-25, secretary to gen. mgr. and chief engr., duties as above, in addition work in steam electric plant, distribution lines, and misc. elect'l. equipment; 1925 to date, elect'l. supt., in direct charge of all harbour elect'l. equipment and sub-station-connected load 6,500 H.P. distribution lines—grain elevator installn. and mtce., power and lighting equipment, signals and telephone systems, dock and shed lighting, series circuits, cold storage power supply and equipment, elect'l. engrg. office work on new installns. and layouts.

CYR—SERAPHIN ADELARD, of 4395 St. Andre Street, Montreal, Que., Born at Montreal, Mar. 11th, 1899; Educ., Academie St. François Xavier, 1915; Passed Prelim. (1921) and Final (1922) examinations of the Province of Quebec Assn. of Architects; 1915-16, dftsman., P. E. Bourassa & Son, cabinet makers; 1916-20, arch'l. dftsman., for J. A. Godin, architect; 1920 to date, with Eastern Steel Products Limited, first as estimator, and since 1924 as asst. to supt. Duties included charge of design of standard steel bldgs., framing for grain elevator spouting and conveyor equipment, calculations of stresses in dockspouts, etc.

FRIGON—AUGUSTIN, of 125 Pagnuelo Ave., Outremont, Que., Born at Montreal, Mar. 6th, 1888; Educ., B.A.Sc. and C.E., Ecole Polytech., Montreal. Special student, Mass. Inst. Tech., 1909. Graduated E.E., Ecole Superieure d'Electricite de Paris, 1921. D.Sc., Univ. of Paris (Sorbonne), 1922; 1906, asst. engr., city of Montreal; 1907, asst. engr., rld. surveying; 1908-09, meter, transformers and motor testing, Montreal Light, Heat & Power; 1910, engr., for Quebec Public Utilities Commn.; 1910 to date, with the Ecole Polytechnique, Montreal, as follows: 1910-17, asst. professor, and 1917 to date, professor, of electr'l. engrg., and from 1922 to date, Dean; 1912-17, junior partner, Surveyer & Frigon, consltg. engrs.; 1923 to date, Director General of Technical Education for the Prov. of Quebec; 1926 to date, chairman, Electrical Commn. of Montreal; 1929, member of the Royal Commission on Radio Broadcasting; Also consltg. engr. for the Caxcade Silico Products Ltd., and for various municipalities in the prov. of Quebec, including Montreal, at different times. (*S. 1907, A.M. 1913.*)

References: A. R. Decary, A. Surveyer, F. C. Laberge, O. O. Lefebvre, A. Boyer, A. E. Dubuc.

HARKNESS—HAROLD WILSON, of Wolfville, N.S., Born at Kanazawan, Japan, Feb. 14th, 1891; Educ., B.A., 1915, B.Sc., 1913, Queen's Univ., M.Sc., 1929, Ph.D., 1930, McGill Univ.; Graduate study and research, Univ. of Chicago and Univ. of Toronto; 1912-14, asst. for firm of Magwood & Stidwell, Cornwall, Ont.; 1918-21, asst. supervisor of bldg. constrn., Cheeloo Univ., Tsinan, Shantung, China; 1918-19, instructor, and 1919-21, associate professor, engrg. and applied physics, Cheeloo Univ.; 1922-27, director of laboratory and professor of engineering and applied physics, also supt. of plant (power, water, light, sewage, bldg., etc.), Cheeloo Univ.; 1922-27, district representative, The Eastern Engineering Works, Tientsin, and consultant for Tsinan Power Co.; 1927-29, research asst., McGill Univ.; 1929 (1 month), asst. physicist, Quebec Forest Industries Assn.; 1930 (summer), research physicist, Price Bros. & Co. Ltd., (Forest fire hazard research); At present, associate professor of physics, Acadia University, Wolfville, N.S. (*A.M. 1920.*)

References: H. T. Barnes, W. H. Sutherland, W. H. Magwood, J. A. Duchastel, R. W. Boyle, C. V. Christie, H. W. McKiel.

PERRY—BRIAN RHODES, of Montreal, Que., Born at Hilton, Man., March 7th, 1895; Educ., B.Sc., McGill Univ., 1915; 1915, instr'man. i/c of one section of party on Intercolonial Rly.; 1915-16, engr., with New England Foundation Co., on foundations in New York City; 1916, dftsman., Shawinigan Water & Power Co.; 1917-18, overseas; 1919, dftsman., Shawinigan Water & Power Co.; 1920-22, supt. on constrn., for Peter Lyall Company; 1922-25, design and in charge of business in Montreal territory for MacKinnon Steel Company; 1925 to date, in private practice, as consltg. engr., Montreal. (*S 1914, A.M. 1923.*)

FOR TRANSFER FROM THE CLASS OF JUNIOR TO A HIGHER CLASS

BRICKENDEN—WILLIAM THOMAS, of 301 Silverbirch Ave., Toronto, Ont., Born at Toronto, July 15th, 1897; Educ., B.A.Sc. (Honours), Univ. of Toronto, 1922; 1920 (Apr.-July), dftsman., Under-Feed Stoker Co. of America, Detroit; July 1920-Sept. 1921, dftsman and asst. engr., Under-Feed Stoker Co. of Canada, Ltd., Toronto; 1922-23, sales engr., A. W. Cash Co. of Canada Ltd. (subsidiary of above company), sale of regulating and reducing valves and combustion control equipment; 1923-27, chief engr., Under-Feed Stoker Co. of Canada, Ltd. (1924 name changed to Riley Engineering & Supply Co. Ltd.) in respon. charge of design, manufacturing, erection service of company's products; 1927-30, asst. to vice-president in charge of sales, Riley Engineering & Supply Co. Ltd., Toronto, direction of sales and consultant in engrg. and mfg.; At present, mech. engr., Thorne, Mulholland, Howson & McPherson, Toronto. (*Jr. 1923.*)

References: A. Ritchie, E. A. Allcut, R. W. Angus, C. B. Hamilton, Jr., F. A. Combe.

GORDON—CHARLES HOWARD, of Montreal, Que., Born at Montreal, Sept. 8th, 1902; Educ., Grad. R.M.C., 1922. B.Sc., McGill Univ., 1924; 1924-25, reinforced concrete designer and dftsman., Sir W. G. Armstrong Whitworth Co.; 1925 to date with Atlas Construction Co. Ltd., as follows: 1925-26, timekeeper and asst. engr.; 1926-27, engr. in charge C.N.R. car facilities, Toronto; 1927-28, engr. and asst. to supt., Welland Ship Canal syphon culvert; 1928-29, engr. in charge of Section 6 for contractors, Welland Ship Canal; 1929-30, in charge of estimating and running various jobs, including Prescott grain elevator, underground conduits, etc., and at present a director of the company. (*Jr. 1925.*)

References: J. B. Porter, A. S. Dawes, C. D. Howe, S. B. Wass, E. G. Cameron.

LAURIE—WILLIAM LITTLE, of Ottawa, Ont., Born at Malvern, Ont., Dec. 4th, 1896; Educ., B.A.Sc., Univ. of Toronto, 1924; 1912, radio operator, and 1914-15, commercial work, Canadian Marconi Co.; 1916-19, radio electr'n. C.E.F., France; 1923 to date, with Royal Canadian Signals, in charge of constrn. and operation of various radio stations operated by the Dept. of National Defence, at present, Capt., in charge of constrn. of radio beacon stations in western Canada on Winnipeg-Calgary-Edmonton air mail routes. (*Jr. 1924.*)

References: E. Forde, W. A. Steel, A. G. L. McNaughton.

LEWIS—JAMES WENTWORTH, of 1030 S. Oak Park Ave., Oak Park, Ill., Born at Saint John, N.B., July 5th, 1896; Educ., Completed 3rd year science, McGill Univ., 1920; 1914-17, student engr., Dept. Public Works, Canada, Saint John Harbour development, gen. survey, soundings, borings, instr'man., plotting and drafting. Charge of parties; 1922-25, transitman, C.P.R., mtce. and constrn., Saint John district; 1925-26, field engr., Riordon Pulp Corpn., layout of industrial bldgs., power line and pipe line surveys, Temiskaming, Que.; 1926-27, promotional engr., Portland Cement Assn., Chicago, concrete control, technical investigations and reports; 1927 to date, with American Concrete Products Co., now American Concrete Marbelite Co., supt. in full charge of production, development and purchasing for three plants, Chicago, Ill. (*Jr. 1920.*)

References: C. C. Kirby, G. H. Lowry, A. Gray, L. S. Dixon, A. G. Tapley, D. A. Abrams.

MURPHY—ALEXANDER GORDON SILCOX, of 1 Church Street, St. Catharines, Ont., Born at Montreal, Sept. 12th, 1899; Educ., B.Sc., McGill Univ., 1922; 1917 (8 mos.), inspr., Board of Engineers, Quebec Bridge; 1921 (5 mos.), inspr., Grand Trunk Arbitration Board; 1922-24, dftsman. and asst. designer, Canadian Bridge Company; 1924-25, asst. bridge engr., Welland Ship Canal, checking designs and estimates of movable bridges; 1925-26, checker, Canadian Bridge Company; 1926-28, asst. structural engr., and 1928 to date, structural engr., Welland Ship Canal, principal asst. in checking designs, estimates and shop drawings for various types of movable bridges. (*Jr. 1922.*)

References: A. J. Grant, M. B. Atkinson, E. Brown, J. Rankin, F. H. Kester, A. E. West.

FOR TRANSFER FROM THE CLASS OF STUDENT TO A HIGHER CLASS

CAMPBELL—WILFRED JOHN, of 4715 Maryland Ave., Detroit, Mich., Born at Ridgetown, Ont., Oct. 21st, 1900; Educ., B.A.Sc., Univ. of Toronto, 1925; Summers 1921-22-23-24, elect'n. with H.E.P.C. of Ontario, Ford Motor Co., and Dodge Bros.; 1925 (May-Oct.), dftsman. and engr. on elect'l. layout of a new plant, for Dodge Bros. Motor Co., Detroit; 1925 to date, with the Detroit Edison Co. as follows: 1925-27, dftsman. and engr. on elect'l. layout and design of substations; 1928 (Jan.-Sept.), elect'l. engr. on field tests of relays, control and indicating instruments and automatic protective equipment; 1928 to date, elect'l. engr., foreman over 16 graduate engrs. doing field testing of relays, control and indicating instruments, automatic protective equipment and automatic control equipment, also design of control and protective schemes. (*S. 1925.*)

References: R. J. Desmarais, F. Stevens, R. C. Leslie, C. G. R. Armstrong, O. Rolfson, L. M. Allan.

COPPING—BRUCE GRAY, of 146 Larch St., Sudbury, Ont., Born at Montreal, Que., Jan. 29th, 1905; Educ., B.Sc., McGill Univ., 1928; 1921-22, lab. asst., test. labs., Can. Gen. Elec. Co., Peterborough, Oht.; 1926 (summer), dftsman., Peterborough Public Utilities Commn.; 1927 (summer), millwright and dftsman., Laurentide Company, Grand Mere, Que.; 1928-29, i/c of mtce. in groundwood and sulphite mills, for above company; 1929-30, asst. and later supt. of sulphite mill, Canada Power & Paper Co., Grand Mere; At present, plant engr., Copper Cliff works, Canadian Industries, Ltd., Sudbury, Ont. (*S. 1926.*)

References: C. M. McKergow, H. O. Keay, R. L. Dobbin, A. B. Gates, A. N. Budden.

DONNELLY—JAMES HENRY L., of 6951 Terrebonne Ave., Montreal, Que., Born at Montreal, Apr. 24th, 1903; Educ., B.Sc., McGill Univ. 1928; 1923 (summer), Dome Mines; 1924 (summer), with Bertolf Bros., landscape contractors; 1926 (summer), with E. G. M. Cape & Co., 1928 to date, with Canada Cement Co., Plant No. 1, Montreal East, work included mech'l. and struct'l. dfting. and design of small steel and machy. repair jobs. Since 1929, asst. to C. W. Edmonds, A.M.E.I.C., chief constrn. engr. on surveying and layout work and erection of reinforced concrete bldgs. at Plant No. 1, also setting of foundation piers for four large rotary kilns. (*S. 1928.*)

References: C. W. Edmonds, H. B. Montizambert, K. L. MacMillan, S. Barr, W. G. H. Cam, J. Hvilivitsky.

SUTHERLAND—GEORGE MacKENZIE, of 43 Quebec St., Sherbrooke, Que., Born at Malagash, N.S., Oct. 4th, 1898; Educ., B.Sc., N.S. Tech. Coll., 1925; 1919-20, timekeeper and checker, D. G. Loomis & Son, contractors; 1925-26, student training course, Ingersoll-Rand Co. Ltd., Phillipsburg, N.J.; 1926-27, asst. supervisor student train'g. with above company; 1927 to date, with Canadian Ingersoll-Rand Co. Ltd., Sherbrooke, Que., as follows: 1927-28, dftsman; 1928-29, dftsman and design of drill steel sharpeners and small hoists; 1929 to date, dfting and design of above and steam condensers—surface type and barometric. (*S. 1924.*)

EMPLOYMENT SERVICE BUREAU

This Service is operated for the benefit of members of the Engineering Profession and Industrial and other organizations employing technically trained men—without charge to either party.

All correspondence should be addressed to

The Employment Service Bureau, The Engineering Institute of Canada

2050 Mansfield Street, Montreal

All notices intended for publication must be received not later than the Tuesday of the week preceding the date of the issue in which they are to be inserted.

Situations Vacant

TOWN ENGINEER—Experienced municipal engineer wanted for a town in Ontario, 5,000 population. Apply giving full particulars to Box No. 647-V.

ENGINEER, between 30 and 34 years of age' experienced and broadly educated. Willing to accept a partnership with investment in a new firm established in large eastern Canadian centre. State fully experience and give references. Apply to Box No. 648-V.

MECHANICAL ENGINEER, university graduate preferred, with at least four years experience in the running, organization and operation of a manufacturing plant, including electric power, high and low pressure steam equipment, heating plant, and motor truck maintenance. A permanent position and good connection with an international company. Apply to Box No. 649-V.

Situations Wanted

CIVIL ENGINEER, A.M.E.I.C., married, desires employment with manufacturer of industrial products, selling to industrial and other markets. His experience includes engineering and building construction, administration and operation of utilities, municipal works, etc. Record of integrity; moderate salary; location immaterial. Apply to Box No. 14-W.

ELECTRICAL ENGINEER seeks connection with Montreal engineer or architect for part time work involving the design and specification for industrial and public buildings. Experienced and capable of complete responsibility. Apply to Box No. 40-W.

CIVIL AND MECHANICAL ENGINEER; aggressive, practical engineer, with background of experience in design, construction, maintenance and operation of pulp and paper mills. Especially qualified to reduce mill costs. Apply to Box No. 53-W.

CIVIL ENGINEER, A.M.E.I.C., R.P.E. (Ont.), fifteen years experience, available on short notice. Experienced surveys, draughting, reinforced concrete design, municipal engineering, construction work, inspection, estimating. Apply to Box No. 107-W.

ELECTRICAL ENGINEER, B.Sc., age 30. Experienced in power distribution and electrical communication, including design of carrier current systems. Apply to Box No. 110-W.

ELECTRICAL ENGINEER, graduate '27, fifteen months students' test course; fifteen months switchboard layouts and substation design. Before graduation experience consisted of machine shop practice and electrical construction. Apply to Box No. 132-W.

COLLEGE GRADUATE, age 34, with over ten years experience in power developments and pulp and paper mill construction and maintenance, largely in direct charge of design or construction; desires new connection as chief or assistant engineer or construction superintendent. Apply to Box No. 167-W.

CIVIL ENGINEER, B.Sc. (McGill), M.E.I.C., P.E.Q. and B.C., with broad experience in hydro-electric power investigations, studies and exploration of forest lands, including design and construction driving and storage dams, wharves, flumes, piers and booms and loading plants, as well as general engineering and contracting, is open for engagement. Location immaterial. Now engaged but available on short notice as projects are nearing completion. Speak French fluently, physically fit, active and energetic, and can get results. References can be furnished if required. Apply to Box No. 177-W.

CIVIL ENGINEER, A.M.E.I.C., B.A.Sc. and C.E. University of Toronto, with twenty years experience, is open for engagement. Three years railroad construction, one year lake drainage and dam construction, nine years municipal engineering, including pavement and bridges, two years town management, one year paving contracting, and one year resident engineer of highway pavement construction. At present in Maritime Provinces. Apply to Box No. 216-W.

CIVIL ENGINEER, B.Sc., A.M.E.I.C., R.P.E. Ont., with twenty-four years experience embracing dams, wharves, grain elevators, foundations, pile driving, highways, municipal

Situations Wanted

engineering, water power surveys, road locations, inspections and estimating is open for engagement as engineer or superintendent in construction, operation or maintenance. Location immaterial. Apply to Box No. 358-W.

CIVIL ENGINEER, A.M.E.I.C., university graduate, O.L.S., married, twenty years experience city surveys, calculations for curved surveys, design, layout and supervision, sidewalks, pavements, sewers and water systems. Acted in capacity of chief engineer for large engineering and surveying firm for five years. Best of references. Available on short notice. Apply to Box No. 413-W.

ELECTRICAL AND MECHANICAL ENGINEER, S.E.I.C., educated Oundle and Manchester, age 24. Student course, Brit.-Westinghouse. Three years design, production, advertising, sales and control of sales force on mechanical and electrical goods. One year outside plant engineering leading public utility company. Desires work in sales, production or engineering capacity. Available immediately. Location immaterial. Apply to Box No. 415-W.

CIVIL ENGINEER, A.M.E.I.C., R.P.E. (Ont.), graduate. Eighteen years experience in survey and construction, railway, hydro-electric and buildings. Experience comprises both office and outside work. Desires responsible position. Would consider position with commercial or manufacturing firm. Available immediately. Apply to Box No. 425-W.

CIVIL ENGINEER, S.E.I.C., 1930 graduate of Nova Scotia Tech. with experience as plane table topographer, instrumentman and draughtsman and particularly interested in hydro-electric power development and reinforced concrete design, desires position. Willing to go to foreign fields. Available at a few weeks notice. Apply to Box No. 431-W.

SALES ENGINEER, B.Sc. (McGill, 1914), A.M.E.I.C., 37, married, presently employed in position of responsibility, desires to communicate with a prominent railway equipment supply house, with a view to becoming its Pacific coast representative. Has a complete knowledge of railway locomotive equipment particularly. Excellent references can be furnished. Apply to Box No. 444-W.

CONSULTING ENGINEER. A member of The Institute with many years experience in general engineering is open for an engagement in consulting, advisory or inspecting capacity. Would like to meet corporation or large contracting firm to whom such qualifications may be useful. Apply to Box No. 445-W.

ELECTRICAL ENGINEER, S.E.I.C., B.Sc., (McGill Univ. '27), age 26. Fifteen months outside plant engineering with large public utility. Twenty months sales engineering experience with electrical manufacturing company. Available on reasonable notice. Apply to Box No. 463-W.

ELECTRICAL ENGINEER, B.Sc. (McGill), Jr.E.I.C., age 28, graduate Canadian General Electric Company test course, with two years experience in the design of induction motors and direct current machines. Previous experience includes electrical installation in large paper mill, and assistant to engineer in charge of small utilities company. Married. Location immaterial. Apply to Box No. 466-W.

CIVIL ENGINEER, experienced in road construction, mine surveying, transmission line survey and construction; paper mill construction; age 27. Available on short notice. Apply to Box No. 468-W.

CIVIL ENGINEER, A.M.E.I.C., age 39, with wide experience on design and construction of reinforced concrete structures, desires position. Apply to Box No. 475-W.

DESIGNING ENGINEER, A.M.E.I.C., P.E.Q., with extensive experience in design and construction of power plants, industrial buildings and hydraulic structures, desires position as designing engineer or resident engineer on construction. Apply to Box No. 492-W.

ELECTRICAL ENGINEER, B.A.Sc. (Univ. Toronto, '29), S.E.I.C., Can. Gen. Elec. Co. test course. Six months experience in the design of induction motors. Experience in electrical maintenance. Apply to Box No. 494-W.

MANAGING CIVIL ENGINEER, college graduate, A.M.E.I.C., C.P.E.Q., 18 years comprehensive experience in all lines of architectural engineering and contracting as designing, detailing, quantity surveying, cost estimating, superintending and general business management, desires to change and wants connection with Montreal firm, preferably with chance to share in business. At present in responsible position as engineer in charge and chief estimator, but available on few weeks notice. Apply to Box No. 495-W.

STRUCTURAL ENGINEER, 20 years experience in the design and construction of all types of steel and reinforced concrete buildings. Available shortly. Location Toronto. Apply to Box No. 501-W.

Electricity Supply and Fuel Consumption

At the beginning of 1922 the Electricity Commissioners for the first time issued a return, showing that during the year ended March 31, 1921, the average fuel consumption in 463 power stations in Great Britain was 3.32 pounds per kilowatt-hour generated, the best showing being made by a station, unnamed, which had generated less than 3,000,000 kilowatt-hours in the year for an average consumption of 1.7 pounds per kilowatt-hour, while the highest thermal efficiency, 17.75 per cent., was attained by a station generating more than 50,000,000 kilowatt-hours. The total coal and coke consumed was 7,356,757 tons. The "Return of Fuel Consumption and Units Generated" for the year ended March 31, 1930, which has now been published by H. M. Stationery Office at a price of 1s. 6d. net, shows the advance towards economy, which has taken place during the intervening period. The return covers 568 stations, in 318 of which coal, coke or oil-fired boilers were installed. These stations generated an aggregate of 11,436,600,400 kilowatt-hours and consumed 10,096,210 tons of fuel, the average consumption, therefore, being 1.97 pounds per kilowatt-hour generated. The most economical station was that at North Tees, which had a fuel consumption of 1.28 pounds per kilowatt-hour generated. Kearsley had a figure of 1.18 pounds, but this covered only six months operation. At the following stations the consumption was approximately equal to, or less than, 1.5 pounds per kilowatt-hour: Portishead (Bristol Corporation), Hayle (Cornwall Electric Power Company), Barking (County of London Electric Supply Company), Padiham (Lancashire Electric Power Company), Lister Drive, No. 3 (Liverpool Corporation), Deptford West (London Power Company), Maidstone, Barton (Manchester Corporation), Percival Lane (Mersey Power Company), Upper Boat (South Wales Electrical Power Distribution Company), and Ferrybridge (Yorkshire Electric Power Company). At 83 other stations the consumption was less or only slightly in excess of 2 pounds per kilowatt-hour, including all five stations of the London Power Company. There were, therefore, 96 stations consuming less than the latter figure, compared with 59 in 1928-29, 32 in 1927-28 and 16 in 1926-27, while at many others the consumption was only a little higher. This is a result on which all concerned are to be congratulated and the prospects of still further improvement are good. On the other hand, 29 steam stations consumed more than 5 pounds per kilowatt-hour, the highest figure being 10.68 pounds. It may be added that 77 oil-engine stations are recorded as consuming 1 pound or less of fuel per kilowatt-hour generated, compared with 70 in 1928-29 and 39 in 1927-28, the most economical being that at St. Martins Lane (Charing Cross Electricity Supply Company) where the consumption was 0.59 pound per kilowatt-hour. The most efficient gas producer station was that at Bude, where the consumption was of 1.5 pounds per kilowatt-hour generated.

The total electricity generated during 1929-30 was 11,961,621,965 kilowatt-hours, an increase of 9.95 per cent over the previous year, while the total fuel consumed was 10,141,291 tons, or an increase of 6.06 per cent.—*Engineering.*

New Type of Floor Construction

The first practical application of the new "battledeck" type of floor construction is soon to be made in Pittsfield, Mass., in a garage. The new type flooring consists of steel plates welded together by a self-propelled automatic welding machine designed by the General Electric Company.

The Pittsfield garage addition will house 300 cars. It will be two storeys high, and the plan dimensions will be 60 feet wide, by 140 feet long.

Announcement of the possibilities of the "battledeck" type of flooring was made at the recent annual convention of the American Institute of Steel Construction, Inc.

The only reason for erecting a building is to provide floors protected from the weather, and the use of material in a floor which weighs more than the expected load on the floor, is a decided disadvantage. The new type of flooring utilizing steel plates and structural steel beams involves much less weight and carries its savings into the vertical framework of the building.

The special automatic welding machine consists of a three-wheeled, self-propelled vehicle driven by an adjustable-speed motor. On the framework are mounted a welding wire feeding device, a reel of welding wire, the travel motor and the control devices. A motor-generator set at a remote point supplies, through a trailing cable, the current for welding and for operating the travel motor.

In operation the machine is placed on the beginning of the seam where it is lined up and started running. It can be easily steered if necessary, but it can usually run without assistance. At the end of the seam it is turned around and started in the opposite direction on the next seam.

The Testing of Watthour Meters

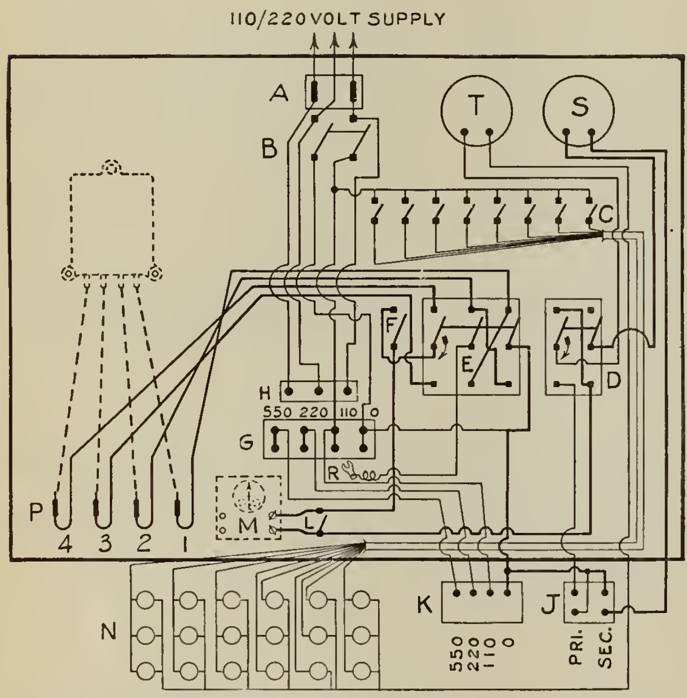
A convenient test panel for the accurate and complete testing of watthour meters has been developed by the meter department of the North York Hydro-Electric Commission. Variation of current on one-quarter ampere steps to 10 amperes may be obtained either direct through the meter under test or through the primary of the step-up loading transformer.

For testing 3-wire meters, a 3-pole double-throw switch transfers the load from one series coil to the other and at the same time retains line-side connection for the potential coil.

A 0-110/220/550 volt auto-transformer furnishes voltage for meters of various ratings. Convenient terminals for connecting a rotating standard are provided. Two hanger straps support a small front panel upon which the meter under test is placed. These can be seen in the photograph and serve to keep the meter away from stray fields and within convenient distance of the operator. Leads to the meter are flexible and weighted below like those on a telephone switchboard, keeping them out of the way when not in use.

A separate test rack provides for 10 meters under dial test.

An adjunct to the panel is a small air compressor and trigger nozzle which facilitates removal of dust from working parts of the meter.



Actual Wiring Diagram of Back of Watthour Meter Test Panel.

Surface mounting switches are shown with terminals projecting through to back of panel. All conductors carrying secondary load to or from current transformer are No. 6 B. and S.; all others are No. 12.

Key

A —30 a., 250 v. fuse block, 15 a., fuses.
B —30 a., 250 v., D.P.S.T. switch.
C —Eight 30 a., 250 v., S.P.S.T. switches.
D —60 a., 250 v., D.P.D.T. switch.
E —60 a., 250 v., 3 P.D.T. switch.
F —60 a., 250 v., S.P.S.T. switch.
G —Eight composition top binding posts.
H —Three plug jacks for potential supply to thermal demand meters when they must be left on line unattended.
J —5-100 a., Ferranti current transformer.
K—0-110/220/550 v., Ferranti auto transformer.
L —60 a., 250 v., S.P.S.T. switch located on outside of meter well.
M—Standard rotating watthour meter located in well in bench top.
N —Lamp bank.
P —Flexible leads to meter under test.
R —Flexible lead with spade terminal for connection to desired potential at terminals G. Potential leads and click switch of rotating standard are connected to corresponding terminals and voltage.
S —0-100 a., Ammeter, Ferranti flush type.
T —0-10 a., Ammeter, Ferranti flush type.

Fine Equipment for New Power Station at Newcastle

The Newcastle-on-Tyne Electric Supply Company, Ltd., are at present constructing a new power station to the west of their existing plant at Dunston. This will be known as Dunston B, and will have an ultimate capacity of six 50,000-kw. sets. To begin with, however, only three sets will be installed, orders for which have already been placed with C. A. Parsons and Company, Ltd. These will be of the tandem type, with one high-pressure and one low-pressure cylinder, the latter having a single exhaust. The initial pressure and temperature will be 600 pounds per square steam inch, and 800 degrees F. respectively, but after leaving the high-pressure turbine at a pressure and temperature of approximately 150 pounds per square inch, and 525 degrees F., the steam will be re-heated to 825 degrees F. before it enters the low-pressure cylinder. The condensers, which will be manufactured by Richardsons, Westgarth and Company, Ltd., of Hartlepool, will have a cooling surface of 40,000 square feet and will be capable of maintaining a vacuum of 29 inches. It will be possible to isolate one-half of the unit for cleaning without completely shutting down the plant. The turbo-alternators will generate three-phase current at a pressure of 13,500 volts and a frequency of 50, the output being stepped up to 66,000 volts for transmission to the company's system, and to the Central Electricity Board. The main switchgear will be on the 66,000 volt circuits and will be manufactured by A. Reyrolle and Company, Ltd., of Hebburn-on-Tyne. The rupturing capacity of the units will be 1,500,000 kv.a. and they will be remotely controlled from a central operating room.

As regards steam raising there will eventually be three boiler houses, arranged at right angles to the engine-room. To begin with, however, one complete stoker-fired boiler-house and one-half of a pulverized fuel fired boiler-house only will be built. Four units will be arranged on each side of each boiler-house with a central firing aisle, half being supplied by Clarke, Chapman and Company, Ltd., of Gateshead-on-Tyne, and half by Babcock and Wilcox, Ltd., of London. Two units in each row will be designed for both steam raising and reheating, and the remainder for steam raising alone. The latter will have an output of 156,000 pounds per hour from water at a temperature of 340 degrees F., while the former will supply 125,000 pounds of steam and be also capable of reheating 180,000 pounds of steam at 150 pounds per square inch from 525 degrees F. to 825 degrees F. The stoker-fired units will be equipped with tubular air heaters and Foster economizers, and the pulverized fuel units with plate air-heaters and return tube economizers of the Babcock type. The stokers will also be of the latest Babcock chain gate type, while eight 5-ton Resolutor mills, manufactured by Clarke, Chapman and Company will supply the pulverized fuel. Cyclone dust extraction plant will be installed between the boilers and chimneys.

The incoming coal will be handled by a duplicate system of elevators for each boiler house with a capacity of 75 tons per hour, while the water for condensing and other purposes will be drawn from the Tyne by six electrically driven vertical centrifugal pumps. These will be installed in a separate pump house.—*Engineering.*

Road Map of Canada

Imperial Oil Limited have issued a four-sheet road map of Canada and northern United States, prepared by Rolph-Clark-Stone, Limited. Toronto, Ont.

These four maps are on a scale of 30 miles to 1 inch and embrace Canada from coast to coast. They also show United States territory as far south as Washington, D.C., in the east and Salem, Ore., in the west. The territory covered is in excess of two million square miles.

Two classes of roads are shown and the main highways are featured by a bold red line. Mileage and highway numbers are conspicuously indicated, also in red. The size of type of place names is governed by the populations of the cities, towns and villages.

On the backs of the maps are to be found plans of the principal cities and elaborate district maps of the principal summer playgrounds in Canada.

Copies may be procured on application to Imperial Oil Limited at any point in Canada.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

A

AERIAL PHOTOGRAPHY

In Industry. Aerial Photography Aids Industry, H. N. Brown. Mfrs. Rec., vol. 94, no. 18, Oct. 31, 1929, pp. 44-45, 3 figs. Examples of value in showing development of new building enterprises, in taking place of progress reports on building construction, and in showing volume of water available for new industries.

AERIAL SURVEYING

Canada. Aerial Surveying in Canada. Engineer (Lond.), vol. 148, no. 3849, Oct. 18, 1929, pp. 404-405, 1 fig. Field, probably unequalled in any country, exists in Canada for useful and economical application of aircraft to investigation of natural resources; upwards of 200,000 sq. mi. have been covered; early experiments; forestry surveying; water powers; mapping of mineral areas; index and filing system.

AERODYNAMICS

Theory. The Theory of Aerodynamics, H. Leavy. Aircraft Eng. (Lond.), vol. 1, no. 4, June, 1929, pp. 121-124. Survey of problems in aerodynamics still awaiting solution on mathematical lines; fundamental equations governing motion of viscous fluid; analogy with elastic structures; importance of Reynolds' number; dimensional theory; Stanton's classic experiments; direct attacks on equations of motion slightly disturbed from steady state has yielded nothing but disappointment; no relative motion; boundary conditions; Von Karman's method. Summary of paper presented before Math. Assn.

AIR COMPRESSORS

Design. Design for Volume Change Differentiates Compressors from Blowers, S. A. Moss. Power, vol. 70, no. 15, Oct. 8, 1929, pp. 564-565, 2 figs. Scientific distinction between blower and compressor is that compressor is definitely designed to take account of appreciable change of volume when air is passing through machine whereas blower takes care of constant volume; theoretical work performed by blower and compressor.

AIRPLANE DESIGN

Factors in. Factors in the Design of Commercial Airplanes, C. T. Porter. Am. Soc. Mech. Engrs.—Advance Paper, no. 36, for mtg. Dec. 2 to 6, 1929, 3 pp. Designing passenger transport planes with right combination of speed and comfort to compete with extra-fare trains is discussed; development of 30- to 40-passenger airplane to equal present speed requirements with reduction of power to 50 to 60 hp. per passenger advocated; direct-drive air-cooled radial engines replaced by geared engines placed inside wing with remote drive to propellers; airplane should approach flying wing with high wing loading and retractable landing gear.

AIRPLANE ENGINES

Cooling for. High-Temperature Liquid-Cooling, G. W. Frank. Soc. Automotive Engrs. Jl., vol. 25, no. 4, Oct. 1929, pp. 329-340 and (discussion) 340-343, 25 figs.; see also West. Flying, vol. 6, no. 4, Oct. 1929, p. 56, 1 fig.

Design. Effect of Surrounding Temperature on Air-Cooled Engines (Effet de la Température Ambiante sur le Fonctionnement des Moteurs). Bulletin Technique du Bureau Veritas (Paris), vol. 11, no. 9, Sept. 1929, pp. 197-201, 3 figs. Notes on self-ignition and detonation; influence of temperature on performance of engine; experimental results.

AIRPLANES

Airfoils. Aerodynamic Characteristics of Twenty-Four Airfoils at High Speeds, L. J. Briggs and H. L. Dryden. Nat. Advisory Committee for Aeronautics—Report No. 319, 1929, 32 pp., 45 figs.

Catapults. Accelerations of Transatlantic Mail by Means of Catapult (L'accélération des courriers transatlantiques par la catapulte). Aéronautique (Paris), no. 124, Sept. 1929, pp. 313-314, 4 figs.

Sheet-Metal Stamping. Sheet Metal Pressing for Airplanes, R. Hudson. Sheet Metal Worker, vol. 20, no. 16, Aug. 9, 1929, pp. 503-504 and 510, 4 figs. Methods employed in sheet-metal department of Boeing Airplane Co., Seattle, for manufacture of airplanes; in manufacture of ailerons and empennages for airplanes, 700-ton press is used to produce corrugated and stream-lined surfaces.

AIRPORTS

Rating. The Selection of Airports and Their Rating, E. Jones. Airports, vol. 3, no. 4, Oct. 1929, pp. 19-20. Unavailability of airport sites meeting present ideal as to area should not be necessarily permitted to discourage acquirement and improvement of airports of lesser size; improvements must tend toward approval of areas now failing to meet present high ratings; advantages of airport located will not depend entirely upon long-distance passenger-mail-goods conveyance; private owners are greatest purchasers of aircrafts.

AIRSHIPS

Design. The External Forces on an Airship Structure with Special Reference to the Requirements of Rigid Airship Design, H. R. Cox. Roy. Aeronautical Soc.—Jl. (Lond.), vol. 33, no. 225, Sept. 1929, pp. 725-811, 41 figs.

Metal Construction. Building the Structure of British Rigid Airship R-101, P. W. Peel. Can. Machy. (Toronto), vol. 40, no. 20, Oct. 3, 1929, pp. 42-47, 5 figs.

R-101. The Large Airships of Great Britain (Les grands dirigeables britanniques), L. Mercier. Aérophile (Paris), vol. 37, no. 11/12, June 1/15, 1929, pp. 163-166, 5 figs. Brief description of British airship R-100 precedes discussion of design of R-101; form of hull and construction of frame; nature of metals employed; ballonets for gas, netting and valves used; Beardmore Tornado engines; arrangement of engine nacelles; distribution of pressure on envelop of R-101.

ALLOYS

Age Hardening. Age-Hardening. Metallurgist (Supp. to Engineer, Lond.), Sept. 27, 1929, p. 130. Remarks based on lengthy discussion of age hardening at meeting of Gesellschaft fuer Metallkinde at Duesseldorf; question upon which discussion centered was whether phenomena of age hardening could be accounted for by dispersion theory; certain number of German metallurgists held view that phenomena are too complex to be accounted for by so simple an explanation; what may prove important step towards general acceptance of dispersion theory was explanation of way in which so-called anomalides in hardening phenomena could be readily fitted into dispersion theory.

ALUMINUM

Sheet. Some Aspects of the Commercial Manipulation of Aluminum, C. F. Nagel, Jr. Sheet Metal Worker, vol. 20, nos. 19 and 20, Sept. 20, and Oct. 4, 1929, pp. 611-612, 615, and 642-643. Sept. 20: Essentials in which aluminum differs from other metals; controlling factors of processes; heat treating aluminum alloys; properties of duralumin; changes during aging; mechanical properties of certain alloys in various tempers. Oct. 4: Aging methods and mediums; annealing aluminum; differences of crystallization; growth of crystals; time and temperature important; annealing heat-treatable alloys. Paper presented before Am. Inst. Min. and Met. Engrs.

ALUMINUM ALLOYS

Cold Working. Effect of Cold Rolling on Physical Properties of Metals, R. L. Templin. Rolling Mill Jl., vol. 3, no. 9, Sept. 1929, pp. 393-394, 1 fig. Abstract of paper presented before Am. Inst. Min. and Met. Engrs.

Welding. Gas Welding Aluminum, W. A. Dunlap. Welding Engr., vol. 14, no. 10, Oct. 1929, pp. 38 43, 7 figs.

ARCHES, CONCRETE

Construction Stresses. The Behaviour of a Reinforced Concrete Arch During Construction, S. B. Slack. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 9, Nov. 1929, pp. 2279-2299, 14 figs. Results of measurements to determine initial behaviour of 160-ft. span, open-spandrel, reinforced-concrete arch rib of bridge at Eatonton, Ga., measurements of which began while concrete was being placed and continued until about one month after bridge was completed.

ARCHES, CONTINUOUS

Theory of. Theory of the Continuous Elastic Arch Resting on Elastic Support (Sulla teoria dell'arco elastico continuo su appoggi elastici), E. Garnier. Politecnico (Milan), vol. 77, no. 6, June 1929, pp. 344-350, 4 figs.

ASBESTOS INDUSTRY

Quebec. Development of the Asbestos Industry in Quebec, J. G. Ross. Can. Min. Jl. (Gardenvale, Que.), 50th anniversary no., Aug. 1929, pp. 91-94, 3 figs. Historical note of discovery; mining began in 1878 and production was 50 tons; rapid development during 12 years; mechanical treatment of mine product; data concerning large producers and men prominent in asbestos industry; 1928 production was 295,821 tons, valued at $11,251,830; 5,159,247 tons rock mined, of which 4,109,823 tons were milled; average value of rock mined was $2.17 per ton.

AUTOMOBILE PLANTS

X-Ray Laboratories. Radiographic Analysis of Metals Suitable for Stressed Parts, W. L. Fink and R. S. Archer. Automotive Industries, vol. 61, no. 16, Oct. 19, 1929, pp. 571-574, 9 figs. Description of X-ray laboratory installed at new foundry of U. S. Aluminum Co. at Fairfield, Conn., field of advantageous use of radiography in metal industry is determined by balancing cost, which is comparatively high, against benefits obtainable through accurate inspection; X-ray apparatus employed was well developed for both diagnostic and deep-therapy medical work; general principles underlying radiography; most of radiographic work has been done on highly stressed parts.

AUTOMOTIVE FUELS

Standardization. Standardization of Automotive Fuels (Erwaegungen zu einer Normung von fluessigen Kraftstoffen), W. Schmidt. Automobiltechnische Zeit. (Berlin), vol. 32, no. 26, Sept. 20, 1929, pp. 569-570. Author suggests test method for standardization of oil fuel, according to which fuel would be tested only in engine, using standard experimental engine for this purpose.

B

BEAMS

Design. Chart for Beam Design Gives Equivalent Distributed Loads, E. McCullough. Eng. News-Rec., vol. 103, no. 15, Oct. 10, 1929, p. 585, 1 fig. Diagram giving factors for converting uniform to equivalent distributed loads.

Curved. The Plaster-Model Method of Determining Stresses Applied to Curved Beams, F. B. Seeley and R. V. James. University of Ill.—Bul., vol. 194, no. 49, Aug. 6, 1929, 36 pp., 15 figs. Explanation of investigation, purpose of which was to determine whether or not brittle-material method using pottery plaster as material, could be made to yield consistent and reliable results, particularly with members of rather irregular shapes requiring complicated moulds for casting members; it also investigated radial tensile stress in curved beam.

BEARING METALS

PROPERTIES. Bearing Metals with Lead, Antimony and Tin Basis (Ueber Lagermetalle aug Blei-, Antimon- und Zinn-Basis), H. Mueller. Zeit. fuer Metallkunde (Berlin), vol. 21, no. 9, Sept. 1929, pp. 305-309 and (discussion), 309-310, 15 figs. Physical requirements of modern highly stressed bearing metals are discussed, i.e., Brinell hardness tensile strength, dilation, and wear; texture and its interrelation with requirements mentioned; suggestions for further development.

BELTS AND BELTING

TESTING. Modern Belt Testing (Neuzeitliche Riemenpruefung), F. Pelckmann. V.D.I. Zeit. (Berlin), vol. 73, no. 40, Oct. 5, 1929, pp. 1425-1427, 6 figs. Modern testing equipment; explanation of engineering terminology; friction coefficient independent of load; test results and their utilization; testing standards.

BOILER CORROSION

RECENT INSTANCES. Recent Instances of Embrittlement in Steam Boilers, F. G. Straub. Am. Soc. Mech. Engrs.—Advance Paper for mtg., Dec. 2 to 6, 1929, no. 43, 2 pp., 2 figs. Cause of recent boiler explosion at Crossett, Ark. is described, failure being attributed to embrittlement produced as result of using soda-ash treatment on water too low in sulphate content; other instances of cracking of seams in steam boilers are also described; emphasis is placed upon regular inspection of leaky seams in steam boilers, particularly when boiler water does not meet A.S.M.E. recommendation.

BOILERS

CORROSION. Heat Conductivity of Boiler Scale (Die Waermeleitfaehigkeit von Kesselstein), A. C. Eberle. Archiv fuer Waermewirtschaft (Berlin), vol. 10, no. 10, Oct. 1929, pp. 334-336, 7 figs.

FAILURES. Cracking of Boiler Plates, A. Pomp and P. Bardenheuer. Metallurgist (Supp. to Engineer, Lond.), Sept. 27, 1929, pp. 131-132, 1 fig. Extensive application is made of Fry's reagent to reveal areas in which local plastic straining of steel has occurred, and which therefore has reduced ductility and increased solubility in corrosive media; three cases of cracking of boiler plates in service are discussed. Review of paper, previously indexed from Mitteilungen aus dem Kaiser-Wilhelm Institut fuer Einsenforschung zu Duesseldorf, No. 128, 1929.

MARINE, DESIGN OF. Type of Marine Boiler with High Steaming Capacity (Note sur un type de chaudière marine à haute vaporisation), E. Rauber. Bul. Technique du Bureau Veritas (Paris), vol. 11, no. 8, Aug. 1929, pp. 170-172, 2 figs. Details of design which was developed with purpose of increasing steaming capacity of tubes with too low output; results of tests on industrial and marine boilers.

OPERATION—LOAD CURVES. How to Prepare a Schedule for Economic Boiler Loadings, H. B. Reynolds. Power, vol. 70, nos. 15 and 16, Oct. 8 and 15, 1929, pp. 553-557 and 593-594, 14 figs.

BRICK

GLASS. Seven Floors of New Skyscraper to be Built of Glass Bricks, Am. Glass Rev., vol. 49, no. 2, Oct. 12, 1929, pp.27-28. 65 storey Palais de France to be erected in New York will be example of use of glass as major building material; upper seven floors will be constructed of glass brick and new type of plate glass, almost exclusively.

BRIDGE DESIGN

STRESSES. Variations in Stresses and Design of Bridges (Om spannings- och formforandringsmatningar a broar), C. R. Kolm. Teknisk Tidskrift (Stockholm), vol. 59, no. 30, July 27, 1929 (Vag och Vattenbyggnadskonst), pp. 81-87, 10 figs. Importance of measuring changes in stresses and design of bridges; progress in technique of measuring and description of present measuring and testing instruments.

BRIDGE PIERS

CONSTRUCTION. Rebuilding Colorado River Bridge after Collapse. Eng. News-Rec., vol. 103, no. 18, Oct. 31, 1929, pp. 683-684, 4 figs. Reconstruction of concrete piers consisting of two concrete-filled cylinders 11.5 ft. in diam., to support two 190-ft. steel spans of highway bridge, at Blythe, Calif.; overturned pier and debris in two submerged spans hinder work; deep sheet piling and tremie concrete used.

Pier Construction for the Mid-Hudson Bridge at Poughkeepsie, New York, J. W. Rollings. Boston Soc. Civ. Engrs.—Jl., vol. 16, no. 8, Oct. 1929, pp. 423-428 and (discussion) 448-449, 15 figs. Construction of two piers, each 60 ft. in width by 130 ft. in length, with semi-circular ends having radii of 30 ft., by open-caisson method; outside walls of caissons were 3 to 3½ ft. thick; details of mixing plant and anchorage of caissons; sudden sinking and tilting of one of caissons and method of righting it; author disapproves of type of caisson used at Poughkeepsie.

BRIDGE SPECIFICATIONS

FRANCE. New French Rules for the Design of Reinforced-Concrete and Metallic Bridges (Nouvelles instructions françaises pour le calcul des ponts en béton armé et métalliques). Annales de l'Association des Ingénieurs Sortis des Ecoles Spéciales de Gand (Ghent), vol. 19, no. 1, 1929, pp. 93-100. Discussion and abridged text of specifications approved by Ministry of Public Works and dated May 10, 1927; load diagrams and general directions for design of highways bridges and bridges for standard-gauge and narrow-gauge railroads.

BRIDGES, CONCRETE ARCH

CONSTRUCTION. Bridge Contractor Uses Floating Machine to Cut Underwater Piles. Construction Methods, vol. 11, no. 10, Oct. 1929, pp. 50-53, 10 figs. Methods of constructing Washington Bridge, Providence, R.I.; bridge consists of double-leaf bascule span 150 ft. long and 12 concrete-arch spans, 89 to 105 ft. long; bridge piers are founded on timber piles; details of mechanical underwater pile cutter; steel truss centering used in construction of river arches are supported on false sand jacks.

The Freyssinet Method of Concrete Arch Construction, A. L. Gemeny. Pub. Roads, vol. 10, no. 8, Oct. 1929, pp. 148-150, 2 figs. Freyssinet method which is applicable to any type of concrete arch eliminates parasitical stresses, which limit concrete arch to comparatively short spans of high rise; temperature as well as combined dead and live-load stresses may be adjusted so as to reduce bending moments to minimum; correction may be made for small foundation movements.

PLOUGASTEL. Unique Construction Procedure on Long-Span Concrete Bridge Arches at Brest, France. Eng. News-Rec., vol. 103, no. 18, Oct. 31, 1929, pp. 691-695, 13 figs. See editorial comment p. 677. Three 612-ft. arches of Plougastel bridge, designed and constructed by E. Freyssinet, were concreted in succession on single centre shifted by barges; box arch design edfor 1,000-lb. load per sq. in. of concrete section; cofferdams constructed of concrete, and concrete caisson used as diving bell; double cableway with travelling electric hoists serves operation.

FRANCE. Reinforced Concrete Bridge Over the Elorn River, Finisterre, H. E. Steinberg. Engineering (Lond.), vol. 128, no. 3327, Oct. 18, 1929, pp. 485-487, 20 figs. partly on supp. plate. Bridge was subject of competition in design, and conditions indicated that it had to be capable of carrying single line of standard railway, as well as roadway 30 ft. wide, for vehicular traffic; it consists of relatively short-approach viaducts and three arched spans over water, each bring 590 ft. in clear; arches consist of hollow reinforced-concrete vaults having four longitudinal walls and top and bottom slabs.

The Plougastel Bridge (Die Bruecke von Plougastel), Beton u. Eisen (Berlin), vol. 28, no. 16, Aug. 20, 1929, pp. 293-297, 17 figs. Design and construction of combined reinforced-concrete bridge consisting of three hollow arches of 186.4 m. span; details of foundation work, timber arch centering, etc.

BRIDGES, HIGHWAY

JAMES RIVER. Construction of the James River Bridge Project, R. C. Wilson and H. B. Pope. Am. Soc. of Civil Engrs.—Proc., vol. 55, no. 9, Nov. 1929, pp. 2357-2374, 10 figs. Design and construction of project consisting of three bridges, totaling 5⅗ mi. in length, and about 11 mi. of concrete roads; largest of these bridges, near Newport News, Va., is about 4½ mi. long; project includes four 210-ft. through trusses, direct-drive lift bridge, 300 ft. long with clearance of 145 ft. when fully opened, double-leaf bascules of rolling type, 110 ft. in length, etc.; materials testing; pile-casting and handling.

BRIDGES, MASONRY ARCH

DESIGN. Design of Continuous Arches Resting on Elastic Supports (Calcolo degli archi continui su appoggi elastici), E. LoCigno. Ingegnere (Rome), vol. 3, no. 8, Aug. 1929, pp. 486-494, 6 figs. Discussion of exact and approximate theoretical formulae by Ritter, Guidi, and Lossier; application of theory to checking of stability of masonry-arch railroad bridge consisting of 13 arches 16.5 m. in span, located at Casale on River Po.

BRIDGES, RAILROAD

STRESSES. The Report of the Bridge Stress Committee, L. H. Swain. Engineering (Lond.), vol. 128, no. 3327, Oct. 18, 1929, pp. 506-507, 3 figs. A propos of publication of British Stress Committee's report and recent discussion as to work done in India on this subject, comparative results are given of actual test values of impact on an Indian railway bridge and corresponding calculated values of impact by Indian basic formula and by Indian covering formula.

BRIDGES, STEEL

PAINTING. Spray-Painting of the Quebec Bridge. Can. Engr. (Toronto), vol. 57, no. 18, Oct. 29, 1929, pp. 665-667, 7 figs. Marked economies effected by spray-painting method; equipment consists of spray guns, air compressor, air-operated winch and pressure-type paint containers; men work for three months each year; single coating requires 7,500 gals. of paint.

BRIDGES, STEEL TRUSS

ARGENTINA. Combined Railroad and Highway Bridge over Rio Dulce in Argentina (Die Eisenbahn und Strassenbruecke ueber den Rio Dulce in Argentinien), F. Bohny. Bautechnik (Berlin), vol. 7, no. 33, Aug. 2, 1929, pp. 501-504, 10 figs. Design and construction of steel-truss bridge consisting of twelve 71-m. spans, having total length of 856 m., located at Santiago del Estero.

CINCINNATI. Continuous Truss Bridge 1,575 Ft. Long at Cincinnati. Eng. News-Rec., vol. 103, no. 19, Nov. 7, 1929, pp. 734-737, 5 figs. Design and construction of river structure forming part of $12,000,000 improvement program of C. and O. Railway; erection of double-tract E-70 silicon steel continuous truss bridge having centre span of 675 ft. and two side spans of 450 ft. each; caisson and foundation details; shoes and expansion details; locomotive crane used in setting heavy steel.

MAINTENANCE AND REPAIR. Turnbuckles Welded into Bridge Eyebar Diagonals, H. F. Cole. Eng. News-Rec., vol. 103, no. 15, Oct. 10, 1929, pp. 585-586, 1 fig. Methods of restressing diagonal of railroad bridge over Kiskiminetas River near Pittsburgh, Pa., with special device consisting of two turnbuckles welded between pair of wing plates at either end.

BRIDGES, SUSPENSION

DISMANTLING. Dismantling Two Long Suspension Bridges. Eng. News-Rec., vol. 103, no. 15, Oct. 10, 1929, pp. 562-569, 16 figs. Removal of condemned structural members and wire cables of Mount Hope and Detroit bridges in record time; cable was separated into strands and flame-cut into sections 15 to 30 ft. long; cuts made between seizings about 6 in. apart.

HUDSON RIVER. Column Test Completed for the Port of New York Authority. Eng. News-Rec., vol. 103, no. 18, Oct. 31, 1929, p. 690. Notes on results of tests by Bureau of Standards on 24-ft. long half-scale models of columns which form portions of towers of new suspension bridge to cross Hudson River; concrete encasement increases strength of steel columns by 40 per cent.

C

CABLEWAYS

AERIAL. The Application of Aerial Tramways to Long and Short Hills, M. P. Morrison. Am. Soc. Mech. Engrs.—Advance Paper, no. 29, for mtg. Dec. 2-6, 1929, 6 pp., 6 figs. Aerial tramways are of value where no other means of transportation is possible and also in competition with other methods of transportation; with aerial tramways length and capacity are unlimited from engineering standpoint; author discusses several locations where tramway has been successfully applied.

CAISSONS

OBLIQUE. Oblique Compressed-Air Sinking Operations in Theory and in Practice (Die schraege Druckluftabsenkung in Theorie und Praxis), E. Paproth. Bautechnik (Berlin), vol. 7, no. 37, Aug. 27, 1929, pp. 566-574, 17 figs. Description of German patented method, invented by C. P. Hansen, for sinking of non-vertical pneumatic caissons in building of bridge piers and abutments; advantages of oblique over vertical sinking of caissons; practical use of method in construction of bridge piers and open weir piers in Germany; theoretical foundations of method, computation of stresses in oblique caissons; application of method to construction of seawalls.

CALCIUM CARBIDE

MANUFACTURE OF. The Manufacture of Calcium Carbide. Chem. Age (Lond.), vol. 21, no. 538, Oct. 19, 1929, p. 356. Discussion of raw materials; suspension of electrodes; electric furnace operates quietly with excess of lime present in charge, but tends to be disturbed if, in order to obtain high-grade carbide or to protect electrodes, excess of carbon in charge is present; large furnace of modern type should work for years continuously without shutting down for serious repairs, if properly handled.

CANADIAN MINES DEPARTMENT

FUNCTIONS OF. The Mines Branch and Its Functions, J. McLeish. Can. Min. Jl. (Gardenvale, Que.), 50th anniversary no., Aug. 1929, pp. 66-70, 8 figs. Comprehensive statement by Director of Mines Branch of Mines Department; general organization; division of Mineral Resources under A. W. G. Wilson; Ore Dressing and Metallurgical division under W. B. Timm; Fuels and Fuel Testing under B. F. Haanel; Ceramics and Road Materials under H. Frechette; Chemical Divisions under F. G. Wait; cooperation with other departments and agencies.

CANALS

WELLAND. The Welland Ship Canal. Engineering (Lond.), vol. 128, no. 3326, Oct. 11, 1929, pp. 462-465, 5 figs. Description of Section No. 6, which was one of later parts for which contract was awarded; solution adopted has included straightening out and realignment of creek along new course to east of channel for ship canal, which, itself is considerably to east of present channel; it is estimated that work involved in this section embraced 11 million cu. yds. of earth excavation, and use of 2 million cu. yds. in water-tank embankments; in making rock dams, run of dumps was employed. (Continuation of serial.)

IRRIGATION. Irrigation Canal and Drainage Ditch Crossings in the Imperial Valley, J. F. Lamb. Hydraulic Eng., vol. 5, no. 10, Oct. 1929, pp. 35-36, 9 figs. Illustrated examples from author's practical experience.

DESIGN. Simplified Method for the Design of Canal Sections (Vereinfachtes Verfahren zur Berechnung der Kanalprofile), O. Schmiedel. Gesundheits-Ingenieur (Munich), vol. 52, no. 31, Aug. 3, 1929, pp. 557-559, 2 figs. Procedure and tables for design of canal sections on basis of Bazin formula, when velocity of stream and hydraulic radius are not given.

CARBON DIOXIDE

Properties. The Thermal Properties of Carbon Dioxide in the Gaseous, Liquid, and Solid States, R. Plank and E. J. Kuprianoff. Information on Refrigeration—Bul. (Paris), no. 11, Mar. and Apr. 1929, pp. 3p-15p, 3 figs. partly on supp. plates. Discussion of such factors as specific volume, equilibrium, latent heats, enthalpies, entropy; tables and charts for carbon-dioxide in solid, liquid, and vapour states.

CARBON DIOXIDE COMPRESSORS

Design. Design Problems of a Carbon-dioxide Refrigeration Machine, T. Mitchell. Power, vol. 70, no. 15, Oct. 8, 1929, pp. 566-567, 1 fig. Solution of various problems may be grouped under two headings: design of pistons and arrangement of parts centering about shaft; illustration of inclosed vertical-dioxide compressor.

CARS

Refrigerator. A Résumé of the Mobile Refrigerator, L. K. Wright. Ice and Refrigeration, vol. 77, no. 4, Oct. 1929, pp. 204-206. Insulation thickness of cars; shipment of produce; circulation of air in cars; artificial refrigeration of cars; refrigerated barges; refrigerated milk cars and ice-cream trucks; overhead bunkers in freight cars; ice consumption of overhead bunker cars.

Street Railroad, Montreal. Two Car Trains, Montreal Tramways Company. Can. Ry. and Mar. World (Toronto), Oct. 1929, p. 638, 2 figs. Illustrated description of two-car trains used on Montreal Tramways Co. which have proved of distinct advantage at heavy-traffic intersections where very short headways are necessary to maintain traffic flow.

CASTINGS

Strength. Strength of Metal Castings and Relation of Iron to Method of Casting (Die Festigkeitseigenschaften von Metallguss einschliessl. Eisen in Abhaengigkeit von der Giessweise), G. Schreiber and H. Menking. Zeit. fuer Metallkunde (Berlin), vol. 21, no. 9, Sept. 1929, pp. 297-302 and (discussion), p. 302, 22 figs. Cause of fluctuations in strength values of all cast metals is investigated; various physical influences are explained with aid of testing model.

CEMENT MORTAR

Steam Treatment. Steam Curing of Portland Cement Mortars, T. Thorvaldson and G. R. Shelton. Can. Jl. of Research (Ottawa), vol. 1, no. 2, July 1929, pp. 148-154. Steam curing of Portland cement mortars in saturated steam at 100, 125, 150, 175 and 200 deg. cent. studied, both as to variations in tensile strength of 2-day and 28-day mortar briquets and as to changes which occurred in crystalline matter in cement; great increase in resistance of Portland cement mortars to alkali action produced by steam curing is connected with production of new crystalline material.

Water Ratio. Fineness of Grinding, Water-Cement Ratio, and Compression Strength of Cement (Malningsfinhet, Vattencementtal och Tryck-Hallfasthet hos Cement), V. Bahrner. Teknisk Tidskrift (Stockholm), vol. 59, no. 39, Sept. 28, 1929, (Vag och Vattenbyggnadskonst), pp. 114-116, 4 figs. Attempt to clarify question of relation between fineness of grinding of cement and water-cement ratio, and show direction in which to seek solution of related questions.

CITY PLANNING

Hexagonal. Hexagonal Planning, N. Cauchon. Instn. Mun. and County Engrs.—Jl. (Lond.), vol. 56, no. 6, Sept. 17, 1929, pp. 340-348, 6 figs. Past president of Town Planning Institute of Canada reports on city-planning activities in Canada and discusses main features and advantages of his town-planning system having hexagonal block as its basic element.

CLAY

New Brunswick. Clays and Shales of the Grand Lake Area, New Brunswick, H. Fréchette and J. F. McMahon. Can. Department Mines—Investigations (Ottawa), no. 697, 1929, pp. 26-45. In mining thin coal seam, it is necessary to mine and hoist large tonnage of shales; samples taken for investigation of possibilities of establishment of clay-working industry; description of location, nature of material, working properties, burned properties and dry-press tests; recommendations as to suitability of materials for manufacture of products.

COAL

Pulverized. *See Pulverized Coal.*

COAL CARBONIZATION

Low Temperature. Combined Low-Temperature Carbonization, Gasification and Combustion, D. Brownlie. Iron and Coal Trades Rev. (Lond.), vol. 139, no. 3216, Oct. 18, 1929, pp. 575-576. Discussion of recent developments in watertube boiler practice; pulverized-fuel developments; low-temperature carbonization plants integral with boiler settings; yield of by-products; other combined processes. Abstract of paper read before Instn. Mech. Engrs.

CONCRETE

Acid Water Effect. Effect on Concrete of Acid Water From Stored Bituminous Coal, E. F. Wolf. Indus. and Eng. Chem., vol. 21, no. 10, Oct. 1929, pp. 908-910, 3 figs. This report covers some observations that have been made on effect of acid water from stored bituminous coal on concrete structures at Gould Street power plant of Consolidated Gas Electric Light and Power Co. of Baltimore; structure of particular interest is 18-in. reinforced-concrete crane-runway wall situated along coal storage field and extending to depth of 11 ft. below ground level.

CONCRETE CONSTRUCTION

Pneumatic Placing. Pneumatically Placed Concrete in Sewage Plant and Outfall Construction, A. T. Cassiere. Hydraulic Eng., vol. 5, no. 10, Oct. 1929, pp. 16-17 and 43-44, 4 figs. In construction of Imhoff tanks, for sewage disposal plant, San Bernardino, Calif., pneumatically placed concrete known as pneucrete was used; detail of core-breaker type nozzle, used in placing concrete; exposed surfaces of concrete structures also show with pneucrete coating.

CONCRETE DESIGN

Charts. Special Charts Simplify Design Problems, R. C. Reese. Eng. News-Rec., vol. 103, no. 17, Oct. 24, 1929, pp. 661-662, 2 figs. Author presents chart for finding minimum depth of concrete beam and required steel area of slab when load, span, etc., are given.

CONVEYORS

Belt. Seattle Uses Belt Conveyors for Big Earth Moving Job, W. E. Philips. Power Transmission, vol. 35, no. 4, Oct. 1929, p. 36, 2 figs. Use of belt conveyors for moving 5,000,000 cu. yds. of earth from Denny-Hill to Elliott Bay, in Denny-Hill Regrade Project No. 2, is described; striking difference between what were considered good standard methods of moving materials before, and simpler, more efficient and economical uses of conveyors, as now applied, was studied.

COPPER ALLOYS

Melting. Development of New Deoxidation and Melting Process for Metals, Especially Copper Alloys (Die Entwicklung eines neuen Desoxydations und Schmelzverfahrens fuer Metalle insbesondere fuer Kupferlegierungen), W. Reitmeister, Giesserei (Duesseldorf), vol. 16, no. 41, Oct. 11, 1929, pp. 945-952 and (discussion) 952-953, 4 figs. Relations between copper and iron alloys are set forth; casting difficulties with bronze; relation between tendency to segregation in raw and cast material; deoxidation of molten bronze with carbon; influence of deoxidation on one segregation, and other causes for zone segregation; new deoxidation process is described.

COPPER ORE TREATMENT

Arizona. Co-ordination of Operation and Research at Clarkdale, Ariz., G. J. Young. Eng. and Min. Jl., vol. 128, no. 16, Oct. 19, 1929, pp. 619-620, 1 fig. Notes on research laboratory organized by United Verde Copper Co.; work is under direction of O. C. Ralston; flotation occupies important place in current studies.

Leaching. Factors Governing Removal of Soluble Copper from Leached Ores, J. D. Sullivan and A. J. Sweet. U. S. Bur. of Mines—Tech. Paper, no. 453, 26 pp., 13 figs. partly on supp. plates. Supplement to U. S. Bur. of Mines—Tech. Paper, no. 441; problem as applied to vat or tank leaching; diffusion and absorption; experimental work; problem as applied to heap leaching; study of manner of crystallization of copper sulphate from solutions evaporating; study of manner of crystallization of copper sulphate from solutions evaporating in capillary and small-bore glass tubes; concentration of copper salts on surface and in interior of ores saturated with copper sulphate and then dried.

CULVERTS

Concrete, Holland. Erection of Some Reinforced-Concrete Structures on the Schaesberg-Kerkrade-Simpelveld Railroad Line in Southern Limburg, Holland (Die Ausfuehrung einiger Kunstbauten aus Eisenbeton in der Eisenbahnlinie Schaesberg-Kerkrade-Simpelveld im Sueden der Provinz Limburg, Holland), L. J. M. Dirickx. Beton u. Eisen (Berlin), vol. 28, no. 12, June 20, 1929, pp. 213-218, 16 figs. Design and construction of three heavy-section culverts under railroad embankment; also of two reinforced concrete slab bridges carrying road over railroad tracks.

Jacking. Cost of Jacking Culvert through Fill Compared with Open Cut Method, W. M. Angas. Eng. News-Rec., vol. 103, no. 17, Oct. 24, 1929, pp. 663-664, 2 figs. Author reports on 48-in. corrugated-iron culvert, 126 ft. long, which was jacked through 34-ft. fill carrying concrete highway at Naval Fuel Depot, San Diego, at cost of but one-third of that estimated for open-cut work; comparative itemized costs.

CUTTING TOOLS

Lathe, Cutting Speeds of. Turning with Shallow Cuts at High Speeds, H. J. French and T. G. Digges. Am. Soc. Mech. Engrs.—Advance Paper, no. 17, for mtg. Dec. 2 to 6, 1929, 31 pp., 42 figs.

D

DAMS

Concrete, Great Britain. Lac Seul Conservation Dam, Ear Falls, T. H. Hogg. Can. Engr. (Toronto), vol. 57, no. 19, Nov. 5, 1929, pp. 683-684, 5 figs. Description of concrete dam containing twenty stop-log sluices of 14 ft. clear width and 40 ft. maximum height, which was built jointly by Ontario and Manitoba Governments on English river at lower Ear Falls, to provide 4,000,000 acre-feet of storage in Lac Seul.

Concrete, Construction. Ryburn Dam. Water and Water Eng. (Lond.), vol. 31, no. 370, Oct. 21, 1929, pp. 451-454, 7 figs. Construction of curved gravity, concrete dam having maximum height of 121 ft. and thickness of 84 ft. at base, to form compensation reservoir of 222,000,000 gals. capacity; details of excavation, concrete pouring, grouting, etc.

Concrete Arch. Small Arch Dam Design Governed by Concrete Economy Need, J. Girand, Jr. Eng. News-Rec., vol. 103, no. 15, Oct. 10, 1929, pp. 569-570, 3 figs. Design and construction of variable-radius arch dam, 110 ft. high, near Safford, Ariz.; dam is about 140 ft. long and contains only 970 cu. yds. of concrete; radii vary from 14 ft. at base to 80 ft. near top; central angle is about 130 deg.; temperature reinforcement is doweled to abutments and grouted.

Concrete Arch, Idaho. Construction Starts on Concrete Arch Dam on the Deadwood River, Idaho. Hydraulic Eng., vol. 5, no. 10, Oct. 1929, pp. 26-28, 1 fig. Feature of single arch dam having radius of 290 ft., height 160 ft., length 700 ft. on crest; central portion of dam being 6 ft. below top to form overflow spillway. Reprinted from New Reclamation Era, Sept. 1929, previously indexed.

Earth, Spillways. Earth Dam with Spillway Channel through Embankment. Eng. News-Rec., vol. 103, no. 19, Nov. 7, 1929, pp. 725-727, 2 figs. Design and construction of water-supply dams for Mitchell, S. Dakota; dam has maximum height of 40 ft. and is ¼ mi. long; central clay core has steel and wood sheet; spillway crest which is 10 ft. below top of dam and is 140 ft. long with constructed concrete lime channel over central portion of dam; report on erosion of dam and settlement of spillway; criticism of design.

Failures. Causes of Failures of Concrete Dams (Orsaken til retongforstorelser i dammbyggnader), A. Elkwall. Teknisk Tidskrift (Stockholm), vol. 59, no. 21, May 25, 1929, (Vag och Vattenbyggnadskonst Supp.), pp. 64-68. Investigation of several dams show that failure is due to disintegration of concrete; Swedish State Commission reports on materials.

Foundations, Geology. Classification, Selection and Adaptation of High Dams, D. C. Henny. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 9, Nov. 1929, pp. 2327-2346. Historical sketch; examples of high dams; foundations for earth, rock-fill and masonry dams; flood, earthquake and earth movement dangers; uplift; tension in foundation; geological requirements for reservoirs; significance of topography at dam site; permeability of rocks of dam site; solubility, softening and disintegration of rocks in water; changes in volume of rocks.

Gravity, Curved. Effect of Curvature on Gravity Dam (L'effet de la courbure des barrages-poids), F. Campus. Génie Civil (Paris), vol. 95, no. 15, Oct. 12, 1929, pp. 352-355, 3 figs. Theoretical mathematical analysis resulting in simplified mathematical expressions.

High. Past Experience with High Dams and Outlook for the Future, A. J. Wiley. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 9, Nov. 1929, pp. 2318-2326. Account of past practice in design of high dams; comments indicate that higher dams of future will be of solid masonry gravity type, preferably of arch-gravity type; comparisons and selection of type; uplift in and under dams; seepage from dams; pressure grouting of contraction joints.

Multiple Dome, Coolidge, Ariz. Construction Methods and Plant Layout at Coolidge Dam, in Arizona, J. G. Tripp. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 9, Nov. 1929, pp. 2347-2356, 3 figs. Planning of concrete plant and excavation; layout of concrete plant; distribution of concrete; choice of concrete mixers; general service problems; construction work.

DEPARTMENT STORES

Construction. Record Speed in Building Construction Due to Ingenious Foundation Scheme, W. T. McIntosh. Eng. and Contracting, vol. 118, no. 11, Nov. 1929, pp. 451-455, 5 figs. Unusual methods of installing foundations make it possible to begin erection of steel work for new Abraham and Strauss department store, Brooklyn, as soon as demolition of old building had been completed; electric shovels taking out general excavation while steel erection was in progress on upper floors; cross section through foundation pits, showing details of work.

DIES

Forging, Manufacture of. Forging Dies Made by Improved Methods, C. B. Phillips. Iron Trade Rev., vol. 85, no. 15, Oct. 10, 1929, pp. 901-903, 5 figs. Practice employed in die-making division of Studebaker Corp., South Bend, Ind., is described; die blocks are bought annealed, impressions cut, and block heat treated and finished; careful heat treating methods described; daily inspection of dies in use; two distinct methods used in forging crankshaft with these dies outlined; new block steel employed for crankshaft and all heat-treating operations eliminated except normalizing.

DIESEL-ELECTRIC POWER PLANTS

COSTS. Diesel Engine Power Costs, E. J. Kates. Power Plant Eng., vol. 33, no. 20, Oct. 15, 1929, pp. 1114-1115, 1 fig. Operating costs of well designed and modernly equipped Diesel plant of Vulcan Rail and Construction Co.; chart showing relationships between output, efficiency, load factor, and operating cost.

Diesel Engine Power Costs for 1927-1928, F. Edler. Power Plant Eng., vol. 33, no. 21, Nov. 1, 1929, pp. 1168-1170. Analysis of Diesel power costs indicate trend toward further plant refinement and need of standardization of cost methods; summary of Diesel-engine data; summary of Diesel-plant operating costs.

DIESEL ENGINES

SUPERCHARGING. Compounding and Supercharging of Diesel Engines (La question du compoundage et de la suralimentation du moteur Diesel), Gautier. Bul. Technique du Bureau Véritas (Paris), vol. 11, nos. 7 and 8, July and Aug. 1929, pp. 155-159 and 177-180, 18 figs. Engines of 4-stroke cycle only are dealt with; notes on recovery of energy lost in exhaust gas; supercharging and means of effecting it; supercharging with exhaust-gas turbo-compressor; comparison of three types of engines; standard 4-stroke supercharged 4-stroke and standard 2-stroke engines; results of tests; conclusions.

New System of Supercharging Werkspoor Engines (Nouveau Système de Suralimentation des Moteurs Werkspoor), Abbat. Bul. Technique du Bureau Véritas (Paris), vol. 11, no. 7, July 1929, pp. 138-139, 1 fig. Details of Van Essen supercharging system employed in Werkspoor engines installed in oil tanker, Megara; instead of supplying necessary air from a rotary blower, underside of main working pistons is utilized; box casting around cylinder forms receiver from which air is supplied to inlet valve at alternate strokes of piston; results of running tests.

DIPHENYL

PROPERTIES. Diphenyl. Indus. Power, Nov. 1929, pp. 41-42, 146 and 148, 2 figs. New substitute for water in heat engineering; yellowish crystalline substance at temperatures below its boiling point, and smelling much like moth balls; threatens to displace water wherever more rapid heat transferring is necessary has no corrosive action on any material; it will burn at high temperatures, presumably around 1,800 deg. fahr.; not to be confused with diphenyl oxide, which is not so stable, and has not proven satisfactory because of tendency to carbonize in tubes; preliminary table of values for diphenyl.

DUST PRECIPITATION

ELECTRIC. Electric Precipitation in Power Plants. Power Engr. (Lond.), vol. 24, no. 284, Nov. 1929, p. 450. Present stage of application of electrical precipitation to central station chimneys and prospects of its further use in this connection.

E

ELECTRIC CABLES

DESIGN. The Most Efficient Size of Cable Conductor, C. G. Watson. Elecn. (Lond.), vol. 103, no. 2682, Oct. 25, 1929, pp. 488-490. Important considerations on designing of low-tension distributing system for heavy loads; calculations involved.

UNDERGROUND, LAYING. Longer Duct Runs Made Possible with Dynamometer Control. Elec. World, vol. 94, no. 13, Sept. 28, 1929, p. 645, 3 figs. 45,000-volt transmission feeder, consisting of three single-conductor, 200,000-cir. mil. lead-covered cables, 1.8 in. in diam. installed in one 5-in. duct, was recently placed in service by Westchester Lighting Co.; maximum duct length in system was 1,002 ft.; to get accurate observation of stresses involved special recording cable pulling stress indicator was constructed which is illustrated.

ELECTRIC CAPACITORS

HIGH-VOLTAGE. With the High-Voltage Capacitor Small Loads Can be Economically Connected to High-Tension Lines, H. Brooks. Elec. Jl., vol. 26, no. 10, Oct. 1929, pp. 477-478, 6 figs. Vector diagram and connections showing how parallel operation can be obtained, are discussed; new scheme has been developed, which, for low-power installations, has number of advantages over direct transformations by means of transfer.

ELECTRIC CONDUCTORS

COPPER. Correlation of the Ultimate Structure of Hard-drawn Copper Wire with the Electrical Conductivity, R. W. Drier and C. T. Eddy. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 259, 1929, 12 pp., 5 figs.; see also abstract in Rolling Mill Jl., vol. 3, no. 10, Oct. 1929, pp. 433-434, 1 fig. Preliminary report of work done on research program for intensive study of copper, effect of direction of drawing; description of samples used; microscopic study showed no structural differences; diffraction; resistivity measurements indicate increase of resistivity with degree of orientation in which cube edge is parallel to fibre axis or direction of drawing.

ELECTRIC GENERATORS

DESIGN. Characteristic Constants of Electric Generators (Constantes caractéristiques des générateurs électriques), E. M. Galvez. Académie des Sciences—Comptes Rendus (Paris), vol. 189, no. 8, Aug. 21, 1929, pp. 329-331. Interrelation between e.m.f. and interior resistance is mathematically analyzed.

ELECTRIC INSULATORS

FLASHOVER. Time Lag of Flashover, P. H. McAuley. Elec. World, vol. 94, no 16, Oct. 19, 1929, p. 780, 1 fig. Cathode-ray oscillogram obtained from five successive, accurately synchronized, voltage applications to string of 16 suspension insulators equipped with arcing rings, shows graphically meaning and relationships of time lag of flashover.

ELECTRIC LINES

CALCULATION. Calculation of Voltage Drop of Long Alternating-Current Lines (Berechnung langer Wechselstromleitungen auf Spannungsabfall), W. Buetow. Elektrotechnische Zeit. (Berlin), vol. 50, no. 42, Oct. 17, 1929, pp. 1515-1519, 22 figs. Graphical method, closely related to methods already known as used in electric works of W. Lahmeyer and Co., in Frankfort on Main; it has advantage that hyperbolic functions are avoided and, because of illustrativeness, errors are easily distracted; method is approximately exact.

GROUNDING. A.W.W.A. Takes Action on Grounding of Electrical Lines on Water Pipes. Water Works Eng., vol. 82, no. 23, Nov. 6, 1929, pp. 1597-1598 and 1634, 1 fig. Text of resolution adopted by executive committee; history of association's stand on matter.

POLES, SETTING. Economical Pole Setting. Elec. World, vol. 94, no. 17, Oct. 26, 1929, pp. 833-834, 3 figs. Comparison of expense of manual and machine methods; variability of soils, labour rates, accounting practices, and other conditions, prevent general conclusion regarding machine economy.

HIGH TENSION, GROUNDING. Installing Grounding Chains on Pole Lines. Elec. World, vol. 94, no. 16, Oct. 19, 1929, pp. 777-779, 11 figs. Methods for using grounding chains on lines of Public Service Co. of Northern Illinois for voltages between 2,300 and 33,000 are illustrated.

HIGH-TENSION, DESIGN. Barren Jack Hydro-Electric Development, N.S.W. Transmission Lines and Substations, J. J. Richardson. Instn. of Engrs. Australia—Jl. (Sydney), vol. 1, no. 8, Aug. 1929, pp. 295-308, 6 figs. Record of principles and methods adopted in design and construction of 66,000-volt transmission lines and substations of Barren Jack system (Australia), including details of surveys, easements and resumptions, towers and poles, insulators, conductors, steelwork and switchgear; tables of transmission-line costs, transmission-line sections, and details and technical data of insulators are given.

ELECTRIC MANUFACTURING PLANTS

MATERIALS HANDLING. Production Method Used in the Electrical Industry, E. L. Spray. Materials Handling (A.S.M.E. Trans.), vol. 51, no. 19, May-Aug., 1929, pp. 61-63. Production methods used in plant of Westinghouse Electric and Manufacturing Co. at Mansfield, Ohio, are described; sad irons, ranges, switches, waffle irons and toasters are now assembled on conveyors, and assembly costs have been reduced from 15 to 35 per cent; results obtained include lower labour costs, reduced inventories, fewer rejects, less floor space, better processes, better machining, and more uniform product.

ELECTRIC MOTORS, ALTERNATING CURRENT

WINDINGS. Locating Winding Faults in Alternating-Current Motors, M. E. Wagner. Power, vol. 70, no. 18, Oct. 29, 1929, pp. 680-683, 8 figs. Short circuits, open circuits and grounds are three faults in a.c. motor winding that operating engineers are most likely to have to contend with; effects of these faults and how to locate source of trouble are explained; a.c. motor windings connected four-pole series-delta; simplified diagrams of three-phase motor connections.

ELECTRIC NETWORKS

PROTECTION. Some Developments in Relay Protection for Power Systems, W. F. Mainguy. Elec. News (Toronto). vol. 38, nos. 19 and 20, Oct. 1 and 15, 1929, pp. 35-40 and 44-48 and 63, 11 figs. Oct. 1: General principles of over-current, directional and differential protection. Oct. 15: Canadian impedance type, distance type and ratio differential type relays and outline of British split-pilot feeder protective gear.

ELECTRIC REACTORS

CHOKE COIL. Effect of Choke Coils, S. M. Jones and R. A. Hudson. Elec. World, vol. 94, no. 15, Oct. 12, 1929, pp. 729-733, 8 figs. Very high inductance needed for choke coils to decrease voltage or steepness of travelling waves; mathematical analysis shows doubtful value of coils for arresters or lines; curves showing effect of choke coil on various types of waves, are given.

DESIGN. Calculation of Enlarged Inductivity of Air-Core Reactors due to Insulation of Windings (Berechnung der durch die Windungsisolation hervorgerufenen Vergroesserung der Induktivitaet von eisenlosen Drosselspulen), J. Hak. Elektrotechnische Zeit. (Berlin), vol. 50, no. 40, Oct. 3, 1929, pp. 1440-1442, 6 figs. Mathematical design analysis.

ELECTRIC RECTIFIERS

METAL. AEG All-Metal Rectifiers Serving an Extensive Urban and District Railway, F. Laun. A.E.G. Progress (Berlin), vol. 5, no. 9, Sept. 1929, pp. 285-290, 8 figs. Details of standard type rectifier; layout, equipment, and diagram of connection of substation of German State Railway in Berlin with all-metal rectifiers of 2,700/1,000 amperes of 800 volts and 3,000/300 amperes of 800 volts.

ELECTRIC SUBSTATIONS

PORTABLE. This Automatic, Portable Substation Supplies Power When and Where It Is Needed. Elec. Jl., vol. 26, no. 10, Oct. 1929, p. 464, 3 figs. Railroad-car type, 500-kw. 600-volt d.c., 2,300-volts at 710 hp. synchronous motor as developed by Missouri Pacific lines is described; it can be used to supply power for seasonal loads, or in emergency.

ELECTRIC WELDING

ARC. Application of Electric Arc Welding, A. Churchward. Heat Treating and Forging, vol. 15, no. 10, Oct. 1929, pp. 1304-1306, 7 figs. Recent progress in fabrication of metals by arc welding is reviewed; description of apparatus by means of which globular formation of any electrode can be observed as well as effect of different kinds of current values with various arc lengths and electrodes with different coatings.

ELEVATORS

ELECTRIC, SAFETY DEVICES FOR. Safety Devices for Elevators (Ueber Sicherheitsvorrichtungen an Aufzuegen). Waerme (Berlin), vol. 52, no. 42, Oct. 19, 1929, pp. 794-795, 1 fig. Description of modern safety methods and equipment including shaft-door closing, counterweights, etc.

ENGINEERS

BRITISH COLUMBIA. Engineering Profession Act of B.C. Can. Engr. (Toronto), vol. 57, no. 15, Oct. 8, 1929, pp. 613-614. Explanation of act and status of engineer in British Columbia as result of Act; beneficial influence to profession; attitude of legislature; formal system of training and examinations.

EVAPORATION

HEAT TRANSMISSION AND. Evaporation and Heat Transmission (Verdunstung und Waermeuebergang), E. Schmidt. Gesundheits-Ingenieur (Munich), vol. 52, no. 29, July 20, 1929, pp. 525-529, 1 fig. Derivation of differential equations; application of these equations to study of condensation on cold surfaces.

F

FERTILIZERS

SEWAGE WASTE. Pulverizing and Screening Dried Sewage Sludge. Eng. News-Rec., vol. 103, no. 16, Oct. 17, 1929, pp. 617-618, 1 fig. At Milwaukee sewage disposal plant fertilizer is made by passing slude over vibrating screens; oversize reduced in disintegrators; cost data; features of disintegrator for sewage sludge.

FLOW OF FLUIDS

RESEARCH. Investigations into the Flow of Fluids (Ergebnisse aus dem Stroemungsinstitut der Technischen Hochschule Danzig), G. Fluegel. Werft-Reederei-Hafen (Berlin), vol. 10, no. 16, Aug. 22, 1929, pp. 335-337, 5 figs.: see translated abstract in Mar. Engr. and Motorship Bldr., Oct., pp. 426-427. Description of equipment of Institute for Hydrodynamics and Aerodynamics of Danzig Technical University, including wind tunnel, circulating water tank for testing floating models, and hydraulic laboratory for stream-flow research on small models; ease with which otherwise complicated flow phenomena, such as through turbines and scavenge process in Diesel engines, can be investigated, is emphasized.

FLOW OF GASES

MEASUREMENT OF. Simplified Formula for Calculating Velocity of Escaping Gases (Forenklad utstromningsformel), B. A. Afzelius. Teknisk Tidskrift (Stockholm), vol. 59, no. 24, June 15, 1929 (Mekanik), pp. 82-83, 2 figs. Three formulae are evolved by which velocity of escaping gases of all pressures beyond critical may be determined with accuracy of less than 1 per cent.

FLOW OF STEAM

PIPES. Simplification of Calculation With Trottle Flange Measurement (Forenkling av raknearbetet vid strypflans-matningar), C. E. Nilson. Teknisk Tidskrift (Stockholm), vol. 59, no 29, July 20, 1929 (Mekanik), pp. 85-96, 7 figs. Adquist and Haerlin's Formulae for measuring steam flow in pipes are given and from these are developed formulae that are accurate, but much simpler.

FLOW OF WATER

CURVED CHANNELS. Loss of Head in Curved Channels (Ueber den Stroemungsverlust in gekruemmten Kanaelen), H. Nippert. V.D.I. Zeit. (Berlin), vol. 73, no. 39, Sept. 28, 1929, pp. 1391-1392. Report on theoretical and experimental study of loss of head in models of channels of rectangular and circular sections, made at hydraulic laboratory of Danzig Institute of Technology. Abstract from Forschungsarbeiten auf dem Gebiete des Ingenieurwesens, no. 320.

SURFACE CURVES. Approximate Tracing of Backwater Curves in Prismatic Canals, etc. (Sul tracciamento approssimato dei profili di rigurgito nei canali ad alveo prismatico in regime permanente), E. Campini. Energia Elettrica (Milan), vol. 6, no. 6, June 1929, pp. 600-607, 8 figs. Theoretical mathematical discussion of methods of computing surface curves of flow in open channels of trapezoidal section, as well as in sewers of ovoidal and other cross-sections; study of hydraulic jump.

FORGING

TIME ELEMENTS IN. Study of Time in Forging Operations (Etude des temps de forgeage), L. Faure. Arts et Métiers (Paris), vol. 82, no. 106, July 1929, pp. 241-248, 14 figs. Elements entering into time in forging are discussed covering preparation of work, tools, and fire, time for re-heating, time for rough forging, and finishing to exact form and trimming, time for inspection, time for displacement, and lost time.

FRAMES, CONCRETE

DESIGN. Statistical Behaviour of Reinforced-Concrete Frames Subject to Shrinkage Stresses (Das statische Verhalten der unter Schwindeinfluss stehenden Rahmentragwerke aus Eisenbeton), L. Herzka. Beton u. Eisen (Berlin), vol. 28, nos. 12, 14, 15 and 16, June 20, July 20, Aug. 5 and Aug. 20, 1929, pp. 220-224, 264-269, 286-288 and 298-304, 16 figs. Theoretical analysis of stresses induced by contraction of concrete in several types of girders and frames; studies of deformation caused by shrinkage; tables of values for solving equations derived; results of laboratory tests of reinforced-concrete frames; numerical examples illustrating application of formulae.

FURNACES, ANNEALING

ROTARY. Multiple-Hearth Rotary Furnace. Iron Age, vol. 124, no. 14, Oct. 3, 1929, p. 908, 1 fig. Description of rotating furnace for bluing, drawing, annealing, and heating at temperatures from 700 to 1,650 deg. fahr., which is produced by Strong, Carlisle & Hammond Co.; central heating chamber is surrounded by 10 compartments for holding work.

G

GAS ENGINES

TESTING. Complete Thermodynamic and Experimental Study of a Gas Engine (Etude thermodynamique et expérimentale complète d'un moteur à gaz), A. Duchesne. Revue Universelle des Mines (Liége), vol. 72, no. 4, Aug. 15, 1929, pp. 97-107, 32 figs. Study of test of May 10, 1927; tabular data and detailed discussion of results; comparison of two tests; correction of errata in issues of Jan. 1, Feb. 1, and 15, Apr. 1, and May 1, 1929.

GASES

IGNITION TEMPERATURES OF. Ignition Temperatures of Mixtures of Carbon Monoxide with Air (Sur les températures d'inflammation des mélanges d'oxyde de carbone et d'air), M. Prettre and P. Lafitte. Académie des Sciences—Comptes Rendus (Paris), vol. 188, no. 22, May 27, 1929, pp. 1403-1410. Ignition temperatures were found to be fairly constant and to have value of 655 deg. cent. for mixtures containing between 10 and 40 per cent carbon monoxide; for greater proportions of carbon monoxide, ignition temperature increased with percentage of carbon monoxide until value of 727 deg. was obtained for mixture containing 72.9 per cent carbon monoxide.

GEOLOGICAL SURVEYS

CANADA. The Geological Survey of Canada, W. H. Collins. Can. Min. Jl. (Gardenvale, Que.), 50th anniversary no., Aug. 1929, pp. 53-65, 6 figs. Historical review of establishment of Geological Survey in 1842 and progress to 1867; expansion from 1867 to 1907; concentration of effort in 1907; present activities in exploration, study of mineral deposits, other investigations, geological and topographic mapping, maintenance of National Museum, and incidental research and educational work.

GEOLOGY

MANITOBA. Geology of Oiseau River Area Manitoba, J. F. Wright. Can. Min. Jl. (Gardenvale, Que.), vol. 50, nos. 4 and 43, Oct. 18 and 25, 1929, pp. 987-990 and 1014 and 1027. Oct. 18: Area about 70 mi. northeast of Winnipeg and 98 mi. north of international boundary; historical notes; topography; water powers; general summary of geology; tabular data on geological formations. Oct. 25: General distribution of rocks and basis of subdivision; quartz-mica schist and conglomerate; quartzite, akose, and greywacke. Condensed abstract of summary report of Geological Survey of Canada 1924, part B. Bibliography. (To be continued.)

GEOPHYSICAL EXPLORATION

ELECTRIC. Some Earth Resistivity Measurements, F. W. Lee, J. W. Joyce, and P. Boyer. U. S. Bur. of Mines—Information Cir., no. 6171, Oct. 1929, 16 pp., 25 figs. on supp. plates. Ground resistivity measurements originally of direct interest in location of ore deposits; further applications in location of proper bridge, dam, and building foundations; factors influencing average resistivity; single-electrode method; methods for measuring earth resistivity; surface and structure effects on resistivity; comparisons of measurements; differentiative resistivity measurements; stratigraphy.

GOLD MINES AND MINING

COMPRESSED AIR. Compressed Air Supply on the Rand, B. Price. Engineering (Lond.), vol. 128, nos. 3326 and 3327, Oct. 11 and 18, 1929, pp. 479-481 and 510-511, 10 figs. Within central area, compressed air supply is furnished in bulk by Victoria Falls and Transvaal Power Co., from pipe system fed by two central compressing stations; detailed descriptions of plant and pipe lines.

GRAIN ELEVATORS

PRESCOTT, ONT. Lower Lake Grain Transshipping Terminal Near Prescott. Can. Ry. and Mar. World (Toronto), Nov. 1929, pp. 720-721, 2 figs. Discussion of design features of proposed grain elevator to be built near Prescott; railroad-track layout and bird's-eye view of site.

HUNGARY. The Grain Elevator of the Free Port of Budapest (Der Getreidespeicher im Freihafen von Budapest), V. Mihaillich. Beton u. Eisen (Berlin), vol. 28, nos. 13 and 14, July 5 and 20, 1929, pp. 229-232 and 261-264, 26 figs. Design and construction of 11-storey reinforced concrete building 96 by 36 m. having total capacity of 32,000 tons; structural details of silos and bins, columns and column footings, etc.; method of erection.

H

HARDNESS TESTING

METHODS. "Cloudburst" Hardness Testing. Iron and Steel Industry (Lond.), vol. 3, no. 1, Oct. 1929, p. 28, 2 figs. Latest improvements and modifications adopted in applying Cloudburst method for hardness testing are given; test is applied to whole surface of many articles simultaneously; hardening is effected by same machines and is continuation of same process as that used in hardness testing.

Modern Method for Testing of Materials in the Workshop (Ein Neuzeitiges Verfahren zur Werkstattmaessigen Pruefung von Werkstoffen), C. Sonanini. Werkstattstechnik (Berlin), vol. 23, no. 16, Aug. 15, 1929, pp. 495-496, 5 figs. Usual methods of hardness testing and their advantages and disadvantages; hardness coefficient and its relation to breakdown strength; description of new hardness tester.

HEAT-INSULATING MATERIALS

THERMAL CONDUCTIVITY. Determining Thermal Conductivity of Heat Insulating Materials, H. Stiles. Chem. and Met. Eng., vol. 36, no. 10, Oct. 1929, pp. 625-626, 2 figs. Description of apparatus for determining heat transfer which has advantage that plant operators can be trained to use method quite satisfactorily; apparatus was designed by writer primarily for purpose of testing heat-insulating properties of wallboard and certain other products made from cornstalks in chemical engineering laboratories of Iowa State College.

HIGHWAY ADMINISTRATION

FINANCING. Pertinent Aspects of Highway Finance, A. D. Ferguson. Can. Engr. (Toronto), vol. 57, no. 14, Oct. 1, 1929, pp. 136-141. Comparative discussion of following methods of financing: pay-as-you-go method, borrowing, serial bonds, and annuity bonds; highway revenues and expenditures; statistics. Paper read before Canadian Good Roads Assn.

HIGHWAY ENGINEERING

CANADA. Canadian Good Roads Convention, W. C. Coo. Can. Engr. (Toronto), vol. 57, no. 14, Oct. 1, 1929, pp. 115-153. Verbatim report of proceedings, papers, and discussions of 16th annual meeting of Canadian Good Roads Association held September 17-19, at Charlottetown, P.E.I.; principal papers and discussions included in this report are indexed separately.

HIGHWAY MARKINGS

ROCK ASPHALT. Rock Asphalt Strip in Concrete Road Makes Permanent Centre Line, J. Pope. Eng. News-Rec., vol. 103, no. 17, Oct. 24, 1929, p. 661, 1 fig. Author commends practice on concrete road between Jefferson City and Louisiana, Mo.

HIGHWAY SYSTEMS

CANADA. Municipal, Township and County Roads. Can. Engr. (Toronto), vol. 57, no. 14, Oct. 1, 1929, pp. 189-212B. Condensed information on population, administration, types and mileage of pavements now laid, future programmes, etc., of great number of Canadian communities.

QUEBEC. Highways in the Province of Quebec, J. E. Perrault. Can. Engr. (Toronto), vol. 57, no. 14, Oct. 1, 1929, pp. 161-164. Good roads making headway; historical sketch of highway development; educational campaign; maintenance; government control; mileage maintained by government; plans for future; expenditures; six-year programme; cost of resurfacing; elimination of railroad crossings and full-stop regulation; tourist traffic; automobile registrations. Paper presented before Can. Good Roads Assn.

PRINCE EDWARD ISLAND. Roads in Prince Edward Island, H. H. Shaw. Can. Engr. (Toronto), vol. 57, no. 14, Oct. 1, 1929, pp. 121-127. History of highway systems of Prince Edward Island since beginning of 18th century. Read before Can. Good Roads Assn.

NEWFOUNDLAND. Road Development in Newfoundland, W. R. Hibbs. Can. Engr. (Toronto), vol. 57, no. 14, Oct. 1, 1929, pp. 127 and (discussion) 127-129. Brief report on work of Newfoundland Road Commission and Highroads Commission. Read before Can. Good Roads Assn.

HOT WATER HEATING SYSTEMS

DESIGN. Numerical Design of Single-Line Hot-Water Heating Systems (Die Berechnung der Einrohr-Warmwasserheizung), F. W. Berli. Gesundheits-Ingenieur (Munich), vol. 52, no. 27, July 6, 1929, pp. 493-496, 3 figs. Discussion of advantages and disadvantages of single-line heating systems; theory of primary and secondary heat circuits; procedure of numerical design and example.

HYDRAULIC POWER DEVELOPMENTS

VERMONT. A Marble Company's Complete Hydro System, F. A. Westbrook. Elec. Light and Power, vol. 7, no. 10, Oct. 1929, pp. 42-43, 120 and 122, 4 figs. Vermont Marble Co. owns six developed water-power sites along Otter Creek between Rutland and in Middlebury, distance of 40 mi.; these are tied together with high-tension transmission line which in turn serves some ten of Company's workings; system is tied in with Vermont Hydro-Electric Corp. from which it purchases power at times of low water and to which it sells its surplus power at times of high water; station equipment is described.

HYDRAULIC TURBINES

DESIGN. Lines of Development and Trends in Present-Day Design of Hydraulic Turbines (Linee di Sviluppo ed Orientamenti costruttivi attuali per le turbine idrauliche), M. Medici. Elettrotecnica (Milan), vol. 16, nos. 19 and 20, July 5 and 15, 1929, pp. 438-448 and 461-468, 52 figs. Review of recent progress in design and construction of reaction turbines, diffusers, rotors, draft tubes, etc. with special reference to Kaplan turbines and Pelton wheels; notes on German, Swiss, and American practice.

TESTING. Measurements of Water Volume in Testing Turbines in the Hammarfors Power Station (Vattenmangdsmatningen vid provningen av turbinerna i Hammarforsens kraftverk), B. Norsell. Tecknisk Tidskrift (Stockholm), vol. 59, no. 42, Oct. 19, 1929, (Mekanik), pp. 131-132, 4 figs. Account of how turbines were tested; turbines together draw 100 cu. m. water per sec. with head of 19.7 m. and efficiency of 93 per cent was reached.

Thermometric Method of Measuring of Efficiency Coefficient of Hydraulic Turbines (Méthode thermométrique de mesure du rendement des turbines hydrauliques), L. Barbillion. Revue Générale d'Electricité (Paris), vol. 26, no. 13, Sept. 28, 1929, pp. 487-497, 11 figs. Method is based on measurement of temperature differences; details of method and equipment required and measures to be taken in order to obtain satisfactory results.

HYDRO-ELECTRIC POWER DEVELOPMENTS

SWITZERLAND. Swiss Water-Power Development—The Oberhasli Scheme. Times Trade and Eng. Supp. (Lond.), vol. 25, no. 587, Oct. 5, 1929, pp. 71, 1 fig. Hydro-electric undertaking, drawing energy from several Aar glaciers, and situated in Haslithal, in Bernese Oberland of Switzerland, will shortly come into partial operation; first portion of scheme is estimated to yield yearly output of 223,000,000 kw-hr. while final development will amount to 538,000,000 kw-hr. for installed horsepower of nearly 250,000.

QUEBEC. A Start Has Been Made on the Beauharnois Power Development. Contract Rec. (Toronto), vol. 43, no. 41, Oct. 9, 1929, pp. 1207-1211, 5 figs. Features of private hydro-electric development located about 25 mi. from Montreal; development forms part of St. Lawrence waterway project; 83 ft. fall and 2,000,000 hp. are available; initial development consists of ten 50,000-hp. generator units and is estimated to cost $65,000,000; engineering features and progress of work.

The Beauharnois Power Development. Elec. News (Toronto), vol. 38, no. 20, Oct. 15, 1929, pp. 39-43, 5 figs. Start has been made on Beauharnois power development; private company is now actively engaged in developing one of sections of St. Lawrence waterway project; provision is made for navigation; details of construction methods; when complete development will use 5,000,000 hp. in hydro-electric power.

HYDRO-ELECTRIC POWER PLANTS

BRITISH COLUMBIA. West Kootenay Completes No. 3 Plant at South Slocan, B.C. Contract Rec. (Toronto), vol. 43, no. 42, Oct. 16, 1929, pp. 1242-1249, 9 figs. Description and details of construction of 56,000-kw. hydro-electric plant near Nelson, B.C., utilizing river having maximum flow of 150,000 cu. ft. per sec.; project comprises two concrete dams, 60 and 70 ft. high, containing respectively 13,000 and 42,000 cu. yds.; camp features; stream control; aggregate storage bins; mixing plant; power house erection methods.

CONOWINGO, MD. The Conowingo Hydro-Electric Development. Engineering (Lond.), vol. 128, nos. 3328 and 3329, Oct. 25 and Nov. 1, 1929, pp. 515-518 and 551-554, 54 figs. partly on supp. plates and p. 560. Oct. 25: Plant as at present developed can produce, with all units working, 378,000 hp.; eventual output will be 594,000 hp.; development consists of dam and power house incorporated in dam structure. Nov. 1: Details of installation of larger gates used for normal spillway section; power plant and equipment, which at present consists of 7 units, with 2 station generators.

ONTARIO. Smoky Falls Development. Elec. News (Toronto), vol. 38, no. 19, Oct. 1, 1929, pp. 29-33, 9 figs. Spruce Falls Power and Paper Co.'s plant on Mattagami River, Ont., to supply power to Kapuskasing pulp and paper mill, some 50 mi. distant; Allis Chalmers vertical-shaft turbines with maximum rating of 18,750 hp. each at 113 ft. head and speed of 163.5 r.p.m.; each directly connected to General Electric 16,500-kva., three-phase, 60-cycle, 6,600-volt generator; power is stepped to 110,000 volts for transmission; description of equipment and wiring diagrams.

OPERATION. Simple Basis for Securing Efficient Hydro Operation, F. Nagler. Elec. World, vol. 94, no 18, Nov. 2, 1929, pp. 875-878, 4 figs. Determination of characteristics of unit performance is necessary in order to make fullest use of available water; calculation of operating curve does not require complete test of unit, but may be based on index of one factor; operating curves developed from velocity gauge index; from current-meter index, and from impact-gauge index.

POWER CALCULATION. Graphic Representation of Energy to be Derived from a Proposed Hydro-electric Installation (Représentation graphique facilitant la recherche d'aménagements hydro-électriques rationnels), R. Blom. Houille Blanche (Lyon), vol. 28, no. 147-148, Mar.-Apr. 1929, pp. 36-38, 2 figs. Description and illustration of systems of graphs to show amount of water available from river basin and to estimate distribution of water in river for power development between two heads in order to determine best sections to be utilized for plurality of stations.

REMOTE CONTROL. Automatic Remote Control of Hydraulic Machinery of the Achensee Power Plant in Tyrol (Die automatische Fernregulierung der Wasserkraftmaschinen im Achensee-Kraftwerk der Tiroler Wasserkraftwerke A.-G.), H. Latzko and O. Plechl. Elektrotechnik u. Maschinenbau (Vienna), vol. 47, no. 36, Sept. 8, 1929, pp. 791-798, 8 figs. Layout of network and formulation of problem; remote-control equipment supplied by Hartmann and Braun; wiring diagrams; operating experience and diagrams; comparison of results obtained with manual regulation.

I

IMHOFF TANKS

OPERATION. Sludge Disposal at the Calumet Sewage Treatment Works, A. H. Goodman and C. E. Wheeler. Water Works and Sewerage, vol. 76, no. 10, Oct. 1929, pp. 440-441, 2 figs. Experiences at Imhoff tank plant of Sanitary District of Chicago; Imhoff sludge-removal data; sludge analysis; record of temperatures in Imhoff tanks; digestion of settled and activated sludge; mechanical removal of slugde; collection of gas from Imhoff tanks.

INDUSTRIAL MANAGEMENT

PLANT ENGINEERING ORGANIZATION. A Practical-Ideal Organization for Plant Engineering, L. C. Morrow. Indus. Eng., vol. 87, no. 10, Oct. 19 9, pp. 504-508, 3 figs. Composite chart of plant engineering function, and personnel of plant engineering department; organization charts of 15 plants; table giving place of plant engineering function in 15 plants; table of equipment for which plant engineering organization is factor in selection; kinds of work included as part of plant engineering function.

INTERNAL-COMBUSTION ENGINES

CRANKSHAFTS. The Design of Dynamically Balanced Crankshafts for Two Stroke Cycle Engines, P. Cormac. Engineering (Lond.), vol. 128, no. 3326, Oct. 11, 1929, pp. 458-461, 1 fig.; see also letter to editor, by C. R. King, in no. 3327, Oct. 18, p. 507.

SCAVENGING. Scavenging and Supercharging of Two-Cycle Engines (Spuelung und Aufladung bei Zweitaktmotoren), E. Stier. V.D.I. Zeit. (Berlin), vol. 73, no. 39, Sept. 28, 1929, pp. 1389-1391, 10 figs. Test results show how through interconnection of scavenging air, line of suitable proportions between cylinder and receiver, constant-pressure scavenging can be replaced by scavenging method with increased pressure and energy of scavenging air can be utilized for subsequent supercharging purposes.

SPECIFIC POWER OF. Problem of Specific Power of Liquid-Fuel Engines (La question de la puissance spécifique des moteurs à combustible liquide), A. Coppens. Union des Ingénieurs sortis des Ecoles Spéciales de Louvain (Brussels), vol. 56, no. 3, Aug. 15, 1929, pp. 3-52, 18 figs. Capacity of engine per unit of weight or inversely; horsepower per kg. engine weight is dependent on inherent characteristics of engine and its calculation; curves, tables, and design data for various types of engines in different fields of application.

(*See also Airplane Engines; Diesel Engines; Gas Engines.*)

IRON MINES AND MINING

LAKE SUPERIOR DISTRICT. The Cleveland-Cliffs Iron Company—History and Organization, S. R. Elliott. Min. Congress Jl., vol. 15, no. 10, Oct. 1929, pp. 727-729, 5 figs. Company organized in 1850 and shipped its first ore in 1852; history of growth and development of one of iron industry's most interesting producers is outlined.

MICHIGAN. The Negaunee District Underground Properties, W. W. Graff and C. Brewer. Min. Congress Jl., vol. 15, no. 10, Oct. 1929, pp. 741-747, 14 figs. Three mines in this district are connected underground for ventilation and safety, but have separate shaft and surface equipment; all equipment is standardized and interchangeable as far as possible; full description of method and equipment.

IRON ORE REDUCTION

ILMENITE. Metallization of the Oxide of Iron in Ilmenite, R. J. Traill and W. N. McClelland. Can. Chem. and Met. (Toronto), vol. 13, no. 10, Oct. 1929, pp. 265-268 and 272. Article previously indexed from Am. Electrochem. Soc.—Advance Paper, no. K. for mtg. May 27-29, 1929.

IRRIGATION

UNITED STATES. Report of the Committee of the Irrigation Division on a National Reclamation Policy. Am. Soc. of Civil Engrs.—Proc., vol. 55, no. 9, Nov. 1929, pp. 2375-2392, 4 figs. Discussion by G. E. P. Smith, R. K. Tiffany and D. Weeks, of report previously indexed from issue of May 1929; tentative five-year national reclamation programme; Federal reclamation and agricultural surplus; prices; effect of federal reclamation on potato industry; economic questions confronting reclamation; cost of reclamation and agricultural development should be apportioned among those receiving general and special benefits.

L

LATHES

MULTIPLE-TOOL. Multiple Machine-Tool Operation and Multiple-Machine Piece Rates (Mehrbankbedienung und Mehrbanakakkord), E. Hermann. Werkstattstechnik (Berlin), no. 18, Sept. 15, 1929, pp. 532-535, 3 figs. Conditions under which multiple-tool operation is efficient; output possibilities with relation to working times; dead time; time in-put, costs, contract wages, limits of efficiency; wage-payment plans.

LEVEES

CONSTRUCTION, MISSISSIPPI RIVER. Mississippi River Levee Work Uses Varied Equipment, V. J. Brown. Eng. and Contracting, vol. 118, no. 11, Nov. 1929, pp. 443-448, 16 figs. First of series of articles on Mississippi River levee work; features of draglines, hydraulic dredges and tower machines being used in contract of Sweet Price Dredging Corp.; general construction plan; progressive stages of work; hydraulic dredging work; drag line work; job control; progress charts and progress reports. (To be continued.)

LIGHTING

INDUSTRIAL INTENSITIES FOR USE IN. Profitable Foot-Candles, M. Luckiesh. Elec. World, vol. 94, no. 15, Oct. 12, 1929, pp. 743-744. In case of lighting, with its many psycho-physiological factors, maximum level of illumination fixed by law of diminishing returns is not so readily determined; it has become necessary not only to supply data on science of seeing, but also to insure its correct interpretation; table of results from test on effect of lighting is given; conclusion from data is that, where critical vision is required, 100 foot-candle represents economic level of illumination.

LIGHTNING GENERATORS

PORTABLE. Portable Lightning Generator for Testing Transmission Lines. Eng. News-Rec., vol. 103, no. 15, Oct. 10, 1929, p. 570, 1 fig. Equipment for generating over 1,000,000 volts assembled in portable form for testing transmission lines by Westinghouse Electric and Manufacturing Co., East Pittsburgh, Pa., is housed in four-wheel trailer which is drawn by tractor equipped with low-voltage generator, belt-driven by tractor motor; five hours are required to assemble apparatus from travelling position.

LIGNITE CARBONIZATION

SASKATCHEWAN. The Carbonization of Saskatchewan Lignite, J. P. de Wet. Can. Min. Jl. (Gardenvale, Que.), vol. 50, no. 41, Oct. 11, 1929, pp. 958-960, 1 fig. Brief general description of commercial carbonization plant of Western Dominion Collieries, Ltd.; advantages of Lurgi process are summarized; output is being increased from 100 to 200 tons per day; coke residue is manufactured into briquettes.

LIMESTONE QUARRIES AND QUARRYING

ONTARIO. Operating a Quarry for Road Contract. Can. Engr. (Toronto), vol. 57, no. 16, Oct. 15, 1929, pp. 621-623, 9 figs. Routly Construction Co., Toronto, operates old limestone quarry to supply stone for highway contract near Cornwall, Ont.; crushing plant operating in conjunction with road contractor's plant has output of 700 tons per day.

LOCOMOTIVE REPAIR SHOPS

PRODUCTION CONTROL. Production Methods in the Railroad Shops, A. E. Iveson. Am. Mach., vol. 71, no. 16, Oct. 17, 1929, p. 672. Savings obtained in railroad shop by modern shop-production methods are discussed; conditions such that mass production can only be practiced on very limited scale; standardization of repair parts difficult; major contributing factors in shop savings include placing materials adjacent to spot where it is to be utilized and giving each group of workmen one particular line of work and specified limited time to perform it; transportation often neglected. Abstract of paper presented before Int. Ry. Gen. Foremen's Assn.

LOCOMOTIVES

DESIGN. Theory of Locomotive Performance in its Development (Die Leistungstheorie der Lokomotive in ihrer Entwicklung), H. Nordman. V.D.I. Zeit. (Berlin), vol. 73, no. 40, Oct. 5, 1929, pp. 1413-1416. Theory of initial train resistance; power characteristics of locomotives originally neither properly represented nor interpreted; better understanding of these principles at present but still presupposes unchangeability of output of full load of boiler; cognizance of dependence of minimum output on speed.

DIESEL VS. STEAM. Economic Comparison of the Steam Locomotive with Different Types of Diesel Locomotives. Locomotive (Lond.), vol. 35, no. 446, Oct. 15, 1929, pp. 384-385. Economic value of steam locomotive as compared with different types of Diesel; description of test run together with test results; conclusion is drawn that Diesel locomotive is economical, although it is only in early stages of development.

HIGH-PRESSURE. High Pressure Locomotive Developments, A. F. Steubing. Am. Soc. Mech. Engrs.—Advance Paper for mtg. Dec. 2-6, 1929, 7 pp., 5 figs. Loeffler and Winterthur locomotives are described; former is express locomotive of 2,500 hp. with pressure of 1,470 lbs. per sq. in.; 1,200 hp. with boiler pressure of 850 lbs. per sq. in.; it is expected to result in fuel saving of 40 to 45 per cent compared with modern superheated locomotives; in road test of Winterthur locomotive but 330 lbs. of coal was necessary for firing up, as compared with double amount necessary for conventional locomotive of equivalent output.

OIL-BURNING. Oil-Burning Locomotives, 2-10-4 Type, Canadian Pacific Railway. Can. Ry. and Mar. World (Toronto), Nov. 1929, pp. 667-669, 4 figs. Low-carbon single steel is employed in crank pins and main and side rods; six cylinders, 25½ by 32 in.; driving wheel 63 in.; locomotive weight in working order 452,500 lbs.; wheel base 46 ft. ½ in.; boiler pressure 275 lbs.; locomotive tractive effort 77,200 lbs.

OIL-ELECTRIC. Canadian National's 2,600 hp. Oil-Electric Locomotives. Ry. Mech. Engr., vol. 103, no. 10, Oct. 1929, pp. 574-577, 5 figs. Demonstration run made with eight-car train; locomotive, which is largest and most powerful of its kind consists of two units and weighs 650,000 lbs. when fully equipped, of which 480,000 lbs. is carried on driving wheels; each unit contains Beardmore 12-cylinder oil engine of solid-injection type, with cylinders of 12-in. bore and 12-in. stroke; nominal rating of engine is 1,330 hp. at 800 r.p.m.; exhaust heat aids oil-fired boiler to heat train; selective data and dimensions of oil electric and steam locomotives.

STEAM-TURBINE. The Steam Turbine Locomotive, J. MacLeod. Ry. Gaz. (Lond.), vol. 51, no. 17, Oct. 25, 1929, pp. 618-609, 2 figs.; see also abstract in Modern Transport (Lond.), vol. 22, no. 554, Oct. 26, 1929, pp. 3 and 5, 1 fig. Discussion of condensing and non-condensing turbine locomotives; general arrangement of geared steam-turbine non-condensing locomotive, 4 ft. 8½ in. gauge, express passenger 4-6-4 type; boiler pressure, 750 lbs. per sq. in.; total steam temperature 750 deg. fahr.; tractive effort, 39,000 lbs., train load, 600 tons; maximum gradient, 1 in 100; steam per drawbar hp. per hr., 12.5 lbs.; coal per drawhar hp. per hr., 1.6 lbs. Abstract of paper before Instn. of Engrs. and Shipbldrs.

LUBRICANTS

CUTTING. Present Practice in the Use of Cutting Fluids, S. A. McKee. Am. Soc. Mech. Engrs.—Advance Paper, no. 59, for mtg. Dec. 2 to 6, 1929, 4 pp. Report is attempt to indicate trend or lack of trend toward use of particular type of cutting agent for given machining operation on given kind of metal; it is based on information obtained from 68 large users of cutting fluids in United States; list of number of plants using any of three general types of cutting agent (dry, water or emulsions, oils or oil mixtures) for each of 19 machining operations on eight kinds of metals; cutting agents used for various operations on given metal.

Oils, Properties of. Relation between Physical Characteristics and Lubricating Values of Petroleum Oils, E. D. Ries. Indus. and Eng. Chem.—Analytical Edition, vol. 1, no. 4, Oct. 15, 1929, pp. 187-191, 3 figs. Preliminary report of work done thus far in projected experimental programme of Chemical Engineering Laboratory of Pennsylvania State College.

LUBRICATION

Oil Films and Bearings. Oil Films and Bearings, H. Brillie and A. M. Robb. Engineer (Lond.), vol. 138, no. 3848, Oct. 11, 1929, pp. 382-384, 5 figs.; see also Shipbldg. and Shipg. Rec., vol. 26, no. 14, Oct. 3, 1929, pp. 405-406. Paper is based on work of G. Reynolds and suggestion that so-called "wedge formation" is not essential to maintenance of perfect film lubrication; expression is developed for giving actual thickness of oil film, or clearance between shaft and journal; outline of bearing for turbine machinery, based on considerations discussed is shown. Abstract of paper before Instn. Naval Architects.

Problems. Lubrication and Lubricants, R. M. Deeley. Engineer (Lond.), vol. 148, no. 3849, Oct. 18, 1929, pp. 405-407, 1 fig. Problem of lubrication is dealt with by first considering friction that occurs when two solid surfaces are in contact (adsorbed film lubrication), and then the state when they are entirely separated by viscous liquid (viscous film lubrication.)

M

MACHINE TOOLS

Hydraulic Feeds. Hydraulic Feeds and Speeds, A. L. DeLeeuw. Am. Mach., vol. 71, no. 19, Nov. 7, 1929, pp. 774-776. Present practice and trend in use of hydraulic feeds and speeds in machine tools are discussed; theoretical advantages and disadvantages of hydraulic feed are taken up; means for overcoming difficulty in having entire feed enme to standstill during certain period of time; it is possible to aid hydraulic feed by mechanical means in such a way that perfect timing is reached. Abstract of paper presented before World Eng. Congress.

MACHINERY

Welded, Design of. Welded Power Apparatus, H. V. Putnam and C. C. Brinton. Welding Engr., vol. 14, no. 10, Oct. 1929, pp. 46-49, 9 figs. Fundamental considerations involved in substitution of electrically welded fabricated steel parts for castings for engines, electric motors, and generators, vertical water wheel generators, high-speed and low-speed d.c. generators and converters and turbo-generators; advantages in this type of construction; equipment needed for electric cutting and arc welding materials; tolerances allowed in fabrication of structural-steel parts; design of structural-steel parts; limitations of fabricated-steel construction.

Vibrations in. Vibrations of Machinery and Foundations (Maschinen- und Fundamentschwingungen). Elektrizitaetswirtschaft (Berlin), vol. 28, no. 492, Sept. 2, 1929, pp. 486-488. Brief review of causes and remedies of vibration in large machinery of any kind in modern practice; short notes on papers read before special convention of Verein deutscher Elektrizitaet Werke.

MATERIALS HANDLING

Industrial Plants. Some Fundamental Principles of Materials Handling, H. V. Coes. Can. Machy. (Toronto), vol. 40, no. 21, Oct. 17, 1929, pp. 66, 68, 70 and 72. Cost of handling materials in two American industries; materials handling an important factor in determining plant layout in new industrial undertaking; principles of laying out materials-handling system; selection of equipment; question of whether return on investment is justified; rules for securing materials-handling economies.

Trends in Standardized Quality Production, J. H. Van Deventer. Am. Mach., vol. 71, no. 19, Nov. 7, 1929, pp. 777-779. Discussion of methods of gaining quality in mass production and how mechanical handling has been applied to attain it; machines grouped according to sequence; automobile production in two divisions; production creates consuming power; production development forces remodeling. Abstract of paper presented before World Eng. Congress.

Iron and Steel Plants. Materials Handling in a Structural Steel Fabricating Plant (Das Foerderwesen in einer Eisenkonstruktionswerkstaette), W. Meyer. Bautechnik (Berlin), vol. 7, no. 37, Aug. 27, 1929, pp. 589-596, 14 figs. Layout of plant fabricating structural steel members, with special reference to organization of conveyor system consisting of various types of platforms, overhead travelling cranes and elevators; statistics on operation and output of plant; cost data on operations; forms of records.

MAGNESIUM ALLOYS

Castings. A Note on Magnesium Alloy for Castings, E. Player. Aircraft Eng. (Lond.), vol. 1, no. 5, July 1929, pp. 175-178, 5 figs. Properties and practical processes in production of magnesium alloy castings are discussed with special reference to Elektron; foundry practice in regard to melting, moulding, and core making of magnesium alloys castings; trimming; machine-shop practice; protection against corrosion; die-castings.

Temperature Effect. High-Temperature Compression and Extrusion Tests of Metals and Alloys (Les essais à chaud métaux et alliages par compression et par filage), A. Portevin. Revue de Métallurgie (Paris), vol. 26, no. 8, Aug. 1929, pp. 435-443, 9 figs. Results of tests carried out on magnesium and magnesium alloys at temperatures not exceeding 500 deg. cent.; extrusion tests were carried out on hydraulic press.

MALLEABLE-IRON CASTINGS

Annealing. Shortens Malleable Anneal. Foundry, vol. 57, no. 19, Oct. 1, 1929, pp. 825-826, 3 figs. Results of investigations conducted by General Electric Co. to learn something of mechanism of carbon precipitation with view of possible shortening of process; high temperature with quick drop to 740 deg. cent. decreases heat-treating interval to 28 or 30 hours.

METALS

Deep-Drawn Plate. Testing of Deep-Drawn Plate (Die Pruefung von Tiefziehblech), M. Schmidt. Archiv. fuer das Eisenhuettenwesen (Duesseldorf), vol. 3, no. 3, Sept. 1929, pp. 213-220 and (discussion) 220-222, 15 figs. Requirement of deep-drawn plates; determination of deep-drawing capacity on drawing press; practical determination of drawing limit; description of simple process and results obtained; comparison with other testing methods.

The Fatigue of Metals—A Review of Progress from 1920 to 1929, H. F. Moore. Am. Iron and Steel Inst.—Advance Paper, for mtg., Oct. 25, 1929, 24 pp., 10 figs.

Machinability. Methods of Tests for Determining the Machinability of Metals in General, with Results, O. W. Boston. Am. Soc. Steel Treating—Trans., vol. 16, no. 6, Nov. 1929, pp. 659-694 and (discussion) 694-710, 54 figs.

Testing, Electric. Nondestructive Testing, E. A. Sperry. Am. Soc. for Steel Treating—Trans., vol. 16, no. 6, Nov. 1929, pp. 771-790 and (discussion), 790-798, 13 figs.

MECHANICAL ENGINEERING

Research with Models. Research in Mechanical Engineering by Small-Scale Apparatus, F. C. Johansen. Instn. Mech. Engrs.—Jl. (Lond.), no. 2, Mar. 1929, pp. 151-271, 29 figs. Objects of paper are to review present position of research by small-scale apparatus to suggest problems in mechanical engineering for which small-scale research appears to promise success; to refer, with brief descriptions, to existing examples of small-scale research in wide range of engineering subjects; and, most particularly, to evoke suggestions for improved methods and new lines of small-scale research in mechanical engineering.

MINES AND MINING

Practice, Developments in. Developments in Mining Practice, W. G. McBride. Can. Min. Jl. (Gardenvale, Que.), 50th anniversary no., Aug. 1929, pp. 116-122 and 174, 5 figs. General review of progress during 50 years; increased production and efficiency; prospecting; technical training; mining methods and mechanization.

British Columbia. A History of Mining in British Columbia, R. Dunn. Can. Min. Jl. (Gardenvale, Que.), 50th anniversary no., Aug. 1929, pp. 82-87, 162-166, 168-170, and 196-201. Brief historical review of mining development, dating from rush to gold placer fields of Cariboo district; Cassiar, Omineca, Similkameen, Atlin and other fields; rock mining; opening of transportation; Kootenay silver mines; Rossland, Trail, and Slocan district; zinc and copper production; northern districts; Premier mine; coal mining; résumé of mineral production; total value to end of 1927 is estimated at $1,048,837,828, during 77 years.

Canada. The Mining Industry in Canada, C. Stewart. Can. Min. Jl. (Gardenvale, Que.), 50th anniversary no., Aug. 1929, p. 37. Brief article by Canadian Minister of Mines; value of 1928 mineral output was $271,000,000, about 10 per cent more than 1927 or about $30 for each inhabitant of Canada; Canada produces about 70 metals or mineral products of economic value and 18 per cent of these constitute about 98 per cent of total annual output value; importance of miner to human industry is stressed.

Nova Scotia. A History of Mining in Nova Scotia. Can. Min. Jl. (Gardenvale, Que.), 50th anniversary no., Aug. 1929, pp. 113-114, 2 figs. Brief review, dating from report by mining engineer in 1640; notes on coal, copper, gold, gypsum, zinc, and lead deposits and mining operations.

MINE VENTILATION

Montana. Ventilation of the Butte Mines, Anaconda Copper Mining Company, A. S. Richardson. Min. Congress Jl., vol. 15, no. 10, Oct. 1929, pp. 813-816. Latest ventilation practice outlined; problem is temperature rather than purity; mine timber heat important factor; exhaust ventilation adopted; shaft compartments surfaced to reduce frictional resistance; flexible tubing used in dead ends.

N

NICKEL DEPOSITS

Ontario. Origin of the Frood Deposits of International Nickel, C. V. Corless. Eng. and Min. Jl., vol. 128, no. 16, Oct. 19, 1929, pp. 624-625. Discussion of paper previously indexed from Can. Min. and Met. Bul., Mar. 1929; submitted by A. C. Halferdahl, who submits interpretation of facts that he concedes may have hypothetical bearing on problem of origin of Frood deposit.

NITRIDATION

Fundamentals of. A Few Practical Fundamentals of the Nitriding Process, H. W. McQuaid and W. J. Ketcham. Am. Soc. Steel Treating—Trans., vol. 16, no. 5, Oct. 1929, pp. 183-195 and (discussion) 194-203, 18 figs. Results obtained in attempting to determine effects of some factors of nitriding process on depth hardness curves as shown by Vicker's test; results indicate that heat treatment prior to nitriding is essential to obtain satisfactory toughness and resistance to shock load; decarburization is not necessarily detrimental to nitriding operation; tests made with tantalum to eliminate or reduce hydrogen on surface being nitrided indicate that hardness is decreased thereby.

Special Steels. Influence of Nitrogen on Special Steels and Some Experiments on Case-hardening with Nitrogen, S. Satoh. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 260, 1929, 19 pp., 20 figs. Notes on tests, with current of ammonia gas at 580 deg. cent. and at 560 deg., on electrolytic iron, iron alloys, and specially prepared steels; effects of carbon, chromium, aluminum, titanium, manganese, molybdenum, zirconium, and of uranium; effect of nickel on penetration of nitrogen in electric arc welding. Bibliography.

NOISE

Instruments for Measuring. Determination of Noise Disturbances with Aid of Barkhausen Noise Meters (Pruefung von Geraeuschbelaestigungen mit Hilfe des Geraeuschmessers nach Barkhausen), E. Neitzel. Gesundheits-Ingenieur (Munich), vol. 52, no. 3 , Aug. 10, 1929, pp. 575-577, 2 figs. Acoustic principles of design of so-called noise meters, to serve as guide for policemen in enforcing rules against unnecessary noise; review of studies of Barkhausen, Lewicki, and Tischner; features of Barkhausen noise meter and methods of its use; scale of noise intensities.

NON-FERROUS METALS AND ALLOYS

Annealing. Annealing of Non-Ferrous Metals, J. F. Schrumn. New England Indus. Elec. Heating Conference—Proc., June 1929, pp. 41-42. Selection of sources of heat for annealing of non-ferrous metals and alloys is economic problem and decision made should be based on overall cost of finished product with different forms of heat; experience of large Connecticut company manufacturing non-ferrous tubing, mainly brass and copper; electric furnaces of other mill using counterflow electric recuperative furnace of 150-kw. capacity, etc.; operation and performance data are given.

Research. Volume Changes During the Solidification of Metals and Alloys of Low Melting Point, W. E. Goodrich. Faraday Soc.—Trans., vol. 25, no. 101, Oct. 1929, pp. 531-569, 21 figs. Metals investigated consist of tin, lead, bismuth, and zinc; lead-tin and bismuth-tin alloys; antimony-tin alloys; lead-antimony alloys; tin-antimony-copper and tin-lead-antimony ternary alloys, and some typical zinc-base alloys containing copper and tin and copper and aluminum.

O

OFFICE BUILDINGS

Construction. Confederation Building, Ottawa, Ont. Can. Engr. (Toronto), vol. 57, no. 17, Oct. 22, 1929, pp. 641-644, 4 figs. New office buildings, 9 storeys high with 16-storey tower, being built for Dominion Government, will cost about $2,500,000 and will have floor area for offices of 156,000 sq. ft.; plan of first floor; methods of steel erection, roof construction, etc.

Heightening. Extra Storeys Added to Steel Frame Building, J. G. Allen. Eng. News-Rec., vol. 103, no. 15, Oct. 10, 1929, pp. 574-575, 2 figs. Three-storey steel-frame building of Protective Life Insurance Co. in Birmingham, Ala., has been increased in height to 14½ storeys instead of to 12 as originally planned, through use of light-weight floor and fireproofing; typical details of reinforcing for wind in lower storeys.

OIL ENGINES

Cylinder Pressures. Pressure Effects in Pre-Combustion Oil Engines, J. A. Polson and H. E. Degler. Power Plant Eng., vol. 33, no. 21, Nov. 1, 1929, pp. 1165-1168, 5 figs. Investigation of pressures in Hvid type oil engine discloses conditions affecting power and efficiency; operation of engine; method of conducting tests; diaphragm indicator used for later tests; results and conclusions; several operating charts are given.

ORE TREATMENT

FLOTATION. Minerals and Flotation, B. M. Snyder and R. Lord. Can. Min. Jl. (Gardenvale, Que.), vol. 50, no. 41, Oct. 11, 1929, pp. 961-964 and 971, 1 fig. Brief résumé of responsiveness of various minerals to flotation; information is believed to be of interest to all mill operators.

CYANIDATION. Half a Century of Cyanidation, A. Anable. Can. Min. Jl. (Gardenvale, Que.), 50th anniversary no., Aug. 1929, pp. 136-141, 190, 192 and 194, 9 figs. Annual world production of gold has almost quadrupled since introduction of cyanide process; essential steps in cyaniding are crushing and grinding, classification, agitation, decantation, percolation, filtration and precipitation; cyanide history from 1887 to 1900, 1900 to 1912, and 1912 to 1929.

OXYACETYLENE WELDING

BRONZE. The Largest Bronze Welding Job in Canada, W. A. Duncan. Can. Machy. (Toronto), vol. 40, no. 20, Oct. 3, 1929, pp. 74-76, 5 figs. Description of repair work made on huge cast-iron shearing press frame of approximately 14 tons weight; job required 1,560 lbs. of bronze welding rod and 45 hrs. of continuous welding; methods of pre-heating; cost figures for complete job are given, showing relative cost between replacement of casting by new one and repair by welding.

P

PAVEMENTS, CONCRETE

EXPANSION JOINTS. Dummy Joints Prevent Cracks in Seattle Concrete Pavements, H. F. Faulkner. Eng. News-Rec., vol. 103, no. 16, Oct. 17, 1929, pp. 607-608, 4 figs. Surveys indicate that transverse dummy joints, which were adopted by city of Seattle as standard construction on concrete pavement three years ago, have almost eliminated cracks; method of construction of dummy joints, using T-bar to make groove, inserting premoulded filler, longitudinal floating over joint; testing continuity over finished dummy joints.

REINFORCEMENT. Reinforcing for Concrete Pavements, B. C. Briody. Can. Engr. (Toronto), vol. 57, no. 15, Oct. 8, 1929, pp. 616-618. Theory and practice in design of reinforcing steel for pavements; expansion and shrinkage of concrete and its effect on slab; frictional resistances to concrete slabs; calculations for design of reinforcement. Bibliography.

PILES

CONCRETE. Concrete Piles Cast Under New High-Pressure System, W. Walls. Compressed Air Mag., vol. 34, no. 10, Oct. 1929, pp. 2897-2898, 4 figs. Casting piles, in place, under air pressure; principal equipment required includes air compressor, casings, and tools commonly employed by well drillers; first length of steel casing is fitted with cutting edge; lengths that make up casing are flush jointed; when firm footing has been struck, hole is carried 2 or 3 ft. deeper and enlarged; subsoil water is removed by air-displacement, cement is introduced under pressure, air at 100 lbs. pressure admitted to compact grout foundation, and pile cast on top of it.

PIPE LINES

LAYING. Modern Pipe Line Construction Methods, E. F. Schmidt. Natural Gas, vol. 10, no. 10, Oct. 1929, pp. 5-7 and 64, 10 figs. Improved construction methods and equipment at lower cost of large lines and reduced time to complete them; advantage of airplane for survey and inspection; mechanized ditching and bandling of materials; organization of labour; welding of pipe line; protective coatings; increased efficiency and lowered accident rates, due to medical examination of applicants before employment.

PIPE, WELDED

TESTING. Tests of Oxwelded Joints in Steel Pipe. Can. Engr. (Toronto), vol. 57, no. 17, Oct. 22, 1929, pp. 649-651, 10 figs. Results of extensive tests made on full-size specimens in all commonly used sizes of pipe; 600-ton testing machine used for tests; types of joints tested; compressive and tensile tests of oxyacetylene welded joints in lap-welded steel pipe. From Dominion Service Tips.

PORTS

QUEBEC. Port Authorities Convention in Quebec. Can. Engr. (Toronto), vol. 57, no. 16, Oct. 15, 1929, pp. 636-638. Report on convention of American Association of Port Authorities; abstracts of papers on tackle vs. cranes, grain-handling equipment, Wolfe's Cove terminals, etc.

CONSTRUCTION, GROUND WATER CONTROL. Lowering Ground-water level in Construction of Port Structures in Antwerp (Le rabattement de la nappe aquifère, les grands travaux du port d'Anvers), P. De Smet. Union des Ingénieurs Sortis des Ecoles Spéciales de Louvain (Brussels), vol. 56, no. 3, Aug. 15, 1929, pp. 53-85, 13 figs. Description of methods of groundwater control in excavation for new marine structures, such as quay-walls and drydocks; use of well-points for draining trenches and foundation pit at various levels.

POWER PLANTS

COMBINED STEAM AND HYDRO-ELECTRIC. Combined Hydro and Steam Power Plants (Die Vereinbeitlichung von hydrokalorischen Verbundbetrieben), M. Seidner. Elektrotechnische Zeit. (Berlin), vol. 50, no. 42, Oct. 17, 1929, pp. 1523-1524. Conditions are outlined by which hydro-electric plants with continuous daily, and annual storage should be combined with steam plants to compound units in order to obtain greater economy and least production costs.

INDUSTRIAL, COST ACCOUNTING IN. Classification of Costs for Industrial Power Plants, W. N. Polakov. Power, vol. 70, no. 15, Oct. 8, 1929, pp. 558-560. Accurate knowledge of power costs is vital to efficient plant management, and necessary to any analysis of manufacturing cost; classification of power-plant expense which should serve as helpful guide in any specific instance; power-plant expense classification.

PULVERIZED COAL

COMBUSTION. Combustion of Pulverized Coal (La Combustion du Charbon Pulvérisé), J. Lacasse. Arts et Métiers (Paris), vol. 82, no. 106, July 1929, pp. 254-260, 11 figs.

Influence of Particle Size on Rate of Combustion of Coal Dust (Einfluss der Korngroesse auf die Entzuendbarkeit von Kohlenstaub), H. Steinbrecher. Archiv. fuer Waermewirtschaft (Berlin), vol. 10, no. 10, Oct. 1929, p. 350.

PUMPING STATIONS

LONDON. The Kempton Park Pumping Station of the Metropolitan Water Board. Engineering (Lond.), vol. 128, nos. 3325 and 3326, Oct. 4 and 11, 1929, pp. 425-427 and 470 and 455-458, 15 figs. partly on supp. plates. Oct. 4: Account of addition consisting of complete pumping plant, and set of primary filters: water is derived from River Thames; arrangements of bunkers and coal and ash-handling plant. Oct. 11: Arrangement of engine house; pumping machinery, constructed by Worthington-Simpson, consists of two vertical triple-expansion engines each of over 1,000 pump hp.; battery of 24 rapid gravity filters is being constructed in reinforced concrete.

PUMPS

SCREW. Testing of Screw Pump with Spiral Casing Made by Deutsche Werke Kiel. A.G. (Beproeving van een schroefpomp met slakkenbuis der Deutsche Werke Kiel A.G.), W. L. H. Schmid. Ingenieur (The Hague), vol. 44, no. 37, Sept. 14, 1929, pp. W.172-W.180, 10 figs. Test results; brief derivation of principal equation for turbine pumps; analogy between characteristics of a turbine pump of various speeds; these can be combined into one uniform characteristic; transformation of kinetic into potential energy in housing; explanation of violent eddying of suction water, etc.

PUMPS, CENTRIFUGAL

EFFICIENCY. Calculations of Efficiency Coefficient of Centrifugal Pumps (Foerutberaekning av verkningsgraden bos centrifugalpumpar), H. O. Dahl. Tecknisk Tidskrift (Stockholm), vol. 59, no. 33, Aug. 17, 1929 (Mekanik), pp. 101-105, 3 figs. Considering different losses in pumps, author shows method of computing efficiency and illustrates its use in four examples.

PROBLEMS. Engineering Problems of Centrifugal Pumps in Thermal Electric and Hydro-electric Plants (Problemi tecnici inerenti alel pompe centrifughe per gli impianti termo ed idroelettrici attuali), M. Medici. Energia Elettrica (Milan), vol. 6, no. 5, May 1929, pp. 469-483, 26 figs. Cavitation and corrosion in boiler feed pumps, turbo-pumps and turbines are discussed; European and American experience reviewed.

PUMPS, ELECTRIC

CONTROL. Variable Speed Control for A.C. Motors Driving Pumps, P. B. Harwood. Power, vol. 70, no. 16, Oct. 15, 1929, pp. 599-601, 3 figs. Two constant-speed and two adjustable-speed pumps are driven by a.c. motors; control on adjustable-speed units automatically gives 16 speeds from flat switch of unique design; two-inch change in water level produces change in speed.

QUALITY CONTROL

BASIC PRINCIPLES. Quality Control and Production Gauges, E. Buckingham. Am. Soc. Mech. Engrs.—Advance Paper, for mtg. Dec. 2-6, 1929, no. 7, 8 pp. Basic principles entering into quantity control and use of production gauges; development of interchangeable manufacturing should result in economies; tolerances should be as large as will result in satisfactory operation; drawings and specifications should give tolerances; analysis of data received from manufacturers regarding cost of inspection and percentage of scrapped parts; comments from several manufacturers. Bibliography.

R

RAILROAD OPERATION

STATISTICS, CANADA. Railway Operating Revenues, Expenses and Other Statistics. Can. Ry. and Mar. World (Toronto), Oct. 1929, pp. 612-615. Operating revenues and expenses of specific and all railroads as a group for June, July and first six months of 1928 and 1929.

RAILROAD STATIONS

MONTREAL. Proposed Passenger Station for Montreal. Modern Transport (Lond.), vol. 22, no. 551, Oct. 5, 1929, p. 13, 2 figs. Continued discussion, together with architectural drawings of work involved in construction of new passenger terminus; sectional view of proposed station is also given; track capacity; viaduct construction.

RAILROAD SIGNALS AND SIGNALLING

CENTRALIZED CONTROL. The D. and R.G.W. Expedites Trains by Centralized Control. Ry. Age, vol. 27, no. 15, Oct. 12, 1929, pp. 856-858, 7 figs. Remote switch machines, spring switches, and direction of movements by signal indication assist in eliminating delays; tracks and signal plan of centralized-control system in vicinity of Tennessee Pass; method of operation by signal indication; satisfactory results.

RAILROAD TIES

CONCRETE. On the Question of the Use of Concrete and Reinforced Concrete on Railways, F. B. Freeman. Int. Ry. Congress Assn.—Bul. (Brussels), vol. 11, no. 5, May 1929, pp. 433-445, 8 figs. Respective merits of various designs of reinforced-concrete ties of London, Midland and Scottish Railway; Norfolk and Portsmouth Line; Pennsylvania Railroad and others; reinforced-concrete roadbed of Pere Marquette Railway and New York Central Railroad.

RAILROADS

ONTARIO. Temiskaming and Northern Ontario Railway. Can. Min. Jl. (Gardenvale, Que.), 50th anniversary no., Aug. 1929, pp. 151-153. Notes on railroad owned by Ontario and operated by Commission; originally built as colonization road to develop agriculture; value of mining areas; pulp and paper; power; coal; scenic and sporting attractions.

INDUSTRIAL DEVELOPMENT, CANADA. The Development Branch of a Railway and How it Works, G. G. Ommanney. Can. Min. Jl. (Gardenvale, Que.), 50th anniversary no., Aug. 1929, pp. 148-150 and 196. Summary of activities of Development Branch of Canadian Pacific Railway Co.; particular attention is given to agriculture, forests, minerals, water power, fisheries and allied industries.

RECLAMATION. The Railroads and Reclamation, J. G. Stuart. Ry. Age, vol. 87, no. 17, Oct. 26, 1929, pp. 977-980, 5 figs. Recovery of discarded material pictured as large field of economy if properly controlled; stores should handle reclamation; quality important; true costs required.

RAIN AND RAINFALL

RUN-OFF. Determination of Run-off Coefficient (Beitrag zur Bestimmung des Abflussbeiwertes bei Regenfaellen), F. Reinhold. Bautechnik (Berlin), vol. 7, nos. 33 and 35, Aug. 2 and 16, 1929, pp. 507-510 and 529-532, 11 figs. Description of experimental lysimeter arrangement at Neufahrwasser near Danzig. Data showing correlation between duration of rainfall and intensities of run-off for various paving materials, also relation between duration of rainfall and run-off coefficient.

REFRIGERATION

EVAPORATING SYSTEMS. The Multi-Feed Multi-Suction Evaporating System, G. Hilger. Ice and Refrigeration, vol. 77, no. 5, Nov. 1929, pp. 344-345, 2 figs. Description of constructive details of new evaporating system for ice-making and refrigerating plants; also description of system installed in large dairy in Pittsburgh; list of applications of system in various parts of country; illustration showing essential features of multi-feed multi-suction evaporating system.

RESERVOIRS

CONCRETE. Methods of Construction of 2,000,000 Gallons Service Reservoir, Hastings, S. Little. Surveyor (Lond.), vol. 76, no. 1968, Oct. 11, 1929, pp. 329-332, 3 figs. Description of new water works; construction of concrete reservoir occupying area of 136 sq. ft., having depth of 18 to 19 ft.; lower half is divided into two compartments by wall 9 ft. high; details of expansion joints; excavation and formworks; testing of concrete. Paper presented before Instn. Mun. and County Engrs.

RIVERS

REGULATION. Regulation of Levels, Flow, and Navigation, Niagara River, G. B. Pillsbury. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 9, Nov. 1929, pp. 2427-2444, 7 figs. Discussion by R. E. Horton, L. L. Davis and T. M. Ripley, of paper published in issue of Sept. 1929; Lake level records of United States

Lake Survey up to 1924 with extension backward from 1859 to 1836; effect of channel deepening at lake outlet control point; prediction of maximum stages; use of storage schedules; operation of regulating works; commerce of Great Lakes; hydraulics of Niagara River; lowering of Lake Erie due to artificial changes.

ROAD CONSTRUCTION

ALBERTA. Improving Highways in Alberta, O. L. McPherson. Can. Engr. (Toronto), vol. 57, no. 16, Oct. 15, 1929, p. 624. Statement by Minister of Highways, reviewing work being undertaken on Jasper highway, Calgary-Edmonton Main Road, etc.; elimination of grade crossings.

ROAD MACHINERY

DEVELOPMENT IN. Road Construction and Maintenance Machinery, G. Marston. Can. Engr. (Toronto), vol. 57, no. 14, Oct. 1, 1929, pp. 134-135 and (discussion) 135-136. Author discusses enormous development in road machinery; operation of tiling machine; preparing surfacing materials; maintenance of roads; costs and operation of equipment; standardization of construction equipment; maintenance and repair equipment. Read before Can. Good Roads Assn.

ROAD MATERIALS

TESTING. The Testing of Non-Bituminous Road Materials, R. H. Picher. Can. Department Mines—Investigations (Ottawa), no. 697, 1929, pp. 68-75. Description of test methods; bedrock and boulders; gravel and sand; sampling methods.

ROADS, CONCRETE

RESURFACING. Resurfacing with Concrete, E. H. Bagford. Highway Engr. and Contractor, vol. 35, no. 3, Sept. 1929, pp. 62-63, 5 figs. Resurfacing of 6-mi. section of Dixie highway between Piqua and Troy, Miami county, Ohio, carrying traffic of 3,000 vehicles per day; new resurfacing placed directly over old pavement and divided into 10 by 40-ft. sections, by means of dummy joints, which are 3 in. deep longitudinally and 2 in. deep transversely.

CONSTRUCTION. Modern Trends in Cement-Concrete Highway Construction, H. S. Van Scoyoc. Can. Engr. (Toronto), vol. 57, no. 14, Oct. 1, 1929, pp. 141-144 and (discussion) 144-145. Discussion of Hunt process of curing, inundation-plant operation, proportioning and finishing, ready-mixed concrete manufacture, concrete testing, etc.; simpler specifications desirable; dummy joints. Paper read before Can. Good Roads Assn.

ROADS, GRAVEL

MAINTENANCE AND REPAIR. Gravel Highways and Their Treatment, R. W. McColough. Can. Engr. (Toronto), vol. 57, no. 14, Oct. 1, 1929, pp. 164-167 and (discussion) 167. Principal operations necessary to maintain serviceable gravel roads; maintenance organization and materials; employment of machinery; blading and dragging; corrugations or ripples; dust layers; application of calcium chloride and common salt. Paper presented before Can. Good Roads Assn.

ROADS, LOW COST

CANADA. Secondary Roads and Their Place in Canadian Highway Development, R. M. Smith. Can. Engr. (Toronto), vol. 57, no. 14, Oct. 1, 1929, pp. 129-132 and (discussion) 032-133. General discussion of construction and maintenance of low-cost roads in Canada such as bituminous penetration pavement, water-bound macadam road, gravel roads, re-tread type of surface; application of bitumen; mulch treatment for gravel roads; Quebec secondary roads; cost of construction.

S

SCREWS

COLD HEADING AND THREAD ROLLING. Cold-Heading and Thread Rolling, F. R. Daniels. Iron Age, vol. 124, no. 16, Oct. 17, 1929, pp. 1027-1028. Characteristics of steel wire best suited to cold heading and thread rolling in making bolts, screws, and rivets are discussed; importanee of adequate drawing; wire finish for bolts, screws and rivets; temper is heavy factor; heat treatment of cold-headed blanks; numerous analyses suitable for cold heading and threading in alloy steel field.

SEAPLANES

DESIGN. Seaplane Design, T. P. Wright and G. A. Luburg. Aviation Eng., vol. 10, no. 2, Oct. 1929, pp. 32-35. Seaplane operation, although confined to sea and waterways, commercially can compete to great extent with that of land plane; requirements for float or hull design, including seaworthiness at rest or at anchor, seaworthiness and stability when under way, low water resistance and absence of suction, clean lines, proper free board and excess buoyancy, and aerodynamic cleanness; arrangements of floats; design of step location, bow, stern, bottom deck, and hydrovanes; structural composite arrangement. Abstract of paper presented before Am. Soc. Mech. Engrs.

LAUNCHING. A Rival to the Catapult. Aeroplane (Lond.), vol. 37, no. 10, Sept. 4, 1929, pp. 653-654, 3 figs. Kiwull Watersail method of launching and picking up seaplanes, which can be used when vessel is under way, is briefly described; Watersail is 98 by 32 ft. expanse of canvas with spreader booms on underside and kind of drogue of wide-mesh netting; plane taxis behind steamer and is run onto trailing runway.

SHEET METAL

TESTING MACHINE FOR. Sheet Metal Testing Machine. Engineering (Lond.), vol. 128, no. 3327, Oct. 18, 1929, p. 497, 4 figs. Tool has been introduced by W. and T. Avery, for testing quality of metal sheets intended for press work, or alternatively for controlling annealing of metal sheets of every description; tester can, if required, be used for mild sheets as much as 10 B.G. thick, but makers recommend that, in general, steel sheets to be tested should not be more than $\frac{1}{16}$ in. thick.

SLABS

CONCRETE. Flat and Corrugated Slabs as New Structural Element of Concrete Construction (Scheiben und Faltwerke als neue Konstruktionselemente im Eisenbetonbau), H. Craemer. Beton u. Eisen (Berlin), vol. 28, nos. 13 and 14, July 5 and 20, 1929, pp. 254-257 and 269-272, 22 figs. Author discusses advantages of self-supporting slabs in construction of bunkers, roofs, floors, walls, etc.

SNOW REMOVAL

ROADS. How the Various States are Handling Their Snow Removal Problems. Roads and Streets, vol. 69, no. 10, Oct. 1929, pp. 378, 380, 384, 386, 388, 390, 398 and 400, 15 figs. Notes on operations in winter of 1928-29 obtained from questionnaire sent to highway departments of states in snow belt.

STREETS. How 73 Cities Are Tackling the Snow Problem. Am. City, vol. 41, no. 5, Nov. 1929, pp. 101-102. Summary of reports from Municipal Officials in charge of snow removal. (To be concluded.)

STEAM CONDENSERS

SURFACE. Alignment Chart for Calculation and Analysis of Surface Condensers (Nomogramm zur Berechnung und Beurteilung von Oberflaechnkondensatoren), H. Kuegne. Waerme (Berlin), vol. 52, no. 37, Sept. 14, 1929, pp. 716-719, 2 figs. Plotting and description of nomogram for direct determination of performance of surface condensers.

Condensing Equipment. Nat. Elec. Light Assn.—Serial Report, Aug. 1929, 35 pp., 33 figs. Study of data received, corrected to common basis of water velocity and inlet water temperature, indicates that performance of single-pass condensers is somewhat better than that of two-pass type; performance of vertical condensers is appreciably better than horizontal condensers with same number of passes; tables and performance data for 15 two-pass and 11 single-pass condensers; leakage resulting from tube vibration has been most effectively remedied by installation of additional tube support sheets and by use of thicker tubes.

STEAM-ELECTRIC POWER PLANTS

DESIGN. Trends in Design of Electric Superpower Plants (Les tendances actuelles dans la construction des supercentrales électriques), L. Le Paige. Revue Universelle des Mines (Liége), vol. 72, nos. 4, 5 and 6, Aug. 15, Sept. 1, and Sept. 15, 1929, pp. 107-111, 144-156, and 173-182, 17 figs. Developments in Europe and United States; capacity of modern plants; fuel economy; guaranteed consumption of modern European turbines from 10,000 to 43,500 kw.; mechanical stokers; economizers and air heaters; boiler equipment; pipe lines; feedwater and water treatment; details of existing plants in United States and Europe.

DETROIT, MICH. New 100,000 Kw. Delray Power Plant Placed in Operation, F. J. Chatel. Power, vol. 70, no. 19, Nov. 5, 1929, pp. 710-715, 6 figs. General description of equipment in new Delray power house No. 3; standard 50,000-kw. units installed; main unit auxiliaries; illustration showing cross-section through boiler house; 15-retort 57-tuyère underfeed stokers.

EVANSVILLE, IND. Ohio River Station. Power Plant Eng., vol. 33, no. 21, Nov. 1, 1929, pp. 1148-1154, 8 figs. New 400-lb. station of Southern Indiana Gas and Electric Co. has initial capacity of 20,000 kw. in two units; steam supplied by two 1,152-hp. boilers fired by underfeed stokers; draft and furnace arrangements give extremely flexible control; coal has equipment enclosed to eliminate dust; cross section through station showing boiler, turbine and auxiliary arrangement; all auxiliary motors operate on 4,400 volts; list of equipment installed in Ohio River station.

STEAM ENGINES

EFFICIENCY. Thermic and Thermodynamic Efficiency Factor of Steam Power Machinery (Thermischer und thermodynamischer Wirkungsgrad von Dampfkraftmaschinen), G. Zerkowitz. V.D.I. Zeit. (Berlin), vol. 73, no. 40, Oct. 5, 1929, pp. 1429-1433, 7 figs. Graphical mathematical analysis.

STEAM HEATING

SATURATED VS. SUPERHEATED STEAM. Superheated vs. Saturated Steam for Heating Systems (Heissoder Sattdampf fuer Heizungsanlagen?), F. Kaiser. Zeit. des Bayerischen Revisions-Vereins (Munich), vol. 33, nos. 15, 16, 17 and 18, Aug. 15, 31, Sept. 15 and 30, 1929, pp. 216-218, 233-237, 249-252 and 259-263, 6 figs. Aug. 15: Notes on steam and surface temperatures. Aug. 31: Heat emission from different parts of heating element. Sept. 15: Results of steam measurement in cookers, drying and heating plants, etc. Sept. 30: Comparison of results with other researches; conclusions.

STEAM PIPE LINES

HIGH-PRESSURE. Construction of Steam Pipe Line of 44 Kg. Pressure and 450 Deg. Temperature (Note sur une exécution de tuyauterie de vapeur à 44 kilogrammes et 450 degrés), F. Battestini. Bull. Technique du Bureau Veritas (Paris), vol. 11, no. 8, Aug. 1929, pp. 173-174, 1 fig. Particulars of installation at power plant of Issy-les-Moulineaux, France; fatigue testing of tubes; properties of steel employed; use of welded joints.

Testing of Material Used in Piping for High-Pressure Steam (Essais des matériaux employés dans les canalisations de vapeur à température élevée), L. Guillet, J. Galibourg and M. Samsoen. Revue Générale de l'Electricité (Paris), vol. 26, no. 15, Oct. 12, 1929, pp. 577-580, 3 figs. Elasticity meter, which is used for keeping temperature of test piece constant at 450 deg. cent., is described; results of tensile-strength tests on nickel and chromium-nickel steels.

STEAM POWER PLANTS

HIGH-PRESSURE. Initial Costs of Power Plants Compared on a Pressure Basis. Power Plant Eng., vol. 33, no. 21, Nov. 1, 1929, pp. 1158-1162, 8 figs. Estimates and actual costs show that additional expense of high pressure ranges from $5 to $10 per kw. of capacity higher than for moderate pressures; analysis shows why higher pressure does not greatly increase total cost; relative costs of various parts in steam and electric generating stations, as prepared by Edison Electric Illuminating Co. of Boston; comparison of cost of following stations: Toronto, Deepwater, Lakeside, Holland, and Northeast.

High-Pressure Steam Installations in Austria (Hochdruck-Dampfanlagen in Oesterreich), P. Swiauer. Elektrotechnik u. Maschinenbau (Vienna), vol. 47, no. 36, Sept. 8, 1929, pp. 772-775. Development in high-pressure steam practice and equipment since 1924; tabulation of high-pressure boiler installations classified according to industries where used; year of installation; data regarding capacities and size.

STEAM TURBINES

HIGH-PRESSURE. Efficiencies of High-Pressure Steam Turbines, I. Melan. Power Plant Eng., vol. 33, no. 20, Oct. 15, 1929, pp. 1111-1112, 3 figs. Investigation of high-pressure turbine tests leads to conclusion that turbine efficiencies are function not only of Parsons characteristic but of weight of steam going through turbine as well; test data on various turbine units operating under wide range of steam conditions. From Siemens-Zeit.

LOSSES. Expansion of Saturated Steam in Steam Turbines (Die Entspannung von Nassdampf in der Dampfturbine), G. Zerkowitz. Archiv. fuer Waermewirtschaft (Berlin), vol. 10, no. 8, Aug. 1929, pp. 271-274, 3 figs. Thermodynamic loss does not occur with formation of large drops, but a flow loss does occur as water drops remain behind steam particles; taking into consideration fact that steam particles along upper boundary expand considerably, simple rules for efficiency loss are obtained.

TESTING. Consumption Tests on Steam Turbines and Influence of Different Factors on their Performance (Essais de consommation des turbines à vapeur et influence de différents facteurs sur leur fonctionnement), M. Hentsch. Science et Industrie (Paris), vol. 13, no. 182, Mar. 1929, pp. 161-165, 14 figs. Notes on condensation and bleeder turbine; definition of efficiency coefficient; variation of pressure at intermediate › oints, etc.

STEEL

AGE HARDENING. The Effect of Aging and Blue-Brittleness on the Toughness of Low-Carbon Steel, A. Kuehle. Metals and Alloys, vol. 1, no. 4, Oct. 1929, pp. 172-175, 11 figs.

Embrittlement. Embrittlement of Steel (Sur la fragilité des aciers), G. d'Huart. Science et Industrie (Paris), nos. 188 and 189, Sept. and Oct. 1929, pp. 559-569 and 636, 58 figs.

Quenching. Hot Aqueous Solutions for the Quenching of Steels, H. J. French and T. E. Hamill. U.S. Bur. Standards—Research Paper, vol. 3, no. 103, Sept. 1929, pp. 399-418, 13 figs.

STEEL FOUNDRIES

Production Control in. Production Control in Steel Foundry, R. A. Fiske. Iron Age, vol. 124, no. 16, Oct. 17, 1929, pp. 1029-1033, 11 figs. partly on supp. plate. Factors which have enabled Sivyer Steel Casting Co., Milwaukee, to keep close control of orders and materials in process, and to forward unusually high percentage of orders on dates scheduled are discussed; accurate checks on materials and plant methods used with frequent inspections and daily "pow-wow" to meet specifications and scheduled delivery dates; old patterns studied before again being sent into shop; shipping schedules discussed at production meetings; records disclose past difficulties.

STRUCTURAL STEEL

Arc Welding. Arc Welding of Steel Frame Structures, M. D. Fish. New England Indus. Elec. Heating Conference—Proc., June 1929, pp. 25-30, 5 figs. Economic side of welded construction; ways in which cost savings may be, and sometimes are, accomplished are pointed out; outstanding difficulties which are temporarily obstructing fair cost comparisons are explained; construction features having special economic significance are illustrated.

SURVEYING

Traverses. Adjustment of Transit and Stadia Traverses, H. S. Rappleye. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 9, Nov. 1929, pp. 2301-2305, 1 fig. Paper presents problem of adjusting transit and stadia traverses, by correcting lengths only, and sets forth simple method of applying theory of least squares.

SEWAGE DISPOSAL

Stream Flow Aeration. Sewage Treatment by Stream-Flow Aeration, H. N. Jenks and M. Levine. Water Works and Sewerage, vol. 76, no. 9, Sept. 1929, pp. 381-386, 5 figs. Improvement in activated-sludge method based on application of stream-flow principle; contrasts and similarities in aerobic sewage treatment; engineering design of stream-flow reaeration; effect of recirculation on retention period; pumping equipment; plant-operating data; efficiency; effect of biologic staging; power requirements; cost of construction. From Pub. Health Report.

Activated Sludge. Activated Sludge Plant Operation in Great Britain, A. S. M. Parsons. Water Works and Sewerage, vol. 76, no. 9, Sept. 1929, pp. 397-399. In attempting to deal with difficulties encountered in activated-sludge plant of Reading Corporation writer was forced to conclusion that many empirical rules of operation are not applicable, and that process is not simply biological; experiment proving that aeration is not essential; carbonaceous fermentation; direct cell action; experience on percolating beds; stages of activated-sludge process.

Sedimentation. Sedimentation of Sewage, A. M. Kivari. West. Construction News, vol. 4, no. 19, Oct. 10, 1929, p. 512. Discussion of principles of sedimentation of sewage in sewage disposal plants; relationship between settleable and suspended solids and biochemical-oxygen demand. Paper presented before Sanitary Engineering Section, University of Southern California.

Aeration. Aerating Sewage, J. L. Mason. West. Construction News, vol. 4, no. 19, Oct. 10, 1929, pp. 523-525, 2 figs. Principles, historical development and present-day practice of activated-sludge process; description of Watsco aerator, invented by F. V. Hammerly, consisting of direct-connected, semi-displacement, screw-type pump, discharging downward through venturi throat; suction produced by flow through restricted throat draws air into sewage stream; results of recent tests of Watsco aerator installation at Montezuma, Calif.

SEWAGE DISPOSAL PLANTS

Operating Costs. Cost of Sewage Works Operation, C. E. Keefer. Water Works and Sewerage, vol. 76, no. 10, Oct. 1929, pp. 423-424. Data for treatment plant of Baltimore, Md.; interest and depreciation charges; calculating depreciation; operation and maintenance charges; cost of sewage treatment at Baltimore per capita per year for 1921 to 1928, including cost of operating treatment units; personnel of Baltimore sewage works. From Sewage Works Jl.

Germany. The Emscher-Type Sewage Disposal Plant at Karnap near Essen (Die Emscher-Klaeranlage bei Essen-Karnap), M. Pruess. Gesundheits-Ingenieur (Munich), vol. 52, nos. 35, 36, and 37, Aug. 31, Sept. 7, and 14, 1929, pp. 615-620, 630-636 and 647-651, 41 figs. General discussion of sewage-disposal problems of Emscher Union of Municipalities; significance of work of Union for area served and particularly for protection of Rhine from pollution with phenol waste; description of very large sewage disposal plant having average daily capacities of 850,000 cu. m. and producing annually 250,000 tons of sludge containing 50 per cent of water; method of flood utilization; total cost over 3,000,000 marks.

SEWER SIPHONS

Design. Experience in Construction of Siphon Sewers (Erfahrungen beim Bau von Abwasserdueckern). H. Rossberg. Gesundheits-Ingenieur (Munich), vol. 52, no. 30, July 27, 1929, pp. 550-555, 3 figs. Comparison of old-fashioned and modern types of design in light of experience of sewer department of Leipzig; design and construction of new type siphon 1.2 m. in diam. under Elster River, in Leipzig, and reconstruction of old type sewer in Leipzig.

SEWERS

Design. Modern Construction of Sewers Greatly Increases Carrying Capacity, F. C. Scobey. Hydraulic Eng., vol. 5, no. 10, Oct. 1929, pp. 18-20 and 45-46, 3 figs. Discussion of elementary principles and formulae used in hydraulic design of concrete sewers; author states modern conduit will carry from 30 to 50 per cent more water, size for size, shape for shape, slope for slope, than was feasible 30 or 40 years ago. Abstract of paper presented before Univ. of South. Calif. short course.

T

TORSION TESTING

Foettinger Torsionmeter. The Foettinger Torsionmeter. Engineering (Lond.), vol. 128, no. 3328, Oct. 25, 1929, pp. 542-543, 2 figs. Indicator rotates with shaft and its dial, being brightly illuminated by proper shaded electric lamp which moves with it; there is, it is stated, no difficulty whatever in taking readings whether shaft be running fast or slow; sleeve disc and drum are all made of aluminum so that even largest sizes of torsion meter is of moderate weight; it is made in nine standard sizes.

TRACKLESS TROLLEYS

Double-Decked, Top-Covered. Trackless Trolley Extension and Modernized Tramcars, R. A. Fernley. Elec. Ry. Bus and Tram Jl. (Lond.), vol. 61, no. 1523, Sept. 20, 1929, pp. 193-195, 4 figs. Description of new double-deck top-covered trackless trolleys with seating capacity for 60 persons, which were manufactured by Richard Garrett and Sons, and are employed on Southend trolley omnibus route; overhead line construction.

TRANSPORTATION

Canada. The Development of Travel in the Canadian North, R. C. Rowe. Can. Min. Jl., (Gardenvale, Que.), 50th anniversary no., Aug. 1929, pp. 155-157 and 194. Review of development of transportation methods; recent accomplishments in airplane travel are featured.

TUBES

Seamless, Manufacture of. Germany Extruding Seamless Tubes of Stainless Steel, W. Trinks. Iron Age, vol. 124, no. 18, Oct. 31, 1929, p. 1160. Marked development in making of seamless tubes in Germany discussed; Mannesmann Tube Co. extrudes seamless tubes up to 3-in. in diam. of stainless steel; several expanding mills being developed; Mannesmann Co. has mill similar to Stiefel expanding mill but uses tension mandrel; new piercing mill; rolling from large hollow ingots. Abstract of paper presented before Am. Soc. Mech. Engrs.

TUNNELS, RAILROAD

Maintenance and Repair. Unusual Methods Used in Repair of Roof Girders in Street Underpass, H. T. Welty. Eng. News-Rec., vol. 103, no. 17, Oct. 24, 1929, pp. 642-643, 2 figs. Method of repairing roof of New York Central Railroad tunnel, under Brook Ave., Bronx, N.Y.C.; dead-load stress placed on new cover plates by torch heating prior to arc welding; details of girders reinforced by new arc-welded cover plates; features of special car equipment used.

TUNNELS, VEHICULAR

Detroit. The Detroit-Canada Vehicular Tunnel. Eng. News-Rec., vol. 103, no. 16, Oct. 17, 1929, pp. 600-606, 16 figs. Construction of tunnel under Detroit River between Detroit and Windsor, Ont., 5,135 ft. long from portal to portal, carrying two 14-ft. roadways, headroom 13.5 ft.; steel-lined reinforced-concrete segments of subaqueous portion, which is 2,454 ft. long, were fabricated on land, towed out and sunk in dredged trench on bottom of river; details of joints between subaqueous segments; shield-driven tunnel design and construction.

V

VIADUCTS, CONCRETE

Construction. Washington Highway Has Heavy Grading for Viaduct, W. A. Scott. Highway Engr. and Contractor, vol. 35, no. 3, Sept. 1929, pp. 43-47, 12 figs. Methods used in construction of Washington State Highway between Vancouver and Maryhill; drilling and blasting, truck haulage of rock, etc.; details of location, design and construction of Cape Horn viaduct consisting of twelve 34-ft. spans, supported by thirteen 3-column concrete bents, costing $110,000.

W

WALLS

Brick, Testing. Compressive Strength of Clay Brick Walls, A. H. Stang, D. E. Parsons and J. W. McBurney. U. S. Bur. of Standards—Jl. of Research, vol. 3, no. 4, Oct. 1929, pp. 507-571, 35 figs. Results are given of compressive tests of 168 brick walls, each 6 ft. long and about 9 ft. high and of 129 wallettes, about 18 in. long and 34 in. high; four kinds of brick, 3 mortar mixtures, 2 grades of workmanship, different curing conditions and 10 different types of masonry (3 solid and 7 holow) were variables; construction data are given which show relative saving in materials and time for hollow types; results of wallette tests confirm, in general, conclusions deduced from wall tests.

Concrete. Modern Concrete Walls (Tidsenliga betongvaggar), T. Bilde. Tecknisk Tidskrift (Stockholm), vol. 59, no. 18½, May 8, 1929, pp. 273-277, 10 figs. Description of fireproof, heat and sound-insulating walls of celluar cellular concrete; experiments with concrete brick with trade names, "gas concrete," "pool stone," and "Nopsa system"; table showing heat-insulating properties of different building materials.

WATER FILTRATION

Wash Water. A New Index for Determining Wash-Water Rates in Rapid Filters. Eng. News-Rec., vol. 103, no. 18, Oct. 31, 1929, pp. 696-698, 4 figs. Investigator of Detroit Water Department finds sand expansion is better than wash-water rise as criterion of effective cleaning; graphical charts for determination of loss of head, wash-water velocity required to expand various sands, etc.; benefits derived by varying wash-water rates with changes of water temperatures.

WATER FILTRATION PLANTS

Ottawa. Experimental Filter at Ottawa. Can. Engr. (Toronto), vol. 57, no. 19, Nov. 5, 1929, p. 686. Information obtained from operation of experimental filters; colourless, tasteless, and sparkling water assured; only alum used as coagulant; 90 per cent of floc will settle in sedimentation tanks and filters will remove remaining ten per cent; filtration requires only one-fifth present quantity of chlorine; corrosive action will be corrected by addition of two grains of lime per gallon.

WATER PIPE LINES

Welding. Electrically Welded Pipe Lines, S. Martin, Jr. Am. Water Works Assn.—Jl., vol. 21, no. 9, Sept. 1929, pp. 1117-1141 and (discussion) pp. 1141-1152, 8 figs. Comparison of riveted with welded pipe; results of preliminary tests to determine proper welding procedure to give reliable and uniform results; operation in manufacture of welded pipe; tentative set of specifications for procedure control for welding inspection and test of welded pipe.

WATER PURIFICATION

Odour and Taste. Improving the Odour and Taste of Potable Water (Verbesserung des Geruchs und Geschmacks von Trinkwasser), F. Sierp. Technisches Gemeindeblatt (Berlin), vol. 32, nos. 11 and 12, June 5 and 20, 1929, pp. 153-156 and 165-169. Review of results of recent studies made in United States, Great Britain, and Germany on tastes and odours caused by algae, fungi and phenol substances; methods of control.

Valuable Report. A Valuable Report, Metropolitan Water Board, London, N. J. Howard. Contract Rec. (Toronto), vol. 43, no. 34, Aug. 21, 1929, pp. 969-970. Report contains statistical data and information on results of purification methods; over 5,481,000,000 gals. of water received treatment of ammonia and permanganate of potash before chlorination at total cost of 46 cents per 1,000,000 gals.; details of bacteriological researches are given: tables of hydraulic equipment and conversion.

WATER SOFTENING

Marion, Ohio. Operating Experiences with a New Water Softening Plant at Marion, Ohio, M. E. Flentje and C. Whysall. Hydraulic Eng., vol. 5, no. 9, Sept. 1929, pp. 13-15 and 43, 1 fig. Plant described is unusual because of extreme hardness of water being treated; use of all-steel construction above ground; application of double carbonation to produce effluent of low alkalinity.

Zeolite Process. Softening Municipal Water Supplies, J. T. Campbell and D. E. Davis. Am. Water Works Assn.—Jl., vol. 21, no. 8, Aug. 1929, pp. 1035-1053, 3 figs. Comparative annual cost estimates for lime-soda vs. zeolite softening; design features of zeolite softener; operating procedure adopted at Ohio Valley Water Company; cost of zeolite softening plant; water softening at Sweickley, Pa. Paper presented before San Francisco Convention.

WATER SUPPLY

Vancouver. Development of Mountain Lake Reservoirs, W. H. Powel. Eng. Jl. (Montreal), vol. 12, no. 9, Sept. 1929, pp. 483-498, 14 figs. Results of experiments and experience with development of water supply system for Vancouver.

WATER SUPPLY ENGINEERING

Great Britain. British Rainfall, Water Consumption and Water Treatment, M. N. Baker. Eng. News-Rec., vol. 103, no. 13, Sept. 26, 1929, pp. 497-500. Notes on recent drought, with summaries of per capita water consumption, methods of water purification in use, etc.; rainfall and runoff of River Thames for 26 seasonal years 1903-1904 to 1928-29 inclusive; treatment of highly polluted water for compensation purposes at Sheffield.

WATER SUPPLY, SURFACE

Canada. Arctic and Western Hudson Bay Drainage. Canada Department of Interior—Water Resources Paper (Ottawa), no. 57, 1929, 224 pp. Results of hydrometric investigations in provinces of Alberta, Saskatchewan, Manitoba, and that portion of Ontario drained by Nelson River for climatic year ending September 30, 1927. See also Engineering Index 1928, p. 1975.

WATER TREATMENT

Ontario. Water Treatment Problems in Ontario and How They Were Solved, A. V. Delaporte. Contract Rec. (Toronto), vol. 43, no. 42, Oct. 16, 1929, pp. 1235-1236. Paper presented before Am. Water Works Assn., previously indexed from Can. Engr., July, 1929

Innovations in Water Treatment, A. V. Delaporte. Water Works and Sewerage, vol. 76, no. 9, Sept. 1929, pp. 390-391. Paper previously indexed from Can. Engr., July 9, 1929.

Taste and Odour Removal. Various Methods for the Removal of Tastes and Odours, L. B. Harrison. Water Works Eng., vol. 72, no. 23, Nov. 6, 1929, pp. 1621-1622, 1 fig. Tastes and their causes; superchlorination and dechlorination; chlorine-ammonia treatment: permanganate-chlorine treatment; activated carbon.

Disinfection. Two Laws of Drinking-Water Purification (Zwei Gesetze der Trinkwasserreinigung), N. Malischewski. Gesundheits-Ingenieur (Munich), vol. 52, no. 32, Aug. 10, 1929, pp. 569-571, 1 fig. On basis of American (Ohio River basin) and Russian practice data, author derives equation correlating bacterial contents of raw and filtered water from same source of supply, and concludes that repetition of same process of purification produces better results than more intensive one-time use of process.

WATER WORKS

Operation, Canada. The Operation of a Waterworks System, W. E. MacDonald. Contract Rec. and Eng. Rev. (Toronto), vol. 43, no. 34, Aug. 21, 1929, pp. 966-968. Maintenance problems discussed are: appurtenances inspection; maintenance of fire hydrants; valves and meters; prevention of electrolysis; regular and systematic survey for detection of leaks; thawing of frozen services; and finally, efficient handling of all general and emergency repairs to system throughout 24 hr. each day.

The Operation of a Waterworks System, W. E. MacDonald. Contract Rec. (Toronto), vol. 43, no. 30, July 24, 1929, pp. 863-865.. Paper presented before Am. Water Works Assn., previously indexed from Can. Engr., July 9, 1929. (To be continued).

Leak Surveys, San Francisco. Leak Surveys of the Spring Valley Water Company, V. E. Perry. Am. Water Works Assn.—Jl., vol. 21, no. 8, Aug. 1929, pp. 1010-1012. Results of 1913 and 1924 leak surveys in San Francisco, using aquaphone for testing and following up with visual inspection of all premises where leaks were reported; in 1924 publicity campaign was adopted and proved very effective; table giving number of services in use, surveyed, and found wasting; also amont of work performed per man per hour in both surveys.

WEIRS

Discharge. New Method of Computing Discharge over Weirs from Velocity Distribution in Nappe over Weir Crest (Neues Berechnungsverfahren fuer den Abfluss an Wehren aus der Geschwindigkeitsverteilung des Wassers ueber der Wehrkrone). Bautechnik (Berlin), vol 7, no. 37, Aug. 27, 1929, pp. 575-582, 28 figs. Critical review of accepted formulae; report on experimental studies made at Hydraulic Laboratory of Danzig Institute of Technology, including cases of complete and partial submergence; theoretical conclusions and formulae derived from experimental studies.

Automatic. Automatic Roof Weirs Used for Reservoir Control on Guadalupe River, E. L. Chandler. Eng. News-Rec., vol. 103, no. 18, Oct. 31, 1929, pp. 685-688, 5 figs. Texas Power Corp. uses Huber and Lutz patented crest gates similar to beaf-trap flood gates at three power plants in southern Texas; method of construction, structural details and details of operating mechanism.

Aprons. Bligh's Formula for Computation of Thickness of Aprons at the Foot of Weirs (Zu Blighs Formel fuer die Flutbettstaerke), E. A. Samarin. Bauingenieur (Berlin), vol. 10, no. 27. July 5, 1929, pp. 481-482, 1 fig. Discussion of formula given in W. Bligh's Practical Design of Irrigation Works, pointing out hidden coefficient of safety and suggesting modification of formula for more precise computation.

Flow. Distribution of Velocity in Nappe over Weir Crest (Die Geschwindigkeitsverteilung im Strahle ueber einer Wehrkrone), R. Winkel. Bautechnik (Berlin), vol. 7, no. 28, June 28, 1929, pp. 438-439, 3 figs. Results of experimental study in hydraulic laboratory of Danzig Institute of Technology; flow over rounded weir crests with heads varying from 8.7 cm. to 19.2 cm.

Measurements. Hydraulic Measuring Stick, J. B. Lippincott. West. Construction News, vol. 4, no. 16, Aug. 25, 1929, pp. 424-428, 5 figs. New device is described for measuring water over free-flowing and submerged weirs without necessity for stilling basins, or considering velocity of approach or other variable factors.

WELDING

Electric. *See Electric Welding, Arc.*

WELDING MACHINES

Operations on. Cutting and Welding Steel Parts to Replace Castings. W. J. Buchanan. Am. Welding Soc.—Jl., vol. 8, no. 9, Sept. 1929, pp. 61-70, 14 figs. List of wide variety of production jobs that can be performed on welding machine; operations required for various machinery parts are described.

WELDS

Metallographic Study of. A Metallographic Study of Some Metallic Arc Welds, H. M. Boylston, A. Jenkin, and J. C Carpenter. Am. Welding Soc.—Jl., vol. 8, no. 9, Sept. 1929, pp. 26-47, 27 figs. Experiments described, deal with variables which affect structure of weld; in addition, metallographic examination, physical tests, and bend tests were made from which allowable working stress has been calculated by Kinzel formula; experiments were confined to 6 different welding conditions. Bibliography.

Testing. Welding Society Considers Methods of Testing. Eng. News-Rec., vol. 103, no. 12, Sept. 19, 1929, pp. 463-466, 4 figs. See editorial comment Research and Confidence on p. 441. Stethoscope, X-rays and electric currents considered for non-destructive examinations of welds at annual meeting of American Welding Society; Sperry method of electrical inspection; Union Carbide and Carbon method of inspecting welds with stethoscope and hammer; results of tests for carbonization of welds; new strain-measuring instruments by J. Hammond Smith; pipe-line welding costs.

WIND POWER

Utilization of. Rational Utilization of Wind Power (L'utilisation rationnelle de la puissance du vent), M. Neu. Société Française des Electriciens—Bul. (Paris), vol. 9, no. 94, June 1929, pp. 570-574. Advantages and disadvantages; wind motors manufactured in Germany and France; equipment in existence and planned installation of 6,000 kw. in Leipzig; production of electric power by means of wind power.

WIND TUNNELS

Motor Control for. Motor Control for Wind Tunnel, W. A. Lewis. Am. Inst. Elec. Engrs.—Jl., vol. 48, no. 9, Sept. 1929, pp. 686-691, 8 figs. Wind tunnel for testing model airplanes and their parts requires accurate control of air velocity; describes tunnel having electric drive for producing air movement and explains system of control, which allows wide range of speeds and holds speed very constant at any set value; either hand or automatic regulation may be employed; hand control is used for fairly constant speed while automatic control gives very close regulation.

WIRE ROPE

Lubrication. Selection and Use of Wire Rope Lubricant, C. D. Meals. Can. Machy. (Toronto), vol. 40, no. 21, Oct. 17, 1929, pp. 74-75 and 77-79, 1 fig. Discussion of why lubrication is necessary for wire rope; selection of lubricant; classification of wire ropes into five classes; hoisting ropes for high speed work; application of lubricant; frequency of lubrication.

The Selection and Application of Wire Rope Lubricant, C. D. Meals. Iron and Steel of Canada (Gardenvale, Que.), vol. 12, no. 7, July, 1929, pp. 183-184, 1 fig. Article previously indexed from Eng. and Min. Jl., June 28, 1929.

Strength of. The Strength of Wire Ropes. Metallurgist (Supp. to Engineer, Lond.), Aug. 30, 1929, pp. 120-121. Review of tests by R. Woernle in which various types were compared in regard to their endurance under similar treatment, that is, on basis of number of times they would stand bending operation of specified type before failure; effects investigated were those of radius of pulley-groove, lay of rope, loading diameter of wires, strength of material; measurements were made of elongation of ropes by usage, and data were obtained regarding reduction in carrying capacity of ropes to enable period of useful life to be judged from number of reversals of bending.

WOOD BENDING

Precautions in. Wood Bending, T. R. C. Wilson. Am. Soc. Mech. Engrs.—Advance Paper, for mtg. Oct. 16-18, 1929, 7 pp., 9 figs. This paper which is based on studies at Forest Products Laboratory, deals only with requirements of bending apparatus and manipulation, emphasizes their importance, and points out that they must be correct before large breakage losses incurred in bending of wood can be reduced materially.

WOOD PRESERVATION

Bakelizing. New Process for Perfectioning of Wood, Bakelization (La Bakélisation), M. Texier. Société des Ingénieurs Civil de France—Bul. (Paris), vol. 82, no. 34, Mar.-Apr. 1929, pp. 277-281. General properties of wood and various process for its improvement for industrial use; bakelization process and properties of wood so treated compared with original wood is shown in tables and curve; test report of insulator pin of bakelized wood; use of bakelized wood in electric-line construction.

Z

ZINC INDUSTRY

Canada. Zinc in Canada. Metal Industry (Lond.), vol. 35, no. 13, Sept. 27, 1929, pp. 302-303. 1 fig. Rouyn district of western Quebec will be important producer of zinc; Tetreault mine near Notre Dame des Anges; zinc-lead field of central Gaspé; Stirling mine in Nova Scotia; Canadian zinc statistics 1898 to 1928 shown; north-west territories. (Concluded,) Paper presented before Am. Zinc Inst.

ZINC METALLURGY

Tainton Process. Progress in Zinc Electrolysis with Special Reference to the Tainton Process (Ueber Fortschritte auf dem Gebiete der Zinkelektrolyse unter besonderer Beruecksichtigung des Tainton-Verfahrens), G. Eger. Metall und Erz (Berlin), vol. 26, no. 15, Aug. 1, 1929, pp. 373-383, 12 figs. Evolution of zinc electrolysis; features of Tainton process; experimental Tainton plants established in United States; description of large scale plant at Kellogg, Idaho, visited by author; present data practice of Tainton process, its economic value.

ZINC MINES AND MINING

Canada. Zinc in Canada, C. Camsell. Metal Industry (Lond.), vol. 35, no. 9, Aug. 30, 1929, pp. 204-207, 1 fig. Abstract of report prepared for Canadian Department of Mines and presented before Am. Zinc Inst., previously indexed from latter's Journal May and June, 1929. (To be concluded.)

ZINC ORE TREATMENT

Electrolytic. World Developments in Electrolytic Zinc, A Zentner. Min. and Met., vol. 10, no. 275, Nov. 1929, pp. 526-531, 1 map and 2 figs. Historical review; production statistics; development in United States, Canada, Mexico, Peru, England, Norway, Russia, Poland, France, Italy, Germany, Africa, and Australia; electrolytic processes; markets; electrothermic smelting of zinc ores in Norway.

Electrolytic, Montana. Electrolytic Zinc Practice at Great Falls and Anaconda, A. E. Wiggin and R. B. Caples. Eng. and Min. Jl., vol. 128, no. 8, Aug. 24, 1929, pp. 319-324, 6 figs. Great Falls plant described by Laist, Frick, Elton and Caples in Am. Inst. Min. Engrs., Trans., vol. 64, 1921; process and equipment are fundamentally same, with improvements to better recoveries and lower costs; flow sheets and description of present practice at each plant.

ZINC PROPERTIES

Data. Physical Constants of Zinc, E. A. Anderson. Am. Soc. for Steel Treating—Trans., vol. 16, no. 6, Nov. 1929, pp. 811-814. Data on atomic weight; atomic number; electrochemical equivalent; crystal structure; allotropy; melting point; boiling point and vapour pressure; latent heats of fusion and vaporization, specific heat; specific gravity; electrical and thermal conductivities; coefficient of expansion; transmission of sound; optical properties; surface tension; magnetic susceptibility; mechanical properties. Bibliography. Recommended Practice Committee Release.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostat copies (white printing on a black background) of the articles listed in this section or others on engineering subjects can be obtained from the Engineering Societies Library at a cost of 25c. per page.

When ordering identify the article by giving: the author; the title of the article; the name of the periodical in which it appeared; and the volume and page numbers. A remittance of 25c. a page should accompany the order.

The print's size is limited to 11 by 14 inches, but where possible, two pages up to 7 by 9 inches in size will be photographed on one print, larger magazines require a print per page.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

AIRPLANE PROPELLERS

Testing. Tests of Five Metal Model Propellers With Various Pitch Distributions in a Free Wind Stream and in Combination With a Model Ve-7 Fuselage, E. P. Lesley and E. G. Reid. Nat. Advisory Committee for Aeronautics—Tech. Report, no. 326, 1929, 18 pp., 20 figs.

AIRPLANES

Fuselages, Manufacture of. Chromium-Molybdenum-Steel Tubing Fuselage Construction, J. H. Kindelberger. Soc. Automotive Engrs.—Jl., vol. 25, no. 5, Nov. 1929, pp. 474-477, 6 figs. Reason why pilots, operators, maintenance men, designers, and manufacturers prefer welded steel to stick and wire construction for airplanes; molybdenum steel developed to make stronger struts possible; strength and reliability of welds depends on designing joints that can be welded without overheating any parts; complicated fittings should be made up into subassemblies; jigs for welding airplane assemblies, including fixtures for drilling holes in assembled frame; measures taken to prevent corrosion.

Performance Testing. Efficiency Data of Some Airplanes (Wirtschaftlichkeitszahlen einiger Flugzeuge), P. Rieppel. V. D.I. Zeit. (Berlin), vol. 73, no. 42, Oct. 19, 1929, pp. 1513-1516. Factors experimentally determined under certain condt ions and in straight flying for some German and American airplanes are explained and tabulated.

Wings, Cantilever, Torsion in. Some Aspects of Torsion in Multispar Cantilever Wings. Air Corps information Cir. vol. 7, no. 627, Aug. 1, 1929, 7 pp., 14 figs. Report based on study in connection with investigation of torsional stresses in propeller blades; excentric torsion; torsion in spars of multispar wing; application to Fokker C-2; torsional properties of wing skin; single spar at same weight and strength in bending is considerably stronger and more rigid torsionally than multispar; most favourable location of single spars is at distance from leading edge equal to 25 per cent of chord; most economical cross section is square.

AIRPORT RUNWAYS

Analysis. Airport Surfaces, C. N. Conner. Eng. News-Rec., vol. 103, no. 22, Nov. 28, 1929, pp. 855-858, 6 figs. Analysis of factors affecting selection and design of airport surfaces; airport loading; characteristics of various low-type and high-type airport surfaces; examples from American and European practice. Paper read before Am. Road Bldrs.' Assn. Airport Conference.

AIRPORTS

Camden, N.J. Central Airport, Camden, N.J. Aero Digest, vol. 15, no. 4, Oct. 1929, pp. 118 and 120, 2 figs. Description of Central airport which occupies site of 350 acres, about 200 of which are used in connection with flying operations.

Construction, Chicago. Another Great Airport for Chicago, J. F. Peaslee. Earth Mover, vol. 16, no. 11, Nov. 1929, pp. 7-9, 4 figs. Methods of grading, involving million cubic yards, in construction of new large airport at Glen View near Chicago.

Planning. Underground Hangar Arrangement for Future Airports, H. W. Corbett. Aero Digest, vol. 15: no. 3, Sept. 1929, pp. 96, 352 and 354, 2 figs. Plan is given for landing fields with hangars, repair shops, waiting rooms, pneumatic mail tubes, rail and motor approaches, hotels, and all mechanical necessities underground, so as to be absolutely free of any and all obstacles; conical shaped field proposed; entry into hangar would be made through score or more of trap-door arrangements operated by observer stationed at peak of cone; periscope observation roof; value of pneumatic tubes for air mail between post office and airport; advantages of this design of airport.

AIRSHIP PLANTS

Construction. Weighted Cables Raise 360-Ton Arches in Airship Dock. Eng. News Rec., vol. 103, no. 23, Dec. 5, 1929, pp. 874-878, 10 figs. Editorial comment on p. 872. Framework of Goodyear-Zeppelin airship factory and dock at Akron (Ohio) airport; building is semi-ellipsoid formed by series of 13 arch trusses of 325-ft. span, 198½ ft. high; counterweight and locomotive crane combination used in erecting framework of spherical doors; falls from traveller and fixed stiff-leg derricks were utilized.

ALLOYS

Aluminum. *See Aluminum Alloys.*
Bearing Metals. *See Bearing Metals.*
Brass. *See Brass.*

ALUMINUM ALLOYS

Corrosion. Corrosion of Aluminum Alloys in Superheated Steam (La corrosion des alliages d'aluminium dans la vapeur d'eau surchauffée), L. Guillet and Ballay. Métallurgie et Construction Mécanique (Paris), no. 44, Nov. 2, 1929, p. 17. Study of mechanical effects of corrosion; comparison of corrosion of pure aluminum and of three alloys by superheated steam. Read before Académie des Sciences.

Properties. Service Characteristics of Light Alloys, E. H. Dix, Jr. Soc. Automotive Engrs.—Jl., vol. 25, no. 5, Nov. 1929, pp. 463-468 and (discussion) 468. Discussion of aluminum and magnesium, in their pure and alloyed states, as most suitable for aircraft construction, physical properties; effects of adding small quantities of alloying elements; heat treating for increasing strength per unit weight of alloys; effect of natural aging and artificial aging at elevated temperatures and of quenching in hot and cold water after heat-treating; several types of corrosion; protection afforded to aluminum alloys by surface coating of pure aluminum.

Protective Coatings. Some Recent Developments in Protective Coatings for Aluminum and Its Alloys, H. Sutton. Metal Industry (Lond.), vol. 35, no. 18, Nov. 1, 1929, pp. 411-412 and (discussion) 412-414.

AMMONIA COMPRESSORS

Trouble Location. Locating the Obstruction in a Clogged Line of the Compressor J. Rathbun. Indus. and Eng. Chem., vol. 21, no. 12, Dec. 1929, pp. 1200-1208. Examples of various troubles with refrigeration systems in different plants and means for overcoming difficulties.

ANTI-KNOCK COMPOUNDS

Tetraethyl Lead. Gaseous Explosions, M. Souders and G. G. Brown. Indus. and Eng. Chem., vol. 21, no. 12, Dec. 1929, pp. 1261-1268, 13 figs. Effect of tetraethyl lead, both in vapour phase and thermally decomposed, on flame speeds and rate of rise of pressure following ignition, was determined for explosive mixtures of benzine, pentane, isohexane. and heptane air; tetraethyl lead vapour was ineffective in retarding combustion until decomposed by burning mixture, whereas decomposed tetraethyl lead, introduced befoie firing charge, retarded both flame speed and rate of rise pressure.

ARCHES, FIXED

Design. Design of Doubly Fixed Arches (Calcul de l'arc doublement encastré), L. Legens. Génie Civil (Paris), vol. 95, no. 18, Nov. 2, 1929, pp. 437-439, 9 figs. Theoretical mathematical analysis of stresses in fixed arches of variable cross-section, of any shape.

AUTOMOTIVE ENGINES

Diesel. *See Diesel Engines, Automotive.*

Fuel Distribution. Report on Air-Fuel-Ratio Tests, H. W. Best. Soc. Automotive Engrs.—Jl., vol. 25, no. 5, Nov. 1929, pp. 532-533 and (discussion) 534, and 536-541, 2 figs.

Manufacture. White Iron Edges on Machined Surfaces of Cylinder Heads and Blocks Are Responsible for Economic Losses, G. M. Eaton. Automotive Industries, vol. 61, no. 22, Nov. 30, 1929, pp. 792-794, 3 figs. Results of investigation recently made in causes of white iron edges in several specific epidemics of this trouble; unalloyed iron, chrome-nickel irons, and chrome-molybdenum irons investigated; fundamental reductions of the trouble can be made by modifying foundry design and pattern practice in way that will remove fin on rough casting.

AUTOMOBILE PLANTS

Heat-Treating Furnaces. Automatic Heat-Treating Unit, W. M. Hepburn. Iron Age, vol. 124, no. 20, Nov. 14, 1929, pp. 1304-1306, 4 figs. Description of three interconnected furnaces installed at Studebaker Plant for purpose of normalizing, hardening, quenching, and drawing; these functions may be separated for various heat treatments, according to requirements of production; furnaces are fired with both gas and oil, gas burners being used in soaking-zone; waste-heat recuperator.

AUTOMOBILES

Bearings, Friction of. Automotive Research—Friction Coefficient Research, L. Illmer. Soc. Automotive Engrs.—Jl., vol. 25, no. 5, Nov. 1929, pp. 545-546. Test contributions of J. Goodman to friction research outlined; author's work along analytical research lines toward practical solution of bearing-design problem discussed; journal friction controlled by pressure factor; advantages of tabulated constants of coefficients.

Testing. Performance Evaluation. Automobile Engr. (Lond.), vol. 19, no. 259, Oct. 1929, pp. 387-388, 2 figs. Description of Tapley performance meter for testing general efficiency of motor vehicles; object is to furnish direct reading evaluations of performance, giving measure in pounds per ton that engine is exerting on driving wheels; methods of measuring top gear acceleration, hill-climbing capacity, tractive resistance, actual power output, and engine friction.

AUTOMOTIVE FUELS

Developments in. Developments in Motor Fuels, D. P. Barnard. Soc. Automotive Engrs.—Jl., vol. 25, no. 5, Nov. 1929, pp. 495-498, 2 figs. Progress in improving fuels for carbureter-type internal-combustion engine must be directed toward securing greater efficiency and reliability in operation, and flexibility; for automobiles cost of fuel on basis of useful work realized per dollar expended is more important than weight; for aircraft, increased cost of power cost must be balanced against increased pay-load possibilities; effect of improving distribution and anti-knock characteristics; Federal Specifications restrict improvement; limitation of sulphur content justified.

B

BALANCING MACHINES

Dynamic Type. Mechanization in Dynamic Balancing, G. Gerber. Eng. Progress (Berlin), vol. 10, no. 11, Nov. 1929, pp. 287-289, 5 figs. Principles and types of machine are described; dynamic balancing machine of 2,200 lbs. capacity is described.

BEARING METALS

Bronzes. Wear Tests on Bearing Bronzes, W. M. Corse. Iron Age, vol. 124, no. 22, Nov. 28, 1929, pp. 1431-1434, 2 figs.

BEARINGS

Friction in. Friction in Journal, Roller, and Ball Bearings in Intermittent Operation (Reibung in Gleit,- Rollen- u. Kugellagern bei aussetzendem Betrieb), L. Klein. V.D.I. Zeit. (Berlin), vol. 73, no. 2, Oct. 19, 1929, pp. 1499-1502, 10 figs. Experiments in laboratory for conveying equipment in engineering

University of Hanover have shown that for friction and anti-friction bearings, friction in intermittent operation is higher than in permanent run and is dependent on relative time of throwing in and out; in both cases friction reaches minimum value only after hours of operation; friction coefficients for various cases.

(*See also Automobiles Bearings.*)

JOURNAL. Journal-Bearing Practice, F. Hodgkinson. Engineer (Lond.), vol. 148, no. 3854, Nov. 22, 1929, pp. 559-562, 8 figs.; and (discussion) pp. 543-544, 3 figs.; see also Engineering (Lond.), vol. 128, no. 3332, Nov. 22, 1929, pp. 690-693, 6 figs., and (discussion) pp. 681-684, 8 figs., and editorial comment, pp. 679-680.

BOILER FEEDWATER

ANALYSIS. Rational Measurement Coefficient for Water Analysis (Rationale sszahl fuer die Wasseranalyse), A. Sulfrian. Waerme (Berlin), vol. 52, no. 47, Nov. 23, 1929, pp. 867-869, 1 fig. Instead of coefficient of hardness which, it is claimed, is on arbitrary basis, "milli" standard unit is proposed, which, author states has scientific basis; relations between milli-unit, degrees of German hardness, milligram substance per liter and standard solution are shown in alignment chart.

BOILERS

BAFFLES FIRE-TUBE. Modern Progress in Fire-Tube Baffles (Neuere Fortschritte an Flammrohr-Einbauten), D. Schulz. Glasers Annalen (Berlin), vol. 105, no. 4, Aug. 15, 1929, pp. 67-68, 3 figs. Increase of flue-gas temperature and increased fuel economy have been attained by use of firebrick which frequently destroyed through sudden fluctuations in temperature; this is prevented by newly patented system, called "Stabilsteine," which is described.

CONTROL. Electric Boiler Control (Die elektrische Kesselregelung), W. Jaekel. Elektrizitaet im Bergbau (Munich), vol. 4, no. 11, Nov. 18, 1929, pp. 208-212, 13 figs. Equipment of Siemens and Schuckert, making exclusive use of electric processes; main object is to obtain favourable combustion at highest efficiency; features of system are discussed.

Rouchka System of Automatic Boiler Control (Les Régulateurs automatiques et les Appareils de Contrôle Roucka dans les Chaufferies Modernes). Technique Moderne (Paris), vol. 21, no. 15, Aug. 1, 1929, pp. 17-18, 1 fig. System developed by E. Roucka at his electrical-instrument works in Czechoslovakia during war, provides completely automatic control over flue dampers, air admission, feedwater supply and rate of grate travel thus reducing work of stoker to general supervision and checking regularity of firebed; every important central station in Czechoslovakia is fitted with Roucka apparatus; There are more than 150 installations in Germany.

CORROSION. Decomposition of Efflorescence on Leaking Boilers Due to Flue Gases (Zersetzung von Ausbluehungen an undichten Kesseln durch die Rauchgase). Zeit. des Cayerischen Bevisions-Vereins (Munich), vol. 33, no. 20, Oct. 31, 1929, pp. 279-280. Results of investigation of efflorescence on boiler supplied with feedwater softened according to lime-soda process; it is shown that flue gases have disintegrating effect on such incrustations.

FEED CIRCUITS. Modern Feed Water Circuits, J. Sims. Elec. Times (Lond.), vol. 76, no. 1985, Nov. 7, 1929, pp. 773-775, 22 figs. Layouts for feedwater circuits, de-aerators, feed heaters, etc., are discussed and illustrated by diagrams; binary-fluid cycle is estimated to give overall thermal efficiency of 32.5 per cent.

HIGH PRESSURE (LOEFFLER). Developments of the Loeffler System of Steam Raising. Engineer (Lond.), vol. 148, no. 3853, Nov. 15, 1929, pp. 516-517. Information is taken principally from recent article in Génie Civil, previously indexed; method consists in evaporating water by blowing highly superheated steam through it, steam for this purpose being taken in saturated condition from boiler itself and forced through superheater by means of steam pump; two commercial installations of Loeffler system are described, in addition to short account of its application to locomotive; security of operation is emphasized.

SEAMLESS. Seamless Boilers for Very High Pressure (Somlose kedeltomler for meget joje tryk), A. Hannover. Tekniske Forenings Tidskrift (Copenhagen), vol. 58, no. 5, Apr. 1929, pp. 69-79, 14 figs. Manufacture of seamless boiler 13.5 m. long, 1.5 m. diam. with wall thickness of 114 mm. is described; boiler was tested at 112 atmos.; materials used in boilers for high pressures are pointed out.

WASTE HEAT, DIESEL ENGINES. Clarkson Silencer Boilers to be Built in Canada. Iron and Steel of Canada (Gardenvale, Que.), vol. 12, no. 10, Oct. 1929, pp. 258-259, 4 figs. Description of Clarkson Thimble-Tube-Silencer boilers and heaters which utilize waste heat contained in exhausts of Diesel engines; device combines purpose of being most effective internal-combustion engine exhaust silencer with highly efficient means of recovering from otherwise waste gases abundant supply either of steam or hot water.

WATER CIRCULATION IN. Experiments Concerning Water Circulation in Boilers (Versuche ueber den Wasserunlauf in Dampfkesseln), E. Schmidt. V.D.I. Zeit. (Berlin), vol. 73, no. 33, Aug. 17, 1929, pp. 1151-1155, 9 figs. It is shown by experiment that self-evaporation is cause of frequently observed reversed water circulation; theory of water circulation has to take self-evaporation and relative velocity in boilers into consideration.

BRASS

HARD, PROPERTIES OF. Properties of Hard Brass (Die Eigenschaften des Hartmessings MS 58), O. Bauer and K. Memmler. Mitteilungen der deutschen Materialpruefungsanstalten, no. 8. Berlin, Julius Springer, 1929, 76 figs. tables and diagrams, 13.50 R.M. Properties of different standard brass varieties were investigated at request of German Industrial Standards Committee by Staal, Materialpruefungsamt and Kaiser-Wilhelm Institut fuer Metallforschung in Berlin-Dahlem; material was supplied by different firms made by different processes, and are to some extent of different chemical composition (varying lead content); methods and results of tests are described.

BRIDGE DESIGN

BRIDGE DESIGN. Bridge Architecture at the Limfjord and Lille Belt (Broarkitektur vid Limfjorden och Lille Baelt). Ingenioren (Copenhagen), vol. 38, no. 32, Aug. 10, 1929, pp. 373-382, 4 figs. It is advocated that, besides satisfying statical requirements, bridges should also give general public impression of strength and rigidity.

GREAT BRITAIN. Problem of Roads and Bridges, B. P. Davies. Modern Transport (Lond.), vol. 22, no. 558, Nov. 23, 1929, p. 33. Development of bridge construction during past three decades has been combined use of steel and concrete in form of reinforced concrete to replace structures of masonry and steel; traditions of past; methods for concrete. Abstract of paper presented to Public Works, Roads and Transport Congress.

BRIDGE PIERS

CONSTRUCTION. Caisson Foundations of Unusual Type Used on Bridge Job, A. G. Ashford. Contract Rec. (Toronto), vol. 43, no. 47, Nov. 20, 1929, pp. 1367-1369, 7 figs. Description of foundations of highway viaduct recently built at Sea Mills, on Portway road between Bristol City and Avonmouth, England; bridge, 329 ft. long and 70 ft. wide, comprises six arches of 46-ft. span; caissons of elliptical cross-section consist of steel shoe and concrete blocks measuring 4 ft. by 4 ft. by 2 ft. 3 in.; after reaching bedrock, about 50 ft. below ground level, caissons were filled with 8 to 1 concrete core.

FOUNDATIONS. Pile Foundations in Swampy Regions (Paelefundering i Sumpegne), A. R. Lamm. Ingenioren (Copenhagen), vol. 38, no. 31, Aug. 3, 1929, pp. 370-371, 3 figs. Description of reinforced-concrete bridge 42.5 m. long with 5 spans built over Pontian River in Malay State, Johore; as river bottom was very soft, special concrete piles with mushroom caps were used.

BRIDGES, BASCULE

FAILURE. Discussion and Rebuttal on the Hackensack Bascule Failure. Eng. News-Rec., vol. 103, no. 20, Nov. 14, 1929, pp. 783-785, 2 figs. Calculated stresses in counterweight towers, discussed by H. Cross; behaviour of pendulum suspended from rotating shaft, discussed by P. W. Ott; rebuttal by board of engineers consisting of O. E. Hovey, G. E. Beggs and D. B. Steinman.

BRIDGES, CONCRETE ARCH

CALIFORNIA. Concrete Arch of Unusual Design Aids Highway Relocation, D. M. McPhetres. Eng. News-Rec., vol. 103, no. 21, Nov. 21, 1929, pp. 815-816, 3 figs. Concrete-arch bridge of open-spandrel type in which columns have curved alignment and are supported on wide arch ribs made use of to eliminate dangerous traffic condition in Santa Cruz County, Calif.; bridge is 326 ft. long, main span consisting of 123-ft. two-ribbed spandrel arch.

CONSTRUCTION. Movable Towers and Hinged Trusses Aid Concreting of Multiple-Arch Bridge. Construction Methods, vol. 11, no. 11, Nov. 1929, pp. 52-53, 4 figs. Methods of construction of bridge across Raritan River, at New Brunswick, N.J., consisting of six 200-ft. main arch spans and several 40-ft. semicircular barrel approach spans; details of excavation, concreting and centering.

BRIDGES, HIGHWAY

RAILWAYS. Precast Concrete Bridge Railing Design Allows Future Shift. Eng. News-Rec., vol. 103, no. 22, Nov. 28, 1929, p. 847, 2 figs. Features of precast concrete railing that can be shifted to new curb line when future traffic requires wider roadway, designed for new Salinas River bridge at San Ardo, California; anchorage between railing-sections and roadway slab is secured by bolts through side, or curb portion of base and slab.

BRIDGES, RAILROAD

STRESSES. A Study of the Causes of Impact on Railroad Bridges, B. R. Leffler. Am. Ry. Eng. Assn.—Bul., vol. 31, no. 318, Aug. 1929, pp. 1-17, 6 figs. Investigation of causes of impact on bridges, based on recommendation and work of Committee XV, Association adopted formula which has been used as safe expression for percentage of impact to be used in designing new bridges and in rating existing bridges.

BRIDGES, STEEL

SPECIFICATIONS. General Specifications for Steel Railway Bridges. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 10, Dec. 1929, pp. 2641-2676. Full text of specifications prepared by Committe of Am Soc. Civil Engrs. and Am. Railway Eng. Assn., released March, 1929; proposals and drawings; general features of design; loads and stresses; unit stresses; details of design; workmanship; weighing and shipping; materials including; structural steel, silicon steel, nickel steel, cast steel, and cast iron.

BRIDGES, STEEL TRUSS

LAKE CHAMPLAIN. Lake Champlain Bridge, C. M. Spofford. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 10, Dec. 1929, pp. 2535-2539 and (discussion) 2539-2548, 5 figs. Design and construction of continuous steel-truss bridge; more detailed data will be found in number of previously annotated papers; economics; piers; braced coffer-dam; safety measures. Discussion includes erection problems—Lake Champlain Bridge, by H. W. Troelsch; methods for bridge foundations, by J. W. Rollins, etc.

BRIDGES, SUSPENSION

ARGENTINA. Thirty-two-Rope Cable Suspension System on South American Bridge, C. G. Gerstrom. Eng. News Rec., vol. 103, no. 23, Dec. 5, 1929, pp. 881-883, 7 figs. Sixteen ropes independently anchored compose each main suspension member of 492-ft. Rio Quequen crossing between Necochea and Loberia, province of Buenos Aires; continuous stiffening girder, bridges river in three spans, with main span 150 m. and two side spans of 60 m.; rocker type of tower was adopted; testing bridge with loaded trucks; cable erection of side-span stiffening girders on falsework; main tower erection; structural details.

DESIGN. Suspension Bridge Analysis by the Exact Method Simplified by Knowledge of Its Relations to the Approximate Method, A. H. Baker. Rensselaer Polytechnic Inst.—Eng. and Science Series, no. 24, June 1929, 32 pp., 11 figs. Thesis prepared with object of reducing to minimum enormous amount of labour, now necessary in analysis of stiffening trusses of suspension bridges by more accurate theory, by set of correction charts giving directly magnitude of discrepancies in approximate theory for any particular case; accurate values can be obtained by applying proper correction to approximate values.

DETROIT RIVER. Ambassador Bridge between Windsor, Ont. and Detroit, Mich. Completed Last Week. Contract Rec. (Toronto), vol. 43, no. 47, Nov. 20, 1929, pp. 1355-1362, 13 figs. Design and construction of world's longest suspension bridge having 1,850-ft. span, and total length between abutments of 7,400 ft.; details of towers and tower piers, cable anchorages and terminals.

HUDSON RIVER. The First Hudson Bridge in New York City (Die erste Hudson-Bruecke bei New York), R. Bernhard. V.D.I. Zeit. (Berlin), vol. 73, no. 42, Oct. 19, 1929, pp. 1504-1508, 15 figs. Design and construction of Hudson River suspension bridge in New York, having single span of 1.067 km.; properties of cable materials, features of steel towers, model testing of bridge members; construction of tower foundation and cable anchorage.

QUEBEC. The Rope-Strand Suspension Bridge at Grand'Mere, Quebec, D. B. Steinman. Eng. News-Rec., vol. 103, no. 22, Nov. 28, 1929, pp. 841-845, 9 figs. New highway toll suspension bridge over St. Maurice River at Grand'Mere, Quebec, with main span of 949-ft., which makes it longest rope-strand cable bridge in world; cable ropes cut to length and socketed in shop; details of anchorage, steel towers, stiffening trusses, method of cable wrapping, etc.; load tests.

BUILDINGS

BASEMENTS. Basement Walls and Floors. Concrete, vol. 35, no. 6, Dec. 1929, pp. 43-48, 9 figs. Hints for builders of basement walls and floors; watertight concrete is important essential; dimensions of foundations and footings; forms for monolithic foundations; retaining walls; recommended concrete mixtures for foundation walls and basements; watertight method of placing concrete floor on footings; placing and curing concrete; estimating quantities.

BUILDINGS, CONCRETE

FORM WORK. Continuous Shoring Speeds Work on Tall Chicago Structure, C. W. Ellsworth and H. S. Keller. Concrete, vol. 35, no. 6, Dec. 1929, pp. 13-15, 3 figs. Report of form work practice and construction of 30-storey Trustees System Service Building in Chicago; use of continuous shoring speeds up construction operations; joist-layout plan; method of framing beam forms; re-using shores.

BUILDINGS, STEEL

DESIGN. The Design of Tall Building Frames to Resist Wind, C. T. Morris and A. W. Ross. Ohio State Univ. Studies—Eng. Experiment Station—Bul., no. 48, June 1929, 73 pp., 16 figs. Method of design for wind-resisting bents of tall buildings, which approaches accuracy and economy, and which is practical for use; calculations of wind stresses in 48-storey tower of American Insurance Union Bldg., in Columbus, Ohio, by slope deflection method; results tabulated and compared with other methods. See Engineering Index, 1928, p. 303.

WELDED. Gas-Welding Design and Erection on a 300-Ton Mill Building, H. M. Priest and H. H. Moss. Eng. News-Rec., vol. 103, no. 24, Dec. 12, 1929, pp. 928-931, 7 figs. See editorial comment on p. 913-914. In constructing new research laboratory building, 260 by 75 by 42 ft. high, and Carbon Research Laboratories, Inc., in Niagara Falls, oxyacetylene welding was utilized for all connections in steel framing; details of joints; half-trusses were welded together on ground; welding data.

Structural Steel Welding, F. P. McKibben. Gen. Elec. Rev., vol. 32, no. 11, Nov. 1929, pp. 622-625, 10 figs. Welding structural steel by electric arc is progressing rapidly as is shown by recent successful completion of 75 bridges and buildings wholly or partially welded; included in these are steam power plants, hotel buildings, plate girders, bridges; details of construction of buildings enumerated are given. Paper read at World Engineering Congress, Tokyo, Japan.

C

CANALS

WELLAND. The Welland Ship Canal. Engineering (Lond.) vol. 128. no. 3332, Nov. 22, 1929, pp. 668-672, 9 figs. partly on p. 678. Description of Section No. 7; of six bridges on Section, four are higeway brieges and two railway bridges; with one exception all these are of vertical-lift span type giving clear height, when open for shipping, of 120 ft. and over; one exception is swing-bridge; details of bridge construction. (Continuation of serial.)

CARS

REFRIGERATOR. North American Develops Mechanical Refrigerator Car. Ry. Age, vol. 87, no. 20, Nov. 16, 1929, pp. 1155-1157, 4 figs. Advantages claimed for new mechanically refrigerated car include saving of approximately 3,000 lbs. in weight over standard refrigerator with full ice bunkers, elimination of all icing and re-icing en route, maintenance of any predetermined constant temperature required for best conditioning of perishable food products, attainment of this result without sacrifice of load-carrying capacity, and complete absence of salt and brine drippings; power obtained from truck axle; operation of refrigeration system.

CARS, STREET RAILROAD

DESIGN. Car Design, H. H. Adams. Traction Shop and Roadway, vol. 2, no. 10, Oct. 1929, pp. 307-309. Recent developments in car design with particular reference to their application on cars of Chicago surface lines; greatly reduced weight; method of noise reduction; new Chicago cars; increased acceleration and automatic control; trend is toward lower car; tests with new trucks and drives.

CAST IRON

HIGH-TEST, MANUFACTURE OF. High Test Cast Iron, R. S. MacPherran. Am. Foundrymen's Assn.—Trans., vol. 37, 1929, pp. 495-500 and (discussion) 729-733, 5 figs. Methods employed by Allis-Chalmers Mfg. Co. in producing high-test cast iron, are discussed; secret of high-test iron seems to be low carbon and high temperature on melting; silicon from 1.50 to 3.00 per cent has been varied without materially affecting strength of test bar; variation due to low melting point of ferro-silicon, small size of ladle, and some large castings made with silicon below 1.80 per cent.

PROPERTIES. Modern Engineering Cast Irons and their Properties, J. C. Pearce. Engineer (Lond.), vol. 148, no. 3852, Nov. 8, 1929, p. 504. Abstract of paper read at British Cast Iron Association, dealing with relationship between size and strength in cast iron; it is pointed out that bar of gray iron, 0.875 in. in diam., cast in given mixture, is stronger than bars of larger diameter cast from same metal at same time, and that specific strength diminished as section increased; cast iron behaves much better than might be expected when subjected to fatigue tests; resistance of cast iron to wear still remains one of unsolved problems.

Recent Views on the Mechanical Properties of Cast Iron, Thum. Foundry Trade Jl. (Lond.), vol. 41, no. 688, Oct. 24, 1929, p. 302. In order to explain its low strength, cast iron is compared with steel baving same percentage of combined carbon; it is proved experimentally that steel behaves elastically in way similar to cast iron wheu its structure is broken by holes and slits; suggestions are given for utilizing figures obtained for deflection at fracture by transverse test for vibrational strength which is very valuable when investigating suitability of cast iron for manufacture. Paper presented before German Foundry Employers' Federation.

CASTINGS

CLEANING. Tests on a Hydraulic Fettling Plant, U. Lohse. Foundry Trade Jl. (Lond.), vol. 41, no. 685, Oct. 3, 1929, p. 240. Process for cleaning castings with jet of water at high pressure forced through small-diameter nozzles which are placed directly on castings to be fettled; results of tests carried out on machine in foundries of Lanz, Mannheim; castings weighed before and after being fettled in order to ascertain how much sand was removed from casting in given time; wet fettling method is thus suitable for any moulding material. Abstract of paper presented before German Iron Founders Employers, Federation.

X-RAY ANALYSIS. X-Ray Inspection of Castings. Soc. Automotive Engrs.—Jl. vol. 25, no. 5, Nov. 1929, p. 551. Value of X-ray analysis of castings is discussed; its solution to problem of over-zealous and careless inspectors; X-ray inspection used successfully in examination of cast steel, bronze and aluminum as well as other articles.

CEMENT BURNING

REACTIONS. The Reactions in Burning Cement, A. C. Davis. Cement aud Cement Manufacture vol. 2, no. 11, Nov. 1929, pp. 303-314. Review of research work; four distinct methods have been used for determining value of exothermic reaction of clinker formation; these methods are enumerated and discussed.

CEMENT, PORTLAND

FINENESS. Effect of Fineness of Portland Cement on Its Properties (Der Einfluss der Feinheit des Portlandzements auf seine Eigenschaften), P. Filossofow. Tonindustrie-Zeitung (Berlin), vol. 53, no. 72, Sept. 9, 1929, pp. 1302-1304, 6 figs. Cement was separated into two fractions by sieving; test specimens were made with various mixtures and it was found that setting time depended upon fineness; 7-day tensile strength also followed fineness, but 28-day and longer strengths were bigher if initial cement was not quite so fine.

CEMENT TESTING

CEMENT TESTING. Variations in Standard Portland Cements, P. H. Bates. Am. Concrete Inst.—Jl., vol. 1, no. 1, Nov. 1929, pp. 65-95 and (discussion) 95-100, 4 figs. Report of committee 202; no such thing as standard portland cement; variations in early strengths, late strength, permeability, shrinkage and plastic yield; chemical heat of setting in large masses; internal stresses in concrete dams are due to heat evolution during setting and resulting shrinkage during cooling; reactions to curing conditions.

CHROMITE DEPOSITS

CANADA. The Obonga Lake Area, A. R. Graham. Can. Min. Jl. (Gardenvale, Que.), vol. 50, no. 44, Nov. 1, 1929, p. 1038. Brief description of area 26 mi. south of Collin station on Canadian National Railway; geological notes; four veins uncovered, 10 in. to 2 ft. wide, showing average of 34 per cent chrome oxide with favourable ratio of iron chromium; deposits are regarded as uncommercial at present, but of importance as future reserves.

CITIES AND TOWNS

ADMINISTRATION. Administration of the Boston Metropolitan District, D. B. Keniston. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 10, Dec. 1929, pp. 2485-2491. Scope of work of Metropolitan District Commission; methods of organization and operation; financial aspects; proportioning costs; metropolitan planning; Water Supply Commission.

CITY PLANNING

TORONTO. Town Planning Problems in Toronto, T. D. le May. Can. Engr. (Toronto), vol. 57, no. 23, Dec. 3, 1929, pp. 779-781. Planning and Development Act and its operatiou iu Toronto; need for comprehensive zoning scheme in Toronto; City and Suburban Plans Act; advantages of zoning; educating public; technical guidance; compulsory town planning; topographical surveys. Paper presented before Eng. Inst. of Can.

COAL MINES AND MINING

STOWAGE. Application of Pneumatic Stowage in Mining (Die Anwendung des Blasversatzes im Bergbau), F. Prockat. Foerdertechnik u. Frachtverkehr (Wittenberg), vol. 22, no. 22, Oct. 25, 1929, pp. 421-425, 4 figs. General discussion of method; mathematical fundamentals of air transmission in pipes; technique of low and high-pressure pneumatic stowage; cost analysis. (To be concluded.)

COAL RESOURCES

UNITED STATES AND CANADA. The Coal Resources of the Northwest, G. W. Evans. Min. Congress Jl., vol. 15, no. 11, Nov. 1929, pp. 898-903, 1 fig. Marketing possibilities are discussed; Crows Nest Pass area has outstanding bituminous deposit; Canada well supplied with everytbing from lignite to anthracite; Washington reserves are largest in Pacific states; Idaho coal of local value only; extensive deposits in Wyoming, Montana, Utah, and Colorado are discussed; oil as competitor with Oregon and California coal.

COLUMNS, CONCRETE

STEEL-CORES. Details of Steel Cores for Reinforced Concrete Columns, F. A. Randall. Concrete, vol. 35, no. 5, Nov. 1929, pp. 13-16, 6 figs. Summary of United States practice as to structural details; column bases; column caps, girder framing; wall columns and corner columns; shop details; column splices. Bibliography.

CONCRETE PRODUCTS

MASONRY, DEVELOPMENTS IN. Recent Architectural Developments in Concrete Masonry, W. D. M. Allan. Concrete Products, vol. 37, no. 4, Oct. 1929, pp. 23-28, 10 figs. Manager of Cement Products Bureau, Portland Cement Assn., discusses standardization and increased use of concrete masonry. portland cement stucco and cast stone; definition of typical American architecture; physical and chemical characteristics of stucco and cementing materials; steps taken by American Concrete Institute to improve quality of portland-cement stucco; characteristics and advantages of cast stone; surfacing of cast stone. Address given before group of Canadian architects.

CONCRETE, READY MIXED

CANADA. Concrete Mixed by the Transit System Now Appear on the Eastern Canada Market. Contract Rec. (Toronto), vol. 43, no. 49, Dec. 4, 1929, pp. 1411-1414, 3 figs. Operation of Toronto Ready-Mix Concrete Ltd.; concrete of any predetermined strength and mixed according to scientific principles can be supplied in any quantity; reaches job heated in freezing weatber; mixing takes place en route to work; details of mixer; merits of system; growing use of system.

COPPER ALLOYS

HARDENED. Hardened Copper for Electrical and Chemical Equipment, W. N. Hibbard. Iron Age, vol. 124, no. 22, Nov. 28, 1929, p. 1434. Uses and properties of hardened coppers known as Everdur and Tempaloy and their welding characteristics are described; table shows composition and physical properties of soft and hardened copper; hardened copper alloys are strong or stronger than medium carbon steels; cold-rolled alloys weld easily and will not season or corrosion crack. Abstract of paper presented before Int. Acetylene Assn.

COPPER MINES AND MINING

BRITISH COLUMBIA. British Columbia's Copper Mines Prospering, F. H. Mason. Eng. and Min. Jl., vol. 128, no. 24, Dec. 14, 1929, pp. 926-927, 4 figs. General review, by special correspondent; with copper price stabilized at $.18, production is expected to show substantial increase over former records; Britannia exploring for orebodies below 2,700 level; Granby puts Bonanza into production and increases reserves at Copper Mountain; Premier Gold developing new properties.

COPPER ORE TREATMENT

BRITISH COLUMBIA. The Allenby Concentrator of the Granby Consolidated Mining, Smelting and Power Company, Limited, H. R. Taylor. Can. Min. and Met. Bul. (Montreal), no. 211, Nov. 1929, pp. 1251-1259, 4 figs. Description of remodeled plants, with capacity of 2,500 tons per day; primary and secondary crushing and fine grinding; specially designed flotation plant, consisting of 28 rougher cells each 18 ft. long, two cleaner cells each 24 ft. long, and two re-cleaner cells each 12 ft. long; flow sheets and data on milling results are given.

CRANES

GEARS AND GEARING. Worm Gears versus Tooth Gears in Modern Crane Design (Schneckengetriebe oder Zahnraduebersetzung in modernen Kranbau), E. Goldberger. Foerdertechnik und Frachtverkehr (Wittenberg), vol. 22, no. 17, Aug. 16, 1929, pp. 309-314, 5 figs. Efficiency of double-geared transmissions; motor capacity; relation of various losses in operation; relative efficiency; current consumption; heat absorption; circumferential force on brake drum; numerical example.

CULVERTS, CONCRETE

MOVING. Concrete Culvert Moved to New Location by Stump Puller and Rollers, J. Calhoun. Eng. News-Rec., vol. 103, no. 20, Nov. 14, 1929, p. 782, 1 fig. In relocating State highway near Heber Springs, Ark., 3-ft. box culvert, 32 ft. long, was removed distance of 41 ft. by stump puller and rollers, at total cost of $149.40; sketch showing arrangement of jacks, rollers and pulling cable.

CUTTING TOOLS

TUNGSTEN CARBIDE. An Appraisal of Carbide Tools, Z. Jeffries. Iron Age, vol. 124, no. 21, Nov. 21, 1929, pp. 1367-1371, 3 figs. Discovery of tungsten carbide, method of manufacturing carbide tools, representative performance in various uses, and future influence of tungsten-carbide cutting tools are discussed; cutting materials which no other metallic material has been able to cut; extraordinary production on metal work; tools for intermittent or jump cuts. Abstract of paper presented before Am. Soc. Mech. Engrs.

D

DAMS, CONCRETE

COAL MINE WATER SUPPLY. Reinforced-Concrete Dam for Coal-Mine Water Supply (Eisenbeton-Stauwerk fuer die Nutzwasserbeschaffung einer Grube), E. Szentkirályi. Glueckauf (Essen), vol. 65, no. 34, Aug. 24, 1929, pp. 1180-1182, 4 figs. Details of dam built specially to impound water for Thommen coal mine and its employees in Vasas establishment at Pecs, Hungary; dam is built across adjoining valley, half mile away, and holds 2¼ million gals.; surface of basin is about 43,000 sq. ft. and maximum depth of water 20 ft.; it is built on Ambursen system; special features of this contruction and its advantages compared with solid, gravity dam are explained.

DAMS, CONCRETE ARCH

CALAVERAS. Calaveras Flood Control Dam, K. L. Parker. West. Construction News, vol. 4, no. 22, Nov. 25, 1929, pp. 611-614, 3 figs. Description of variable radius concrete arch dam with gravity section abutments and gravity wall; 160 ft. high, 1,400 ft. long on crest, 50 ft. thick at base, aud 7 ft. thick at top; built by city of Stockton, Calif.; plans were revised after construction began; details of excavation methods, concrete placing, camp facilities, etc.

DAMS, EARTH

CONSTRUCTION. Construction of Municipal Dam, Melfort, J. G. Schaeffer. Can. Engr. (Toronto), vol. 57, no. 21, Nov. 19, 1929, pp. 723-725, 5 figs. Construction of 100,000,000-gal. water-supply reservoir for Melfort, Sask., having clay core dam, 900 ft. long and of 25 ft. maximum height; unit prices of construction; total cost, exclusive of land, is about $30,000.

SETTLEMENT. Long Period Settlement Records of Two Earth Dams, J. A. Holmes. Eng. News-Rec., vol. 103, no. 20, Nov. 14, 1929, pp. 769-772, 6 figs. See editorial comment on p. 755. Data on periodical levels taken for 16 years on Somerset dam (105 ft. high) and for five years on Davis Bridge dam (216 ft. high) in southern Vermont, built by semi-hydraulic process; mechanical analyses of materials; rate of settlement curves; present conditions of dams; well-compacted earth embankment reaches virtual stability in few years.

DAMS

SPECIFICATIONS. Building Code for Dams, F. A. Noetzli. West. Construction News, vol. 4, no. 21, Nov. 10, 1929, pp. 574-576. Discussion by A. Floris, L. Jorgensen and others, taking up; uplift, inclined contraction joints, resistance to earthquakes; lamination of arch dams, sliding factor, testing of models and temperature changes.

DIELECTRICS

MEASUREMENTS. Dielectric Absorption and Dielectric Loss, J. B. Whitehead. Franklin Inst.—Jl., vol. 208, no. 4, Oct. 1929, pp. 453-468, 11 figs. Absorption and loss studies on high-grade impregnated paper condenser; charge and discharge curves are taken; by means of vacuum-tube amplifier and oscillograph to within 0.001 sec. of instant of application of voltage and at values of 500, 1,000 and 1,500 volts, corresponding to those at which alternating loss measurements were made; loss was measured on 60 cycles at Shering bridge; loss as computed from von Schweidler's expressions is compared with measured values.

DIES

FORGING, HEAT TREATMENT OF. American v. British Die-Tool Treatments, J. W. Urguhart. Mech. World (Lond.), vol. 86, nos. 2233 and 2234, Oct. 18 and 25, 1929, pp. 373-374 and 386-387. Oct. 18: Review of compositions and methods of hardening forging dies in England and America; tempering limits of drop-hammer die block; composition; forging-machine die-block requirements; some hot-pressing die steels; chromium-steel die tools difficult to machine; English die steels. Oct. 25: Carburized plain and nickel-steel die blocks; essential carburization condition; hammer work and normalizing; sock-resisting nickel steels; heat-application points of importance.

DIESEL ENGINES

AUTOMOTIVE. F. B. Stearns Develops Two-Cycle Overhead Camshaft Diesel Engine of the Solid Injection Type, A. F. Denham. Automotive Industries, vol. 61, no. 21, Nov. 23, 1929, pp. 748-750, 3 figs.

Widespread Development of Automotive Diesels is Not Anticipated, H. M. Crane and A. L. Clayden. Nat. Petroleum News, vol. 21, no. 48, Nov. 27, 1929, pp. 81, 84, and 91. Abstract and commentary by Clayden, of address by Crane before National Petroleum Assn.; discussion of popular idea that Diesel is fundamentally better than gasoline motor and eventually supplants it; opinion is expressed that, except for certain limited fields, it is highly improbable that automotive Diesels will ever be nearly as suitable as gasoline engines.

CANADA. The Diesel Engine and Canadian Development. Power House, vol. 23, no. 21, Nov. 1929, pp. 66-69, 7 figs. General discussion of increased use of Diesel engine for various services in Canada; local conditions determine power installation; test results on two Diesel engines installed in plant of Robert Simpson Co.; other specific installations; general classifications.

DESIGN. Recent Developments in the Airless Injection of Fuel in Diesel Engines. Sulzer Tech. Rev. (Switzerland), no. 3, 1929, 23 pp., 39 figs. Three main tendencies in development of Diesel engines in recent years have been: (1) increasing size of engine; (2) developing small high-speed type; and (3) means employed to introduce fuel and improved combustion; problems arising when considering introduction of necessary quantity of fuel at right moment; importance of duration of injection; illustrated description of accumulating valves for Diesel engines.

FUEL INJECTORS. Design of Injection System Determines Fuel Consumption, A. Peters. Power, vol. 70, no. 21, Nov. 19, 1929, pp. 789-790, 4 figs. Author claims that tests he has run prove that variable stroke fuel pump is superior to by-pass controlled pump for high-speed solid injection Diesels.

HIGH-PRESSURE. High-Pressure Diesel Engines (Zur Frage der Hochdruckdieselmaschine), C. Commentz. Maschinen-Konstrukteur (Leipzig), vol. 62, no. 20, Oct. 15, 1929, pp. 461-462. Economic factors entering in design of high-pressure Diesel engines, i.e., use of material, and cost of construction in relation to fuel consumption, are discussed; author quotes figures from American practice.

MARINE (RICHARDSONS-WESTGARTH). Development and Performance of the Richardsons-Westgarth Oil Engine, W. S. Burn. Shipbldg. and Sbipg. Rec. (Lond.), vol. 34, no. 20, Nov. 14, 1929, pp. 589-591, 1 fig. Author shows development of design described by him in 1926, as result of intervening three years' work; double-acting two-stroke engine has proved very satisfactory; from time to time trouble was occasioned, mostly from mysterious causes; tendency has been slightly to increase weight and width; crankshaft is now made with cast-steel webs with integral balance weights; fuel-injection experiments. Abstract of paper before North-East Coast Instn. of Engrs. and Shipbldrs.

MARINE—SUPERCHARGING. The Werkspoor Supercharging System. Mar. Engr. and Motorship Bldr. (Lond.), vol. 52, no. 626, Nov. 1929, pp. 448-450, 3 figs. New system of supercharging has been developed in connection with Werkspoor four-stroke crosshead-type engines; system consists in closing in lower sides of working pistons and providing space with automatic air suction and delivery valves; piston displacement serves to compress air to moderate pressure.

DIPHENYL

PROPERTIES OF. Vapour Pressure and Heat of Vaporization of Diphenyl, J. Chipman, and S. B. Peltier. Indus. and Eng. Chem. vol. 21, no. 11, Nov. 1929, pp. 1106-1108, 1 fig. Vapour pressure of diphenyl has been determined between 162 and 322 deg. cent.; equation is derived which should be valid for extrapolation up to 10 to 15 atmospheres; vapour density has been determined and heat of vaporization calculated; properties of diphenyl are shown to be in accord with those of other aromatic hydrocarbons.

DRILLS

POWER REQUIREMENTS OF. Power Required to Drill Cast Iron and Steel, O. W. Boston and C. J. Oxford. Am. Soc. Mech. Engrs.—Advance Paper, no. 4, for mtg. Dec. 2-6, 1929, 22 pp., 55 figs.

E

ECONOMIZERS

GILLED TUBES FOR. Gilled Tubes, G. Tansley and O. Kubalek. Engineer (Lond.), vol. 148, no. 3853, Nov. 15, 1929, p. 532, 2 figs. Account of experiments with gilled tubes for economizers; number of B.t.u.'s transmitted per degree difference was highest with plain tube and lowest with deep gill; outer periphery of deep gill was very much less effective than inner periphery; results from properly designed gill cast on tube will be approximately equal to results from plain tube per square foot of heating surface. Abstract of paper read before Instn. Engrs. and Shipbldrs. in Scotland.

ELECTRIC CIRCUIT BREAKERS

INTERNAL ISOLATION. Internal-Isolation Switchgear. Engineering (Lond.), vol. 128, no. 3332, Nov. 22, 1929, pp. 674-675, 3 figs. It is generally necessary to move whole circuit-breaker structure bodily, if it is required to examine it; in design devised by G. E. Whitehead, and manufactured by Switchgear and Cowans, Ltd., of Old Trafford, Manchester, this disadvantage is overcome by keeping circuit breaker properly fixed and coupling it up to, or disconnecting it from, busbars through moving isolating carriage of light weight and simple design.

ELECTRIC CODES

ELECTRIC CODES. Illumination or Wiring Standard—Which?, J. R. Cravath. Elec. World, vol. 94, no. 21, Nov. 23, 1929, pp. 1028-1029. Franklin specification proposes standard of illumination, whereas California Commercial Red Seal Plan would make adequate wiring basis of approach to problem.

ELECTRIC FURNACES

FOUNDRY. Short-Cycle Malleableizing Improves Product and Saves Time. Elec. World, vol. 94, no. 20, Nov. 16, 1929, p. 989, 2 figs. New short-cycle annealing process for production of malleable iron castings by which it is possible to produce malleable iron in 30 hrs. or less, has been announced by General Electric Co.; furnace and control panel for short-cycle annealing are illustrated.

INDUSTRIAL. Industrial Electric Furnaces. Elec. Rev. (Lond.), vol. 105, no. 2708 and 2710, Oct. 18 and Nov. 1, 1929, pp. 674-676, and 773-774, 9 figs. Illustrations of notes on selected items from manufacturers' products, i.e., Birlec rotating annular-hearth furnace; Metropolitan-Vickers induction furnace at Vickers-Armstrong Works; double-ended furnace for precious metals, Electric Furnace Co.; Lecfur melting pot; 3.2-kw. "Birlec" pusher-type furnace; Wild-Barfield carburizing furnaces; "E.F.C." high-frequency resistance furnaces.

LOSS MEASUREMENT. Open-Door Losses Determined for Electric Furnaces, R. M. Cherry. Elec. World, vol. 94, no. 21, Nov. 23, 1929, p. 1029. Open-door losses for given furnace temperature will depend upon area of door opening, time door remains open; number of openings per hour and design of furnace front and door. Abstract of paper presented before Indus. Elec. Heating School, Case School of Applied Science.

ELECTRIC GENERATORS

ALTERNATING CURRENT. New Alternator of 50,000 Kw. of Generating Plant at Gennevilliers of l'Union d'Electricité (le nouvel alternateur de 50,000 kilowatts de l'usine génératrice de Gennevilliers de l'Union d'Electricité), L. Guyon. Revue Générale de l'Electricté (Paris), vol. 13, no. 18, Nov. 2, 1929, pp. 705-719, 18 figs. Three-phase, 6,000/6,400-volt, 1,500-r.p.m. generator designed and manufactured by Schneider and Co., in such manner that rotor can be replaced by 35,000 and 40,000-kw. rotors of other generators already installed; design data and test results are given in curves and tables.

ELECTRIC INSULATION

FAULTS. Insulation Faults, W. Wilson. World Power (Lond.), vol. 12, no. 71, Nov. 1929, pp. 432-435, 1 fig. Continuity of working can only be secured for electrical equipment by obviation of faults as far as is humanly possible, and by minimizing of their effects when they do occur; these functions require for their efficient fulfilment careful study of fault itself, and more especially of its nature and its life-history; brief discussion will go far towards dispelling mystery surrounding failure of insulation, and to indicate effective means of coping with trouble.

TESTING. The Bridge-Meg Resistance Tester. World Power, vol. 12, no. 70, Oct. 1929, pp. 303-304, 5 figs. New resistance tester for measuring electric insulation resistance, developed by Evershed and Vignoles, Ltd., of Chiswick.

ELECTRIC LAMPS

INCANDESCENT. Theory and Characteristics of Mazda Lamps. Nat. Lamp Works—Gen. Elec. Co.—Bul., no. 56, Oct. 1929, 56 pp., 45 figs. Production of light by incandescence; relative distribution and energy distribution curves; spectral sensitivity of photoelectric cell; efficiency of lamps; filament operating temperature; vacuum and use of gas; filament temperatures, diameters, and lengths; inside frosting; effect of frequency; effects of excessive temperatures on lamps; exponents of lamp characteristics; designed life of lamps; right lamp for service; Steps in manufacture. Bibliography.

ELECTRIC LIGHT AND LIGHTING

DESIGN. Artificial Light in Architecture (Das kuenstliche Licht in der Baukunst), E. Summerer. Licht u. Lampe (Berlin), vol. 18, no. 20, Oct. 3, 1929, pp. 1107-1113, 13 figs. Architect and illuminating engineer discussed problem of interior lighting; determination of intensity required; design of lighting fixtures; table of properties of materials used in lighting; characteristics of various types of lights; economy in mechanical layout.

ELECTRIC LINES

CALCULATION. Overhead Line Nomogram for Inclined Spans (Das Freileitungsnomogramm fuer geneigte Spannfelder), I. Schwarzkopf. Elektrotechnik u. Maschinenbau (Vienna), vol. 47, no. 40, Nov. 10, 1929, pp. 985-988, 3 figs. Mathematical analysis; graphs and curves for calculations.

SAG. Sag Chart for Copper Conductors, W. T. Taylor. Elec. (Lond.), vol. 103, no. 2683, Nov. 1, 1929, pp. 522-523. Series of curves giving sag values for copper conductors (⅜ in. ice loading) in terms of variable span length.

UNDERGROUND. A 100,000-Volt Cable Line, W. Parey. Eng. Progress (Berlin), vol. 10, no. 11, Nov. 1929, pp. 285-286, 3 figs. One year's operating experience on 100-kv. three-phase cable line laid by Grosskraftwerk Franken Co., Numeberg, during 1927 and 1928; cable is designed to transmit 40,000 kva., but at present is loaded with only 16,000 kva.; three single-core cables, supplied by Siemens-Schuckertwerke A.-G., having copper area of 195 sq. mm.; description of this cable has been previously indexed from Elektrizitaetswirtschart, July 1, 1929.

ELECTRIC MANUFACTURING INDUSTRY

CANADA. Power Finance and Imperial Preference, H. Quigley. World Power, vol. 12, no. 70, Oct. 1929, pp. 314-320. Economic discussion concerning electric manufacturing industry; table giving production and consumption of electrical machinery and apparatus for 1920-1928; table giving electricity supply first by water and steam turbine, second by a.c. and d.c. generators; capitalization tables of American controlled companies, Canadian-controlled companies, and independent companies; also table giving generating capacity and output of various companies of Canada.

ELECTRIC MOTORS

INDUCTION. Special Types of Induction Motors. AEG Progress (Berlin), vol. 5, no. 10/11, Oct.-Nov., 1929, pp. 307-311, 13 figs. Types of motors for special purposes described agree in regard to electric characteristics with standard AEG-induction motors type DA, whereas their mechanical features deviate according to duties for which they are determined; drip-proof induction slip-ring motors; externally positioned flame-proof slip-ring enclosure; separately ventilated induction motors; totally enclosed self-ventilated induction motors, etc., are described.

SQUIRREL CAGE, STARTING. Automatic Throw-in Devices for Squirrel-Cage Motors (Les embrayages automatiques appliqués au démarrage des moteurs à cage d'écureuil), M. J. Betbenod. Société Française des Electriciens—Bul. (Paris), vol. 9, no. 97, Sept. 1929, pp. 923-926. Conditions for ideal automatic starting; various French types of throw-in gears applied; energy storage in throw-in equipment during starting.

ELECTRIC NETWORKS

ALTERNATING CURRENT. Solving System Problems by Means of the Power Network Analyser, H. L. Hazen and M. F. Gardner. Power Plant Eng., vol. 33, no. 22, Nov. 15, 1929, pp. 1220-1222, 1 fig. Description of model, constructed at Massachusetts Institute of Technology, applicable to solution of operating problems met with in a.c. networks of various kinds; development of network analyzer; analyzer based on one-line diagram of system.

GROUNDING. The Unsolved Grounding Problem, F. A. Cambridge. Elec. News (Toronto), vol. 35, no. 22, Nov. 15, 1929, pp. 43 and 50. Author ascribes absence of security in present-day grounding practice of electric distribution systems to following factors: lack of appreciation by utility engineers of what constitutes effective grounding; reluctance of utility executives to incur financial outlay necessary; employment of unsuitable system of distribution and methods of conducting current; deficiencies in rules and regulations.

SHORT CIRCUIT CALCULATIONS. The Short Circuit Calculating Table and Its Applications, M. P. Osburn. Hydro-Elec. Power Commission of Ontario—Bul. (Toronto), vol. 16, no. 10, Oct. 1929, pp. 349-358, 8 figs. Short-circuit calculating equipment used for solution of two distinct classes of problems, namely, those involving design and those involving operation of large systems, is described.

ELECTRIC REACTORS

FEEDER REACTORS. Complete Installation of Feeder Reactors, E. G. Burr and S. A. Craig. Elec. News (Toronto), vol. 38, no. 22, Nov. 15, 1929, pp. 37-40, 4 figs. Installation of reactors and regulators is arranged to give phase isolation in enlarged Slater Street substation, Ottawa Electric Co.; reactors are installed on three shelves, one above other and each shelf houses one phase of reactors and also that phase of group bus; two types are employed, reactors constructed with enameled wire rated at 2 per cent (i.e., 46 volts) at 200 amp., 65 deg. cent. rise, and reactors wound with insulated wire rated at 3 per cent (69 volts) at 250 amp., 60 deg. cent. rise.

ELECTRIC SWITCHGEAR

LOW TENSION. The Design of Low Tension Switchgear, W. Wilson. World Power, vol. 12, no. 70, Oct. 1929, pp. 321-327, 9 figs. Functions of switchgear are to carry and interrupt flow of power; maximum power ruptures without arcing of carbon, copper and brass; design of current-carrying surfaces; design of current-breaking elements; mechanical effects.

MANUFACTURE. British Workshops. World Power (Lond.), vol. 12, no. 71, Nov. 1929, pp. 468-471, 6 figs. Discussion of rigid requirements or specifications adhered to in manufacture of electric switchgear at works of W. Lucy and Co., Ltd., Oxford; specific reference to street lighting products.

ELECTRIC TRANSFORMERS

DESIGN. Some Economic Aspects Affecting the Design of Large Power Transformers, F. F. Brand and H. O. Stephens. Gen. Elec. Rev., vol. 32, no. 11, Nov. 1929, pp. 632-637, 9 figs. Increase in kilovolt-ampere rating; growth in system voltages; efficiencies; capitalization of losses; increased complexity of design; lightning; insulation; reliability. Paper read at World Power Conference, Tokyo, Japan.

SURGES. Effect of Surges on Transformer Windings, J. K. Hodnette. Am. Inst. Elec. Engrs.—Jl., vol. 48, no. 11, Nov. 1929, pp. 829-832, 14 figs. Study of reaction of transformer windings in grounded neutral systems when subjected to transient voltage surges such as exist on normally insulated lines; measurements of voltage distribution throughout windings between various elements and to ground were effected by means of cold cathode-ray oscillograph and sphere gaps; stresses due to voltages occurring on transmission systems.

ELECTRIC WELDING

ATOMIC-HYDROGEN. The Welding of Ferrous and Non-Ferrous Metals by the Atomic-Hydrogen Flame, H. A. Weinman. Aviation Eng., vol. 2, no. 11, Nov. 1929, pp. 13-15, 13 figs. Atomic-hydrogen welding process, and equipment used is described; upon entering atomic-hydrogen welding flame, portion of gas is made to pass through an electric arc, remainder merely serving to replenish envelope of molecular hydrogen around arc; welding tungsten, molybdenum, cast-iron alloy steels, aluminum and its alloys, brass and nickel; process is used to weld metals and alloys presenting difficulties to other forms of welding.

ELECTRODES

SODERBERG SELF-BAKING. The Soderberg Self-Baking Electrodes, M. Sem. Can. Chem. and Met. (Toronto), vol. 13, no. 6, June 1929, pp. 177-178, 4 figs. Description of electrode referred to in article by J. Silberstein, indexed from same journal, April 1929; novel principle is that electrode is being built up from green paste in one end, as baked electrode at other end wears away in electric furnace.

ENGINEERING

BIOLOGICAL FACTORS. The Biological Factor in Engineering (Der biologische Faktor in der Technik), W. Ostwald. V.D.I. Zeit. (Berlin), vol. 73, no. 33, Aug. 17, 1929, pp. 1149-1150. Discussion of philosophical character, arguing that engineering, which is defined as study of generation and control of energy, belongs to social sciences and must draw upon physiology and psychology for its fundamental data; nature of engineering control division of labour and co-operation.

ETHICS. Engineering Ethics, E. E. Wall. Engrs. Club of St. Louis—Jl., vol. 9, no. 10, Oct. 1929, pp. 3-5. American Society of Civil Engineers has, through one of its committees, published lengthy reports concerning proper charges for engineering services; reports state that charges or methods of making charges must be based on fixed and stable compliance with established code of ethics; committee also states that outside employment of professors and salaried officials is only permissible when fees are in no case lower than that which would be normally charged by practicing professional engineer.

EXPLOSIVES

PROPERTIES. Explosive Properties of "Chloratite 3" with Varying Content of Petroleum (Die Sprengtechnischen Eigenschaften von Chloratit, etc.), A. Haid and H. Selle. Zeit. fuer das gesamte Schiess-u. Sprengstoffwesen (Munich), vol. 24, no. 7, July 1929, pp. 251-252, 2 figs. Petroleum content of this chlorate explosive was varied from 0 to 16 per cent and effect measured by determinations of sensitiveness to impact, by transmission of detonation through air gap, by rate of detonation, and by effect of lead blocks and copper cylinders; it is concluded that most favourable content of petroleum is 8 to 9 per cent.

F

FLOOD CONTROL

MISSISSIPPI RIVER. Bonnet Carré Spillway Believed to Be at Wrong Location, A. B. B. Harris. Eng. News-Rec., vol. 103, no. 21, Nov. 21, 1929, pp. 818-819, 2 figs. Author attacks location as faulty and wasteful and outlines reasons for his belief that $10,000,000 or more can be saved by more thoroughly studied design. See editoril comment on p. 794.

FLOODLIGHTING

FEATURES OF. Floodlighting. Elec. News (Toronto), vol. 38, no. 21, Nov. 1, 1929, pp. 33-36, 9 figs. Features of this type of lighting, which has many uses, are discussed; in illuminating building exteriors it has created new art which is rapidly gaining in popularity; various Canadian buildings equipped with floodlighting are illustrated.

FLOW METERS

QUANTITY-RATE. Quantity-Rate Fluid Meters, E. S. Smith, Jr. Am. Soc. Mech. Engrs.—Advance Paper, no. 40, for mtg. Dec. 2 to 6, 1929, 21 pp., 11 figs. Study of correlation of coefficients and expansion factors, using Reynolds number and acoustic velocity ratio; venturi tubes and square-edged orifices are placed upon common basis and graphical methods of use are shown; example illustrating relation between flow similarity, Reynolds number, and coefficient; study of factors which cause departure from theoretical flow conditions; fluid metering in practice; basio formula for quantity-rate meters; venturi-tube and orifice analysis. Bibliography.

FLOW OF FLUIDS

SIMILARITY APPLIED TO. Similarity: Limitations in Its Application to Fluid Flow, J. M. Spitzglass. Am. Soc. Mech. Engrs.—Advance Paper, no. 42, for mtg. Dec. 2-6, 1929, 9 pp., 8 figs. General historical review of development of theory of fluid-flow, since Torricelli, in 1643, to most recent studies of 1929, with special reference to geometrical and hydraulic similitude; author concludes that hydraulic similarity being matter of experiment, large sizes may or may now show same results as smaller ones. Bibliography.

FLOW OF GASES

THERMODYNAMICS. Impact Losses in Flow of Gases and Vapours through Sudden Expansions in Pipe Lines (Stossverlust an ploetzlichen Erweiterungen in Rohren beim Durchfluss von Gasen und Daempfen), A. Busemann and W. Nusselt. V.D.I. Zeit. (Berlin), vol. 73, no. 44, Nov. 2, 1929, pp. 1588-1589, 4 figs. Theoretical debate of phenomenon on basis of general thermodynamic principles; entropy diagrams.

FLOW OF WATER

MEASUREMENT. Measurement of Stream Velocity by Air Bubbles, O. Miyagi. Tohoku Imperial Univ.—Tech. Report (Sendai), vol. 8, no. 4, pp. 587-603, 3 figs. Starting with observation that spherical air bubbles of diameter larger than 0.27 cm. arrive to surface with nearly constant velocity of about 24 cm. per sec., author made precise laboratory tests of measuring average current velocities of order of magnitude of 0 to 15 cm. per sec.; mathematical equations for determination of velocity from observations of horizontal displacement of bubbles during this rise from bottom.

FUELS

CALORIFIC VALUE. Gross or Net Calorific Values. World Power, vol. 12, no. 70, Oct. 1929, pp. 370 and 373. It is important to avoid confusion and error which are likely to arise from indiscriminate use of gross and net calorific values of fuel used without clearly specifying which basis is taken; American practice leans toward gross calorific values of fuel, while continental practice is more frequent to use net or lower calorific value; discussion of proximate and ultimate analysis of fuel.

G

GAS ENGINES

BLAST-FURNACE-GAS. Modern Blast Furnace Gas Engines, F. J. Taylor. Gas and Oil Power (Lond.), vol. 25, no. 289, Oct. 3, 1929, pp. 3-5, 4 figs. Practicability of slow-burning properties of blast-furnace gas in large slow-running gas engine; discussion of pistons and valves, governor design; waste-heat recovery and blowing engines.

GAS PIPE LINES

DESIGN. Economical Gas Transmission by Tapered Pipe Lines, L. T. Jones. Eng. News-Rec., vol. 103, no. 20, Nov. 14, 1929, p. 779, 1 fig. Long distance transportation of nearly double usual amount of gas for same cost has been made possible by development of improved form of girth weld, cost of which is independent of diameter of pipe line, provided only that weight is kept constant; effect of increasing number of sections in stepped pipe line; gas pressures in 250-mi. tapered pipe line. Abstract of paper presnted before Pac. Coast Gas Assn.

WELDING. Welded Joints Used in Long Oil Pipe Line. Eng. News-Rec., vol. 103, no. 24, Dec. 12, 1929, p. 927. Bell and spigot joints, sealed by welding process; were used throughout entire 624 mi. length of 12-in. welded-steel oil pipe line, recently completed between Cushing, Okla., and Chicago district; in joining 40-ft. sections of pipe each weld was made in two beads to eliminate pinholes; current was supplied by portable gasoline engine driven welders.

GASES

HEAT-CONDUCTIVITY. Instruments to Measure Heat Conductivity (Varmeledningsinstrumenter), C. A. Robak. Teknisk Ukeblad (Oslo), vol. 76, no. 24, June 14, 1929, pp. 249-251, 6 figs. Method of measuring heat conductivity of several gases are described, also instruments used and results of three tests on reliability of instruments to measure contents of hydrogen in air.

GEARS

CUTTING. Determination of Back Lash with a Given Tooth Profile (Ermittlung der Gegenflanke bei gegebenem Zahnprofil), F. Roetscher. V.D.I. Zeit. (Berlin), vol. 73, no. 41, Oct. 12, 1929, pp. 1469-1471, 9 figs. Simple method is described for determining back lash for given tooth profile which also permits determination of tooth form produced in any cutting machine according to helicoidal system; action of different parts of cutting machine is followed and better conception of phenomena occurring with gear generation of gears is thereby obtained.

PLANETARY. Planetary Gearing Calculations and Design, W. Richards. Machy. (Lond.), vol. 35, no. 889, Oct. 24, 1929, pp. 105-109, 5 figs. Large reductions possible with planetary gear trains are taken up; general arrangement of planetary reduction gear; method of tabulating results of movements; planetary reduction gear with driving and driven members rotating in same direction; law governing direction in which driven gear revolves; centre distances and pitches of planetary gears.

GEOLOGY

ALASKA. Geology and Mineral Deposits of Southeastern Alaska, A. F. Buddington and T. Chapin. U.S. Geol. Survey—Bul. no. 800, 394 pp., 39 figs. on supp. plates. Summary of all available data on general geology of southeastern Alaska. accompanied by reconnaissance geologic map of southern and eastern parts; it is stated that report is not and can not be comprehensive treatise, as information now available is utterly inadequate.

BRITISH COLUMBIA. Britannia Beach Map-Area, British Columbia, H. T. James. Canada Dept. of Mines—Geol. Survey (Ottawa), memoir 158, no. 2193, 1929, 134 pp., 18 figs. Report on field work in area including one of largest copper mines of British Columbia; general geology; historical notes and statistics of mineral production; general classification and mineralogy of deposits; description of individual deposits; summary classification of mineral deposits and theoretical discussion of their relations.

MANITOBA. Geology of Oiseau River Area, Manitoba. Can. Min. Jl. (Gardenvale, Que.), vol. 50, nos. 44, 45 and 46, Nov. 1, 8 and 15, 1929, pp. 1040-1041, 1062-1063, 1069-1076, and 1089-1090, 1098-1099 and 1101. Nov. 1: Metargillite, slate, chert, and tuff; adesite, trachyte, dacite, and chlorite schist; comparison of sedimentary-volcanic complex with similar groups in nearby areas. Nov. 8: General character and distribution. Nov. 15: Mode of occurrence of gabbro; diorite, quartz diorite, and granodiorite; relations between various rocks; econoic geomlogy. (Concluded.)

GOLD MINES AND MINING

BRITISH COLUMBIA. The Hedley Mine and Mill. Can. Min. and Met. Bul. (Montreal), no. 211, Nov. 1929, pp. 1260-1271, 6 figs. General notes on Nickel Plate mine and allied claims, near town of Hedley, B.C.; contact-metamorphic ore body in limestone, with gold-bearing sulphide in gangue of lime-silicate; mine workings; mining methods; diamond drilling; transportation; electric power; stamp mill and cyanidation data.

PLACER, CALIFORNIA. Mining Placer Gravel On Steep Grades, J. W. Neill. Eng. and Min. Jl., vol. 128, no. 20, Nov. 16, 1929, pp. 1-772, 771 fig. Mining machine designed for special problem, but not built; essential units consist of steam shovel to do digging and floating washing plant to handle gravel, recover gold, and stack tailings; outfit equipped with 1 ½-cu. yd. bucket; should be able to dig from 75 to 90 cu. yds. per hr., depending on gravelbank conditions and skill of operators.

ONTARIO. The Pickle Lake—Crow River Area, M. E. Hurst. Can. Min. Jl. (Gardenvale, Que.), vol. 50, no. 46, Nov. 15, 1929, pp. 1080-1081. Area in district of Patricia, about 140 miles northeast of Sioux Lookout station on Canadian National Railway; geological data; quartz veins in greenstones; some veins are gold-bearing, and others carry practically no value; brief notes on exploration and development.

GOVERNORS

CENTRIFUGAL. Critical Valuation of Various Centrifugal Spring Governor Systems (Betrachtungen ueber die kirtische wertung verschiedener Flichkraft-Feder-Regler-Systeme), F. Heinzmann. Maschinen Konstrukteur (Leipzig), vol. 62, no. 20, Oct. 15, 1929, pp. 466-468, 7 figs. Study based on numerical examples for different types of standard equipment, intended to determine how far their efficiency meets requirements of practice.

GRINDING MACHINES

HYDRAULIC DRIVE. High-Speed Grinding Machines with Hydraulic Feed. Engineering (Lond.), vol. 128, no. 3330, Nov. 8, 1929, pp. 589-590, 2 figs. Details of machines made by Karl Jung, Berlin, designed for precision work on small parts; in internal grinding machine, small diameter of grinding wheel necessitates very high shaft speeds to obtain desired peripheral speed; machine under consideration has been designed so that spindle speeds of as high as 30,000 r.p.m. may be safely obtained; surface grinding machine differs in application of hydraulic principle from internal grinding machine in that, in this case, work is traversed by oil gear and grinding wheels by hand.

GUNS

GRINDING. Grinder for Reconditioning Bores of Naval Guns, R. H. Raube. Machy. (N.Y.), vol. 36, no. 3, Nov. 1929, p. 223, 1 fig. Description of gun grinder for reconditioning bores of large naval guns, recently developed by Hutto Engineer-Works, Inc., Detroit, Mich. for reconditioning 12-, 14-, and 16-in. guns; support for spindle used in grinding full length of rifling of these guns in provided by seven centralizing rests; grinding head driven by 7½-hp. d.c. motor.

GYPSUM DEPOSITS

CANADA. Occurrences of Canadian Gypsum Deposits by Provinces. Pit and Quarry, vol. 19, no. 2, Oct. 23, 1929, p. 78. Information issued by Development Branch of Canadian Pacific Railway; greater portion of Canada's production comes from Nova Scotia which Provinces exports most of its production to United States; in New Brunswick, beautiful white gypsum is extensively mined at Hillsborough, Albert County; deposits occur in Niagara peninsula of Ontario; large deposit is worked at Lake St. Matin near Gypsumville, Manitoba; several deposits occur in northern Alberta; gypsum industry of British Columbia is now on producing basis.

H

HARDNESS TESTING

BRINELL. The Hardness of Steel Balls Used for the Determination of Brinell Hardness Numbers of Materials, R. G. Batson and S. A. Wood. Dept. Sci. and Indus. Research—Special Report, no. 16, 1929, 30 pp., 3 figs. Description of research to enable specifications to be prepared for hardness of steel balls used for Brinell hardness testing; hardness tests using diamond indenting tool and by ball flattening method; crushing strength of balls by three-ball method; determination of hardness numbers of steel specimens of high and uniform hardness when made with balls of different hardness; file tests on balls.

HEAT EXCHANGERS

HEAT TRANSMISSION IN. Heat Transfer in Cross-Current Heat Exchangers (Der Waermeuebergang im Kreuzstromwaermeaustauscher), G. Zimmermann. Zeit. Bayerischen Revisions-Vereins (Munich), vol. 33, nos. 19 and 20, Oct. 15 and 31, 1929, pp. 267-270 and 280-283. Oct. 13: Theoretical discussion; calculation of temperature field resulting from heat transfer in cross current according to Nusselt. Oct. 31: Tests were carried out in experimental plant; main purpose was to determine relation of heat transfer and transmission coefficients to velocity; two fans were installed, one for air and one for flue gas.

HEAT-INSULATING MATERIALS

TESTING. Tests of the Properties of Insulating Materials, O. R. Randall. Engineering (Lond.), vol. 128, no. 3331, Nov. 15, 1929, pp. 657-659, 6 figs. Discussion of certain methods which may be used to investigate properties of insulating materials; attempt is made to place testing of such material upon more exact footing than has previously been in use. Paper read before Brit. Assn. at Johannesburg.

HEAT TREATMENT

AIR EFFECTS. Effect of Atmospheres on the Heat Treatment of Metals, E. G. de Coriolis and R. J. Cowan. Indus. and Eng. Chem., vol. 21, no. 12, Dec. 1929, pp. 1164-1168, 1 fig. Effects of various atmospheres on metals during typical heating operations ranging from 350 to 2,500 deg. fahr.; these effects are shown to be essentially of chemical nature; methods for application of heat are considered; account is given of research work of American Gas Assn. in connection with forging; problem of bright annealing is considered; use of steam for bright annealing of copper is discussed.

HIGHWAY ENGINEERING

QUEBEC. A Few Economical and Technical Aspects of the Road Problem of the Province of Quebec, A. Fraser. Eng. Jl. (Montreal), vol. 12, no. 10, Oct. 1929, pp. 527-531. Review of highway development in province of Quebec and discussion of provincial highway policy; transportation facilities as economic factors; highways vs. railways; progressive construction as road policy; study of subsoil conditions; practical results obtained through experiments and studies.

HOUSES

HEAT INSULATING MATERIALS. Experimental Houses at Norges Tekniska Hoeskole, (Forsekshusene ved Norges Tekniske Hoeskole), A Bugge. Teknisk Ukeblad (Oslo), vol. 76, no. 39, Sept. 26, 1929, pp. 400-401, 4 figs. Results of investigation on houses to find value of heat insulation of different building materials.

LIGHTING. Home Lighting. Nat. Elec. Light Assn.—Serial Report 289-119, Sept. 1929, 11 pp., 4 figs. Potential domestic lighting market is discussed and it is shown that this market can be developed by establishment of "service" in home lighting; outline of necessary qualifications of home lighting specialists' functions of lighting service division and their value to electric service company; potential market, its activities, equipment and value to other departments, are discussed.

HYDRAULIC LABORATORIES

MEMPHIS, TENN. Hydraulic Laboratory Planned for Mississippi River Studies, H. D. Vogel. Eng. and Contracting, vol. 68, no. 12, Dec. 1929, pp. 510-512, 5 figs. Foreign experimental installations tabulated and discussed, and proposed new laboratory at Memphis, Tenn., outlined; early work by United States engineers; general characteristics of foreign laboratories; general features of proposed laboratory.

HYDRAULIC TURBINE

BEARINGS. The Development of the Water-Turbine, R. W. Miller. Mech. World (Lond.), vol. 86, no. 2236, Nov. 8, 1929, pp. 442-444, 7 figs. Design of Escher-Wyss and other thrust bearings and method of lubricating bearings explained; method of taking away heat generated so that friction coefficient is maintained within safe limits; upper thrust rings divided into inner and outer rings.

GOVERNORS. Present Tendency in Methods of Hydraulic-Turbine Control (Les tendances actuelles en matière de régulation des turbines hydrauliques), M. Barbillon. Technique Moderne (Paris), vol. 21, no. 15, Aug. 1, 1929, p. 487. Action of several types of governor is mentioned, including mixed indications of tachyometer and accelerometer; double indication of Neyret-Beylier-Picard and Pictet governor, which has been installed on 4,000-kw. unit at Beauffort, Savoy, since 1925; and Ateliers des Charmilles governor.

PRESSURE CONTROL. Mechanics of Hydraulic-Turbine Pressure Regulation, A. Pfau. Am. Soc. Mech. Engrs.—Advance paper no. 34, for mtg. Dec. 2-6, 1929, 17 pp., 20 figs. Paper describes mechanical means whereby desired field results can be obtained under existing conditions of operation and of pipe line characteristics; calculations, formulae, and examples of speed and pressure control take up such points as closing gates, passing through position of static balance of turbine gates, formulae for speed regulation, effect of pressure variations on speed, and calculations of pressure rises in pipe lines.

PROPELLER. Increased Kilowatt Output of Adjustable-Blade Propeller Turbines, C. R. Martin. Am. Soc. Mech. Engrs.—Advance Paper, no. 28, for mtg. Dec. 2-6, 1929, 6 pp. 8 figs.

SPEED CONTROL. Changing Requirements in Hydraulic Turbine Speed Regulation, F. Nagler. Am. Soc. Mech. Engrs.—Advance Paper, no. 32, for mtg. Dec. 2-6, 1929, 6 pp., 8 figs. Hydraulic engineer of Allis-Chalmers Manufacturing Co. discusses design and operation of governing equipment of hydraulic turbines with special reference to flyball control and oil-pressure speed-reducing mechanism; discussion is illustrated with examples from practice of Louisville Hydro-Electric Co., Conowingo power plant, etc.

HYDRO-ELECTRIC POWER DEVELOPMENTS

IRELAND. The Shannon Hydro-Electric Power Development Scheme, B. Cunningham. Nature (Lond.), vol. 124, no. 3133, Nov. 16, 1929, pp. 763-766, 4 figs. Shannon undertaking is now at point of effective operation for partial development; attention is confined in this article to first stage or partial development, which is extent of present undertaking; this consists of works below Killaloe and comprises weir across river bed, artificial channel about 7½ mi. long, and tail race, 1¼ mi. long.

QUEBEC. Second Great Power Development on Saguenay River Begun at Chute-à-Caron. Eng. News Rec., vol. 103, no. 23, Dec. 5, 1929, pp. 889-895, 11 figs. 260,000 hp. generated by part of fall between tailwater of plant at Isle Maligne and tidewater at Chicoutimi to be developed at concrete dam, 200 ft. high, at Chute-à-Caron as first stage of 1,000,000-hp. development, in plant on Shipsaw River; large volume of water in river up to 300,000 cu. ft. interferes with construction.

SWITZERLAND. The Grimsel Hydro-Electric Power Scheme, G. M. Ross. Engineer (Lond.), vol. 148, no. 3854, Nov. 22, 1929, pp. 540-544, 10 figs. partly on p. 552. Scheme comprises main reservoir at Grimsel, connecting to auxiliary reservoir and catchment area at Gelmer, from which three power stations utilize water in turn, stations being sited at gradually descending levels down Haslithal; when first stage is completed in 1932, annual output will amount to 223 million kw. hr. from installed power of 100,000 hp.

HYDRO-ELECTRIC POWER PLANTS

CONOWINGO, MD. The Conowingo Hydro-Electric Development. Engineering (Lond.), vol. 128, no. 3331, Nov. 15, 1929, pp. 613-616, and 13 figs. partly on Supp. Plate. Details of seven combined main and auxiliary alternator sets; four of these were manufactured by General Electric Co. and remainder by Westinghouse Electrical and Manufacturing Co.; each main alternator has output of 40,000 kva., and supplies three-phase current at pressure of 13,800 volts and frequency of 60 cycles, when running at 81.8 r.p.m.; description of switchgear. (Concluded.)

DESIGN. Recent Advances in the Utilization of Low-Head Water Powers, S. Svenningson and E. Brown. Eng. Jl. (Montreal), vol. 12, no. 11, Nov. 1929, pp. 567-580, 19 figs. Review of more important improvements, in design, construction, and operation of water wheels, power-houses, and other elements of hydro-electric plants utilizing heads up to 200 ft.; effects of higher specific speed; high-speed runners; propeller runners with movable and adjustable blades; rubber as lining for water-wheel guide bearings; amount of concrete pe. lineal foot of power house. Paper presented before World Eng. Congress, Tokyo.

NORWAY. West Coast Country Community Power Company—Aavella Power Plant (Vest-Opland kommunale kraftselskap—Aavella kraftanlegg), J. Moelmen. Teknisk Ukeblad (Oslo), vol. 76, no. 40, Oct. 3 1929, pp.407-412. Power plant in Western Norway is described; two Pelton wheels each of 1,960 hp. are installed; head is 308 m.; pipe line is partly of steel and partly of wood; history of progress of work, cost of building, and running expenses are given.

ONTARIO. Adjustable-Blade Runners Increase Hydro Plant Output, J. F. Roberts. Power, vol. 70, no. 21, Nov. 19, 1929, pp. 792-795, 7 figs. Plant designed for ten 12,000-hp. units at 26-ft. head; adjustable-blade propeller runners allow increasing output of each nearly 2,000 hp. during low-head high-water conditions; two units have ejectors in draft tube to increase runners' output during high-water conditions.

Smoky Falls Hydro Station. Power Age, vol. 6, no. 11, Nov. 1929, pp. 69-74 and 88, 8 figs. Discussion of electrical features of Spruce Falls Power and Paper Co. plants at Smoky Falls and Kapuskasing.

PUMPED STORAGE. Extension of High-Pressure Storage Installation at Murg-Schwarzenbach Plant (Erweiterung der Hochdruck-Speicheranlage des Murg-Schwarzenbach-Werkes), E. Treiber. V.D.I. Zeit. (Berlin), vol. 73, no. 33, Aug. 17, 1929, pp. 1156-1158, 4 figs. Hydraulic storage of electric energy has been successful in Murg-Schwarzenbach plant, second storage pump of twice the output of largest present pump; installation of these pumps in places not designed for it, requires special design of water supply and drawings.

Hydraulic Power Plants with Pumped Storage (Kraftwasserpeicheranlagen), R. W. Mueller. Dinglers Polytechnisches Jl. (Berlin), vol. 344, no. 8, Aug. 1929, pp. 153-159, 10 figs. System of water storage by means of Sulzer pumps in times of low loads; increase in application of Sulzer pumps from 1905-1928; combined steam and hydraulic operation with water storage; typical load diagrams for large and small cities; 4,500-hp. two-stage Sulzer pump equipment; description of hydro-electric plants equipped with hydraulic storage.

QUEBEC. Westbury Basin Hydro-Electric Plant Supplying the City of Sherbrooke. Contract Rec. (Toronto), vol. 43, no. 48, Nov. 27, 1929, pp. 1381-1384, 7 figs. Description of recently completed power development on St. Francis River, near East Angus, Que.; equipped with two 2,900-hp. units; growth of generating capacity for Sherbrooke, Que.; list of plants supplying Sherbrooke.

SASKATCHEWAN. Island Falls Hydro Power Development, F. S. Small. Can. Engr. (Toronto), vol. 57, no. 23, Dec. 3, 1929, pp. 765-770, 11 figs. Description of most northerly power development in Canada; geographical and drainage conditions of Churchill River basin; temporary plant supplies power for construction of main development which will have initial capacity of 44,500 hp. and ultimate capacity of 86,000 hp. and will include concrete gravity dam of about 80 ft. maximum height, concrete spillway dam of Ogee profile and 100,000 cu. ft. per sec. in capacity.

WASHINGTON. Nature Makes Settings for Tacoma's Low Cost Water Power, I. F. Montgomery. Universal Engr., vol. 50, no. 5, Nov. 1929, pp. 19-23, 16 figs. Brief history of electricity generation; general statistical review of Nisqually power house and Cushman power plant; electric line system.

I

ICE FORMATION

ST. LAWRENCE. St. Lawrence and Its Ice Problem, H. T. Barnes. Can. Engr. (Toronto), vol. 57, no. 21, Nov. 19, 1929, pp. 738-739. Ice formations and their effect on navigation and power development; formation of anchor ice; chemicals to destroy ice.

ADHESION. The Formation and Adhesion of Ice, H. T. Barnes. Eng. Jl. (Montreal), vol. 12, no. 10, Oct. 1929, pp. 549-551. Results of investigation carried out on formation of anchor ice which throw considerable light on condition under which ice film will adhere to aircraft; formation of snow, hoar frost, hail, sleet, and ice-sand; temperature and humidity; velocity of air currents; terrestrial radiator; comparison with ice in water.

IMPACT TESTING

NOTCHED-BAR. Fractures in Steel and Significance of Transition Region of Notch Toughness (Die Brucharten des Stahles und die Bedeutung des Uebergangsgebietes der Kerbzaehigkeit), F. Fettweis. Stahl und Eisen (Dusseldorf), vol. 49, no. 45, Nov. 7, 1929, pp. 1621-1627, and (discussion) 1627-1628, 11 figs.

INDUSTRIAL ECONOMICS

CANADA. The Movement of the Centres of Population, Industry and Developed Water Power in Canada, H. E. M. Kensit. Eng. Jl. (Montreal), vol. 12, no. 11, Nov. 1929, pp. 605-609, 3 figs. Article previously indexed from Can. Engr., Oct. 29, 1929.

INTERNAL-COMBUSTION ENGINES

DESIGN. Pressures in Combustion-Chamber Engines (Der Druckverlauf im Zuendkammermotor), H. Ruehle. Zeit. fuer Tecknische Physik (Leipzig), no. 10, 1929, pp. 465-472, 7 figs. Graphical mathematical method of solution of differential equations is applied to problem of machine design and it is shown how difficult calculations can be made clear by systematic treatment.

THERMODYNAMICS. The Thermodynamics of Heat Transference, A. A. Herzfeld. Automobile Engr. (Lond.), vol. 19, no. 259, Oct. 1929, pp. 374-376, 3 figs. Calculations affecting output of internal-combustion engines are given; only turbulent flow considered is developing formulae for heat transference during combustion and expansion in high speed engine; formulae of von Karman and Latzko; flow conditions in cylinder analyzed; border gas layer for various piston positions; calculation of duration and rate of propagation of combustion; mass rate of combustion; influence of dissociation on combustion.

(*See also Diesel Engines; Gas Engines; Motor Buses; Oil Engines.*)

IRON AND STEEL INDUSTRY

PRODUCTION, CANADA. Production of Iron and Steel in Canada. Iron and Steel of Canada (Gardenvale, Que.), vol. 12, no. 10, Oct. 1929, pp. 260-261. Statistics are given for production of pig iron, ferro-alloys, steel ingots and castings, and prices. during August, 1929 and eight months preceding August as well as 1928.

IRON AND STEEL PLANTS

HAMILTON, ONTARIO. Improvements at Hamilton Steel Plant. Iron and Steel of Canada (Gardenvale, Que.), vol. 12, no. 10, Oct. 1929, pp. 253-255, and 259, 5 figs. Description of new open-hearth furnaces, merchant mill, gas holder and other additions made by Steel Co. of Canada, Ltd., to their Hamilton works.

L

LEAD SMELTING

BLAST FURNACE. Smelting in the Lead Blast Furnace, G. L. Oldright and V. Miller. U.S. Bur. of Mines—Reports of Investigations, no. 2966, Nov. 1929, 7 pp. Supplement to U.S. Bur. of Mines—Report of Investigations, nos. 2954, 2957, 2963 and 2965; effect of conditions at various tuyeres on form of lead and composition of slag. Conclusion of series of 5 papers based on data collected from one furnace of Int. Smelting Co. at Tooele, Utah.

LEAD-ZINC MINES AND MINING

AUSTRALIA. Mount Isa's Plans for Mining, Milling, and Smelting Outlined, E. C. B. Heden. Eng. and Min. Jl., vol. 128, no. 20, No. 16, 1929, p. 778. Glory holes will be used in mining oxidized ore at Mount Isa; this part of orebody extends to depth of 200 ft.; shrinkage stoping will be used in extracting sulphide ore; first production plans call for 1,500 tons of oxidized ore daily to be treated by gravity concentration and flotation, and for 500 tons of sulphide ore daily, to be treated by flotation only; flow sheet is given.

LIGHTING

INDUSTRIAL. The Elements of Good Factory Lighting, D. W. Thorpe. World Power, vol. 12, no. 70, Oct. 1929, pp. 337-342, 9 figs. Illustrated description of good and efficient factory lighting; consideration of lighting-points to be adopted in general lighting; article considers aspect of good factory lighting with relation to efficiency.

LIGHTNING ARRESTERS

ZIGZAG. Unshackling the Lightning Arrester, B. E. Ellsworth. Elec. World, vol. 94, no. 19, Nov. 9, 1929, pp. 935-936, 1 fig. Elimination of lightning troubles is apparently result of Zigzag arrester connection in use by Iowa-Nebraska Light and Power Co. operating approximately 1,800 mi. of transmission line and serving 200 towns and villages.

LIGNITE DEPOSITS

ONTARIO. The Ontario Lignite Field, A. R. R. Jones. Can. Min. Jl. (Gardenvale, Que.), vol. 50, no. 45, Nov. 8, 1929, pp. 1056-1057. Notes of interview with T. F. Sutherland, acting deputy minister of mines of Ontario; area known as Onakawana, near Blacksmith Rapids on Aabitibi River, about 130 mi. north of Cochrane; drilling results indicates yield of 20,000,000 tons per sq. mi.; analysis of char before briquetting and of briquettes with 10 per cent asphalt binder.

LOCOMOTIVES

DIESEL. Requirements of Locomotive Design for Diesel-Engine Drive (Die Anforderungen des Lokomotivbaues an den Dieselmotor), F. Meineke. V.D.I. Zeit. (Berlin), vol. 73, no. 42, Oct. 19, 1929, pp. 1509-1512, 9 figs. Until now Diesel engines have been too expensive and complicated in construction to be efficient; this especially concerns drive between motor and driving wheels as Diesel engines of common design have been used; railroad practice requires suitable engine of constant performance in large range of speeds; requirements concerning design and performance of such engines are discussed.

PASSENGER. Great Northern Buys Six 4-8-4 Type Passenger Locomotives. Ry. Age, vol. 87, no. 19, Nov. 9, 1929, pp. 1097-1098, 1 fig. Locomotives built by Baldwin for operation over mountain territory between Havre, Mont., and Whitefish; cylinders, diameter and stroke 28 in. by 30 in.; total engine weight 472,120 lbs.; total engine wheelbase 45 ft. 6 in.; driving wheels 73 in.; maximum rated tractive force 67,000 lbs.

SUPERHEATER. A Note on Superheating and Locomotive Cylinder Efficiency, E. L. Diamond. Engineer (Lond.), vol. 148, no. 3854, Nov. 22. 1929, pp. 541-543, 4 figs. There appears to be no information of detailed character as to exact behaviour of steam in locomotive cylinder under varying running conditions; writer reconstructed quantitatively two series of indicator diagrams taken at Pennsylvania Railroad Co.'s locomotive testing plant at Altoona; these relate to E6S 4-4-2 and K4S 4-6-2 superheater locomotives; he suggests that it would be worth while to discover just how locomotive efficiency varies with superheat.

WHEELS, PRESSURE OF. Dynamic Pressure of Locomotive Wheels (Ueber den dynamischen Druck der Lokomotivraeder), G. Lomonossoff. Glasers Annalen (Berlin), vol. 53, nos. 5 and 6, Sept. 1 and 15, 1929, pp. 80-84 and 92-98, 12 figs. Mathematical analysis regarding dynamic effect of vibrations and forces of locomotive mechanism and of stresses upon springs, rails, and bridges.

LUBRICANTS

GREASES, ZINC OXIDE. An Electroplating Lubricant. Indus. Chem. (Lond.), vol. 5, no. 57, Oct. 1929, p. 412, 1 fig. As result of corrosion in Keenok friction gears when using ordinary lubricants and due to electrolytic action set up by differences in electric potential, firm of Keenok Gears Limited have introduced new lubricant; zinc oxide was chosen as most suitable material for lubricant; results from practical point of view has been to eliminate wear of parts.

OIL VISCOSITY. More Recent Results Concerning Viscosity of Lubricants Under Pressure (Neuere Ergebnisse ueber die Druckzaehigkeit bon Oelen), S. Kiesskalt. V.D.I. Zeit. (Berlin), vol. 73, no. 42, Oct. 19, 1929, pp. 1592-1903, 1 fig. Former experiments of author are completed on basis of later American experience; exponential equation for increase of viscosity under pressure is confirmed and more simple relation between sensitivity for temperatures and for pressure, are indicated with aid of curves. See reference to earlier work in Engineering Index, 1928, p. 504.

M

MACHINERY

DESIGN. A Revolution in Machinery Design, W. S. Kelley. Iron Age, vol. 124, no. 19, Nov. 7, 1929, pp. 1229-1231. In design of machinery revolution affecting industrial machinery, particularly represents breaking with tradition, being economical rather than technical; factors in imitating design; inhibitions in providing for power; habit of restricting application of power to one point of machine is heritage of older days; few designers making use of great flexibility of electric motors. (To be continued.)

FOUNDATIONS, VIBRATIONS OF. Vibration of Foundations (Ueber Fundamentschwingungen), H. Kayser. V.D.I. Zeit. (Berlin), vol. 73, no. 37, Sept. 14, 1929, pp. 1305-1310. Principles of new methods for computing resonance by means of energy equations; report on observations and measurements of vibrations of turbine foundations; comparison of calculated and observed results; effect of nature of foundation site; deadload compensation for dynamic stresses.

MALLEABLE-IRON CASTINGS

BRIDGE RAILS. Making Large Malleable Castings, E. F. Cone. Iron Age, vol. 124, no. 21, Nov. 21, 1929, pp. 1364-1366, 5 figs. Employment of large malleable-iron castings as railings for new Liberty Bridge which span Monongahela River in downtown district of Pittsburgh is discussed; posts and railings stand severe tests.

MARBLE QUARRIES AND QUARRYING

OHIO. Marble Cliff Quarries Company Manufactures Hydrate and Quicklime in Modern Plant, T. L. Collins. Pit and Quarry, vol. 19, no. 2, Oct. 23, 1929, pp. 67-70, 9 figs. Output of this plant is approximately 30,000 tons year, about one-half quicklime and one-half hydrate; operated in connection with this plant is pulverizing plant, manufacturing pulverized raw limestone; also ready-mix mortar plant.

MASONRY

STANDARDIZATION. A Standard Unit of Dimension for Masonry, F. T. Heath. Clay-Worker, vol. 92, no. 5, Nov. 1929, pp. 354-363, 16 figs. Construction problems due to lack of coordination in sizes of masonry materials; difficulties can be overcome by adoption of standard unit of dimension by architects, engineers, and masonry material manufacturers; unit should approximate one brick length plus one mortar joint, two brick widths plus two joints, or three brick thicknesses plus three joints; application of unit plan is given for face brick paving block, firebrick, etc.

MATERIALS

GRANULAR, HEAT CONDUCTIVITY OF. Method for Determination of Thermal Conductivity of Pulverulent Substances at High Temperatures (Ueber ein Verfahren zur Bestimmung der Waermeleitfachigkeit pulverfoermiger Koerper hohen Temperaturen), M. Pirani and Wangenheim. Zeit. fuer Technische Physik (Leipzig), no. 10, 1929, pp. 413-424, 7 figs. Method, experimental arrangements and equipment for determination at high temperatures and for different materials; measured values of various materials are given in tables and curves, and discussed.

METALS

FATIGUE OF. The Fatigue of Metals. Engineer (Lond.), vol. 148, no. 3855, Nov. 29, 1929, p. 584. According to Gough, in whole experience of National Physical Laboratory, no case has been encountered in which slip bands indicative of plastic yielding have not been apparent at stresses which would never fatigue material; surface defects have considerable influence on lowering fatigue strength; this, taken in conjunction with demonstration that fatigue strength is reduced by contact with liquids which produce chemical effect on metal, leaves little room for doubt that fatigue failure commences at surface of metal.

RARE. Metals of the Tungsten and Tantalum Groups, C. W. Balke. Indus. and Eng. Chem., vol. 21, no. 11, Nov. 1929, pp. 1002-1007, 14 figs. Chemical and physical properties of four metals, columbium and tantalum on one hand, and molybdenum and tungsten on other; in all cases minerals containing these elements are essentially salts of acid radical containing metal, for chemically these four elements are more acid in character than basic; preparation of metallic tungsten is considered typical case.

SOLIDIFICATION. Volume Changes During the Solidification of Metals and Alloys, W. E. Goodrich. Engineering (Lond.), vol. 128, no. 3331, Nov. 15, 1929, p. 659. Results of measurements made on behalf of Die Casting Committee of British Non-Ferrous Metals Research Association, on metals of low fusibility, viz., tin, lead, bismuth, antimony, and their alloys. Brief abstract of paper read before Faraday Soc.

TESTING, TENSILE. Tension and Compression. Metallurgist (Supp. to Engineer, Lond.), Oct. 25, 1929, pp. 146-147. Experience shows that in many ways different mechanical properties of engineering metals are closely linked together; close correlation exists between tensile strength and Brinell hardness, at all events in steel, while fatigue range also seems to be closely related to ultimate tensile strength; closer study of relation between tensile and compression properties of more important structural materials is essential.

X-RAY ANALYSIS. X-Ray Methods for Determining of Flaws in Construction Materials (Roentgenverfahren zur raeumlichen Ausmessung von Fehlstellen in Werkstoffen), C. Kantner and A. Herr. V.D.I. Zeit. (Berlin), vol. 73, no. 24, June 15, 1929, pp. 811-816, 24 figs. Principles of densographic and stereometrometric processes giving results of great precision far exceeding that of usual methods; description of special apparatus and method of using it, with special reference to study of flaws in castings and welds.

MINES AND MINING

CONTROL MAPS. A Well-Planned Numbering and Sketching System Facilitates Control of Underground Operations, A. Kwiecinski. Eng. and Min. Jl., vol. 128, no. 22, Nov. 30, 1929, pp. 848-850, 4 figs. Basis of system is division of entire mining area into rectangular blocks with 100 m. sides; each block is numbered and letters of different types are used to indicate different types of mine work; description of details of sketching system and conventional signs.

DEEP, VENTILATION. The Engineering Aspect of Dealing With Temperature and Humidity Conditions of Mine Atmospheres at the Great Depths Associated with some of the Gold Mines of the Witwatersrand, J. H. Dobson. Chem., Met. and Min. Soc. of S. Africa (Johannesburg), vol. 30, no. 2, Aug. 1929, pp. 58-62 and (discussion) 69-74. Mathematical study of heat exchange in mine air, rock and rock surface, and bodies of miners; refrigeration of mine air; economic limit of quantity of air for ventilation; refrigeration of air supply at surface; cooling effect of compressed air; use of liquid air; use of ice; direct cooling of workers.

MINING EXPLORATION

QUEBEC. A Review of Exploration Work in the Rouyn Camp, J. G. MacGregor. Can. Min. and Met. Bul. (Montreal), no. 211, Nov. 1929, pp. 1280-1289. General remarks, including discussion of geological problems, review of past and present exploration methods, and prediction as to type of exploration campaign that will be largely adopted in future search for ore.

MOTOR BUSES

ENGINES, HEAVY-OIL. Surveys the Present State of Progress of Heavy Fuel Engines and Their Possibilities, G. J. Shave. Bus and Coach (Lond.), vol. 1, no. 10, Oct. 1929, pp. 380-386, 5 figs. Possibilities which compression-ignition motor offers of utilizing wide field of cheap fuel; expenditure necessary for comprehensive research is sound investment; advantages and disadvantages of heavy-oil fuel; fuels available; combustion problems; heavy-oil vaporizers; vaporizer limitations; compression-ignition engines; fuel injection; constant-stroke pumps; heavy-fuel engines; fuel injectors; Diesel engines types; starting; maintenance and repair.

MOTOR TRUCKS

DESIGN. Motor Vehicle Design, J. B. Osler. Modern Transport (Lond.), vol. 22, no. 557, Nov. 16, 1929, (Supp. Sec.), pp. xxi and xxiii, 1 fig. Discussion of proper vehicle design and effect on motor-fleet operation; diagram showing operating cost per mile at various vehicle speeds; maintenance expenditure.

MOTORSHIPS

DIESEL (GRAINMOTOR). A Canadian Motorfreighter for Canal and Lake Service. Motorship, vol. 14, no. 11, Nov. 1929, p. 795, 1 fig. Grainmotor is 260 ft. in length o.a., with loaded displacement of 3,605 tons; on draft of 14 ft. she has capacity of 100,000 bu. of grain; equipped with 8-cylinder 4-cycle Bessemer Diesel engine delivering 800 s.hp. at 200 r.p.m.

N

NICKEL DEPOSITS

WORLD DEPOSITS. World Deposits of Nickel (Vaerldens nickelmalmstillgangar), H. Carlborg. Jernkontorets Annaler (Stockholm), no. 10, 1929, pp. 493-494. Brief history of nickel; description of nickel ore minerals, nickel-mining and refining processes; use of nickel and nickel alloys; geology of nickel deposits; mine production statistics are given for years 1913 to 1927; present yearly consumption is 40,000 tons. Bibliography.

NICKEL SMELTERS

ONTARIO. Where Frood Ore Will be Milled and Smelted. Eng. and Min. Jl., vol. 128, no. 20, Nov. 16, 1929, p. 773, 3 figs. Illustrations and brief notes describing construction work of International Nickel Co. at Copper Cliff, Ont.; initial output will be about 120,000 tons of blister copper yearly and probably 40,000 or 50,000 tons of nickel.

NOISE

MEASUREMENT OF. Measurement of Machine Noises, B. A. G. Churcher and A. J. King. Elec. Times, vol. 76, no. 1986, Nov. 14, 1929, p. 816, and (discussion). Comprehensive investigation carried out by Metropolitan-Vickers Electrical Co.; work was initiated with object of attacking in thorough and comprehensive manner problem of noise emitted by motors, but technique and measuring apparatus developed in connection with sound tests on motors are also directly applicable to other classes of apparatus. Paper read before Instn. Elec. Engrs.

O

OIL ENGINES

COMBUSTION IN. Ratio of Mixture and Combustion Processes in Oil Engines (Mischungsverhaeltnis u. Verbrennungsvorgaenge im Oelmotor), P. Meyer. V.D.I. Zeit. (Berlin), vol. 73, no. 24, June 15, 1929, pp. 824-826, 3 figs. Reference to earlier suggestions for determination of mixture ratio from exhaust-gas analysis; exact determination of constituents of combustion gases in self-mixing and injection engines in case of lack of air; combustion tests in bomb showed deviations in self-mixing engines; attempt to explain this phenomenon is made.

OPEN-HEARTH FURNACE PRACTICE

STEEL QUALITY. Getting Open-Hearth Steel Quality. Iron Age, vol. 124, no. 21, Nov. 21, 1929, pp. 1382-1384, 1 fig. Further review of round table discussion taking place at Open-Hearth Committee meeting of American Institute of Mining and Metallurgical Engineers; report of one of two Quality Control Committees for rimmed steel; quality in killed steel; progress on open-hearth investigation; pouring practice; use of purifiers for iron and steel; manganese vs. aluminum as deoxidizer; soaking pit heating and chipping costs; atomizing oil fuel with superheated steam. (To be concluded.)

ORE TREATMENT

CLASSIFICATION. The Importance of Classification in Fine Grinding, J. V. N. Dorr and A. D. Marriott. Eng. and Min. Jl., vol. 128, no. 23, Dec. 7, 1929, pp. 880-887, 26 figs. Discussion of wet fine grinding with mechanical classifiers, particularly as carried on at nine large copper milling plants in Western part of North America; paper is limited to information obtained from contact with machine with which authors are familiar, namely Dorr classifier and bowl classifier; flow sheets of some of larger mills are given, with tabular data on milling results.

P

PAINT

PLASTICITY OF. The Plasticity of Paint, F. H. Rhodes and J. H. Wells. Indus. and Eng. Chem., vol. 21, no. 12, Dec. 1929, pp. 1273-1277, 7 figs. Yield point of paint increases with concentration by volume of pigment in paint; in paints containing equal concentrations by volume of pigment yield point varies inversely with average particle size; this relationship is qualitative only and is affected by specific character of pigment; extent to which plastic characteristics of paint are altered by addition of given amount of thinner depend to some extent upon specific character of thinner; turpentine produces relatively less change in plastic characteristics than does either petroleum thinner or xylene.

PAVEMENTS

ASPHALT. Asphalt Pavements of Rough Texture, F. J. Leduc. Can. Engr. (Toronto), vol. 57, no. 22, Nov. 26, 1929, pp. 749-750. Construction of anti-skid pavements in Europe; definition of skidding; seal coats; sheet asphalt; application of rock asphalt; producing asphalt coule. Paper read at Asphalt Paving Conference.

BRICK. Brick Manufacturers Discuss Paving Practices at Annual Meeting. Eng. News-Rec., vol. 103, no. 24, Dec. 12, 1929, pp. 939-941, 1 fig. Abstracts of papers on losses in power-shovel grading, brick-laying by roller conveyors, improvements in brick-road construction, repairing and salvaging old pavements, fillers, bituminated sand as cushion material, asphalt and grout-filled sections and regional highway planning.

Flexible Bases for Vitrified Brick Pavements, H. F. Harris. Nat. Paving Brick Mfrs. Assn.—Proc. of mtg. Feb. 13-15, 1929, pp. 77-80 and (discussion) 81-83, 2 figs. Author discusses merits of flexible bases in light of experience of city of Trenton, N.J., mechanical analysis of black base mixtures; cost data.

TESTING. Field Testing for Transverse Strength of Pavement Slabs, W. C. Hammatt. Pub. Works, vol. 60, no. 12, Dec. 1929, pp. 471-472, 3 figs. Method of obtaining test beams and slabs which have been placed and cured under same conditions as pavement.

PHOTOELASTICITY

PHOTOELASTICITY. Some Experimental Methods and Apparatus for Determining the Stresses in Bridges and Framed Structures, E. G. Coker. Instn. Civ. Engrs.—Proc. (Lond.), pt. 1, no. 4733, 1929, 23 pp., 9 figs. Author reports on application of photoelastic methods to study of stresses in nitrocellulose models of arches; concludes that complete stress distribution in member can be found by mechanical measurements made on member itself combined with optical measurements obtained from transparent model, thus eliminating laborious calculations, especially in complicated structures of indeterminate type. Bibliography.

POTASH DEPOSITS

RUSSIA. Potash Deposits in the Urals, W. P. Kotchetkoff. Eng. and Min. Jl., vol. 128, no. 22, Nov. 30, 1929, pp. 842-845, 2 figs. Review of exploration work near Solikamsk and Ust Borovaya, in province of Perm; since 1917; potash mineral sylvite or potassium chloride occurs in rock salt; layers of primary mineral carnallite, magnesium-potassium chloride are also found; explored area of 60 sq. km. is estimated to contain total of 600,000,000 tons of potassium oxide; analysis and comparison with Stassfurt and Alsace salts are given.

POWER PLANTS

STEAM ACCUMULATORS FOR. Ruth's Accumulator for Peak Loads and for Standby Service in Electric Power Plants (Ruthsspeicher zur Spitzendeckung und als Momentanreserve in Elektrizitaetswerken), E. Praetorius. Elektrizitaetswirtschaft (Berlin), vol. 28, no. 490, Aug. 2, 1929, pp. 432-435, 4 figs. Momentary standby service as applied in plant in Malmo, Sweden, connected with municipal heating systems; systems of Munich, Elberfeld, Leipzig, Charlottenburg, etc.; savings and cost of energy; equipment load and wiring diagram of Charlottenburg plant are illustrated.

PRESSURE VESSELS

WALL THICKNESS. Non-Ferrous Metal Walls for Pressure Vessels (Die Wandungen der Dampffaesser aus Nichteisenmetallen), G. Hoennicke. Waerme (Berlin), vol. 52, no. 45, Nov. 9, 1929, pp. 835-841, 7 figs. Two examples are given of results obtained with cylinder plates of non-ferrous metal, described in Feb. 16 and 23, 1929, issues of this journal; riveted joint of cylinder exposed to internal pressure and its influence on thickness of plate; calculation of all parts of pressure-vessel walls with uniform degree of safety is recommended.

PUMPING STATIONS, ELECTRIC

DAYTON, OHIO. Economy Result of Electric Drive in Pumping Station, C. G. Tarkington. Water Works Eng., vol. 82, no. 25, Dec. 4, 1929, pp. 1755 and 1758. Synchronous motor driven centrifugal pumps furnish water for city of Dayton; methods of control; speed regulation; records show 75 per cent overall efficiency; power factor; efficiency; speed regulation; dependability of operation.

PUMPS, CENTRIFUGAL

PERFORMANCE. Characteristics of Centrifugal Pumps, E. L. Maag. Power House, vol. 23, no. 21, Nov. 5, 1929, pp. 17-21, 5 figs. Diagrams illustrating characteristic curves of 6- and 16-in. single-stage pump; importance of curves for designing engineer; diagram illustrating characteristic curves of 8- and 10-in. two stage pumps.

R

RADIATORS, HEATING

STEAM. Correct Methods for Venting Steam Radiators, T. N. Thomson. Plumbers Trade Jl., vol. 87, no. 10, Nov. 15, 1929, pp. 24-25, and 74, 4 figs. Description of method of overcoming venting troubles that occur when modern water-pattern radiators are used in one-pipe steam heating systems.

RAIL MOTOR CARS

FUELS. Distillate as Rail-Car Fuel, E. Wanamaker. Soc. Automotive Engrs.—Jl., vol. 25, no. 5, Nov. 1929, pp. 499-501, and 514.

GASOLINE-ELECTRIC. Gas-Electric Motor Car Transportation on Steam Railroads, P. M. Gillilan. South. and Southwest Ry. Club—Proc., vol. 20, no. 5, Sept. 1929, pp. 15-52 and (discussion) 53-61, 16 figs.

RAILROAD CROSSINGS

SIGNALS. Traffic Light Protects Crossing, B. L. Smith. Traction Shop and Roadway, vol. 2, no. 10, Oct. 1929, pp. 313-314, 2 figs. Chicago South Shore and South Bend Railroad protects Michigan City, Ind., crossing with city "stop and go" light; operation of signal; layout of electrical circuit.

RAILROAD SIGNALS

AUTOMATIC BLOCK. Automatic Block Signals Protect Train Movements. Ry. Signaling, vol. 22, no. 11, Nov. 1929, pp. 410-411, 3 figs. Either-direction signals on double-track line controlled automatically by approach of train through Canadian Pacific Connaught Tunnel; track and signaling layout; train establishes direction for signal control; auxiliary equipment.

RAILROAD SIGNALS AND SIGNALING

NEW METHOD. New Method of Train Describing. Modern Transport (Lond.), vol. 22, no. 558, Nov. 23, 1929, pp. 5-6, 4 figs. Apparatus just completed by Relay Automatic Telephone Co., in association with British Power Railway Signal Co.; installation of this nature has recently been put into service on British railway; features of new system are use of two wires only between cabins and ability of receiving cabin to pass on descriptions selectively to one or more boxes.

AUTOMATIC BLOCK. Normal and Reverse Direction Signals Solve Operating Problem for D. & R. G. W. on Mountain Grade. Ry. Age, vol. 87, no. 23, Dec. 7, 1929, pp. 1322-1324, 6 figs.; see also Ry. Signaling, vol. 22, no. 12, Dec. 1929, pp. 452-453, 5 figs. Description of signal installation, with control arranged for either-direction operation on either track, which has improved safety of train operation and increased track capacity; illustration of track and signal plan; zones used for control.

INTERLOCKING. Automatic Interlocker Saves over 8,000 Train Stops Annually. Ry. Signaling, vol. 22, no. 11, Nov. 1929, pp. 407-409, 8 figs. Simplified control system used at C. and A. N.Y.C. crossing at Streator Junction, Ill.; brief description of colour-light signals and emergency release switch, also relay box at crossing.

RAILROAD TERMINALS

MONTREAL. Economic Aspects of the Montreal Terminal, S. W. Fairweather. Can. Ry. Club—Official Proc., vol. 28, no. 6, Sept. 1929, pp. 25-59. Chart showing present rate of growth of greater Montreal in comparison with that of other metropolitan districts; brief description of proposed terminal facilities; tables showing transportation increase in last 40 years; diagrams illustrating growth of Canadian National Railways, Montreal Terminal; construction of Montreal Terminal will involve expenditure of $50,000,000; synopsis is given of tangible benefits.

RAILROAD TERMINALS, FREIGHT

LOUISVILLE, KY. Freight Terminal is Model of Efficiency, L. M. Brown. Elec Traction, vol. 25, no. 11, Nov. 1929, pp. 571-572, 4 figs. Interstate Public Service Co. constructs new freight terminal in Louisville, Ky., for efficient handling of its growing freight business; 22 cars loaded at one time; interchange with electric and steam lines.

RAILROADS

CANADA. Colonization and Development as Affecting Railway Construction and Operation, J. S. Dennis. Can. Ry. Club—Official Proc., vol. 28, no. 7, Oct. 1929, pp. 25-33. Brief history of work performed by Colonization and Development Dept. of Canadian Pacific Railway for past 57 years; results of activities undertaken for purpose of producing traffic; system a necessity in development of Canada as whole.

MOUNTAIN. Rack Railroads and Their Importance for Mountainous Countries (Los ferrocarriles de cremallera y su importancia para paises montanyosos), C. R. Mathaler. Anales de Ingenieria (Bogota), vol. 47, no. 433, April 1929, pp. 91-108, 12 figs. General discussion, with tabular data on maximum grades of steam railroads in Switzerland, France, and Austria; historical and descriptive notes on rack systems; switches and turnouts; steam locomotives; electric locomotive and cars; combined rack and adhesion railroads; comparison between adhesion and combined types, with corresponding tabular technical data.

RAILS

Flaw Detection. About 800,000 Rails Tested Electrically for Flaws, E. A. Sperry. Iron Age, vol. 124, no. 21, Nov. 21, 1929, p. 1366. Considerable success attained in non-destructive internal testing of steel rails for detection of flaws, particularly transverse fissures; two detector cars have made permanent records of about 800,000 rails showing condition of their internal structure. Abstract of paper presented before Nat. Metal Congress.

REFRIGERATION

Research. Methods of Obtaining Extremely Low Temperatures (Sur la manière dont on obtient les températures très basses), W. H. Keesom. Revue Universelle des Mines (Liége), vol. 72, no. 8, Oct. 15, 1929, pp. 225-233, 13 figs. Description of method developed in cryogenic laboratorory at Leyden; historical reference to liquefaction of ammonia gas in 1798, and helium in 1908, both accomplished in Holland; description of refrigeration research work of Kamerlingh Onnes; description of apparatus and practice in obtaining temperature of 2.3 deg. Kelvin, at which liquid helium exhibits properties differing from liquid helium at higher temperature.

REFUSE DISPOSAL

United States and Europe. Review of Question of Refuse Disposal (En oversigt over dagrenovationsporgsmaalet), S. Sorensen. Ingenioren (Copenhagen), vol. 38, no. 22, June 1, 1929. pp. 257-263, 16 figs. Mode of removal of waste in different cities in United States and Europe are described and compared as to costs and efficiency of systems.

REMOTE CONTROL

Optical Indicator. Remote Control with Pictorial Indication (Sinnbildliche Fernanzeige), Ahrens. Foerdertechnik und Frachtverkehr (Wittenberg), vol. 22, no. 23, Nov. 8, 1929, pp. 439-440, 5 figs. Special type of electric position indicator developed by Siemens and Halske, to be used for movable bridges, sluices, ship control, etc., and which gives plastic pictorial idea of position of moving parts remotely operated.

ROLLING MILLS

Billet Mills, Design of. Improvement of Billet Mills (Die Entwicklung des Platinenwalzwerkes), W. Kraemer. Stahl und Eisen (Dusseldorf), vol. 49, no. 46, Nov. 14, 1929, pp. 1653-1654, 1 fig. Recommendations are made to improve efficiency of billet mills and reduce costs; plan of suggested mill for production of billets is shown as continuous mill is too costly, improved universal mill with Lauth three-high mill is proposed.

Journal Bearings. New Types of Journal Bearings in Rolling Mills (Neue Gleitlagerformen in Walzwerken), H. Weinlig. Stahl u. Eisen (Dusseldorf), vol. 49, no. 44, Oct. 31, 1929, pp. 1573-1579, 19 figs. Further development of bearings at Roechling iron and steel work in Woelklingen; bearings with linked chambers; pressure lubrication; testing of different kinds of wood to determine their adaptability; comparative experimental results; wood-frame bearing has been used successfully in different mills.

RESERVOIRS

Surveying. Levelling for Tunnels and Reservoirs for the Boston Metropolitan District Water Supply, L. G. Harris. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 10, Dec. 1929, pp. 2597-2607 and (discussion) 2601-2603. Details of method of running series of precise or first order levels from established Government bench-mark at Springfield, Mass., along railroads, to Boston via Oakdale, Mass. Discussion includes: Comparison with Cascade Tunnel, by H. B. Alvord; Cooperation of the United States Coast and Geodetic Survey, by J. B. Babcock, 3rd; Inaccuracy of Levelling Rods, by H. G. Avers; Coastal Surveys in Rhode Island, by L. L. Holland; Proper Monumentation, by C. H. Birdseye.

RESERVOIRS, CONCRETE

Construction. Reinforced Concrete Reservoir at Barnet. Concrete and Constr. Eng. (Lond.), vol. 24, no. 11, Nov. 1929, pp. 643-646, 3 figs. Methods of construction of 5,000,000-gal. water reservoir having depth of 12 ft.

Pittsburgh, Pa. Construction of Concrete Reservoirs with Special Reference to Foundation Work in Abandoned Mines, R. M. Riegel and G. L. Hendrickson. Engrs. Soc. West. Penn.—Proc., vol. 45, no. 8, Nov. 1929, pp. 343-366 and (discussion) 367-378, 11 figs. Design and construction of Brashear and McNaugher concrete distribution reservoirs for water works of Pittsburgh, Pa., 23,000,000 gals. and 5,500,000 gals. in capacity, respectively; maximum depth of water is 25 ft.; details of retaining walls, grouting operations, etc.; partly worked coal veins were found at both reservoir sites.

RETAINING WALLS

Halifax. Interesting Retaining Wall at Halifax. Surveyor (Lond.), vol. 76, no. 1972, Nov. 8, 1929, p. 429, 2 figs. Construction of masonry retaining wall of 27-ft. maximum height; details of reinforced-concrete beams used to bond wall.

RIVERS

Improvement, Models. Benefits of Proposed River Cutoffs Determined by Model. Eng. News Rec., vol. 103, no. 23, Dec. 5, 1929, pp. 886-888, 4 figs., editorial on p. 871. Des Moines River at Ottumwa, Iowa, reproduced in hydraulic laboratory of University of Iowa for determination of benefits of proposed cutoffs; construction of model; test procedure; effect of cut-off channels across bends; effect of channel enlargement.

ROAD CONSTRUCTION

Blasting. Blasting on Highway Construction Projects, H. M. Hamilton. Dupont Explosives Service Bul., Nov. 1929, 8 pp. 4 figs. Blasting as key to shovel efficiency; spacing, depth and diameter of holes as factors in blasting results; kinds and grades of dynamite best suited for blasting sand rock and limestone; circuit tester as saver of time and money; underloading blasting machine as precaution for avoiding misfires; steps for safeguarding property and traffic against damage from blasting.

Detours. Road Reconstruction without Detouring, W. A. Van Duzer. Eng. News Rec., vol. 103, no. 23, Dec. 5, 1929, pp. 884-885, 2 figs. Improvements of Lincoln Highway in Westmoreland County, Pa., between Greensburg and Ligonier where 3 mi. section traverses narrow creek valley and no parallel roads were available; plan necessitated carrying of traffic over right-of-way; alternating files of one-way traffic were maintained around steam-shovel operations and sections of concrete pavement during curing periods; with delays not exceeding 10-minutes to section.

ROAD MATERIALS

Bituminous. An Asphalt Emulsion for Road Surfaces. Can. Engr. (Toronto), vol. 57, no. 21, Nov. 19, 1929, pp. 733-734, 6 figs. Properties and uses of British road emulsion Colas in construction; successful tests on Ontario highways, airport runways, etc.

The Application of the Bituminous Sands of Alberta to Road Construction, K. A. Clark. Contract Rec. (Toronto), vol. 43, no. 48, Nov. 27, 1929, pp. 1398-1400. Scientific and Industrial Research Council of Alberta discusses effect of fine materials; kerosene; emulsion formation during bituminous sand separation operations; oil-in-water emulsions.

ROADS

Low Cost. Asphalt Paving Conference Deals with Improvement of Secondary Roads. Eng. News-Rec., vol. 103, no. 20, Nov. 14, 1929, pp. 776-778. Producers, Technologists and Contractors' Association discuss series of closely related papers on low-cost road construction, utilizing bituminous materials of all kinds at annual Asphalt Paving Conference at West Baden, Ind.; résumé of papers on cooperative research; methods of low-cost road construction; re-tread construction; oiling; subgrade treatment; non-skid surfaces; emulsions; airport runways.

ROCK DRILLS

Sharpening. Centralization and Electrification of Drill-Steel Shops Effects Savings in Labour, Fuel and Material, H. I. Altshuler and J. T. Lewis, Jr. Eng. and Min. Jl., vol. 128, no. 20, Nov. 16, 1929, pp. 766-769, 8 figs. Description of drill-sharpening equipment and practice of Companyia de Real del Monte y Pachuca, at Pachuca Hidalgo, Mexico; sharpening, formerly done at each of eight separate mines, is now concentrated at two central shops.

ROOFS

Design. Hangars Carry Expansion Ends of Long Roof Trusses, W. S. Wolfe. Eng. News-Rec., vol. 103, no. 21, Nov. 21, 1929, pp. 801-802, 2 figs. Roof details of new auditorium for industrial Mutual Association at Flint, Mich.; with one end of trusses free to swing on 6-in. pin at top of column, possible movement of 4 in. is provided for.

S

SAND AND GRAVEL PLANTS

Electric Drive. Gravel Plant Operation by Hydro Power, W. W. Southam. Can. Engr. (Toronto), vol. 57, no. 22, Nov. 26, 1929, pp. 745-746, 5 figs. Modern plant having capacity of 1,200 tons per hr. is operated entirely by electricity except two steam locomotives; electrically operated drag lines, motor-driven screens and washing plant.

SEAPLANES

Design. Large Flying Boats (Die Gross-Flugboote), Schuster. Glasers Annalen (Berlin), vol. 105, no. 7, Oct. 1, 1929, pp. 105-111, 8 figs. Problems to be solved in designs of seaworthy seaplanes, i.e., resistance and power requirements of flying boat at starting, and increase in weight when type of boat is enlarged; most important German and foreign flying boats are summarized; typical design of Rohrbach and Dornier flying boats.

SEPTIC TANKS

Data on. Data on Cesspools, Septic Tanks and Sewage Disposal Fields, W. A. Hardenbergh. Plumbers Trade Jl., vol. 87, no. 10, Nov. 15, 1929, pp. 12-14, 5 figs. Abstracts from bulletin issued by Connecticut Board of Health for regulation of sewage-disposal systems.

SEWAGE DISPOSAL

Sludge Utilization. Sludge Disposal at Marion, Ohio, F. G. Browne. Pub. Works, vol. 60, no. 12, Dec. 1929, pp. 449-453, 3 figs. Description of sewage disposal plant serving population of 25,000; five years experience with sludge disposal; operating details; costs.

SEWAGE DISPOSAL PLANTS

Design. Basing Sewage-Works Requirements on Stream Pollution Studies, A. C. Purdy. Eng. News-Rec., vol. 103, no. 21, Nov. 21, 1929, pp. 813-815, 4 figs. In Middletown, N.Y., defeat of first proposed bond issue, was followed by adoption of second and simpler plan after analytic work, which demonstrated necessity of proposed plan and offers satisfactory provisions against stream pollution at one-third cost of first project.

Japan. First Two Activated-Sludge Plants in Japan, T. Kawahara. Eng. News-Rec., vol. 103, no. 24, Dec. 12, 1929, p. 938, 1 fig. Features of Horidome plant of Nagoya, capacity 11,000,000 gals. daily, which will be roofed over and provided with ventilation shaft 100 ft. above level of adjacent roadway; also features of Atsuta plant, designed for capacity of 4,700,000 gals. per day in dry weather, serving population of 130,000.

SEWAGE PUMPING STATIONS

Hamilton, Ont. The Hamilton Intercepting Sewer and Main Pumping Station, H. S. Philips. Eng. Jl. (Montreal), vol. 12, no. 10, Oct. 1929, pp. 532-535, 6 figs. General description of system and equipment consisting of five 14- to 16-in. vertical centrifugal wood trash pumps with electric motors automatically operated by master controller.

SEWERAGE

Canada. Sewage Treatment for Grand Marais. Can. Engr. (Toronto), vol. 57, no. 20, Nov. 12, 1929, pp. 719-720. Abstract of report by Gore, Nasmith and Storrie, consulting engineers, Toronto, accompanying previously indexed report by J. C. Keith; single plant for population of 10,000, estimated to cost $415,000 with annual capital and operation charges amounting to $46,500 is recommended.

SEWERS

Outfall, Construction. Divers Place Pipe in 60-ft. of Water on Seattle Sewer Job. Eng. News-Rec., vol. 103, no. 20, Nov. 14, 1929, pp. 782-783. Method of placing 700-ft. length of cast-iron outfall sewer pipe, 4 ft. in diam., on piles which were driven in trench; pipe was lowered in 36-ft. lengths consisting of three 12-ft. sections that had been fastened together on shore.

Ventilation. Chlorine and Sewer Ventilation, H. C. H. Shenton. Can. Engr. (Toronto), vol. 57, no. 21, Nov. 19, 1929, pp. 731-732. Sewer ventilation and prevention of odours in sewage by use of chlorine; practice in London and America.

SHORE PROTECTION

Chicago. Lake Levels and Damage to Shore Property at Chicago, W. G. Potter. Eng. News-Rec., vol. 103. no. 20, Nov. 14, 1929, pp. 767-768, 1 fig. See editorial comment, p. 757. Waterfront development and disregard of highwater stages contribute to damage by recent storms; elevation of Lake Michigan 1860 to 1929; shore protection has become necessity; protection should be mainly by bulkheads or breakwaters parallel to shore; property owners should combine and thus get uniform and better construction at lower cost. Abstract of paper read before West. Soc. Engrs.

SHOVELS

Road Grading. Power-Shovel Production Grading Highway Roadbed, A. P. Anderson. Eng. News-Rec., vol. 103, no. 22, Nov. 28, 1929, pp. 860-861. Study of actual average rates at which power shovels were found to be operating and at which pay yardage was being handled on more than 120 going projects in various sections of United States; study includes analysis of 48,000 complete shovel cycles and compilation of records giving complete data on movement of more than 400,000 cu. yds. of excavation; effect of kind and character of material on power-shovel production in highway grading work.

SIPHONS

Concrete. Building High-Head Siphons on the Yakima Project. Eng. News-Rec., vol. 103, no. 20, Nov. 14, 1929, pp. 763-765, 4 figs. Description of 25 reinforced-concrete and joint pipe siphons of main and branch canals of Kittitas division; siphons are up to 13-ft. in diam., and concrete carries pressure heads up to 153 ft.; construction joints and details of reinforced-concrete siphons showing eccentric shoulder and copper water stop; leakage tests on ten concrete siphons show average loss of 0.0192 gal. per min. per linear foot of barrel.

SNOW REMOVAL

Railroads. The Operation and Maintenance of Railway Track in Districts of Heavy Snowfall, G. B. Brown. Eng. Jl. (Montreal), vol. 12, no. 11, Nov. 1929, pp. 588-590, 3 figs. Chief operation engineer of Canadian National Railway reports on practice of his company in using wedge-and-wing plows, rotary plows, and flanger cars. Paper presented before World Eng. Congress, Tokyo.

SOILS

Bearing Capacity. A Practical Method for the Selection of Foundations Based on Fundamental Research in Soil Mechanics, W. S. Housel. Univ. of Mich.—Dept. of Eng. Research, no. 13, Oct. 1929, 117 pp., 44 figs. Method is developed, in light of experiments with loaded round and square plates bearing on clays only; theory of pressure distribution on bearing areas, quite contrary to usual principles is developed; straight-line relation of bearing capacity to relative size of bearing area; characterization of soils by coefficients determined by tests.

SOLIDS

Viscosity in. Viscosity in Solids, R. L. Wegel. Bell Laboratories Rec., vol. 8, no. 3, Nov. 1929, pp. 94-99, 5 figs. Distortion of piece of solid matter is generally accompanied by two kinds of energy losses: thermodynamic losses due to changes of volume, and losses due to shearing between layers of material: these shearing viscous losses are discussed.

SPEED REDUCERS

Variable Speed. An Infinitely Variable Speed Gear. Gas and Oil Power (Lond.), vol. 25, no. 289, Oct. 3, 1929, p. 18, 1 fig. Description of infinitely variable-speed gear manufactured by Crofts, Ltd.; speed ranges from zero to 1,000 r.p.m. and above, also reverse; great advantage is of bringing machinery to rest or at any desired speed.

SPRINGS

Coil. Oscillations of Compound Springs, A. S. Langsdorf. Wash. Univ.—Sci. and Technology, no. 3, Oct. 1929, 17 pp., 4 figs. In order that springs of compound type may be designed to minimize oscillations under given operating conditions, it is necessary to analyze their performance by mathematical methods, so as to derive formulae in terms of spring constants; accordingly, analysis has been worked out to cover any general case.

STEAM-ELECTRIC POWER PLANTS

Deepwater, N. J. Deepwater—A New Idea in Central Stations. Power Plant Eng., vol. 33, no. 22, Nov. 15, 1929, pp. 1204-1214, 11 figs. Deepwater is one of first large central stations to go into operation utilizing 1,200 lbs. pressure exclusively and is also one of first to supply large quantities of high pressure exhaust steam to industrial plant; coal delivered both by rail and water; boilers to be operated at 1,350 lbs. drum pressure; forced and induced draft; heat balance diagram of deepwater; feedwater system; make-up feedwater is evaporated; list of principal equipment is given; turbine generators; condensing equipment; electrical features; instruments and metering.

England. The Hams Hall Generating Station of The Birmingham Corporation. Engineering (Lond.), vol. 128, nos. 3329, and 3332, Nov. 1 and 22, 1929, pp. 545-547 and 663-666, 18 figs. partly on supp. plate. Nov. 1: First section, now finished, comprises 60,000 kw., total cost of construction being 1,336,400 pounds; it contains two 30,000-kw. units, but there is room for a third set of same output, which it is proposed to erect in 1933-1934; details of coal-handling plant. Nov. 22: Boiler plant; ash-handling and water-softening plant.

The Portishead Generating Station of the British Corporation. Engineering (Lond.), vol. 128, no. 3331, Nov. 15, 1929, pp. 654-655, 3 figs. partly on p. 624. Station consists of four main sections, viz., boiler house, turbine house, and low-tension and high-tension switch houses, which are built in tiers on hill side; steam-raising equipment consists of four Vickers header straight-tube boilers, supplied by Vickers Boiler Co.; two main turbines were manufactured by Metropolitan-Vickers Electrical Co.; each main generating unit is solidly connected to bank of three 8,333-kva. transformers, whereby pressure is stepped up to 33,000 volts for transmission to Bristol.

STEAM HEATING PLANTS

District, Toronto, Ont. The Toronto Terminals Central Steam Generating Station, J. Breakey. Power House, vol. 23, no. 21, Nov. 1929, pp. 70 and 74-80, 17 figs. Illustrated description of power plant which will be used as supply steam for various purposes in Toronto; boiler equipment; ash handling steam for various purposes in Toronto; boiler equipment; ash handling; draft indicator; layout of boiler room, showing position of boilers, forced-draft fans, water-softening tank, etc.; electric winch; steam flow records; water measurement; feed pumps and generator set.

STEAM POWER PLANTS

Developments in. Scientific Developments in Steam-Driven Power Station Practice, D. Brownlie. Elecn. (Lond.), vol. 103, no. 2683, Nov. 1, 1929, pp. 525-526. Notes on pulverized-fuel firing; high-pressure boilers; substitutes for water in boilers; low-temperature carbonization; sulphur problem (To be concluded.) Extracts from paper read before Instn. Mech. Engrs.

Germany. Large Thermal Power Stations in Germany (Les grandes centrales thermiques allemandes), P. Jarrier. Technique Moderne (Paris), vol. 21, no. 16, Aug. 15, 1929, pp. 497-500, 3 figs. Review of present practice is concluded; cheapening of peak-load supply by utilization of water-power storage (natural or pumped) and by means of Ruths' thermal storages; particulars of large turbo-alternator sets and relative merits of alternative arrangements of high- and low-pressure and back-pressure units; back-pressure working is specially advantageous in district heating systems; appendix gives information dealing with high-pressure installations.

Heating and Power. Steam Stand-By and Central Steam Heating Plant of the City of Winnipeg, G. W. Oliver. Engineering (Lond.), vol. 128, no. 3331, Nov. 15, 1929, pp. 609-612, 7 figs. Details of stand-by plant of 11,000 kw. capacity combined with central heating division, utilizing boilers of stand-by plant during winter months; building is divided into four sections, comprising (1) coal-handling and preparation plant; (2) boiler room; (3) turbine room; (4) electric substation, each of which is described.

Power and Process. Power and Process Steam Supplied From Central Station to Paper Mill, W. G. Allen. Power, vol. 70, no. 20, Nov. 12, 1929, pp. 748-752, 4 figs.

STEEL

Annealing. Testing of Tempered Steel (Provning av hardat stal), A. Lundgren. Jernkontorets Annaler (Stockholm), no. 8, 1929, pp. 367-374. Communication from State Testing Laboratory on investigation of influence of speed of cooling after annealing on properties of tempered steel and influence of speed of annealing on properties of tempered steel; it is shown that increasing time of annealing increases resistance to bending and impact, but decreases hardness.

Creep. Creep of Steel Under Simple and Compound Stresses, R. W. Bailey. Engineer (Lond.), vol. 148, no. 3853, Nov. 15, 1929, pp. 528-529, 8 figs. Two series of tests are recorded; one was made upon steel tubes strained separately at same temperature by tension and torsion producing equal maximum shear stress; other was made upon lead pipes under internal pressure with superimposed axial loading. Paper read before World Power Conference, Tokio.

High-Speed, Cutting Qualities. Influence of Composition and Heat Treatment on Properties of High-Speed Steel Used as Cutting Tool (Om sammansattningens och varmebehandlingens inverkan pa snabbstalens egenskaper som skarande), G. Wallquist. Jernkontorets Annaler (Stockholm), no. 7, 1929, pp. 305-350, 41 figs. Results of American, German, and Swedish investigations show that vanadium is best alloy for improving cutting qualities of steel and that difference of 25 deg. cent. from ideal hardening temperature lowers cutting quality 65-86 per cent; ideal annealing temperatures for chromium-tungsten-vanadium high-speed steels and for cobalt steel are given.

Manufacture, Electric Process of. High Quality Steel Is Produced in Electric Furnaces, H. D. Phillips. Foundry, vol. 57, no. 23, Dec. 1, 1929, pp. 997-998. Practice at plant of Empire Steel Casting Co., Reading, Pa. for manufacture of acid steel in electric furnaces is discussed; general method used in manipulation of heats, with special emphasis on deoxidation of slag and removal of practically all of ferrous oxide from slag; 1-in. diameter round gate off green sand casting was bent 90 deg. with sledge hammer.

Working Stresses for Steel at High Temperatures, D. S. Jacobux. Am. Soc. Mech. Engrs.—Advance Paper, no. 22, for mtg. Dec. 2 to 6, 1929, 5 pp., 7 figs. Results of practical experience used for setting maximum working stresses up to temperatures of 800 deg. fahr.; above this, working stresses are scaled down in proportion to falling off of stresses producing creep; first curve of creep points published by J. J. French used and working stresses for given temperature are taken at ⅔ creep-point stress; effect on stress of piercing boiler shell with holes and of transmitting heat through equalization of stress through extension of most-strained fiber.

STREET LIGHTING

Winnipeg, Manitoba. Trends in Street Lighting, R. M. Love. Elec. News (Toronto), vol. 38, no. 21, Nov. 1, 1929, pp. 29-32, 7 figs. Features of street-lighting equipment in Winnipeg are discussed; principal street is lighted by 10,000 lumen lamps and asymmetric dome refractors; various types of lamp posts are illustrated.

STRUCTURAL STEEL

Inspection. Inferior Structural Steelwork, A. W. A. Eden. Eng. News-Rec., vol. 103, no. 20, Nov. 14, 1929, pp. 773-774, 5 figs. Author discusses objectionable practices in erection of steelwork of buildings, such as use of second-hand steel members, etc.; specific recommendations for prevention of abuses.

T

TOLERANCES

Skoda vs. D. I. N. System. German and Skoda Tolerances Compared—Discussion, G. Schlesinger and N. N. Sawin. Am. Mach., vol. 71, no. 22, Nov. 28, 1929, pp. 887-889, 3 figs. Reply to discussion of author's article published in Mar. 7 issue of magazine; proof is given that N. N. Sawin's proposal, based rather on point of view that workman should not be trained, than on requirements of interchangeable manufacture, cannot be applied in practice; workman, in applying new medium grade tolerances proposed to three most important classes of fits, may get so many rejections that it must be strongly recommended not to introduce such fits into workshops; data is given on press tests.

TUNNELS, RAILROAD

Construction. Tunnel Driving in the Cumberland Mountains. Construction Methods, vol. 11, no. 11, Nov. 1929, pp. 34-37, 9 figs. Report on excavation of more than 2,000,000 cu. yds. of material and driving of about 9,000 ft. of tunnel on 13.6 mi. of single-track construction for Louisville and Nashville Railroad; details of drilling and mucking, and bench excavation; heavy timbering was required; description of concreting plant.

TUNNELS, SERVICE MAIN

London. Damage to Post Office Cables by Fires in London Subways. Post Office Elec. Engrs. Jl., vol. 22, Oct. 1929, pp. 213-219, 4 figs. General description of London underground ducts for gas, water and electric mains, telephone cables, etc., covering about 7 mi. under city's main thoroughfares; flooding and fire in ducts in January and June 1928, respectively; restoration of lines and service.

TUNNELS, VEHICULAR

Detroit. Pressed Steel Plates Reduce Tunnel Lining Cost. Construction Methods, vol. 11, no. 11, Nov. 1929, pp. 50-51, 5 figs. Report on use of steel liners in construction of Detroit-Canada tunnel under Detroit River; liners are 2 ft. 6 in. wide and lining of tunnel is made up of rings each ring being composed of 11 segments and key section.

Liverpool. The Mersey Tunnel. Iron and Coal Trades Rev. (Lond.), vol. 119, no. 3217, Oct. 25, 1929, p. 622. History of project; principal features; contracts; tunnel shield is probably largest of type so far built, being 46 ft. 8 in. diameter.

V

VIADUCTS, CONCRETE

Construction. Concrete Handling on 4,800-Ft. Viaduct. Contractors and Engrs. Monthly, vol. 19, no. 4, Oct. 1929, pp. 72-75, 11 figs. Construction of new concrete structure and earth embankment, which replaces old wooden Harahan viaduct in Arkansas, opposite Memphis, including bridge across railroad tracks and 3,498-ft. viaduct with maximum height of 65 ft.; layout of materials-handling plant; pouring footings and columns; concrete railing cast on job.

W

WASHERS

Lock. A New Type of Lock Washer. Mech. World (Lond.), vol. 86, no. 2233, Oct. 18, 1929, pp. 366-367, 7 figs. Description of new locking principle applied to shakeproof washer manufactured by Barber and Colman, Ltd., Manchester; in two models positive locking action is obtained by twisted teeth that surround external or internal edge of washer; another type particularly used with countersunk-head screws; another type combines locking device with terminal.

WATER PIPE LINES

Materials. Large Water Pipe. Eng. News-Rec., vol. 103, no. 24, Dec. 12, 1929, pp. 922-927, 1 fig. Editorial comment on p. 914. Symposium on materials, joints coatings and cause of breaks and other factors in design and construction including following articles; Reliable Pipe for Main Arteries in Large Cities Needed, C. B. Burdick; Steel Chosen for 54 in. Water Intake at East Chicago, P. Hansen; One Firm's Practice as to Choice of Materials for Pipe Over 30 in. Diameter, D. W. Howes; Earlier Conclusions on Value of C. for Various Materials after Use Confirmed, D. H. Maury.

Railroad Crossings. Pipe Tunnels for Water Mains under Railroad Tracks, L. G. Lenhardt. Eng. News-Rec., vol. 103, no. 21, Nov. 21, 1929, p. 816, 1 fig. Pipe in tunnel generally preferable to pipe buried in trench; cost of supporting tracks; practice at Detroit. Abstract of paper read before Am. Water Works Assn.

WATER WORKS

Calgary, Alberta. Extensions to Water Works, Calgary, Gore, Nasmith and Storrie. Can. Engr. (Toronto), vol. 57, no. 20, Nov. 12, 1929, pp. 707-710, 1 fig. Abstract of consulting engineers' report covering present water-supply system and proposals for extensions; recommended supply from Elbow River to cost $3,770,000; areas, population, and density of population in various cities in Canada; Chinook reservoir proposed.

WEIRS

Discharge of. Measuring Flow of Water with Sharp-Edged Weirs (Wassermessung mit scharfkantigen Ueberfallwehren), T. Rehbock. V. D. I. Zeit. (Berlin), vol. 73, no. 24, June 15, 1929, pp. 817-823, 5 figs. General review of weir-discharge theories; effect of temperature on velocity distribution in weir nappes; critical review of weir-discharge formulas beginning with Poleni's formula, published in 1767; justification of author's original formula published in 1911 on basis of 280 recent weir-discharge determinations by various investigators; author presents new simplified and more usable form of his original 1911 equation expressing discharge of weirs.

Fully Contracted Weirs, J. G. Burnell. Instn. Engrs. of Australia—Jl. (Sydney), vol. 1, no. 10, Oct. 1929, pp. 361-369, 2 figs. Available experimental data are summarized; subject of end contractions is discussed and conclusions reached as to true values of same for rectangular weirs; comparison is made of discharges given by modified formula of Hamilton Smith, Jr., with all available data, very satisfactory agreement being shown for rectangular suppressed weirs of any proportions; results obtained with short weirs by Steward and Longwell at Boise, in 1911; work of Schoder and Turner on suppressed weirs.

WELDING

Electric. *See Electric Welding.*

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostat copies (white printing on a black background) of the articles listed in this section or others on engineering subjects can be obtained from the Engineering Societies Library at a cost of 25c. per page.

When ordering identify the article by giving: the author; the title of the article; the name of the periodical in which it appeared; and the volume and page numbers. A remittance of 25c. a page should accompany the order.

The print's size is limited to 11 by 14 inches, but where possible, two pages up to 7 by 9 inches in size will be photographed on one print, larger magazines require a print per page.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

ABRASIVE MATERIALS

TESTING. Determination of Breaking Strength of Granular Abrasives (Bestimmung der Bruchеigenschaften gekoernter Schleifmittel), C. Krug. V.D.I. Zeit. (Berlin), vol. 73, no. 48, Nov. 30, 1929, pp. 1707-1709, 6 figs. Testing of corundum and silicon carbide; resistance against rapidly changing loads; curves for analyzing qualities from breaks, allowing for making of specifications for grinding wheels.

AERIAL TRANSPORTATION

CANADA. Canadian Aviation in 1929, H. A. Somerville. Airway Age, vol. 11, no. 1, Jan. 1930, pp. 58-60, 2 figs. Increases registered in all phases of Dominion aeronautics; 24 accidents which cost lives of 29 individuals; 89 commercial operators and 27 private owners; Western Canada Airways operating 33 aircraft; Government air service; winter flying; new airports; Indian treaty made; transatlantic route; air mail; number of flights.

AERODYNAMICS

AIR RESISTANCE. Air Resistance at Very High Velocities (Der Luftwiderstand bei sehr grossen Geschwindigkeiten), J. Ackeret. Schweizerische Bauzeitung (Zurich), vol. 94, no. 15, Oct. 12, 1929, pp. 179-183, 18 figs. Discussion of laws of resistance of air to bodies moving with very high velocities on basis of theoretical studies and experimental results obtained at Kaiser Wilhelm Institute of Aerodynamic Research; streamline photographs of projectiles; applications of these laws to ballistics, design of high-speed steam turbines and aeronautics.

AERONAUTICS

PROGRESS IN. Progress in Aeronautics. Mech. Eng., vol. 52, no. 1, Jan. 1930, pp. 3-13, 6 figs. Progress report prepared by Aeronautic Division of American Society of Mech. Engineers covering following subjects: power plants; airplane design and construction; aerodynamics; air transport and other civil flying; progress of naval aviation; military aircraft progress in 1929; airships; airports.

AIRPLANE ENGINES

DIESEL. Diesel Airplane Engines (Les moteurs diesel d'aviation), A. Frachet. Nature (Paris), no. 2815, Aug. 15, 1929, pp. 166-170, 7 figs. Problem of adaptation of Diesel engine to aviation as solved in Germany with Junkers engine and in England with Beardmore is discussed; of Diesel in safety from fire on board airplane; reliability in operation and simplicity of construction; possibilities realized in high-speed Diesel; Packard Diesel constructed in series; results of work of Junkers; test of Beardmore.

MANUFACTURE. Layout of a Manufacturing Plant, F. L. Faurote. Iron Age, vol. 124, no. 26, Dec. 26, 1929, pp. 1730-1731. Description of layout of plant Wright Aeronautical Corp., for manufacture of airplane engines; foundations laid for system of mass production and unit assembly; engines mounted on special assembly frames equipped with wheels so that power unit may be moved along tracks as weight grows.

TESTING. Developing a New Type of Motor. U.S. Aviation Quarterly, vol. 1, 1929, p. 43. Discussion of various tests made at Aeronautical Engine Laboratory, Naval Aircraft factory, Philadelphia, which may affect profoundly design of internal combustion engines; tests on Prestone cooling liquid which would permit smaller radiator; possibilities of closed system.

AIRPLANE PROPELLERS

VARIABLE-PITCH. Variable-Pitch Propellers, F. W. Caldwell. Soc. Automotive Engrs. Jl., vol. 25, no. 6, Dec. 1929, pp. 656-664 and (discussion) 664-666, 16 figs. Effect of camber ratio and of angle of attack on speed at which burble occurs; efficiency of propellers as static-thrust producers; method of momentum to compute thrust and application of adjustable-pitch propellers to supercharged engines; causes of forces required to operate control adjustments; method of elastic-stress analysis; with increase of propeller-tip speeds and engine horsepower, aerodynamic advantages of controllable-pitch propeller become more important.

AIRPLANES

GLIDERS, USE OF. On Motorless Flying. Aeroplane (Lond.), vol. 37, no. 19, Nov. 6, 1929, pp. 1089-1090, 1092, 1094 and 1096, 9 figs. Use of gliders for sport and also for purpose of scientific research is discussed; comparison with bird flight; opinions of C. Lougheed considered; it has been shown in Germany that serious gliding experiments, expecially in study of gliding angles, can be made with help of ordinary airplane.

SPEED. The Economic Speed-Weight Relation in Air Transportation, E. P. Warner. Soc. Automotive Engrs. Jl., vol. 25, no. 6, Dec. 1929, pp. 635-640, 6 figs. Relations of payload to engine horsepower, initial cost of airplane and engine, costs per pound of payload and per passenger-mile, and value of time saved by greater speed; five means for securing higher cruising speed; seeking to operate at cruising speeds of more than 1.8 times minimum flight speed does not appear economically advisable at present; increasing cruising speed depends on use of engines, engine combinations, maintenance methods and large smooth airports.

STABILITY. Balancing and Stability of Airplanes (Centrage et stabilité des avions), M. Guibert, Aéronautique (Paris), vol. 11, no. 125, Oct. 1929, pp. 339-346, 10 figs.

Longitudinal Stability for Very Large Airplanes, A. Kelmin. Aviation Eng., vol. 2, no. 12, Dec. 1929, pp. 9-11, 1 fig. Problem of longitudinal stability of airplane is discussed taking damping into consideration; suggestion is made that large machines can be short coupled, have their weight concentrated along longitudinal axis, and have large static stability secured mainly by constant centre of pressure, or other methods independent of product of tail area.

AIRSHIPS

R 100. H. M. Airship R 100. Engineer (Lond.), vol. 148, no. 3856, Dec. 6, 1929, pp. 604-605, 4 figs., partly on p. 608. R 100, built at Howden, Yorkshire, is fitted with gasoline engines which is likely to result in flights being confined to cool climates, including Transatlantic voyages; equipment consists of six Rolls-Royce "Condor" III B engines, each developing 660 hp.; passengers and crew are accommodated in three-decked compartment slung inside hull at point forward of its maximum diameter; length 709 ft.: max. diam. 133 ft., over-all height, 135 ft.; gas capacity is over 5,000,000 cu. ft.

ALLOYS

ALUMINUM. *See Aluminum Alloys.*

ANTI-CORROSIVE. Properties of Corrosion-Resisting Alloys, P. S. Menough. Blast Furnace and Steel Plant, vol. 17, no. 11, Nov. 1929, pp. 1648-1651 and 1655, 3 figs.; see also Heat Treating and Forging, vol. 15, no. 11, Nov. 1929, pp. 1437-1440, and 1450, 3 figs.

BEARING METALS. *See Bearing Metals.*

MAGNESIUM. *See Magnesium Alloys.*

ALUMINUM ALLOYS

CASTINGS. Cast Aluminum Alloy That Compares With Die Castings, L. H. Fawcett. Iron Age, vol. 124, no. 26, Dec. 26, 1929, pp. 1722-1724, 4 figs. Description of unusual practice at United States Naval Gun Factory for casting aluminum alloys; castings are made in sand and require minimum machining; metal and wooden patterns used; moulding of chute casting; typical case; closing mould and pouring; machining and assembling; casting made with tolerances approaching die castings.

PROPERTIES. Brinell Hardness, Elastic Limits, and Tensile Strength of Commercial Aluminum Alloys (Brinelhaerte, Elastizitaetsgrenze und Zugfestigkeit verguetbarer Aluminium legierungen), H. Bohner. Zeit. fuer Metallkunde (Berlin), vol. 21, no. 11, Nov. 1929, pp. 387-389, 1 fig. Influence of different stresses and duration of stress on Brinell hardness; formula is proposed for calculation of Brinell hardness of aluminum-copper alloys from tensile strength and elastic limits; further tests are deemed necessary.

ARMOUR PLATE

MACHINING. An Armour Plate Ordeal for Tungsten-Carbide, H. A. Ingram. Am. Mach., vol 72, no. 2, Jan. 9, 1930, pp. 39-42, 6 figs. Description of difficult and unusual job recently completed by Hull Construction Department at United States Navy Yard, Puget Sound; machining face-hardened nickel-steel armour plate by utilizing peculiar cutting properties of tungsten-carbide after ordinary cutting tools had repeatedly failed; comparison of methods for cutting armoured tube shown.

B

BEARING METALS

THERMIT. A New Product of Bearing-Metal Research. Metal Industry (Lond.), vol. 35, no. 19, Nov. 8, 1929, pp. 441-442. Description of alloy bearing metal known as Thermit of Universal Bearing Metal, which had been produced by T. Goldschmidt, A.G., Essen, in connection with G. von Hanffstengel: structure of Thermit comprises uniformly distributed hardening bodies bedded in plastic eutectic ground-mass which is rich in lead; through high softening point of Thermit alloys, favourable hardness conditions are maintained; slipperiness of Thermit investigated by process of von. Hanffstengel; casting of Thermit. Abstracted from Technische Blaetter, Aug. 4.

BLAST FURNACES

GERMANY. Blast-Furnace Plant of Fried. Krupp Company at Essen-Borbeck (Das Hockhofenwerk der Fried. Krupp Aktiengesellschaft in Essen-Borbeck), R. Dietrich. Kruppsche-Monatschefte (Essen), vol. 10, no. 139, Oct. 1929, pp. 139-159, 29 figs. Plant and auxiliary machinery are fully described and illustrated, in addition to numerous photographs in text, map of layout of works, plans and elevations of various machines, and elevation of one of blast-furnaces are given.

PRACTICE. Modern Blast Furnace Theory and Practice, R. H. Sweetser and S. P. Kinney. Iron and Steel Eng., vol. 6, no. 11, Nov. 1929, pp. 575-579, 2 figs. Adoption of measure of performance of blast furnace has indirectly resulted in almost doubling daily output of pig iron in stacks of given height and bosh diameter; cleaning blast-furnace gas; movement of hot metal; adoption of three-shift day; merchant blast furnaces.

BOILER CODES

A.S.M.E. Revisions and Addenda to the Boiler Construction Code. Mech. Eng., vol. 52, no. 1, Jan. 1930, pp. 77-78. Boiler Code Committee has received and acted upon number of suggested revisions which have been approved for publication as addenda to code; these are published with corresponding paragraph numbers to identify their location in various sections of code and are submitted for criticism and comment.

BOILER FURNACES

WATER-COOLED. Determination of Circulating Speed in Cooling-Wall Tubes (Bestimmung der Umlaufgeschwindigkeit in Kuehlwandrohren), W. Boie. Feuerungstechnik (Leipzig), vol. 17, no. 21-22, Nov. 15, 1929, pp. 232-235, 9 figs. Increase in efficiency of boilers demands water-cooled combustion chamber walls; their increasing use necessitates paying of greater attention to circulation in cooling tubes; method of determining steam-water mixture and velocity is described.

BOILER TUBES

HEAT TRANSMISSION IN. Determination of Heat-Transfer Coefficients by Means of Diffusion Tests (Bestimmung von waermeuebergangszahlen durch Diffusionsversuche), W. Lohrisch. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens (Berlin), no. 322, 1929, p. 46-49. Heat transfer of flowing gases in tubes arranged perpendicularly to direction of flow was investigated by Thoma's method of determining heat-transfer coefficients from diffusion phenomena; heat-absorption tests were carried out on rotating single tubes (atmos boilers); heat-transmission coefficient is established as function of air velocity and suggestions are made for improving heat transfer.

Heat Transfer in Water Tubes (Waermeuebergang in Wasserrohren), F. Jaklitsch. Waerme (Berlin), vol. 52, no. 46, Nov. 16, 1929, pp. 851-854. As results of tests carried out by Soennecke, it is shown that transmission in water tubes can be determined by formula already developed for air and steam; this fact suggests possibility of existence of single heat-transfer law, independent of substance or its aggregate state.

BOILERS

DESIGN. Utilization of Heat Radiation as Means of Reducing Cost of Boiler Plants (Die Ausnutzung der Waermestrahlung als Mittel zur Verbilligung von Kesselanlagen), W. Schultes. Waerme (Berlin), vol. 52, no. 49, Dec. 7, 1929, pp. 939-944, 12 figs. Theory of radiation boiler is discussed and diagrams are presented to illustrate heat transfer by radiation, and contact; examples are given of two kinds of boilers utilizing heat radiation, namely water-tube with cooled furnace and fire-tube boiler with pulverized-coal furnace and no ignition chamber.

MANUFACTURE—WELDING. Welding of Boilers, Pressure Vessels and Steam Lines, C. W. Obert. Power, vol. 70, no. 23, Dec. 3, 1929, pp. 904-905. Outline of present status of fusion welding and attitude of A.S.M.E. Boiler Code Committee and other authorities. Abstract of paper read before Int. Acetylene Assn.

OPERATION, LOAD DISTRIBUTION IN. A Method of Loading Boilers for Maximum Fuel Economy, B. M. Thornton. Engineering (Lond.), vol. 128, no. 3336, Dec. 20, 1929, pp. 796-797, 5 figs.

WATER-TUBE. High-Capacity Boilers at Low Cost (Der billige Hochleistungskessel), O. Wirmer. Waerme (Berlin), vol. 52, no. 48, Nov. 30, 1929, pp. 904-908, 4 figs. In view of unfavourable business conditions in Germany, and present lack of funds, possibilities of developing cheaper design of water-tube boilers were studied with result that new type of vertical-tube boiler with two drums has been developed which is capable of maximum loads.

Model Tests on Water Circulation in Vertical-Tube and Inclined-Tube Boilers (Modellversuche ueber den Wasserumlauf in Steil- und Schraegrohrkesseln), K. Cleve. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens (Berlin), no. 322, 1929, p. 1. Water-circulation theory of Muenzinger was experimentally examined and influence of heating, tube diameter, incline, and length of tube, etc., on water circulation was investigated; flow resistance of water during passage through tube was determined and calibrating curves developed for instruments used in measuring velocity of flow in boiler tubes.

BORING AND TURNING MACHINES

GIANT. A Giant Boring and Turning Mill, H. Vogler. Eng. Progress (Berlin), vol. 10, no. 12, Dec. 1929, pp. 309-312, 3 figs. See also Machy. (Lond.), vol. 35, no. 894, Nov. 28, 1929, pp. 275-276, 1 fig. Large boring and turning mill with 39 ft. diam. of table, length of cross rail 72 ft., for machining of rotors and stators, etc. of large turbine units, made by Schiess-Defries for J. M. Voith, machine builders of Heidenheim, Germany; pieces of 200 tons can be machined; capacity of main motor is 250 hp.; travelling speed of tools 8.2 ft.

VERTICAL. Vertical Boring and Turning Machine with Table of 12 m. Diameter (Tourcarrousel vertical à pleateau de 12 mètres de diamètre). Génie Civil (Paris), vol. 95, no. 20, Nov. 16, 1929, pp. 477-480, 6 figs. Machine is built by Schiess-Defries in Duesseldorf for Voith in Heidenheim and will be used for working large hydraulic turbine parts, such as rotors, stators, etc.; pieces up to 18 m. diam. and weighing 700 tons can be machined on lathe, of which constructional details are given.

BOREHOLES, EXPLORATORY

CANADA. Deep Borings in British Columbia and Yukon, D. C. Maddox. Can. Dept. of Mines—Geol. Survey (Ottawa), no. 2202, 1929, pp. 194A-195A. Brief notes on 1928 work of Borings Division of Geological Survey of Canada; information is collected from various sources and laboratory tests are made on samples submitted.

BRIDGE CONSTRUCTION

GREAT BRITAIN. The Forth Bridge, E. W. Moir. Engineer (Lond.), vol. 148, no. 3859, Dec. 27, 1929, pp. 684-685, 1 fig. Construction details of bridge built in 1882; author was one of supervising engineers; building and launching of large caissons for foundations; cantilever movements by sun; setting-out of Forth bridge. Abstract of presidential address to Junior Inst. of Engr., Dec. 13, 1929.

BRIDGE DESIGN

BRIDGE DESIGN. Some Bridges of 1929. Engineer (London), vol. 149, no. 3860, Jan. 3, 1930, p. 22, 3 figs. on supp. plate. Among notable bridges briefly described are Ambassador bridge over Detroit River, Khartoum Omdurman bridge across White Nile; and Royal Albert bridge, Saltash.

HISTORICAL REVIEW. Progress Review of Bridge Engineering, D. B. Steinman. Can. Engrg. (Toronto), vol. 57, no. 27, Dec. 31, 1929, pp. 849-854. Historical review of improvements in bridge design and construction during past 50 years; theory of bridge design; different types of steel-bridge construction. Article previously indexed from various sources in 1929.

BRIDGES

FLOORS. Development Tests on a Light Floor for Bridges, L. S. Moisseiff. Eng. News-Rec., vol. 104, no. 2, Jan. 9, 1930, pp. 71-74, 8 figs. Slab weighing only 57 lbs. per sq. ft., armoured and reinforced by system of T's and flats, carries equivalent highway loads on 4-ft. span; deflection contours produced by concentrated loads at centre of span; stress-strain relation; tests made for Tri-Lock Co. of Pittsburgh, Pa., has shown that properly armoured surface of slab will require no additional pavement and that omission of pavement will save weight of 30 lbs. per sq. ft.

STRENGTHENING. The Strengthening of Bridges by Electric Welding. Ry. Engr. (Lond.), vol. 50, no. 599, Dec. 1929, pp. 464-466, 8 figs. Discussion of economics in bridge maintenance secured by electric welding.

WIDENING. The Widening of Highway Bridges, C. S. Chettoe. Instn. Mun. and County Engrs.—Jl. (Lond.), vol. 56, no 13, Dec. 24, 1929, pp. 725-749 and (discussion) 752-763, 34 figs. Review of principles and practical methods employed in Great Britain in widening of masonry or brick bridges, cast iron, wrought iron or steel arches, iron or steel truss or girder bridges, suspension bridges.

BRIDGES, BASCULE

ROTTERDAM. The New Bascule Bridge of the Queen over Koningshaven in Rotterdam (Le nouveau pont Basculant de la Reine sur le Koningshaven, à Rotterdam), L. Dalton. Génie Civil (Paris)), vol. 95, no 24, Dec. 14, 1929, pp. 581-586, 12 figs. Design and construction of two-leaf bridge spanning navigable passage 50 m. wide and 27 m. wide; non-movable approaches, of reinforced concrete, are 17.3 m. in span and 32.5 m. wide; structural details of bascule leaves; also details of operating mechanism.

BRIDGES, CONCRETE

DESIGN. Some Points on Reinforced Concrete Bridge Design, C. S. Chettoe. Surveyor (Lond.), vol. 76, no. 1978, Dec. 20, 1929, pp. 621-624, 17 figs. General principles of design of elements of concrete bridges, such as reinforced-concrete slabs, beams, portal frames, abutments, wing and spandrel walls, arches, etc.; skew-arch bridges.

BRIDGES, RAILROAD

RECONSTRUCTION. The Regirdering of the Railway-Bridge over the Krishna River Madras and Southern Mahratta Railway, India, N. N. Colam. Instn. Civil Engrs.—Min. of Proc., vol. 227, 1928-1929, 1st, pt., pp. 245-256 and (discussion) 257-263, 1 fig. Method of regirdering single-track meter-gauge bridge without interruption to traffic, is believed to be new and capable of modification to meet most cases; essential feature of scheme was service span to carry traffic over gap between any two piers while old permanent span was being removed and new one put in its place.

BRIDGES, STEEL

DESIGN. Bridges, D. B. Steinman. Brooklyn Engrs.' Club—Proc., vol. 28, part 1, Oct. 1929, pp. 52-84, 20 figs. Elaboration of paper entitled "Fifty Years of Progress in Bridge Engineering, from Brooklyn Bridge to Liberty Bridge," printed in Oct. 1926 issue of same journal; review of 50 years progress in different types of steel-bridge construction; Eads bridge; Hell Gate arch bridge; Forth Bridge; Carquinez Straits Bridge; Florianoplis Bridge; Liberty Bridge; beauty in steel.

BUILDING MATERIALS

CANADA. Nineteen-Twenty-Nine was Record Year for Production of Structural Materials. Contract Rec. (Toronto), vol. 44, no. 4, Jan. 22. 1930, pp. 88-89. Official estimate of minerals, fuels and construction materials produced last year totals $303,876,000; cement, lime, sand, stone, brick, tile, etc. all show increases.

BUILDINGS

VIBRATIONS. On the Diffraction on Artificial Shocks Caused by a Small Building, S. Nakamura. Tohoku Imperial Univ.—Science Report (Sendai), vol. 18, no. 3, Oct. 1929, pp. 401-407, 5 figs. Geophysical laboratory of Tohoku Imperial University was disturbed by artificial shocks which were caused by hammering in nearby factory; shocks were observed at several points in and near building; as period of shock was about 0.07 sec., their wave-length of several meters was comparable in length to dimensions of building; results of observation show slight diffraction of shocks.

BUILDINGS, CONCRETE

CONSTRUCTION. Cableway Removes Debris and Forms on Concrete Building Job, Z. Witkin. Eng. News-Rec., vol. 104, no. 1, Jan. 2, 1930, pp. 37-38, 1 fig. Operating experience and diagram of cableway used in handling forms and debris on concrete building job.

C

CAMS

DESIGN. Cam Design from the Standpoint of Stress Analysis. J. Flodin. Machine Design, vol. 1, no. 4, Dec. 1929, pp. 18-23, 10 figs. Force to be transmitted is important consideration in design in addition to movement of follower; force factors to consider are discussed.

CANALS

WELLAND. Engineering Features of the Welland Ship Canal, F. E. Sterns. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 8, Oct. 1929, pp. 2063-2072, 6 figs. Dimensions, number and location of locks; filling culverts; lock-gates; safety horns; gate operation; inspection; fenders; regulating works; bridges.

CARBON DIOXIDE

THERMAL PROPERTIES. Thermal Characteristics of Carbon Dioxide in Gaseous, Liquid, and Solid Condition (Die thermischen Eigenschaften der Kohlensaeure im gasfoermigen fluessigen und festen Zustand), R. Plank and J. Kuprianoff. Zeit. fuer die gesamte Kaelte-Industrie (Munich), vol. 1, no. 1, 1929, 64 pp., 17 figs. partly on supp. plates. Recapitulation of previous works; analysis of equilibrium curves, specific volume; latent heat, enthralpy and entropy; gas tables and diagrams are given. Bibliography.

CAST IRON

HIGH-TEST. Production of High-Strength Cast Iron. Machy, (N. Y.), vol. 36, no. 4, Dec. 1929, p. 302. Description of Meehanite, which is produced by refinement of ordinary process employed in making semi-steel; ultimate strength and yield point of ordinary cupola Meehanite metal said to be 46,000 lbs. per sq. in.; effect of heat treatment on Meehanite; methods of adding nickel to cast iron; Gunite, wear-resisting iron.

PROPERTIES. New Theories of the Mechanical Properties of Cast Iron (Neuere Anschauungen ueber die mechanischen Eigenschaften des Gusseisens), A. Thum. Giesserei (Duesseldorf), vol. 16, no. 50, Dec. 13, 1929, pp. 1164-1173 and (discussion) 1173-1174. Notch effect of graphite veins and its influence on strength and elasticity of cast iron; evaluation of coefficients of deflection in bending test; ductility and durability; comparison of cast iron and steel.

CEMENT PLANTS

NEW YORK. Glens Falls Modernizes to Make High Early Strength Cement, H. A. Schaffer. Concrete, vol. 36, no. 1, Jan. 1930, pp. 101-108, 15 figs. History of plant and its gradual modernization; introduction of rotary kilns, switching from dry process to wet process of manufacture, equipment for production of ironclad Velo cement; company now has grinding capacity of 6,000 barrels standard portland or 4,000 barrels of Velo; plant is interchangeable; tests of Velo cement.

CEMENT, PORTLAND

TESTING. Durability of Portland Cement, T. Merriman. Eng. News-Rec., vol. 104, no. 2, Jan. 9, 1930, pp. 62-64. Solubility of cement lime in 15 per cent sugar solution serves as durability test of portland cement; 32 cements compared by Committee C-I of American Society for Testing Materials were tested by author; difference in cements as shown by tests; modifying effect of lime; relation to alumina content; index of disintegration; action of sugar-lime solution is criterion of completeness with which cement has been manufactured.

CIVIL ENGINEERING

UNITED STATES. A Survey of Engineering Progress, 1929-1930. Eng. News-Rec., vol. 104, no. 6, Feb. 1930, pp. 211-226, 37 figs. Editorial survey of business conditions, construction industry of United States; structural developments; materials of construction; new construction technique; progress on new engineering projects and notable structures including Mississippi Flood Control, Kill van Kull bridge, Chrysler Building, etc.; new railroad construction; highway trends; city and regional engineering; water and interstate controversies; air transport; four pages of pictorial survey of construction projects of 1929.

COAL CARBONIZATION

LOW-TEMPERATURE. Low-Temperature Carbonization in Germany, D. Brownlie. Iron and Coal Trades Rev. (Lond.), vol. 119, no. 3225, Dec. 20, 1929, pp. 939-940. Description of Tormin process for making hard, dense, smokeless fuel from coking bituminous coal dust and fines, by heating under low-temperature conditions, 430 to 650 deg. cent., subjecting charge at same time to strong mechanical compression.

Scientific Developments in Steam-Driven Power Station Practice. D. Brownlie. Machy. Market (Lond.), nos. 1513, 1514, 1515, and 1516, Nov. 1, 8, 15, and 22, 1929, pp. 1005-1006, 1029-1030, 1051-1052, 1073-1074, and 1076, 6 figs. Nov. 1: Combined low-temperature carbonization, gasification, and combustion discussed; one aspect of future development of power-station practice according to entirely different methods; valuable by-products of coal; sulphur problems. Nov. 8: Details of Babcock, Pintsch, Hanl, and Hereng processes. Nov. 15: KSG process. Nov. 22: Kwollaston process; gas-fuel system; MacLaurin and other processes. Paper presented before Instn. Mech. Engrs.

COAL MINES AND MINING

MECHANIZATION. Method and Cost of Mining in a 100 per cent Mechanized Mine, W. F. Hazen and E. J. Christy. Min. Congress Jl., vol. 16, no. 1, Jan. 1930, pp. 32-41, 7 figs. Mining practice, methods and costs in 100 per cent mechanized mine; detailed description of mining method employed, equipment used and results obtained; mine operates two eight-hour shifts each day, with time between for servicing mechanical equipment and taking in supplies.

CONCRETE AGGREGATES

TESTING. Tests of Longitudinal and Structural Changes of Concrete Aggregates and Cement Mortars at Temperatures up to 1,200 Deg. (Versuche ueber Laengen- und Gefuegeaenderung von Betonsuschlagstoffen und Zementmoerteln unter Einwirkung von Temperaturen bis 1,200 Deg.), K. Endell. Stahl. und. Eisen (Duesseldorf), vol. 50, no. 1, Jan. 2, 1930 pp. 21-22, 1 fig. Results of investigations are shown in diagram giving linear thermal expansion when heating up to 1,200 deg. cent. of different aggregates and pure portland cement. Abstract of report No. 60 of German Committee for Reinforced Concrete.

CONCRETE DESIGN

SIMPLIFIED. Reinforced Concrete Design Simplified, J. R. Griffith. Concrete, vol. 36, no. 1, Jan. 1930, pp. 40-42, 4 figs. Method of construction and use of alignment chart for computation of stirrup spacing in accordance with American Concrete Institute code requirements.

CONCRETE MIXING

TRIAL METHOD. A Scientific Trial Method for Designing Concrete Mixtures, R. E. Robb. Am. Concrete Inst.—Proc., vol. 25, 1929, pp. 281-289, and (discussion) 290-291, 6 figs. Device for determining percentage of moisture in aggregates; steps to be followed in making scientific trial design.

WATER TABLES, ETC. Water Tables and Curves for Use in Designing and Estimating Concrete Mixtures, H. J. Gilkey. Am. Concrete Inst.—Proc., vol. 25, 1929, pp. 292-298, 4 figs. Tables and graphs covering water-cement ratio by loose or bulk volume, gallons of water per bag of cement, pounds of water per bag of cement, water-cement ratio by absolute volume and ratio of water to cement by weight; strength ratios based upon Abrams curves.

CONSTRUCTION INDUSTRY

CANADA. Complete Construction Figures for 1929. Contract Rec., (Toronto), vol. 43, no. 3, Jan. 15, 1930, pp. 49-51. Revised figures show that contracts amounted to $576,651,800; analysis by provinces and classes of work; statistical tables.

COOLING TOWERS

CHARACTERISTICS OF. Characteristics of Water Coolers (Quelques Propriétés des Refrigérants d'Eau), M. Bonnemort. Chaleur et Industrie (Paris), vol. 10, no. 113, Sept. 1929, pp. 428-432, 5 figs. General discussion; curves showing temperature differences and presentation of general characteristics in graphs.

DIESEL PLANTS. Cooling Towers for Diesel Plants, L. A. Pease. Power, vol. 70, no. 23, Dec. 3, 1929, pp. 886-887, 2 figs. Discussion of types of water-cooling towers; atmospheric towers used in majority of cases; diagrammatic layout of commonly used atmospheric cooling tower.

COPPER

ANNEALING. Anomalies of Annealing After Cold Hardening of Copper and Brass (Anomalies du recuit après écrouissage du cuivre et des laitons), F. Eugene. Société d'Encouragement pour l'Industrie Nationale—Bul. (Paris), vol. 128, no. 5, May 1929, pp. 361-379, 20 figs. Study of anomaly described by P. Nicolau which affects not only hardness but fitness for swaging characterized by deflection before rupture in Erichsen test, and, in less degree, elongation; dilatometric tests effected by differential dilatometer of Chevenard show that phenomena of annealing copper and brass is sufficiently different.

COUPLINGS

FLEXIBLE. The Steel-Shaw Flexible Coupling. Engineering (Lond.), vol. 128, no. 3332, Nov. 22, 1929, p. 68?, 2 figs. It has been designed to allow for amount of misalignment which appears to be inevitable in even most accurate of erection operations, flexible elements of coupling are enclosed in split casing, which contains oil, and rotates with them.

CRANES

CONTROL. Easy Crane Control by Push Buttons. Iron Age, vol. 124, no. 26, Dec. 26, 1929, pp. 1740-1741, 1 fig. Description of 40-ton riveting crane in plant of Lasker Iron Works, Chicago; accurate sporting for riveting work, saving in labour increase in production reported; independent push-button control station one at control point of each poll riveter are interlocked so that only one set of push buttons can be used at one time.

CUPOLAS

MIXERS. Some Notes on Cupola Receivers, M. G. Woods. Foundry Trade Jl. (Lond.), vol. 41, no. 691, Nov. 14, 1929, pp. 353-354 and 356, 6 figs. Various types of receivers for cupolas are described, including Whiting cupola and receiver, jolting receivers, Hurst's oil-fired receiver, outside and inside receivers; advantages and disadvantages of receivers outlined.

REFRACTORIES FOR. Cupola Refractories, C. Presswood. Foundry Trade Jl. (Lond.), vol. 41, nos. 692 and 693, Nov. 21 and 28, 1929, pp. 369-371, 376 and (discussion) 389-390. Nov. 21: Cost of cupola operation reflected in finished materials; temperature conditions; temperature fluctuations; influence of fluxes; neutral linings; destruction by abrasion; influence of furnace gases; brick linings; materials available; spalling; siliceous bricks; neutral bricks; rammed linings; patching materials. Nov. 28: Cupola refractories and cost of castings; glazing of refractories; effect of continuous working.

CUTTING TOOLS

TUNGSTEN CARBIDE. An Armour Plate Ordeal for Tungsten-Carbide, H. A. Ingram. Am. Mach., vol. 72, no. 2, Jan. 9, 1930, pp. 39-42, 6 figs. Description of difficult and unusual job recently completed by Hull Construction Department at United States Navy Yard, Puget Sound; machining face-hardened nickel-steel armour plate by utilizing peculiar cutting properties of tungsten-carbide after ordinary cutting tools had repeatedly failed; comparison of methods for cutting armoured tube shown.

D

DAMS

GOVERNMENT SUPERVISION. State Supervision of Dams. Power, vol. 7, no. 3, Jan. 21, 1930, p. 112. It is generally recognized that design, construction and maintenance of dams for power development and other projects should be under state supervision; some such control is already exercised; how to make this supervision most effective without placing unnecessary burden on owners of projects, and how to insure safe structures were considered during Power Division session at American Society of Civil Engineers' recent annual convention in New York City.

DAMS, CONCRETE

CONSTRUCTION. Thomson Dam and Reservoir, H. C. Ash. Am. Concrete Inst.—Proc., vol. 25, 1929, pp. 29-38 and (discussion) 39-46, 16 figs. Description of early construction methods with particular attention given to such details as selection of materials, and mixing, placing and curing of concrete.

DIE CASTING

ALUMINUM-ALLOYS. Effect of Pores on Strength of Die Castings (Der Einfluss von Poren auf die Festigkeit von Spritzguss), L. Frommer, W. Kuntze, and G. Sachs. V.D.I. Zeit. (Berlin), vol. 73, no. 45, Nov. 9, 1929, pp. 1609-1612, 4 figs. Report on X-ray study and mechanical tests of aluminum die castings, made at German Bureau for Materials Testing and Kaiser Wilhelm Institute for Physical Chemistry and Metallurgical Research; authors estimate effect of blow-holes in reducing specific strength of casting at not much over 10 per cent.

ZINC-BASE. Strength of Zinc Base Die Castings, R. M. Curts. Iron Age, vol. 124, no. 25, Dec. 19, 1929, pp. 1655-1658, 13 figs. Remarkable improvement which has been made to physical properties of zinc-base die-casting alloys; improvement has been large recently; gravity and pressure methods compared; types and relative merits of alloys available.

DIES

STAMPING. Metal Stamping Dies, E. E. Clark. Metal Stampings, vol. 2, no. 11, Nov. 1929, pp. 865-870, 9 figs. Typical die layout; planning sequence of stamping and forming operations; comparative estimating die costs.

DIESEL-ELECTRIC POWER PLANTS

ALBERTA. Electrical Development in Northern Alberta, A. J. Cantin. Elec. News, vol. 39, no. 2, Jan. 15, 1930, pp. 51-52, 4 figs. Modern plant has one 200-hp. Atlas Diesel engine direct-connected to 160-kw. 2,200-volt 60-cycle 3-phase generator with 8½-kw. 120-volt exciter, and one 300-hp. Atlas Diesel engine direct-connected to 250-kw. 300-r.p.m. generator, also with direct-connected exciter.

HOTELS. Hotel New Yorker Diesel Generator Now Operating. Oil Engine Power, vol. 7, no. 12, Dec. 1929, pp. 682-686, 8 figs. Use of Diesel engines in Hotel New Yorker power plant is based on ability to improve balance between electric power load and heating load; Diesel engine able to carry summer electric load; charts illustrating heat saving creditable to Diesel; brief description of Davis heater which contributes to Diesel economy.

DIESEL ENGINES

AUTOMOTIVE. History of Light Diesel Engines, E. C. Magdeburger. Soc. Automotive Engrs. Jl., vol. 25, no. 6, Dec. 1929, p. 698. Development of high-speed oil-engines is discussed; fluid injection saves weight. Diesels on motor-coaches; peculiarity of Packard engine is that single valve serves both for exhaust and inlet.

MARINE. The Large Diesel Engine, H. Becker. Brit. Motor Ship (Lond.), vol. 10, no. 117, Dec. 1929, pp. 353-355, 8 figs. Special types of Diesel engines suitable for marine purposes are discussed; airless-injection, fuel consumption, gearing and comparative weights and sizes with special reference to M.A.N. engines. Supplement to article published in July 1929 issue of same journal.

The Marine Diesel Engine, H. Blache. Brit. Motor Ship (Lond.), vol. 10, no. 115, Oct. 1929, pp. 247-251, 11 figs. Details of new Burmeister and Wain double-acting two-stroke type; advantage of design is that main piston does not cut off and uncover exhaust ports, subjecting piston surface to great heat from rebounding of exhaust gases from remainder of cylinders, as is case with other types of two-stroke engines. Extract from paper read on occasion of Centenary of Royal Technical University, Copenhagen.

PULVERIZED-FUEL. The Use of Pulverized Coal in Internal-Combustion Engines (Kohlenstaub als Triebmittel fuer Brennkraftmaschinen), H. Jentzsch. Werft-Reederei-Hafen (Berlin), vol. 10, no. 20, Oct. 22, 1929, pp. 409-411, 3 figs.; see also brief translated abstract in Mar. Engr. and Motorship Bldr., vol. 52, no. 627, Dec. 1929, p. 504. Original work of Diesel has been continued by Pawlikowski and fairly successful pulverized-coal engine developed; author emphasizes necessity for greater investigation of pulverized-fuel motor and points out that its ultimate development will admit of cost of running Diesel engine as against oil to be reduced to one quarter.

E

ELECTRIC CONDENSERS

SYNCHRONOUS. Automatic Regulation of Synchronous Condensers Equipped with Super-Speed Excitation, L. W. Thompson and P. J. Walton. Am. Inst. Elec. Engrs.—Paper for mtg. Dec. 2-4, 1929, 4 pp., 8 figs. Extensive field tests made on super-high-speed excitation equipment used with 30,000-kva. synchronous condensers at Plymouth Meeting Substation of Philadelphia Electric Co. is described; oscillograms and calculated curves showing performance of equipment are included together with discussion of results obtained.

ELECTRIC FURNACES

INDUCTION. Induction Furnaces. Engineer (Lond.), vol. 148, nos. 3858 and 3859, Dec. 20 and 27, 1929, pp. 652-654 and 680-682, 17 figs. Furnaces are of two kinds, standard frequency induction and those which employ high-frequency currents; while former is limited by metallurgical considerations and problems of electrical design high-frequency furnace removes these limitations and gives wider field to metallurgical research, and to melting of metals having high melting points; details of Ajax Northrup and Ajax Wyatt furnaces; review of research on coreless induction furnaces; examples of furnaces and auxiliary equipment are illustrated.

ELECTRIC HEATING

THERMAL STORAGE. The Heating of Buildings Electrically by Means of Thermal Storage, S. E. Monkhouse and L. C. Grant. Instn. Elec. Engrs.—Advance Papers, Sept. 19, 1929, 9 pp., 5 figs. Authors advocate more extended use of electrical heating by adopting thermal storage, thus enabling energy to be used during off-peak hours; they contend that such a system is economical to operate and they show that, for large buildings, electric heating can compete with systems employing other forms of fuel.

ELEVATORS, CONSTRUCTION

SAFETY GATES. Simple Elevator Safety Gate, G. E. Peachey. Eng. News-Rec., vol. 104, no. 1, Jan. 2, 1930, p. 34, 1 fig. Description of gate consisting of single cross-bar and hinged brace, for building construction elevators.

ELECTRIC GENERATORS

DIRECT CURRENT, THREE-WIRE. Operation of Three-Wire Generators, C. Lynn. Power, vol. 71, no. 4, Jan. 28, 1930, pp. 135-137, 9 figs. Difference between two and three-wire d.c. generators is outlined; it is shown how neutral is produced and how three-wire generators are operated in parallel; elementary diagrams of 3-wire generators and their connections; simplified diagram of two 3-wire generators connected in parallel.

ELECTRIC INSULATING MATERIALS

MOULDED. Trends in Radio and Their Bearing on Moulded Tube Bases, E. B. Saul. Plastics, vol. 6, no. 2, Feb. 1930, pp. 101-102, 2 figs. High-frequency transmission and broadcasting bring up insulation problems which may force tube manufacturers to seek other materials than moulded resinoids for tube bases.

ELECTRIC LINES

POLES, CONCRETE. Graphical Determination of Deflections of Armoured Concrete Poles (Détermination graphiques des flèches des poteaux en béton armé), P. Gully. Revue Générale de l'Electricité (Paris), vol. 26, no. 22, Nov. 30, 1929, pp. 887-890, 4 figs. Mathematical graphical analysis; calculation of deflection of concrete poles with load at top; experimental results are in accordance with theoretical calculations.

HIGH TENSION, PROTECTION. The Protective Relay Installation at the Toronto-Leaside Transformer Station of the Hydro-Electric Power Commission of Ontario, E. M. Wood. Power Age, vol. 6, no. 12, Dec. 1929, pp. 79-84, 4 figs. Outline of transmission problem and adopted system diagram and application of relaying to system and transformer station; general requirements; types of relays used.

ELECTRIC MACHINERY

SYNCHRONOUS. Stability of Synchronous Machines—Effect of Armature Circuit Resistance, C. A. Nickle and C. A. Pierce. Am. Inst. Elec. Engrs.— Paper, for mtg. Dec. 2-4, 1929, 13 pp., 12 figs. Theory of synchronous machines as developed by Doherty and Nickle has been extended to include determination of effect of armature-circuit resistance on damping torque; equations are developed for damping torque of synchronous machines in general, i.e., both salient-pole and round rotor types; mathematical analysis is checked with laboratory experiments.

ELECTRIC MANUFACTURING INDUSTRY

CANADA. The Electrical Trade Position in Canada, A. S. L. Barnes. Elec. Rev. (Lond.), vol. 106, no. 2719, Jan. 3, 1930, pp. 3-6. Canadian correspondent summarizes present position of affairs in electric manufacturing industry; opinions, criticism, and suggestions offered by various authorities are quoted and view is expressed that concerted attack on market by British companies and firms would be well-timed.

ELECTRIC MOTORS

INDUCTION. Quiet Induction Motors, L. E. Hildebrand. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 1, Jan. 1930, pp. 7-11, 4 figs. Magnetic noise in induction motors is caused by vibration of magnetic parts produced by varying forces associated with changing flux density in adjacent air parts of magnetic circuit; torsional vibration of motor is caused by unbalanced windings or applied voltages; causes of vibration of rotor and stator; magnetic noise can be predicted from qualitative analysis of air-gap field supplemented by analysis of stiffness of parts.

ELECTRIC NETWORKS

DESIGN. Recent Trends in Power System Development, W. F. Sims. Elec. Light and Power, vol. 8, no. 1, Jan. 1930, pp. 36-39, 7 figs. Changes in trend of substation design; growing use of mercury-arc rectifiers; notes on trends in distribution, interconnection, transmission, load building, and rehabilitation.

ELECTRIC POWER INDUSTRY

CANADA. Canadian Electrical Industry is Prosperous, D. C. Durland. Can. Engr. (Toronto), vol. 58, no. 2, Jan. 14, 1930, pp. 131-132. Business of Canadian General Electric Co., Ltd., showed increase for 1929 of 20 per cent. over preceding year; steady increase in demand for electricity; equipment installed in hydro power plants during year.

ELECTRIC POWER SUPPLY

ECONOMICS. Power Plant Economics, H. Quigley. World Power (Lond.), vol. 13, no. 55, Jan. 1930, pp. 36-44, 16 figs. Survey of progress achieved; capital expenditure on generating plant; capital expenditure of transmission and distribution; average costs of typical stations in Great Britain; overall thermal efficiency; electricity supply costs; generating stations in Great Britain and United States compared; table giving production costs in electricity supply.

ELECTRIC SUBSTATIONS

DESIGN. Modern Trends in Sub-Station Design, J. B. Kitchen. Power House (Toronto), vol. 24, no. 1, Jan. 1930, pp. 63-68, 5 figs. Discussion of two leading factors which influence substation design; description of station construction with respect to Toronto system; advances in control, relay protection, transformers, mercury-arc rectifiers.

ELECTRIC TRANSFORMERS

CURRENT. Current Transformers for Protective Devices, A. M. Wiggins. Elec. Jl., vol. 27, no. 1, Jan. 1930, pp. 39-41, 8 figs. Current transformers must be selected with care or incorrect operation will result; action of relay or other protective device depends to large extent on this operation; applications to protective schemes should be based upon consideration of kind of protection used, and upon characteristics of current transformer under abnormal conditions which are to be guarded against.

F

FLOOD CONTROL

MISSISSIPPI RIVER. What Is Being Done for Flood Control on the Mississippi. Pub. Works, vol. 61, no. 1, Jan. 1930, pp. 8-11, 3 figs. Brief outline of work in progress on Bonnet Carre floodway, Birds Point and New Madrid floodways; development of construction methods; contractors' problems; Mississippi River Commission organization and personnel.

Mississippi Flood Control. L. Brown. Eng. News-Rec., vol. 104, no. 6, Feb. 6, 1930, pp. 227-231, 6 figs. Chief of Engineers of United States Army discusses origin of plan of flood control, major elements of this plan and principles conceived to govern its development and prosecution, with suggestion of prospective changes; criticism of Bonnet Carre spillway; flood magnitude and safety margins; new levee sections; floodway flowage and control; representative levee-building equipment.

FLOORS

CONCRETE SLABS. One Way Concrete Slab Floors Widely Used in Northwest, G. Runciman and H. L. Worthington. Eng. News-Rec., vol. 104, no. 2, Jan. 9, 1930, pp. 68-70, 4 figs. The type of design is favoured on account of simplicity, and savings in storey height and in cost of forms and plastering; typical floor systems using one-way reinforcing; list of buildings in State of Washington baving one-way concrete slab floors.

FLOW OF AIR

MEASUREMENT. Measurement of Air Flow, E. Ower. Instruments, vol. 2, nos. 10 and 12, Oct. and Dec., 1929, pp. 347-358 and 443-454, 7 figs. Theoretical mathematical discussion regarding general principles of pressure-tube anemometer; flow of air in pipes; resistance of pipe to motion of fluid along it; characteristics of flow in pipes; turbulent flow in pipes.

FLOW OF FLUIDS

ROTATING TUBES. Flow Phenomena in Revolving. Tubes (Stroemungserscheinungen in rotierenden Rohren). F. Levy. Forschungsarbeiten auf den Gebiete des Ingenieurwesens (Berlin), no. 322, 1929, pp. 18-45, 22 figs; see also abstract in V.D.I. Zeit. (Berlin), vol. 73, no. 42, Oct. 19, 1929, p. 1512. Purpose of investigations was to find means of improving efficiency of diffusers; tests were carried out on rotating cylindrical tubes such as are used in atmos boilers and rotating diffusers; most important result is fact that pressure drop in straight tubes is greatly reduced by influence of wall rotation; transformation of flow energy into kinetic energy in diffuser is studied.

THEORY. New Theory of Flow (Neue Wege in der Stroemungslehre), J. Maercks. Glueckauf (Essen), vol. 65, no. 36, Sept. 7, 1929, pp. 1234-1241, 11 figs. According to new theory described, friction resistance is in all flow phenomena a function of Reynolds coefficient; elementary explanation and derivation of this coefficient is given and its application to flow in tubes, nozzles, and orifices is explained.

FLOW OF STEAM

MEASUREMENTS. Precision of Nozzle Measurements of Steam Flow in Acceptance Testing (Ueber die Genauigkeit von Dampfmessungen mittels Duesen bei Abnahmversuchen), M. Ten Bosch. Schweizerische Bauzeitung (Zurich), vol. 94, no. 17, Oct. 26, 1929, pp. 209-212, 7 figs. Discussion of precision based on experimental study by Witte; precise measurements of pressure differences and temperatures; nozzles can be calibrated by using cold water; author concludes that in practice allowance should be made for errors up to 2 per cent.

FORGINGS

STEEL, HEAT TREATMENT OF. A Microscopic Study of Improperly Heated Forgings. A. S. Jameson. Am. Soc. Steel Treating—Trans., vol. 17, no. 1, Jan. 1930, pp. 81-89, 20 figs. It is purpose of paper to illustrate few of defects which result from uncontrolled heating of steel prior to hot working or forging, and in doing this show how valuable a tool microscope is in determining exact occurrence of these flaws.

UPSET. Development of Upset Forgings, W. E. Crocombe. Iron Age, vol. 124, no 23, Dec. 5, 1929, pp. 1513-1515, 2 figs. Many advantages of upset method of forging are discussed and its development traced; saving of one-fifth in weight and great improvement in output; uniform grain conditions give higher strength; much greater production obtained; upset method eliminates tong holds; plea for adequate cost analysis.

FREIGHT TRANSPORTATION

CANADA. Steam Railway Traffic in Canada. Can Ry. and Mar. World (Toronto), no. 383, Jan. 1930, pp. 14-16, 1 fig. Chart illustrating revenue freight forwarded on Canadian railways, 1921-1928 inclusive, arranged by provinces; statistics of freight transportation are given.

FUEL ENGINEERING

PROGRESS REPORT. Progress in Fuel Utilization in 1929. Mech Eng., vol. 52, no. 1, Jan. 1930, pp. 13-19. Progress report submitted by Fuels Division of American Society Mechanical Engineers, dealing with following subjects: solid fuels, liquid fuels, natural gas, manufactured gas, low temperature carbonization, boilers, boiler furnaces, stokers, pulverized fuel, fuel oil, diesel engines, locomotives, industrial furnaces and power plants, domestic heating, refractories and research.

FURNACES

MELTING, PULVERIZED COAL. Uses Rotary Foundry Melting Furnace. Iron Age, vol. 124, no. 24, Dec. 12, 1929, p. 1586. Description of furnace of unique design called Brackelsburg which has recently been put into operation in Germany in production of high-quality gray and malleable castings; furnace is horizontal cylindrical shell, rotating during melting and super-heating and fired with powdered coal; rate of revolution slow during melting. From Publication no. 131 of Kaiser Wilhelm Institute fuer Eisenforschung.

G

GAUGES

ELECTRIC. The Electric Gauge, A. V. Mershon, J. W. Matthews and B. C. Waite, Jr. Gen. Elec. Rev., vol. 32, no. 12, Dec. 1929, pp. 674-675, 3 figs. Instrument is independent of human sense of touch; simple and rapid to manipulate; amplification factor is 10,000; electric gauge has been developed to meet for accurate gauging device that has but minimum of moving parts and that will permit routine gauging operations to be conducted with great rapidity.

GEAR CUTTERS

CROWN-GEAR HOBBING. Crown Gear Hobbing Fixture for Turret Lathe, O. S. Marshall. Machy, (N. Y.), vol. 36, no. 4, Dec. 1929, pp. 297-298, 5 figs. Description of fixture of unusual design applied to Hartness flat turret lathe for hobbing teeth on crown-tangent-tooth gear; basically fixture is application of Hartness chasing attachment to driving of hob.

GEARS

NON-METALLIC, MANUFACTURE OF. Design of Textolite Gears, H. D. Randall. Am. Mach., vol. 71, no. 26, Dec. 26, 1929, pp. 1033-1035, 7 figs. Methods employed in manufacturing Textolite gears are described; gears fabricated out of non-metallic materials present problems somewaht different from ordinary practice; blanks may be moulded for plain pinions or may be die formed with or without moulded in steel hubs and webbed wheels; tables show allowable horsepowers for Textolite gears.

GEOLOGY

SASKATCHEWAN. Southern Saskatchewan, F. H. McLearn. Can. Dept. of Mines—Geol. Survey (Ottawa), no. 2206, 1929, pp. 30B-44B, and (appendix) 45. Discussion of stratigraphy and structure; oil and gas possibilities are mentioned but not discussed; brief notes on clays and mention of report by J. G. Phillips on tests of samples collected in 1928; notes on petrography of sediments, by F. J. Fraser.

BRITISH COLUMBIA. Mineral Deposits of Alice Arm District, British Columbia, G. Hanson. Can. Dept. of Mines—Geol. Survey (Ottawa), no. 2202, part A, 1929, 27A-49A, 3 figs. Report on field work of July and August 1928; general description; mineral deposits are classed as molybdenite deposits; high grade silver-bearing veins in argillite, silver-lead deposits in volcanic rocks, sphalerite deposits and chalcopyrite deposits; notes on individual mining properties.

ONTARIO. Preliminary Report on Woman River and Ridout Map-Areas, Sudbury District, Ontario, R. C. Emmons and E. Thomson. Can. Dept. Mines—Geol. Survey (Ottawa), no. 2191, 1929, 28 pp. and index, 2 maps in pocket. Report on fieldwork in areas in Sudbury district; topography; general geology; main feature of economic interest is iron formation and associated sulphide deposits; pyrrhotite, pyrite, chalcopyrite, sphalerite, and galena occurrences, by townships.

H

HANGARS

DOORS, ELECTRIC DRIVE FOR. Designing Drive and Control for 600-Ton Hangar Doors, W. J. Watson. Machine Design, vol. 1, no. 3, Nov. 1929, pp. 9-12, 7 figs. Description of door-moving mechanism designed for airship hangar of Goodyear Zeppelin Corp., at Akron, Ohio. Each wheel has individual axle; worm gear also prevents swinging; electric cutout switches mounted on runway adjacent to driving unit so that projections for door operate them, door coming to slow down, increasing speed.

HEADING MACHINES

COLD-HEADING RIVETS. An Accurate Cold Heading Machine. Engineer (Lond.), vol. 148, no 3856, Dec. 6, 1929, pp. 616-617, 6 figs. Details of machine brought out by E. White, of Windsor, Works, Redditch, for making such objects as rivets, screw blanks, etc. with exceptional degree of accuracy; it will, in fact, work to nearest 0.002 in.

HEAT EXCHANGERS

CHARACTERISTIC CURVES. Heat-Exchanger Characteristic Curves (Eschangeurs de chaleur semblables courbes caracteristiques), M. Véron. Chaleur et Industrie (Paris), vol. 10, nos. 114 and 115, Oct. and Nov. 1929, pp. 469-478, and 549-556, 5 figs. Mathematical analysis of heat exchange between fluids through separating partition; equations for thermal efficiency developed; formulae and characteristic curves giving efficiency and losses in reheaters.

HEAT TRANSMISSION IN. Heat Transmission in Cross-Current Heat Exchangers (Der Waermeuebergang im Kreuzstromwaermeastauscher), G. Zimmermann. Zeit. Bayerischen Revisions-Vereins (Munich), vol. 33, nos. 21, 22 and 24, Nov. 15 and 30, and Dec. 31, 1929, pp. 297-302, 315-317, and 343-350, 24 figs. Nov. 15: Temperature measurement of air and flue gases; preliminary tests; dimensioning of ducts. Nov. 30: Conducting and evaluation of tests; calculation of heat volume discharged from flue gases and heat absorbed from air. Dec. 31: Determination of temperatures of plates; heat-transfer coefficient; comparison of theoretical discharge-temperature curve with practical results.

HEAT PUMPS

PRINCIPLE OF. The Heat Pump—An Economical Method of Producing Low-Grade Heat from Electricity, T. G. N. Haldane. Inst. Elec. Engrs.—Advance Paper, Sept. 7, 1929, 10 pp., 7 figs. Method of converting electrical energy into heat energy is based on general principle that efficiency of heat engine working in normal cycle is given by difference between high and low temperature multiplied by high temperature; application of this principle to heating of buildings and for such purposes as heating of public baths is discussed, and estimated figures for installation are given; experiments by author demonstrated soundness of principles on which pump is based.

HIGH BUILDINGS

CONSTRUCTION. Getting Materials to the Right Place at the Right Time. Am. Contractor, vol. 50, no. 52, Dec. 28, 1929, pp. 11-13, 4 figs. Details of Pittsburgh contractor's system of expediting material delivery and distribution; material delivery reports; distribution dispatches; material routings; application of this system to construction of 27-storey addition to William Penn Hotel, Pittsburgh, within period of twelve months.

HOT-AIR HEATING

FANS. Friction Losses and Observed Static Pressures in a Domestic Fan Furnace Heating System, A. C. Willard and A. P. Kratz. Heating, Piping, and Air Conditioning, vol. 1, no. 8, Dec. 1929, pp. 683-687, 6 figs. With increasing tendency to apply various types of small disc and propeller fans as well as small centrifugal fans to warm-air furnace-heating system of gravity circulating types has developed without proper attention to heads or resistances; description of apparatus, test procedure, and discussion of results are given. To be presented before Am. Soc. Heat. and Vent. Engrs.

HOT-WATER HEATING

PUMPING VS. GRAVITY SYSTEMS. Pumping vs. Gravity Heating Systems (Schwerkraft oder Pumpenheizung), M. Hottinger. Gesundheits-Ingenieur (Munich), vol. 52, no. 38, Sept. 21, 1929, pp. 657-660, 1 fig. Advantages of pumping over gravity heating systems; limiting cases; determination of pump capacity; safety provisions; comparative cost data.

HYDRAULIC MACHINERY

Design. Calculation and Design of Hydraulic Machines and Presses (Calcul et construction des presses et machines hydrauliques), A. Lambrette. Technique Moderne (Paris), vol. 21, nos. 18 and 20, Sept 15, and Oct. 15, 1929, pp. 572-576 and 646-652, 13 figs. Practical design data and tables; description of different types of presses; choice of construction materials; installation of presses.

HYDRAULIC TURBINES

Draft Tubes. Contribution to the Theory of the Vertical and Cylindrical Draft Tubes (Bidrag till den vertikala och cirkulara sugtrummans teori), H. Berglund. Teknisk Tidskrift (Stockholm), vol. 59, nos. 42 and 46, Oct. 19 and Nov. 16, 1929, (Mekanik), pp. 132-140 and 151-152, 4 figs. Through gradual widening of suction line from turbine, author contends that higher efficiency may be reached; he develops formulae for construction of suction lines based on this theory and applies them to examples.

Propeller-Type. Hydraulic Turbines of the Propeller Type (Le turbine idrauliche ad elica), G. Buchi. Energia Elettrica (Milan), vol. 6, no. 10; Oct. 1929, pp. 1002-1023, 48 figs. Compilation on developments of design, construction and operation of Kaplan turbines and their appurtenances; description of propeller turbine installations of Lilla Edet plant in Sweden and of Mori plant in Italy; development of propeller turbines in America with special reference to Moody turbine; high- and low-speed types of Bell propeller turbine.

Regulation. Present Tendencies in Regulation of Hydraulic Turbines (Tendances actuelles en matière de regulation des turbines hydrauliques), L. Barmillion. Société des Ingénieurs Civils de France—Mémoires et Compte Rendu des Travaux (Paris), vol. 82, no. 5/6, May/June, 1929, pp. 688-715, 38 figs. General review of theory and practice of hydraulic-turbine regulation, with special reference to accelerometric and tachymetric criteria and special devices and in French practice.

Testing. Measurement of Turbine Efficiency (Sur une nouvelle méthode de mésure du rendement des turbines hydrauliques), L. Barbillion. Chaleur et Industrie (Paris), vol. 10, no. 113, Sept. 1929, pp. 423-427, 1 fig. Study of new means of measuring turbine efficiency, termed by author "thermometrical method," based on difference in temperature between water before and after passing turbines, this difference being proportional to losses of energy by friction, leakage, etc.; principles of method are disclosed with calculations worked out.

HYDRAULICS

Progress in. Progress in Hydraulics. Mech. Eng., vol. 52, no. 1, Jan. 1930, pp. 19-23. Progress report submitted by Hydraulic Division of American Society Mechanical Engineers, dealing with following subjects: factors affecting economics of hydro-electric power development; governmental regulation and supervision of utilities and structures; governmentally owned hydro plants and projects; model testing; dams and accessories; measurement of water; adjustable-vane turbines; high-speed propeller-type turbines impulse; reaction turbines; generation; frequency and load control; penstocks; pumps; fish screens and fishways and hydrology.

HYDRO-ELECTRIC POWER DEVELOPMENTS

St. Lawrence River. Another Chapter in St. Lawrence River Power Development. Power, vol. 71, no. 4, Jan. 28, 1930, pp. 128-129, 1 fig. If New York State's Governor and Legislature agree upon water-power policy, there remain national and international questions to be settled regarding St. Lawrence River before power can be developed on its international section.

British Columbia. Developing Northern B.C. Power, D. Anderson. Contract Rec. (Toronto), vol. 44, no. 4, Jan. 22, 1930, pp. 79-83, 8 figs. Subsidiary of Power Corporation of Canada developing power resources in Prince Rupert region; new plant at Falls River to have ultimate capacity of 32,000 hp.; proposed development takes advantage of fall of about 160 ft.; power-house is being designed for two 6,000- and two 10,000-hp. units.

Canada. Water Power Development in Canada During the Past Year. Contract Rec. (Toronto), vol. 43, no. 3, Jan. 15, 1930, pp. 45-47, 4 figs. Review of development in Quebec, New Brunswick, and Nova Scotia. (Concluded.)

Hydro-Electric Power Progress in Canada. Can. Engr. (Toronto), vol. 58, no. f2, Jan. 14, 1930, pp. 133-136. Review prepared by Dominion Water Power and Reclamation Service of Department of Interior discloses that capacity brought into operation during year was 378,400 hp., bringing total for Dominion to 5,727,600 hp.; over $75,000,000 expended during year on construction.

Hydro-Electric Power Development in Canada. Engineering (Lond.), vol. 129, no. 3339, Jan. 10, 1930, pp. 62-63. Brief review of some outstanding developments; fact that Canada has at present hydro-electric installations amounting to 5,500,000 hp. does not appear to exercise any influence in arresting pace of new construction, and plans are under consideration, and in some cases actually in execution, for number of projects which will reach 1,000,000-hp. stage.

Water Power Development in Canada During the Past Year. Contract Rec. (Toronto), vol. 43, no. 1, Jan. 1, 1930, pp. 31-34, 4 figs. General statistical review; year's outlay $69,000,000; $292,000,000 will be required to complete undertakings planned for next three years; over 378,000 hp. placed in operation in 1929, making Canada's total 5,727,600 hp. (To be continued.)

Ontario. Hydro Power Development at Smoky Falls. Can. Engr. (Toronto), vol. 58, no. 2, Jan. 14, 1930, pp. 121-124, 5 figs. Spruce Falls Power and Paper Co. build power development at Smoky Falls on Mattagami River to supply power to pulp and paper mill at Kapuskasing; initial installation of three turbines gives total output of 56,000 hp.; provision for additional unit; concrete dam at Smoky Falls has maximum height of 65 ft.; operating head is 114 ft.; description of railway and transmission lines.

HYDRO-ELECTRIC POWER PLANTS

Gate Control. Automatic Gate Control Maintains Normal River Flow, D. P. Dinapoli. Elec. World, vol. 94, no. 25, Dec. 21, 1929, pp. 1220, 1 fig. On Pit River development of Pacific Gas and Electric Co., gate operation must fulfill two requirements: first, to maintain given river flow and second, to vary flow to follow slight seasonal variations which accompany normal river flow; device for this purpose consists of three main elements, float mechanism, relays, and sluice gate with its motor and contactor; wiring diagram of automatic sluice-gate control equipment is given.

Pumped Storage. Two 8,100 hp. Pumps Supply Water for Power Generation. Power, vol. 70, no. 25, Dec. 24, 1929, pp. 1006-1008, 7 figs. Illustrated description of vertical-shaft, single-inlet, single-stage, bottom-suction, volute-type pumps rated at 162,000,000 gals. per day, against 240-ft. gross head used in Rodky River hydro-electric plant of Connecticut Light and Power Co.; cross-section of one of two pumps; curves obtained from test made on model pump, and on pump in actual operation.

Automatic. Large Automatic Hydro Plant Has High Reliability, C. W. Colvin. Elec. World, vol. 95, no. 2, Jan. 11, 1930, p. 112. Operating experiences with 10,000-kva. fully automatic Alouette hydro-electric plant of British Columbia Electric Railway Co. during first year's operation has shown full justification for extra expense incurred in providing additional equipment required for full automatic operation.

Niagara Falls. Niagara Power, N. R. Gibson. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 1, Jan. 1930, pp. 139-140. Discussion by F. P. Williams of paper previously indexed from issue of Sept. 1929, limitation of diversion of water under existing treaty; economic benefits; ultimate diversion.

Saskatchewan. Churchill River Now Harnessed at Island Falls, F. S. Small. Power Age, vol. 6, no. 12, Dec. 1929, pp. 69-75, 8 figs. Description of early progress of Island Falls development; power plant being built will have initial capacity of 44,500 hp., with provision for future expansion to total of 86,500 hp.; temporary power plant; general layout of main dam and power house at Island Falls; section through main units.

Remote Control. Trethewey Falls Hydro-Electric Plant, S. W. Black. Contract Rec. (Toronto), vol. 43, no. 1, Jan. 1, 1930, pp. 6-8, 4 figs. Remote-control development at 35 ft. head 2,300 hp. power house, constructed by Hydro-electric Power Commission of Ontario. on Muskoka River.

Quebec. Montreal's New Station Has Special Features. Elec. News (Toronto), vol. 39, no. 2, Jan. 15, 1930, pp. 41-47, 13 figs. Movable blade turbines for variable flow and head and twelve sided welded stator frames are used in plant of Montreal Island Power Co.; feature of this development is that as flow increases from 35,000 to 90,000 cu. ft. per sec., head on plant decreases from 26 to 18 ft.; ultimate continuous output of new plant is estimated at 65,000 hp., but turbines installed will be capable of delivering 120,000 hp.; notes on head works, hydraulic and electric equipment are given.

I

IMHOFF TANKS

Design. Improvements in the Imhoff Settling Tank, O. Mohr. Surveyor (Lond.), vol. 77, no. 1980, Jan. 3, 1930, p. 15, 2 figs. Submerged settling compartments for elimination of foaming with steeper slopes for sides of sedimentation compartment walls are self cleansing; details of Imhoff tanks of Schwerin, Germany.

INDUSTRIAL TRUCKS

Electric. Materials Handling Problems Solved by Use of Electric Truck, H. E. Stocker. Iron Trade Rev., vol. 85, no. 24, Dec. 12, 1929, pp. 1502-1503, 3 figs. Description of new electric industrial truck used in plant of Driver-Harris Co., Harrison, N.J., in manufacture of nickel-chrome wire; time and costs are cut by use of electric lift truck and platforms in moving product through various operations; four-wheel drive and four-wheel steering, sensibility and flexibility of controls, and ability to operate equally well in either direction obtained.

INLAND WATERWAYS

St. Lawrence River. St. Lawrence Project Condemned. Ry. Age, vol. 88, no. 2, Jan. 11, 1930, pp. 147-150, 1 fig. Engineers report to Montreal Trade Board says present waterway not used to capacity; cost estimates too low; rate saving only two cents per bushel; Welland's cents exceed estimates 140 per cent; mariners condemn St. Lawrence project; westward grain movement increases; statement showing relation of annual costs in transport to capital investment, based on present and assumed future volume of through freight.

INTERNAL-COMBUSTION ENGINES

Compression Limits. Limit of Compression in Internal-Combustion Engines (Sur la limite de compression dans les moteurs à explosion), P. Dumanois. Bul. Technique du Bureau Veritas (Paris), vol. 11, no. 10, Oct. 1929, pp. 215-220, 1 fig. Importance of even very slight variations in time on combustion process is pointed out; investigation of what takes place when compression in engine is increased; tests were carried to confirm, if possible, assumption that oxidation takes place during compression.

Crankshafts. Critical Speeds of Crankshafts, A. Gorfinkel. Engineering (Lond.), vol. 128, no. 3337, Dec. 27, 1929, pp. 827-829, 3 figs. Author explains how calculation may be simplified and results, sufficiently exact for practical requirements, attained with reasonable ease and rapidity; methods described originated in connection with design of Diesel engines constructed by Carels Brothers in Ghent but are applicable to all multi-throw crankshafts.

Indicators. New Compression Indicator, G. L. Holzapfel. Instruments, vol. 2, no. 11, Nov. 1929, pp. 418-419. Holzapek indicator designed to fill need for accurate and reliable instrument; is screwed into spark-plug orifice and engine cranked, owing to action of check valve, pressure of gas pumped into space communicating with pressure gauge soon reaches maximum pressure reached in engine cylinder during compression stroke, this being registered on pressure gauge; check valve is so designed that it is absolutely gas-tight so that compressed gas trapped in upper part of body is held there, recording maximum compression pressure.

Thermodynamics of. The Thermodynamics of Heat Transference, A. A. Herzfeld. Automobile Engr., (Lond.), vol. 19, no. 261, Nov. 1929, pp. 441-444, 3 figs. Propagation of combustion in direction of flow of gas is given with accuracy sufficient for practical purposes; calculation of linear rates of combustion at right angles and opposite to direction of flow of gas; formulae for L-head engine; method for determining volumetric efficiency of existing engine; determining heat developed by each combustion; by these formulae, places of highest heat transference can be determined.

Vibration. The Effect of the Damping of the Throws on the Torsional Vibration of the Crankshaft system of an Internal Combustion Engine, J. Morris. Roy. Aeronautical Soc. (Lond.), vol. 33, no. 227, Nov. 1929, pp. 1086-1087, 2 figs. Formulae for frequencies in torsional vibrations of crankshaft of direct-drive engine having equal throws and equal journals; in view of considerable moment of inertia of airscrew compared with that of throw, author finds that its damping will not appreciably affect above result, which again is exact having ragard to conditions assumed.

(*See also Airplane Engines; Diesel Engines; Oil Engines.*)

IRON AND STEEL RESEARCH

Progress in. Progress in Metallurgical Research, H. C. H. Carpenter. Iron and Coal Trades Rev. (Lond.), vol. 120, no. 3230, Jan. 24, 1930, pp. 152-153. Most important event of year 1929 is formation of Iron and Steel Industrial Research Council composed of members of Iron and Steel Institute, National Federation of Iron and Steel Manufacturers, and of research associations of industries connected with iron and steel; policy is encouragement of definitely technical investigations designed to overcome immediate and pressing difficulties, and to explore must obvious lines of development by suitable means; research in United States; other researches.

J

JIGS AND FIXTURES

Design. The Planning and Design of Stand Type Jigs, J. A. Potter. Am. Mach., vol. 72, no. 2, Jan. 9, 1930, pp. 62-63, 4 figs. Standards of quality and tolerance, as well as available machines, dictate type of fixture and number of operations; exposition of various factors governing type of jig to be used on particular production job.

L

LATHES

Cutting Tools. Cutting Capabilities of Lathe Tools, D. Smith. North-East Coast Instn. of Engrs. and Shipbldrs.—Advance Paper (Newcastle-upon-Tyne), Dec. 6, 1929, 26 pp., 13 figs. Brief outline of development of cutting metals, their chemical composition and functions; Stellite, Cooperite, Widia, and Perdurum; heat treatment of tool steels and some of their properties; difficulty experienced in obtaining rational law between cuts of different dimensions and cutting speed; work done by Manchester Lathe Tool Committee on effect of depth of cut and traverse, shape of tool, and speed on durability of ordinary high-speed tools; also on forces exerted on tool when cutting iron and steel.

LIGHTING

Industrial. Cost of Lighting Industrial Buildings, M. Luckiesh. Elec. World, vol. 94, no. 24, Dec. 14, 1929, p. 1181. In recent analysis cost of lighting six representative types of industrial buildings, four single-storey, and two multi-storey, for eight-hour work period in day-time and for average weather conditions, was studied.

LOCOMOTIVE REPAIR SHOPS

MONTREAL. Railway Locomotive Shops Designed for Highest Efficiency. Contract Rec. (Toronto), vol. 43, no. 4, Jan. 22, 1930, pp. 67-70, 7 figs. Main features of new buildings erected by Canadian National Railways in Montreal; locomotive shop is rectangular in plan, 265 ft. 4 in. wide by 1,056 ft. long; lighting is by Holophane units; electric welding circuit is wired through sub-floor and plugs are located at convenient points on steel columns.

LOCOMOTIVES

DIESEL. 1,200-H.P. Diesel-Compressed Air Locomotive For the German State Railways. Engineering (Lond.), vol. 128, no. 3334, Dec. 6, 1929, pp. 748-749, 1 fig. Mechanical portion was built by Maschinenfabrik Esslingen A.-G. of Esslingen, while Diesel engine and compressed-air transmission, with which it is equipped, were manufactured by Maschinenfabrik-Augsburg-Nurnberg (M.A.N.); locomotive is of 4-6-4 type; power developed by engine is utilized for drying air compressor; compressed air thus obtained is passed into heater, through which exhaust gases from engine are led, and is then transmitted to locomotive cylinders, which are placed outside frames at one end.

ELECTRIC. 5,400-H.P. Electric Locomotive for the Paris, Lyons, and Mediterranean Railway. Engineering (Lond.), vol. 128, no. 3335, Dec. 13, 1929, pp. 786-787, 2 figs. Details of locomotive made by Oerlikon designed so as to be capable of hauling 700-ton train at speed of 56 mi. per hr. up gradient of 0.8 per cent, and at 68 mi. per hr. on level; consists essentially of single frame, which is mounted on two articulated subframes; each of latter is equipped with three driving axles and truck, latter being of standard P.L.M. type; two pantograph collectors and four contact shoes on each side are provided for current-collection purposes.

FEEDWATER HEATERS. Locomotive Feed Water Heater. Engineer (Lond.), vol. 148, no. 3857, Dec. 13, 1929, p. 632, 3 figs. Improved type of A.C.F.I. apparatus has been fitted to Pacific type engines No. 2580, Shotover and No. 2576 White Knight, on L. and N.E. Railway; standard type of A.C.F.I. heaters, consisting of two circular chambers placed on top of boiler behind chimney, have been superseded by heater arranged to fit into smokebox, ahead of chimney; this arrangement eliminates heat losses by radiation.

FIREBOXES, COPPER WELDING. Copper Welding (Die Kupferschweissung), R. Samesreuther. V.D.I. Zeit. (Berlin), vol. 73, Dec. 7, 1929, pp. 1731-1732, 4 figs. Discussion deals principally with copper welding of locomotive fireboxes; comparison of riveted and welded copper fireboxes; method of welding and after-treatment of welds.

FORGINGS. Locomotive Forgings, L. H. Fry. Am. Soc. Steel Treating—Trans., vol. 17, no. 1, Jan. 1930, pp. 1-33 and (discussion) 33-53, 17 figs. Production of locomotive forgings which will give good results in service necessitates employment of correct methods from melting of steel to finished forging; various steel-melting processes are discussed and compared; importance of ingot structure is considered; forging process is described and resulting structures of steel forgings illustrated by photomicrographs.

LUBRICATING GREASES

ZINC OXIDE. A Zinc-Containing Lubricant for the Prevention of Corrosion. Metals and Alloys, vol. 1, no. 6, Dec. 1929, pp. 281-283. In running of device known as Keenok pinion in which rapidly varying local stresses are set up, it was found that serious trouble was caused by corrosion of working parts; conclusion was reached that corrosion was electrolytic effect produced by rapidly varying local stresses to which parts were subjected; prolonged study was made of means to prevent corrosion; successful results were reached by employing as lubricant grease with which considerable proportion of zinc oxide was mixed. From Engineer (Lond.), Sept. 27, 1929.

M

MACHINE SHOP PRACTICE

PROGRESS IN. Progress in Machine-Shop Practice, K. H. Condit. Mech. Eng., vol. 52, no. 1, Jan. 1930, pp. 26, 27. Progress report prepared by Machine Shop Practice Division of American Society of Mechanical Engineers outlining most important development, during past year; adaptation of new tungsten carbide cutting tools to machine tool uses in considered most important development.

MACHINERY

WELDED CONSTRUCTION. Economy of Material in Welded Construction, M. Hilpert. Welding Jl. (Lond.), vol. 26, no. 313, Oct. 1929, pp. 315-316 and 331, 4 figs. Figures and data give probable reduction in weight secured by welding process, compared with other methods of assembly. Abstract of paper presented before Matls. Congress in Berlin.

Welding in Machinery Manufacture (Schweissen im Maschinenbau), H. Neese. V.D.I. Zeit. (Berlin), vol. 73, no. 49, Dec. 7, 1929, pp. 1738-1739, 12 figs. Advantages of welding in machinery manufacture are briefly set forth; good machines, good electrodes, and good training of welders are, however, absolutely necessary.

MAGNESIUM ALLOYS

TEMPERATURE EFFECT. Compression and Extrusion, A. Portevin. Metallurgist (Supp. to Engineer, Lond.), Nov. 1929, pp. 173-175, 2 figs. Review of paper previously indexed from Révue de Métallurgie, Aug. 1929; relationship between behaviour of given metal or alloy under high-temperature compression test and its behaviour in extrusion press is discussed; author obtains autographic stress-strain diagrams of four distinct types; interpretation of these four types in terms of single generalized pair deformation of metal under viscous flow and under work-hardening conditions, respectively.

MALLEABLE CASTINGS

USE IN MACHINE CONSTRUCTION. Malleable Castings Offer Many Possibilities to Designers, J. B. Deisher. Machine Design, vol. 1, no. 3, Nov. 1929, pp. 31-34, 4 figs. Applications of malleable castings to machine construction are discussed; machinability of malleable casting is one of its economic virtues; castings can be poured at comparatively low casting temperature resulting in smooth surface; present and potential uses; research and standardization of quality.

METAL SPRAYING

COMPRESSED-AIR. Protection of Steel from Corrosion by Non-Ferrous Metals. Metal Industry (Lond.), vol. 35, no. 22, Nov. 29, 1929, p. 518, 2 figs. Description of mechanical process of spraying molten metal directly on to steel, developed by Metals Coating Co.; wire of any commercial metal is fed at definite rate through nozzle into oxy-acetylene or oxy-hydrogen flame; molten metal is atomized and sprayed by means of compressed air; special attachment used when tubes are to be coated internally.

METALS

COLD WORKING. Effects of Cold Working on Physical Properties of Metals, R. L. Templin. Am. Inst. Min and Met. Engrs.—Tech. Pub., no. 238, 1929, pp. 1-15 and (discussion) 15-17, 2 figs. Factors of variations in conditions present in remounting, casting, chilling, and preheating of initial ingot are assumed to remain constant; factors that must be considered simultaneously with cold working; definition of cold work and equivalent cold work; graphs, tabular data, and formulae are given. Bibliography.

HARD-FACING. Development and Application of Hard-Facing, M. C. Smith. Machy. (N. Y.), vol. 36, no. 3, Nov. 1929, pp. 219-222, 6 figs. Description of materials and methods employed in newly developed process of applying veneer of hard alloy to metal surface by fusion welding; repairing oil-well tools by welding on metal lead to development of hard-facing; three classes of alloys used in hard-facing; problem of finding. suitable hard-facing alloyt; heory of mixed-alloy welding rod; substituting hard-facing for heat-treatment; kinds of hard-facing alloys available; advantages offered by hard-facing process.

TESTING. Vibration Strength (Schwingungsfestikeit), P Ludwik. Zeit des Oesterreichischen Ingenieur und Architekten Vereines (Vienna), vol. 81, nos. 41/42, Oct. 11, 1929, pp. 403-406. Results of bending and impact endurance tests of polished and variously notched bars of duralumin, copper, zinc, cast iron, steel, steel alloys, and other metals, are discussed.

MINES AND MINING

MANITOBA. Mining in Manitoba during 1929, J. P. de Wet. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 1, Jan. 3, 1930, pp. 11-17, 5 figs. General review, with notes on activities of each of principal operating companies; notable features were establishment of large-scale metal-mining enterprise in Northern Manitoba, and success of Tyndall limestone in securing contract for 1,000,000 cu. ft. of building stone for use in Toronto.

QUEBEC. Mining in Quebec during 1929, J. E. Perrault. Can. Min. Jl., (Gardenvale, Que.), vol. 51, no. 2, Jan. 10, 1930. pp. 32-34. Estimated total value of mineral production is more than $43,000,000; Horne copper smelter at Noranda; prospecting active, particularly in western Quebec, in Gaspe Peninsula and in Chibougamou lake district; use of aircraft; Gaspe zinc, lead, and copper deposits; asbestos in largest individual product; water power development; geological service.

MORTISING MACHINES

TESTS. Mortising Wood (Langlochfraesen in Holz), G. Harnisch. V.D.I. Zeit. (Berlin), vol. 73, no. 43, Oct. 26, 1929, pp. 1538-1540, 13 figs. Communication regarding tests made by author on design and performance of usual mortising and characteristics of various kinds of woods.

MOTOR TRUCKS

DESIGN. Trends in Motor Truck Design, B. B. Bachmann. Ry. Age (Motor Transport Sec.), vol. 87, no. 26, Dec. 28, 1929, pp. 1513-1514. Discussion of general characteristics of motor-truck design showing that modern design is balanced between transportation requirements of vehicle and available materials of construction.

N

NON-FERROUS FOUNDRY PRACTICE

CASTINGS. Notes on Castings, L. Shane. Am. Soc. Naval Engrs.—Jl., vol. 41, no. 4, Nov. 1929, pp. 589-596. Author claims that difficulty in making composition G castings is almost exactly contemporaneous with introduction of open-flame furnace, such as Schwartz, or Rockwell, or Monarch furnaces; writer has solved problem in many places, reducing losses to almost negligible extent by merely requiring manufacturing plants where he has been on duty to return to practices of 35 years ago; procedure in effect at Portsmouth Navy Yard, where difficulties in manufacture of Composition G have been overcome; method of manufacture of manganese bronze; monel castings.

O

OIL ENGINES

INDICATORS. Indicating Oil Engines, G. B. Fox. Diesel Engine Users Assn. (Lond.), no. 307, 1929, pp. 1-15 and (discussion) 16-30, 9 figs. Discussion of manipulation of indicator, defects; indicating air compressors; light spring diagrams; tuning multi-cylinder engine; reference to examples; types of diagrams; types of indicators; simple dead-weight spring tester.

P

PAVEMENTS

STREET, DESIGN. Street Paving Design Progress, B. Vallas. Can. Engr. (Toronto), vol. 58, no. 1, Jan. 7, 1930, p. 104. Committee report of street paving, design and construction presented at convention of American Society for Municipal Improvement; curing cement-concrete roadways; construction of sidewalk necessary.

BRICK. Resurfacing Old Pavements with Vitrified Brick, H. G. Sours. Clay Workers, vol. 93, no. 1, Jan. 1930, pp. 40-42. Description of resurfacing practice of Summit County, Ohio; nature of work; methods of constructing curbs, patching and levelling of depressions, laying and rolling brick; costs; conclusions and recommendations.

CONCRETE. Building Industrial Driveways. Concrete, vol. 36, no. 1, Jan. 1930, pp. 44-46, 5 figs. Instruction covering methods for constructing concrete pavements for industrial traffic; thickness of slabs; materials and proportions; preparing subgrade; joints and curbs; curing concrete pavements.

PETROLEUM INDUSTRY

PROGRESS IN. Progress in the Petroleum Industry. Mech. Eng., vol. 52, no. 1, Jan. 1930, pp. 41-47, 2 figs. Progress report submitted by Petroleum Division, of American Society Mechanical Engineers, dealing with following subjects: progress in pipe-line transportation, pipe joints and fittings, welded pipe lines, pumping station machinery, automatic pipe-line pumping stations, construction of pipe lines, pipe-line tankage, corrosion of pipe. lines, progress in oil refining; tanks and tank roofs; refining stills; pumps; automatic control of stills; gasoline recovery and stabilization; general practice and power plant practice.

PLANERS

HYDRAULIC-DRIVE. Planing Machine With Hydraulic Drive (Tischhobelmaschine Mit Fluessigkeitsantrieb), M. Kronenberg. Werkstattstechnik (Berlin), vol. 23, no. 21, Nov. 1, 1929, pp. 613-615, 1 fig. It is shown that from theoretical point of view, machines which avoid all rotary masses must be efficient and would make possible development of planers into speed-cutting equipment; design of machine of this type is discussed; tests have shown increase in cutting power, quiet performance, and smooth reversing.

POWER PLANTS

STEAM VS. HYDRO-ELECTRIC. Economics of Water vs. Steam Power, G. A. Orrok. Can. Engr. (Toronto), vol. 58, no. 1, Jan. 7, 1929, pp. 111-114, 3 figs. Evaluation of cost of water power; comparative total costs of steam and hydro-electric power; limitations to which hydro-electric plants are subject; self-sufficiency of steam plants; cost of steam-generated power is steadily decreasing. Paper read before Wrold Eng. Congress, Tokyo, previously indexed from Mech. Eng., Dec. 1929.

PRESSURE VESSELS

DESIGN. Building of Vessels for High Pressure and High Temperature Service, T. M. Jasper. Combustion, vol. 1, no. 6, Dec. 1929, pp. 23-30, 13 figs. Paper considers pressure vessels intended for severe service under following headings: design, materials, fabrication, and testing; proper method of design is to construct pressure vessel and then test; results of various tests are shown graphically; discussion of various materials for pressure vessel construction together with their outlet strengths; methods of plate manufacture; welded joint testing. Paper read before Tokyo World Engineering Congress.

PROTECTIVE COATINGS

METALLIC. Practical Experiences with Protection of Boiler Parts Against Combustion by the "Alumetier" Process (Praktische Erfahrungen ueber den Schutz von Kesselteilen gegen Verbrennung durch das Alumetierverfahren), C. Commentz. Korrosion und Metallschutz (Leipzig), vol. 5, no. 11, Nov. 1929, pp. 248-249. "Alumetier" process, which has been successfully used in past few years for protection of grate bars and other boiler parts from furnace gases, consists in first spraying metal parts with aluminum layer, after which they are given airtight coating; aluminum and iron are diffused at suitable temperature, thus forming tenaceous heat-resisting alloy.

PUMPING STATIONS

DIESEL. Diesel Engines for Water Works Service, R. L. Baldwin. Water Works Eng., vol. 83, no. 2, Jan. 15, 1930, pp. 81, 82 and 101. Development of Diesel engine and its employment in pumping plants; case of motor-driven triplex pump; comparison with other prime movers; operating costs. Indexed in Engineering Index 1929, from Can. Engr., Dec. 10, 1929.

R

RAIL MOTOR CARS

GASOLINE-ELECTRIC. Separate Power Supply for Rail Auxiliaries. Ry. Elec. Engr., vol. 20, no. 12, Dec. 1929, pp. 414-417, 4 figs. Description of two new power plants, one six-cylinder and other eight-in-line, of similar design, developing 400 and 535 hp., respectively, developed by J. G. Brill Co., Philadelphia; eight-cylinder equipment described in detail; in addition to main engine, small automotive-type four-cylinder of 15 hp. is used to drive 32- to 40-volt generator, having continuous rating of 7.5 kw., for battery charging and other purposes; low-voltage circuit diagram given.

RESULTS WITH. Rail Motor Car Section. Ry. Age, vol. 87, no. 21, Nov. 23, 1929, pp. 1234-1235, 1 fig. Review of Rail Motor Car Section of Toronto Meeting of Motor Transport Division, American Railway Assn., with abstracts of reports and papers; Comparison of Ability of Rail Motor Cars Versus Steam for Operation Under Serious Snow Conditions, Lollis; rail cars attract no traffic; rail car in Canada; description of rail motor train, Blue Bird, operated daily by Chicago Great Western between Rochester and Minneapolis.

RAILROAD MECHANICAL ENGINEERING

PROGRESS IN. Progress in Railroad Mechanical Engineering. Mech. Eng., vol. 52, no. 1, Jan. 1930, pp. 57-58. Progress report submitted by Railroad Division of American Society Mechanical Engineers, dealing with following subjects: high-pressure locomotives, turbine locomotives, internal-combustion locomotives and freight cars.

RAILROAD OPERATION STATISTICS

CANADA. Railway Operating Revenues, Expenses and Other Statistics. Can. Ry. and Mar. World (Toronto), no. 383, Jan. 1930, pp. 8-11. Statistics covering all railroads, Canadian National and Canadian Pacific.

RAILROAD STATIONS

HAMILTON, ONT. Passenger Station at Hamilton for Canadian National Railways. Can. Ry. and Mar. World (Toronto), no. 383, Jan. 1930, pp. 6-7, 1 fig. Brief discussion of changes in plans for passenger station; building will measure 83 ft. from north to south, 189 ft. from east to west; general layout of building is given.

RAILROAD TIES

PRESERVATION. The Crosstie in Canada, G. P. MacLaren. Ry. Eng. and Maintenance, vol. 26, no. 1, Jan. 1930, pp. 22-23, 1 fig. Description of practices generally adopted by Canadian railways; purchase and manufacture of ties; shipping ties to treating plants; seasoning of ties; yard layout; adzing, boring and incising plant; checking of hardwood ties; advantages of boring ties before treatment; mechanical wear of ties; axe-made vs. sawn ties; substitute ties. Abstract from paper previously indexed from Eng. Jl., Dec. 1929.

RAILROADS

SNOW REMOVAL. Fighting Snow in a Real Snow Country, C. B. Brown. Ry. Eng. and Maintenance, vol. 26, no. 1, Jan. 1930, pp. 13-15, 4 figs. Account of problems encountered and methods employed in keeping Canadian National Lines open during winter; snow fences and sheds help; heavy work encountered at terminals; expense necessarily runs high. Presented before World Eng. Congress, Tokyo.

RAIN AND RAINFALL

RUN-OFF. Simple Chart Aids Forecasting of Run-Off, L. H. Parker. Elec. World, vol. 95, no. 2, Jan. 11, 1930, p. 97, 1 fig. Problem of forecasting seasonal river for hydro plants of Turlock, Calif., irrigation district has resulted in development of run-off indicator which is discussed; watershed of Tuolumne River is located partially in high altitudes of Sierra Nevada and no accurate reports of snow depth and water content are available as early in year as was desirable.

ROAD DESIGN

CURVES. A Simple Treatment of Super-Elevation, Transition Curves and Vertical Curves, H. Criswell. Surveyor (Lond.), vol. 76, no. 1977, Dec. 13, 1929, pp. 593-596, 8 figs. Curvature and super-elevation as applied to highway construction, vertical curves included; theory of transition curve; methods of effecting super-elevation; comparison of two methods; need of transition curves; need for vertical curves.

ROAD MATERIALS

BITUMINOUS. Road Tar, H. C. Head. Instn. Mun. and County Engrs.—Jl. (Lond.), vol. 56, no. 12, Dec. 10, 1929, pp. 649-660 and (discussion), 661-675. General remarks of tar as road material; early road tars; characteristics of good read tars; methods of application; hints to tar distillers; petroleum bitumens; slipperiness. Paper prepared for Pub. Works, Roads and Transport Congress 1929.

ROADS

ASPHALT. Developments in Asphalt Pavements, H. W. Skidmore. Can. Engr. (Toronto), vol. 58, no. 2, Jan. 14, 1930, pp. 129-130 and 139. Classification of soils; old roadbeds as foundations; bases; black base; thorough mixing of aggregates important. Previously indexed from Roads and Streets, July 1929.

ROLLING MILLS

BEARINGS. Report of the A.I. and S.E.E. Special Committee on Bearings and Special Study Regarding Lubrication of Anti-Friction Bearings on Mill and Crane Motors, F. D. Egan. Iron and Steel Engr., vol. 6, no. 10, Oct. 1929, (discussion) pp. 547-551. Discussion of paper published in July 1929 issue of magazine, which was given by A. J. Standing, J. L. Brown, C. C. Pecue, H. A. Winne, A. M. MacCutcheon, S. N. Roberts, and W. B. Connally.

Roll Bearings for Cold Rolling Mills, C. E. Davies. Metal Industry (Lond.), vol. 35, nos. 20 and 21, Nov. 15 and 22, 1929, pp. 459-462 and 496-497, 5 figs. Nov. 15: Conditions under which cold roll bearings are called upon to operate; British practice in cold rolling steel and non-ferrous metals; unavoidable disadvantages of roller bearings; demand for highly efficient and robust bearings; forced lubrication; design of bearings for flood lubrication; recirculating oil. Nov. 22: Trouble due to heating of bearings eliminated; exceptionally lower power consumption at highest speeds attained, taking maximum possible reduction per pass; high-speed strip mill.

EXPERIMENTAL. Cold-Rolling Mill at the Research Laboratory, Sheffield University. Engineering (Lond.), vol. 128, no. 3334, Dec. 6, 1929, pp. 729-730, 5 figs., partly on p. 728. New laboratory to be devoted to study of cold working of metal is equipped with plant equal, if not superior in capacity and efficiency, to any similar installation of experimental machinery for research work in connection with cold rolling and drawing of metals; rolls, which are 10 in. in diam. by 10 in. face, are suitable for cold rolling steel and any other metal strip up to 6 or 7 in. wide, and any thickness from 3/15 in. down to thinnest strip usually rolled; these rolls are of Hadura alloy steel.

ROOFS

CONCRETE. Steep Concrete Roof Slab Constructed of Gunite, E. R. Huber. West. Construction News, vol. 4, no. 24, Dec. 25, 1929, pp. 669-670, 2 figs. Method of guniting roof wing of Christian Science Benevolent Association Building, Arden Wood, San Francisco; slope is three vertical on two horizontal; slab is of concrete, 3 in. thick and reinforced with steel bars; all gunite was composed of one part cement to four and one half parts of graded sand.

S

SAND

MOISTURE DETERMINATION. Comparison of Methods of Determining Moisture in Sands, W. R. Johnson. Am. Concrete Inst.—Proc., vol. 25, 1929, pp. 261-270, and (discussion) 271-279, 3 figs. In applying water-cement method of proportioning concrete to actual job conditions there is need for quick, accurate method of determining moisture content in sand; number of methods being used include drying to constant weight, measurement of displacement in liquid, change in electrical resistance due to moisture, and change in specific gravity of testing liquid; advantages and disadvantages of these methods.

SEWAGE DISPOSAL

SEPARATION. Successive Separation in Sewage Disposal Systems, F. C. Temple. Surveyor (Lond.), vol. 76, nos. 1978 and 1979, Dec. 20 and 27, 1929, pp. 615-616 and 647-648. Dec. 20: General review of various methods of liquefaction and separation in one operation; mechanical separation of solids and liquids; Indian research work; macerating tank; Imhoff and Travis tanks. Dec. 27: Bio-aeration treatment; two-stage process; removal of solids from tanks; ideal installation. Paper presented at Assn. of Managers of Sewage Disposal Works conference.

SEWAGE FILTERS

ENGLAND. Sewage Trickling Filters for Bradford, England. Eng. News Rec., vol. 104, no. 3, Jan. 16, 1930, p. 104. Main features of 60-acre trickling sewage filter project; beds cover from three to eleven acres each and are terraced out in sections on hillside.

SHEET-METAL WORKING

DRAWING. Influence of Rounding Off in Drawing of Hollow Pieces of Thin Sheet (Einfluss der Abrundung beim Ziehen von Hohlkoerpern aus duennen Blechen), H. Draeger. Stahl und Eisen (Duesseldorf), vol. 49, no. 48, Nov. 28, 1929, pp. 1731-1732. Results of author's experimental investigations; influence of rounding off of drawing angle on tensile stress of workpiece was tested on brass and white-metal sheets.

STEAM

HIGH-PRESSURE. High-Pressure Steam Operation in Future Economic Practice (Der Hochdruckdampfbetrieb in der zukuenftigen Engergiewirtschaft), S. Loeffler. Ingenieur (Hague), vol. 44, no. 45, Nov. 9, 1929, pp. 223-231, and (discussion) W231-232, 16 figs. High pressure steam processes and equipment are discussed from standpoint of opinion, still prevailing sometimes, that there is no advantage in applying pressures over 35 atmos.; author states that no advantage is to be obtained when temperature is not raised accordingly; high-pressure boilers, equipment, pipe lines, and operation characteristics are given.

STEAM CONDENSERS

WATER CHLORINATION. Chlorinating Circulating Water Keeps Condenser Clean, V. M. Frost and W. F. Rippe. Power, vol. 70, no. 25 Dec. 17, 1929, pp. 961-963, 6 figs. Investigation at Kearny station for purposes of experimenting with chlorine gas for treatment of circulating water; discussion of test procedure; chart showing record of chlorination dosage and concentration; curve of heat-transfer comparison of chlorinated and unchlorinated condenser; list of pro and con items of chlorination. Abstract of paper read before Metropolitan Section, A. S. M. E., Nov. 21.

STEAM-ELECTRIC POWER PLANTS

BIRMINGHAM, ENGLAND. The Hams Hall Generating Station of the Birmingham Corporation. Engineering (Lond.), vol. 128, nos. 3336 and 3337, Dec. 20 and 27, 1929, pp. 793-796 and 829-832, 34 figs. partly on supp. plates. Dec. 20: Particulars of main turbo-alternators with maximum continuous rating of 30,000 kw. and running at speed of 1,500 r.p.m.; turbines are of single-casing type, impulse blading being used throughout. Dec. 27: Switchgear and main transformers.

FRANCE. Extensions in the Issy-Les-Moulineaux Plant of the Compagnie Parisienne de Distribution d'Electricité (Les Extensions de l'Usine d'Issy-Les-Moulineaux de la Compagnie Parisienne de Distribution d'Electricité), Galatoire-Malégarie. Génie Civil (Paris), vol. 95, no. 14, Oct. 5, 1929, pp. 314-323, 13 figs., partly on supp. plate. Extension comprises six boilers of 1,800 sq. m. and 44 kg. steam pressure superheated to 450 deg.; turbo generator of Compagnie Electrique-Mécanique of 35,000 kw. and two of 11,000 kw. of Société Générale de Construction Electriques et Mécaniques and Société Rateau; notes on boiler and turbine equipment, coal and ash handling, etc., and construction of building; double-page plate of drawing.

NEW YORK CITY. 160,000 KW. Generator Goes into Operation at the New York Edison Company's Plant, D. S. Snell. Power, vol. 70, no. 27, Dec. 31, 1929, pp. 1030-1033, 7 figs. Discussion of mechanical features of unity power factor, three-phase, 25-cycle, 1,500-r.p.m., 11,400-volt generator recently installed in 14th St. station of New York Edison Co.; procedure in shipment and handling; unusual arrangement of ventilating air-cooling system; outline of ventilating system, showing arrangement of blowers, air coolers and housings; electrical features. See also Engineering Index, 1928, p. 1744.

OPERATING PRESSURES AND TEMPERATURES. Steam Pressure and Temperatures, F. S. Clark Power, vol. 70, no. 24, Dec. 10, 1929, pp. 932-935, 6 figs. Conclusions of study made by author and associates of Stone and Webster; effect of various factors that should be considered in selecting operating pressure and temperature of central power plant; experience with 1,200-lbs. installations; fuel economy of high steam pressures and temperatures; growth in capacity of turbine-generator units since 1903; developments in higher steam temperatures; moisture in turbine exhaust for various initial steam conditions. Abstract of paper presented at World Power Conference in Tokyo.

TEST CODES. Test Code for Complete Steam-Electric Power Plants. Mech. Eng., vol. 52, no. 1, Jan. 1930. pp. 74-75. Tentative draft of code in series of twenty-one, formulated by Am. Soc. Mech. Engrs. Committee on Power Test Codes.

STEAM POWER PLANTS

DESIGN. Influence of Operating Conditions on Layout and Cost of Construction of Steam Power Plants (Einfluss der Betriebsverhaeltnisse aud die Ausgastaltung und die Ausbaukosten von Dampfkraftanlagen), J. Kock. Waerme (Berlin), vol. 52, no. 50 Dec. 14, 1929, pp. 955-960, 10 figs. Importance of obtaining reliable basic data for design of a plant; factors governing selection of power equipment and pipe lines; advantages in use of constant-pressure accumulators combined with regenerative process; peak-load service; examples are given showing advantages of constant-pressure accumulators.

HIGH-PRESSURE. The Future of Higher Steam Pressures in Steam Electric Generating Stations, I. E. Moultrop. Am. Inst. Elec. Engrs.—Jl., vol. 48, no. 12, Dec. 1929, pp. 875-877. See also Power, vol. 70, no. 27, Dec. 31, 1929, pp. 1035-1036. Construction and operating experience has shown that large part of theoretically possible gains in efficiency due to higher steam pressures has been obtained in practice; future possibilities of higher pressures are described.

STEAM PIPE LINES

FRICTION OF. Friction of Water Vapour in Pipe Lines and Connections (Du frottement de la vapeur d'eau dans les tuyaux et ajustages), J. Rey. Chaleur et Industrie (Paris), vol. 10, no. 115, Nov. 1929, pp. 519-525. Theoretical mathematical analysis and application of equations developed on superheated and saturated steam, water vapor, etc.; comparison of experimental results obtained by Ledoux, Auscher and author; tabulation of coefficients of friction.

WATER SEPARATORS. Calculation of Water Separators for Steam Pipe Lines (Berechnung der Wasserabscheider fuer Dampfleitungen), E. Kaschny. Waerme (Berlin), vol. 52, no. 44, Nov. 2, 1929, pp. 824-829, 3 figs. Table is given which can be used to determine diameter of water separator; points to be observed in calculation of wall thickness; use of welded separator for high pressures and temperatures should be avoided.

STEAM TURBINES

DESIGN. General Trend of Steam Turbine Development, E. L. Robinson. Blast Furnace and Steel Plant, vol. 17, no. 12, Dec. 1929, pp. 1825-1829, 8 figs. Results that have been attained through improvements in steam utilization in production of power by steam turbine are outlined; fuel savings striking; size of units; double flow units; regenerative cycle; economic rating; higher temperatures; resuperheated; higher pressures; compound units; economic indications;

heat rates; auxiliary apparatus. Paper presented before World Power Conference at Tokyo.

Limits of Economy, Pressure, Temperature, and Output in Turbine Design (Grenzen der Wirtschaftlichkeit, des Druckes, der Temperatur und der Leistungen im Turbinenbau). Brennstoff und Waermewirtschaft (Halle), vol. 11, no. 15, Aug. 1, 1929, pp. 266-270, 7 figs. Curves showing progress in heat consuming from 1905 and estimated up to 1935; efficient coefficients and heat consumption per kw-hr. of ideal and actual installation; 6,000 kw. for 50 atmos. and 20 atmos. back pressure at 3,000 r.p.m. and 1,060 to 1,500 hp. Diesel engine installations are discussed and compared.

STEEL

AIRCRAFT. Steels for Automobiles and Aeroplanes, W. H. Hatfield. Automobile Engr. (Lond.), vol. 19, no. 261, Nov. 1929, pp. 464-474, 1 fig. Review of steels available for use in manufacture of automobiles and airplanes; manufacture of steel used in automobile and airplane production reviewed; ordinary carbon and alloy steels; valve steels; spring steels and springs; steels for chassis frames and bodies; tubes; nitriding steels and nitralloy; rustless steels; rustless sheets and strips; most suitable steel for each part is recommended in five-page table.

ALLOY. New Fields for Alloy Steels Opened by More Exacting Demands, C. E. MacQuigg. Iron Trade Rev., vol. 85, no. 25, Dec. 19, 1929, pp. 1559-1561. Present adaptations of alloy steels and how they have solved multitude of problems where question of physical properties was paramount; in 1928 over 6 per cent of entire production of steel in this country was alloy steel, including copper-bearing steel; bridges, rails, airplanes, and cutting tools constitute four typical applications. Abstract of paper presented before Am. Inst. Min. and Met. Engrs.

Types of American Alloy Steels. E. F. Cone. Iron Age, vol. 124, no. 26, Dec. 26, 1929, pp. 1735. Results of canvass of 1928 production to determine how much alloy-steel of different types was made in United States; copper and chromium steels lead in ingots; molybdenum alloy steels; many special steels are made; features of alloy cast steels; chromium leads among alloying metals; some of industrial uses.

ELECTRIC-PROCESS. Production of Electric Steel for Castings, G. Batty. West. Mach. World, vol. 20, no. 12, Dec. 1929, pp. 451-454, 1 fig. Two sharply differentiated methods of procedure are discussed as being applicable to production of both straight carbon and alloy steels for castings; it is affirmed that, in ordinary conditions that pertain in steel foundry, where scrap contamined by adherent sand is used as part of charge, definite boil of bath must be secured, with some inevitable elimination of carbon, in order that finely divided non-metallics be cleansed from bath.

TEMPERATURE EFFECT. Steam Piping of the New Central Plant of C. P. D. E. and Properties of Steel at High Temperatures (La tuyauterie de vapeur de la nouvelle Centrale de la C. P. D. E., etc.), Dessus, Leconte, and J. Galibourg. Société des Ingénieurs Civils de France—Mémoires et Compte-Rendu des Travaux (Paris), vol. 82, nos. 5/6, May, June, 1929, pp. 479-538, 16 figs. Description of high-pressure steam electric plant of Issy-les-Moulineaux of Compagnie Parisienne de Distribution d'Electricité with special reference to tests showing behaviour and strength of steel of high-pressure steam pipe.

STREET TRAFFIC CONTROL

GREAT BRITAIN. Control of Road Traffic. Modern Transport (Lond.), vol. 22, nos. 559, 560 and 562, Nov. 30, 1929, p. 16, Dec. 7, 1929, pp. 24 and 28, Dec. 21, 1929, pp. 23-24. and vol. 23, no. 564, Jan. 4, 1930, pp. 16-17, 7 figs. Problem of traffic drifts; formulation of definite route plan; restricting routes; coercing drivers; one-way street and advantages of system; underlying principles; system in operation; lessons in driving; acquiring bad driving habits; proposed "highway code"; transporting masses; road passenger traffic control; increased travelling facilities; calculating service requirements; unified control necessary.

STRUCTURAL STEEL

WELDING. Electrically Welded Steel Structures (Elektrisch geschweisste Eisenkonstruktionen), E. Rosenberg. V.D.I.Zeit. (Berlin), vol. 73, no. 59, Dec. 7, 1929, pp. 1742-1746, 24 figs. Preliminary tests are described for welding of steel railroad bridge, based on which basic calculations are recommended; suggestions for simplification of design with regard to advantages of electric welding; reliability of welded joints; description of electrically welded roof of 100m. long and 12 m. wide pavilion.

FABRICATION. Fabricating and Handling Equipment. Iron Age, vol. 125, no. 2, Jan. 9, 1930, pp. 151-154 and supp. p. opposite p. 167, 6 figs. Description of unusual materials-handling methods employed in fabricating plant of R. C. Mahon Co., Detroit, whereby structural steel fabricator makes savings and gets output of 17.9 tons monthly per man; steel handled on gravity and monorail conveyors; handling steel during punching; turn-over table for drilling H-columns.

T

TEMPERATURE

CONTROL. Time-Cycle Control Units. Am. Mach., vol. 71, no. 26, Dec. 1929, p. 1043, 3 figs. Photographs are given showing examples of what may be accomplished in governing of operations having repetitive timing.

HIGH, MEASUREMENT OF. The Accurate Measurement of High Temperature, W. E. Forsythe. Am. Ceramic Soc.—Jl., vol. 12, no. 12, Dec. 1929, pp. 780-813, 9 figs. Standard temperature scale defined; methods of measuring temperature from very low values to highest obtainable are described; use of thermocouples discussed; different form of optical pyrometers discussed and advantages and disadvantages of types pointed out; use of absorbing screens in extending scale of optical pyrometer outlined.

TOOL STEEL

HARDENING. Inherent Hardenability Characteristics of Tool Steel, B. F. Shepherd. Am. Soc. Steel Treating—Trans., vol. 17, no. 1, Jan. 1930, pp. 90-110 and (discussion) 110, 15 figs. Paper discusses variations in hardening properties encountered in carbon tool steels; pointing out that among steels of practically identical composition, wide variations in depth of hardness penetration are possible; it shows by use of spcial test, magnitude of these variations between heats from same manufacturer and between different manufacturers.

TOOLS

ELECTRIC. Electric Tools (Elektrowerkzeuge), H. Schoenberr. V.D.I. Zeit. (Berlin) vol. 73, no. 47, Nov. 23, 1929, pp. 1681-1684, 14 figs. Notes on design and construction of electric tools, taking as example development in design of hand drilling machines; discussion of machines and motors for d.c. and a.c. operation.

TUBES

STEEL, CALORIZING. Calorizing Tubes to Resist Corrosion, B. J. Sayles. Iron Age, vol. 124, Dec. 5, 1929, pp. 1510-1512, 4 figs. Methods employed in calorizing seamless-steel tubes for oil stills; calorizing serves dual purpose on cracking-still tubes rendering interior immune to sulphur corrosion while exterior is protected from oxidation; rotating retort contains steel tubes, granular aluminum, and hydrogen atmosphere.

V

VISCOSIMETERS

HOT-WIRE. Two Hot-Wire Viscosimeters, E. G. Richardson. Jl. of Sci. Instruments (Lond.), vol. 6, no. 11, Nov. 1929, pp. 337-343, 6 figs. Instruments based on convective cooling of electrically heated wire, for giving distribution of velocity across liquid, flowing in cylindrical tube and flowing in annular space between two concentric cylinders, one rotating and other at rest; examples of their use are given.

W

WASTE ELIMINATION

ELECTRIC MANUFACTURING PLANTS. Waste Reduction at Westingbouse, C. B. Auel. Am. Mach., vol. 71, no. 25, Dec. 19, 1929, pp. 1011-1012, 4 figs. Methods employed by Westinghouse Electric and Manufacturing Co. for elimination of waste are discussed; company saves $50,000 annually through intelligent handling of plant educational campaign directed against waste.

WATER METERS

TESTING. Methods of Testing Large Water Meters, R. E. Ferguson. Can. Engr. (Toronto), vol. 57, no. 27, Dec. 31, 1929, pp. 855-856, 3 figs. Testing with Freeman nozzle; field tests; installation of 8-in. meter for testing; testing for loss of pressure; effect of setting on testing 4-in. compound meter in field. Article previously indexed from Am. City, Oct. 1929.

WATER PIPE LINES

CORROSION. The Durability of Distribution Systems, H. Y. Carson. Am. Water Works Assn.—Jl., vol. 21, no. 12, Dec. 1929, pp. 1675-1683, and (discussion) 1683-1686, 6 figs. Effect of soil and water corrosion on uncoated and cement-lined cast-iron and wrought-iron pipe; durability of cast iron; physical and chemical aspects; rust on cast iron; removing incrustations.

WATER SUPPLY

CANADA. St. Lawrence and Southern Hudson Bay Drainage, Ontario and Quebec. Dept. of Interior, Canada—Water Resource Paper, no. 58, 1929, 390 pp. Report of Dominion Water Power and Reclamation Service, Department of Ottawa presenting results of hydrometric investigations in Ontario and Quebec, arranged under headings of main and tributary basins.

WATER WHEELS

PELTON. Unsteady Jet Flow from Pelton Wheel Nozzles, R. H. Evans. Engineering (Lond.), vol. 28, no. 3333, Nov. 29, 1929, p. 701, 2 figs. Experiments were carried out on 7-hp. Pelton wheel, 14½ in. diam. at Leeds University; results show that it is very desirable to fit series of guides behind needle, parallel to axis, so as to eliminate any whirl in water and reduce amount of turbulence near jet.

WATER WORKS

TORONTO. The New Toronto Filtration Plant and Other Extensions, W. Gore. Am. Water Works Assn.—Jl., vol. 21, no. 12, Dec. 1929, pp. 1620-1628, 1 fig. Extensions to be carried out provide for additional daily supply of 75,000,000 gals.; layout of extensions; diagram showing inter-connection of present and new water-supply systems; new 200 m.g.d. filtration plant; filtered water tunnel will be 7 ft. in diam. or length of 30,993 ft.; new service reservoir will contain 50,000,000 gals.

WELDING

MACHINERY. *See Machinery.*

RODS FOR. Progress in Use of High-Grade Welding Rods (Fortschritte in der Verwendung hochwertiger Schweissdraehte), F. Sommer. V.D.I. Zeit. (Berlin), vol. 73, no. 49, Dec. 7, 1929, pp. 1764-1768, 5 figs. After description of welding rods in general use, some new types are described; special mention is also made of new rods for corrosion and heat-resisting welds and wires for autogenous welding.

STRUCTURAL STEEL. *See Structural Steel.*

TECHNIQUE OF. Welding Technology (Schweisstechnik), Fuechsel. V.D.I. Zeit. (Berlin), vol. 73, no. 49, Dec. 7, 1929, pp. 1725-1726 and 9 figs. partly on supp. plate. Brief notes on applications and limitations of welding, introductory to series of article in same journal on welding practice, each of which is indexed separately.

WOOD CONSTRUCTION

TEST OF. Wood as a Construction Material (Holz als Bauonstruktionsmittel), K. Schaechterle. V. D. I. Zeit. (Berlin), vol. 73, no. 50, Dec. 14, 1929, pp. 1771-1780, 71 figs. Paper reports results of test made by railroad administrations of Germany in cooperation with Stuttgart Institute of Technology to determine strength of many types of wood joints; principles of design of wood trusses; review of use of wood in construction of city auditorium of Muenster, 18 m. radio towers near Koenigsberg, train-sheds of Stuttgart railroad station; centring of concrete bridge arches up to 140 m. span, etc.

WOOD

CREOSOTED. Treated Timber in Dock and Bridge Construction, R. J. Middleton and P. E. Philip. Eng. News-Rec., vol. 104, no. 5, Jan. 30, 1930, pp. 185-186. Abstracts of two papers on use of creosoted Douglas fir piles and timber for dock, trestle and truss-bridge construction in Western States and in Canada, presented at annual meeting of American Wood Preservers Association; fire hazards in creosoted dock construction; construction of Fraser River timber-bridge, at Quesnel, B.C., consisting of Howe-truss spans, three 180 ft. and two 150 ft. long.

WORLD ENGINEERING CONGRESS

TOKYO, JAPAN. The World Engineering Congress in Japan. Engineering (Lond.), vol. 128, nos. 3336 and 3337, Dec. 20 and 27, 1929, pp. 820-82 and 853-855. Dec. 20: Summaries covering number of miscellaneous subjects; production and use of coal; Diesel-engine problems; machine tools; agricultural engineering; electrical engineering; telegraphy, telephony, etc.; illuminating engineering; endurance properties of metals; general metallurgy. Dec. 27: Aeronautics; steam plants; turbo-compressors and pumps; hydro-electric installations.

The World Engineering Congress in Japan. Engineer (Lond.), vol. 149, no. 3861, Jan. 10, 1930, pp. 50-51. Mention is made of two papers; Railway Transportation of Perishable Freight, by C. A. Richardson and E. T. McCormick, and Collecting Snow Plow, K. Hashima; credit for longest paper will probably go to 35,000-word contribution from F. L. Estep, dealing with steel industry of United States; brief reviews of following papers: Public Health Engineering, by C. W. Fuller, P. Eddy and E. B. Phelps; Earthquake and Building Construction, K. Mashima; Progress of Illuminating Engineering in Japan, S. Seki. (Continuation of serial.)

WROUGHT IRON

MANUFACTURE. Comparative Properties of Wrought Iron Made by Hand Puddling and by the Aston Process, H. S. Rawdon and O. A. Knight. U. S. Bur. of Standards—Jl. of Research, vol. 3, no. 6, Dec. 1929, pp. 953-992, 40 figs. Radically new process, recently developed is now coming into commercial use, in which pig iron, which has been refined in Bessemer converter, is poured into molten slag so as to produce intimate mingling made by hand puddling forms the subject of this report; test results failed to show any marked difference in products of two processes; new product appears to have all of essential properties usually connoted by name, wrought iron.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostat copies (white printing on a black background) of the articles listed in this section or others on engineering subjects can be obtained from the Engineering Societies Library at a cost of 25c. per page.

When ordering identify the article by giving: the author; the title of the article; the name of the periodical in which it appeared; and the volume and page numbers. A remittance of 25c. a page should accompany the order.

The print's size is limited to 11 by 14 inches, but where possible, two pages up to 7 by 9 inches in size will be photographed on one print, larger magazines require a print per page.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

ACETYLENE GENERATORS

Tests on. Seventh Session of the German Acetylene Commission (Siebente Sitzung des Deutschen Acetylenausschusses), E. Sauerbrei. Autogene-Metallbearbeitung (Halle), vol. 23, no. 1, Jan. 1, 1930, pp. 5-9. Session in Berlin in 1929, reported on removal of dangerous mixtures in acetylene generators; testing of high- pressure water containers; testing methods for chemical purifying compounds, small generator of 2 kg. filling capacity, etc.

AERIAL TRANSPORTATION

Financing. Western Air Issues Statement for 1929. Aviation, vol. 28, no. 6, Feb. 8, 1930, p. 269. Consolidated operating statement of Western Air Express Inc., and Western Air Express Corp., of Dec. 31, 1929, is given; during 1929 company increased its daily schedule mileage from 2,400 to 7,200; passenger traffic and passenger revenue increased almost fourfold during year.

Government Subsidies. State and Aerial Transportation Companies (Lo stato e le societa di transporti aeri), C. Rocca. Rivista Aeronautica (Rome), vol. 62, no. 12, Dec. 1929, pp. 494-511. General discussion of policy of subventions to private aviation companies; subvention policies of Italy, France, and other states; system of cooperation between state and private aerial transportation companies.

United States. Science in Relation to Regulating and Promoting Civil Aviation, W. P. MacCracken. Roy. Aeronautical Soc.—Jl., vol. 33, no. 228, Dec. 1929, pp. 1139-1166, 18 figs. Aerial transportation discussed from point of view of what has taken place in United States during past few years; results of Air Commerce Act of 1926; regulations by Department of Commerce; advantages of vast distances in United States to aeronautical developments; attitude of public; student pilots' permit; increase in air mail; accident analysis; aerodynamic loads and spinning.

AERODYNAMICS

Air Flow. Air Flow Through Suction Valve of Conical Seat, K. Tanaka. Tokyo Imperial Univ.—Report of Aeronautical Research Inst. (Tokyo), vol. 4, no. 51, Nov. 1929, pp. 361-424, 54 figs. partly on supp. plates. Analytical investigation of air flow through suction valve of conical seat; four flow configurations investigated here analytically assuming them as potential flow and their motions to be two-dimensional; some modified flow states which were derived from variations of profiles of valve and seat were also solved analytically; results compared with corresponding experimental results obtained in Part 1. (In English.)

AERONAUTICAL RESEARCH

Germany. Jahrbuch 1929 de. Deutschen Versuchsanstalt fuer Luftfahrt, E. V., Berlin-Adlershof, edited by W. Hoff, Ottfried V. Dewitz, and G. Madelung. Munich and Berlin: R. Oldenbourg, 42 marks. Reviewed in Engineering (Lond.), vol. 129, no. 3341, Jan. 24, 1930, pp. 100-101. Year book, an illustrated quarto volume, reviews in two divisions activities of Adlershof station during year ending March 1929; first short division contains general information and abstracts of over 200 papers and reports on test work done; second division contains 39 papers, with their discussions.

AERONAUTICS

United States. Remarkable Development in the South of Aeronautical Activities, C. E. Williams. Mfrs. Rec., vol. 97, no. 3, Jan. 16, 1930, pp. 49-52, 9 figs. Account of progress in development of all phases of aeronautical activities in Southern States covering airplane manufacture, airport construction, airway establishment.

AGRICULTURAL MACHINERY INDUSTRY

Denmark. Danish Market for Agricultural Implements, Machinery, and Tools, H. Sorensen. Commerce Reports, no. 2, Jan. 13, 1930, pp. 106-107. Current market conditions; Danish agricultural implements industry; harvesting machinery; market for grain drills and threshers; plows, harrows, and cultivators sold in Denmark; hay rakes and land rollers; potato planters and diggers; use of tractors in agriculture; dairy and creamery machinery and equipment; poultry equipment; distribution and credit conditions.

Exports and Imports. American Industrial Machinery Exports Fluctuate, L. J. Cochrane. Commerce Reports, no. 3, Jan. 20, 1930, pp. 173-175, 2 figs. Gains and losses in principal classes of machinery; metal-working, oil well, and refinery machinery, mining and quarrying machinery and pumping equipment; power generating, construction, conveying, and textile machinery.

AIRPLANE BRAKES

Wheel, Bendix-Perrot. Aero Wheel-Brakes, Hall. Flight (Lond.), vol. 21, no. 48, Nov. 29, 1929, p. 1266; see also Aeroplane, vol. 337, no. 22, Nov. 27, 1929, pp. 1236, 1238, 1 fig. Description of Bendix-Perrot wheel brake and its component parts; how torque is to be transmitted to fuselage; wide wheel tread is desirable; reduction in landing run of machines fitted with modern Bendix-Perrot brake was 50 per cent; fitting of brakes has effect of assisting ground crew; it permits use of tail wheel, instead of skid; servo control necessary. Abstract of paper read before Westland Aircraft Soc.

AIRPLANE DESIGN

1930 Trend. 1930 Airplane Design. Aviation, vol. 28, no. 7, Feb. 15, 1930, pp. 331-340. Opinions of 1930 trend in airplane design are given by airplane builders; bigger flying boats and research on aerodynamic novelties, variegated wing loadings, duralumin triumphant, L. C. Milburn; evolution along standard lines and restricted landing speeds, R. B. Beisel; cantilever wings and lower aspects ratios, H. C. Richardson; more variable-lift devices and cantilever wings, better landing gears, T. P. Wright; size depends on demand, wood and metal remain in balance, A. A. Gassner. (To be continued).

AIRPLANE ENGINES

Design. The Engine Builders Look at 1930. Aviation, vol. 28, no. 7, Feb. 15, 1930, pp. 341-348. Symposium of engine design tendencies by powerplant engineers and manufacturers; better accessibility and improved standard fuels, skeptical on Diesel, G. J. Mead; More air-cooled Vees, better mountings, more coherent installation, and Diesels sometime, but not yet, P. B. Taylor; relation between engine forms and fuselage form, better fuels not to be counted on, R. Insley; better accessories and better reliability, better cooperation of airplane and engine designer, H. M. Mullinnix; other discussions. (To be continued.)

Diesel. Junkers Develops Diesel Engine for Aircraft Use, E. P. A. Heinze. Automotive Industries, vol. 62, no. 4, Jan. 25, 1930, pp. 121-122, 3 figs. Description of Junkers Diesel aircraft engine which is of two-stroke piston type and maintains 650 hp. up to altitude of 11,400 ft.; weight is 2.6 lbs. per hp. and piston speed 2,160 ft. p.m.

Lubrication. Aircraft Engine Operation. Lubrication, vol. 15, no. 12, Dec. 1929, pp. 133-144, 18 figs. Requirements of operation of average airplane engine; choice of proper grades of oil to meet operating conditions; cooling and protection of lubrication while in air; advantages of dry sump lubrication; engine and bearing construction; oiling diagrams of Packard 12-cylinder V, Wright Whirlwind, Curtiss Challenger, Curtiss Conqueror, and Kinner aircraft engines; bearings and gear assembly in Pratt and Whitney Wasp, Le Blond 60 Model 5AD, Maybach, Continental and Cirrus Mark III engine; U. S. Government aircraft oil specifications; auxiliary lubrication.

The Lubrication of Aircraft Engines, F. A. Foord. Roy. Aeronautical Soc.—Jl. (Lond.), vol. 33, no. 228, Dec. 1929, pp. 1089-1110 and (discussion) 1110-1132, 13 figs. Ideal characteristics of lubricant for aircraft-engine; adoption of low-viscosity oils not practicable at present; to obtain best viscosity-temperature curve for all conditions it is necessary to blend oils from different crudes; lubrication system of Bristol Jupiter, Armstrong-Siddeley Jaguar, Rolls-Royce F, Napier Lion, and A.D.C. Hermes engines, as well as combined oil cooler and cleaner; Vickers Potts are described.

Maintenance and Repair. Maintenance of Air-Cooled Engines in Commercial Operation, E. Hubbard and L. S. Hobbs. Soc. Automotive Engrs.—Jl., vol. 26, no. 1, Jan. 1930, pp. 91-94. Principles of maintaining engines of fleet of airplanes as determined for Boeing passenger and mail service operating from Chicago to and along Pacific Coast; more difficult to form basis for judgment of fuels than of lubricating oils; cost weighed against possible damage from inferior fuel; effect on economy of temperature controls; provision for oil cooling in which regulation is effected with control of engine temperature; present conditions as to ice formation in carburetor.

Reduction Gears. Speed Reducer (Lorraine Untersetzungsgetriebe fuer Flugmotore). Automobiltechnische Zeit. (Berlin), vol. 32, no. 10, Oct. 10, 1929, pp. 630-631, 3 figs. Lorraine Co., of Argenteuil, has built speed reducer for heavy aircraft which reduces engine speed 1.545 to 1. for engine speed of 1,900 r.p.m.; mechanism is simple, consisting primarily of propeller shaft resting on two roller bearings and bronze thrust bearing; connection to propeller shaft is made by two planetary gears; mechanism is lubricated by special forced-feed system.

Salmson. A New Salmson Engine. Aviation, vol. 28, no. 5, Feb. 1, 1930, pp. 209-210. Description of new 500-hp. 18-cylinder double radial air-cooled engine Model Mk. 18 Ab; cylinders arranged in double row without stagger engine thus having same frontal area that a 9-cylinder engine of same bore and stroke has; pistons, valves, rocker gear interchangeable with corresponding parts of Model 9 Ab.230-hp., 9 Cm 260-hp., and 18 Cmb 520-hp. engines; starting by means of compressed air; weight 992 lbs.

AIRPLANE FUELS

Requirements for. Fuels and Dopes for Aircraft Engines, A. E. Dunstan. Aircraft Eng. (Lond.), vol. 1, no. 10, Dec. 1929, pp. 344-346. Review of requirements for airplane fuels and progress made in past six years towards meeting them; cracked material essential; volatility; investigation of certain additional degree of volatility in middle range which is necessary even though engine itself is hotter than average motor-car engine; physical and chemical stability necessary; question of layering; anti-knock value; increased efficiency attained by increasing compression ratios; evaluation of anti-knock quality; effect of changed conditions; best hydrocarbons; accurate testing method.

AIRPLANE MATERIALS

Metals. The Development of Metals for Aircraft Purposes, Rosenhain. Aeroplane (Lond.), vol. 37, no. 26, Dec. 25, 1929 (Aeronatutical Eng. Supp.), pp. 1434 and (discussion) 1436. General trend in development of metals for airplane is given with estimation of present direction and future tendencies; various steels, aluminum alloys, and very light alloys such as those based on magnesium are considered in regard to strength-weight ratio, stiffness, resistance to fatigue, to wear, and to corrosion, strength at high temperatures, and ease of working. Abstract of paper presented before Roy. Aeronautical Soc.

Rubber. Conquest of the Air—Rubber in Airplane Construction, C. Saurer. India Rubber World, vol. 81, no. 4, Jan. 1, 1930, pp. 57-58, 5 figs. Application of rubber to automotive industry; discussion of rubber in airplane shock absorbers, and other uses in airplane construction. Paper read before Am. Soc. Mech. Engrs.

Wood. Ash, White (Aircraft Use). U. S. Navy Dept. Specification No. 39A2, Dec. 2, 1929, 4 pp. General specifications covering following; grade, material and workmanship, general and detail requirements, method of inspection, tests, packing and marking. Bibliography.

AIRPLANE PROPELLERS

VARIABLE PITCH. Ratier Metal Propeller of Variable Pitch in Flight (L'hélice métallique Ratier à pas variable en vol), P. Leglise. Aéronautique (Paris), vol. 11, no. 127, Dec. 1929, pp. 407-411, 12 figs. Difficulties of designing propellers with pitch variable in flight; formulae for calculating forces acting at blade root developed; couple perpendicular to plane of bearing which is absorbed by action of balls; value of total torque found to be very high; Ratier company developed helicoidal thrust bearing; two- and three-bladed wood propellers; details of Ratier propellers; mechanisms for controlling variations in pitch.

AIRPLANE STRUTS

AERODYNAMIC THEORY. Aerodynamic Theory and Test of Strut Forms, R. H. Smith. Nat. Advisory Committee for Aeronautics, Report no. 335, 1929, 41 pp., 40 figs. Results of direct-problem study of finding flow boundaries, in uniform stream, of few balanced combinations of sources and sinks whose types of distribution are predetermined, and then of finding theoretical pressure on boundary surfaces; this considered as strut sequel to Fuhrmann's investigation, one being study in two dimensions, other in three; mathematics for equations of two-dimensional potential flow.

AIRPLANE WINGS

DESIGN. Wings—A Coordinated System of Basic Design, R. U. Upson. Soc. Automotive Engrs.—Jl., vol. 26, no. 1. Jan. 1930, pp. 15-30 and (discussion) 30 and 37, 13 figs. Practical coordination of existing data to furnish improved method for establishing best general proportions of wings; low-wing monoplane in power flight; summary of wing variables; effect of reduction in fixed drag; low-wing monoplane and rectangular-wing biplane in gliding flight; wind-tunnel research; flight data; effect of plan form on induced drag and lift curve; generalized equations for airfoil sections; computation of parasite drag.

PRESSURE DISTRIBUTION. Wind Tunnel Pressure Distribution Tests on Series of Biplane Wing Models, M. Knight and R. W. Noyes. Nat. Advisory Committee for Aeronautics—Tech. Notes No. 330, Dec. 1929, 6 pp., 36 figs. on supp. plates. Information is given on changes in forces on each wing of biplane cellule for various combinations of stagger and gap, stagger and sweepback, stagger and decalage, and gap and decalage; since each test was carried up to 90 deg. angle of attack, results may be use, in study of stalled flight and of spinning as well as in structural design of biplane wings.

AIRPLANES

EXPERIMENTAL. The Tanager and the Dub Pilot, E. P. Warner. Aviation, vol. 28, no. 6, Feb. 8, 1930, pp. 249-252, 4 figs. Discussion of Tanager as symbol of trend of times and one of most foremost fruits of Guggenheim Safe Aircraft Competition; qualities of safe airplane are summarized as author rates it; two auxiliary controls for trailing-edge flaps and adjustable stabilizer; flap controls serve to reduce minimum speed; landing gear of immense ruggedness; very soft shock absorber system; possibilities of beginner pilot flying Tanager in air safely and landing.

FIRE PREVENTION. Combatting Airplane Fires, H. Brunat. Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 550, Jan. 1930, 18 pp., 14 figs. Measures and precautions recommended for reducing danger of fire; examples are given of study of fires and question of how fires break out and spread in each particular case; suggestions made to engineer in designing and building airplane, to mechanics in choosing material, and to pilot in flight which will greatly reduce danger of fire. From Comité Français de Propagande Aéronautique, Paris.

PASSENGER (COMMERCIAL). Sunbeam Cabin Biplane. Aviation, vol. 28, no. 5, Feb. 1, 1930, pp. 208. Details of new Sunbeam Model C-1 biplane produced by Commercial Aircraft Co., at Los Angeles Metropolitan Airport, Van Nuys, Calif., which has Wright J-6 300-hp. engine; four passengers seated in cabin; open cockpit for pilot and passenger; aerotruss brazed-steel wing ribs throughout wings and ailerons; fireproof treating of fabric covering; wing span 34 ft.; 1,000 lbs. payload.

PASSENGER (GENERAL DEVELOPMENT CO.) A Giant American Monoplane. Flight (Lond.), vol. 21, no. 1094, Dec. 13, 1929, pp. 1298-1301, 2 figs. Description of Christmas monoplane designed to carry 160 passengers; wing span 262 ft.; power 8,800 hp.; four planes to be built by General Development Co., at once; two fuselages are girders, constructed of steel tubing and covered with plywood; in nose of each is unit of four 1,100-hp separate engines symmetrically arranged around propeller shaft; passenger accommodation arranged in 14 compartments each seating from 4 to 6 people in leading edge; top speed 145 m.p.h.; cruising range 800 miles.

PASSENGER (HODKINSON). The Hodkinson Transport. Aviation, vol. 28, no. 5, Feb. 1, 1930, pp. 208-209, 1 fig. Description of eight-place triple-engined transport sesquiplane powered with three Curtiss Challengers engines, both outboard engine nacelles being mounted directly on upper surface of wings; wood wings; steel-tube fuselage; upper wing span 56 ft.; 1,380 lbs. payload.

PASSENGER (JUNKERS). Giant Junkers Airplane G 38 (Das Junkers-Grosslandflugzeug G 38). V.D.I. Zeit. (Berlin), vol. 74, no. 1, Jan. 4, 1930, pp. 2-6, 10 figs. Detailed description of structural features and aviation equipment of tri-motored monoplane having wing span of 44 m., length of 23 m. and maximum height of 6.5 m., weighing 13 tons, capable of lifting 11 tons; engines develop 2,400 hp., speed is 170km. per hr., range 3,400 km.; in its design this airplane resembles original Nurfluegel type patented by Junkers in 1910.

RADIO APPARATUS. Air Transport Communication, R. L. Jones and F. M. Ryan. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 1, Jan. 1930, pp. 50-54, 33 figs. Design of radio-telephone system for transport planes in flight requires quantitative knowledge of transmission conditions encountered in plane-to-ground communication; experimental investigations of these conditions over available frequency range has been carried out and results are given; complete aircraft radio-telephone system designed for use of air transport lines and airplane radio receiver designed for reception of government radio aids to air navigation are described.

TRAINING (AIRCRAFT BUILDERS). Student Prince Training Plane. Aviation, vol. 28, no. 5, Feb. 1, 1930, p. 210, 1 fig. Description of new training biplanes Student Prince manufactured by Aircraft Builders, Inc., Portland, Ore.; positive absence of bounce in landing; upper wing span 30 ft. 3 in.; Cirrus Mark 111 4-cylinder in-line engine, with streamline cowling.

AIRPORTS

PLANNING. Comments on Prize-Winning Designs in the Lehigh Airports Competition, A. Black. Am. City, vol. 42, no. 1, Jan. 1930, pp. 101-104, 3 figs. General conditions of contest; comments on winners of four highest awards.

The Lehigh Airports Competition, C. F. McReynolds. Aviation, vol. 28, no. 3, Jan. 18, 1930, pp. 104-107, 2 figs. Description of quadrant airport designed by A. C. Zimmerman and H. Harrison which won first prize; design provides day and night operations in any wind direction; star loading point provides three-storey arrangement with passenger handling on ground floor.

AIRSHIPS

R.100. The Airship R.100, R. B. Brigham. Flight (Lond.), vol. 21, no. 1096, Dec. 27, 1929, pp. 1352-1354, 1 fig. Design and construction of airship R. 100 is given; 16 main longitudinals and 16 transverse frames; making of spiral strip duralumin tube girders, by specially designed machine; building up of upper main bracing; adjustments of structure; method of mooring; inspection for corrosion.

R.101. A Comparison of England's Two New Airships. Aviation, vol. 28, no. 2, Jan. 11, 1930, pp. 65-68, 5 figs. Airship R.101 is compared with R.100 in regard to structural differences; methods of attaching envelope; R.100 not fitted with reefing girders; passenger accommodation is located in one bay of ship and is on three floors, whereas that of R.101 is in two bays; another difference in favour of R.101 is that its evaporative cooling system makes equivalent heat of 1,000 hp. in one radiator available to warm air.

AIRWAYS

RADIO BEACONS. Course-Shift Indicator for Double-Modulation Type Radio-beacons, H. Diamond and F. W. Dunmore. Aero Digest ,vol. 15, no. 6, Dec. 1929, pp. 168 and 170. Course-shift indicating instrument developed to further increase reliability of visual directive radio-beacon system developed by Bureau of Standards; instrument indicates to station operator whether given course as laid out in space remains unvarying during given time of operation and greatly facilitates check of beacon calibration.

ALLOY STEEL

NOTES ON. Notes on Alloy Steels, J. H. Andrew. Foundry Trade Jl. (Lond.), vol. 41, no. 694, Dec. 5, 1929, pp. 411-412. Some lesser-known facts concerning alloy steels are discussed; advantages associated with hot work; constitution and mechanical strength; formation of carbides; choice of alloy steels; depth hardness; temper brittleness; quenching temperatures; influence of rate of cooling on fracture. Abstract of paper presented before Instn. of Engrs. and Shipbldrs. in Scotland.

ALLOY STEEL CASTINGS

PROPERTIES OF. Compares Properties of Various Alloy Steel Castings, D. Zuege. Foundry, vol. 58, nos. 1 and 2, Jan. 1, pp. 100-103 and Jan. 15, 1930, pp. 71-74, 5 figs. Jan. 1: Data relating to alloy steels adapted to foundry use; classification; characteristic effects of chromium, nickel, manganese, vanadium, and molybdenum upon structure of steel; comparison of chrome-nickel and manganese carbon steel. Jan. 15: Physical characteristics for casting purposes compared; reactions of different steels for various heat treatments; agreement between structure and properties.

ANTIMONY MINES AND MINING

CHINA. Report on the Pan-Hsi Antimony Mine, Yi-Yang, Hunan, C. C. Tien, S. Y. Yuo and H. C. Wang. Far Eastern Rev. (Shanghai), vol. 25, no. 9, Sept. 1929, pp. 411-414, 4 figs. One of most important antimony mines in Hunan, situated about 48 mi. southwest of city of Yi-Yang Hsien; topography and geology; ore deposit; mining; smelting; mechanical equipment; transportation; tabular data on production and operating expenses.

ARCHES, CONCRETE

CONSTRUCTION STRESSES. The Behaviour of a Reinforced Concrete Arch during Construction, S. B. Slack. Am. Soc. Civil Engr.—Proc., vol. 56, no. 2, Feb. 1930, pp. 365-368. Discussion by H. J. Gilky, and A. H. Fuller, of paper indexed from issue of Nov. 1929.

ASBESTOS DEPOSITS

RUSSIA. Asbestos Deposits in Northern Baschenova in Ural (Das Asbestvorkommen noerdlich Baschenowa in Ural), A. Ohnesorge. Zeit. fuer Praktische Geologie (Halle), vol. 37, no. 9, Sept. 1929, pp. 166-169, 8 figs. Report of study trip, describing briefly deposits, genesis, and structure of veins; production in 1927-1928 was 27,000 tons.

ASPHALT

OKLAHOMA. Accelerated Weathering Properties of Oklahoma Asphalts, P. G. Shelley. Okla. Geol. Survey—Cir., no. 19, Oct. 1929, 37 pp., 1 fig., 5 supp. plates. Oklahoma sand and rock asphalt deposits are estimated to contain from 1 to 13 million tons; discussion of other research work; collection and description of samples; laboratory work; results of weathering tests. Bibliography.

ATMOSPHERIC ELECTRICITY

STUDY OF. Study of Fulminating Matter; Serpentine Forms (Contribution à l'étude de la matière fulminante. Les formes serpentines), E. Mathias. Académie des Sciences—Comptes Rendus (Paris), vol. 189, no. 21, Nov. 18, 1929, pp. 813-815. Impurities in atmosphere and their influence on kind, colour and other characteristics of fulminating phenomena caused by atmospheric electric discharges.

AUTOMOBILE BEARINGS

STANDARDIZATION. Ball and Roller Bearings Division. Soc. Automotive Engrs. Jl.—Reports of Divisions to Standards Committee (Section 2), Jan. 1930, pp. 14-20, 2 figs. Proposed American Standard and proposed revision of S.A.E. Standard for annular ball bearings of single-row type; proposed American recommended practice for annular ball and roller bearings of wide type.

AUTOMOBILE BODIES

DESIGN. Variation in Structure and Material for Use in Automobile Bodies Viewed in the Light of Recent European Trends, A. F. Denham. Automotive Industries, vol. 62, no. 5, Feb. 1, 1930, pp. 158-159. Review of Cast-Steel Body Conference at Society of Automotive Engineers Meeting in Detroit with abstracts of papers presented and discussion; Body Mounting, E. C. Gordon-England; summary of European and American body design differences, T. L. Hibbard; Sheet Steel and All Steel Body, G. L. Kelley.

AUTOMOBILES ENGINES

AIR FILTERS. Design of Automobile Air Filters (Luftfilter, ihre Bauart und Wirkungsweise), G. F. Dierfeld. Motor (Berlin), vol. 17, no. 11, Nov. 1929, pp. 38-41, 9 figs. There are two types of filters, centrifugal and screen type; centrifugal type operates primarily on centrifugal principle in which dust particles are thrown out into special duct while clean air enters engine; second type, operating on screen principle, has no moving parts, but must be cleaned periodically; examples of both are given.

FUEL VAPORIZING. Experiments in Vaporizing Fuel, G. Autenreith Soc. Automotive Engrs.—Jl., vol. 26, no. 1, Jan. 1930, pp. 13 and 108, 1 fig. Results obtained in internal-combustion engines in which practically all vaporization was accomplished before mixture entered manifold system; advantages obtained if complete or approximately complete vaporization can be produced before fuel reaches inlet manifold; vaporizing device described; power and economy improved.

MOUNTING. Elimination of Chassis Vibration, E. H. Smith. Soc. Automotive Engrs.—Preprint for mtg., Jan. 20-24, 1930, 4 pp., 3 figs. Development of method of mounting engine so as to reduce transmission of vibration from it to frame; rubber blocks of various shapes were tried until truncated-pyramid type gave promise of excellent results; longer dimension was placed crosswise of car, which afforded horizontal engine-stability; rubber washers used there to separate engine from frame; device by which vibrations in engine and frame could be measured electrically; rubber mounting reduced frame vibration to one-sixth of its original value.

SPARK PLUGS. Spark Plug Terminal Material is Factor in Performance, H. Rabezzana and D. W. Randolph. Automotive Industries, vol. 62, no. 3, Jan. 18, 1930, pp. 83-87 and 99, 16 figs. Factors affecting secondary potential and breakdown of sparking voltage of plugs under operating conditions; results of extended study made by AC Spark Plug Co. of electrical characteristics of ignition system in engine operation; employment of new electrode alloy substantially reduces sparking voltage required; engine speed, temperature and proper carburetion are important.

SUPERCHARGERS. An Exhaust Gas Turbo Charger. Automobile Engr., (Lond.), vol. 19, no. 262, Dec. 1929, pp. 509-510, 7 figs. Description of recent German developments in small exhaust-gas turbine for use with high-speed internal-combustion engine; heat difficulties overcome by internal air cooling of rotor and turbine blades; turbo-charger units can be fitted to any standard car; air thus preheated and compressed effects perfect evaporation of fuel in carburetor.

AUTOMOBILE MANUFACTURE

NITRIDATION. Nitriding Investigations, R. Sergeson. Soc. Automotive Engrs. Jl., vol. 26, no. 1, Jan. 1930, pp. 110-111. Résumé of developments of nitralloy and nitriding process; results obtained by nitriding compared with those obtained by carburizing effects of various temperatures during nitriding process; furnaces, methods and results; nitriding increases strength of steel.

AUTOMOBILE SHOCK ABSORBERS

DISCUSSION ON. Shock Absorbers, J. M. Nickelsen. Soc. Automotive Engrs.—Preprint, for mtg. Jan. 20-24, 1930, 4 pp. Things which appear most pertinent in connection with shock absorbers and their action on car are discussed, including type of control that can be secured through use of two-way hydraulic shock absorber and possible variation in energy absorption due to temperature which occurs in some of units on market.

AUTOMOBILE STANDARDIZATION

S.A.E. REPORT. S.A.E. Standards Report Adopted with Few Changes. Automotive Industries, vol. 62, no. 4, Jan. 25, 1930, pp. 129-131, 1 fig. Review of Standards Committee meeting of Society of Automotive Engineers in Detroit is given with changes made in proposals of divisions, regarding roller chain standards, metric-size spark plugs, electric head and tail lamps, non-ferrous metals, tanks for chromium plating, and passenger car body types.

AUTOMOBILE TRANSMISSIONS

HERRINGBONE GEAR. Composite Herringbone Gears, A. Nichols. Automotive Industries, vol. 62, no. 2, Jan. 11, 1930, p. 58, 1 fig. Discussion of composite herringbone gear invented by H. T. Thompson, chief engineer of Reo Motor Car Co.; one-half of gear has one pitch while other half has different pitch; automobiles with transmissions having composite herringbone gears have been driven under all possible conditions, from low to high car speed and from no load to full load on drive, change then being made to over-drive or coasting action; passengers in car not being able to distinguish by sound when gears were being used and when they were not.

AUTOMOBILES

FRONT-WHEEL DRIVE. Front-Wheel Drive, W. J. Muller. Soc. Automotive Engrs.—Preprint, for mtg. Jan. 20-24, 1930, 3 pp. Design of Ruxton front-wheel-drive automobile is discussed; Universal, Cardan and Weiss joints; lubrication; improved driving stability of front-wheel-drive car; steering advantages; disposition of drive-universals and axis of steering-knuckle spindles; greatest outstanding departure lies in transmission; lost traction on steep grades; weight transfer due to acceleration; weight distribution.

Bodies for Front-Wheel-Drive Cars, J. Ledwinka. Soc. Automotive Engrs.—Preprint for mtg., Jan. 20-24, 1930, 2 figs. Opportunity for body designer of front-driven cars to create harmony and beauty of lines; pan can be brought down even with bottom flange and height of springs increased and more comfortable cushion made; advantage of appearance in overall height, advantage of lowering centre of gravity which will add to steadiness, reducing side sway, and adds to roadability of car; front-wheel drives are necessarily of long wheelbase requiring economy in length of foot-room in body; muffling noise at front; absence of gear shift lever through floor.

Bucciali Front-Wheel Drive Car Has Independent Suspension, P. M. Heldt. Automotive Industries, vol. 62, no. 3, Jan. 18, 1930, pp. 75-and 96. Description of front-wheel-drive car also possessing independent suspension for both front and rear wheels, which has been developed by Bucciali Brother, Paris; transmission is arranged with its shafts transverse to frame and speed-charge mechanism is incorporated in drive beyond speed reducing gear.

PERFORMANCE TESTING. Speed of Automobiles with Minimum Fuel Consumption (Die Fahrgeschwindigkeit des niedrigsten Brennstoffverbrauches von Kraftfahrzeugen), O. Steinitz. Automobiltechnische Zeit. (Berlin), vol. 32, no. 35, Dec. 20, 1929, pp. 810-812, 2 figs. Results of calculation show that best speed in relation to fuel consumption per kilometer lies between half and total of maximum speed.

AUTOMOTIVE FUELS

DETONATION. Comparison of Antiknock Ratings Determined in Different Laboratories, C. H. Barton, C. H. Sprake and R. Stansfield. Soc. Automotive Engrs.—Preprint for mtg. Jan. 20-24, 1930, 4 pp., 2 figs. Tests conducted in laboratories of three British oil companies to obtain uniform ratings of antiknock values described; Delco, Armstrong-Whitworth and Ricardo E-35 engines tested; very concordant knock ratings for different fuels obtained with engines of widely different design and working conditions if temperature and speed are carefully controlled and settings adjusted for maximum-knock mixture strength.

Detonation Characteristics of Some of the Fuels Suggested as Standards on Antiknock Quality, J. M. Campbell, W. G. Lovell and T. A. Boyd. Soc. Automotive Engrs.—Preprint for mtg. Jan. 20-24, 1930, 6 pp., 4 figs. Quantitative data of some individual fuels suggested presented in terms of compression ratio for incipient knock over entire range of composition from zero to 100 per cent concentration as determined in admixture with normal heptane; normal heptane only one having sufficient degree of tendency to knock to make it suitable to form lower limit of scale of antiknock quality consisting of two pure fuels mixed in various proportions.

New Knock Testing Method Developed at University of Michigan, G. G. Brown and H. E. Zuck. Nat. Petroleum News, vol. 22, no. 3, Jan. 15, 1930, pp. 61-62 and 64, 2 figs. Method consists essentially in determining, by use of variable-compression, single-cylinder engine, compression ratio at which fuel gives distinct knock; this engine was developed in laboratory of National Advisory Committee for Aeronautics; one of new features is use of injection pump instead of carburetor for conveying fuel into cylinder.

Knock Test Apparatus and Methods are Standardized by Michigan Engineering Experiment Station, G. G. Brown. Automotive Industries, vol. 62, no. 4, Jan. 25, 1930, pp. 112-115 and 122, 4 figs. Description of methods and installed apparatus employed by Department of Engineering Research, University of Michigan, for making tests of fuels and giving certificates of special knock rating; single-cylinder variable-compression engine used; next important development is means of detecting incipient knock which is independent of human ear.

RESEARCH. Pressure Feed Gasoline System Recommended for Aircraft. Automotive Industries, vol. 62, no. 5, Feb. 1, 1930, pp. 157. Review of Cooperative Research Sessions of Society of Automotive Engineers meeting with abstracts of three papers by members of Bureau of Standards; The Properties of Gasoline with Reference to Vapour Lock, O. C. Bridgeman; Influence of Atmospheric Conditions on Knock Test, D. B. Brooks; Effect of Engine Design and Fuel Volatility on Acceleration Characteristics, C. S. Bruce.

SPECIFICATIONS. Fuel Specifications as Viewed by the Fleet Operator, A. Hughes, Jr. Soc. Automotive Engrs.—Jl., vol. 26, no. 1, Jan. 1930, pp. 49-53. Conditions met by operator in purchase of fuels and practical limitations of fuel specifications are surveyed; requirements that fuel must meet to be satisfactory to operator; experience of United Railway and Electric Co. of Baltimore with fuels used since it began operations in 1915; close cooperation of engine and petroleum engineers with fleet operators is urged.

B

BALANCING APPARATUS

SELF-CENTREING. Design and Use of Self-Centreing Devices. Machy. (N. Y.), vol. 36, no. 5, Jan. 1930, pp. 398-400, 1 fig. Design of pivoted levers and sliding rods provided with self-centreing features which automatically return parts to central positions; self-centreing devices for angular movement; self-centreing device; self-centreing devices of sliding type; methods of eliminating lost motion.

BALANCING MACHINES

JAPANESE. A Japanese Balancing Machine. Engineer (Lond.), vol. 149, no. 3863, Jan. 24, 1930, pp. 110-111, 7 figs. Kuno of Mitsubishi Research Laboratories has invented and developed machine by means of which, it is claimed, amounts and positions of weights required to balance rotor can be determined with great accuracy in relatively short time; factor which it measured is dynamic unbalance of rotor; it is, however, also applicable to static balancing of rotors.

BAUXITE

ANALYSIS. Bauxites and Their Chemical Composition (Les bauxites et leur composition chimique), V. Charrin. Génie Civil (Paris), vol. 96, no. 3, Jan. 18, 1930, pp. 63-64. Tabulated chemical analysis of French types of red, white, and gray refractory bauxite.

BEAMS

CONTINUOUS. Moment and Shear Diagrams for Continuous Beams and Rigid Building Frames, N. M. Stineman. Am. Concrete Inst.—Jl., vol. 1, no. 3, Jan. 1930, pp. 211-277, 18 figs. Distinction between continuous beam and rigid frame; methods employed in computing values for diagrams; ratio between column stiffness and girder stiffness; use of diagrams with illustrative examples; cut-and-try method not necessary; methods of obtaining approximate shear and bending moments in unequal spans; rigid frames with girders of unequal span; columns in same storey having unequal stiffness.

BEARINGS

JOURNAL. Journal Bearing Practice, F. Hodgkinson. Mech. World (Manchester), vol. 86, nos. 2241 and 2242, Dec. 13 and 20, 1929, pp. 560-562 and 576-577, 8 figs. See also Metal Industry (Lond.), vol. 35, nos. 25 and 26, Dec. 13 and 20, 1929, pp. 565-568, and 591-592, 8 figs. Dec. 13: Problems of bearings for dynamos, motors, steam turbines, and the like where flooded lubrication is applied and machinery must be placed in operation with full unit load on bearing; accuracy required in machining bearings; Michell or Kingsbury bearing. Dec. 20: Data regarding fluid pressures on bearings. Abstract of paper read before Instn. Mech. Engrs.

BELT DRIVE

DISCUSSION OF. The Necessity for Elasticity in Power Transmission, V. Sahmel. Power Transmission, vol. 36, no. 1, Jan. 1930, pp. 81-87, 7 figs. Careful discussion of use of belt wrapping pulley in short centre drives, with some of more important problems involved in such installations.

BELTS AND BELTING

LEATHER. Good Practice in the Use of Leather Belts, R. C. Moore. Power Transmission, vol. 36, no. 1, Jan. 1930, pp. 43-52, 15 figs. Practical analysis of belt operating requirements based on author's investigations as chief engineer of large belt manufacturer; determining horsepower rating; table giving maximum horsepower rating recommended for leather belting; effect of misalignment of pulleys.

RUBBER. Good Practice with Rubber Transmission Belts, T. A. Bennett. Power Transmission, vol. 36, no. 1, Jan. 1930, pp. 53-54, 3 figs. Practical discussion of rubber belting in transmission work; rubber belt construction. (To be continued.)

BENZOL

ANILINE RECOVERY. Continuous Operating Benzol-Washing Plant for Recovery of Aniline from Aqueous Salt Solutions (Die kontinuierlich arbeitende Benzolwaschanlage zur Gewinnung des Anilins aus einer waesserigen Salzloesung), O. Krebs. Chemische Fabrik (Berlin), no. 37, Sept. 11, 1929, pp. 407-408, 1 fig. In certain dye works large quantities of alkaline solution of glycine containing about 30 per cent of aniline are produced; continuous extraction process by which aniline liquor is passed downwards in thin streams through rising column of benzol affords means whereby gylcine solution may be freed almost completely from aniline at small cost.

RECOVERY PLANTS. Recovery of Benzol from Coal Gas, with Particular Reference to the Use of Active Charcoal, H. Hollings, S. Pexton, and R. Chaplin. Gas Jl. (Lond.), vol. 188, no. 3474, Dec. 18, 1929, pp. 777-780. Experimental work indicates that constituent primarily responsible for gum formation and depreciation of active charcoal is hydrocyanic acid; its removal results in great prolongation of life of charcoal and in production of benzol which does not resinify under normal storage conditions. Conclusion of paper read before Instn. Chem. Engrs. from same journal, Dec. 11, 1929, indexed in Engineering Index, 1929.

BLAST FURNACE GAS

POWER GENERATION. A French Interconnected System, L. A. E. Sekutowicz and A. Evain. Elec. Rev. (Lond.), vol. 105, no. 2717, Dec. 20, 1929, pp. 1118-1120, 1 fig.; see also Elec. Times (Lond.), vol. 8, no. 11, Nov. 27, 1929, pp. 1079-1080. Electricity generating plant and distribution network of Société Electrique de la Siderurgie Lorraine; installations that have so far been completed comprise 10 works, which include 60 blast furnaces; 5 four-cylinder gas engines of 22,000 kw., and 6 converter groups are installed; kilowatt-hour transmitted by network of company from commencement has been 7,931,074 in 1923 and 112,403,727 in 1928.

BLOOMING MILLS

REVERSING. 35 in. Reversing Roughing Rolling-Mill Plant. Engineering (Lond.), vol. 129, no. 3341, Jan. 24, 1930, pp. 103-105, 1 fig. Details of mill constructed by Brightside Foundry and Engineering Co. for Tata Iron and Steel Co. of India; mill and its drive have been proportioned for large production; largest bloom size to be rolled will be approximately 18 in. by 18 in. in section, and smallest 8 in. by 8 in.; description of main electrical equipment, mill train, roll-changing mechanism, roller tables, and manipulator.

BLUEPRINT WASHING MACHINES

NEW WASHER-DRYER. A New Washer-Dryer for Photoprints. Engineer (Lond.), vol. 149, no. 3863, Jan. 24, 1930, p. 116, 3 figs. Washing and drying machine for blueprints made by Precision Photo Printing Plant, is characterized by fact that after prints have been fed in they require no attention until they are delivered dry ready for delivery.

BOILER CONTROL

COMBUSTION. Automatic Boiler-Control Equipment in Steam-Electric Power Plant of Chantenay (Installation de réglage automatique de chaudières à l'usine génératrice thermique de Chantenay), J. Hak. Revue Générale de l'Electricité (Paris), vol. 26, no. 24, Dec. 14, 1929, pp. 969-974, 7 figs. Automatic combustion-control system of Roucke was installed for 24 Babcock and Wilcox boilers of 340 sq. m. and 2 boilers of same type of 635 sq. m. feeding 6 turbo-alternators of 5,000 and 2 of 10,000 kw.; short note on evaporation tests and fundamental equations of combustion regulation employed are given.

BOILER MANUFACTURE

FLANGING PRESSES. Hydraulic Boiler-Plate Flanging Press. Engineering (Lond.), vol. 129, no. 3338, Jan. 3, 1930, pp. 14, 2 figs. on p. 16. Press was made by Rice and Co. and supplied to firm of marine-boiler makers; on machine of this type are anvil block fixed to table, and plow block attached to inner of two vertical hydraulic rams.

BOILER OPERATION

LOAD FLUCTUATIONS. Influence of Load and Load Fluctuations on Operating Efficiency of Boiler Plants (Einfluss der Belastung und der Belastungsschwankungen auf den Betriebswirkungsgrad), E. Praetorius. Waerme (Berlin), vol. 53, no. 1, Jan. 4, 1930, pp. 1-5, 10 figs. There is often great discrepancy between designed and actual efficiency of boiler plant due to very great losses and operating fluctuations which frequently occur; these losses depend partly on status and nature of boiler load and partly on degree of fluctuations; comparative tests of Josse, Koeniger, and author are discussed.

BOILER TUBES

BEADING. Effect of Beading of Tubes on Properties of Material and Stresses in Tube Plates (Die Wirkung des Einwalzens von Rohren auf die Werkstoffeigenschaften und die Spannungsverhaeltnisse der Rohrplatte), E. Siebel. Mitteilungen auf dem Kaiser-Wilhelm-Institut fuer Eisenforschun (Duesseldorf), vol. 11, no. 17, 1929, pp. 279-285, 13 figs. Permanent deformations of tube plate and their influence on propertics of material; results of tests with expanded rings; influence of rolling process on Rockwell hardness and notch strength; influence of width of ring.

BOILERS

HIGH PRESSURE (BENSON). Experiments on Benson Boiler (Untersuchungen am Bensonkessel), E. Josse. V.D.I. Zeit. (Berlin), vol. 73, no. 51, Dec. 21, 1929, pp. 1815-1819, 5 figs. Efficiency and heat balance; heat contents of steam; stresses and heat transfer coefficient of heating surfaces at various boiler loads and at pressures above and below critical value; condition of water and steam at different locations of heating surface; operating experiences are shown in tables and curves. Communication from mechanical engineering laboratory of Charlottenberg Institute of Technology.

PULVERIZED-COAL FIRED, TESTING. Experiments on Temperature Distribution, Heat Emission, and Combustion in a Modern Pulverized-Coal Boiler (Versuche ueber Temperaturvertileung Waermeabgabe und Verbrennungsverlauf in einem neuzeitlichen Kohlenstaubkessel), E. Kuhn. Archiv fuer das Eisenhuettenwesen (Duesseldorf), vol. 3, no. 7, Jan. 1930, pp. 441-458, 23 figs. Description of boiler and testing equipment and evaluation of results; temperature distribution in combustion chamber and boiler, and other test results are presented graphically.

VIBRATIONS. Hum of Boilers (Das Brummen der Dampfkessel), W. Weck. Internationale Bergwirtschaft und Bergtechnik (Halle), vol. 22, no. 24, Nov. 27, 1929, pp. 387-389, 4 figs. Explanation of cause of and hum, means of prevention; effect of inferior fireboxes and poor draft.

WATER TUBE. New Design of Water-tube Boiler. Times Trade and Eng. Supp. (Lond.), vol. 25, no. 598, Dec. 21, 1929, p. 336. Departure from usual design of water-tube boiler has been made by Woelcker, Bernburg, Germany; design is such that combustion chamber and surface heated by radiation are arranged at about same level, while drums and tubes that are heated by contact with combustion gases are situated at lower level.

BORING AND TURNING MACHINES

SINGLE-COLUMN. Large Single-Column Boring and Turning Mill. Machy. (Lond), vol. 35, nos. 895, Dec. 5, 1929, pp. 308-309, 3 figs. Description of single-column boring and turning mill, built by Etablissements Charles Berthiez, Paris, which is claimed to be largest of this type ever built; maximum diameter of work 23 ft.; maximum height turned 14 ft.; provision for increasing turning capacity; constant-speed motor employed, 18 changes of table speed and 12 rates of feed being obtained by means of two gear boxes.

BRICK CONSTRUCTION

REINFORCED. La Brique Armée Homogène dans la Construction Générale, L. Atthenont. Paris: Librairie Polytechnique Ch. Béranger, 15 rue des Saints-Pères 1929, 90 f. Reviewed in Engineer (Lond.), vol. 149, no. 3863, Jan. 24, 1930, p. 109. Title must be translated Homogeneous Reinforced Brickwork in Construction Generally, subtitle being, Its Calculation Simplified, according to Rules applicable to Homogeneous Bodies; author's main purpose is to prove that brick can take place of concrete in steel-reinforced structures, and is, in many respects, to be preferred.

BRICKMAKING PLANTS

COAL HANDLING. Coal Handling in Operation of Ring Kilns (Kohlenbefoerderung nach und auf den Ringofen), W. Gressier. Tonindustrie-Zeitung (Berlin), vol. 53, nos. 71 and 73, Sept. 5, 1929, pp. 1285-1286, and Sept. 12, pp. 1317-1319. Suggestion for rationalization in transport of coal to plant and feeding of fuel in kiln; transport direct to work by ships or railroad cars; motor trucks and tractors; methods and equipment for charging kiln with fuel.

INDIANA. Northern Indiana Brick Company Operates Modern Sand-Lime Brick Plant at Mishawaka, Ind. Pit and Quarry, vol. 19, no. 8, Jan. 15, 1930, pp. 61-65, 11 figs. Northern Indiana Brick Co., Mishawaka, Ind. operates one of most modern sand-lime brick plants in Middle West; plant uses only most up-to-date types of equipment, went into operation on May 28, 1928, and has capacity of 30,000 bricks per day; during summer months plant is operated 18 hrs. per day and produces as high as 55,000 bricks.

BRIDGE CONSTRUCTION

FINANCING. The Financing of Bridge Construction Work in New York. Engineering (Lond), vol. 129, no. 3341, Jan. 24, 1930, pp. 113-114. Port of New York Authority has, in recent years, financed bridge construction amounting to nearly $100,000,000 by method which consists in sale of bonds of nature of debenture, or income, bonds to provide funds for major part of cost of each project being paid out of appropriations made by States of New York and of New Jersey.

BRIDGES, RAILROAD

CONSTRUCTION. An Interesting Bridge Reconstruction on the G.W.R., H. S. B. Whitley. Ry. Gaz. (Lond.), vol. 52, no. 3, Jan. 17, 1930, pp. 82-83, 3 figs. Description of old structure replaced by double-line bridge in 42 working hours; St. Austell station; three main girders vary in length from 82 to 92 ft., and weigh from 21 tons to 30 tons.

RECONSTRUCTION. Rapid Process for Replacing Metallic Railroad Bridges (Procédé rapide pour le remplacement de ponts-rails métalliques). Génie Civil (Paris), vol. 95, no. 26, Dec. 28, 1929, pp. 644-645, 4 figs. Description of methods used by Société Commerciale de Belgique in replacing steel-truss and steel-girder superstructures of bridges of state railways of Greece.

BRIDGES, STEEL ARCH

GREAT BRITAIN. Newcastle-Gateshead New Road Bridge. Engineer (Lond.), vol. 149, no. 3863, Jan. 24, 1930, pp. 95-96, 13 figs. partly on supp. plates. Outline of bridge and its approaches and other particulars accompanying series of drawings of various parts of structure crossing Tyne River; arch of mild steel, is of two-hinged type; it consists of two crescent-shaped ribs arranged at 45 ft. centres; arch ribs were built out simultaneously from all four hinges; foundations for abutments were taken down to solid rock; continuous girder spans were launched into position by rolling out from earth approaches.

BRIDGES, TOLL

PAST AND PRESENT. Toll Bridges, Past and Present, P. K. Schuyler. Brooklyn Engrs. Club—Proc., vol. 28, part 2, Jan. 1930, pp. 19-31 and (discussion) 32-40. 8 figs. Toll bridges in United States: types, franchises, rates of toll, methods of financing; outlook for future legislation; map showing toll bridges of United States; table of private and public toll bridge financing for past few years shows total of $227,000,000; proposed series of national toll bridges.

BRONZE

FOUNDRY PRACTICE. Copper Oxide Eliminates Aluminum, J. H. Cheetham. Foundry, vol. 58, no. 3, Feb. 1, 1930, pp. 99. Description of series of tests made to ascertain whether contaminated copper alloy could be purified after melting and before pouring; estimated savings in using copper oxide against remelting whole aluminum-contaminated heat.

BUILDINGS

CONSTRUCTION PROGRAM. South's 1929 Building Program Relatively Greater Than in Rest of Country, C. E. Williams. Mfrs. Rec., vol. 97, no. 6, Feb. 6, 1930, pp. 62-66, 5 figs. Some major building projects which indicate something of diversity of building in South.

REMODELING. Remodeling: An Opportunity for the Architect, R. L. Davidson and W. E. Malm. Arch. Rec., vol. 67, no. 2, Feb. 1930, pp. 180-201, 20 figs. Remodeling opportunities as means of making business; meaning of obsolescence; calculating obsolescence; remodeling of buildings containing stores; modernizing elevator equipment in office and apartment buildings; light-weight construction; alteration costs; present standards of foot-candles of illumination for commercial interiors; reflection value of various paint colours; building planning service.

C

CABLEWAYS

DRIVE. Influence of Karlik Pulley on Stress of Cable and on Type of Cableway Drive (Der Einfluss der Karlikscheibe auf die Beanspruchung des Zugseiles, etc.), A. Schurig. Foerdertechnik u. Frachtverkehr (Wittenberg), vol. 22, no. 25, Dec. 6, 1929, pp. 491-494, 8 figs. Examples from different installations with and without Karlik drive are illustrated and discussed, showing great saving in power in favour of Karlik drive; brakes for Karlik drives are described. (Concluded.)

SOUTH AFRICA. The Elands Valley Aerial Ropeway. S. African Min. and Eng. Jl. (Johannesburg), vol. 40, no. 1990, Nov. 16, 1929, pp. 282-284, 8 figs. Illustrations, credited to R. Starkey, and text describing aerial cableways transport asbestos ore 5 and 9/10 miles from New Amianthus asbestos mine to Elandshoek station on Delagoa Bay railroad; Bleichert monocable with capacity 7½ tons per hour.

CALCIUM CARBIDE

STATISTICS. Statistics of Manufacture and Consumption of Calcium Carbide, Dissolved Acetylene and Oxygen in 1929 (Wirtschaftliche Statistik betr. Herstellung un Verbrauch von Calcium-carbid, geloestem Acetylen und Sauerstoff im Jahre 1929), W. Rimarski. Autogene-Metallbearbeitung (Halle) vol. 23, no. 1, Jan. 1, 1930 pp. 2-4. Statistical data and figures are indicated.

CAMS

DESIGN. Avoiding Variation in Curvature of High-Speed Cams (Bekaempfung der Unstetigkeiten bei schnellaufenden Steuernocken), R. Doerfel. Maschinenbau (Berlin), vol. 8, no. 21, Nov. 7, 1929, pp. 729-731, 6 figs. Development of appropriate curve for various purposes is indicated and its design by aid of simplates, is discussed.

CAR DUMPERS

ROTARY. Rotary Car Dumper a Feature of State Line Station. Power, vol. 71, no. 6, Feb. 11, 1930, pp. 204-207, 6 figs. Illustrated description of automatically operated car dumper, which is 60 ft. long and has capacity of twenty 120-ton cars per hour; cars are pushed up incline by electrically operated mule, and on decline are controlled by electric-pneumatic retarders.

CARBON-DIOXIDE REFRIGERANTS

EFFECT OF. Carbon Dioxide Preservation of Meat and Fish, D. H. Killeffer. Indus. and Eng. Chem., vol. 22, no. 2, Feb. 1930, pp. 140-143, 2 figs. Effect of carbon-dioxide gas on meat; degree of preservative action; effect of carbon dioxide on bacterial growth; application of transportation of meat and fish.

CARS, STREET RAILROAD

DOUBLE DECK. New Light-weight Double-deck Bogie Car for Birmingham. Elec. Ry. Bus. and Tram. Jl. (Lond.), vol. 62, no. 1540, Jan. 17, 1930, pp. 25-28, 4 figs. Outstanding features of experimental tram car; overall length 33 ft. 6 in.; overall width 6 ft. 3 in.; seating capacity 63 passengers; curve illustrating acceleration and deceleration of tramcar; curve illustrating current consumption of new car as compared with other cars.

MAINTENANCE AND REPAIR. Renewing Wheel Flanges. Am. Mach., vol. 72, no. 7, Feb. 13, 1930, pp. 305-306, 3 figs. Description of methods employed by United Railways and Electric Co., Baltimore, Md., in repairing wheel flanges of its trolley cars.

SASKATOON. Double Truck, Double End One Man Cars, Saskatoon Municipal Railway. Can. Ry. and Mar. World (Toronto), no. 383, Jan. 1930, p. 41, 1 fig. Illustrated description of double-truck, double-end, one-man motor cars, employing rolling bearings and air operated doors; general dimensions of cars are given; structural features are also given.

CARS, TANK

UNIVERSAL DESIGN. 80-Ton Railway Wagon for 3-Ft. Gauge. Engineering (Lond.), vol. 129, no. 3341, Jan. 24, 1930, pp. 102-103, 6 figs. Details of car trucks of unusual design supplied by Baguley (Engineers), Ltd. to Anglo-Persian Oil Co. for use on their 3-ft. gauge lines in Persia; intended for transport of steel tanks, 83 ft. long and 10 ft. in diam., load full being 80 tons; stock is required to take curves of 95-ft. radius; trucks are designed with four six-wheel trucks by means of which good distribution has been ensured.

CAST IRON

ANNEALING. Modern Methods of Annealing Gray and Malleable Cast Iron (Neuzeitliches Gluehen von Grau und Temperguss), R. Stotz. Giesserie (Duesseldorf), vol. 16, no. 52, Dec. 27, 1929, pp. 1209-1220, 21 figs. Notes on annealing pots of iron alloys resistant to piping; annealing media and their preparation; chamber and tunnel ovens for pulverized-coal and gas firing; pulverizing costs for bituminous coal; ideal annealing curves are presented.

ARC WELDING. Metallic Electrodes for Cast-iron Arc Welding, S. Satch. Am. Inst. Min. and Met. Engrs.—Trans., 1929, pp. 144-165 including discussion. Writer has been able to obtain series of cast irons, from gray to white, without using cast-iron electrodes but by coating on wrought-iron bars mixtures of carborundum and graphite; practical application of cast-iron welding. Article indexed in Engineering Index, 1929, from Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 162, Jan. 1929.

EXPANSION. Expansion Coefficients of Cast Iron (Beitrag zum Ausdehnungs Koeffizienten des Gusseisens), F. Roll. Giesserei Zeitung (Berlin), vol. 27, no. 1, Jan. 1, 1930, pp. 4-7, 11 figs. Brief notes of structure of metals, after which author explains relation of expansion to structural constituents, and relations of expansion coefficients to alloying elements; expansion coefficient increases slowly with amount of heating until it approaches a maximum. Bibliography.

TEMPERATURE EFFECT. Influence of Structure of Cast Iron on Changes Due to High Temperature (Influence de la structure de la fonte sur les alterations subies aux températures élevées), A. Le Thomas. Académie des Sciences—Comptes Rendus (Paris), vol. 189, no. 17, Oct. 21, 1929, pp. 639-641. Differences in behaviour of series of 10 bars of cast iron of diameters varying from 13.0 to 100.5 mm., but otherwise similar, due to heat treatment have been examined; more slowly cooling thick bar is more stable than quicker cooling thin one.

WELDING. Welding of Cast Iron and Cast Steel (Schweissen von Gusseisen und Stahlguss), W. Hoffmann. Autogene Metallbearbeitung (Halle), vol. 22, no. 22, Nov. 15, 1929, pp. 331-333, 5 figs. Experiments are carried out in order to determine behaviour of various iron and steel castings when welded; average values of quantity which can be obtained are tabulated.

CEMENT PLANTS

TEXAS. Trinity's Cement Plants at Dallas and Fort Worth Each Has Capacity of 4,000 Barrels Daily, T. K. Knox. Pit and Quarry, vol. 19, no. 8, Jan. 15, 1930, pp. 27-39, 47 figs. The plants of Trinity Portland Cement Co., Tex., former wet-process, and latter dry-process, are described and illustrated.

CEMENT, PORTLAND

CLINKERS. Multistage Process for Burning Portland Cement Clinker, R. D. Pike. Indus. and Eng. Chem., vol. 22, no. 22, Feb. 1930, pp. 148-152, 6 figs. Apparatus for three-stage process; modification of original arrangement; potash collection at Davenport; process with waste-heat boiler and potash-collecting plant; calculation of heat balances; Davenport experiment; complete separation of calcining and clinkering stages; comparison of proposed arrangements; comparison with usual rotary kiln.

CERAMIC KILNS

HEAT RECOVERY. Cooling Zone as Source of Heat in Ring-Kiln Practice (Die Kuehzone im Ringofenbetrieb als Wasemequelle), G. Paschke. Tonindustrie-Zeitung (Berlin), vol. 53, no. 73, Sept. 12, 1929, pp. 1320-1321, 2 figs. Cooling in ring kiln should be conducted in such manner that after heat is utilized for air heating and other heating purposes, there should always be some heat left in cooling zone. (Concluded.)

CHAIN DRIVE

ROLLER. Roller Chain Drives—Their Selection and Use, R. S. Dyson. Power Transmission, vol. 36, no. 1, Jan. 1930, pp. 88-90, 9 figs. Description of constructional features of roller chain; proper application gives best results; information needed in selecting roller chain drive; formula for chain pull.

SILENT. Silent Chain Drives, C. R. Weiss. Power Transmission, vol. 36, no. 1, Jan. 1930, pp. 57-61, 9 figs. Constructional features which influence selection, installation and operation of silent chains in economic transmission of power; installation of chain drives; lubrication of silent chain; advantages of chain drives.

CHAINS

MANUFACTURE. Link and Sprocket Chains, Their Manufacture, Properties and Application (Glieder und Gelenkketten, ihre Herstellung, Iegenschaften und Verwendung), F. Reidig. Foerdertechnik u. Frachtverkehr (Wittenberg), vol. 22, no. 25, Dec. 6, 1929, pp. 494-497. Conveyor chains, crane chains, drive chains and other sprocket chains are discussed, and references are made to D.I.N. standards. (Concluded.)

CHEMICAL ENGINEERING

ECONOMIC TREND. Economic Trend in the Chemical Industry, H. H. Dow. Indus. and Eng. Chem., vol. 22, no. 2, Feb. 1930, pp. 113-116, 2 figs. Description of interchange system; development of labour savers in chemical plant; brine and bromine-plant development at Midland; epsom-salt plant; brine evaporation.

CHIMNEYS

CONCRETE. Heat Permeability of Reinforced-Concrete Chimneys (Die Waermedurchlaessigkeit von Eisenbetonschrornsteinen), O. Graf. Archiv fuer Waermewirtschaft (Berlin), vol. 11, no. 1, Jan. 1930, pp. 23-24, 7 figs. As results of measurements on experimental chimney heat-conductivity coefficients of reinforced concrete, masonry, and other insulating materials are given for conditions approximating those in practice.

CITY PLANNING

BOSTON. Planning for Boston—1630-1930, E. M. Herlihy. City Planning, vol. 6, no. 1, Jan. 1930, pp. 1-13, 5 figs. Secretary of Boston City Planning Board traces development of Boston city plan during last 300 years; maps of Boston in 1630, 1722, 1880 and 1926.

CIVIL ENGINEERING

UNITED STATES. Present Status of Major Engineering Projects. Eng. News-Rec., vol. 104, no. 6, Feb. 6, 1930, pp. 254-258, 5 figs. Progress noted on highway and railroad bridges, hydro-electric power projects, water-supply structures; railway terminals and improvements, flood control and navigation, sanitary district of Chicago, Merchandise Mart, Chicago, etc.

CLAY DEPOSITS

CANADA. Manufactures of Canadian Clay. The Can. Engr. (Toronto), vol. 58, no. 4, Jan. 28, 1930, p. 168. Notes on distribution of deposits of raw material for brick, tile and sewer pipe in Maritime and Quebec; clay manufactures in Ontario; western production increasing; resources in British Columbia are varied.

CLAY PRODUCTS

MANUFACTURE. Fire Brick, Glazed Ware, and Enameled Ware Improved by Study of Manufacturing Methods, H. D. Hubbard. Commercial Standards Monthly, vol. 6, no. 6, Dec. 1929, pp. 159-161, 2 figs. Brief account of investigations of manufacture of clay products by U. S. Bur. of Standards.

CLOCKS

ELECTRIC. New Types of Electric Clocks (Neue elektrische Uhren), J. Baltzer. Elektrotechnische Zeit. (Berlin), vol. 51, no. 2, Jan. 9, 1930, pp. 45-47, 4 figs. Three new types are described; Junghans Electronom system, Kienzle self-winding clock with striking mechanism are discussed; Junghans clock is to serve master clock in electric time system, Kienzle and Ato clocks are independent, battery-operated time pieces.

COAL CARBONIZATION, LOW TEMPERATURE

SALERMO PROCESS. The Development of the Salermo Process. Chem. Age, (Lond.), vol. 22, no. 552, Jan. 25, 1930, pp. 75-76, 1 fig. Steady development of Salermo process during past few years; object and principles of process explained.

COAL CLEANING

MODERN TIMES. Coal Cleaning in Modern Times, R. Lessing. Gas Jl. (Lond.), vol. 189, no. 3478, Jan. 15, 1930, pp. 147-150, 5 figs. Sources of ash content; other coal constituents; significance of coal cleaning to carbonizing industries; large-scale plant in South Wales; float and sink tests. Abstract of lecture before Southern Assn. of Gas Engrs. and Mgrs.

COAL CUTTERS

TESTS, GERMAN. German Tests of Bar and Chain Coal Cutters, W. Maevert. Colliery Guardian (Lond.), vol. 139, no. 3600, Dec. 27, 1929, pp. 2462. Bar-type machines were first given preference, but chain-type cutters have recently been adopted in many instances; tabular comparative time study on bar and chain machines data on results of various tests; under many conditions, chain-type machine is now preferred. Translated abstract of article indexed in Engineering Index, 1929, from Glueckauf, Sept. 14 and 21, 1929.

COAL DEPOSITS

ORIGIN. Primordial Material of Coal (Das Urmaterial der Steinkohle, R. Potonie. Internationale Bergwirtschaft und Bergtechnik (Halle), vol. 22, no. 25, Dec. 11, 1929, pp. 395-398, 2 figs. In discussion of origin of coal it is asserted that it can be proven palaeontologically that not only lignin but also cellulose contribute to form coal.

COAL GEOLOGY

IDENTIFICATION, MEANS OF. Means of Identifying Coal Strata (Die Hilfsmittel zur Identifizierung von Steinkohlenfloezen), K. Patteisky. Internationale Bergwirtschaft und Bergtechnik (Halle), vol. 22, nos. 22 and 23, Oct. 30 and Nov. 13, 1929, pp. 315-354 and 367-373, 15 figs. Discussion of means to aid in identifying coal strata, Oct. 30: Identification of main veins in district. Nov. 13: Location of smaller deviations of main veins.

COAL MINES AND MINING

ELECTRIC EQUIPMENT. List of Manufacturers of Permissible Equipment and Explosion-Proof Accessories, as of Jan. 1, 1930, L. C. Ilsley. U. S. Bur. Mines—Information Cir., no. 6222, Jan. 1930, 5 pp. Circular prepared, to present information in easily available form, in response to inquiries received as to where accessories for permissible equipment can be obtained.

LIGHTING. Increase of Output in Coal Mining Resulting From Better Lighting (Leistungssteigerung im Kohlenbergbau durch verbesserte Beleuchtung), L. Schneider. VDE Fachberichte der XXXIV. Jahresversammlung des Verbandes Deutcher Elektrotechniker in Achen (Achen), 1929, pp. 69-70, 3 figs. In place of usual mine safety lamps 40 firedamp-proof lamps of 70 watts at 150 volts have been installed in timber at distances of 4 m.; increase in production because of this better method of lighting is shown in graphs.

SURVEYS. The Use of Ordnance Survey Data on Mining Surveys, D. A. Hutchison. Colliery Guardian (Lond.), vol. 139, no. 3600, Dec. 27, 1929, pp. 2455-9245 and (discussion) 2459-2461; see also abstract in Iron and Coal Trades Rev. (Lond.), Jan. 3, 1930, p. 7. Supplement to paper indexed in 1929; trigonometrical control; mapping problems; requirements of mine surveyor; general principles of semigraphic method of resection. Read before Inst. of Mine Surveyors.

COAL WASHING

RHEOLAVEUR. Coal Washing by Rheolaveurs (Le lavage des charbons par Rhéolaveurs), A. France. Génie Civil (Paris), vol. 95, no. 25, Dec. 21, 1929, pp. 622-623. Theory of coal washing by water or pneumatic cleaning. Paper read before Conference on Bituminous Coal at Pittsburgh.

COBALT-NICKEL ALLOYS

MAGNETIC PROPERTIES. Magnetization of Nickel Cobalts to the Saturation Point (Sur l'aimantation à saturation des nickel-cobalts et les moments autoniques du nickel et du cobalt), P. Weiss, R. Forrer and F. Birch. Académie des Sciences—Comptes Rendus (Paris), vol. 189, no. 20, Nov. 12, 1929, 789-791, 1 fig. Alloys of 70 per cent of cobalt and upwards show large extent of resistance against magnetization and it has not been possible to attain saturation; magnetizing curves for various per cents of cobalt from 40 per cent upwards are given.

COKE MANUFACTURE

BY-PRODUCT. Developments in By-Product Coke Industry, H. Zeller. Blast Furnace and Steel Plant, vol. 18, no. 1, Jan. 1930, pp. 94-95, 1 fig. Use of blast-furnace gas on ovens and release of coke-oven gas for domestic purposes is important item of improvement in by-product coke industry; phenol-removal methods perfected.

CONCRETE

REINFORCED. Review of Reinforced Concrete, E. O. Rose. Gas Jl. (Lond.), vol. 188, no. 3475, Dec. 25, 1929, pp. 830-831. Economic aspect; rapid-hardening cements; specialists in concrete; provision of form scaffolding; architectural aspect.

CONCRETE CONSTRUCTION

FORMS. Sizes of Removable and Permanent Forms, Pans, or Domes Made of Wood, Steel, or Other Material Used in Concrete Ribbed Floor Construction. U. S. Bur. of Standards—Simplified Practice Recommendation, no. R87-29, 1929, 12 pp. Recommendations covering history of project, general conference, meeting of manufacturers and dealers, results, benefits, of simplified practice, organization and duties of standing committee, and list of simplified practice recommendations.

CONCRETE MIXING

RULES FOR. Just How Do You Make Good Concrete, E. Godfrey. Can. Engr. (Toronto), vol. 58, no. 3, Jan. 21, 1930, pp. 153-154. High strength not most important property; shortcomings of water-cement ratio theory; fluidity of concrete not necessarily harmful; insufficient mixing; rodding fallacy; requisites for durable cement; making concrete waterproof; old rules best.

FIELD ANALYSIS. A Method of Determining the Constituents of Fresh Concrete, W. M. Dunagan. Am. Concrete Inst.—Jl., vol. 1, no. 2, Dec. 1929, pp. 202-210, 5 figs. Plan of method of sampling of fresh concrete from structure at any point and determining amounts of water, cement, fine and coarse aggregate, making use of Archimedian principle of water displacement; details of procedure.

PLANTS. Transit-Mix Concrete Corp. Solves Many Problems in Marketing of Concrete in New York City, W. F. Trauffer. Pit and Quarry, vol. 19, no. 8, Jan. 15, 1930, pp. 23-26, 11 figs. Description of Transit-Mix Concrete Corp., New York City, which operates number of strategically located plants which furnish most of commercial ready-mixed concrete for metropolitan area.

CONCRETE REINFORCEMENT

DURABILITY. Observation of an Exposed Reinforced Concrete Beam, W. I. Freel. Am. Concrete Inst.—Jl., vol. 1, no. 3, Jan. 1930, pp. 278-282, 4 figs. Observations on reinforced-concrete beam which had been tested to destruction and was exposed to outdoor weather conditions for 24 years; reinforcing steel embedded in cracked concrete was found incrusted with rust while steel in sound concrete, a few inches away, was discovered in perfect condition.

CONCRETE TESTING

RECENT RESEARCHES. Recent Researches on Cement, Cement Mortar and Concrete, O. Graf. Pit and Quarry, vol. 19, no. 8, Jan. 15, 1930, pp. 49-53, 9 figs. Author pleads for tests which correspond to actual field conditions and reviews progress made in improving desirable mechanical properties of concrete and cement mortar; texture and structure of cement mortar and concrete; use of concrete in road construction. Indexed in Engineering Index, 1929, from V.D.I. Ziet. Sept. 28, 1929.

CONSTRUCTION EQUIPMENT

TRANSPORTATION. Winter Transportation Problems. Can. Engr. (Toronto), vol. 58, no. 3, Jan. 21, 1930, p. 144. Methods of hauling equipment and supplies for construction of mining plant at Flin Flon and power development at Island Falls, both in northern Manitoba; branch railway constructed; tractor-train service.

CONSTRUCTION EQUIPMENT INDUSTRY

FOREIGN MARKETS. Foreign Markets for American Road Construction Equipment, L. J. Cochrane. Commerce Reports, no. 2, Jan. 13, 1930, pp. 94-96, 2 figs. Exports radiply increasing; shipments in 1928 double those in 1925; Canada leading market; sales to Russia; Cuba and Argentina purchase much machinery; marked increase in exports to Brazil, Mexico and Uruguay; demand increases in Columbia, South Africa, and Germany; trends in Australian and Japanese markets; gains and losses in business in other principal markets; comparison of exports; of various types of road construction and maintenance equipment.

CONSTRUCTION INDUSTRY

SOUTHERN STATES. Drainage and Flood Control Active Factors in South's Expansion, C. E. Williams. Mfrs. Rec., vol. 97, no. 3, Jan. 30, 1930, pp. 44-47, 5 figs. Survey of important construction and engineering projects of general character undertaken or proposed in 16 Southern States last year shows that, in addition to numerous projects completed, work is now under way on major jobs in widely scattered sections of South, and that work will shortly be initiated on undertakings for which contracts were let in closing weeks of 1929.

UNITED STATES. Facts and Figures of Construction. Eng. News-Rec., vol. 104, no. 6, Feb. 6, 1930, pp. 259-262, 3 figs. Drop in construction during 1929 likely to be made up in 1930, with total of ten billions in prospect; public works and utilities budgets ample, costs stable, and financing is easier; bond sales on increase; bond yields and stock prices; prevailing bond coupon rates; construction volume and national income; production of major commodities; prices of materials; estimated construction budget for 1930.

CONVEYORS

AID PRODUCTION. Conveyors Aid Production Problems. Iron Age, vol. 125, no. 4, Jan. 23, 1930, pp. 300-302, 6 figs. Rearrangement of factory made by Dayton Pump and Manufacturing Co., Dayton, Ohio, so as to eliminate waste space and installation of comprehensive conveying system for handling materials; handling of pumps in calibrating room; method of visual control of production.

COPPER

ELECTROLYTIC. Further Observations on Workability of Electrolytic Copper (Weitere Beobachtungen bei der Knetbearbeitung von Elektrolyt-Kupfer), K. Bernhoeft and W. Wunder. Zeit. fuer Metallkunde (Berlin), vol. 22, no. 1, Jan. 1930, pp. 27-29, 8 figs. Rupture of electrolytic copper bars occurring with hot rolling has led to great economic losses; suggestions are given for improving quantity of rolling-mill product; tests show that above all, transverse fractures must be avoided in rolling.

COPPER ALLOYS

P.-M.-G. METAL. P.-M.-G. Metal. Foundry Trade Jl. (Lond.), vol. 41, no. 692, Nov. 21, 1929, pp. 375-376, 5 figs. Description of P.-M.-G. metal which is substitute for gun-metal and phosphor bronze; melting practice being carried out in pit fires of usual type, conditions being exactly same as for gun-metal, except that less notice was taken of casting temperature; moulding; mechanical tests; heat-treated P.-M.-G.; comparison of cast P.-M.-G. metal with Admiralty gun-metal.

COPPER MINES AND MINING

MICHIGAN. Mining Methods and Practice in the Michigan Copper Mines, W. R. Crane. U. S. Bur. of Mines—Bul., no 306, 188 pp., 147 figs. History and early development; transition period; recent methods; character and occurrence of ore; development of mines; extraction of ore by advancing methods, retreating methods and robbing pillars; exploration of mines; support in mines; handling ore and rock; drainage and ventilation; mining practice; suggested improvements in practice; records of unit production; costs in detail.

CORE MAKING

OIL SAND. Hidden Facts in Oil-Sand Practice, F. Hudson. Foundry Trade Jl. (Lond.), vol. 41, nos. 696 and 697, Dec. 19 and 26, 1929, pp. 443-446, 459-460 and (discussion) 460 and 464, 11 figs. Dec. 19: Object is to promote interest in research relative to fundamental principles required for successful, economical and efficient oil-sand core practice; sieve and subsidence test; effect of sand relative to binder economy and core in regard to strength, permeability, finish, heat conductivity, refractoriness, and gas evolution on casting. Dec. 26: Effect of binders relative to core strength, permeability and finish. Paper presented before Inst. Brit. Foundrymen.

D

DAMS, CONCRETE

FROST DAMAGE. Repairs to Dam at Lake St. Francis, P. E. Bourbonnais. Can. Engr. (Toronto), vol. 58, no. 3, Jan. 2, 1930, pp. 141-143, 3 figs. Gunite employed in repairing disintegrated portions of Allard Dam at Lake St. Louis, Que.; dam, consisting of series of plain concrete arches 15 ft. span, is 43 ft. high and 602 ft. long; failure was due to poor concrete and frost action; details of reinforcing and anchorage arrangement in gunite repair coating.

DAMS, HIGH

SYMPOSIUM. High Dams—A Symposium. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 1, Jan. 1930, pp. 183-185, 1 fig. Discussion by F. G. Switzer, of paper indexed from issue of Nov. 1929.

DAMS, MASONRY

RAISING. The Assouan Dam. Engineering (Lond.), vol. 129, no. 3341, Jan. 24, 1930, pp. 101-102, 5 figs. Reference is made to report reviewed in Feb. 8, and Mar. 8, 1929, issues of this journal on proposed heightening of dam; in accepting general plans for strengthening structure put forward by Commission, Macdonald made proviso that, as maxmum, water level shall be raised by only 8 m., instead of 9 m. proposed by Commission, and has reserved right to introduce additional strengthening works which will not interfere with general plan; contract for work has been let to M. Norton Griffiths and Co.

DAMS, ROCK FILL

FAILURES. The Failure of a Rock Fill Dam in Victoria, J. T. Noble Anderson. Engineer (Lond.), vol 149, no. 3863, Jan. 24, 1930, pp. 100-102, 5 figs. Report of investigation of failure of Eildon (Sugarloaf) weir across Goulburn River, on April 26, 1929; subsidence of bank on up-stream side of core wall occurred, exposing core wall to maximum depth of 26 ft.; in discussing whether whole structure is efficient for purpose for which it was designed, Board states that in its present condition it probably is not, nor can original design be restored.

DEPARTMENT STORES

DESIGN. Planning Future Expansion for the Department Stores, K. Welch. Arch. Rec., vol. 67, no. 2, Feb. 1930, pp. 202-204, 4 figs. Vice-president in charge of design of Grand Rapids Store Equipment Corporation discusses means which can be provided for additional expansion in future when designing entirely new building.

DIESEL ENGINES

ANTE-CHAMBER. Size of Ante-Chamber and Its Influence on Working of Ante-Chamber Diesel Engine (Die Vorkammergroesse und ihr Einfluss auf das Arbeitsverfahren der Vorkammer-Dieselmaschinen), H. Mehlig. Automobil-technische Zeit. (Berlin), vol. 32, nos. 32 and 34, Nov. 23, 1929, pp. 723-725, and Dec. 10, 1929, pp. 783-785, 5 figs. Report of investigation carried out at Institute for Internal Combustion Engines and Thermotechnology of Hanover Institute of Technology; influence of heat admission during compression; differential equations for compression; influence of change of speed, cross-section ratio and compression temperature.

AUTOMOTIVE. Light-Weight Diesel-Engines, O. D. Treiber. Soc. Automotive Engrs.—Preprint for mtg. Jan. 20-24, 1930, 3 pp., 5 figs. Light-weight engines must run at high speeds, utilize high-strength materials at high stresses, and develop high mean effective pressure; with equal mean effective pressures, Diesel engines can be made only about 15 per cent heavier than corresponding gasoline engines for motorcoach and motor truck service; advantages and disadvantages of plain and auxiliary combustion chambers; foundry conditions limit lightness; mechanical details of Triber engines.

Combustion Chambers, Injection Pumps and Spray Valves of Solid Injection Oil Engines, J. E. Wild. Soc. Automotive Engrs.—Preprint for mtg., Jan. 20-24, 1930, 23 pp. Relation between method of combustion, shape of combustion chamber and characteristics of injected fuel spray is discussed; design of engine with precombustion chamber, and engines with direct injection, spray atomization and spray atomization by air whirls; engines with auxiliary air chamber taken up; devices developed to introduce fuel into combustion chamber, covering various injection valves, injection pumps and nozzlse.

BUCKEYE. The Buckeye Diesel Makes Its Appearance. Power, vol. 71, no. 2, Jan. 14, 1930, pp. 62-63, 3 figs. Description of four-stroke-cycle mechanical-injection Diesel brought out by Buckeye Machine Co., Lima, Ohio; capacities from 200 to 400 hp.; bore and stoke 13 by 18 in.; rating 65 hp. per cylinder at 277 r.p.m.; individual fuel-injection pump for each cylinder; design characteristics of engine.

CANADA. The Adoption of the Diesel Engine in Canada. Engineering (Lond.), vol. 129, no. 3341, Jan. 24, 1930, p. 124. Review of progress made during past year in application of Diesel power to locomotives, ship propulsion, portable generating plants, and stationary power plants.

CRANKSHAFTS. New Formula for the Calculations of Shafts for Diesel and Semi-Diesel Engines (Nouvelle formule pour le calcul des arbres des moteurs Diesel et Semi-Diesel, Technique du Bureau Véritas—Bul. (Paris), vol. 11, no. 12, Dec. 1929, p. 252. Machine Section of Technical Committee of the Bureau Veritas has presented proposal for revision of formulae employed for calculation of crankshafts applicable to all internal-combustion engines; this proposal, which has been approved and accepted, is presented.

DESIGN. New Fulton Diesel is Designed for Mechanical Injection. Power, vol. 71, no. 4, Jan. 28, 1930, pp. 138-139, 4 figs. Description of four-stroke-cycle mechanical-injection Diesel built by Fulton Iron Works Co.; cylinders 13½ in. by 18 in.; 65 hp. per cylinder at 300 r.m.p.; engines made in sizes ranging from two to eight cylinders; constructional features of frame, crankshaft, and mechanical injection system.

HISTORY. Development of Diesel Engine from Viewpoint of its Construction and its Use (L'évolution du moteur Diesel au point de vue de sa construction et de son emploi), A. Garnier. Vie Technique et Industrielle (Paris), vol. 11, no. 117, June 1929, pp. 523-529, 2 figs. Author reviews Diesel-engine practice up to 1913 and investigates whether disadvantages experienced at that time still have left traces on conception of present-day engineers.

MARINE (DOXFORD). The Opposed-Piston Oil Engine, J. Harbottle. Mech. World (Manchester), vol. 87, nos. 2244 and 2245, Jan. 3 and 10, 1930, pp. 11-14 and 33-36, 9 figs. Jan. 3: Comparison of two-stroke-cycle double-acting engine of opposed-piston type; scavenging system of Junkers, Doxford and Cammel Laird-Fullagar oil engines. Jan. 10: Starting air valves, manoeuvring, and cycle of operations of Doxford engine described; materials; fuel consumption; lubricating oil; comparison of unbalanced forces and couples. Abstract of paper read before Inst. Mar. Engrs.

MARINE (RICHARDSONS-WESTGARTH). Development and Performance of the Richardsons-Westgarth Oil Engine, W. S. Burn. Mech. World (Manchester), vol. 86, no. 2240 and 2241, Dec. 6 and 13, 1929, pp. 536-538 and 554-555, 8 figs. Dec. 6: System of alternate nozzle scavenge air ports at one side of centre of liner and exhaust ports on other side has been retained withmodifications which improved scavenge efficiency; scavenge pump; fuel-pump unit; fuel injection experiments. Dec. 13: Results of tests; design of combustion chambers, fuel-valves, and fuel-valve nozzles; nozzle coolng or cleaning. (Concluded.) Abstract of paper before North-East Coast Instn. of Engrs. and Shipbldrs.

DIPHENYL

DERIVATIVES. Syntheses in the Diphenyl Series, R. L. Jenkins, R. McCullough, and C. F. Booth. Indus. and Eng. Chem., vol. 22, no. 1, Jan. 1930, pp. 31-34. Methods which give excellent yields are described for preparation of following mono-substituted derivatives of diphenyl: ortho and para, chloronitro, and amino-diphenyls; melting points and boiling points of these materials are given; methods for four of these derivatives have been applied on semi-plant scale; commercial production of any of them awaits only development of sufficient demand. Bibliography.

DISCS

ROTATING. The Effect of Axial Restraint on the Stress in a Rotating Disc, W. G. Green. Lond., Edinburgh, and Dublin Philosophical Mag. and Jl. of Science (Lond.), vol. 8, no. 53, Dec. 1929, pp. 993-1018, 2 figs. University of London doctorate thesis presenting theoretical mathematical analysis of rotating disc carried on shaft; symmetrical distribution of normal traction about point on plane boundary; symmetrical distribution of tangential surface traction about point on plane boundary.

DISTRIBUTION PROBLEMS

TREND IN. The New Trend in Distribution, W. G. Jamison. Power Transmission, vol. 36, no. 1, Jan. 1930, pp. 104-110. Study of problems of distribution with suggestion toward applying to them type of engineering analysis which has been so successful in increasing production; application of power increases production; development of method of studying cost of distribution. Condensed report of address before Soc. Indus. Engrs.

DRILLING MACHINES

HIGH SPEED. High-Speed Automatic Drilling Machines. Engineering (Lond.), vol. 129, no. 3338, Jan. 3, 1930, p. 29, 2 figs. Details of machines made by Ludwig Loewe and Co. A. G. of Berlin; heads may be used singly or in groups up to four, and two types are made, one of which, intended for mass production, has drive of eight speeds, viz. 420 to 2,100 r.p.m. through plain change pulleys; other, intended for ordinary work, has four speeds, from 600 to 2,000 r.p.m., obtained by stepped pulleys controlled by handwheel.

DRYDOCKS

BROOKLYN. Opening of New Todd Graving Dock. Mar. Eng. and Shipg. Age, vol. 35, no. 1, Jan. 1930, pp. 22-24, 5 figs.; see also Pac. Mar. Rev., vol. 27, no. 1, Jan. 1930, pp. 6-7, and 30, 5 figs.; and Mar. News, vol. 16, no. 8, Jan. 1930, pp. 49 and 59, 1 fig. Particulars of Todd's new graving dock at Robins plant at Erie Basin, Brooklyn, N.Y., unique methods were employed in design and construction of this dock owing to fact that dock is located in subsoil and foundation of quicksand and boulders.

E

ECONOMIZERS

COMBINED WITH AIR HEATERS. Increased Efficiency with Industrial Steam Raising Plant. World Power (Lond.), vol. 12, no. 72, Dec. 1929, pp. 579-582, 6 figs. Construction and operation of supermisers; discussion of supermiser installation at Consett Iron Works; accessories and instruments.

85 Per Cent Efficiency from Lancashires. Power Engr. (Lond.), vol. 24, no. 285, Dec. 1929, pp. 484-489, 7 figs. Illustrated description of supermiser installed at Manton Colliery workshop where important economies are being realized by its operation; boiler plant consists of battery of thirteen 8 ft. 6 in. by 30 ft. Lancashire boilers, delivery steam at 100 lbs. per sq. in. and 450 deg. fahr.; description of entire power plant; test results of Lancashire boilers fitted with supermiser.

ELECTRIC CABLES, HIGH TENSION

SWITZERLAND. High-Voltage Cable Equipment of Oberhasli Power System (Die Hochspannungskabelanlage der Kraftwerke Oberhasli A.-G.), P. E. Schneeberger. Schwiez. Elektrotechnischer Verein (Assn. Suisse des Electriciens)—Bul. (Zurich), vol. 20, no. 22, Nov. 2, 1929, pp. 753-767, 22 figs. Generated load of from 112,000 to 28,000 kva. in Handeck plant is transmitted on 50-kv. cable installed in tunnels which in winter form only admittance to plant; transmission system is described and electric characteristics are given; construction work is illustrated.

ELECTRIC EQUIPMENT

PROTECTION. Protection of Electric Equipment Against Excessive Voltages (Der Schutz elektrischer Anlagen gegen Ueberspannungen), E. Flegler. Elektrotechnische Zeit. (Berlin), vol. 51, no. 3, Jan. 16, 1930, pp. 73-77, 11 figs. Precise knowledge of excessive voltage phenomena is required in order to evaluate protective value of equipment; cathode-oscillograph investigations by W. Rogowski pertaining to these phenomena is referred to as having brought much of value to increase knowledge of subject; paper gives picture of protection of electric equipment against excessive voltage in light of investigation.

ELECTRIC FURNACES

RECENT DEVELOPMENTS IN. Recent Developments in Electric Furnaces, D. F. Campbell. Inst. of Metals—Advance Paper, 1929, 20 pp., 8 figs. Improvements and modifications in melting practice during last two years; relative performance of small and large induction furnaces; high-frequency furnaces; heat-treatment furnaces; specific furnaces, including continuous furnaces for annealing brass strip; largest brass works, where electricity is utilized more than elsewhere described with explanation of uses of electricity, energy consumed, and effect of special precautions to improve power and load factors.

ELECTRIC LAMPS

INCANDESCENT. Life of the Electric Incandescent Lamp (Das Leben der elektrischen Gluehlampe). W. Kochler. Licht und Lampe (Berlin), vol. 19, no. 1, Jan. 9, 1930, pp. 22-26, 4 figs. General viewpoint as to proper use and purpose; dependence of life on utilization; adaptability of lamp to operation conditions; use of silvered lamps; lamps with more than one filament system; graphs and tables are given.

Behaviour of Incandescent Lamps in Closed Fixtures (Das Verhalten von Gluehlampen in geschlossenen Geleuchten), B. Schmelzle. Licht und Lampe (Berlin), vol. 18, no. 23, Nov. 14, 1929, pp. 1300-1302. Life and temperature measurements on lamps of 500 and 750 watts in firedamp-proof fixtures; analysis and discussion of results.

NEON. Technical Data Concerning the Fabrication of Luminous Tubes (Betriebstechnisches ueber die Fabrikation von Leuchtroehren), M. Arndt. Licht und Lampe (Berlin), vol. 18, no. 23, Nov. 14, 1929, pp. 1307-1308, 5 figs. As discolouring has been experienced mainly in lamps made by small manufacturing concerns, without adequate means of research and experience, some of important manufacturing processes are outlined.

ELECTRIC LIGHT AND LIGHTING

COLOUR. Importance of Colour in Lighting, W. A. G. Martin. Elecn. (Lond.), vol. 104, no. 2693, Jan. 17, 1930, p. 63. Two aspects to be studied; reflection and translucence; illumination and decoration; possibility of attaining perfect balance by day and night; blending fittings with furnishing; wide choice available.

FIXTURES. Engineering Progress and Increase in Profits Resulting from Use of Application of Light Metals in Lighting Equipment Industry (Technischer Fortschritt und Gewinnsteigerung in der Beleuchtungsindustrie durch Leichtmetallverwendung), P. Schwerber. Licht und Lampe (Berlin), vol. 18, no. 24, No. 28, 1929, pp. 1371-1374. Properties of light metals and alloys, application of these and their influence on economic side in fixture manufacturing are discussed.

ELECTRIC LINES

VOLTAGE DROP CALCULATION. Line Voltage-Drop Diagram with Consideration of Phase Displacement (Diagramm des Spannungsabfalles in einem Netzwiderstand bei Phasenschiebung), W. Werdenberg. Schweiz. Elektrotechnischer Verein (Assn. Suisse des Electriciens)—Bul. (Zurich), vol. 20, no. 23, Dec. 1, 1929, pp. 797-800, 4 figs. Diagram for calculation of line-voltage drop as function of phase angle applicable to electric lines and transformers.

ELECTRIC LOCOMOTIVES

FRANCE. Electrically Driven Stock of Chemins de Fer du Midi (Le matériel roulant électrique Chemins de Fer du Midi). Industrie Electrique (Paris), vol. 38, no. 897, Nov. 10, 1929, pp. 485-492, 4 figs. Principal characteristics of type 2C2, 500-hp., 1,500-volts, 85 km. per hr ; and type BB 1,000-hp. rail motor ear, carrying 19,100 kg. of passengers and 16,000 of freight, at 85 km. per hr.

ELECTRIC MANUFACTURING PLANTS

BALTIMORE. Western Electric's Mammoth Baltimore Plant, R. W. Edmonds. Mfrs. Rec., vol. 97, no. 4, Jan. 23, 1930, pp. 53-55, 9 figs. Plans and progress of work started Jan. 19, 1929, on new Point Breeze plant of Western Electric Co. at Baltimore to employ 30,000 workers.

ELECTRIC MEASURING INSTRUMENTS

ELECTRIC MEASURING INSTRUMENTS. Meter and Instrument Section: Chairman's Address, E. W. Hill. Instn. Elec. Engrs.—Jl. (Lond.), vol. 68, no. 396, Dec. 1929, pp. 24-27. Electric meters do not measure electricity; elusive electrons can be numbered but electric meter does not do it expressly; what is measured is not alone number or quantity of electrons engaged, but something more important and fundamental, namely, their activity while they execute tasks imposed on them by man's ingenuity.

ELECTRIC MEASUREMENTS

REMOTE. Indicating and Recording Methods in Remote Measuring Practice (Neue Anzeige und Registriermethoden in der Fernmesstechnik), W. Stern. Elektrotechnische Zeit. (Berlin), vol. 51, no. 3, Jan. 16, 1930, pp. 77-80, 10 figs. It is shown how remote measurement installations can be combined with remote-control equipment; new method for registration of output measurements for load-distributing installation in which load mountains are automatically recorded by instrument.

ELECTRIC MOTORS

CAPACITY EFFECT. The Capacity Effect and Natural Free Period of a Direct-Current Armature, J. C. Prescott. Instn. Elec. Engrs.—Jl. (Lond.), vol. 68, no. 397, Jan. 1930, pp. 185-191. Correspondence between electrostatic and "dynamical" capacities is re-stated in somewhat different form, and theory of instability of compounded motors is developed as extension; series of experiments is described, results of which are cited as confirmation of results obtained by mathematical analysis, and details of solution of certain of equations are given.

STARTERS. The Sousedik Automatic Starter for Three-Phase Motors. Engineering (Lond.), vol. 129, no. 3341, Jan. 24, 1930, p. 106, 6 figs. Starter invented by J. Sousedik is designed to overcome disadvantages of using ordinary wound-rotor motor with slip rings, while retaining simplicity of squirrel-cage type; consists essentially of two soft iron cores which, when motor is at rest, are pressed against spindle by helical springs.

SQUIRREL CAGE. 1,250-Hp. Motors Drive Boiler-Feed Pumps, P. C. Smith. Power, vol. 71, no. 6, Feb. 11, 1930, pp. 218-219, 3 figs. Dimensions of 3,600-r.p.m. squirrel-cage induction machines kept small through use of fabricated-steel frame.

ELECTRIC POWER SUPPLY

WISCONSIN. Ontario Under Wisconsin Conditions, G. C. Neff. Pub Service Mgmt., vol. 48, no. 1, Jan. 1930, pp. 5-6 and 26-28 and no. 2, Feb. 1930, pp. 45-48 and 60-63. Author proves that if Wisconsin conditions were substituted in Ontario, or if Ontario hydro-electric system, owned and operated by province and municipalities, had to operate under conditions in Wisconsin, there would have to be spent in Niagara system alone approximately $175,000,000 more than has already been spent there and that fixed charges on this together with necessary added operating expenses would add $31,000,000 to annual cost of Niagara part of system alone.

ELECTRIC RAILROADS

ELECTRIC RAILROADS. More Business and How to Get It. Elec. Ry. Jl., vol. 74, no. 2, Feb. 1930, pp. 89-90. Ways of securing additional traffic were theme of annual meeting of Central Electric Railway Assn. held at Cleveland Jan. 23-24; other topics of interest were technique of freight handling and employee training.

Electric Traction on Railways, R. Brooks. Manchester Assn. of Engrs.—Trans. (Manchester), 1928-29, pp. 37-68 and (discussion) 69-80. Application of electricity to operation of suburban services and to specific types of main-line sections; equipment for motor coaches and locomotives; current collection and regenerative braking; important types of transmission gear from motors to axles of locomotives and their suitability for different services; operating results, and progress of electrification in various countries. Indexed in Engineering Index, 1929, from Metropolitan Vickers Gaz., July 1929.

EQUIPMENT. Rolling Stock Purchases Largely Increased, T. M. van der Stempel. Elec. Ry. Jl., vol. 74, no. 1, Jan. 1930, pp. 33-36, 2 figs. Nearly 1,300 passenger cars, 130 freight and service cars and 77 electric locomotives were bought during 1929 by electric railways; cars for handling heavy traffic on city surface lines predominated; large car orders also were placed for rapid transit lines and for electrified suburban service; interurbans purchases comparatively few new cars; rolling stock ordered during 1929 as listed under 22 States, Porto Rico and Canada.

OPERATION COSTS. Electric Railway Costs and Fares in 1929, A. S. Richley. Elec. Ry. Jl., vol. 74, no. 1, Jan. 1930, pp. 13-14, 6 figs. Fares and wages continue to increase, but in smaller measure than during 1928 and 1927; commodity prices and construction costs maintain level practically same as during past three years; curves illustrating trend of fares and costs from 1926 to 1929 inclusive.

ELECTRIC SWITCHGEAR

INTERNAL ISOLATION. Internal Isolation Switchgear. Elecn. (Lond.), vol. 104, no. 2692, Jan. 3, 1930, p. 13, 2 figs. Principles of new design; stationary circuit breaker; elimination of heavy gear; economy in size and weight; self-interlocking.

ELECTRIC TRANSFORMERS

LOSSES. Additional Losses in Transformers (Ueber zusaetzliche Verluste in Transformatoren), F. Heiles. VDE Fachberichte der XXXIV. Jahresversammlung des Verbandes Deutscher Elektrotechniker in Aachen (Aachen), 1929, pp. 71-74, 6 figs. Leakage field of transformer under certain conditions can cause considerable addtiional losses in winding copper when no special preventive measures in arranging and design of windings are taken; various winding arrangements are discussed and formula for their loss calculation is developed.

POTENTIAL. New Type Potential Transformer for High Voltages (Ein neuer Spannungstransformator fuer Hoochsspannungen), A. Meyerhans. Elektrotechnische Zeit. (Berlin), vol. 51, no. 1, Jan. 2, 1930, pp. 17-18, 4 figs. Construction of less expensive potential transformer is described; principal electric characteristics and main dimensions are given.

RATIO MEASUREMENTS. A Ready Method of Measuring the Voltage Ratio and Phase Angle of High-Voltage Transformers, G. Yoganandam. Instn. Elec. Engrs. (Lond.), vol. 68, no. 397, Jan. 1930, pp. 192-193. Quick and ready method, in which well-known high-voltage Schering bridge is employed, is described; formula for voltage ratio and phase angle are given, together with expressions for sensitivity of bridge; accuracy obtained by method meets requirements of all industrial tests as well as research work.

SWITCHED UNDER LOAD. Transformers Which Can be Switched Under Load (Unter Last schaltbare Transformatoren), De Francesco. VDE Fachberichte der XXXIV. Jahresversammlung des Verbandes Deutscher Elektrotechniker in Aachen (Aachen), 1929, pp. 86-88, 6 figs. Requirement of equipment is bought about by inter-connected operation and regulation of network systems; equipment of Peoge, Chemnitz, based on patents of Jansen, is described.

ELECTRIC WELDING. ARC

ATOMIC HYDROGEN. The Role of Atomic Hydrogen in Welding, S. Martin. Jr. Am. Mach., vol. 72, no. 7, Feb. 13, 1930, pp. 301-304, 10 figs. Discussion of unusual method of welding steels, alloys and non-ferrous metals with outline of what it can, and what it cannot do; application to cast steel and steel with high carbon content, chrome steel, aluminum, copper, duralumin, and zinc.

AUTOMATIC. Automatic Arc Welding, W. L. Warner. Am. Welding Soc.—Jl., vol. 8, no. 10, Dec. 1929, pp. 9-20, 11 figs. Requirements of fusion welding are taken up; importance of suitable clamping apparatus and procedure for welding thin sheet metal successfully discussed; magnetic effect produced by electric current passing through arc must be controlled; how flux opèrates and how it is handled; electromagnetic control scheme developed by General Electric Co.; applications of automatic arc welding. Paper presented before Am. Welding Soc. and Am. Soc. Mech. Engrs., indexed in Engineering Index, 1929.

ELECTROPLATING

ELECTROPLATING. The Recent Awakening of the Electro-Depositing Industry, R. S. Hutton. Chem. Age, (Lond.), vol. 22, no. 553, Feb. 1, 1930, pp. 7-8. Work of pioneers; research and electroplating industry; organization of research; chromium plating; appeal for cooperation in research; more funds required.

ENGINEERS

SALARIES. What Happens to the Engineer. Am. Mach., vol. 72, no. 7, Feb. 13, 1930, p. 307, 2 figs. Tabular presentation is given of replies to questionnaire issued in 1927 by Executive Committee of Machine Shop Practice Division of American Society of Mechanical Engineers to 2,700 engineers.

EXPLOSIVES

DETONATION. Calibration of Cordeau Detonant for Measuring Time in Dautriche Method of Determining Detonation Velocities (Die Eichung von Trinitrotoluol Zuendschnur. etc.), H. Selle. Zeit. fuer das Gesamte Schiess-und Spreng-stoffwesen (Munich), vol. 24, no. 11, Nov. 1929, pp. 420-422. Accuracy of detonation velocities of explosives as determined by Dautriche method depends on accuracy with which detonation velocity of T.N.T. in cordeau detonant is known; detonation velocities of cordeau detonant from various sources should not vary more than 2 per cent; detonation velocity of fulminate fuse was found to be 5151 m. per sec. by spark-chronograph method.

GERMANY. Development of Explosives in Germany During and Since the World War (Entwicklung des Sprengstoffwesens in Deutschland in und nach dem letzten kriege), Mente. Zeit. fuer die gesamte Schiess-und Sprengstoffwesen (Munich), vol, 24, no. 10, Oct. 1929. pp. 373-376. Effect of War on explosives practice especially with regard to shortage of raw material; new explosives developed since War; simplification in explosives due to mining classification lists.

F

FEEDWATER TREATMENT

SCALING. Prevention of Scaling by Water Treatment Inside of Boilers (La prevention des incrustations par le traitement de l'eau a l'intérieur des chaudières). Génie Civil (Paris), vol. 95, no. 2, Jan. 11, 1930, pp. 43-44. Internal treatment methods based on chemical reactions and substances reacting on incrustation because of their physical properties; precautions to be taken and limitations in use of internal treatment are briefly outlined.

FERTILIZER INDUSTRY

DEVELOPMENTS IN. Impending Developments in the Fertilizer Industry, E. Collett. Chem. Age (Lond.), vol. 22, no. 549, Jan. 4, 1930, pp. 3-4. 1 fig. Review of recent developments showing that one of most important tendencies in synthetic fertilizer industry, which is showing itself more and more, is production of complete fertilizer, free from "ballast."

FIREBRICK MANUFACTURE

METHODS. Refractory Brick and its Manufacture, H. E. Townsend. Blast Furnaces and Steel Plant, vol. 18, no. 1, Jan. 1930, pp. 105 and 195-196. Methods by which firebricks are made are discussed; how fireclay is obtained; dry-press process; special fireclay products.

FIRE PREVENTION

BUTTE, MONT. Report on the City of Butte, Mont. Nat. Board of Fire Underwriters—Report, no. 141, Jan. 1930, 23 pp., 1 supp. map. Fire-fighting facilities; structural conditions and hazards; recommendations

EAU CLAIRE, WIS. Report of the City of Eau Claire, Wis. Nat. Board of Fire Underwriters—Report, no. 404, Feb. 1930, 19 pp., 1 supp. map. Fire-fighting facilities; structural conditions and hazards; recommendations.

Great Falls, Mont. Report on the City of Great Falls, Mont. Nat. Board of Fire Underwriters—Report, no. 133, Jan. 1930, 19 pp., 1 supp. map. Fire-fighting facilities; structural conditions and hazards; recommendations.

FLOUR MILLS

Air Conditioning. Air Conditioning a Flour Mill, E. S. Miller. Heat. Piping and Air Conditioning, vol. 11, no. 2, Feb. 1930, pp. 97-100, 2 figs. General discussion of air-conditioning requirements of flour mills; specific reference is made to mill of Acme-Evans Co., Indianapolis, Ind.; ton of air per barrel of flour.

FLOW OF AIR

Pipes. Mechanical Displacement of Air Under Low Pressure (Déplacement mécanique de l'air sous faible pression), J. Merlan. Chaleur et Industrie (Paris), vol. 10, nos. 111, 112, 113 and 114, July, Aug., Sept. and Oct., 1929, pp. 325-333, 408-414, 454-458 and 503-508, 30 figs. Mathematical analysis pertaining to flow of air in pipe lines; load losses in linear system; economic velocity; graphical methods for calculation; reaction fans; technology of fans; analytical design of perfect fan. (To be continued.)

FLOW OF FLUIDS

Pipes. Variable Flow in Pipes, H. Bateman. Phys. Rev., vol. 35, no. 2, Jan. 15, 1930, pp. 177-183. Theoretical mathematical discussion of variable pressure gradient or forced motion of pipe in longitudinal direction which, at time when it ceases to act, will have produced prescribed distribution of velocity over cross-section of pipe; subsequent changes in distribution as motion decays are also investigated; initial velocity profile with curvature of one sign will retain this property as it changes into profiles for different stages of decaying motion.

FOUNDATIONS

Design. Foundation Engineering, B. Geen. Manchester Assn. Engrs.—Trans. (Manchester), 1928-29, pp. 149-181 and (discussion) 181-194, 15 figs. Examination and choice of site; light loads; heavy loads; disadvantage of deep piers; heavy raft foundations; excavation adjacent to raft foundation; yield point of soil, piling, and desirable clauses in foundation contracts are discussed; question of determination of actual loads on footings is discussed; eccentric loads; foundations to resist flotation; allowance for impact. Indexed in Engineering Index, 1929, from Machy. Market (Lond.), Apr.9 and 26 and May 3, 1929.

FOUNDRIES

Materials Handling. The Mechanical Handling of Foundry Materials, R. Spriggs. Foundry Trade Jl. (Lond.), vol. 41, nos. 694 and 695, Dec. 5 and 12, 1929, pp. 409-410 and (discussion) p. 430. Dec. 5: Various methods of handling raw materials are outlined; mechanizing moulding; transportation of cores; difficult problems of dry-sand work. Dec. 12: Milled sand should be stored; desirability of stocking pig-iron; skip charging of cupolas; belt conveyors need ample rollers; tilting skip charging defended.

FRAMED STRUCTURES

Rigid. Moment and Shear Diagrams for Continuous Beams and Rigid Building Frames, N. M. Stineman. Am. Concrete Inst.—Jl., vol. 1, no. 3, Jan. 1930, pp. 211-277, 18 figs. Distinction between continuous beam and rigid frame; methods employed in computing values for diagrams; ratio between column stiffness and girder stiffness; use of diagrams with illustrative examples; cut-and-try method not necessary; methods of obtaining approximate shear and bending moments in unequal spans; rigid frames with girders of unequal span; columns in same story having unequal stiffness.

Rigid Design. Simplified Rigid Frame Design, H. Cross. Am. Concrete Inst.—Jl., vol. 1, no. 2, Dec. 1929, pp. 170-183. Definition of rigid frames; methods of rare analysis; sources of stresses; simplified procedure of analysis; illustrative problems; fixedend moments. Report of Special Committee.

G

GAUGES

Plug. Wear of Materials for Plug Gauges (Abnutzung-an-Werkstoffen fuer Lehrdorne), O. Nieberding. Maschinenbau (Berlin), vol. 8, no. 23, Dec. 5, 1929, pp. 798-800, 1 fig. Testing materials for gauges by U. S. Bureau of Standards has shown that materials generally used show different behaviour with respect to wear; chromium-steel surfaces and nitrided steels give best results; hardness is no measure for resistance against wear; steels tempered after hardening and which can be filed will show less wear than non-tempered materials. Material is based largely on papers by H. J. French and H. K. Herschman. See Engineering Index 1927, p. 374.

GAS HOLDERS, WATERLESS

British Columbia. Vancouver's Waterless Holder. Gas Jl. (Lond.), vol. 188, no. 3475, Dec. 25, 1929, p. 825, 1 fig. Brief note of $300,000 gas holder of British Columbia Electric Railway Co., with capacity of 3,000,000 cu. ft.; aluminum painting done entirely by spraying machine.

GAS RETORTS

Continuous Vertical. Evolution of the Continuous Vertical Retort, A. Duckham. Gas Jl. (Lond), vol. 188, no. 3475, Dec. 25, 1929, pp. 828-829. Author's remarks are confined to process known as Woodall-Duckham system; four main types used in gas-works; advantages of continuous vertical retort; output of gas per square foot of ground space; refractory materials; heat conservation; high yield of gas per ton of coal; Tokyo plant is described. Abstract of paper read before World Power Conference, Tokyo, Japan.

GEAR CUTTING MACHINE

Dividing Heads. Automatic Dividing Devices of Gear Machining Equipment (Die selbsttaetigen Teilvorrichtungen der Zahnradbearbeitungsmaschinen), H. Brandenberger. Maschinenbau (Berlin), vol. 8, no. 21, Nov. 7, 1929, pp. 727-729, 10 figs. Accurate machining, free of jerking, is obtained in dividing equipment developed; viewpoints discussed are illustrated with equipment of Bilgram-Reinecker, Gleason, Oerlikon and Maag.

GEARS AND GEARING

Planetary. An Electrically-Controlled Gear Shift. Machy. (Lond.), vol. 35, no. 899, Jan. 2, 1930, pp. 454-455, 3 figs. Description of automatic radial engagement of worm and spiral gearing which furnishes slow forward and fast return speed; planetary gearing permits electrical control; practical application of gear shift; power for driving and shifting delivered from one source; ready engagement of gear teeth assured; arrangement of electrical control.

GEOPHYSICAL EXPLORATION

Gravitational. A Gravitational Survey over the Pentland Fault near Portobello, Midlothian, Scotland, W. F. P. McLintock and J. Phemister. Geol. Survey of Great Britain (Lond.), part 2, 1929, pp. 10-28, 10 figs. Full text of paper previously indexed, jointly with paper on Buried Kelvin Valley, from abstract in Iron and Coal Trades Rev., Dec. 27, 1929.

GOLD MINES AND MINING

Gold Coast, Africa. Geological and Mining Features of the Tarkwa-Abosso Goldfield with Coloured Geological Map and Sections, O. A. L. Whitelaw and N. R. Junner. Gold Coast Geol. Survey—Memoir, no. 1, 43 pp., and index, 39 figs., supp. plates, 19 maps in pocket. Notes on early history; topography; about 85 sq. mi. surveyed in detail tabular data on employment, production, machinery, development, and ore reserves; geology of region and of gold reef; diamond drill data descriptions of individual mines.

GRINDING MACHINES

Hydraulic Drive. 78-in. Hydraulic Face-Grinding Machine. Engineering (Lond.) vol. 49, no. 3340, Jan. 17, 1930, pp. 72-74, 10 figs. Diskus-Werke A.-G., of Frankfort, have introduced machine in which work is stationary and movement is given to grinding head; machine will take grinding wheels up to 6 ft. 6¾ in. in diam. and is suitable for grinding frames or standards of large oil engines, or similar heavy work.

Roll. New Roll Grinder. Iron Age, vol. 125, no. 4, Jan. 23, 1930, pp. 318, 2 figs. Description of hydraulic roll grinder Model B designed by Landis Tool Co., Waynesboro, Pa., for rapid and accurate grinding of small diameter rolls; machine will grind roll bodies, straight, concave, or convex, and is built in four sizes having 16-, 20-, 24-, and 28-in. swing; hydraulic work-carriage traverse and reversal is featured as providing almost unlimited number of speeds.

Surface. Double-Surface Grinding Machine for Special Purposes (Doppelflaechenschleifwerk fuer Sonderzwecke), S. Weil. Machinenbau (Berlin), vol. 8, no. 23, Dec. 5, 1929, pp. 795-797, 9 figs. Equipment manufactured by Naxos-Union, Frankfort, for grinding of large flat parts and frames of speed presses and rotating machinery; parts are ground on top and below and sometimes both sides; side frames to be ground are clamped in double layers and have thickness of from 60 to 100 mm. each.

GYPSUM

Hydration. Speed of Hydration of Gypsum Anhydrite, P. P. Budnikov. Journal Russkovo Physico-Chimicheskovo Obshchestva (Leningrad), vol. 41, no. 9, 1929, pp. 1717-1720, 1 fig. Report from chemical laboratories of Kharkov Institute of Technology on tests of speed of hydration of natural and synthetic gypsum.

H

HARDNESS TESTING

Conversion Values. Conversion of Hardness Numbers of Steels and Some Metals (Umrechnung von Haerteziffern bei Staehlen und einigen Metallen), A. Wallichs and H. Schallbroch. Maschinenbau (Berlin), vol. 8, no. 24, Dec. 19, 1929, pp. 824-827, 6 figs. Conversion values relative to Brinell number are experimentally determined for hardness testing equipment of various types and for carbon and chromium-nickel steels, aluminum and copper alloys; conversion curves are developed for practical use.

HEAT TRANSMISSION

Constants. Heat Transfer Constants and Applications of Heat Transfer, W. R Woolrich and L. Holdredge. Heat. Piping and Air Conditioning, vol. 11, no. 2, Feb. 1930, pp. 127-131. General consideration of five general applications of heat transfer that are encountered in heating and ventilating engineering; authors have given constants which are recomputed for 70-deg. difference in temperature and rearranged to more usable form; heat requirements for heat transmission from buildings.

HIGHWAY ADMINISTRATION

United States. Imperative Necessity for More Federal Aid in Road Building, T. L. Oddie. Mfrs. Rec., vol. 97, no. 2, Jan. 9, 1930, pp. 56-57. Steady increase in state expenditures for road work; vehicle usage increases; great mileage of low-type roads big problem; must rebuild big mileage hard-surfaced roads to present standards; urges speed in enacting bills providing $50,000,000 additional federal aid annually; need for increase in federal aid allowance per mile; need for increased expenditures for roads in forest reserves.

HIGHWAY ENGINEERING

American Methods. American Construction Methods Influence Highway Building Throughout the World, P. Johnson. Mfrs. Rec., vol. 97, no. 2, Jan. 9, 1930, p. 66-68, 7 figs. Discussion of plans of International Road Congress to meet in United States in 1930 with representation from Western Europe, Russia, Australia, Africa, Latin America and Orient.

HIGHWAY SYSTEMS

United States. Greater Mileage of Paved Highways Nation's Acute Need, E. E. Duffy. Mfrs. Rec. vol. 97, no. 2, Jan. 9, 1930, pp. 53-55, 8 figs. Motor-vehicle registration and usage outstrips road construction resulting in traffic congestion; country's mileage of first class pavements averages but 2,000 miles for each state.

HOSPITALS

Air Conditioning. Temperature and Humidity Control of an Oxygen Chamber, J. B. Hashagen. Heat. Piping and Air Conditioning, vol. 11, no. 2, Feb. 1930, pp. 122-123, 3 figs. Illustrated description of oxygen chamber designed by A. L. Barach, and used in Columbia Presbyterian Hospital in New York City; temperature and humidity control; operation of system.

HOT WATER HEATING

Piping. Pipe and Orifice Sizes for Small Gravity Circulation Hot Water Heating Systems, E. G. Smith. Heat., Piping and Air Conditioning, vol. 11, no. 2, Feb. 1930, pp. 135-152, 12 figs. Investigation of two-pipe underfoot feed, direct-return system with bare mains; presentation of tables which have been prepared from results of experimental work; methods of pipe-line layout; tables giving capacities of direct radiation of orifices designed for vapour systems. Presented before Am. Soc. Heat. and Vent. Engrs.

HOT WATER SUPPLY

Heat Storage. New Small Type of Hot-Water Storage Equipment (Ein neuer kleiner Heisswasserspeicher). Rittershaussen. Elektrotechnische Zeit, (Berlin), vol. 51, no. 1, Jan. 2, 1930, pp. 12-13, 1 fig. Expensive metering equipment which is required for connection of hot-water storage equipment to network has prevented introduction of small types; new rate is developed by which this equipment can be avoided and resulting changes in storage equipment are outlined.

HYDRAULIC ACCUMULATORS

Principles. Hydraulic Power Accumulation, A. Page. Elec. Rev. (Lond.), vol. 105, no. 2718, Dec. 27, 1929, pp. 1131-1134, 7 figs. Brief outline of applications and principles of hydraulic power-accumulating installations, widely adopted on Continent, with reference to possibilities of this system of water-power storage as applied to steam-generating stations.

HYDRO-ELECTRIC POWER DEVELOPMENTS

India. Upper Ganges Canal—Hydro Electric Scheme. Times Trade and Eng. Supp. (Lond.), vol. 25, no. 603, Jan. 25, 1930, p. 452. Irrigation branch of United Provinces Government are constructing hydro-electric scheme of considerable local economic importance in connection with Upper Ganges Canal; irrigation branch will deliver low-tension three-phase 50-cycle power at sub-stations in all towns and large villages having population of 500 and upwards.

Quebec. Beauharnois Hydro Power Development. Can. Engr. (Toronto), vol., 58 no. 1, Jan. 7, 1930, pp. 101-103, 5 figs. Principal features of power development being undertaken by Beauharnois Power Corp.; large portion of initial 80-ft. head development of 500,000 hp. has already been sold; power canal, 15 miles long, provides navigation facilities; curve showing increase in total power installations in Ontario and Quebec from 1900 to 1928.

Winnipeg. Growth of the Winnipeg Hydro System, J. G. Glassco. Can. Engr. (Toronto), vol. 58, no. 4, Jan. 28, 1930, pp. 161-163, 3 figs. Manager of Winnipeg Hydro-Electric System notes substantial increase in consumption and corresponding reduction in power and lighting rates since inauguration of Winnipeg "Hydro"; central heating plant giving satisfactory results; power development under construction will give additional 100,000 hp.

HYDRO-ELECTRIC POWER PLANTS

British Columbia. Powell River Hydro-Electric Plant, British Columbia. Engineer (Lond.), vol. 149, no. 3863, Jan. 24, 1930, pp. 112-113 and 6 figs. partly on p. 106. Gravity-type dam has maximum height of 58 ft. and spillway length of 600 ft; flood discharges are passed through 19 Taintor gates; plant was intended to supply power to 250-ton paper mill, but mill was extended to capacity of over 500 tons; power plant consists of two distinct installations; more recently provided generator room contains one vertical-shaft turbine direct connected to C.G.E. 12,000-kva., 2300-volt, 50-cycle, three-phase generator.

Ice Control. Protecting Hydro Power Plants from Ice, S. Mornington. Can. Engr. (Toronto), vol. 58, no. 4, Jan. 28, 1930, pp. 169-172, 13 figs. Description of compressed air installation made at one of Seattle's hydro-electric plants to safeguard station from ice during winter and from fine trash at all times; compressed air thaws slush ice. Indexed in Engineering Index, 1929, from Compressed Air Mag., July 1929.

I

ICE PLANTS

Knoxville, Tenn. 130-Ton Plant with Dual Pressure, C. P. Goree, Jr. Refrigeration, vol. 47, no. 1, Jan. 1930, pp. 59-62, 6 figs. Illustrated description of new plant of Atlantic Ice and Coal Co. at Knoxville, Tenn., which embodies many outstanding new features of design; floor plan showing layout of principal equipment.

IMHOFF TANKS

Digestion, Etc. Foaming and Sludge Digestion in Imhoff Tanks, W. D. Hatfield. Indus. and Eng. Chem., vol. 22, no. 2, Feb. 1930, pp. 172-174, 1 fig. Progress of digestion, foaming, gas collection, sludge liquor alkalinities, acidities, pH's, and lime treatment of digestion chambers in Imhoff tanks covering two-year record of routine study and analysis is discussed; high carbon dioxide in gas seemed to be best indication of poor digestion and probable foaming. Bibliography.

INDUSTRIAL MANAGEMENT

Japan. The Management Movement in Japan, L. M. Gilbreth. Mgmt. Rev., vol. 19, no. 2, Feb. 1930, pp. 39-44. Account of section 12 or World Engineering Congress in Japan which was devoted to scientific management and brief review of papers presented.

INDUSTRIAL RESEARCH

Application to Industry. Industrial Research, F. A. Freeth. Engineer (Lond.), vol. 149, no. 3863, Jan. 24, 1930, p. 115. Main stress is laid upon spirit in which research is conducted; author deals with question of research not as confined to chemical industry, but as applicable to general industries of country as whole; suggests that key to successful industrial research will be found in development of individual scientific enthusiasm of research worker. Abstract of address before joint meeting of Soc. of Chem. Industry, Inst. of Chem., Soc. of Dyers and Colourists, and Manchester Literary and Philosophical Soc.

INTERNAL COMBUSTION ENGINES

Combustion. Contribution to the Study of Normal Burning in Gaseous Carbureted Mixtures, M. R. Duchene. Nat. Advisory Committee for Aeronautics—Tech. Memo., no. 547, Jan. 1930, 18 pp. 10 figs. Results of numerous investigations; study to provide equipment permitting study of propagation of region of reaction in mixtures of air and carbureted gases enclosed within cylinder; influence of richness of explosive mixture on rate of flame propagation, of degree of volumetric compression on one of hydrocarbons, and of variation of initial temperature of mixture before compression. From Service Technique et Industriel de l'Aéronautique, Bul. Technique, no. 54, Dec. 1928.

Combustion Analysis. Combustion Balance in Multi-Cylinder Internal Combustion Engines, C. E. Cox. Instruments. vol. 3, no. 1, Jan. 1930, pp. 63-64, 1 fig. Cards of pressure-time type drawn on paper fed from large roll are discussed; chart showing pressure peaks which cover 275 deg. of crank angle including compression and part of expansion; many cards are recorded on short chart so that easy analysis of combustion conditions can be made.

IRON AND STEEL METALLURGY

Advancement in. Advancement in Iron and Steel Metallurgy During 1929, H. M. Boylston. Fuels and Furnaces, vol. 8, no. 1, Jan. 1930, pp. 23-36. Discussion of progress made in ferrous metallurgy; development of stainless iron and steel; changes in dimensions and capacity of blast furnaces; increase in size of open hearth furnaces and developments in open hearth process; advancements in steel making, uses of alloy steels and knowledge of their compositions; studies of constitutional diagrams, use of x-ray, and developments of automatic metallographic polishing machine; developments of various heat treatments and resulting structure of materials; advances made in nitriding process.

L

LEAD ALLOYS

Developments of. Lead and Lead Alloys, G. O. Hiers. Min and Met., vol. 11, no. 277, Jan. 1930, pp. 5-6. Development of lead-calcium alloy with high fatigue strength; use of lead-alloy anodes in electrolytic zinc production; lead-lined articles for chemical equipment; antimonial lead-sheet tank linings for chromium plating; Bureau of Standards investigating use of lead for bearing metal. Bibliography.

LEVEES

Construction, Mississippi River. Levee-Building Operation, C. S. Hill. Eng. News-Rec., vol. 104, no. 6, Feb. 6, 1930, pp. 232-239, 20 figs. Construction conditions, methods and plans of Mississippi flood protection; lump unit-price requirements; borrow-pit restrictions; payment practices; track layout for industrial railway operation; standard superflood levee sections; appraisal of construction methods; dragline excavators; slackline cableway excavators; industrial railway haulage; tractor and crawler wagon work; experimental machines. Introductory note by T. H. Jackson.

LIBRARIES

Lighting. The Lighting of the Bodleian Library, Oxford. Illum. Engrg. (Lond.), vol. 23, Jan, 1930, p. 18, 2 figs. Two schemes were proposed; to light each individual reader's desk strongly and to provide low general illumination; to provide general illumination of high intensity, and no local illumination at all; after discussion was decided that latter arrangement was best.

LIGHT AND LIGHTING

Reflectors. Characteristics of Light-Diffusing Glasses (Die Kennzeichnung lichtstreuender Glaeser), L. Bloch. Licht und Lampe (Berlin), vol. 18, no.26, Dec. 26, 1929, pp. 1483-1486, 2 figs. Properties of light-diffusing materials; directed, diffused, and total reflection; absorption; practical importance of difference between directional and diffusing transparency; samples of reflector design and their characteristics.

LOCOMOTIVE FEEDWATER TREATMENT

Ireland. Water Softening Plants on the Great Southern Railways of Ireland. Engineer (Lond.), vol. 149, no. 3863, Jan. 24, 1930, pp. 103-104, 4 figs. Policy has been adopted by this Company of laying down large water-softening plants on mainline system; plants are all of Lassen-Hjort continuous automatic separate measurement type, supplied by United Water Softeners, in which hard water and reagents applied to soften it are synchronously metered and mixed in relatively small predetermined and adjustable quantities.

LOCOMOTIVE REPAIR SHOPS

Japan. Scheduling Locomotive Repairs in a Japanese Shop, F. H. Colvin. Am. Mach., vol. 72, no. 5, Jan. 30, 1930, pp. 207-211, 10 figs. Boiler repair in locomotive shops of Imperial Government Railways in Japan is outlined; careful study of operations involved, improved methods, and modern equipment, adopted during period of seventeen years, have cut time of shopping from 30 days to five, with actual reduction in personnel.

LOCOMOTIVES

Canadian National Railways. Northern (4-8-4) Type Locomotives, Canadian National Railways. Can. Ry. and Mar. World (Toronto), no. 383, Jan. 1930, pp. 1-3, 5 figs. Illustrated description of locomotives built by Montreal Locomotive Works for either passenger or fast freight service; cylinders 25 by 30 in.; driving wheels 73 in.; working pressure 250 lbs. per sq. in.; maximum tractive effort, 56,800 lb.; total engine wheelbase 43 ft. 10 in.; total engine weight in working order 33,800 lbs.; discussion of constructional features.

High Pressure. New High-Pressure Three-Cylinder Compound Locomotive for L. M. S. R. Modern Transport (Lond.), vol. 22, no. 562, Dec. 21, 1929, p. 9, 4 figs. Description of converted "Royal Scot" incorporating double boiler-pressure of 900 and 250 lbs. per sq. in.; cylinders 11 ½ by 18 by 26 in.; tractive effort 33,200 lbs. per sq. in.; weight in working order 24 tons; total engine wheelbase 52 ft. 9 ¼ in.

LUBRICATING OIL

Airplane Engines. Relationship of Laboratory Tests and Cold Weather Motor Operation of Various Oils. Air Corps Information Cir., vol. 7, no. 640, Oct. 1, 1929, 10 pp. 23 figs. Report covers pumping tests made on selected group of 20 oils taken from samples which were tested for resistance to shear as described in first progress report; purpose was to determine relationship between viscosity curve and pour point as determined by usual laboratory methods and pumpability at low temperatures for number of representative lubricating oils; most important result is relation of viscosity to pumpability at low temperatures.

LUMBER INDUSTRY

Exports and Imports, United States. Approximately $5,000,000 Increase in 1929 Wood Export, A. Marlowe. Commerce Reports, no. 6, Feb. 10, 1930, pp. 382-384. Net increase in value of exports of lumber and wood products in 1929 indicated by figure of $166, 951,000 which preliminary official statistics show, falls only about $200,000 short of reaching $5,000,000 mark, and is rise of nearly 3 per cent; comparison of last two year's trade by main groups of export schedule.

M

MACHINE TOOL DESIGN

Germany. Developments in German Machine Tool Design. Machy. (Lond.), vol. 35, no. 896, Dec. 12, 1929, pp. 360-364, 6 figs. Throughout past year standardization has been keynote of development in German machine tool industry while influence of rationalization in its strictest sense is also apparent; most striking example is provided by standard centre lathe developed by Union of German Lathe Builders; multi-operation machines; simplification of controls; reduction of loading time; improvements in drives.

Great Britain. Developments in British Machine Tool Design. Machy (Lond.), vol. 35, no. 896, Dec. 12, 1929, pp. 321-334, 28 figs. Review of British machine tool design during year; extra movement of rapid traverse adopted; station loading is growing practice; adaptation of standard centre mounting and of chucks have gradually been evelvod into radically new types; chief interest centres around motor applications; hydraulic feeds; push-button controls; ball roller and bearing applications; many different lubrication methods; pneumatic power; braces and stays; multi-spindle machines.

United States. Machine Tool Developments in the United States. Machy. (Lond.), vol. 35, no. 897, Dec. 19, 1929, pp. 390-395, 10 figs. Discussion of cylinder boring machines, horizontal boring machines, hydraulic feed, automatic milling machine, continuous milling machine, bridge type milling machine, automatic continous bevel-gear cutting machine, spiral bevel-gear generator, automatic gear shaper, gear hobbing machines, unusual hob-spindle mounting, gear burnishing machine, high-speed hydraulic press and machinability of metals. (Concluded).

MACHINE TOOLS

Hydraulic Drive. Hydraulically Operated Machine Tools. Machy. (N. Y.), vol. 36, no. 5, Jan. 1930, pp. 369-370, 1 fig. Functions of hydraulic transmissions as applied to many different types of modern machine tools are described; table is given showing different types of machines and application of hydraulic transmissions for each type.

MALLEABLE IRON CASTINGS

Malleable Iron Castings. Malleable Iron Castings (Temperguss), B. Osann. Maschinenbau (Berlin), vol. 8, nos. 23 and 24, Dec. 5 and 19, 1929, pp. 785-789 and 832-834, 20 figs. Definition; melting, casting, and annealing in pots and furnaces, cleaning and processing, are discussed; metallurgical processes, such as admixture of manganese, silicon and sulphur, influence properties; causes of failures in annealing; strength qualities; strength of malleable cast iron.

MANGANESE DEPOSITS

Manganese Deposits. World's Deposits of Manganese Ore (Die Manganerzlagerstaetten der Welt), F. Lohmann. Internationale Bergwirtschaft und Bergtechnik (Halle), vol. 22, no. 18, Sept. 4, 1929, pp. 283-290. Descriptions and capacities of deposits and analysis of ore, production and consumption in different countries from 1915 to 1927.

METALS

Crystallization. Theory of Recrystallization (Zur Therie der Rekristallisation), G. Tammann. Zeit. fuer anorganische und allegemeine Chemie (Leipzig), vol. 185, nos. 1 and 2, Dec. 10, 1929, pp. 1-34, 5 figs. General physical theory of recrystallization of metals; state of crystal after is plastic deformation; formation of recrystallization nuclei; changes in texture and structure accompanying recrystallization, with special reference to changes in grain size during thermal deformation.

MINE HOISTS

Electric. Development in the Uses of Electricity, R. P. Sloan. North-East Coast Instn. Engrs. and Shipbldrs.—Trans. (Lond.), vol. 45, 1928-1929, pp. 347-364 and (discussion) 365-372, 7 figs. Considerable amount of work had been done on investigation of winding problems with view of determining profile and dimensions of winding drums best suited to projected winding programme; in one recent case where 900-hp. motor would be required to meet existing winding conditions, it was found that if judicious alterations were made to drum profile and to shaft equipment, same hourly duty could be carried out by 400-hp. motor.

MINERAL RESOURCES

Australia. The Mineral Wealth of Australia—A Forecast, E. C. Andrews. Australasian Inst. of Min. and Met.—Proc. (Melbourne), no. 75, Sept. 30, 1929, pp. 57-58. General and political discussion of conditions which affect mining industry; improvement in prospecting, mining, and metallurgical methods; cooperation of government; relation between geological structure and minerals, of which deposits occur in Australia. Bibliography.

MINES AND MINING EQUIPMENT

Replacing of. Factors Affecting the Replacing of Equipment, P. B. Bucky. Min. and Met., vol. 11, no. 278, Feb. 1930, pp. 99-101. Discussion as to whether new equipment will make more profit for mining operation or will it pay better to keep on using old equipment.

MOTOR BUS BRAKES

DESIGN. Heavy-Duty-Motorcoach Brake-Design, G. A. Green. Soc. Automotive Engrs.—Jl., vol. 26, no. 1, Jan. 1930, pp. 41-48, 12 figs. Need for four-wheel brakes on motor coaches; motor coach- and automobile-brake problems compared; advantages and disadvantages of conventional forms of brake-operating mechanisms, namely, mechanical, compressed-air and hydraulic systems, are listed and commented upon; merits of materials used are compared; metal-to-metal and propeller-shaft brakes; future developments of braking systems for heavy-duty motor coaches.

MOTOR BUS CLUTCHES

TWO TYPES COMBINED. Combining Two Types of Clutch. Commercial Motor (Lond.), vol. 50, no. 1295, Jan. 7, 1930, p. 798, 1 fig. Description of combined cone and plate-type clutch embodied in 1930 passenger models of Karrier motor buses; it has been found that most satisfactory proportion of total torque for plate clutch varies from 15 to 25 per cent according to vehicle load.

MOTOR BUS DESIGN

TREND OF. The Trend of Motor Coach Design, F. R. Fageol. Can. Ry. and Mar. World (Toronto), no. 383, Jan. 1930. pp. 46-47. General review of motor-bus design of less few years; probable design in future. Abstract of paper read before Soc. Automotive Engrs. and Am. Ry. Assn.'s Motor Transport Division.

MOTOR BUS LINES

ELECTRIC RAILROAD OPERATION. Bus Operations Are Steadily Expanded by Electric Railways, J. R. Stauffer. Elec. Ry. Jl., vol. 74, no. 1, Jan. 1930, pp. 20-26, 3 figs. Purchases of new buses and extensions of bus mileage during past year denote normal and healthy progress; almost 2,200 buses were bought and nearly 4,000 miles of route was added; bus operations by electric railways and subsidiary companies as listed under 47 states, Hawaii, Philippine Islands, Porto Rico and Canada; buses bought by railways during 1929 as listed under States, United States Possessions and Canada.

MOTORCYCLE INDUSTRY

STATISTICS. The Motor-Cycle and Cycle Industry. Engineering (Lond.), vol. 129, no. 3341, Jan. 24, 1930, pp. 114-115. Statistical data on people employed; United Kingdom exports of motorcycle and tricars; international exports; net imports of pedal cycles.

MOTOR TRUCK DESIGN

TREND IN. The Trend of Weight and Size in the Development of Motor-Truck and Motor Coaches, P. Schon. Soc. Automotive Engrs.—Preprint for mtg., Jan. 20-24, 1930, 31 pp., 4 figs. Vibrating slow-speed, four-cylinder engines replaced with higher-speed, smoothly operating, six-cylinder powerplants; improvements in chasis units; question of what constitutes overload; improvements in chassis units; question of what constitutes overload; standardization of load spaces; comparative load-space dimensions for six different motor-trucks; motor vehicles legislation and taxation; differences in state laws handicaps motor-truck design; Hoover code protects interests of transportation; pneumatic and solid tires.

MOTOR TRUCK TRANSPORTATION

TRAILERS. Tractor-Semi-Trailer Operation, A. W. Kenerson. Soc. Automotive Engrs.—Jl., vol. 26, no. 1, Jan. 1930, pp. 105-107, 1 fig. Benefits derived by analysis made by Standard Oil Co. of Ohio of application of semi-trailer to petroleum transportation; means whereby interchangeability of tractors and trailers was accomplished throughout entire field of operation outlined; semi-trailer specifications developed; adaptation of tractors to trailers; extra heavy-duty tractor justified; mechanical flexibility and operating safety; assembly of units and initial cost.

MOTOR TRUCKS

PERFORMANCE CHARTS. Performance Capabilities at a Glance. Motor Transport (Lond), vol. 50, no. 1296, Jan. 13 1930, pp. 34-37, 3 figs. Description of chart method of quickly ascertaining from known factors road behaviour of transport vehicles; chart has been drawn up taking tractive resistance to be 40 lbs. per ton on level; second chart shows relations between engine speed, road speed, back-axle ratios and tire sizes for Sauer chassis.

SIX-WHEEL. Discussion of Six-Wheel-Vehicle Papers, E. W. Templin, L. R. Buckendale, A. M. Wolf, and G. M. Sprowis. Soc. Automotive Engrs. Jl., vol. 26, no. 1, Jan. 1930, pp. 59-66, 7 figs. Discussion following presentation of papers on six-wheel motor trucks published in December 1929 issue of Journal is given; question of whether tires of greater carrying capacity can be provided by tire manufacturers; effects of torque reaction on tires; dual rear tires for six-wheel vehicles are said to be most advantageous; diagrams showing how weight shifts between rear truck-unit axles analyzed; conversion of four-wheel into six-wheel vehicles by applying secondary axle.

N

NICKEL

ELECTROLYTIC. The Preparation of Pure Electrolytic Nickel, C. G. Fink and F. A. Rohrman. Am. Electrochem. Soc.—Preprint, no. 57-2, May 29-31, 1930, pp. 11-24, 5 figs. Elimination of copper from nickel-copper electrolytes is discussed; history and classification of methods for removing copper; experiments and results on effects of pH, current density, metal on concentration, temperature and agitation upon cathodic deposit; method for rapid removal of more than 90 per cent of copper present as impurity in nickel solutions.

O

OIL-ELECTRIC LOCOMOTIVES

THREE-POWER. Three-Power Locomotive Tested by the Illinois Central. Ry. Elec. Eng., vol. 21, no. 1, Jan. 1930, pp. 14-16, 4 figs. Description of flexibility and economy of 90-ton switcher which is proved by four months' operation, three sources of motive power: two Buda 155-hp. six-cylinder gas engines, connected to two General Electric 66-kw. electric generators; Exide iron-clad 180-cell, 544 amp-hr. storage battery floats across line, and overhead electric line; curves showing speed-tractive effort characteristics; general dimensions.

OIL ENGINES

OIL SPRAYING SYSTEMS. Experimental and Analytical Determination of the Motion of Hydraulically Operated Valve Stems in Oil Engine Injection Systems, A. G. Gelalles and A. M. Rothrock. Nat. Advisory Committee for Aeronautics—Report No. 330, 1929, 20 pp., 12 figs. Research on pressure variations in injection system of N.A.C.A. spray photography equipment and on effects on motion of timing valve stem; methods of analysis of pressure variations and general equation for motion of spring-loaded stem for timing valve are applicable to spring-loaded automatic injection valve, and in general to all hydraulically operated valves.

OPEN HEARTH FURNACES

GERMANY. Talbot Process in Steel Furnace, F. Brandt and W. Alberts. Iron Age, vol. 125, no. 4, Jan. 23, 1930, pp. 309-311, 3 figs. Description of Talbot furnace which was studied for installation in Vereinigte Stahlwerke, Huette Ruhrort-Meiderich; 200-ton open-hearth unit makes heat in four hours; details of design and operation; gas and air valves; motor-operated dampers; furnace titled by pivoted racks; furnace nearly 100 ft. long; mixed gas used as fuel; much pig iron in charge; heavy production attained; B.t.u. consumption under 4,000,000.

ORE TREATMENT

FLOTATION. The Trend of Flotation, A. J. Weinig and I. A. Palmer. Colo. School of Mines—Quarterly, vol. 24, no. 4, Oct. 1929, 152 pp. Ores adapted to flotation; discussion of methods; kinds of flotation; theory; reagents; consumption of reagents; operations; equipment; testing; practice; custom plants; concentrating plants using selective flotation; milling and reagent costs; royalties and patents; marketing of concentrates; manufacturers of flotation machines in United States; freight rates on metals, ores, and concentrates; wage scales. Bibliography.

P

PAVEMENTS

BRICK. Brick Pavements for Modern Traffic, J. Adler. Can. Engr. (Toronto), vol. 58, no. 3, Jan. 21, 1930, pp. 155-157. Paving brick and its development; cement grout and asphalt filler for joints; method of pouring asphalt filler; depth of paving brick; use of squeegee cart. Paper presented before Am. Soc. for Min. Improvements.

RUBBER. The Use of Rubber for Roads and Pavements, H. W. Newman. Commerce Reports, no 2, Jan. 13, 1930, pp. 97-98. Objections to use of rubber; advocates claim many advantages; history of rubber road building; Akron had first rubber street in America; practical endurance tests in Great Britain; advantages of rubber industry.

PHOTOELASTICITY

FAVRE'S METHOD. The Favre Purely Optical Method for Photoelastic Determination of Elastic Constraints (Méthode purement optique de Favre pour la détermination photoélasticimétrique des contraintes élastiques). Génie Civil (Paris), vol. 95, no. 22, Nov. 30, 1929, pp. 543-545. Theoretical mathematical principles of method developed by H. Favre at Zurich Institute of Technology; examples illustrating application of method to determination of principal stresses in circular disc.

PILES, CONCRETE

DRIVING. Value of Reinforced-Concrete Pile-Driving Formulae (La valeur des formules de battage des pieux en béton armé), H. Lossier. Génie Civil (Paris), vol. 95, no. 26, Dec. 28, 1929, pp. 638-641, 7 figs. General study of phenomena accompanying pile driving; comparison of Bénabenq practical formula with so-called Dutch dynamic formula; author stresses necessity of preliminary driving tests prior to driving of precast reinforced-concrete piles.

PISTON RINGS

CASTING. Casts Piston Rings Individually, E. Bremer. Foundry, vol. 58, no. 2, Jan. 15, 1930, pp. 64-68, 10 figs. Methods employed by Piston Ring Co., Muskegon, Mich., in producing rings from 5-8 to 64 in. in diam.; three cupolas used for melting; bulk of moulding is accomplished on specially designed squeezer-type moulding machines; moulding methods described in detail.

PLANERS

METAL WORKING. Combined Planer and Milling Machine of 4,100 mm. Working Width and 800 mm. Working Length (Eine kombinierte Hobel- und Fraesmaschine mit 4,100 mm. Arbeitsbreite und 8,000 mm. Arbeitslaenge), F. Sipmann. Maschinenbau (Berlin), vol. 8, no. 24, Dec. 19, 1929, pp. 827-829, 4 figs. Equipment built by Schiess-Defries in Duesseldorf for Brown Boveri and Co., in Baden, Switzerland, is to serve mainly for machining of casings of high-capacity turbines; electric drive and control throughout; equipment weighs 210,000 kg.

METAL WORKING, HYDRAULIC DRIVE. High-Speed Planer with Hydraulic Drive (Schnellhobler mit Fleussigkeitsgetriebe), C. E. Berck. Maschinenbau (Berlin), vol. 8, no. 22, Nov. 21, 1929, pp. 769-770, 6 figs. Compressed oil-driven planer developed by Lange and Geilin, Magdeburg, in collaboration with designer of compressed-oil drive, Sturm, of Stuttgart, is discussed; speed diagrams are given.

PLASTICS

CELLULOSE. The Cellulose Acetate Plastics, J. Rossman. Plastics, vol. 6, nos. 1 and 2, Jan. 1930, pp. 21-22 and 28-30 and Feb. 1930, pp. 74-75. Jan.: Progress in art of non-flammable and moulded products is reflected best in patented art, where all real research contributions are laid down. Feb.: Steadily forging to front, and capable of many applications, these products have an interesting history and have engaged serious attention of many workers and inventors. (To be continued.)

PLATES

STRESSES. On the Stresses in the Neighbourhood of a Circular Hole in a Strip Under Tension, R. C. J. Howland. Royal Soc. of Lond.—Philosphical Trans. (Lond.), vol. 229, Jan. 6, 1930, pp. 49-86. Paper presents solution by successive approximation of problem of determining stresses in plate under tension bounded by two parallel edges and containing hole midway between edges; comparison of theoretical results with those obtained by Coker, Chakko, and Satake, using optical methods.

PORCELAIN MANUFACTURE

PROCESS CONTROL. Process Control in Continuous Production, F. H. Riddle and H. F. Royal. Indus. and Eng. Chem., vol. 22, no. 1, Jan. 1930, pp. 14-20, 8 figs. System of Champion Porcelain Co.; raw materials; storage and withdrawal system for raw materials; grinding of lump andalusite and dumortierite; preparation of body; formation of cores; burning of ware; product finishing and testing; engineering department.

POTENTIOMETERS

HIGH TENSION. New Type Potentiometer for High Voltages (Ein neuartiger Spannungsteiler fuer Hochspannung), H. Schaefer. Elektrotechnische Zeit. (Berlin), vol. 51, no. 2, Jan. 9, 1930, pp. 55-56, 2 figs. Equipment consisting of 60 Dralowid high-resistance elements of megohms each, is described.

POWER PLANTS

STEAM VS. HYDRO-ELECTRIC. Water or Steam Power—The Economics of the Question, G. A. Orrok. Power, vol. 71, no. 4, Jan. 28, 1930, pp. 148-150, 2 figs. Evaluation of cost of water power; comparative total costs of steam and hydro-electric power; limitations to which hydro-electric plants are subject; self-sufficiency of steam plants; comparison curves of total costs of steam and hydro-electric power; cost of steam generated power is steadily decreasing. Paper read before World Engineering Congress, Tokyo. Indexed in Engineering Index, 1929, from Mech. Eng., Dec. 1929.

PRESSURE VESSELS

ALUMINUM. Tests With Aluminum Pressure Vessels (Versuche mit Dampffaessern aus Aluminum), M. Ulrich. Waerme (Berlin), vol. 53, no. 2, Jan. 11, 1930, pp. 25-26, 5 figs. Deformations of different boiler parts under different pressures is discussed; tests form part of experimental study being carried out at materials-testing laboratory of Stuttgart Institute of Technology.

WELDING. Welding for Boilers, Pressure Vessels and Steam Lines, C. W. Obert. Power Plant Eng., vol. 34, no. 3, Feb. 1, 1930, pp. 174-175. Present status of allowed construction and methods; welded boiler drums; welds for piping. Abstract of paper presented before Int. Acetylene Assn.

PROTECTIVE COATINGS

CORROSION. Corrosion—A Problem in Protective Coatings, F. N. Speller. Gas Jl. (Lond.), vol. 189, no. 3479, Jan. 22, 1930, pp. 209-211. Notes on relative corrosion of wrought-iron steel, and pure iron; corrosion and electrochemical theory; natural protective films; protection with thick coatings; more resistant metals. Paper read before Am. Soc. Steel Treating. Indexed in Engineering Index 1929, from various sources.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostat copies (white printing on a black background) of the articles listed in this section or others on engineering subjects can be obtained from the Engineering Societies Library at a cost of 25c. per page.

When ordering identify the article by giving: the author; the title of the article; the name of the periodical in which it appeared; and the volume and page numbers. A remittance of 25c. a page should accompany the order.

The print's size is limited to 11 by 14 inches, but where possible, two pages up to 7 by 9 inches in size will be photographed on one print, larger magazines require a print per page.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

AERIAL TRANSPORTATION

Canada. Some Notes on the Technical Problems of Canadian Aviation, D. C. M. Hume. Flight (Lond.), vol. 21, no. 1094. Dec. 13, 1929, pp. 1312-1314. Geographical survey of Canada and climates prevailing in different parts outlined; position of Canada from flying point of view unique; effect of climate on aircraft; trouble with wood and rubber parts due to climate and fungi; difficulties with engine; evolution of skis; immediate requirements of future. Abstract of paper presented before Roy. Aeronautical Soc.

AIRPLANE ENGINES

Design. Gauging Airplane-Engine Performance, J. H. Geisse. Soc. Automotive Engrs.—Jl., vol. 26, no. 2, Feb. 1930, pp. 221-224 and (discussion) 224-225, 1 fig. All factors exclusive of reliability can be evaluated so as to provide good basis for choosing engine; effect of changes in engine weight on operating cost; tables show effect of increased engine weight, operating cost, and operation-expense items that are affected; increasing weight of 200-hp. engine from 400 to 494 lbs. would be justified provided increases in time between partial and major overhauls and total life could be correspondingly increased; engine resistance.

Diesel. Diesel Engines, W. G. Meyers. Aeronautics, vol. 6, no. 2, Feb. 1930, pp. 19-20, 70, and 72, 5 figs. Review of what has been done to date in developing Diesel or oil burning engine for high speed and light weight requirements of aircraft; opposed-piston type of oil engine developed by H. Junkers; troubles encountered in development of Diesel engines outlined by Morgan; technical features on Packard Diesel.

AIRPLANE PROPELLERS

Forging. Development of the Drop-Forged Metal Propeller, F. W. Caldwell. Am. Soc. Mech. Engrs.—Advance Paper, for mtg. Mar. 12, 1930, 5 pp. Development of type of propeller suitable for drop forging is discussed; selection of forged-steel blade of very high aspect ratio and great diameter with low camber ratios at tip, but with comparatively thick sections in inner part; eliminating fluttering tendency; designing first aluminum alloy propeller; improvements in methods of inspection; limit of life of blades not yet established; question of vibration.

Variable Pitch. Test of an Adjustable Pitch Model Propeller at Four Blade Settings, E. P. Lesley. Nat. Advisory Committee for Aeronautics—Tech. Notes No. 333, Feb. 1930, 15 pp., 11 supp. figs.

AIRPLANES

Design. Aircraft of the Near Future, W. Mitchell. Aeronautics, vol. 6, no. 1, Jan. 1930, pp. 12-14, 58, 60, and 64, 4 figs. Trend of aircraft production is outlined; passengers and freight should be carried in wings instead of fuselage; landing gear should be folded up when airplane is in flight; variable pitch propellers; superchargers; airplane structure; engine self-starters; blind flying; gyroscopic compasses; criticism of Graf Zeppelin; advantages of airships as airplane carrier.

Metal Construction. Metalizing the Airplane H. V. Thaden. Am. Soc. Mech. Engrs.—Advance Paper for mtg., Mar. 12, 1930, 7 pp. Advantages of metal airplanes; two basis schools of structural design, one making use of conventional type of framed structure and other monolithic type of structural design which in general is not amenable to conventional determinate analysis; important advantage of monolithic type; type of fuselage structure using transverse bulkheads but replacing longitudinals with sheet metal corrugated longitudinally; skin takes all of shear loads and chord loads; different wing structures; inspectability of interior of structural importance.

ALLOY STEEL

Anti-Corrosive. Recent Developments in Corrosion and Heat-Resisting Steels, R. Hadfield, T. G. Elliot and R. J. Sarjant. Chem. and Industry (Lond.), vol. 49, no. 4, Jan. 24, 1930, pp. 41T-51T, 11 figs. Development of non-corroding and heat-resisting steels; mechanical and physical properties of corrosion-resisting steels; photomicrographs; resistance to scaling and strength at high temperatures; industrial applications of corrosion-resisting and heat-resisting steels.

Heat-Resisting. Alloys That Resist Heat, T. H. Nelson. Iron Age, vol. 125, no. 6, Feb. 6, 1930, pp. 431-434, 3 figs. Selection of suitable material for heat resistance is not a simple problem; four classes of alloys available; corrosion and heat resistance are same problem; heat corrosion in domestic heaters; failure often due to chemical corrosion; special dependence on certain alloys; alloys for both corrosion and heat; special steel for valves; more nickel than chromium not essential.

ALLOYS

Aluminum. *See Airplanes.*
Bronze. *See Bronze.*
Copper. *See Copper Alloys.*

ASBESTOS

Review of 1929. Asbestos, N. R. Fisher. Eng. and Min. Jl., vol. 129, no. 3, Feb. 8, 1930, p. 116. Brief review of asbestos industry for 1929, regarded as unusually prosperous year; notes on production in Canada, Rhodesia, Union of South Africa, Cyprus, Russia, United States, and Italy; prospects for 1930 are problematical.

ASPHALT MANUFACTURING PLANTS

Chicago. Pavrite Asphalt Plant a Modern Installation, P. J. Kealy. Highway Engr. and Contractor, vol. 36, no. 2, Feb. 1930, pp. 70-73, 3 figs. Description of Chicago asphalt plant for manufacture of cold mixed bituminous product at rate of 50 tons per hour; drier arrangement; tower design; chute arrangement; heating of asphaltic cement; asphalt storage; vibrating screen, etc.

AUTOMOBILE PLANTS

Production Machine Tool for. A Production Machine-Tool of Elastic Design, J. B. Armitage. Soc. Automotive Engrs.—Jl., vol. 26, no. 1, Jan. 1930, pp. 87-88 and (discussion) 89-90 8 figs. Adaptation of standard machine tool to automobile manufacture as worked out by one milling-machine manufacturer is discussed; beginning with milling machine of relatively simple design, special heads are substituted or added according to requirements of job; adding duplicate head at front makes machine duplex and one or more adjustable heads for vertical spindles can be supported between two main heads.

AUTOMOBILES

Front-Wheel Drive. An American Front-End-Drive Car. Sci. Am., vol. 142, no. 1, Jan. 1930, pp. 28-29, 4 figs. Description of Cord front-drive automobile; history of front-drive car in America is mostly racing; closeness with which Cord car hugs ground and yet has road clearance equal to most rear-drive cars.

B

BEAMS

Aluminum, Testing. Pioneer Tests of Aluminum Beams Reveal Good Structural Qualities, R. L. Templin and E. C. Hartmann. Eng. News-Rec., vol. 104, no. 8, Feb. 20, 1930, pp. 314-316, 5 figs. Report on tests made at research laboratories of Aluminum Co. of America; six aluminum and four steel I-beams 5 to 10 in. deep, and 10½ ft. long were tested; aluminum beams found to support 13 per cent more load than steel of same size and 130 per cent more load per pound of weight. See editorial comment on p. 307.

Perforated, Stresses in. Effect of a Circular Hole on the Stress Distribution in a Beam under Uniform Bending Moment, Z. Tuzi. Lond., Edinburgh and Dublin Philosophical Mag. and Jl. of Sci. (Lond.), vol. 9, no. 56, Feb. 1930, pp. 210-224, 6 figs. Investigation of stress distribution in beam having hole on neutral axis and subjected to uniform bending moment; experimental results obtained by photoelasticity, using new material, Phenolite, five times more sensitive than Xylonite; stresses are measured directly, counting interference fringes; experimental results compared with theory worked out in this paper.

BEARINGS

Anti-Friction, Fits in. Assembly Fits in Anti-Friction Bearings (Einbaupassungen fuer Waelzlager), T. Damm. Werkstattstechnik (Berlin), vol. 24, no. 2, Jan. 15, 1930, pp. 49-50, 2 figs.

Anti-Friction, Pressure Measurements on. Pressure Measurements on Roller Bearings (Druckmessungen an Walzenlagern), O. Von Auwers. Wissenschaftliche Veroeffentlichungen aus dem Siements-Konzern (Berlin), vol. 8, no. 2, July 8, 1929, pp. 137-143, 22 figs. Examples of measurement and possibilities of their practical application; many sidedness of measurements if viewed from economic angle.

Lubrication. Oil Lubricated Journal Bearings (Les coussinets à routement sur huile), H. Brillie and A. M. Robb. Génie Civil (Paris), vol. 95, nos. 24 and 25, Dec. 14, 1929, pp. 586-589 and Dec. 21, 1929, pp. 618-620, 14 figs.

BOILERS

Design. Influence of Design of Boiler and Firebox on Slag Formation on Heating Surface (Einfluss der Kesselbauart und Feuerraumform auf das Verschlacken der Heizflaeche). Waerme- und Kaelt-Technik (Muehlhausen) ,vol. 32, no. 2, Jan. 31, 1930, pp. 6-8, 4 figs. It is shown how, with aid of softening curve of coal ash, it is possible to determine numerically if danger of slag formation exists; advantages of such softening curves for design of boilers and boiler furnaces as compared with usual fusion-point determination is demonstrated.

Furnaces, Design of. Economics of Boiler Furnace Design, J. Y. Parce, Jr. Colo. Engr., vol. 26, no. 2, Jan. 1930, pp. 52-54, 70 and 72, 4 figs. Principal factors which enter into economic study of boiler-furnace problem are discussed; water and air-cooled wall construction; minimum total surface requirements reached when furnace is about 40 per cent water-cooled; several different ways of partially cooling furnace; each type of water-cooled furnace designed has some field for which it is particularly advantageous.

Furnaces, Water - Cooled. Furnaces for Powdered Coal—Should They be Apartmented? R. Mathews. Power Plant Eng., vol. 34, no. 4, Feb. 15, 1930, pp. 218-221, 1 fig. Discussion of boiler efficiency with reference to furnaces with water walls and article advocates more attention to thermodynamics of solid flue combustion; Scotch marine boiler offers same problem as small water-cooled furnaces; experiments must be resorted to in order to obtain necessary information; carbon particles form effective heat screen; forced circulation might be advisable.

Marine, Pulverized-Coal-Fired. Pulverized Coal for Marine Boilers, E. H. Peabody. World Eng. Congress Part 1—Paper (Tokyo), no. 426, 1929, 23 pp., 10 figs. on supp. plates. Brief discussion of pulverized-coal burning installations; major portion of paper touches on following; tests at Philadelphia Navy Yard; burner design; advantages of pulverized coal; type of pulverizer; screens for classifying pulverized coal; distributors; driers; review of papers on pulverized coal for marine purposes. (In English.)

Pulverizen-Coal-Fired. General Operation Experiences with the First Wood Steam Generator, E. W. Smythe. Engineering (Lond.), vol. 129, no. 3342, Jan. 31, 1930, pp. 149-152, 8 figs.; and Engineer (Lond.), vol. 149, nos. 3864, 3865, and 3866, Jan. 31, 1930, pp. 142-144, and (discussion) 127-128, Feb. 7, p. 170 and (discussion) 157-158, and Feb. 14, pp. 194-195, 25 figs. Record of actual experience obtained throughout various stages of development and subsequent operation of first radiant-heat boiler in Great Britain, fired exclusively with pulverized fuel, comprising plant known as Wood steam generator. Paper read before Instn. Mech. Engrs., Jan. 24, 1930.

REGULATORS. Automatic Boiler Control in a Combined Steam-Hydro-electric Plant (Automatische Kesselregelung in einem Dampf-Wasser-Kraftwerk), K. d'Huart. Waerme (Berlin), vol. 53, no. 9, Mar. 1, 1930, pp. 134-138, 14 figs. Economic load equalization of boiler sets in combined steam-hydro plants obtained with furnace control regulators; requirements of such regulations; description of Arca regulators and results obtained.

BRIDGE DESIGN

PROGRESS IN. Fifty Years of Progress in Bridge Engineering, D. B. Steinman. Iron and Steel of Canada (Gardenvale, Que.), vol. 13, no. 1, Jan. 1930, pp. 1-4, 7-8, 19-21 and 23, 5 figs. Historical sketch of improvement in bridge design and construction during past 50 years is given; theory of bridge design; different types of steel-bridge construction are described. Abstract of paper presented before Am. Inst. Steel Construction, indexed in Engineering Index 1929, from Military Engr., Sept.-Oct., 1929.

BRIDGE PIERS

STRENGTHENING. Reinforcing Railroad Bridge Piers under Heavy Traffic. Eng. News-Rec., vol. 104, no. 10, Mar. 6, 1930, pp. 406-407, 4 figs. Work on Lower Maumee River two-track, steel-truss bridge, at Toledo, involves difficult underpinning work using open metbod of widening piers.

BRIDGES, CONCRETE

DESIGN. Ferro-Concrete in Bridge Construction. Modern Transport (Lond.), vol. 22, no. 59, Nov. 30, 1929, pp. 11-12, 3 figs. Discussion of use of reinforced concrete in bridge construction; two main metbods in constructing reinforced-concrete bridge are girder type, which is built on familiar beam and slab principle, and arch type, wbicb takes form of series of parallel ribs.

CONSTRUCTION. Construction Plant and Metbods for Concrete Bridges. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 8, Oct. 1929, pp. 2049-2051 and (discussion) 2052. Abstract of committee report; discussion of factors that affect bridge contractor's bid; stream studies; progress schedule; importance of safety; pumping equipment.

BRIDGES, CONCRETE ARCH

CONSTRUCTION. Two Higb Travelling Towers with Chutes Place Concrete on New Brunswick Multiple Arch Bridge, M. Goodkind. Eng. News-Rec., vol. 104, no. 8, Feb. 20, 1930, pp. 317-321, 8 figs. Design and construction of highway bridge conisting of six 202-ft. open spandrel arches, flanked by four 40-ft. barrel arches on north end and five similar spans on south end; three-hinged steel trusses used for centreing; celluloid models cbecked design and determined location of expansion joints; contractors plant layout; details of travelling concrete towers. See editorial comment on p. 308.

Huge Steel Arch Centres Moved as Units in Rapid Construction of 48-Span Intercounty Concrete Highway Bridge across the Susquehanna River. Construction Methods, vol. 12, no. 1, Jan. 1930, pp. 54-59, 19 figs. Method of construction of concrete arch bridge, 7,374 ft. long, witb 38 ft. roadway and 6 ft. sidewalks, on highway between Philadelpbia and Pittsburgh, consisting of 28 three-rib reinforced-concrete arch spans, 180 ft. long; details of arch steel trusses used as centreing; methods of moving centreing and concreting of arch ribs.

BRIDGES, MASONRY ARCH

WIDENING. Widening the Concorde Bridge of Paris (L'élargissement du Pont de la Concorde à Paris). Génie Civil (Paris), vol. 96, no. 6, Feb. 8, 1930, pp. 134-135, 4 figs. Details of plan for widening old masonry arch bridge over Seine from 14.75 m. to total width of 35 m., 21 m. being allowed for vehicular traffic and 7 m. on each side of it for pedestrians.

BRIDGES, RAILROAD

STRESSES. On the Question of the Investigation into the Static and Dynamic Stresses in Railway Bridges (Subject III for Discussion at the Eleventh Session of the International Railway Congress Association), A. A. C. Ronsse and R. Desprets. Int. Ry. Congress Assn.—Bul. (Brussels), vol. 11, no. 12, Dec. 1929, pp. 3013-3128, 4 figs. General considerations; brief study of vibratory state of girder on two supports; comparison between results of Frencb and German impact formulae; comparison with recent English rules.

BRIDGES, STEEL

SUPERIORITY OF. The Superiority of the Steel Bridge. Iron and Steel of Canada (Gardenvale, Que.), vol. 12, no. 12, Dec. 1929, pp. 299-301 and 316, 3 figs. Flexibility and movability defined; initial cost and maintenance cost of bridges; reasons why steel bridge is superior in permanence. (Concluded.) Reprinted from Am. Inst. of Steel Construction.

BRIDGES, STEEL ARCH

DESIGN. Plans and Research—Kill van Kull Bridge, O. H. Ammann. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 3, Mar. 1930, pp. 487-493 and (discussion) 494-500, 4 figs. Report on preliminary studies; traffic demands; comparative designs for two-hinged spandrel-braced steel arch 1,646 ft. in span; model tests found invaluable economy of special steels; discussion by J. Jones, L. S. Moisseiff, C. M. Spofford, C. E. Chase, C. E. Fowler; model studies in connection with Detroit River Bridge and Maumee River Bridge; alternative suspension design; advantages of continuous bridge; art in large bridges.

BRIDGES, STEEL TRUSS

MONTREAL. Fabrication and Erection of Superstructure of Montreal South Shore Bridge, L. R. Wilson. Eng. Jl. (Montreal), vol. 13, no. 1, Jan. 1930, pp. 3-54, 101 figs. Detailed report on construction of steel bridge, having total length of 8,817 ft. exclusive of approaches, and comprising symmetrical cantilever span 1,937 ft. long; secondary steel-truss spans vary from 96 to 249 ft. in length; general alignment of bridge is not straight; details of construction equipment. Paper presented before Eng. Inst. of Canada.

BRIDGES, SUSPENSION

GERMANY. The New Cologne-Muelheim Highway Bridge over the Rhine (Die neue Strassenbruecke ueber den Rhein in Koeln-Muelheim), F. Herbst. V.D.I. Zeit. (Berlin), vol. 74, no. 6, Feb. 8, 1930, pp. 161-167, 28 figs., partly on supp. plate. Details of design, construction, and architectural treatment of suspension bridge of 315 m. span, over 600 m. total length, and about 32 m. overall width; steel towers are 52 m. high; details of anchorages and methods of cable spinning.

PORTLAND, ORE. Rope-Strand Cables Used in New Bridge at Portland, Oregon, D. B. Steinman. Eng. News-Rec., vol. 104, no. 7, Feb. 13, 1930, pp. 272-277, 7 figs. St. Jobns Bridge witb 1,207-ft. suspended span over Willamette River, sets new record for rope-strand cables; architectural studies result in use of batter-leg towers with pointed arches; details of stiffening truss connections at main and cable bent towers; celluloid tower model gave deflections that indicated stresses below computed values; saddle details of rope-strand cable; total contract cost was $3,222,206.

BRONZE

CASTINGS. Effects of Oxidation and Certain Impurities in Bronze. J. W. Bolton and S. A. Weigand. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 281, for mtg. Feb. 1930, 17 pp., 36 figs. Paper discusses some fundamental metallurgical principles involved in production of sound cast bronze, and supplements previous paper in whicb theory was advanced tbat oxidation in bronze casting is due to incipient shrinkage; effects of certain impurities and of actual oxidizing conditions are shown; appendix deals with appearance of various inclusions. Bibliography.

C

CABLEWAYS

LOCATION OF. Improving on Rope-Tramway Location by Using Angle Towers and Stations, F. C. Carstarphen. Eng. and Min. Jl., vol. 129, no. 2, Jan. 23, 1930, pp. 59-62, 11 figs. Author contends that high efficiency of straight-line tramway location is fallacy; discussion of various problems involved in design and location; suggestions as to most economical and efficient type of design.

CANALS

WELLAND. Construction Methods on the Welland Ship Canal, E. G. Cameron. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 8, Oct. 1929, pp. 2081-2097, 12 figs. History of project; cost distribution; earth excavation; dredging operations; rock excavation; excavating and loading costs; lock construction; form work; concrete bandling and form moving in flight locks; Chippawa Creek siphon culvert.

CHESAPEAKE AND DELAWARE. The Chesapeake and Delaware Canal, E. I. Brown. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 2, Feb. 1930, pp. 293-340, 11 figs. Record of construction of navigation canal, connecting Delaware River with Chesapeake Bay, having length of 14 mi. and summit level 17 ft. above mean low water of Delaware River; history of project from 1764; quantities, yardage, prices, total costs, and methods of procedure in connection witb dredging operations; descriptions of bridges; outline of hydraulic theory as applied to project; economic value of canal.

CAST IRON

HIGH TEST. Recent Developments in the Metallurgy of Cast Iron, R. Moldenke. Metals and Alloys, vol. 1, no. 7, Jan. 1930, pp. 327-328. Outline of present-day knowledge of improving cast iron to previously not dreamt-of degree; bebaviour of graphite nuclei in cupola melting under increasing conditions of superheat, the higher the temperature the more complete being their solution in molten iron; microstructure of high-test cast iron predominately pearlitic.

CEMENT MORTAR

STUDY OF. A Study of Portland Cement Mortars Having Diatomaceous Earth as An Admixture, J. E. Buchanan. Am. Concrete Inst.—Jl., vol. 1, no. 2, Dec. 1929, pp. 184-201, 6 figs. Report on University of Idabo tests comparing behaviour and characteristics of portland-cement mortars containing small percentages of diatomaceous earth with identical plain portland cement mortars; effect of diatomaceous earth upon consistency, expansion, compressive strengtb, shrinkage in air, and time of set. Bibliography.

CHEMICAL ENGINEERING

PROGRESS IN 1929. Chemical Engineering Progress in 1929, J. W. Hinchley. Indus. Chemist (Lond.), vol. 6, no. 51, Feb. 1930, pp. 53-56. Attitude of manufacturer toward chemical research; need for chemical engineering research; improvements in fuel economy; importance of materials of construction such as iron and steel alloys; progress in utilization of iron-nickel-chromium alloys; bearing properties of stainless steel; nitrogen method of hardening steel; use of nickel alloys; metals coatings; chemical plant equipment.

CHROMIUM-NICKEL STEEL

DRAWING. Drawing Chrome-Nickel Alloy Utensils. Iron Age, vol. 125, no. 6, Feb. 6, 1930, pp. 445-446, 1 fig. Allegheny metal used for hotel, household and hospital ware requires high heat treatment and special care in processing methods employed by Lalance and Grosjean and Grosjean Mfg. Co., Woodbaven, N.Y.; white pickled instead of polished sheets; heat treated at 1,900 to 1,950 deg.; finished by grinding four times, welding to be used for attachments.

CHROMIUM PLATING

COMMERCIAL. Commercial Chromium Plating, R. Schneidewind. Univ. of Mich.—Dept. of Eng. Research, no. 3, Jan. 1930, 60 pp., 23 figs. Practical side of chromium plating is discussed; properties of chromium plate; equipment including motor generators, rheostats, tanks, fume exhausting apparatus, temperature-control equipment, racks and contacts, and anodes; process of plating; bath; preparation of surface; effect of variations in plating conditions and solutions; notes on throwing power; control methods in chromium plating; stripping; inspection; defective chromium plating; costs.

COAL

CARBONIZATION, LOW-TEMPERATURE. Low-Temperature Carbonization, D. Brownlie. Chem. and Industry (Lond.), vol. 49, no. 5, Jan. 31, 1930, pp. 92-94, 2 figs. Account of modern work on commercial scale with Babcock process; arrangement consists of overhead coal bunker, pre-drier, retort, and screw-conveyor feed gear to chain-grate stokers, while coal in passing down tbrough retort is carbonized at about 1,290 deg. fahr. by mixture of superheated steam and combustion gases.

HANDLING. *See Materials Handling.*

COAL MINES AND MINING

ELECTRIC POWER. Electric Power for the Union Pacific Company Mines, D. C. McKeehan. Min. Congress Jl., vol. 16, no. 2, Feb. 1930, pp. 128-130, 8 figs. Central power plant for Rock Springs groups of mines in southern Wyoming; description of boiler room, power house, water-cooling system, transmission lines, transformers, underground substations, and underground feeder lines.

MECHANIZATION. Mechanical Operation at Hanna Mines, J. V. McClelland. Min. Congress Jl., vol. 16, no. 2, Feb. 1930, pp. 109-112, 9 figs. Descriptions of operations at mines in Wyoming with large electric shovel, mechanical loaders, rock shovels, scrapers and conveyors; mechanical loading on 100 per cent basis; slope driving in beavy pitch and thick coal; description of drainage and ventilation.

NOVA SCOTIA. Nova Scotia's Coal Production. Can. Engr. (Toronto), vol. 58, no. 6, Feb. 11, 1930, p. 211. Total output for last year was 6,339,492 tons; outlook promising; substantial increase in gypsum production.

QUEBEC. The Rouyn District of Quebec. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 2, Jan. 10, 1930, pp. 38-39. Notes on progress of mines and smelter during 1929.

COLUMNS, CONCRETE

DESIGN. Design of Reinforced Concrete Columns Subject to Flexure, H. Cross. Am. Concrete Inst.—Jl., vol. 1, no. 2, Dec. 1929, pp. 157-169. Discussion of sources of flexure; bending moments in columns not integral with girders; design methods; designing for invariable moment and variable moment; use of high strength concrete; variation of column diameter; tensile reinforcement; flared column heads; allowable stresses.

CAST IRON CORES. Reinforced-Concrete Columns with Cast-Iron Cores. Eng. News-Rec., vol 104, no. 7, Feb. 13, 1930, pp. 277-278. Compilation of information on nature and service of Emperger type of reinforced-concrete column, used in McGraw-Hill Building, Chicago; reduced size for given strength is advantage in large buildings; solid and bollow cores; use and tests; building code provisions.

COMBUSTION

FURNACE. Calorific Value, Heat Balance, and Efficiency in Furnace Tecbnique (Heizwert, Waermebilanz und Wikungsgrad in der Feuerungstechnik), K. Rummel and G. Neumann. Arcbiv. fuer das Eisenhuettenwesen (Duesseldorf), vol. 3, no. 8, Feb. 1930, pp. 531-544, 1 fig. Relations between cbemical energy and calorific value for wet and dry fuels (solid, liquid, and gaseous); balances with upper and lower calorific value; advantages and disadvantages of upper and lower values.

CONCRETE

READY-MIXED. Ready-Mixed Concrete, S. Walker. Rock Products, vol. 33, no. 3, Feb. 1, 1930, pp. 87-90. Tendency towards use of finished materials; field for ready-mixed concrete; types of job; size of community necessary; location of plant; capacity of plant and investment; selection of type of equipment; dry batching plants; effect of transportation on quality. Paper presented before Nat. Sand and Gravel Assn.

CONCRETE TESTING

PERMEABILITY. Some Permeability Studies of Concrete, F. R. McMillan and I. Lyse. Am. Concrete Inst.—Jl., vol. 1, no. 2, Dec. 1929, pp. 101-142, 20 figs. Report on tests undertaken by Portland Cement Assn., for studying water-tightness of concrete mixtures; description of apparatus for determining resistance of concrete to penetration of water; leakage curves for concrete specimens; effect of method of moulding and of duration of test; effect of water-cement ratio, curing and age; characteristics of cement; effect of direction of pressure and amount of paste; effect of admixtures.

CONSTRUCTION INDUSTRY

CANADA. Vital Problems of the Construction Industry Discussed at Quebec Convention. Contract Rec. (Toronto), vol. 43, no. 6, Feb. 5, 1930, pp. 127-137. Report on proceedings of 1930 annual meeting of Canadian Construction Association; abstracts of discussions and resolutions on credits, group advertising, salesmanship, freight rates, five-day week, use of Canadian material; apprentice training survey, etc.

CONVEYORS

BOX. A Conveyor System that Handles Three Million Boxes a Year, T. A. Keefer. Machy. (N.Y.), vol. 36, no. 6, Feb. 1930, pp. 437-441, 8 figs. Discussion of conveyor system employed in plant of National Cash Register Co., Dayton, Obio, of which over eight miles are in use; installation served six buildings containing over 100,000,000 sq. ft. or 24 acres of floor space; vertical conveyors extend from basements to top floors; how boxes are dispatched and received; conveyor spirals permit temporary storing of boxes.

COPPER

GAS CONTENTS. A Theory Concerning Gases in Refined Copper, A. E. Wells and R. C. Dalzell. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 270, for mtg. Feb. 1930, 15 pp., 2 figs. Certain gases dissolve in molten copper, partly evolving on solidification; cuprous oxide, colloidally dispersed in molten copper, adsorbs certain gases; solidification liberates parts of adsorbed gases; porosity in cast copper is caused by gases from two sources; sulphur dioxide dissolves in molten copper, partly reacting witb it to form cuprous sulpbide and cuprous oxide, but only small quantities are produced in refined copper. Bibliography.

COPPER ALLOYS

COPPER-MAGNESIUM. Constitution of Magnesium-Copper Alloys, J. A. Gann and A. W. Winston. Am. Soc. for Steel Treating—Trans., vol. 17, no. 2, Feb. 1930, pp. 292-293, 1 fig. Equilibrium diagram and results of investigation of crystal structure and X-ray examination. Recommended Practice Committee release.

WELDING. Welding Facts and Figures, D. Richardson and E. W. Bircb. Welding Jl. (Lond.), vol. 26, no. 315, Dec. 1929, pp. 386-388. Properties of copper and nickel alloys are discussed; high copper alloys have excellent welding cbaracteristics combined witb good strength; analysis of nickel alloys and methods of welding taken up.

COPPER ORE TREATMENT

BRITISH COLUMBIA. The Allenby Concentrator of tbe Granby Company, H. R. Taylor. Eng. and Min. Jl., vol. 129, no. 4, Feb. 24, 1929, pp. 175-177, 4 figs. Brief outline of important steps in development of concentration practice; description of equipment and practice in present concentrator, with capacity 2,500 dry tons per day; flow sheets and milling data are given; consumption of flotation reagents; costs are not given.

QUEBEC. Twelve Months' Milling at Noranda, C. G. McLachlan. Can Min. and Met.—Bul. (Montreal), no. 214, Feb. 1930, pp. 237-258, 5 figs. Outline of operations at concentrator treating massive sulphide ore carrying copper and gold, and sometimes zinc; climatic difficulties; lack of flotation operators; tailings disposal; characteristics of ore; flow sheet; operating data; sampling and assaying practice; concentration of this ore by flotation is feasible, but is complex problem.

COPPER SMELTING PLANTS

MONTANA. Anaconda Copper's Washoe Plant, R. H. Bradford. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 4, Jan. 24, 1930, pp. 9-10. Brief account describing principal features of plant and changes that bave been made.

CRANES

ALUMINUM TRAVELLING. Travelling Crane is Built of Aluminum, F. V. Hartman and E. C. Hartmann. Iron Trade Rev., vol. 86, no. 6, Feb. 6, 1930, pp. 82-83, 2 figs. Description of 10-ton travelling crane recently installed in works of United States Aluminum Co., Massena, N.Y.

BRIDGE. Ore-Handling Bridges, A. C. Brown. Iron and Steel (A.S.M.E. Trans.), vol. 51, no. 25, Sept.-Dec., 1929, pp. 31-40, 30 figs. Development of bridge type of tramway; various methods proposed to secure stability and safety in ore bridges in order to withstand wind storms of high velocity; types of wind bracing; skewing bridges for avoiding twisting stresses when one end of bridge travels faster tban other; four mechanisms largely used; tracks and track wbeels; improvements in trolley design.

CUTTING TOOLS

STANDARDIZATION. Production Division. Soc. Automotive Engrs.—Jl. Reports of Divisions to Standards Committee (Section 2), Jan. 1930, pp. 30-49, 30 figs. Proposed American standard for milling cutters; nomenclature; definitions of milling cutters; proposed revision and extension of S.A.E. standard for woodruff key-slot cutters and gauges; proposed revision of S.A.E. recommended practice for plug and ring gauges; proposed American standard and revision of S.A.E. standard for cut and ground threads for taps; line cuts and dimensions given for different types of milling cutters, keyways, and gauges.

TESTING. Laboratory Tests Aid Tool Development, C. O. Herb. Machy. (N.Y.), vol. 36, no. 6, Feb. 1930, pp. 425-429, 9 figs. Description of physical testing and cbemical laboratories of Morse Twist Drill and Macbine Co., Bedford, Mass.

TUNGSTEN CARBIDE. Fixed Method Preferred to Free Hand Operations in Grinding Cemented Tungsten Carbide Tools, H. W. Wagner. Automotive Industries, vol. 62, no. 9, Mar. 1, 1930, pp. 370-373, 5 figs. As material to be ground is very valuable, wheel cost is of less importance than when bigh-speed steel is shaped; successful methods include compromises in grade, special devices and feeding skill; grinding resistance; General Electric Co. using grinding machines witb spring pressure between wheel and work; remedies suggested for grinding; pressure and feed; wet grinding; lapping and honing.

CYLINDERS

STRESSES IN. Approximate Theory of Cylindrical Sbell (Théorie approchée de l'enveloppe cylindrique épaisse). Génie Civil (Paris), vol. 95, no. 23. Dec. 7, 1929, pp. 566-568, 5 figs. Author proposes original mathematical analysis of stresses in cylindrical shells which approximate results of analysis based on theory of elasticity; application of tbis tbeory to case of non-cylindrical shells and shells made of reinforced concrete, also to cast-iron and concrete linings of mine shafts.

D

DAMS

SAFETY. How Can Safety be Attained in Dam Construction, A. Hazen. Water Works Eng., vol. 83, no. 1, Jan. 1, 1930, pp. 11-12, 44, 47-48 and 51-52, 2 figs. Causes of dam failures; analogy with rock slides; types of dams: tbeoretical triangle cannot be used in practice; stresses in masonry dams; factors of safety for arcb dams, buttress dams, rock-fill and earth dams; eartbquakes; how dams are to be made safe against sliding; table sbowing relative thickness of number of masonry dams. From paper read before World Eng. Congress.

UPLIFT PRESSURE. Hydrostatic Uplift Under Masonry Dams, H. de B. Parsons. Engineering (Lond.), vol. 129, no. 3344, Feb. 14, 1930, pp. 135-136, 11 figs. Hydrostatic uplifts for soil foundations under Colorado and Percho dams; author is unaware of any observations under dams, which do not record hydrostatic heads; recorded observations exhibit similar characteristics; hydrostatic uplift head under base of dam should be treated as independent force, like gravity and water pressure. (Concluded.)

DAMS, CONCRETE ARCH

STRESSES. Cantilever and Arch Resistance to Hydrostatic Loads of Single Arch Dams (La ripartizione del carico idrostatico fra travi ed archi nelle dighe di ritenuta a volta unica), E. Campini. Atti del Sindacato Provinciale Fascista Ingegneri di Milano (Milan), vol. 8, no. 11, Nov. 1929, pp. 343-369, 25 figs.; see also Energia Elettrica (Milan), vol. 11, no. 6, Nov. 1929, pp. 1093-1116, 25 figs. Theoretical matbematical analysis of distribution of loads and resistances in arch dams; study of tests of Stevenson Creek experimental dam in California, Amsteg dam in Switzerland, Salmon River dam in Alaska, and Pacoima dam in California.

DESIGN. Laminated Arcb Dams witb Forked Abutments, F. A. Noetzli. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 2, Feb. 1930, pp. 261-292, 11 figs. Mathematical theory of modified design avoiding complexities of thick arch and resulting in economies; design involved subdivision of total arch thickness into two or more separate arches; analysis of stresses by means of charts; principles of cone dam and of forked abutments; effect of sloping crown and of laminations; stepped water-level or fractional concrete arch dam at Marege, France, also Railroad Canyon (cone arch) Dam near Elsinore, Calif. are presented as examples.

DAMS, EARTH

SALUDA RIVER. Construction Features of the World's Largest Earth Dam. Contractors and Engrs. Monthly, vol. 2, no. 1, Jan. 1930, pp. 115-119 and 128, 9 figs. Report on construction of semi-hydraulic fill dam, on Saluda River, Columbia, S.C., 1½ mi. long and 208 ft. high; construction of concrete spillway and of power house.

DAMS, MULTIPLE DOME

COOLIDGE, ARIZ. Construction Metbods and Plant Layout for Coolidge Dam in Arizona, J. G. Tripp. Eng. and Contracting, vol. 69, no. 2, Feb. 1930, pp. 78-81, 3 figs. Planning of concrete plant and excavation; layout of concrete plant; distribution of concrete; choice of concrete mixers; general service problems. Indexed in Engineering Index 1929, from Am. Soc. Civil Engrs.—Proc., Nov. 1929.

DIESEL-ELECTRIC POWER PLANTS

GREAT BRITAIN. Supercharged Diesel Generator at Ashford. Gas and Oil Power (Lond.), vol. 25, no. 292, Jan. 2, 1930, pp. 61-62, 1 fig. Description of 1,350-hp. eight-cylinder Davcy Paxman oil engine set, for normal load of 600 kw., but capable of developing 900 kw., when supercharged; engine, wbicb bas Englisb-Electric single bearing alternator, is claimed to be first of its type installed in any electric station in Great Britain; supercbarger was constructed by British Brown-Boveri, Ltd.

DIESEL ENGINES

AUTOMOTIVE. Fuel Injection witb By-Pass Valve Control for Diesel Engines Developed by Linke-Hofmann-Busch, E. P. A. Heinze. Automotive Industries, vol. 62, no. 10, Mar. 8, 1930, pp. 398-400, 6 figs.

FUEL INJECTION IN. Injection Lags in a Common-Rail Fuel Injection System, A. M. Rotbrock. Nat. Advisory Committee for Aeronautics—Tecb. Notes, no. 332, Feb. 1930, 7 pp., 7 figs.

GREAT BRITAIN. British Compressorless Diesel Engines (Englische Kompressorlose Diesel-motoren), H. Mehlig. V.D.I. Zeit. (Berlin), vol. 74, no. 6, Feb. 8, 1930, pp. 171-172, 8 figs. Short note on engines of Crossley Brothers; Blackstone Co.; Davey, Paxman and Co.; Glenniffer Motors, Ltd.; Beardmore and Co.; some details of design are given.

DRILLING MACHINES

HEADS, DESIGN OF. Designing Multiple-Spindle Drilling Heads, A. M. Wasbauer. Machy. (N.Y.), vol. 36, no. 6, Feb. 1930, pp. 475-476 and 2 supp. sbeets 171 and 172. Application of data sheets to solutions of problems involved in designing drilling heads equipped witb drills of various sizes wbich must all feed at same rate; chart is given which has scale sbowing number of cubic inches of metal removed per minute by drills ranging from ⅛ to 1⅛ in. in diam. operated at feeds of from 1 to 12 in. per min.

SPEED STANDARDIZATION. Applicability of the VDW Standard Rules for Speed Changers in Drives of Machine Tools Used in Manufacture of Drilling Machines (Die Anwendbarket der VDW-Richtlinien fuer die Stufenspruenge der Getriebe von Werkzeugmaschinen bei dem Bobrmaschinenbau), R. Panzer. Werkstattstechnik (Berlin), vol. 23, Dec. 1, 1929, pp. 661-666, 5 figs. 157 drilling machines of German, English, and American manufacture bave been investigated and it is found that all speed changers come within limits of tbird VDW specification and that limits are enough; one example to determine total transmission ratio is given.

E

ECONOMIZERS

RECENT DEVELOPMENTS IN. The Economizer—Some Recent Developments, With Experimental Data and Conclusions, G. E. Tansley and O. Kubalek. S. Wales Inst. of Engrs.—Proc. (Cardiff, Wales), vol. 45, no. 6, Feb. 11, 1930, pp. 480-512 and (discussion) 512-519, 12 figs. Paper deals with some of more recent aspects of beat recovery from so-called waste gases, fuel economizer being taken as best known and most widely used appliances for this purpose; results on tests of economizers; discussion of various types of economizer surface; description of gilled-tube economizer; examples of calculation of saving effected by use of economizer.

ELECTRIC ARCS

CALORIMETRIC STUDY OF. The Calorimetric Study of the Arc, P. P. Alexander. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 2, Feb. 1930, pp. 138-141, 9 figs. Attempt to determine distribution of energy in electric arc by calorimetric metbod; total energy input was measured by specially calibrated watt-hour meter; energy dissipated at anode and at cathode was estimated by temperature rise of electrodes; presence of different fluxes alters distribution of energy between graphite electrodes; energy at anode was mucb higher tban that at catbode.

ELECTRIC CABLES

IONIZATION. Ionization Studies in Paper-Insulated Cables, C. L. Dawes and P. H. Humphries. Am. Inst. Elec. Engrs.—Advance Paper, no. 18, for mtg. Jan. 27-31, 1930, 7 pp., 11 figs. Value of maximum power factor and of voltage at whicb it occurs are shown to be very simple functions of three characteristic cable constants; fact tbat maximum power factor is independent of gas pressure, determined experimentally by E. S. Lee, is verified botb experimentally and analytically; general shape of power-factor curve is analyzed. Bibliograpby. Third paper of series previously indexed from Am. Inst. Elec. Engrs.—Jl., Jan. 1929.

ELECTRIC CIRCUIT BREAKERS

DESIGN. High Power Switchgear, L. C. Grant. Engineer (Lond.), vol. 149, no. 3864, Jan. 31, 1930, pp. 132-133, 2 figs.; see also editorial comment on p. 138. Arc stability produces greater consistency of distress symptoms than is possible witb ordinary oil switcb, and new step is to reduce amount of energy appearing at arc under given circuit conditions; reduction can take two forms; it would appear that there is no great difficulty in designing circuit breaker of quencbed-arc type to deal with two or three million kva. on 100 per cent service basis. Abstract of paper read before Instn. Elec. Engrs.

AIR. Deion Grids for Oil Breakers, J. Slepian, B. P. Baker and H. M. Wilcox. Elec. World, vol. 95, no. 5, Feb. 1, 1930, pp. 249-251, 6 figs. Extension of variation of Deion principle to conventional type of oil circuit breaker by relatively slight changes indicates vast field for attainment of improved breaker operation; theoretical considerations and test results reported. Paper read before Am. Inst. Elec. Engrs.

OIL. The Use of Oil in Arc Rupture, B. P. Baker and H. M. Wilcox. Am. Inst. Elec. Engrs.—Advance Paper, no. 45, for mtg. Jan. 27-31, 1930, 11 pp., 10 figs. Relationship of rupturing ability of oil circuit breakers to system stability problems; conclusions as to effectiveness with which oil must be used in arc rupture if requirements of stability are to be met; new device known as Deion-grid, developed to permit application of scientific principles to arc extinction in oil and its theory of operation; conclusions as to effectiveness of this device, which bears no relation to Deion air-break circuit breaker.

ELECTRIC CONDUCTORS

INDUCED VOLTAGES. Calculations of Induced Voltages in Metallic Conductors, H. B. Dwight. Am. Inst. Elec. Engrs.—Advance Paper, no. 10, for mtg. Jan. 27-31, 1930, 6 pp., 5 figs. Review of rules and procedure used in electrical engineering for calculation of induced voltages in metallic conductors, not including radiation effects.

ELECTRIC CONVERTERS

FREQUENCY. A 40,000-Kw. Variable-Ratio Frequency Converter Installation, E. S. Bundy, A. Van Niekerk, W. H. Rodgers. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 2, Feb. 1930, pp. 120-124, 5 figs. Installation of two 20,000-kw. adjustable-load, variable-ratio, frequency converters interconnecting 25-cycle and 50-cycle systems of Niagara, Lockport and Ontario Power Co. at Lockport Substation is described; function of various machines is explained; important features of control and interesting incidents in past 18 months of operation are pointed out.

ELECTRIC FURNACES

GERMANY. Electric Furnaces (Ueber Elektro-Oefen), V.D.I. Belani. Montanistische Rundschau (Berlin), vol. 21, no. 24, Dec. 16, 1929, pp. 479-483, 4 figs. Various types of furnaces built by Siemens and Halske A. G. are enumerated; uses to which they may be put and their special features; arc furnaces are used for production of sponge iron, of high-quality alloy steels, and of high-quality cast iron (in conjunction with cupola), for melting scrap, and for refining (in duplex process with open-hearth furnace or bessemer converter).

HEATING-TREATING. Electric Heat and Heat-Treating Alloy Steel, T. W. Hardy. Heat Treating and Forging, vol. 16, no. 1, Jan. 1930, pp. 53-58, 9 figs.

STEEL-MAKING. A Modern Electric Steel Plant (Ein neuzeltliches Elektro-Stahlwerk), K. Kerpely. Giesserei-Zeitung (Berlin), vol. 27, no. 4, Feb. 15, 1930, pp. 101-102, 4 figs. Description of new plant in Campia Turzii, Roumania, for production of iron and steelwire and wire products of all kinds; reasons are given for installing electric furnace, which is 3-phase arc type with capacity of 1 to 1.5 tons, equipped with 500-kva. 3-phase oil transformer with automatic hydraulic electrode regulation of Brown-Boveri system.

ELECTRIC GENERATORS

MANUFACTURE. Electric Heating Assists in Machine Assembly, E. L. Doty. Elec. Jl., vol. 27, no. 1, Jan. 1930, pp. 49-50, 3 figs. Electric space heaters are particularly useful in securing accurate expansion and compression adjustments necessary in erecting large structural machines, viz., water-wheel generators.

VENTILATION. Ventilation of Revolving-Field Salient-Pole Alternators, C. J. Fechheimer. Am. Inst. Elec. Engrs.—Advance Paper, no. 48, for mtg. Jan. 27-31, 1930, 25 pp., 49 figs. Experimental and analytical studies; in experimental study model of hard wood was used, with multiple of vent ducts of normal width of ⅜ in. each in stator, slots and teeth being of approximately average width; in appendices equations for resistance and volume distribution and method for allowing air flow through holes back of core for various fans and for external pressure drops, and equations for parabolic volume distribution, are given.

ELECTRIC LIGHT AND LIGHTING

ULTRA-VIOLET. Simulating Sunlight—A New Era of Artificial Lighting, M. Luckiesh. Am. Inst. Elec. Engrs.—Advance Paper, no. 33, for mtg. Jan. 27-31, 1930, 6 pp., 9 figs. Facts regarding health-giving properties of ultra-violet radiation from sun are outlined and production of similar radiation by artificial means is discussed; methods of obtaining desired rays are mentioned; information is given on new tungsten-filament mercury-vapour lamp which has been developed to provide this radiation conveniently and safely.

ELECTRIC LINES

CALCULATION. Development by Series of Impedance of Line with Uniformly Distributed Characteristics (Sur le développement en série de l'impédance d'une ligne uniforme), J. R. Pomey. Revue Générale de l'Electricité (Paris), vol. 27, no. 5, Feb. 1, 1930, pp. 163-164. Mathematical analysis; it is stated that calculations developed are of importance in telephone lines employing repeater relays with regard to quality of production.

ELECTRIC LINES, HIGH TENSION

LIGHTNING. Lightning Investigation on Transmission Lines, W. W. Lewis and C. M. Foust. Am. Inst. Elec. Engrs.—Advance Paper, no. 38, for mtg. Jan. 27-31, 1930, no. 38, 12 pp., 19 figs. Surge voltage investigations for 1926 and 1927 are briefly reviewed, and data given for 1928 and 1929; cathode-ray oscillograph has played prominent part in last two years work, and about 115 oscillograms have been obtained; new instruments were introduced in 1929; personnel, equipment, and technique are available for complete solution of problem, by means of field and laboratory studies.

Lightning Voltages on Transmission Lines, R. H. George and J. R. Eaton. Am. Inst. Elec. Engrs.—Advance Paper, no. 35, for mtg. Jan. 27-31, 1930, 8 pp., 11 figs. During summer of 1929 studies were made to determine characteristics of voltage transients set up on transmission lines by lightning; cathode-ray oscillograph and number of surge voltage recorders were connected to 140-kv. transmission line in such manner that lightning disturbances were recorded by instruments; equipment used, and results obtained from season's investigations. Bibliography.

Lightning Investigation on 220-Kv. System of the Pennsylvania Power and Light Company (1928 and 1929), N. N. Smeloff and A. L. Price. Am. Inst. Elec. Engrs.—Advance Paper, no. 51, for mtg. Jan. 27-31, 1930, 10 pp., 18 figs. Results of investigation on 114 circuit miles of 220-kv. system located in territory where severe lightning storms are frequent; number of devices was used successfully, such as surge-voltage recorders, cathode-ray oscillographs, electric field-intensity recorders, and lightning-stroke recorders; data on operating characteristics and constants are given. Bibliography.

Lightning on Transmission Lines, J. H. Cox, E. Beck. Am. Inst. Elec. Engrs.—Advance Paper, no. 22, for mtg. Jan. 27-31, 1930, 9 pp., 16 figs. Work done and results obtained in Norinder-type cathode-ray oscillograph studies of lightning on transmission lines during 1929; various installations and methods of test are described; wave shapes recorded are illustrated and their meaning discussed; preliminary description of artificial lightning investigation, using portable 1,000,000-volt surge generator and portable cathode-ray oscillograph.

GROUNDING. The Effect of Corona on Ground-wire Protection of Power Transmitting Circuits, E. M. Hunter. Gen. Elec. Rev., vol. 33, no. 2, Feb. 1930, pp. 100-103, 2 figs. Early calculations neglecting corona; test results indicate better protection; subsequent calculations accounting for corona; check of test results.

ELECTRIC MACHINERY

THEORY. Generalized Theory of Electrical Machinery, G. Kron. Am. Inst. Elec. Engrs.—Advance Paper, no. 9, for mtg. Jan. 27-31, 1930, 18 pp., 29 figs. Electric machinery is analyzed from new point of view; analytical quantities like magnetizing current, armature reaction leakage flux, transient reactance are not introduced; only such quantities are used as actually exist in machine at one particular load; thereby theory of electric machinery is expressed in terms of minimum possible number of quantities; no hypothetical currents or fluxes are used and no actual physical quantity is left out. Bibliography.

INDUCED VOLTAGES. Induced Voltage of Electrical Machines, L. V. Bewley. Am. Inst. Elec. Engrs.—Advance Paper, no. 11, for mtg. Jan. 27-31, 1930, 11 pp., 5 figs. Discussion of general equation for induced voltage of electric machines having parallel coil sides, and which includes as special cases single and polyphase induction motors, synchronous generators, d.c. generators, synchronous converters, and static transformers; tables and curves for comparing effects of skew, pitch, distribution, and phase connection harmonic reduction factors; method for summing finite series of distribution summations is given in Appendix.

SYNCHRONOUS. Three-Phase Short Circuit Synchronous Machines, R. E. Doherty and C. A. Nickle. Am. Inst. Elec. Engrs.—Advance Paper, no. 5, for mtg. Jan. 27-31, 1930, 15 pp., 16 figs. Analysis is divided into three parts covering; case of short circuit at no-load when resistance is negligible in determining magnitude of current and same case where resistance does affect magnitude of current, and case of short circuit under load when resistance is negligible. Bibliography.

Transient Torque-Angle Characteristics of Synchronous Machines, W. V. Lyon and H. E. Edgerton. Am. Inst. Elec. Engrs.—Advance Paper, no. 21, for mtg. Jan. 27-31, 1930, 13 pp., 10 figs. Problem of sudden load on non-salient pole alternator is solved by integraph for enough different conditions so that performance of practically any machine of this type may be easily predicted from compiled results; simplest type of equation representing an ideal synchronous machine is solved; integraph is capable of solving problems of much more complicated nature than those presented.

ELECTRIC MANUFACTURING PLANTS

TESTING LABORATORIES. A High Voltage Testing Laboratory. Engineer (Lond.), vol. 149, no. 3865, Feb. 7, 1930, pp. 155-157, 10 figs. In cable-testing department of Siemens Brothers and Co., of Woolwich, English Electric Co., has installed plant for testing single-core cables for working pressures up to 76 kv. to earth suitable for 132-kv. three-phase systems and of three-core cables designed to operate at 66-kv. between cores.

ELECTRIC MOTORS

ALTERNATING CURRENT, TRANSIENTS. Power Transients in A.-C. Motors—A Watt-Oscillograph Study, L. E. A. Kelso and G. F. Tracy. Am. Inst. Elec. Engrs. —Jl., vol. 49, no. 2, Feb. 1930, pp. 102-106, 10 figs. Application of watt-oscillograph to study of performance of rotating a.c. machinery under transient conditions; some typical transient cases are presented with view to illustrating possibilities of such application; analysis of film taken with watt-oscillograph yields not only power but current and power factor also; watt elements of oscillograph developed for this study; method of analyzing oscillograms is given.

INDUCTION. Quiet Induction Motors, L. E. Hildebrand. Am. Inst. Elec. Engrs. —Advance Paper, no. 3, for mtg. Jan. 27-31, 1930, 5 pp., 4 figs. Magnetic noise in induction motors is caused by vibration of magnetic parts; torsional vibration is caused by unbalanced windings or applied voltages; vibration of stator by distortion from circular shape results from presence of other simple combinations of fields; magnetic noise produced by motor can be predicted from qualitative analysis of air-gap field and stiffness of parts. Bibliography.

ELECTRIC NETWORKS

ALTERNATING CURRENT. Low-Voltage A.C. Networks of the Standard Gas and Electric Company's Properties, R. M. Stanley and C. T. Sinclair. Am. Inst. of Elec. Engrs.—Jl., vol. 49, no. 2, Feb. 1930, pp. 116-120, 2 figs. Low-voltage a.c. network utilizing secondary network protectors adopted Standard Gas and Electric Co. for service in areas of high-load density; system has been applied to cities of second class and smaller, although load density in certain cases is high; each individual installation was made after study of conditions involved; underlying principles of designs and operating experience.

DESIGN. Calculation of Diversity Factor (Die Berechnung des Verschiedenheitsfaktors), S. Prochoroff. Elektrotechnische Zeit. (Berlin), vol. 51, no. 7, Feb. 13, 1930, pp. 230-232, 2 figs. Nomogram is developed on basis of probability calculations and maximum load of network is determined under assumption that its value is maintained for certain duration, for instance, adjusting time of relay; load impulses of short duration are not considered.

LOAD CONTROL. Controlling Power Flow with Phase-Shifting Equipment, W. J. Lyman. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 2, Feb 1930, pp. 97-101, 8 figs. Case of load control where closed rings or parallel path circuits are involved, are discussed; principles of voltage phase angle and power flow; actual tests performed on very large interconnected system with 250-mi. transmission loop, involving five power companies and total generator capacity well over 1,000,000 kw.; results are analyzed for checking theoretical against actual values and forming basis for solution of problems of similar nature.

VOLTAGE REGULATION. Induction Regulators, A. H. Altmann. AEG Progress (Berlin), vol. 6, no. 1, Jan. 1930, pp. 1-5, 7 figs. Theoretical considerations; external and internal apparent power; magnetizing current; vector diagrams of ideal single-induction regulator; circle diagram showing construction of actual rotor current; connection diagrams; design of induction regulator.

ELECTRIC POWER SUPPLY

BERLIN. Past and Future Developments of Power-Supply System of BEWAG (Entwicklung der Strombersorgung der BEWAG in Vergangenheit Gebenwart und Zukunft), M. Rehmer and E. Krohne. Elektrizitaetswirtschaft (Berlin), vol. 29, nos. 499 and 500, Jan. 1, 1930, pp. 1-7 and Jan. 2, 1930, pp. 36-39, 15 figs. Review and historical development up to 1929; future developments are to be simplification of 30-kv. distribution network and of 100-kv. loop line; it is contemplated to introduce distribution system applying two voltages for districts of highload density and one with three voltages and small transformer stations for low-load density sections; comparison with some American systems.

CHICAGO. System Connections and Inter-Connections Chicago District, G. M. Armbrust and T. G. LeClaid. Am. Inst. Elec. Engrs.—Advance Paper, no. 13, for mtg. Jan. 27-31, 1930, 15 pp., 13 figs. Characteristics of Chicago territory and power system which has been planned to supply this region; extent and nature of territory, loads, and service standards are outlined; 25-cycle and 60-cycle systems, including voltages up to 132 kv. are described; protective and control features are discussed, as well as operating procedure; service record and developments being planned for future.

PHILADELPHIA. Fundamental Plan of Power Supply in the Philadelphia Area, R. Bailey. Am. Inst. Elec. Engrs.—Advance Paper for mtg., Jan. 27-31, 1930, no. 14, 8 pp., 6 figs. Service requirements for various kinds of load demands in Philadelphia area; territory served and distribution of load in it; fundamental plan of system of Philadelphia Electric Co.; various reasons and conditions which has led to development of system are explained; interconnections with other electric utilities; operating procedure, relating particularly to allocation of load to various generating stations, reserve capacity, and frequency control; basic principles followed.

ELECTRIC SWITCHGEAR

METAL-CLAD. The Metal-Clad Switchgear at State Line Station, A. M. Rossman. Am. Inst. Elec. Engrs.—Advance Paper for mtg. Jan. 27-31, 1930, 4 pp., 8 figs. Two-kv. metal-clad outdoor-type switchgear is described; design is departure from customary engineering practice in that all live parts are immersed in oil and enclosed in metal housings with each phase in its own independent compartment; switchgear insures maximum safety to operating and maintenance personnel and reduces construction costs for power-station switching; design is adapted to mass production.

ELECTRIC TRANSFORMERS

AUTO. Inversion Currents and Voltages in Auto-Transformers, A. Boyajian. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 2, Feb. 1930, pp. 142-145, 5 figs. Analysis of 7,500-kv.a., three-phase units at Detroit for various possible connections and conditions of operation; novel theory and method of auto-transformer circuit representation is developed; fact is brought out and explained that fault currents to ground on secondary lines of auto-transformer may be larger when stepping-up than when stepping-down which prediction has been verified by test.

DISTRIBUTION. Distribution Transformers and Their Connections, J. Showalter. Elec. News, vol. 33, nos. 4 and 5, Feb. 15, 1930, pp. 46-48, Mar. 1, 1930, pp. 43-45 and (discussion) 45-46, 21 figs. General outline of equipment and its characteristics; terms used in transformer practice; standard voltage needed; expensive wattless current; single-phase service; three-phase distribution; protection; transformer performance.

LOADING. Loading Transformers by Temperature, V. M. Montsinger. Am. Inst. of Elec. Engrs.—Advance Paper for mtg. Jan. 27-31, 1930, no. 27, 15 pp., 21 figs. Safe loading of transformers by temperature requires not only knowledge of thermal laws but also knowledge of what is safe temperature limit to be maintained; author questions advisability of loading transformers continuously up to present A.I.E.E. Limit of 105 deg. cent. hot spot and argues for establishment of differential of 10 deg. cent. between limit to be maintained continuously by means of overloads and limit to be reached occasionally with rated load.

OPERATION. Operating Transformers by Temperature, W. M. Dann. Am. Inst. Elec. Engrs.—Advance Paper, no. 2, for mtg. Jan. 27-31, 1930, 4 pp. Proposal, sponsored by Transformer Subcommittee of Committee on Electrical Machinery, which is intended to serve as guide in operating transformers by temperature rather than in accordance with their nameplate ratings.

TAP CHANGERS. Tap Changing Under Load for Voltage and Phase-Angle Control, H. B. West. Am. Inst. Elec. Engrs.—Advance Paper, no. 7, for mtg. Jan. 27-31, 1930, 7 pp., 17 figs. Connections employed and equipment used in connection with static transformers for purposes of voltage and phase-angle control are briefly discussed.

ELECTRIC WELDING

STRUCTURES UNDER DYNAMIC STRESS. Electrically Welded Structures Under Dynamic Stress, M. Stone and J. G. Ritter. Am. Inst. Elec. Engrs.— Advance Paper, no. 17, for mtg. Jan. 27-31, 1930, 6 pp., 18 figs. It is shown that by properly considering such factors as maximum working stress, residual welding stresses, and stress concentration, it is possible to weld any type of structure without fear of trouble; many cases of such structures are described as to their method of fabrication and success of operation.

ARC. Cathode Energy of the Iron Arc, G. E. Doan. Am. Inst. Elec. Engrs.—Advance Paper, no. 6, for mtg. Jan. 27-31, 1930, 9 pp. Available energy at cathode of iron arc for welding in air and disbursement of this available energy to cathode process are analyzed.

RESISTANCE. Resistance Welding, B. T. Mottinger. Am. Inst. Elec Engrs.—Advance Paper, no. 36, for mtg. Jan. 27-31, 1930, 7 pp., 11 figs. Paper is directed to engineers interested in application of resistance welding to industries; discussion foreshadows some of latest tendencies of development; it deals with some fundamentals of design though it is not written as complete treatise on subject, nor especially for those engaged in designing of resistance welding machinery.

ENGINEERING

CANADA. Engineering Achievements of 1929. Can. Machy. (Toronto), vol. 40, no. 26, Dec. 26, 1929, pp. 223 and 227-233, 19 figs. Engineering accomplishments in Canada are outlined; Ambassador Bridge as well as tunnel between Windsor and Detroit; Welland Canal; Chats Falls and Back River power development; nickel research; Hudson Bay Railway; oil-burning locomotives.

EVAPORATION FORMULAE

STREAM-FLOW. A New Method of Estimating Stream-Flow Based Upon a New Evaporation Formula, J. A. Folse. Carnegie Inst. of Wash.—Pub., no. 400, 1929, 230 pp., 21 maps on supp. plates. Part I deals with investigation of laws of evaporation from observations on Great Lakes; how investigation was made and how final evaporation formula was derived; evaporation formula derived is used in establishing formulae of relationship between daily flow of perennial stream in moist climate and rainfall, snowfall, vapour pressure, air temperature, and wind velocity observed on its watershed.

F

FANS

TESTING. Tests of Disc and Propeller Fans, A. I. Brown. Heat, Piping and Air Conditioning, vol. 2, no. 2, Feb. 1930, pp. 157-163, 1 fig.

FEEDWATER TREATMENT

SOFTENING. Some Notes on Water Softening, J. Gordon. Gas World (Lond.), vol. 92, no. 2370, Jan. 4, 1930, pp. 10-13 (Coking section), 1 fig. Power plant at Lambton consists of six Lancashire boilers, each 30 ft. long by 8 ft. in diameter; four are heated by gas and waste heat from ovens and two are hand-fired; total evaporation of water per day is about 50,000 gal.; boiler water tests; softening inside boiler; chemistry of softening by caustic soda; lime and soda ash treatment; amount of sludge and of evaporation. Paper read before Coke Oven Managers' Assn.

Water Softening Practice in Great Britain, D. Brownlie. Combustion, vol. 1, no. 7, Jan. 1930, pp. 39-44, 10 figs. Description of improved types of reagent feed gear and combined lime and soda ash and base-exchange treatment, chief features for boiler feedwater; description of typical installation and four systems that are used most intensively.

FLIGHT

[*See Gliding.*]

FLOW OF GASES

NATURAL GAS PIPE LINES. Determination of Friction Coefficient of Long-Distance Gas Pipe Lines (Zur bestimmung der Reibungszahl in. Ferngasleitungen), E. Guman. V.D.I. Zeit (Berlin), vol. 74, no. 4, Jan. 25, 1930, pp. 107-110, 3 figs. Theory of flow of gas through pipe lines; results of six months observations and measurements on flow of natural gas through 48 km. of 25.3 cm. pipe line between Sarmas and Turda, in Roumania; measurements indicate variation of friction coefficient with Reynolds number.

FORGINGS

HEAT TREATMENT. Heat Treating in a Modern Forge Shop, M. J. Gorman. Heat Treating and Forging, vol. 16, no. 1, Jan. 1930, pp. 41-42, 3 figs. Description of heat-treatment equipment of Moore Drop Forging Co., which consists of four continuous ranging in sizes from 13 to 21 ft. long and 6 ft. wide; handling quenching mediums; typical results of heat treatment; hardening forging and header dies.

FURNACES

METALLURGICAL. The Application of Pulverized Fuel to the Malleable Iron Foundry. Iron and Steel Industry (Lond.), vol. 3, no. 4, Jan. 1930, pp. 120-121 and 128, 2 figs. Use of pulverized coal in melting furnaces for production of malleable cast iron, and savings obtained discussed; advantages of using pulverized coal in annealing furnaces.

NORMALIZING. Recent Developments in Normalizing Sheet Steel, E. S. Lawrence. Fuels and Furnace, vol. 8, no. 2, Feb. 1930, pp. 191-194. Discussion of major mechanical, mechanical-metallurgical, and metallurgical improvements of continuous sheet-normalizing furnace; correctly constructed cooling chamber wherein time and rate of cooling sheets are emphasized. Abstract of Paper presented before Am. Soc. Steel Treating.

FOUNDRIES

RESEARCH IN. Research in the Foundry, E. E. Griest. Am. Foundrymen's Assn.—Trans. and Bul., vol. 1, no. I, Jan. 1930, pp. 79-86.

G

GAUGES

ELECTRIC. Electric Precision Gauge of Great Accuracy. Machy. (N.Y.), vol. 36, no. 6, Feb. 1930, pp. 435-436, 3 figs. Description of electric gauge designed to meet demand for accurate gauging device that has minimum of moving parts and that will permit routine gauging operations to be conducted with greater rapidity; with amplification factor of 10,000, this gauge, independent of human touch, makes possible measurements to 0.00005 in.; gauge may be used for both inside and outside measuring.

The Electric Gauge, A. V. Mershon, J. W. Matthews and B. C. Waite, Jr. West. Machy. World, vol. 21, no. 1, Jan. 1930, pp. 10 and 30, 3 figs. Description of electric gauge developed to meet demands for accurate gauging device for quantity inspection purposes; gauge is independent of human sense of touch; simple and rapid to manipulate; amplification factor 10,000 times.

OPTICAL. Optics in Measuring Technique (Die Optik in der Messtechnik), Berndt. Deutsche Optische Wochenschrift (Weimar), vol. 16, no. 1, Jan. 5, 1930, pp. 2-4, 15 figs. Description of instrument for gauging machine tools, drills, screw threads, gear teeth, etc.

Optical Measuring Machines. Engineering (Lond.), vol. 129, no. 3344, Feb. 14, 1930, pp. 236-237, 11 figs. Measuring machine made by C. Zeiss, of Jena, dispenses with use of micrometer screws and gauge blocks, which are subject to slow molecular changes, and of hydraulic feelers, which must exert some pressure, and is based upon comparator principle; optical system of optimeter is explained by diagram.

GEOLOGY

ONTARIO. Geological Structure of the Southwest Portion of the Sudbury Basin, E. S. Moore. Can. Min. and Met.—Bul. (Montreal), no. 216, March 1930, pp. 351-361, 2 figs. Ore deposits in basin are attributed to faulting that split basin parallel to its long axis; various early geological reports are cited; outline of geological history of area; dikes and other minor intrusions; discussion of faulting; nickel-copper and zinc-lead deposits are mentioned. Bibliography.

GLIDING

SAILPLANING. Sailplaning, H. Hartshell. Aero Digest, vol. 16, no. 1, Jan. 1930, pp. 113-115, 3 figs. Prediction of how sailplaning may be practised in future and principles in which sailplane may be flown; monoplane glider is chosen with high aspect ratio and safely controllable flying speed as low as 20 to 25 m.p.h.; velocities acting on sailplane are calculated; forces and velocities projected in transverse vertical plane; no glider built like airplane can soar effectively.

GOLD ORE TREATMENT

LABORATORY INVESTIGATIONS. Testing Ores for Recovery of Gold Content, O. D. Welsch. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 3, Jan. 17, 1930, pp. 60-61, 1 fig. Discussion of laboratory investigations to determine process or combination of processes to which ore sample submitted will lend itself most profitably; processes most generally used for recovery of gold are amalgamation, cyanidation by agitation or by percolation, gravity concentration, and concentration by flotation.

CANADA. Gold Milling in Canada, J. J. Denny. Can. Min. and Met.—Bul. (Montreal), no. 213, Jan. 1930, pp. 105-120, 7 figs. Purpose of paper is to present brief outline of Canadian practice in milling of gold-bearing ores, not, however, including those auriferous ores which are mined and milled primarily for their content of some other metal; tabular gold production statistics; mill structure; crushing; classification; concentration; chlorination; flow sheets are given. Advance publication for mtg. Mar. 1930.

H

HANGARS, CONCRETE

MONTREAL. Montreal Has First Concrete Arch Hangar Built in North America. Contract Rec. (Toronto), vol. 44, no. 5, Jan. 29, 1930, p. 94. Description of hangar at Point aux Trembles Airport, Montreal, Que., measuring 100 by 100 ft.; 11 arch ribs have reinforced-concrete beams tying them across bottom of each arch; total cost $39,000.

HARBOUR IMPROVEMENTS

FORT CHURCHILL, MANITOBA. Harbour Development Works at Fort Churchill on the Hudson Bay Railway. Engineering (Lond.), vol. 49, no. 3340, Jan. 17, 1930, p. 71. Works in hand include construction of wharf 1,600 ft. in length, of concrete cribwork, with depth of water permitting vessels of 30 ft. draft to lie alongside at low tide; work to be done includes dredging of area 1,600 ft. by 60 ft. to depth of 32 ft. below low-water level, requiring removal of quarter of million yards of material.

HARDNESS TESTING

BRINELL. Brinell Indentations with Different Testing Loads (Brinelleindruecke bei verschiedener Prueflast), P. W. Doehmer. Zeit. fuer Metallkunde (Berlin), vol. 22, no. 1, Jan. 1930, pp. 31-32, 3 figs. Author claims that for practical testing purposes, conversion of ball-impression diameters obtained with specific load into diameters obtained with other loads is not possible without knowledge of N-value of material; it is simpler to actually measure desired ball-impression with other testing loads instead of calculating it; some results of practical calculations are listed.

HEAT CONDUCTIVITY

MEASUREMENT. Measurement of Heat Conductivity by Suitable Variation of Kohlrausch Method for High Temperatures (Waermeleitfaehigkeitsmessung nach einer fuer hohe Temperaturen geeigneten Variation der Kohlrausch-schen Methode), R. Holm. Zeit. fuer Technische Physik (Leipzig), vol. 10, no. 12, 1929, pp. 621-623, 2 figs. Description of method, measurements on platinum and control test on Holm's contact theory.

HEAT-INSULATING MATERIALS

PROPERTIES OF. Heat Insulators, E. Griffiths. Dept. of Scientific and Indus. Research—Food Investigation (Lond.), no. 35, 1929, 96 pp., 37 figs. Definition of thermal conductivity; design of apparatus for conductivity tests; temperature measurements; typical example of thermal conductivity experiment; convection currents in granular materials; description of materials tested, and values of their thermal conductivity; moisture absorbing capacity of insulating materials; temperature of combustion of various insulators; calculation of heat flow in complex structures; determination of specific heats of insulating materials.

HEAT TRANSMISSION

PARALLEL PLATES TO FLOWING AIR. Heat Transfer to Air Between Two Plane Parallel Plates in Eddy Current (Der Waermeuebergang an Luft zwischen zwei ebenen parallelen Platten bei Wirbelstroemung), W. Haucke. Archiv. fuer Waermewirtschaft (Duesseldorf), vol. 11, no. 2, Feb. 1930, pp. 53-58, 7 figs. Experimental study of heat transfer of two parallel plates 48 mm. apart to air current flowing between them; evaluation of results.

HEAT TREATMENT

Economics of. Economics and Economies of Heat-Treating, R. M. Keeney. Am. Mach., vol. 72, no. 5, Jan. 30, 1930, pp. 225-227, 3 figs. Selection of source of heat for industrial heat-treatment of metals discussed; items influencing overall cost; various applications of annealing furnaces in Connecticut; fuels for annealing brass; measurable progress has been made in atmospheric control of electric furnaces for bright-annealing copper; for annealing nickel-silver stampings, electric furnaces increasingly used. Abstract of paper read before Am. Soc Steel Treating.

HOISTS

Electric, for Freight Cars. Special Safety Devices Built into Electric Freight Car Hoist. Iron Trade Rev., vol. 86, no. 3, Jan. 16, 1030, pp. 44-45, 1 fig. Description of 200-ton freight car hoist recently erected for new power station of Dusquesne Light Co., Pittsburgh; complete machinery and all auxiliary apparatus enclosed in structural steel shaft tower of guide type erected at end of elevated railroad siding; gates, counter-weights and hydraulic buffers provided on 50-ft. hoist with capacity of 400,000 lbs.

HYDRAULIC TURBINES

Draft Tubes. Diffusors of Modern Hydraulic Turbines (I moderni diffusori nelle turbine idrauliche), G. Buechi. Energia Elettrica (Milan), vol. 6, no. 12, Dec. 1929, pp. 1201-1210, 32 figs. Outline of Prasil theory of draft tubes; theory and features of conical draft tubes, circular diffusors, Kaplan curved axis diffusor, White and Moody hydraucone regainer; Voith, Escher Wyss curved and partitioned draft tubes, etc.

Propeller. On the Hydraulic Efficiency of Propeller Turbines and Propeller Pumps. F., Numachi. Soc. of Mech. Engrs.—Jl. (Tokyo) vol. 32, no. 152, Dec. 1929, pp. 483-493, 15 figs. Paper deals with theoretical study of variations of hydraulic efficiency of propeller turbine and of propeller pump with respect to following coefficients: peripheral velocity of rotation; axial velocity of flow, and ratio of of outer diameter to inner diameter of wheel; graphical representations of results service to give information to select suitable values of coefficients. (In English.)

HYDRO-ELECTRIC POWER DEVELOPMENTS

British Columbia. Developing Northern B.C. Power, D. Anderson. Elec. News (Toronto), vol. 39, no. 1, Jan. 1, 1930, pp. 37-40, 8 figs. Subsidiary of Power Corp. of Canada is developing power resources in Prince Rupert region; new plant at Falls River to have ultimate capacity of 32,000 hp.; resources of district; Falls River development; general layout; transmission-line data; 8,000 ft. Skeena river crossing.

Canada. Canada Adds 378,400 Hp. Elec. World, vol. 95, no. 7, Feb. 15, 1930, p. 342. Canada added 378,400 hp. to its hydro-electric installations in 1929, bringing total for whole Dominion to 5,727,600 hp., according to annual review prepared by Dominion Water Power and Reclamation Service, issued as Bulletin no. 1353; list of hydro plants completed in 1929 or planned for early start is given.

Current Canadian Hydro-Electric Development. Chem. and Industry (Lond.), vol. 49, no. 3, Jan. 17, 1930, pp. 56-58. Estimated hydro-electric power in Canada, at close of 1928, was 5,349,232 hp., as compared with 2,327,955 in 1918; general summary of more recent activities, covering work which has just been completed, under construction, and major projects contemplated in immediate future.

Hydro-Electric Progress in 1929. Elec. News (Toronto), vol. 39, no. 1, Jan. 1, 1930, pp. 29-36, 11 figs. Many large developments commenced in 1929; over 378,000 hp. placed in operation, making Canada's total 5,727,600 hp.; short notes on progress arranged according to provinces.

Quebec. Progress at Chute à Caron, S. Rivett. Power House (Toronto), vol. 23, no. 23, Dec. 5, 1929, p. 31, 4 figs. Brief discussion of development carried on by Alcoa Power Co.; sketch of hydro-electric development work being carried out at Chute-à-Caron, Quebec.

HYDRO-ELECTRIC POWER PLANTS

Construction. Construction Plant and Methods for Hydro-Electric Installations. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 8, Oct. 1929, p. 2049. Abstract of committee report; shipping schedules to control arrival of different parts of machinery as needed; erection schedules for waterwheels, generator and electrical installations.

Montreal. Back River Power Development Has Many Special Features. Contract Rec. (Toronto), vol. 44, no. 7, Feb. 12, 1930, pp. 163-169, 11 figs. General layout and description of equipment of 120,000-hp plant of Montreal Island Power Co., near Montreal; details of 12,000 hp. movable blade turbines for variable flow and head and of 12 sided welded stator frames; turbines are rated 7,150 to 12,000 hp. between 18 and 26 ft. head; notes on electric equipment.

Ice Control. Forming of Troublesome Ice Prevented by Jets of Compressed Air, J. S. Meehan. Compressed Air Mag., vol. 35, no. 3, Mar. 1930, pp. 3045-3049, 13 figs. Description of equipment and practice at Station No. 1, of Turner Falls Power & Electric Co. on Connecticut River, in township of Montague, Mass.; line of 1¼ in. pipe hung on wall of canal at depth of 12 ft.; brass plugs with 1-64 in. holes at 3 ft. intervals deliver air bubbles at average pressure of 10 lb., preventing formation of shell ice; other parts of intake system were protected in similar manner.

I

ICE

Heat Conductivity of. Thermal Conductivity of Ice Between 0 and 125 Deg. (Die Waermeleitfaehigkeit von Eis zwischen 0 and 125 deg.), M. Jakob and S. Erk. Zeit. fuer die gesamte Kaelte-Industrie (Berlin), vol. 36, no. 12, Dec. 1929, pp. 229-234, 5 figs. Report from experiments made to determine conductivity of ice; thermo-elements were frozen in cakes of ice and constants computed from readings; table of constants obtained and description of apparatus used.

IMHOFF TANKS

Design. Results of Tests on Sewage Treatment, H. E. Babbitt and H. E. Schlenz. Univ. of Illinois Eng. Experiment Station.—Bul., no. 198, Dec. 3, 1929, 95 pp., 38 figs. Report on tests to study sludge digestion in shallow Imhoff tanks with view of reducing expense and difficulties of deeper tanks; effectiveness of roofs in hastening drying of sludge; drawing sludge into drying beds in cold weather; factors affecting sedimentation and reduction of suspended particles in sewage; heating sludge compartments of Imhoff tanks to increase quantity of gas produced; effect of circulating tank-liquor in preventing scum formation.

IMPACT TESTING

Notched-Bar. Stresses in Fatigue Impact Testing (Zur Frage der Beanspruchung beim Dauerschlagversuch), A. Thum and S. Berg. V.D.I. Zeit. (Berlin), vol. 74, no. 7, Feb. 15, 1930, pp. 200-204, 12 figs. Condensed report on experimental study made at Darmstadt Institute of Technology; effect of elastic hysteresis and notching on magnitude of stresses caused by impact with special reference to maximum stresses; lines of force at abrupt changes in cross-sections of specimens; diagrams of distribution of stress intensities at notches; photographs of fractures. Full report published in Bul. No. 331, Forschungsarbeiten auf dem Gebiete des Ingenieurwesens.

INDUSTRIAL PLANTS

Purchased vs. Generated Power. A Discussion Comparing Costs of By-product and Purchased Power, A. L. Rogers. Power, vol. 71, no. 7, Feb. 18, 1930, pp. 253-255, 4 figs. Comparative cost data is given for two industrial plants, one in which process steam is used for power generation and for mill purposes and other in which management purchases electric power, but all steam required for manufacturing purposes is generated in low pressure boiler plant.

INLAND WATERWAYS

Operation. Waterway Transportation from the Viewpoint of Operation, T. Q. Ashburn. Am. Soc. Civil Engrs.—Proc., vol. 52, no. 3, Mar. 1930, pp. 546-560, 4 figs. Discussion and comparison of private, contract, and common carriage, as well as common carriage under joint rail and water rates, on three types of inland waterways: Lake type (Great Lakes and connecting channels), per ton-mile cost, 0.64 mill; lock-canal type, closed by ice part of year (New York Barge Canal), per ton-mile cost, 3 mills; and river type, adequate channel open year round (Mississippi River, St. Louis and South), per ton-mile cost, 1.07 mills.

INTERNAL-COMBUSTION ENGINES

Efficiency. Energy Charts for the Calculation of Standard Efficiencies of Internal Combustion Engines. W. J. Goudie. Instn. of Engrs. and Shipbldrs. in Scotland, vol. 72, 1928-1929, pp. 440-485 and (discussion) 485-495, 14 figs. Energy chart described in this paper is attempt to provide graphical substitute for involved calculation, by means of which absolute thermal efficiency of any internal-combustion engine can be obtained to close degree of approximation by simple process of projection; it takes account fully of effect, on ideal efficiency of fuel composition, air-fuel ratio, variation of specific heat.

Problems. Problems of Internal-Combustion Engine (Problemedes Verbrennungsmotors), L. Richter. Zeit. fuer Technisches Physik (Leipzig), vol. 10, no. 11, 1929, pp. 573-579, 5 figs. Theory and practice; ignition and combustion; two and four-cycle engines; exchange of mixture and heat transmission; cycle processes; combustion mechanical and thermal problems of power-engine design. Bibliography.

[*See also Airplane Engines; Diesel Engines.*

IRON AND STEEL PLANTS

Germany. Blast Furnaces and Metallurgical Work of Essen-Borbeck (Hochofen- und Huettenwerk Essen-Borbeck). V.D.I. Zeit. (Berlin), vol. 74, no. 2, Jan. 11, 1930, pp. 33-43, 17 figs. Description of Krupp iron and steel plant having two blast furnaces; 70 to 80 per cent of ore arrive by water; details of river harbour and railroad ore-handling equipment; blast furnaces having useful capacity of 660 cu. m.; charging equipment and steam electric power plant equipped with two 14,000-kw. turbo-generators.

Sweden. Sandvik, one of the World's Foremost Makers of Fine Steel. Swedish Export (Stockholm), vol. 14, no. 1, Jan. 1930, pp. 4-6, 3 figs. Description of steel works in Sweden manufacturing highly refined grades of Bessemer and open-hearth steel, seamless steel tubes, wire rods, tool steel, and cold rolled steel, plant makes broadest strip of cold rolled, hardened steel so far manufactured, 600 mm.; and has record for making thinnest strip, 0.003 mm. (In English.)

IRON CASTINGS

Chilled, Hardness Testing of. Hardness Testing of Hard Chill Castings (Die Pruefung der Haerte von Schalenhartguss), O. Keune. Kruppsche Monatshefte (Essen), vol. 10, Dec. 1929, pp. 200-203, 2 figs. Features of Brinell and scleroscope hardness-testing methods; it is shown, on basis of various measurements, that last-mentioned method gives widely deviating results in case of hardness testing of hard-chill castings; on the other hand test results check in case of hardened steel; method for calibration of scleroscope.

J

JIGS AND FIXTURES

Welded. Advantages of Arc Welded Jigs, Fixtures, and Machine Tools Demonstrated in Westinghouse Manufacturing Plant, J. R. Weaver. Automotive Industries, vol. 62, no. 6, Feb. 8, 1930, pp. 186-188, 5 figs.

L

LATHES

Cutting Pressures. Measurement of Cutting Pressure on Lathe by Means of Electric Dynamometer (Schnittdruckmessungen an der Drehbank mit einer elektrischen Messdose), W. Mauksch. Wissenschaftliche Veroeffentlichungen aus dem Siemens-Konzern (Berlin), vol. 8, no. 2, July 8, 1929, pp. 130-136, 6 figs. Practical application of condenser principle for measuring of cutting pressure and its practicability is indicated by experiments by which laboratory equipment and standard lathe have been used.

LEAD

Properties of. Physical Constants of Lead, J. E. Harris. Am. Soc. for Steel Treating —Trans., vol. 17, no. 2, Feb. 1930, pp. 282-287. Constants given are atomic weight, isotopes, allotropic modifications, density, crystal form, melting point, boiling point, critical temperature, heat of fusion, heat of vaporization, thermal conductivity, electrical resistivity, electrode potential, viscosity, optical properties, tensile strength, elongation and hardness, elastic limit and Youngs' modulus. Bibliography. Recommended practice committee release.

LEVELLING

Indirect Method. Indirect Levelling Method on River Bank, A. G. Ashford. Can. Engr., vol. 58, no. 6, Feb. 11, 1930, pp. 209-210, 2 figs. Method of surveying eroded river bank where direct measurements were impossible on account of liquid state of mud; target was tied at centre of cord, twice length of longest line, and being operated by assistant at each end of cord, was held with its base just touching mud at each point, at which it was desired to get level.

LIGHTNING ARRESTERS

Thyrite. Thyrite: a New Material for Lightning Arresters, K. B. McEachron. Gen. Elec. Rev., vol. 33, no. 2, Feb. 1930, pp. 92-99, 15 figs. Characteristics of ideal arrester are outlined; thyrite and its properties and operating characteristics are discussed; equipment is described. Paper read before Am. Inst. Elec. Engrs.

LOCOMOTIVE TERMINALS

Toronto. Toronto Locomotive and Car Facilities, Canadian Pacific Railway. Can. Ry. (Toronto), no. 382, Dec. 1929, pp. 733-734, and 740-743, 8 figs. Brief illustrated description of locomotive house, coaling plant, turntable, steel water tank, building, passenger-car yards, etc., being built by Canadian Pacific Railroad; general layout map illustrating locomotive and car facilities.

LOCOMOTIVES

Diesel. Completion of the First 1,200-Hp. Diesel Locomotive for the German Governmental Railroad (Die Fertigstellung der ersten 1,200 PS-Diesel-Lokomotive fuer die Reichsbahn), Witte. Glasers Annalen (Berlin), vol. 106, no. 3, Feb. 1, 1930, pp. 35-39, 3 figs. Diesel compressed-air-2-C-2 locomotive is described in some detail; Diesel engine is of M.A.N. type 1,000 to 1,200-hp. at 450 r.p.m.; water cooling is used; driving gear operated by compressed and heated air of 7 atmos. and 350 deg.; length of engine is 75.8 m., weight in operating conditions is 126 tons; simplicity of operation is featured.

Developments in Diesel Traction. Gas and Oil Power (Lond.), vol. 25, no. 292, Jan. 2, 1930, pp. 63-64, 1 fig. Recent development in locomotive history has been effected by German State Railways, who have constructed 1,200-hp. Diesel-engined locomotive employing compressed-air drive; air pressure of 103 lbs. per sq. in., heated by exhaust of Diesel, and then actuates normal locomotive cylinders; comparison with Diesel-electric drive; table giving operating cost; comparison of performance of Diesel-electric and steam locomotives.

Railway Traction by Oil-Engines, A. E. L. Chlorlton. Instn. Civil Engrs. —Minutes of Proc. (Lond.), no. 4716, 1929, 32 pp. 10 figs. Discussion of Diesel propulsion for railroad traction; comparison of efficiencies; suitability for railway service; table giving comparative prices of coal, fuel oil, and Diesel oil per ton; comparative test results of several Diesel locomotives; table of costs of operation of steam and oil-electric locomotives; typical oil-electric equipments.

ELECTRIC. French Railway Adopts 5,300-Horsepower Electric Locomotives, M. Japiot. Ry. Age, vol. 88, no. 7, Feb. 15, 1930, pp. 427-429, 3 figs. Paris, Lyons, Mediterranean railway using unusually large single-cab electric passenger experimental locomotives of singular design; engines designed to fit particular needs of high-speed service on Mont-Cenis line; electrical apparatus; driving wheels, 63 in.; total locomotive wheelbase 68 ft. 3 in.; total weight of locomotive 351,000 lbs.; continuous rating of tracting force 28,700 lbs.; maximum speed 81 m.p.h.

HIGH-PRESSURE. British Build 4-6-4 Type Locomotive of Novel Design. Ry. Age, vol. 88, no. 8, Feb. 22, 1930, pp. 473-474, 4 figs. Engine just completed on London and North Eastern Railway to designs of H. N. Gresley is for express passenger work, has four compound cylinders and boiler pressure is 450 lbs. per sq. in.; cylinders, 12 by 20 by 26 in.; weight of engine, in working order, 103.6 tons; total engine wheelbase 40 ft. 0 in.; rated maximum tractive force 40,040 lbs.; description of boiler auxiliaries, running gear and tender.

IMPROVEMENTS IN. On the Question of Improvements in the Steam Locomotive (Subject VI for Discussion at the eleventh Session of the International Railway Congress Association), H. N. Gresley. Int. Ry. Congress Assn.—Bul. (Brussels), vol. 11, no. 11, Nov. 1929, pp. 2689-2819, 23 figs. Contents of report divided into following chapters: increased boiler pressure; superheating; feed-water heating; air preheating; valves and valve gear; arrangement of front end.

On the Question of Improvements in the Steam Locomotive (Subject VI for discussion at the eleventh session of the International Railway Congress Association) T. Bals. Int. Ry. Congress Assn.—Bul. (Brussels), vol. 11, no. 11, Nov. 1929, pp. 2421-2497, 29 figs. Increased pressures and high superheats; improvements in design of superheaters and parts connected with superheating; feed water heating and air preheating; improvements of valve gears.

NEW TYPES. On the Question of Locomotives of New Types; in Particular Turbine Locomotives and Internal Combustion Motor Locomotives (Subject V for Discussion at the Eleventh Session of the International Railway Congress Association), Cossart. Int. Ry. Congress Assn.—Bul. (Brussels), vol. 11, no. 11, Nov. 1929, pp. 2397-2420. Discussion of turbine and Diesel locomotives; high-pressures locomotives; general considerations; report covers Belgium, France, Italy, Portugal, Spain, and their Colonies.

REPAIR SHOPS. Canadian National Builds Large Shop at Montreal. Ry. Age, vol. 88, no. 9, Mar. 1, 1930, pp. 549-555, 7 figs. Canadian National Railways build locomotive erecting and machine shop at Point St. Charles, Montreal; building is 1,056 ft. long by 265 ft. wide; shop incorporates many unique features of construction, arrangement and operation.

VALVE GEARS. 4-6-0 Type Four-Cylinder Locomotive Fitted With Beardmore-Caprotti Valve Gear. Engineering (Lond.), vol. 129, no. 3342, Jan. 31, 1930, pp. 132-134, 8 figs.; see also Engineer (Lond.), vol. 149, no. 3864, Jan. 31, 1930, p. 132, 13 figs. Details of modification carried out on London and North-Eastern Railway system; whole of valve gear works in oil baths; closing of steam and exhaust valves is controlled by springs.

Method for Standardization of Valve Gear of Reciprocating Steam Locomotives (Ein weg zur Vereinheitlichung der Steuerungen gefeuerter Kolben Dampflokomotiven), K. Ewald. Glasers Annalen (Berlin), vol. 106, nos. 1 and 2, Jan. 1, 1930, pp. 3-7, and Jan. 15, pp. 15-19, 6 figs. Jan. 1: Mathematical design analysis pertaining to Walschaert Heusinger valve gear. Jan. 15: Standardized piston valves; internal and external valve gears.

LUBRICATION

RESEARCH. Friction-Coefficient Research, L. Ollmer. Soc. Automotive Engrs.—Jl., vol. 26, no. 1, Jan. 1930, pp. 67-86, 18 figs. Experimental result of different investigators correlated and principles common to all tests in which frictional resistance depends primarily upon fluid shear established; behaviour during starting; viscosity determinations; maximum contact factors; journal test discussed; little research directed to friction losses as found in automobile-crankshaft bearings; lack of efficient lubrication of drives responsible for colossal motive-power losses; reasonably reliable method for predetermining certain kinds of friction losses.

THEORIES. Modern Theories of the Structure of Lubricating-Oil Films (Neuere Theorien ueber den Aufbau des Schmiero elfilmes), A. V. Blom. Petroleum (Berlin), vol. 25, no. 46, Nov. 13, 1929, (Supp.), pp. 3-6, 2 figs.

M

MACHINE TOOLS

CUTTING PRESSURE. Researches on the Cutting Force, M. Okoshi. Inst. Phys. and Chem. Research—Sci. Papers (Tokyo), vol. 12, no. 220, Jan. 15, 1930, pp. 167-192, 22 figs. Description of ordinary methods for measuring cutting force of machine tools, including brake, work-done, balance, diaphragm, and capacity-change methods; new measuring methods outlined include preliminary test, strength of quartz, planing-tool dynamometer, improved lathe-tool dynamometer, improved drill dynamometer; improved milling-tool dynamometer; switch mechanism; method of measuring piezoelectric charge.

[*See also Automobile Plants.*]

MACHINERY

MANUFACTURE, TEMPERATURE EFFECT ON LARGE PIECES. Influence of Difference in Temperature on Change in Shape of Large Workpieces (Der Einfluss von Waermeunterschieden auf die Formaenderung grosser Werkstuecke), C. Krug. Werkstattstechnik (Berlin), vol. 24, no. 1, Jan. 1, 1930, pp. 11-13, 4 figs. Relations between temperature difference, degree of density and precision of fit in machining are mathematically analyzed.

TUNGSTEN CARBIDE OVERLAYS. Welded-On Overlays in Machine Design, M. C. Smith. Am. Mach., vol. 72, no. 6, Feb. 6, 1930, pp. 265-267, 11 figs. Discussion of how tungsten carbide and similar materials can be deposited by welding torch or arc to form local wear-resistant surfaces on machine parts.

WELDED, DESIGN OF. General Principles of Welded Designs, A. M. Candy. Nebraska Blue Print, vol. 29, no. 4, Jan. 1930, pp. 114-117, 12 figs. Maximum advantages inherent in using arc welding can only be gained by designing work specifically for welding; designs of welded piece for bedplate, welded rotor and other parts are discussed; continuity of beam.

MATERIALS HANDLING

CARGO HANDLING. Lowers Cost of Cargo Handling, H. E. Stocker. Mar. Rev., vol. 60, no. 3, Mar. 1930, pp. 50-51 and 60, 7 figs. Types of mechanical cargo-handling equipment recently installed at New York terminal of American Hawaiian Steamship Co., where total of approximately 600,000 tons of cargo are handled annually.

LUMBER MILLS. Hoisting Apparatus and Bulk Conveyors (Hebezeuge und Massenfoerderer). Foerdertechnik und Frachtverkehr (Wittenberg), vol. 23, no. 4, Feb. 14, 1930, pp. 74-77, 15 figs. Discussion and description of hoisting and transport apparatus used in saw mills and lumber storage yard; tower slewing, travelling crane, log handling cranes, and conveyors are shown in some detail.

SHEET-METAL WORKING. Materials Handling in the Stamping Plant, A. K. Burditt and W. F. Schaphorst. Metal Stampings, vol. 3, no. 2, Feb. 1930, pp. 113-117, 8 figs. Description of various types of trucking equipment and platforms, together with their specific applications and advantages for handling and storage of stampings.

METALS

CUTTING, THEORY OF. Cutting Theory (Ueber die Zerspannungstheorie), H. Friedrich. Maschinenbau (Berlin), vol. 9, no. 2, Jan. 16, 1930, pp. 47-51, 2 figs. Methods of scientific investigation and application; comparison with modern methods of research for cutting resistance and cutting speed, limiting values as basis for conformity of theory and practice.

DRAWING. The Testing of Thin Sheet Metal, E. Siebel and A. Pomp. Metallurgist (Supp. to Engineer, Lond.), Jan. 31, 1930, pp. 6-7. With view to overcoming difficulties of ordinary tensile test as applied to thin sheet metal, and at same time affording measurements of ductility of material, authors have devised new form of cupping which is described. Review of paper indexed in Engineering Index, 1929, from Mitteilungen aus dem Kaiser-Wilhelm-Institut fuer Eisenforchung, vol. 11, 1929.

ELONGATION. Significance and Evaluation of Elongation of Metals (Zur Deutung und. Bewertung der Bruchdehnung bei Metallen) W. Kuntze. Zeit. fuer Metallkunde (Berlin), vol. 22, no. 1, Jan. 1930, pp. 14-22, 17 figs. It is claimed that maximum elongation is not proof of resistance to rupture; results of tests in which influence of elongation under bending and torsion, and its relation to strain hardening and decay of material relations between elongation and notch touchness, etc., are determined.

FATIGUE. Derivation of Vibration Strength from Tensile and Cohesive Strength (Berechnung der Schwingungsfestigkeit aus Zugfestigkeit und Trennfestigkeit), W. Kuntze. V.D.I. Zeit. (Berlin), vol. 74, no. 8, Feb. 22, 1930, pp. 231-234, 3 figs.

The Failure of Steel Castings and Forgings Through Fatigue. Nor-East Coast Inst. of Engrs. and Shipbldrs.—Advance Paper (Newcastle-Upon-Tyne), for mtg. Jan. 24, 1930, 14 pp., 4 figs. on supp. plates. Rather loose application of term fatigue is discussed; one type of fracture only is classed as fatigue fracture others described being barred; erroneous conceptions of fatigue are discussed and its mechanism is described; metallurgical and mechanical aspects are dealt with, and ways avoiding fatigue are suggested; number of examples of fatigue failures are briefly described.

TEMPERATURE EFFECTS. Effect of Small Changes in Temperature on the Properties of Bodies, M. D. Hersey. U.S. Bur. of Standards—Jl. of Research, vol. 4, no. 1, Jan. 1930, pp. 137-156. After reviewing usual methods of solution, general mathematical treatment of problem is given, from which two additional methods are derived that can sometimes be usefully applied: (1) simple calculation, made possible by theory of dimensions, which does not require detailed formula for property in question; and (2) combined theoretical and experimental solution, in which experimental factors have been reduced to minimum; stiffness of steel spring is taken as example.

WEAR TESTING. Recent Results of Research on Wear of Materials (Neuere Ergebnisse der Abnutzungsforschung), M. Fink. V.D.I. Zeit. (Berlin), vol. 74, no. 3, Jan. 18, 1930, pp. 85-87, 4 figs. Features of Amsler wear-testing machines; results of recent research in Germany, Great Britain, and United States on such subjects as rusting of steel, mechanical production of oxidation in rolling, rail corrugations, etc.

MINES AND MINING

CANADA. Mineral Production of Canada during 1929. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 2, Jan. 10, 1930, pp. 34-35. Brief statistical review, with estimated total value of $303,876,000 for metallics, fuels, miscellaneous non-metallics, clay products, and other structural materials.

New Record Output in Canada, S. J. Cook. Eng. and Min. Jl., vol. 129, no. 3, Feb. 8, 1930, pp. 141-142. General review for 1929, with production estimated; new records were established in output of asbestos, cement, clay products, copper, gold, gypsum, lime, nickel, petroleum, salt, stone, sand and gravel, and zinc; total increase in value of mineral output in Canada in 1929 as compared with figures for 1928 was $28,887,000.

N

NICKEL INDUSTRY

BRIEF REVIEW. Nickel, T. W. Gibson. Eng. and Min. Jl., vol. 129, no. 3, Feb. 8, 1930, p. 123. Brief review for 1929; mines of Sudbury district furnish 10 per cent of world's supply; balance is chiefly from New Caledonia; Canadian properties are largely owned and operated by International Nickel Co. of Canada, Ltd. which recently took over properties of Mond Nickel Co.; about 2,000,000 tons smelted in 1929, with nickel content about 58,000 tons; notes on construction activities; exports of 2 companies from New Caledonia show decrease in production.

NITRIDATION

EUROPEAN PRACTICE. Nitriding of Steel in European Practice, J. W. Urquhart. Heat Treating and Forging, vol. 16, no. 1, Jan. 1930, pp. 48-50 and 52. Ammonia-heat, method of producing intense local hardness is reviewed; aluminum content is indispensable; hardness of case is comparable to bort; properties of nitrided steel surface; low temperature advantages of nitriding; depth of nitrided zone; preparation of nitralloy steels; steels suggested for nitriding; firing boxes for nitriding; electric resistor furnace used in Europe for nitriding.

NOTCHED BARS

STRESSES IN. Danger of Notched Sections (Ueber die Kerbgefahr), W. Kuntze. V.D.I. Zeit. (Berlin), vol. 74, no. 3, Jan. 18, 1930, pp. 78-82, 11 figs. Report from Materials Testing Office of Germany giving results of new series of tests; effect of shape and depth of notch on stresses; variable effect of maximum notch stresses in tension and bending upon resistance of test specimen; value of quality of materials for safety of notched sections.

NOZZLES

DISCHARGE. Coefficients of Flow of Standard Nozzles, H. Mueller and H. Peters. Nat. Advisory Committee for Aeronautics—Tech. Memo., no. 549, Jan. 1930, 6 pp., 3 supp. figs. Results of experiments in hydraulic laboratory of Munich Institute of Technology; two standard nozzles for pipes of 2.76 and 6.89 in. in diam. tested, using water as flowing medium; results compared with those of Jacob, Kretzschmer, and Witte; with use of pitot tubes in irregular flow, calculations made with greater error; present flow coefficients apply only to plants geometrically similar to author's.

O

ORE DEPOSITS

THEORY. Relation of Electrode Potentials of Some Elements to Formation of Hypogene Mineral Deposits, B. S. Butler and W. S. Burbank. Am. Inst. Min. and Met.—Trans. 1929, pp. 341-353 and (discussion) 353-356. Paper is attempt to set forth some of geologic and chemical relations of minerals, with particular reference to some ore deposits in Colorado that show sharp changes in mineralogy and metal content of primary ore with change in depth. Article indexed in Engineering Index, 1929, from Am. Inst. Min. and Met.—Tech. Pub. 166, Feb. 1929.

ORE TREATMENT

PROGRESS IN. Progress in Cyaniding and Ore Dressing, A. James. Eng. and Min. Jl., vol. 129, no. 1, Jan. 9, 1930, pp. 13-16, 2 figs. General remarks of filtration, roasting, fine grinding, slime leaching, and flotation; comments on mining investments and other subjects.

P

PAVEMENTS, ASPHALT

Economic Value. Economic Value of Asphalt Surfacing, G. W. Craig. Can. Engr. (Toronto), vol. 58, no. 5, Feb. 4, 1930, pp. 187-188. Surfacing of cement concrete pavements; asphalt wearing surfaces; maintenance; surfacing of concrete bases; ultimate cost at end of 40 yrs. Paper read before Eighth Annual Asphalt Paving Conference.

Construction. Paving Plant Equipment and Methods, J. W. Devitt. Can. Engr. (Toronto), vol. 58, no. 4, Feb. 4, 1930, pp. 193-194. Improvements in construction and operation of asphalt paving plants; paper presented at annual asphalt paving conference; road drying units; types of oil burners; power for plant operation; mixing boxes; proportioning materials; adding mineral filler; heating asphaltic cement. Paper read before Eighth Annual Asphalt Paving Conference.

PAVEMENTS, CONCRETE

Curing. The Arlington Curing Experiments, L. W. Teller and H. L. Bosley. Pub. Roads, vol. 10, no. 12, Feb. 1930, pp. 213-225 and 28, 16 figs. Effects of various curing treatments on concrete pavement slabs; tests show that curing condition affects slab length; black coating caused higher temperatures; early burlap and transverse joints reduced cracking; subgrade friction; slab curling; movement of slabs due to swelling of subgrade; method of curing and surface hardness; loss of moisture; effect of steel reinforcing on frequency and width of cracks.

PAVEMENTS, GRANITE

Heavy Traffic. Granite and Cement for Heavy Traffic, E. A. Slater. Surveyor (Lond.), vol. 77, no. 1983, Jan. 24, 1930, p. 88. Author recommends special type of road consisting of concrete foundation and granite sett paving.

PENSTOCKS

Jet Dispersers. Hydraulic Jet Dispersers for the Arapuni Power Plant. Engineering (Lond.), vol. 129, no. 3342, Jan. 31, 1930, p. 137, 2 figs. Pipe lines are each being fitted at lower end with Glenfield energy disperser; by means of these, energy of 3,000 cusecs of water escaping from each of jets, and amounting to nearly 50,000 hp. will be harmlessly disposed of, water falling on surface of river in form of heavy rain.

PIPE

Oxyacetylene Welding. Fabrication of Welded Piping Designs. Linde Air Products Publication, published by Union Carbide and Carbon Corp., 30 E. 42nd St. New York, N.Y., 84 pp., 35 figs. Procedure control for oxyacetylene welding line joints in steel or wrought iron pipe; procedure control for fabrication of oxwelded pipe fittings; templet layout for pipe fittings; tables for estimating costs.

PIPE, CONCRETE

Centrifugal Casting. Centrifugally Cast Concrete Pipe for Water Supply (Schleuderbetonrohre fuer Trinkwasserversorgung), Keller. Gas und Wasserfach (Munich), vol. 72, no. 46, Nov. 16, 1929, pp. 1115-1118, 5 figs. Composition of mix and methods of casting of Hume, Vianini, and other patented types of centrifugal concrete pipe; results of tests, including resistance to chemical corrosion; systems of reinforcement and joints.

PIPE FITTINGS

Standardization. Influence of Standardization in the Heat and Power Industry, A. M. Houser. Mech. Eng., vol. 52, no. 3, Mar. 1930, pp. 210-211. Author illustrates functioning of sectional committees organized under procedure of American Standards Association by reference to activities of Sectional Committee on Pipe Flanges and Fittings; refers more specifically to standardization of cast-iron flanged fittings as example of this work.

X-Ray Analysis. X-Raying Large Steel Castings, A. St. John and H. R. Isenburger. Iron Age, vol. 125, no. 7, Feb. 13, 1930, pp. 499-501, 9 figs. Further information given about X-ray inspection of heavy cast-steel pipe fittings for high pressure service, some of which were recently examined on job instead of at laboratory; castings for 1,200-lbs. pressure steam plant; how current for X-rays was produced; X-ray pictures hard to reproduce.

PIPE JOINTS

Welded. Welded Line Joints for Steel Pipe, W. I. Gaston. Iron Age, vol. 125, no. 6, Feb. 6, 1930, pp. 435-437, 9 figs. Types of welded line joints used today, are considered from standpoints of strength, flow conditions and economy; Vee butt joint is all-purpose joint; square ends preferred on thin walls; closed Vee usable for low-pressure work; couplings sometimes welded to prevent leaks; use of liners.

PLATES

Rectangular, Stresses in. Transversal Oscillations of Rectangular Plates with Special Regard to Buckling (Transversalschwingungen rechteckiger Platten mit besonderer Ruecksicht der Knickung), H. Grauers. Ingeniors Vetenskaps Akademien (Stockholm), no. 98, 1929, 68 pp., 16 figs. Thorough treatise on strains in rectangular plates subjected to various loadings; it is shown how to find magnitude of evenly distributed external forces, that make equilibrium labile and conditions to which edges are subjected; formulae are derived and diagrams are worked out for various conditions. (In German.)

PRESSURE VESSELS

Welding. Welded Boilers, E. R. Fish. Am. Welding Soc.—Jl., vol. 8, no. 10, Dec. 1929, pp. 24-35, 6 figs. General discussion of methods of welding boilers, both high- and low-pressure; including forge or hammer welding, autogenous or fusion welding, electric resistance welding, and thermit welding; X-ray examination; defects in line welds, girth seams or structural joints may be detected by use of stethoscope.

PUMPING STATIONS

Costs. Pumping and Filtration Costs of a Small Town Water System, W. S. Davis. Am. Water Works Assn.—Jl., vol. 22, no. 1, Jan. 1930, pp. 99-102. Operating cost data for low-service and high-service centrifugal pumps, pumping against head up to 340 ft., serving 1,000 customers.

Electric vs. Steam. Comparative Data on Steam and Electric Pumping Stations, J. F. Laboon. Am. Water Works Assn.—Jl., vol. 21, no. 12, Dec. 1929, pp. 1640-1648. Electrically driven pumps are most advantageous where reservoir or standpipe storage is available; electric power economical at Wheeling, W. Va.; results of Nashville, Tenn.; comparison between Nashville and Erie plants; costs of electric and steam-driven plants.

Piping. Pump Discharge Headers and Pump Piping for Water Works Stations, F. G. Cunningham. Am. Water Works Assn.—Jl., vol. 22, no. 1, Jan. 1930, pp. 1-12 and (discussion) 12-16. Meeting maximum demand; functions of good discharge system; header layouts and details; suction connections; check valves. Indexed in Engineering Index, 1929, from Mun. News, July 1929.

Electric, Newport, R.I. Changes in Power for Pumping at Newport, R.I., H. Watson. New England Water Works Assn.—Jl., vol. 43, no. 4, Dec. 1929, pp. 410-415. Replacement of steam pumping equipment with modern electrically driven centrifugal pumps of double-suction type, with motors mounted on common base; motors are all of squirrel-cage induction type operating directly from 2,300-volt line, at which voltage all current is metered; maximum pump capacity 6 m.g.d. against head of 158 ft.

PUMPS

Feedwater. Centrifugal Pump as a Feedwater Pump (Die Kreiselpumpe als Kesselspiesepumpe), L. Klein and Gossmann. Foerdertechnik u. Frachtverkehr (Wittenberg), vol. 22, nos. 24 and 25, Nov. 22 and Dec. 6, 1929, pp. 459-461 and 486-487, 14 figs. Advantages and suitability of centrifugal pumps as feedwater pumps; design of several makes of pumps is shown; details of stuffing boxes.

PUMPS, CENTRIFUGAL

Design. Studies of Regulation, Theoretical and Actual Pumping Heads of Centrifugal Pumps (Untersuchungen ueber Regelung, theoretische und workliche Foerderhoehe von Kreiselpumpen), W. Siebrecht. V.D.I. Zeit. (Berlin), vol. 74, no. 3, Jan. 18, 1930, pp. 87-88, 3 figs. Excerpts from Bulletin No. 321 of Forschungsarbeiten auf dem Gebeite des Ingenieurwesens, on tests made at Braunschweig Institute of Technology, on regulation by admitting of air into suction of pump, effect of various positions of buckets, etc.; discussion of Pfleiderer method of computation for design of centrifugal pumps.

Deep Well. Deep-Well Centrifugal Pumps (Tiefbrunnen-Kreiselpumpen), W. Schulz. V.D.I. Zeit. (Berlin), vol. 74, no. 8, Feb. 22, 1930, pp. 235-238, 9 figs. Hydraulic characteristics of deep wells, particularly drilled wells, and adaptation of pump construction to meet special conditions of deep well pumping; features of semi-axial types of multi-stage pumps with as many as 12 stages, manufactured by Klein, Schanzlin & Becker; description of several devices for protection of pumps against sand carried in water pumped; economic considerations.

PUNCH PRESSES

Carry-Motion. The Carry-Motion Press and its Work, F. R. Daniels. Machy. (N.Y.), vol. 36, no. 5, Jan. 1930, pp. 354-358, 6 figs. Features of press equipped with magazine feed, multiple dies, and automatic transfer machanism are described; tooling arrangement for hinges; forming hinge-pin eye; broaching inner faces of hinge-pin eyes; operations for making formed bushings; materials used for tools.

Q

QUANTITY SURVEYING

Uniform System. Uniform System of Quantity Survey. Can. Engr. (Toronto), vol. 58, no. 7, Feb. 18, 1930, pp. 229-230. Features of proposed American system to aid in development of scientific method of quantity survey for purpose of bringing about more economical results in estimating, bidding and contract awarding procedure.

R

RAIL MOTOR CARS

Maintenance and Repair. Maintaining Rail Motor Cars on the New Haven, E. O. Whitfield. Ry. Mech. Engr., vol. 104, no. 1, Jan. 1930, pp. 28-34, 16 figs. Description of methods used in administration of automotive division of New York, New Haven and Hartford; unit replacement programme, in which complete spare assemblies are kept on hand ready for application; number, type and age of rail motor cars in service; record of failures chargeable to different mechanisms during 1928 and 1929; tools and fixtures for repair work.

North America. The 1929 Rail Motor-Car Orders, C. B. Peck. Ry. Age, vol. 88, no. 1, Jan. 4, 1930, pp. 99-101, 5 figs. Capacity of engine units has reached 500 hp.; trend continues toward greater power plant capacities and weights; power-plant capacity of rail motor cars, United States and Canada; list of orders for rail motor cars and trailers arranged alphabetically by purchasers.

Oil-Electric. F.I.A.T. Rail Car with Airless-Injection Engine. Engineering (Lond.), vol. 129, no. 338, Jan. 3, 1930, pp. 7-9, 8 figs. There is seating accommodation for 8 persons in first-class and for 30 persons in third-class compartment; engine is of six-cylinder type operating on four-stroke cycle; cylinders have bore of 7.84 in. and piston stroke is 10.7 in.; generator is of separately excited type, and has six main and six commutating poles.

Steam. Oil-Fired, Superheated Steam Rail Motor Cars (Heissdampftriebwagen mit Oelfeuerung), O. Guenther. V.D.I. Zeit. (Berlin), vol. 74, no. 4, Jan. 25, 1930, p. 118, 1 fig. Type developed by Esslingen Machine Works of Venezuelan railroads; car weighs 35 kg. tons and has 42 seats; trailer has 32 seats and weighs 16 tons; Venezuelan oil was used on test stand for average loading at 30.2 km. per hr.; 130 kg. was fired without leaving residues; steam is superheated 340 to 380 deg. cent.; 135 hp. developed, yielding tractive effort of 1,205 kg.; operating speed approximately 50 km. per hr.

Switzerland. Rail Motor Car of Bern-Neuenburg Railroad (Die Triebwagen der Bern-Neuenburg-Bahn), A. E. Mueller. Elektrotechnische Zeit. (Berlin), vol. 50, no. 51, Dec. 19, 1929, pp. 1841-1844, 7 figs. Design, details and first operating experience of 1,440-hp. 15,000-volt 16 ⅔-cycle car, weighing 59.5 tons, 20.9 m. long and carrying 5 tons of passengers and freight, continuous speed is 50 km. per hour.

RAILROAD ELECTRIFICATION

Buenos Aires. Buenos Aires Electrified Interurban System. Traction Shop and Roadway, vol. 3, no. 1, Jan. 1930, pp. 1-2, 3 figs. Central Argentine Railway completes electrification in order to improve service and economize on operating expenses; description of three routes; new rolling stock; map of Buenos Aires interurban system.

France. Electrification of the French Railroad, D. C. Woods. Commerce Reports, no. 2, Jan. 13, 1930, pp. 113-115. Development of interest in electrification; 1930 programme; progress and prospects of Midi railway; Paris-Orleans second in progress; state railway, Paris, Lyons and Mediterranean.

United States. Much Construction Work Features Heavy Electric Traction in 1929. Elec. Ry. Jl., vol. 74, no. 1, Jan. 1930, pp. 46-47, 1 fig. Brief discussion of railroad-electrification work carried on during past year; table of installations of electrical operation of steam railroads in United States; curves showing mileage of steam railroads electrified and total weight of active electric locomotives.

RAILROAD REPAIR SHOPS

Equipment. Old Engines and Generators Rebuilt for Compressors, F. E. Estling. Power, vol. 71, no. 5, Feb. 4, 1930, pp. 169-170, 3 figs. Brief description change-over in Canadian National Railways shops in Winnipeg, Canada; steam engines to compressors and generators to motors for driving them.

RAILROAD SIGNALS AND SIGNALING

Central Control. Trains Operate by Signal Indications on the Paducah and Illinois, J. H. Schubert. Ry. Age, vol. 88, no. 2, Jan. 11, 1930, pp. 141-143, 5 figs. Engire railroad, involving five junctions and bridge over Ohio River, included in dispatcher-controlled system; operation of dispatcher-controlled signal system; outside construction.

RAILROAD STATIONS

Baggage Service. New Baggage Service Sheds of the Austerlitz Railroad Station in Paris (Les nouvelles halles du service des messageries de la gare de Paris-Austerlitz), C. Dantin. Génie Civil (Paris), vol. 96, no. 2, Jan. 11, 1930, pp. 29-33, 7 figs. General layout of tracks and platforms; sheds 300 m. long, by 60 m. wide, have reinforced-concrete arch ribs of 16 to 25 m. in span; structural details of roof arches; equipment and method of operation of baggage service.

RAILROAD TERMINALS, FREIGHT

Construction. Economical Methods on Freight Depot Construction. Am. Contractor, vol. 51, no. 7, Feb. 15, 1930, pp. 11-15, 5 figs. Report on methods used in construction of Pittsburgh freight terminal project; track facilities on site used to expedite steel erection and material delivery.

Hamilton, Ont. Canada Steamship Lines, Limited, New Terminals at Hamilton. Can. Ry. (Toronto), vol. 382, Dec. 1929, pp. 785-786, 1 fig. Canada Steamship Lines, Ltd., has under construction freight terminal on waterfront property being located conveniently for movement of freight by ship, rail and truck; general description of new terminal; layout and cross-section illustration of new terminal.

REFRACTORY MATERIALS

Heat Conductivity. Measuring Thermal Conductivity of Refractory Materials at High Temperatures (Waermeleitfachigkeitsmessungen und Feuerfesten Materialien bei Hohen Temperaturen), A. Eucken and H. Laube. Tonindustrie Zeitung (Berlin), vol. 53, no. 91, Nov. 14, 1929, pp. 1599-1602, 4 figs. Spherical heating element wound with platinum wire is used; material to be tested is made into two hemispheres surrounding heating elements; thermocouples are embedded in concentric grooves and lead wires are brought to surface at considerable distance from junctions.

RAILROAD TRAIN CONTROL

Great Britain. Train and Traffic Control on the L.N.E.R. Ry. Gaz. (Lond.), vol. 52, no. 2, Jan. 10, 1930, pp. 48-50, 1 map. Control methods are widely adopted on London and North Eastern Railway; particulars of controls, arranged in order in which they were opened, are given.

RAILROADS

Single Track. The Operation of Single Lines of Railway. Ry. Gaz. (Lond.), vol. 52, no. 2, Jan. 10, 1930, pp. 59-60, 2 figs. and no. 3, Jan. 17, 1930, pp. 84-85, 1 fig. Jan. 10: Continued description of methods in use in India; Indian requirements as to token instruments. Jan. 17: Illustrated description showing how double line of railway can, with single-line methods of operation, be made almost equivalent of four tracks; unidirectional single-line method. (Continuation of serial.)

REFRIGERATING COMPRESSORS

Multiple Effect. A Study of Multiple Effect Compression, H. Sloan. Refrigeration, vol. 47, no. 1, Jan. 1930, pp. 39-42, 6 figs. Illustrated description of multiple-effect cycle; calculating capacity; table giving multiple-effect compressor and receiver data; illustrating operation.

REFRIGERATING ENGINEERING

Present Trends. Present Trends in the Practice of Refrigerating Engineering, F. Ophuls. Refrig. Eng., vol. 19, no. 1, Jan. 1930, pp. 1-2 and 16. Brief review of past developments in refrigeration; increasing scope of art; general outlook in refrigerating engineering; brief consideration of Mechanical Refrigeration Safety Code.

REFRIGERATING PLANTS

Pumps. Pumps for Ice Plants and Refrigerating Plants, J. J. Alden. Southern Power Jl., vol. 48, no. 2, Feb. 1930, pp. 79-87, 11 figs. Discussion of pumping requirements for ice-making plants; variable speed drives; curves showing combined capacity of centrifugal pumps operating parallel; direct acting steam pumps; provision for testing; straight line diagram for use in solution of pump problems; angle of impeller vanes.

REFRIGERATION

Heat Transmission and. Heat Transmission and Refrigeration, C. S. Keevil. Refrig. Eng., vol. 19, no. 2, Feb. 1930, pp. 41-44, 3 figs.

Low-Temperature. Developments in Application of Low-Temperature Brine Freezing. Cold Storage (Lond.), vol. 32, no. 381, Dec. 19, 1929, pp. 391-392, 3 figs. Development of quick freezing brings nearer, for all connected with production, preparation, marketing, and consumption of perishable foods, facility which bids fair to place them on even footing with producers and manufacturers of non-perishable goods; survey of quick-freezing methods.

Periodical Absorption. Periodical Absorption Refrigerating Machines (Ueber Periodische Absorptionskaeltemaschinen), K. Linge. Zeit. fuer die gesamte Kalte-Industrie, (Berlin), vol. 8, no. 36, August 1929, pp. 149-157, 8 figs. Influence of condensation and evaporation temperature on dry and wet absorption machines is investigated for commercial machines and ideal machines; results show that dry machines using caclium chloride ammonia have marked advantage over wet machines using hydraulic ammonia.

Tendencies in. A Survey of Tendencies in Modern Refrigerating Design, B. C. Oldham. Cold Storage (Lond.), vol. 32, no. 382, Jan. 16, 1930, pp. 8-11, 3 figs.

REFRIGERATORS

Electric. The Heat Pump, T. G. N. Haldane. Elec. Rev. (Lond.), vol. 105, no. 2718, Dec. 27, 1929, pp. 1161-1162. Suggested economical method of producing low-grade heat from electricity; reversible heat engine has been treated simply as heat pump, most familiar type of which is refrigerator.

REFUSE DISPOSAL

United States. Garbage—Is it a City Asset or Liability? West. City, vol. 6, nos. 1 and 2, Jan. 1930, pp. 42-43 and Feb., pp. 42-43. Condensed information on collection and disposal methods and costs as practiced in 23 representative western municipalities ranging from metropolitan cities to cities of less than 10,000 population. (Continuation of serial.)

REFUSE INCINERATORS

Baltimore. Reclaiming and Disposing of a City's Trash, W. Viessman. Am. City, vol. 42, no. 1, Jan. 1930, pp. 109-110, 5 figs. Features of five new municipal Davis-type incinerators built by city of Baltimore at cost of $500,000; salvaging equipment and methods; operating data for plants; revenue from salvaged material, 1928.

RESEARCH

Ontario. Progress of the Ontario Research Foundation, O. E. Ellis. Can. Machy. (Toronto), vol. 40, no. 26, Dec. 26, 1929, pp. 277-282, 3 figs. Important part which Ontario Research Foundation already bears in growth and development of province of Ontario; metallurgical division; new laboratories; hardness testing machines; furnace room; photomicrograph equipment; search for existing information; results depend on industry.

RESERVOIRS

Discharge Measurements. Graphical Methods for Measuring of Discharge, etc. (Procéde graphique pour la mesure des débits, etc.), C. Chaudoir. Génie Civil (Paris), vol. 96, no. 2, Jan. 11, 1930, pp. 44-45, 3 figs. Author outlines graphical method of determining discharge from water supply distribution reservoirs, or larger equalizing reservoirs, from continuous graphical record of water-level heights in such reservoirs.

Protection. Enforcement with other Beverages, J. F. Jackson. New England Water Works Assn.—Jl., vol. 43, no. 4, Dec. 1929, pp. 402-408 and (discussion) 408-409. Discussion of laws enforced in respect to bathing in water-supply reservoirs; brief reports on some Connecticut lawsuits.

RESIN, SYNTHETIC

Testing. Service Tests on Moulded Resinoid Products, K. Ripper and P. Schmidmeier. Plastics, vol. 6, no. 1, Jan. 1930, pp. 11-13, 2 figs. Simultaneous exposure to chemical fumes and electric current show advantages of resinoids over metals and ceramic products.

RETAINING WALLS

Design. General Formulae for Computation of Thrust and Bearing of Earths (Formules générales pour calculer la poussée et la butée des terres), L. Ravier. Génie Civil (Paris), vol. 95, no. 26, Dec. 28, 1929, pp. 647-647, 3 figs. Anonymous discussion of articles indexed from issue of Dec. 14, treating of application of retaining-wall formulae to construction of hollow type reinforced-concrete seawalls; numerical examples.

General Formulae for Computation of Thrust and Bearing of Earths (Formules générales pour calculer la poussée et la butée des terres), L. Ravier. Génie Civil (Paris), vol. 95, nos. 24, Dec. 14, 1929, pp. 596-597, 2 figs. Author presents transformation of Poncelet analysis from which formulae of Coulomb and Rankine follow as particular cases.

ROAD DESIGN

Curves. Superelevation of Road Curves (La technique des virages relevés sur les routes), R. Bégard. Génie Civil (Paris), vol. 96, no. 3, Jan. 18, 1930, pp. 59-60, 2 figs. Comparative discussion of French formula by Galatoire-Malégarie and State of Ohio or Voshell formula; graphical charts for computing superelevation required.

ROAD MACHINERY

Use of. Use of Mechanical Equipment in Highway Construction Work, T. W. Allen. Mfrs. Rec., vol. 97, no. 2, Jan. 9, 1930, pp. 58-61, 9 figs. Examples of modern road-building machinery and influence upon speed of machinery construction.

ROAD MATERIALS

Bituminous, Great Britain. Development of Tar Roads in Great Britain, W. E. Cone. Gas. Jl. (Lond.), vol. 189, no. 3476, Jan. 1, 1930, pp. 31-32. Road experience, particularly as to surface tarring, indicates that trend is favouring use of more viscous tar than hitherto; importance of relationship between tars of varying consistency and mineral aggregates of different physical characteristics; advantage of tar macadam in conservation of existing roads and production of granular surface that eliminates skidding. Abstract of paper read before German Road Tar Committee.

Concrete Aggregates. Progress and Present Status of Research on Mineral Aggregates for Asphaltic Type Roads, P. Hubbard. Rock Products, vol. 33, no. 1, Jan. 4, 1930, pp. 155-156. Summary of research to date on type and characteristics of aggregate required for this kind of construction; uniformity of aggregate is its prime requirement; evaluation of mineral aggregates; angularity and compaction; toughness, hardness and resistance to abrasion; graduation and stability; fine aggregate mixtures studied; sands from different sources affect stability.

Investigations in the Field of Rock Products Conducted by the Bureau of Public Roads During 1929, F. H. Jackson. Rock Products, vol. 33, no. 1, Jan. 4, 1930, pp. 144-145. During past year U.S. Bureau of Public Roads has carried on number of investigations of interest to both producer and consumer of mineral aggregates used in road construction; effect of kind and character of aggregate; use of maximum amounts of coarse aggregate; looking for lightweight concrete pavement; studies of fine aggregates; soundness of aggregate.

Emulsions. Emulsions for Asphalt Pavements ,L. Kirschbraun. Can. Engr., vol. 58, no. 5, Feb. 4, 1930, pp. 185-186. Definition and types of emulsions; emulsions as related to paving industry; mechanical technique of preparation; specific properties of emulsions for paving purposes. Paper presented before Assn. of Asphalt Paving Technologists. Indexed in Engineering Index, 1929, from Roads and Streets, Dec. 1929.

Steel. Road Building Providing Outlets for Steel, J. J. Palmer. Commerce Reports, no. 2, Jan. 13, 1930, pp. 92-93, 1 fig. Materials entering directly into road building; auxiliary equipment commonly employed in road building; new outlets for steel opened by new roads; market for hardware products.

ROAD SURFACE TREATMENT

Road Surface Treatment. The Surface Treatment of Roads, A. C. Tregoning. Instn. of Engrs. of Australia—Jl. (Sydney), vol. 1, no. 12, Dec. 1929, p. 440. Surface treatment of roads to enable them to withstand stresses caused by modern traffic is discussed; binders used in surface treatments include minerals, bitumens and tars, chemical preparations, etc.; mineral aggregates which are used with bituminous binders, include screenings, gravels, sands, etc.; various methods in use are described in detail with discussion on cost and traffic-carrying capacity; section of paper is devoted to plant used in various methods.

ROADS, ASPHALT

Cold Weather Construction. Rock Asphalt Construction in Cold Weather, S. F. Ferguson. Highway Engr. and Contractor, vol. 36, no. 1, Jan. 1930, pp. 68-70 and 2 figs. Report on direct steam heating to facilitate unloading and laying of rock asphalt at low temperatures; spacing of jets; steaming time; coal consumption; steaming equipment.

ROADS, CONCRETE

Construction. Curing Concrete Pavements and Working Periods, C. R. Waters. Good Roads, vol. 72, no. 8-9, Aug.-Sept. 1929, pp. 384 and 386. Curing concrete pavements with asphaltic emulsion; coloured pavement; working night shifts. Article previously indexed from Roads and Streets, July 1929.

Construction Plant and Methods for Concrete Roads. Am. Soc. Civil Engrs.—Proc., vol. 55, no. 8, Oct. 1929, pp. 2046-2048 and (discussion) 2048-2049. Abstract of committee report; number of set-ups; railroad facilities; plant layout; switch tracks and switching; storage piles and bins; cranes and unloading practice.

ROADS, LOW COST

Construction Studies. Low Cost Road Construction Studies, J. T. Pauls. Can. Engr. (Toronto), vol. 58, no. 7, Feb. 18, 1930, pp. 226-228. Progress in field studies on bituminous treatment of low-cost road construction; method of surface treatment; construction and maintenance costs; grades of bituminous material; typical soil grading. Paper presented before Eighth Annual Asphalt Paving Conference.

ROADS, LOW COST

Surface Treatment. Bituminous Surface Treatment of Sand-Clay and Topsoil Roads. Pub. Roads, vol. 10, no. 11, Jan. 1930, pp. 193-212, 19 figs. Report on co-operative study by Bureau of Public Roads and asphalt industry on surface treatment of sand-clay and topsoil roads with bituminous materials; projects selected for detailed study are described; steps in preparing sand-clay surface for treatment; examination of samples from subgrades and bases; analyses of bituminous materials; specifications used in bituminous surface treatment; construction and maintenance costs.

ROCK PRODUCTS RESEARCH

Bureau of Standards. Investigations at Bureau of Standards Dealing with Cement, Lime, Gypsum and Stone. Rock Products, vol. 33, no. 1, Jan. 4, 1930, pp. 137-141. Total of 60 samples of different composition have heen collected; cast stone; waterproofing agents for concrete; diatomaceous silicas as admixture in concrete; constitution of portland cement; durability of bond between mortar and hrick; strength of brick walls; strength of gypsum fibre concrete; soundness tests for lime; particle size distribution of hydrated lime; strength of commercial sand-lime brick; wear resistance of flooring materials; slate investigation.

ROLLING MILLS

Anti-Friction Bearings. A Review of the Proceedings of A.I. and S.E.E. in Connection with the Development of Anti-Friction Bearings in the Iron and Steel Industry, D. M. Petty. Iron and Steel Engr., vol. 7, no. 1, Jan. 1930, pp. 12-20. Review of data and information on what Association of Iron and Steel Electrical Engineers has compiled in connection with anti-friction bearings.

Blooming Mills. A New Three-High Blooming and Slab-Blooming Mill. Iron and Steel Industry (Lond.), vol. 3, no. 4, Jan. 1930, pp. 107-110, 8 figs. Description of three-high (blooming and) slab blooming mill suited for dealing with blooms weighing up to 2 tons each, which has been added to rolling plant of Societe Italiana Ernesto Breda, Milan; without changing rolls mill is capable of rolling blooms of 1 ft. 4 and 9–16 in. and 10 in. down to billets of 7 and ⅛ in. and 4 in. cross section or to any other rectangular section within these limits.

ROLLING MILLS

COOLING BEDS. Modern Cooling Beds (Neuere Kuehlbettbauarten), M. Curth. Stahl und Eisen (Duesseldorf), vol. 50, nos. 3 and 4, Jan. 16, 1930, pp. 65-70 and Jan. 23, pp. 99-104 and (discussion) 105, 34 figs. Requirements of efficient cooling bed and defects in existing types are set forth and certain improvements in design are discussed; recent types of cooling beds for different materials are described; suggestions for improvements in operation for purpose of achieving more accurate rolling.

DESIGN. Roll Pass Design, W. Trinks. Rolling Mill Jl., vol. 4, no. 2, Feb. 1930, pp. 49-53, 15 figs. Causes of formation of fins and overfills in rolling and methods by which they may be avoided are outlined; in general these effects can be minimized by rounding or chamfering corners of passes and use of convex box passes.

ELECTRIC CONTROL. Steel Mill Auxiliary Control Specification Guide Forms. Iron and Steel Engr., vol. 7, no. 1, Jan. 1930, pp. 1-8. Set of guide forms which have been compiled to enable purchasing agents, steel-mill engineers and their assistants to properly prepare requisitions for d.c. magnetic control apparatus; resistor applications; general guide forms given for specifying non-reversing d.c. magnetic controllers, reversing or reversing-plugging d.c. controllers, reversing dynamic braking d.c. magnetic controllers, and d.c. crane protective, switchboard and panels.

ELECTRIC DRIVE. Electrical Drives for Steel Plants, A. F. Kenyon. Iron and Steel Engr., vol. 7, no. 1, Jan. 1930, pp. 20-23, 3 figs. Description of new electric drive which has been installed during 1929; during year approximately 300,000 hp. in main roll drives of 300 hp. and larger, have been sold, making total capacity on main roll drives more than 2,500,000 hp.; truck type circuit breakers extensively applied with satisfactory results.

FILLING ROLL PASSES. Filling of Roll Passes (Das Fuellen von Kalibern), W. Tafel and G. Wagener. Stahl und Eisen (Duesseldorf), vol. 50, Jan. 30, pp. 126-128, 6 figs. Investigation of method developed by S. Ekelund for determination of ingot depth of irregular passes by means of practical tests; in most cases failure resulted; agreement with Tafel method of calculation is confirmed.

ROOFS

INSULATION. Roof Insulation, W. S. Wallace. Textile World, vol. 77, no. 1, Jan. 4, 1930, pp. 60-62 and 100, 7 figs. Conservative prediction is made that within few years practically all mill and other industrial buildings will have insulated roofs; discussion of insulating materials used in mill-roof construction.

ROTORS

BALANCING. Balancing Rotating and Reciprocating Masses (Ueber den Ausgleich umlaufendeer sowie hin- und hergehender Massen), W. Hohmann Maschinen-Konstruktur (Berlin), vol. 62, nos. 22, 23 and 24, Nov. 15, Dec. 1 and Dec. 15, 1929, pp. 515-519, 530-532 and 554-563, 51 figs. Theory and practice of balanced rotating masses, such as crankshaft of locomotives and revolving machines, and reciprocating parts, as in reciprocating machines, are treated; results from test machines are illustrated by examples. (To be continued.)

RUBBER

STRESS-STRAIN PROPERTIES. Thermodynamics of Stressed Vulcanized Rubber, R. H. Gerke. Indus. and Eng. Chem., vol. 22, no. 1, Jan. 1930, pp. 73-76 and (discussion) 76-77, 1 fig. Equilibrium stress-strain curves; effect of temperature on modulus; conventions and definitions; first and second laws of thermodynamics; very rapid stress-strain curves. Bibliography.

S

SAND, FOUNDRY

TESTING. Investigation of Endurance of Bond Strength of Various Clays in Moulding Sand. Univ. of Ill.—Bul., vol. 27, no. 18, Dec. 31. 1929, 25 pp. 6 figs. Report on tests to determine physical chemical properties of clays and to compare their bond strength when used in moulding sands under casting conditions; thermal conductivity of moulding sands and effect of heat on clays and moulding sands; effect of repeated heatings on permeability of moulding sands.

SCREW THREADS

COMPARISONS. Some Striking Comparisons between Different Screw Threads. Machy. (Lond.), vol. 35, no. 897, Dec. 19, 1929, pp. 388-389, 3 figs. Advantages and disadvantages of so-called self-locking nut and bolt utilizing Dardeled thread; fundamental of thread is cone, which naturally locks itself with increasing effectiveness into external cone, which forms nut, as pressure is increased question is whether advantage of having self-locking thread is not obtained; through disadvantage of greatly increased stresses in either nut or bolt; study of profiles of several threads and advantages and disadvantages tabulated with sufficient accuracy for general purposes.

STANDARDIZATION. Screw-Threads Division. Soc. Automotive Engrs. Jl.—Reports of Divisions to Standards Committee (Section 2), Jan. 1930, pp. 50-55, 10 figs. Proposed revision of American standard and S.A.E. standard for wrench head bolts and nuts and wrench openings; proposed American standard and S.A.E. standard for slotted-head screws; line cuts and dimensions given for flat, round, oval, and fillister-head machine screws, flat, button and fillister-head capscrews, round, flat, and oval-head wood screws, and brass and steel wood screws.

SEAPLANES

PASSENGER (CONSOLIDATED). The Consolidated Commodore Flying Boat, L. E. Neville. Aviation, vol. 28, no. 2, Jan. 11, 1930, pp. 49-55, 23 figs. Description of Consolidated Commodore Model 16, largest commercial flying boat to be built in United States, which is commercial adaption of Navy XPY-1; central hull monoplane flying boat; two Pratt and Whitney 575-hp. Hornet engines; forgings and open sections used in structure; maximum of athwart-ship bracing employed in structure; large proportion of weight of floor system carried by longitudinal members contributing to general strength of hull; section sizes standardized; plane operating on New York-Rio and Buenos Aires lines.

SEISMOGRAPHS

PRINCIPLE OF. Seismographs (Seismografer), H. Renqvist. Tekniska Forenings I Finland Forhandlingar (Finland), vol. 49, no. 12, Dec. 1929, pp. 217-221, 8 figs. Principle of seismographs is explained and application of principle in various apparatus is described.

SEWAGE DISPOSAL PLANTS

ALLIANCE, OHIO. Third Sewage Treatment Plant at Alliance Overcomes Nuisances, A. A. Burger. Am. City, vol. 42, no. 1, Jan. 1930, pp. 139-142, 4 figs. Design and construction of new plant for Ohio town having population of 36,000; construction plant layout; excavation methods; concreting plant; placing filtering material; total cost of work is about $800,000.

ELECTRIC EQUIPMENT. The Modern Sewage Disposal Plant, R. C. Allen. Elec. Jl., vol. 27, no. 2, Feb. 1930, pp. 82-86, 10 figs. Proper selection of pumps, electric motors, and control equipment makes possible clean, neat and efficient layout; features Newark, New Jersey, Jamestown, Va., Syracuse, N.Y. and Santa Cruz, Calif., plants are given; equipment is described.

SEWAGE DISPOSAL RESEARCH

NEW JERSEY. New Jersey Sewage Disposal Experiments, G. T. Hammond, W. R. Copeland. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 3, Mar. 1930, pp. 521-527. Progress report of Committee of Sanitary Engineering Division, on work of W. Rudolfs, etc., digestion of sewage sludge at high temperatures; enzymes; beneficial action of ripe sludge depends upon age; concentration of more than 15 per cent of solids prevents digestion; effect of organic acids upon number of bacteria and protozoa; drainage is more important than evaporation in dewatering sludge; tests with industrial wastes; chlorination; composition of materials for sprinkling filters.

SHEET METAL TESTING

NEW METHOD. New Testing Method for Sheet Metal (Ein Neues Pruefverfahren fuer Feinbleche), E. Siebel and A. Pomp. Mitteilungen aus dem Kaiser-Wilhelm-Institut fuer Eisenforschung (Duesseldorf), vol. 11, no. 18, 1929, pp. 287-291, 4 figs. Advantages and disadvantages of usual testing methods are discussed; deep-drawing widening test and stress conditions with this test; drawing force and circular stress; maximun load and strength; determination of best testing conditions; calculation of tensile strength; influence of thickness of plate.

SILICA SAND

UNITED STATES. Silica Sand in 1929. Rock Products, vol. 33, no. 1, Jan. 4, 1930, p. 117, 1 fig. Owing to major consolidations in glass-sand producing districts in Eastern states and Ohio and Illinois recently, there has been gradual strengthening of prices in silica industry, increase in price on glass sand were slight and in some locations there was no price movement during past year.

SLUICE GATES

ELECTRIC HEATING. Winter Operation of Sluice Gates. Elec. News (Toronto), vol. 39, no. 2, Jan. 15, 1930, pp. 48-50, 4 figs. Electric heating units built into gates and steel members at gains, successfully combat ice formation at critical periods; capacity of heaters generally recommended is 4 kw. per duct, and for this capacity are usually 10 ft. long.

SMOKE ABATEMENT

DUST COLLECTION. Some Problems of Dust Collection, J. W. Gibson. Iron and Coal Trades Rev. (Lond.), vol. 120, nos. 3229 and 3230, Jan. 17 and 24, 1930, pp. 83 and (discussion) 171; see also abstract in Colliery Guardian (Lond.), vol. 140, nos. 3603 and 3604, Jan. 17 and 24, 1930, pp. 234 and 324-325. Pulverized-coal firing has stimulated question of flue-dust emission from power station and factory chimney; main factors of problem of cleaning flue gases are enumerated and discussed. Abstract of paper read before Midland Inst. of Min. Engrs.

SOLVENTS

RECOVERY. Process and Apparatus for Recovery of Volatile Solvents (Verfahren und Apparate zur Gewinnung fluechtiger Stoffe), J. Bodewig. Chemische Fabrik (Berlin), no. 44, Oct. 30, 1929, pp. 471-473, 7 figs. Three possible courses are: condensation, absorption by solid reagents as activated carbon or silica gel, absorption by liquid reagents; in Cheminova process vapour-charged air is treated with absorbent in Feld gas washers; recoveries up to 95 per cent are possible under practical conditions and fire risks are negligible; method has also been applied to recovery of benzene, benzol, acetone, etc.

SPEED REDUCERS

PLANETARY. Planetary Reduction Gear. Engineering (Lond.), vol. 129, no. 338, Jan. 3,1930, p. 13. Gear known as Moss planetary speed transformer is recent production of Moss Gear Co., Birmingham, Eng., who have also taken opportunity afforded by construction of their new works of completely redesigning and increasing range of their worm and double-helical reduction gears; planetary reduction gear is made suitable for powers up to 40 b.hp. and ratios up to 100:1.

SPRINGS

LAMINATED. Experiments on Laminated Springs. Engineering (Lond.), vol. 129, no. 3338, Jan. 3, 1930, pp. 26-28, 17 figs. Review of recent reports of Department of Scientific and Industrial Research of experimental work at National Physical Laboratory; these deal respectively with their displacement while running; effect of nip on their mechanical properties; and, in continuation of latter work, further inquiry into their endurance.

STANDARDIZATION

UNITED STATES. The A.S.M.E. and Standardization under the A.S.A., W. S. Monroe. Mech. Eng., vol. 52, no. 3, Mar. 1930, pp. 209-210. Brief sketch of historical background for movement in United States; American Society of Mechanical Engineers is entitled to credit for having originated standardization activities in this country; any group of men in or out of member organizations of American Standards Association can originate standardization project by presenting it to standards committee of any one of organizations in A.S.A.; at present time A.S.M.E. is sponsor or joint sponsor for 26 sectional committees under procedure of American Standards Association.

STEAM CONDENSERS

SURFACE. Direction of Tube Axis, and Mean Axis of Flow into Tube Bank in Surface Condensers, T. Petty. Mech. World (Manchester), vol. 87, no. 2246, Jan. 17, 1930, pp. 53-54, 2 figs. Exhaust inlet branch of relatively large size situated centrally between tubeplates of two-pass condenser is sufficiently near theoretically correct position; principle may serve as guide to rational procedure in condensers of special type, as in single-pass naval condensers, or in low-vacuum condensers.

STEAM-ELECTRIC POWER PLANTS

DESIGN. Design of Modern Super Plants (Bau neuzeitlicher Gross-kraftwerke), A. Bannwarth. Elektrotechnische Zeit. (Berlin), vol. 51, no. 6, Feb. 6, 1930, pp. 209-212, 1 fig. Arrangement of building and space requirements are discussed from standpoint of modern steam and equipment practice.

PRESSURE CONTROL FOR. Steam Pressure Control for Stations Operating on a Two Pressure System, J. L. Kimball. Combustion, vol. 1, no. 8, Feb. 1930, pp. 30-33, 3 figs. Discussion of central generating stations operating under two-pressure systems; effective utilization of high-pressure steam gives rise to numerous questions affecting selection and arrangement of pressure-control valves, especially during period when it is necessary to operate with two pressures before station is completely changed over to high pressure cycle.

STEAM HEATING PLANTS

DISTRICT, NEW YORK CITY. Steam Service from Central Stations in New York City, W. J. Baldwin, Jr. Nat. District Heat. Assn.—Bul., vol. 15, no. 2, Jan. 15, 1930, pp. 84-97. Comprehensive discussion of present activities of New York Steam Corp., which is only public utility supplying steam under franchise in New York City; types of buildings supplied with steam; description of piping system; list of new large buildings which are purchasing steam; description of steam generating plants and their operation. Paper read before Am. Soc. Heat. and Vent. Engrs.

DISTRICT, TORONTO. C.P.R. Central Heating Plant, Toronto. Can. Engr. (Toronto), vol. 58, no. 5, Feb. 4, 1930, pp. 181-184, 8 figs. Description of steam plant serving Union Station, C.P.R. and C.N.R. Express Offices, and Royal York Hotel; details of eight horizontal water-tube Babcock boilers rated at 810 hp. each, automatic stokers and forced draft equipment, coal and ash-handling plant, Terry steam turbines driving Lea Courtney centrifugal pumps, Conchrane deaerating heater and water softener, etc.

STEAM PIPE BENDS

HIGH PRESSURE. Tests on High-Pressure Pipe Bends, W. Hovgaard. Jl. of Mathematics and Physics, vol. 8, no. 4, Dec. 1929, pp. 293-344, 27 figs. Series of tests, supplementing tests previously made on pipes designed for moderate steam pressures, shows that formulae established for pipes of moderate wall thickness hold good also for more thick-walled high-pressure pipe; longitudinal stresses in middle surface can be used as strength criterion; so long as maximum longitudinal stress at middle surface does not exceed 20,000 lbs. per sq. in. there will be no appreciable permanent set.

STEAM POWER PLANTS

FUEL ECONOMY. Boiler-Firing Economies (Aufgaben der Feuerungstechnik), Marcard. Waerme (Berlin), vol. 52, no. 48, Nov. 30, 1929, pp. 890-896, 9 figs. It is claimed that by improving efficiency of boiler furnaces and by use of low-grade fuels, it is possible to greatly reduce fuel costs; price of steam is gauge of steam-power-plant efficiency.

HIGH PRESSURE. 1,400-lb. German Station uses Steam Reheaters, C. H. S. Tupholme. Power Plant Eng., vol. 34, no. 3, Feb. 1, 1930, p. 187, 1 fig. Mannheim-Rheinau superimposes 1,420-lb. extension on original 1,285-lb. section; diagrammatic arrangement of high and low pressure sections of Mannheim-Rheinau station.

Developments in the Generation of High-Pressure Steam, I. E. Moultrop and M. D. Engle. Iron and Coal Trades Rev. (Lond.), vol. 120, no. 3233, Feb. 14, 1930, p. 285, 2 figs. Enumeration of high-pressure stations now under construction in United States; brief description of principal features. Abstract of paper read before Instn. of Engrs. and Shipbldrs. in Scotland.

High-Pressure Extensions to the Issy-Les-Moulineaux Power Station. Engineer (Lond.), vol. 149, no. 3866, Feb. 14, 1930, pp. 178-180, 4 figs. For supply of high-pressure steam six boilers were provided, each designed to evaporate normally 70 tons of water per hour; coal is prepared in separate pulverizing house, with capacity of 900 tons per day; boilers are of three-drum bent-tube type; metal employed is basic Siemens-Martin steel; all accessories of high-pressure pipe system are of forged steel, except bodies of valves, for which cast steel was employed.

The Generation of Superpressure Steam, S. Loeffler. Engineering (Lond.), vol. 129, no. 3339, Jan. 10, 1930, pp. 58-60, 10 figs. Considerations set forth are based mainly on experience with author's boiler, characteristic feature of which is that water is evaporated in non-fired vessel or container, by pumping through it supply of superheated and superpressure steam. Translated from Contribution in Festschrift Prof. Dr. A. Stodola zum 70. Geburtstag, 1929.

The Future of Higher Steam Pressure in Steam-Electric Generating Stations, I. E. Moultrop. Am. Inst. Elec. Engrs.—Paper for mtg., Dec. 2-4, 1929, 3 pp. Biggest problem before station designers today is to reduce cost of construction per unit of capacity; some engineers have suggested that cheaper and less economical stations should be built; high standards of efficiency that have been established and reduced cost of construction by intensive study and better design; better engineering in future is answer to problem.

INDUSTRIAL, GREAT BRITAIN. New Developments in British Industrial Steam Station Practice, D. Brownlie. Combustion, vol. 1, no. 8, Feb. 1930, pp. 39-43, 7 figs. Review of British practice in industrial power plants; illustrated description of superviser installations, also description of Atkinson rotary furnace; test results of rotary furnace installation operating standard Lancashire boiler with superheater, but not feed-water economizers.

PEAK-LOAD EQUALIZATION. Equalization of Power Fluctuations in Steam Power Plants (Der Ausgleich von Energieschwankungen in Dampfbetrieben), B. Gentzcke. Archiv. fuer Waermewirtschaft (Berlin), vol. 11, no. 1, Jan. 1930, pp. 16-22. It is shown that admission and emission of energy can be influenced in many cases even without steam accumulator to such extent that entire plant operates efficiently; examples are given of process steam plants, and steam-electric plants; comparison of different types of accumulators.

REFUSE BURNING. Utilization of Refuse and Coal Mixtures in Power and Gas Plants (Verbrunnung von Muell-Kohle-Mischungen durch Elektrizitaet- und Gaswerke), P. Wollenhaupt. Waerme (Berlin), vol. 53, no. 2, Jan. 11, 1930, pp. 17-20. Up to present time refuse incineration has been automatically effected in cellular ovens without coal addition; this operation is expensive and wasteful; with underfeed stoker, by adding coal to refuse, continuous operation is effected which obviates any necessity for pretreatment of refuse; it is recommended that municipal power and gas plants make use of such coal-refuse burning furnaces.

UNIVERSITY OF CHICAGO. Chicago University's New Steam Plant. Power, vol. 71, no. 5, Feb. 1930, pp. 164-168, 7 figs. Complete costs, operating data and guarantees for three 12,040-sq. ft. boilers, equipped with water walls, economizers, air preheaters, forced-draft chain grate stokers, and combustion control; lists of principal equipment in new boiler plants.

STEAM TRAPS

PROCESS HEATING. Trap Installation for Process Work, T. H. Rea. Heat, Piping and Air Conditioning, vol. 11, no. 2, Feb. 1930, pp. 108-112, 11 figs. Consideration of steam traps for process heating work; two kinds of process heating; draining cylinder driers; estimation of steam traps required to drain any apparatus. (Continuation of serial.)

STEAM TURBINES

GOVERNORS. Controlling Bled Steam Without Frequency Fluctuation, S. H. Hemenway. Power, vol. 71, no. 2, Jan. 14, 1930, pp. 59-61, 8 figs. Requirements of turbine bleeder pressure regulators have been increased from indifferent control to present-day need of holding bled steam pressure within close limits and at same time maintaining electrical frequency with change in bled steam demand; illustrated description of various types of steam turbine governors; performance curves of bleeder service.

SPECIFICATIONS. British Standard Specification for Steam Turbines. Brit. Eng. Standards Assn. (Lond.), no .132, Jan. 1930, 10 pp. Specifications for rating, economical rating, governing characteristics, speed adjustments; emergency cut-off speed; maximum speed; steam or heat consumption; limits of lubricating oil temperature; hydraulic test for parts exposed to boiler-pressure; lubricating oil; parallel running; vibration and noise; critical speed of rotating element; standard equipment.

STEEL

ALLOY. *See Alloy Steel.*

CHROMIUM-NICKEL. *See Chromium-Nickel Steel.*

HEAT TREATMENT. Structural Steel Heat Treated, P. F. Lee and H. A. Schade. Iron Age, vol. 125, no. 7, Feb. 13, 1930, pp. 510-514, 1 fig. Results of investigation undertaken to determine what physical properties could be obtained by heat treatment of hot rolled low-carbon steel, comparable to S.A.E. 1020 steel; preliminary tests on 45 steels; test pieces given various draws after water-quench; high-elastic-limit steel produced by quenching 0.20 carbon 0.60 manganese steel from 1,600 deg. fahr. and drawing at 1,100 deg.; welded joints respond to same treatment; tests on weldability of structural steel.

The Heat Treatment of Steel, H. Rickli. Engineering (Lond.), vol. 129, no. 3342, Jan. 31, 1930, pp. 141-142. Editorial comment on paper presented before World Power Conference in Tokyo, in which author drew attention to number of cases in which attempt to improve properties of alloy steels by heat treatment had been responsible for explosion of rotors of high-speed three-phase alternators; it seems certain that immediate cause of accidents was internal stresses set up by heat treatment; he suggests abandonment of process of heat treatment, and use for rotors of well-annealed alloy steels.

STAINLESS. Corrosion-Resisting Steels and Their Applications, J. H. G. Monypenny. Iron and Steel Industry (Lond.), vol. 3, no. 4, Jan. 1930, pp. 111-115, 4 figs.

TEMPERATURE EFFECT. Steel at Elevated Temperatures, A. Sauveur. Am. Soc. Steel Treating—Trans., vol. 17, no. 3, Mar. 1930, pp. 410-448, 38 figs. Some of physical properties at different temperatures of carbon steels, of austenitic and of non-austenitic steels have been investigated by twisting small grooved bars; factor of stiffness obtained by dividing breaking load in pounds by angle of twist in degrees bring out sharply blue-heat range in some steels; time-strain curves are obtained which throw considerable light on behaviour of steel of different compositions when subject to plastic deformation.

TENSILE TESTING. Tensile Properties of Rail and Other Steels at Elevated Temperatures, J. R. Freeman, Jr., and G. W. Quick. Am. Inst. of Min. and Met. Engrs.—Tech. Pub., no. 269, for mtg. Feb. 1930, 48 pp., 38 figs. Notes on special study of tensile properties, in approximate temperature range of 400 to 700 deg. cent.; ductility decreases with temperature increase, over a portion of range; elongation and reduction of area decrease at 500 to 650 deg.; data on rate of cooling and temperature distribution are also given. Bibliography.

STEEL CASTINGS

DEFECTS. Steel Castings and Their Design with Regard to Castings Properties and Machinability (Stahlformgusstuecke und ihre Konstruktion mit Ruecksicht auf die Giessbarkeit und die Bearbeitung). Zeit. fuer die Gesamte Giessereipraxis (Berlin), vol. 50, nos. 51 and 52, Dec. 22, 1929, pp. 431-433 and Dec. 29, 1929, pp. 441-443, 11 figs. Discussion of defects occurring frequently with steel castings, such as piping and cold cracks, and suggestions for their prevention.

SILICON STEEL. Properties of Silicon Steel in Form of Steel Castings (Ueber die Eigenschaften von siliziumlegiertem Stahl in Form von Stahlguss), E. H. Schulz and F. Bonsmann. Stahl und Eisen (Duesseldorf), vol. 50, no. 6, Feb. 6, 1930, pp. 161-168, 14 figs. Investigations of six silicon-steel mixtures in comparison with unalloyed steel castings; strength properties with and without annealing; influence of annealing temperature; tensile and notched-bar tests after different pretreatments at minus 80 to plus 500 deg. cent.; results of wear and corrosion tests.

STEEL MANUFACTURE

BILLET CHIPPING. To Clean Billet Surface by Machine, R. S. Haydock. Iron Age, vol. 125, no. 5, Jan. 30, 1930, pp. 366-368, 2 figs. Explanation of billet Shipping and methods and equipment used for operation; effect of work upon operator; description of various types of machines used; new equipment suggested. Abstract of paper presented before Am. Soc. Mech. Engrs., indexed in Engineering Index, 1929.

RESEARCH. Research Necessary for Plant Control of Manufacture and Subsequent Treatment of High-Quality Steel (Die Betriebsueberwachung bei der Herstellung und Weiterverarbeitung von Edelstahl und die dadurch bedingte Betriebsforschung), R. Hohage. Stahl und Eisen (Duesseldorf), vol. 50, no. 4, Jan. 23, 1930, pp. 93-97 and (discussion) 97-99, 5 figs. Notes on inspection of raw material; melting and slag handling; temperature measurement; pouring of steel and necessary tests; heat-conductivity determination proceding heat treatment; hardness testing; quenching; methods of determining toughness; defects and their prevention.

STEEL, STRIP

PROPERTIES. Deep Drawing Cold Rolled Steel Failures, P. Mabb. Machy. (Lond.), vol. 35, no. 899, Jan. 2, 1930, pp. 446-447, 1 fig. Properties of high-grade deep drawing quality strip used in press shops are discussed; troubles due to irregularity of grain structure and to softness of material; importance of correct structure which should be capable of withstanding shock and deformation; trouble cured by heat treatment; effect of material tolerance.

STEEL STRUCTURES

SPECIFICATIONS, CANADA. Standard Specification for Steel Structures for Buildings. Can. Eng. Standards Assn.—Specification (Ottawa) A16, Jan. 1930, 39 pp. Second edition containing revisions, principal of which is raising of allowable unit stress for axial tension from 16,000 to 18,000 lbs. per sq. in.

STEEL TESTING

RESEARCH. Testing of Hardened Steel (Provning av hardat stal), A. Lundgren. Statens Provningsanstalt (Stockholm), no. 45/46, 1929, pp. 1-9. Report of research to determine effect of velocity of quenching after tempering and effect of time of tempering on mechanical properties of hardened steel.

STREAM FLOW

ESTIMATING. A New Method of Estimating Stream-Flow Based Upon a New Evaporation Formula, J. A. Folse. Carnegie Inst. of Wash.—Pub., no. 400, 1929, 230 pp., 21 maps on supp. plates. Part I deals with investigation of laws of evaporation from observations on Great Lakes; how investigation was made and how final evaporation formula was derived; evaporation formula derived is used in establishing formulae of relationship between daily flow of perennial stream in moist climate and rainfall, snowfall, vapour pressure, air temperature, and wind velocity observed on its watershed.

STREAM GAUGING

CURRENT METERS. Ott Current Meter for Determination of Velocity and Direction of Water Currents (Moulinet Ott, pour la détermination de la vitesse et de la direction des courants d'eau). Génie Civil (Paris), vol. 96, no. 1, Jan. 4, 1930, pp. 20-21, 3 figs. Description of electric horizontal-axis current meter of propeller type, which can be used in depths up to 100 m. and determines velocity from 5 cm. per second to 3 m. per second with error of 1/1500; errors in direction not exceeding 2 degrees; details of mechanical and electrical parts.

CURRENT METERS, TESTING. Effect of Turbulence on the Registration of Current Meters, D. L. Yarnell and F. A. Nagler. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 2, Feb. 1930, pp. 381-382. Discussion by C. S. Bennett of paper indexed from issue of Dec. 1929.

UNITED STATES. Forty Years of Research Into Water Resources, F. H. Newell. Eng. News Rec., vol. 104, no. 4, Jan. 23, 1930, pp. 132-136, 9 figs. Historical review of problems and vicissitudes of building up present system of keeping continuous and accurate records of water resources of United States; details of gauging stations and measuring cars. Foreword by J. C. Hoyt.

STREAM POLLUTION

MISSISSIPPI RIVER. Pollution Studies of the Upper Mississippi River, F. L. Woodward. Indus. and Eng. Chem., vol. 22, no. 2, Feb. 1930, pp. 189-192, 5 figs. Article covers briefly activities of Minnesota State Board of Health and cooperating departments in studying pollution problem of Mississippi River from Minneapolis and St. Paul, Minn., to La Crosse, Wis., distance of 160 mi.; it was found that conditions of pollution are evident during winter time as far down stream as outlet of Lake Pepin, distance of 100 mi.; tentative classification from pollution standpoint, of river below Minneapolis is given.

STREET RAILROADS

TROLLEY WIRE BREAKS. Low Records Made in Trolley Wire Breaks. Elec. Ry. Jl., vol. 74, no. 1, Jan. 1930, pp. 48-49, 9 figs. Continued improvement over previous figures; survey shows average reduction of more than 60 per cent accomplished during past eight years; progress in overhead trolley wire maintenance during last eight years is clearly shown by general decrease in number of breaks.

STORAGE BATTERIES

DENMARK. Danish Market and Trade in Batteries, P. H. Pearson. Commerce Reports, no. 5, Feb. 3, 1930, pp. 315-316. Domestic production of storage batteries; much material for batteries imported; imports of storage batteries; American batteries used in automobite trade prices; domestic production of dry-cell batteries sufficient.

STONE QUARRIES AND QUARRYING

OHIO. Rockport Stone Produces Material Used as Top Dressing for Local Roads. Pit and Quarry, vol. 19, no. 8, Jan. 15, 1930, pp. 57-58, 4 figs. Description of Rockport Stone Co. operating small crushed-stone plant near Beaver Dam about 6 mi. northwest of Bluffton, Ohio; plant has capacity of 160 tons per day and has been in operation for about six years; single semi-Diesel 75-hp. engine operates entire plant including hoists, crushers, screen and elevators.

STRUCTURAL STEEL WELDING

STATUS OF. Structural Steel Welding, F. P. McKibben. Metals and Alloys, vol. 1, no. 7, Jan. 1930, p. 328. Present status of structural steel welding; welding and building codes; tests on welded joints; welded plate girder; qualification of welders; inspection of shop and field welding.

SURVEYING

NATIONAL. National Surveys, E. M. Jack. Pan.-Am. Geologist, vol. 52, no. 4, Nov. 1929, pp. 241-266. General discussion of duties and functions for which national survey ought to be responsible, and of certain characteristics which such survey should have; description of work of certain national surveys, both foreign and in British Empire; applications of knowledge derived from such work, for benefit of South Africa.

TOPOGRAPHIC, CANADA. Work of Topographical Surveys. Can. Engr. (Toronto), vol. 58, no. 3, Jan. 21, 1930, p. 157. Excerpts from report on surveys of Department of Interior, Canada; progress in topographical survey in Maritime and Western provinces of Canada, with special reference to mapping and photography in British Columbia.

T

TELEPHONE

CARRIER CURRENT. Experience With Carrier-Current Communication on a High Tension Interconnected Transmission System, P. Sporn and R. H. Wolford. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 2, Feb. 1930, pp. 129-133, 9 figs. Fundamentals of carried communication system over transmission network are outlined; installations on 132-kv. network having extent of 2,500 linear miles is described; experience with various types of equipment; receiving and transmitting systems; data as to cost, maintenance, reliability, traffic, and safety are cited.

TEMPERATURE MEASURING INSTRUMENTS

INDUSTRIAL. Temperature Instrument Developments in 1929, M. F. Béhar. Instruments, vol. 3, no. 1, Jan. 1930, pp. 3-13, 6 figs. Survey of what 1929 has brought forth in fields of indicating and recording thermometers and pyrometers; recorder, automatic thermometric and pyrometric controllers; special automatic controllers; industrial and electrical resistance thermometers; indicating pyrometers; pyrometric accessories.

TEXTILE MILLS

AIR CONDITIONING. Correct Regulation of Humidity, J. W. Cox, Jr. Black and White, vol. 2, no. 6, Jan. 1930, pp. 34-36, 3 figs. Purpose of article is to show how accurately regulated and controlled humidity conditions have increased production and lowered cost, as well as improved quality.

THREAD CUTTING MACHINE

SUPER-DUTY. Thread Milling Machine. Macny. (Lond.), vol. 35, no. 896, Dec. 12, 1929, pp. 365-366, 3 figs. Description of Super-Duty thread milling machine developed by Lees-Bradner Co., London, especially for wide range of thread milling and dealing with straight taper, internal or external threads and cut right or left hand; machine is also equipped for straight turning, facing and chamfering operations and is particularly adapted to milling of oil-well tools, tool joints, drill pipe and shafts.

TIN DEPOSITS

BORING, METHODS OF. Methods of Boring and Winnipeg Tin in Malaya, B. A. Hadley. Australasian Inst. of Min. and Met.—Proc. (Melbourne), no. 75, Sept. 30, 1929, pp. 121-130. Short account of methods of boring alluvial tin properties in Malaya; outline of methods of concentrating tin oxide by means of jigs.

TOLERANCES

CLEARANCE, FITS AND. Tolerances, Clearance and Fits in Machine Building (Toleranzen Spiele und Sitzarten im Maschinenbau), A. F. Lessochin. Werkstattstechnik (Berlin) vol. 24, no. 2, Jan. 15, 1930, pp. 44-48. Attempt is made to clear up fit and allowance problem along scientific lines; it is assumed that conditions in practical application follow law of probability which can be traced only by experiment; equations are developed; Czechoslovakian, German and ISA (international) standard proposals are analyzed.

TRACKLESS TROLLEYS

UNITED STATES. Interest Revived in Trackless Trolley Operations. Elec. Ry. Jl., vo. 74, no. 1, Jan. 1930, pp. 37-40. During past two years this type of service has enjoyed marked increase in popularity; more trackless trolleys were bought in 1929 than in any recent year; seven companies are now operating 65 such vehicles; synopsis of all operations since first installation in 1910 is presented.

TRACTOR PLANTS

CONVEYORS. Semi-Portable Conveyors in Tractor Production, C. B. Lord. Am. Mach., vol. 72, no. 5, Jan. 1930, pp. 215-216, 6 figs. Discussion of how San Leandro, Calif., tractor plant of Caterpillar Tractor Co., has facilitated production and reduced costs through system of portable and semi-portable, gravity, roller conveyors; short roller conveyors of gravity type keep materials steadily on move from one operation to another.

TRAFFIC SIGNS, SIGNALS AND MARKINGS

ELECTRIC. Correct Timing Signals Essential in Traffic Regulation, T. M. Matson. Elec. Ry. Jl., vol. 74, no. 2, Feb. 1930, pp. 82-84, 2 figs. Brief review of requirements which must be met for efficient traffic flow; factors influencing time ratio and length of cycle at single intersection are discussed; timing for signal systems covering number of intersections will be discussed in future article. (To be continued.)

TRAILERS

MOTOR TRUCK. 100-ton Industrial Trailer Truck. Ry. Gaz. (Lond.), vol. 51, no. 25, Dec. 20, 1929, p. 966, 1 fig. Description of vehicle, constructed by R. A. Dyson and Co., Ltd., for Pickfords Limited, is of extremely unorthodox and novel design and includes many special construction and operating features; trailer is of flat-top type, loading platform 22 ft. long by 8 ft. wide and height to top of platform not more than 42 in.; main frame superimposed upon two trucks, 60 tons capacity each; description of steering arrangement.

TRAINS

RAILROAD ACCIDENTS, DERAILMENT. Derailments on Open Track (Les déraillements en pleine voie). Génie Civil (Paris), vol. 95, no. 23, Dec. 7, 1929, pp. 561-566, 6 figs. Statistics of train derailments and analysis of their causes; discussion of rail defects, improper design or construction of tracks, faulty train operation, wrong methods of carloading and train make-up, defects in rolling stock and their elements as factors contributing to occurrence of derailments.

TRANSFORMER OIL

CONDUCTIVITY. The Conductivity of Insulating Oils, J. B. Whitehead and R. H. Marvin. Am. Inst. Elec. Engrs.—Advance Paper for mtg. Jan. 27-31, 1930, 9 pp., 12 figs. Experiments on charging current and other associated phenomena in high-grade transformer oil; charging currents remaining after elimination of initial transient were studies to within few hundredths second of application of continuous voltage; two samples of same oil obtained at different times differed radically; appendix gives theoretical discussion on influence of space charges; it is shown that at least qualitatively these account for observed phenomena. Bibliography.

TRUSSES, STEEL

WELDING. Structural Welding Scores Success on Large Western Project, A. W. Lewis. Am. Welding Soc.—Jl., vol. 8, no. 10, Dec. 1929, pp. 35-39, 6 figs. Description of world's heaviest welded truss just completed by Pacific Iron and Steel Co., Los Angeles, for Forest Lawn Memorial Park Mausoleum, Glendale, Calif.; is form part of all welded steel-frame mausoleum extending over top of existing building; one of trusses is 96 ft. long by 18 ft. high, having maximum chord stresses approximating 1,000,000 lbs.

TUBES

RIBBED. Investigation of Cooling Ribs (Undersokning av Kylflansar) M. Blomqvist. Teknisk Tidskrift (Stockholm), vol. 60, no. 3, Jan. 18, 1930, (Mekanik) pp. 5-13, 29 figs. Discussion of formulae for calculating effect of ribs; description of test made to check formulae and discussion of results obtained, and comparison with theoretical figures from different formulae; tests shows that square or rectangular ribs are more efficient than circular.

TUBES, NON-FERROUS

STRESSES. The Measurement of Initial Stresses in Hard-Drawn Tubes, J. Fox. Engineering (Lond.), vol. 129, no. 3340, Jan. 17, 1930, pp. 65-67, 16 figs. Outline of theory regarding initial stresses in cold-drawn tubes; measurement of circumferential stress; distribution of longitudinal stress; experiments to determine initial stress distribution and their maximum values; experiments on season cracking; hollow-sunk brass and arsenical-copper tubes season-crack provided sink is sufficiently large; hollow-sunk non-arsenical copper tubes do not season-crack.

TUNNELS, SUBAQUEOUS

STRAIT OF GIBRALTAR. Projects for Submarine Tunnel under the Strait of Gibraltar (Les projects de tunnel sous-marin sous le détroit de Gibraltar). Génie Civil (Paris), vol. 96, no. 1, Jan. 4, 1930, pp. 12-15, 9 figs. Features of railroad and vehicular tunnel projects suggested by Berlier, Ibanez de Ibero and P. Jénevois, G. Herrera.

TURBO-BLOWERS

LARGE. The Largest Turbo Blast Furnace Engines in the World. Iron and Steel Industry (Lond.), vol. 3, no. 3, Dec. 1929, pp. 81-82, 3 figs. Description of two turbo blast-furnace engines in German blast-furnace plant designed to supply air for blast furnace capable of producing 1,000 tons of pig iron per day; on normal service, each of these turbo-blowers takes in 2,620 cu. m. of air per min. and compresses it at 2½ atmospheres when working at 2,900 r.p.m.; blowers driven by high-pressure turbines.

TURBO GENERATORS

TESTING. Testing Equipment for Steam Turbines in Testing Station of Muelheim Works of Siemens and Schuckert (Die Pruefeinrichtungen fuer Dampfturbinen im Grossen Prueffeld des Muelheimer Werkes der S.S.W.), A. Bross. Siemens-Zeit. (Berlin), vol. 9, no. 12, Dec. 1929, pp. 872-873, 2 figs. Plant which had been taken over from Thyssen has been extended so that double-casing 30,000-kw. unit and triple casing 50,000-kw. unit including generators, and units of same capacity without generators can be tested simultaneously; cranes can be coupled in such way that pieces of 100 tons can be handled.

V

VANADIUM

POSSIBILITIES OF. Possibilities of Production of Radium and Vanadium from Carnotite, H. A. Doerner. Indus. and Eng. Chem., vol. 22, no. 2, Feb. 1930, pp. 185-189. Vanadium from carnotite and related ores; distribution and variation of production costs; production from low-grade ores; concentration methods; extraction of radium from concentrates; extraction with acids; preliminary roasting; chemical dissolution of silica; volatilization of silica; recovery of vanadium and uranium.

VEGETABLE OILS

POLYMERIZATION OF. The Polymerization of Drying Oils, J. O. Cutter. Chem. Age (Lond.), vol. 22, no. 551, Jan. 18, 1930, p. 46. Changes that occurred in linseed and tung oils upon heating; properties of oils in liquid state; review of knowledge available today concerning compositions of linseed oil and tung oil; two theories of polymerization which had been put forward to explain changes which were observed.

VIADUCTS, CONCRETE

SEATTLE, WASH. High Concrete Stresses Used in Design of Viaduct of Novel Design, W. F. Way. Eng. News-Rec., vol. 104, no. 8, Feb. 20, 1930, pp. 327-329, 4 figs. Design and construction of Woodway Park Viaduct, Seattle; eight 40-ft. spans carried on tall columns without sway bracing of any sort; slab spans of 40 ft. have maximum depth of 17½ in.; design planned for simple formwork and easy placement; stresses of 1,200 lbs. per sq. in. in bending and 360 lbs. per sq. in. in shear were limiting working values for concrete. See editorial comment on pp. 307-308.

VISCOSIMETERS

ACCURACY. Accurate Cochius Viscosimeter (Ein genaues Cochiusviscosimeter), H. J. Schulz. Chemische Fabrik (Berlin), vol. 47, Nov. 20, 1929, pp. 497. Extremely accurate results are obtained from using special glass tubes made by Rheinische Praezisions-Glasfabrik.

W

WASTE ELIMINATION

INDUSTRIAL. Many Industrial Wastes Uneliminated, H. V. Coes. Iron Age, vol. 125, no. 1, Jan. 2, 1930, pp. 67-68. Numerous leaks in production and distribution remain unstopped, awaiting attention of management; further elimination of waste can be best obtained by distribution research, merchandise research, industrial research, and management research.

WATER

CRITICAL POINT. Research on the Critical Point of Water, J. Havlicek. Engineering (Lond.), vol. 129, no. 3338, Jan. 3, 1930, pp. 1-3, 4 figs. Account of theoretical investigation, made in 1915, in which author studied change from ideal liquid to ideal vapour, both phases retaining their ideal properties at all temperatures and at all pressures; equations deduced showed that border curves of ideal substance would meet in cusp and not in horizontal tangent and also that there was critical temperature above which only gaseous phase could exist, no matter how high the pressure.

VAPOUR PRESSURE. Effect of an Inert Gas under Pressure upon Vapour Pressure of Water (Ueber den Einfluss eines indifferenten Gases unter Druck auf den Dampfdruck des Wassers.) J. J. van Laar. Zeit. fuer Physikalische Chemie (Leipzig), vol. 145, no. 3-4, Dec. 1929, pp. 207-219. Fact discovered experimentally by E. P. Bartlett, that steam pressure may be increased 4 times by introducing inert gas, such as nitrogen, under high pressure, say 100 atmos., is proved by mathematical discussion of author to follow directly and with quantitative precision from exact thermodynamic theories of energy.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostat copies (white printing on a black background) of the articles listed in this section or others on engineering subjects can be obtained from the Engineering Societies Library at a cost of 25c. per page.

When ordering identify the article by giving: the author; the title of the article; the name of the periodical in which it appeared; and the volume and page numbers. A remittance of 25c. a page should accompany the order.

The print's size is limited to 11 by 14 inches, but where possible, two pages up to 7 by 9 inches in size will be photographed on one print, larger magazines require a print per page.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

AERONAUTICAL RESEARCH LABORATORIES

Canada. The Aeronautical Laboratories of the National Council of Canada, J. H. Parkin. Eng. Jl. (Montreal), vol. 13, no. 2, Feb. 1930, pp. 95-103, 10 figs. Scope and nature of work of laboratories; requirements for wind-tunnel testing; types of wind tunnels; open-jet closed-return form of wind tunnel adopted for Laboratory described in detail; test tank for hydro-dynamic laboratory for research on seaplanes; test of power-plant equipment.

AIRPLANE PROPELLERS

Blade Interference. On the Aerodynamical Interference of Propeller Blades, T. Moriya. Tokyo Imperial Univ.—Faculty of Eng.—Jl. (Tokyo), vol. 18, no. 7, Jan. 1930, pp. 195-212, 11 figs.

Testing. Experimental Study of Screw Propellers in Yaw (Experimentelle Untersuchungen an schraeg angeblasenen Schraubenpropellern), O. Flachsbart and G. Kroeber. Zeit fuer Glugtechnik und Motorluftschiffahrt (Munich), vol. 20, no. 23, Dec. 14, 1929, pp. 605-614, 30 figs. Study of forces on propeller models of different pitch in wind tunnel with inclined angle of attach of 0 to 90 deg.

AIRPLANES

Design. Miscellaneous Collected Airplane Structural Design Data Formulae, and Methods, J. E. Younger. Air Corps Information Cir., vol. 7, no. 644, Mar. 1, 1930, 9 pp., 16 figs. Data, formulae, and methods for torsion in various sections, properties of airfoil section, combined loading English riveting practice, torsion in braced framework, bent strut, weight and load factors, axial load allowed in corrugated sheet, torsion combined with bending, single spar wing, torsional rigidity of shell wing, angle of twist of any thin-walled tube, flange efficiency, flat and curved thin sheet, torsion strength, landing chassis, and thin webs of deep beams.

Some Economical Aspects of Airplane Design, S. Kleinhans. Am. Soc. Mech. Engrs.—Preprint, for mtg. Mar. 12, 1930, 10 pp.

Fuels. Behaviour of Fuels for Airplanes Under Low-Temperature Conditions (Das kaelteverhalten von Kraftstoffen zur Verwendung in Luftfahrzeugen), E. Rackwitz and A. v. Philippovich. Luftfahrtforschung (Munich), vol. 5, no. 4, Nov. 28, 1929, pp. 148-156, 14 figs. Behaviour of benzol-gasoline, benzol-tuoline, alcohol-gasoline, alcohol-benzol, and alcohol-gasoline-benzol as fuels under low-temperature conditions as encountered in aviation are experimentally investigated; results are given in tables, curves, and graphs. Communication of Germany Experimental Laboratory for Aviation (D.V.L.)

Landing Gear. Undercarriage Developments, G. H. Dowty. Roy. Aeronautical Soc.—Jl., vol. 34, no. 230 Feb. 1930, pp. 170-183, 15 figs.

Multi-Engined. Multi-Motored Airplanes, J. J. Pesqueira. Aviation Eng., vol. 3, no. 3, Mar. 1930, pp. 7-8, 3 figs.

Seaplanes. *See Seaplanes.*

Welden Joints in. Strength of Welded Joints in Tubular Members for Aircraft. Aviation Eng., vol. 3, no. 3, Mar. 1930, p. 8. Results of investigation made by Bureau of Standards of strength of welded aircraft joints; efficiencies of butt joints averaged about 88 per cent in tension and 85 per cent in compression; inserted gusset plates and U-straps were best methods of reinforcing T and lattice joints; in loading T-joints with supports as close together as possible, joint having U-strap was about 30 per cent stronger than unreinforced joint.

Wind Tunnel Testing. Full Scale Wind Tunnel Tests with a Series of Propellers of Different Diameters on a Single Fuselage, F. E. Weick. Nat. Advisory Committee for Aeronautics—Report, no. 339, 1930, 16 pp., 16 figs. Aerodynamic tests were made with four geometrically similar metal propellers of different diameters on Wright Whirlwind J-5 engine in open-cockpit fuselage; tests were made in 20-ft. propeller research tunnel of National Advisory Committee for Aeronautics; results show little difference in characteristics of various propellers, only one of any importance being increase of efficiency of order of 1 per cent for 10 per cent increase of diameter.

AIRPORTS

Floating. Armstrong Seadrome Project Progresses, E. Hanson. Airway Age, vol. 11, no. 3, Mar. 1930, pp. 353-357, 7 figs. Description of seadrome, Langley, to be put on New York to Bermuda route; main platform 1,100 by 180 ft., widened at centre to 340 ft. to take care of superstructures, is supported at height of 80 ft. above water mean level by 32 columns; drome can swing freely before wind travelling about buoy with radius of 500 ft.; test work accomplished.

Quebec. Building the St. Hubert Airport Near Montreal, Quebec. Am. City, vol. 42, no. 2, Feb. 1930, pp. 119-121, 4 figs. Description of government airport occupying area of 975 acres and having runways 150 ft. in width and from 1,800 to 2,000 ft. in length; emulsified asphalt replaces hot asphalt; use of cross tiling; applying emulsion; dirigible mooring mast.

AIRSHIP DESIGN

Rigid. Rigid Airships, E. W. Stedman. Eng. Jl. (Montreal), vol. 13, no. 2, Feb. 1930, pp. 104-122, 47 figs. History of development of airships from time of first hot-air balloon is traced; Zeppelin airships; airships in R.31 and R.33 classes; aerostatics; fuels; hull design; general arrangement of rigid airship; description of British airship R.101; reference to R.100 and Z.M.C. 2 metal-clad airship. Bibliography.

ALLOYS

Beryllium. *See Beryllium Alloys.*

Copper. *See Copper Alloys.*

Die-Casting. *See Die-Casting.*

Iron-Molybdenum. *See Iron-Molybdenum Alloys.*

ALUMINUM

Rolling Mills. Mill Rolls Large Aluminum Shapes. Iron Age, vol. 125, no. 13, Mar. 6, 1930, pp. 707-710, 3 figs. Aluminum Structural mill rolling channels up to 14 in., as well as other shapes and flats, squares and rounds, was put into service by Aluminum Co. of America at Massena, N.Y.; by alloying aluminum, heating, treating it, and aging it, material is produced that has physical properties comparable with those of mild steel.

Spinning. The Spinning of Aluminum, W. J. Leeder. Metal Industry (Lond.), vol. 36, no. 9, Feb. 1930, pp. 241-244, 8 figs. Adaptability of spinning process which offers advantages of utmost importance; advantages of aluminum; spinning methods outlined; lubrication of blanks; speed of rotation; blank sizes; temper of material; chucks; pressed wood and spinning; tools for spinning.

Structural Shapes. Rolling Aluminum Structural Shapes. Eng. News-Rec., vol. 104, no. 11, Mar. 13, 1930, pp. 452-453, 2 figs. See editorial comment on p. 429. New Massena mill of United States Aluminum Co. is turning out range of sections from zees to channels of strong alloy from 3,000 lb. ingot casting and rolling methods; structural mill is served by overhead crane built of aluminum alloys.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS

Fifty Years of. Fifty Years of the A.S.M.E., C. W. Rice. Mech. Eng., vol. 52, no. 4, Apr. 1930, pp. 261-276, 7 figs. Review of status of mechanical engineering in 1880, year of Society's birth; reasons for Society of Mechanical Engineers; period of expansion; administration of Society affairs; decentralization; activity of individual members; aims and organization; participation during World War; international relations; meetings and some important papers; publications; local and student branches; technical committees; standardization; research; power test codes; boiler code; opportunities of future.

ASBESTOS PLANTS

Electric Equipment. A New 4,000 Ton Asbestos Mill, J. R. Mole. Elec. News (Toronto), vol. 39, no. 3, Feb. 1, 1930, pp. 51-54, 7 figs. Asbestos Corporation's latest addition at Thetford Mines, P.Q., known as "Beaver," is completely and thoroughly electrified for hoisting, crushing, drying and milling; plant used over 6,600 hp.

ASH HANDLING

Hydraulic. Progress in Design of Hydraulic Ash-Disposal Plants (Fortschritte im Bau hydraulischer Entaschungsanlagen), A. Zoebelein. Waerme (Berlin), vol. 53, no. 6, Feb. 8, 1930, p. 86. Experiences of past winter have shown that flotation process (scavenging trough) caused difficulties in frezing weather, whereas well-designed hydraulic ash-disposal plants, due to slight water requirement, were unaffected by severest weather conditions; improvements in these plants have been effected by use of low and medium pressure.

AUTOMOBILE ENGINES

Diesel. *See Diesel Engines.*

Fuel Vaporizing in. Compression Aids Vaporization of Engine Fuel, P. M. Heldt. Automotive Industries, vol. 62, no. 11, Mar. 15, 1930, pp. 435-436. While under conditions outlined, typical of engine operation under full load, compression increases heat necessary to vaporize fuel in theoretically correctly proportionated mixture by amount equal to that required to raise temperature of air in mixture 41 deg. fahr., compression on results in generation of heat to amount which would raise temperature of air 382 deg. fahr.

AUTOMOBILES

Bodies, Manufacture. The Production of Automobile Body Stampings. Metal Stampings, vol. 3, no. 3, Mar. 1930, pp. 261-264, 4 figs. Quantity production methods employed in manufacture of automobile body and fender stampings feature synchronized conveyor lines and teletype instructions to line setters; principal operation include: forming, die trimming or rotary power shearing, wiring and edging, and seaming by means of special folding blade and roller machine.

Performance Testing. New Method to Determine Time, Power Consumption, and Cost of Operation of Automobiles (Ein neues Verfahren zur Ermittlung der Fahrzeiten, des Betriebstoffverbrauchs und der Fahrkosten der Kraftwagen), W. Mueller. Verkehrstechnik (Berlin), vol. 47, no. 8, Feb. 21, 1930, pp. 97-103, 4 figs. Based on study of resistance against motion and engine power of cars, graphical and analytical method is derived by which power consumption and operating costs may be determined; method is illustrated by example.

B

BALANCING MACHINES

Optical. A New Optical Dynamic and Static Balancing Machine, Y. Taji. Mar. Engr. and Motorship Bldr. (Lond.), vol. 53, no. 630, Mar. 1930, pp. 90-92, 7 figs. New machine was designed by S. Kuno, of Mitsubishi Research Laboratories; principal feature of this machine is that dynamical and statical balancing of turbine rotors, etc., can be carried out with high degree of accuracy in very short time by measuring amplitude and phase of oscillation of rotor, due to unbalance, and determining magnitude and position of balancing weight.

BEAMS, STEEL-CONCRETE

Strength of. Strength of Steel Beams Encased in Concrete, P. W. Leisner. Concrete, vol. 36, no. 2, Feb. 1930, pp. 29-30, 2 figs. High points of European investigations and practice; each material considered as taking part of load; tests by Danish State railways; Swedish tests; high working stresses adopted in bridge building by Swiss Federal Railways.

BELTS AND BELTING

Rubber, Friction of. The Coefficients of Friction Between Rubber and Various Materials, R. Ariano. India-Rubber Jl. (Lond.), vol. 59, no. 2, Jan. 11, 1930, pp. 6-8.

BERYLLIUM ALLOYS

Uses. Magnesium, Magnesium-Rich Alloys and Beryllium Alloys, T. H. Turner. Metal Industry (Lond.), vol. 36, no. 3, Jan. 17, 1930, pp. 85-89, 8 figs. Present uses of magnesium and beryllium alloys are discussed; ability to produce magnesium alloy casting at approximately same price as similar size aluminum alloy casting is surprising, machining magnesium alloy castings; magnesium sheet; resistance to corrosion; present-day applications; promising developments of beryllium has been direct production of beryllium alloys of copper and nickel to be used as temper alloys.

BOILERS

Automatic Control of. Economy of Automatic Boiler-Control Equipment (Wirtschaftlichkeit selbsttaetiger Kesselregelanglagen), P. Kaufman. Waerme (Berlin), vol. 53, no. 8, Feb. 22, 1930, pp. 117-120, 1 fig. Use of automatic boiler-control equipment not only reduces operating costs, but also initial costs of plant, increases operating safety and reliability, and ease in operation; economic limits of automatic control are discussed.

Feedwater Treatment. Water Softening Plant at the Peerless White Lime Co., R. W. Smith. Rock Products, vol. 33, no. 6, Mar. 15, 1930, pp. 63-65, 3 figs. Description of water-softening plant which has been functioning for some time at Peerless White Lime Co., Ste. Genevieve, Mo., has several interesting features; designed and constructed by company engineers, its operation is entirely automatic; efficient automatic operation giving steady supply of soft water for boilers and other uses; hardness reduced to minimum.

Heat-Storage. Electrode Steam Boilers at Carliol House. Elec. Times (Lond.), vol. 77, no. 1996, Jan. 23, 1930, pp. 163-164, 2 figs. Headquarters of Newcastle-on-Tyne Electric Supply Co. was first building in England to be equipped with electrical thermal storage heating plant; plant comprises two 1,000-kw. Oerlikon steam boilers (one as standby), operating on three-phase, 6,000 volts supply direct; two calorifiers in which heat in steam is transferred to water; and two thermal storage cylinders, having combined capacity of 28,500 gals.; total energy stored is 40 million.

High Pressure. The Design and Results of a 600 Lb. per Sq. In. Boiler Installation, W. Nithsdale. Engineering (Lond.), vol. 129, no. 3350, Mar. 28, 1929, pp. 406-408, and (discussion), 416-418, 6 figs. Endeavour is made to discuss some points in design of high-pressure boiler plant, with special application to land installation which has been in commercial operation for some time in Britain, steam-rasing parts only being dealt with. Paper read before Inst. Mech. Engrs., Mar. 21, 1930.

High-Pressure, Welding. Welding on High-Pressure Boilers, F. Hofmann. Am. Welding Soc.—Jl., vol. 9, no. 1, Jan. 1930, pp. 7-16, 13 figs. Report of results after two years' operation of high-pressure Loeffler boiler in power station of Karolina plant of Witkowitz Collieries, Czechoslovakia.

Locomotive. *See Locomotives.*

Plates, Stresses in. Failure and Life of Boilers and Vibration Resistance of Material (Schaeden und Lebensdauer der Dampfkessel in ihrer Abhaengigkeit von der Beanspruchung und Schwingungsfestigkeit der Werkstoffe), M. Ulrich. Veroeffentlichungen des Zentral-Verbandes der Preussischen Dampfkessel-Ueberwachungs-Vereine (Halle), no. 5, 1929, pp. 7-14, 8 figs.

Pulverized-Coal-Fired. Development of Pulverized-Coal Firing for Fire-Tube Boilers (Die Entwicklung der Kohlenstaubfeuerung fuer Flammrohrkessel), P. Krebs. Waerme (Berlin), vol. 53, no. 11, Mar. 15, 1930, pp. 169-175, 12 figs. Account of first tests with pulverized-coal-fired fire-tube boilers, and unsuccessful results with boiler without combustion chamber; improvements in design; success of turbulent firing in marine boilers, and application of experiences to stationary boilers.

Tubes, Ribbed. Gilled Tubes for Boiler Combustion Chambers. Engineering (Lond.), vol. 129, no 3350, Mar. 28, 1930, p. 421, 2 figs. Description of boiler combustion chamber fitted with gilled, or winged water-tube on system developed by J. Deschamps, Paris; gilled rings which are fitted over tubes are described by author as "ailettes," which may be translated as "little wings"; purpose of ailettes is to improve combustion and to allow to reduction in size of combustion chamber.

Water-Tube. Influence of Coefficient of Excess Air on Behaviour of Water-Tube Boilers (Einfluss der Luftueberschusszahl auf das Verhalten von Wasserrohrkesseln), F. Michael. Feuerungstechnik (Leipzig), vol. 18, no. 112, Jan. 15, 1930, pp. 5-9, 7 figs. Result of calculation of Babcock and Wilcox inclined-tube boiler with lignite stepped-grate firing; relation of heat output per square meter heating surface and flue-gas temperatures to excess air; and relation of exhaust-gas temperature, efficiency of superheating, and feedwater, and air preheating to excess air.

Wood-Waste-Fired, Efficiency of. High Efficiency Obtained from Wood Waste Fuel, K. P. Mykanen. Power Plant Eng., vol. 34, no. 6, Mar. 15, 1930, pp. 334-336, 4 figs. Tests made by Association of Power and Fuel Economy in boiler plant of Enso-Gutzeit Osakeyhtio, Finland, show efficiencies of 85 per cent when using wet wood waste; tabulated tests data and calculated results of seven 8-hr. boiler tests; efficiency curves drawn from three tests.

BORE HOLE SURVEYING

New Device. New Electric Well Surveying Device Simplifies Long Operation, W. F. Lowe. Nat. Petroleum News, vol. 22, no. 5, Jan. 29, 1930, pp. 57-58, 1 fig. Description of new instrument, called Driftmeter, claimed to have many advantages over older methods; principle of device is measurement of directional shifts by change in current intensity of electric circuit; tabular comparative readings of Driftmeter and acid bottle, in survey of two wells.

BRASS CASTINGS

Influence of Silicon. The Influence of Silicon in Foundry Red Brasses, H. M. St. John, G. K. Eggleston and T. Rynalski. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 300, for mtg. Feb. 1930, 18 pp., 21 figs. Incipient shrinkage; silicon in copper and copper alloys; factors influencing grain size; experimental procedure; experimental results; sources of silicon and its removal; discussion of results, with summary enumerating 13 conclusions drawn.

BRIDGE CONSTRUCTION

Cofferdams. Cofferdams Built on Shore. Constructor, vol. 12, no. 3, Mar. 1930, p. 61, 3 figs. In construction of Cherokee Bridge over Tennessee River, at Knoxville, two cofferdams, each 40 by 120 ft. by 25 ft. high outside dimensions, and containing 150 tons of timber and 4 tons of hardware, were built on bank of river, launched and floated to pier site supported on 150 empty sealed barrels of 50 gal. capacity.

BRIDGE DESIGN

Composite Trusses. Approximate Formulae for Design of Composite Trusses for Bridges (Naeherungsformeln zur Berechnung von Haenge- und Sprengwerken fuer Bruecken), O. Seyller. Schweizerische Bauzietung (Zurich), vol. 95, no. 1, Jan. 4, 1930, pp. 1-3, 2 figs. Mathematical analysis of stresses leading to derivation of approximate formulae; numerical examples.

BRIDGES, CONCRETE

Construction. Concrete Bridge Construction in Walla Walla County, E. R. Smith. Pub. Works, vol. 61, no. 2, Feb. 1930, pp. 59-62, 7 figs. County engineer of Walla Walla Co., Washington, describes construction of single- and multiple-span concrete highway bridges of moderate length; sample of construction sketches; detailed bid sheets; official dope sheets, etc.

Germany. Two New Highway Bridges over Naabarme in Schwandorf (Zwei neue Strassenbruecken ueber die Naabarme in Schwandorf), von Moro. Zentralblatt der Bauverwaltung (Berlin), vol. 49, no. 47, Nov. 20, 1929, pp. 762-764, 8 figs. Design and construction of concrete bridges, of maximum span 35 m.; details of spiral reinforcement of abutment of concrete arch bridge.

Ontario. New Bridge and Dam at Arnprior, Ont. Can. Engr. (Toronto), vol. 58, no. 12, Mar. 25, 1930, pp. 421-424, 6 figs. Description of combined water works dam and highway bridge, constructed at cost of $100,000 to replace old timber structure; entire structure built of reinforced concrete; bridge is 500 ft. long and 33 ft. wide; dam is 23 ft. high.

Steel Reinforcements. Welded Reinforcement for a Concrete Highway Bridge. Engineer (Lond.), vol. 149, no. 3868, Feb. 28, 1930, pp. 252, 1 fig. Brief description of multi-span reinforced concrete bridge in Victoria; light trusses, which were welded throughout, were constructed to span between piers; their form is such that they could be entirely embedded in concrete and act as partial reinforcement.

BRIDGES, CONCRETE ARCH

Germany. The Giebichenstein Bridge at Halle (Die Giebichensteinbruecke in Halle), A. Heilmann. Bauingenieur (Berlin), vol. 10, no. 45, Nov. 8, 1929, pp. 789-794, 10 figs. Construction of concrete arch bridge over Saale River, having maximum span of 60 m., to replace obsolete steel truss bridge; architectural treatment and ornamental sculpture for bridge.

Reinforced-Concrete Arch Bridge over Lahn River between Oberlahnstein and Niederlahnstein (Eisenbetonbogenbruecke ueber die Lahn zwischen Ober- und Niederlahnstein), A. Dischinger. Bautechnik (Berlin), vol. 7, no. 55, Dec. 20, 1929, pp. 861-863, 6 figs. Design and construction of hiway bridge having single span 78 m. long; details of reinforcement and erection falsework; total cost 192,000 marks.

Columbia-Wrightsville. Wooden Trestle Speeds Construction of Multiple-Arch Reinforced Concrete Highway Bridge, W. C. Fry, Jr. Contractors and Engrs. Monthly, vol. 20, no. 2, Feb. 1930, pp. 68-72, 8 figs. Design and construction of highway bridge between Columbia and Wrightsville, Pa.; having overall length of 7,374 ft. and comprising 28 arch spans, each 198 ft. on average; use of steel centreing; plant layout; timber trestle; tests.

BRIDGES, MOVABLE

Great Britain. Swing-Bridges over the Weaver Navigation, with Some Information about Other Movable Bridges, J. A. Saner. Instn. Civ. Engrs.—Selected Eng. Papers (Lond.), no. 79, 1929, 9 pp., 2 figs. Mechanical features are tabulated; statistical data on dimensions, etc. of more than 20 movable bridges in Great Britain.

BRIDGES, RAILROAD

England. Reinforced Concrete Railway Bridges, R. L. McIlmoyle. Concrete and Constr. Eng. (Lond.), vol. 25. no. 1, Jan. 1930, pp. 37-45, 10 figs. Report on practice of London, Midland and Scottish Railway; deck slab reinforcement; general arrangement of bridge over railway; lay-out of flat slab bridges; slab reinforcement and construction joints.

BRIDGES, STEEL

Welding vs. Riveting. Endurance Tests on Riveted and Welded Bridges, R. Bernhard. Metallurgist (Supp. to Engineer, Lond.), Feb. 1930, pp. 23-24. Author describes number of informative tests carried out to investigate behaviour of bridges under repeated loading; tests were intended also to show difference between riveted and welded bridges with particular reference to latest developments in welding practice. Translated abstract of article indexed in Engineering Index 1929, from V.D.I. Zeit., Nov. 23, 1929.

BRIDGES, SUSPENSION

Quebec. One of Canada's Great Highway Bridges, P. L. Pratley. Contract Rec. (Toronto), vol. 44, no. 9, Feb. 1930, pp. 220-226, 14 figs. Design and construction of suspension bridge over St. Maurice River at Grand'Mere, Que.; having span of 949 m., towers 128 ft. high and roadway 18 ft. wide; anchorage system; truss loading; rope strand system adopted; cable assembly.

BRONZE CASTINGS

Unsoundness in. Unsoundness in Bronze Castings, E. J. Daniels. Inst. of Metals—Advance Paper, no. 515, for mtg. Mar. 12, 13, 1930, 18 pp., 7 figs. Effect of some pure gases on soundness of bronze, and of casting in sand moulds of metal subjected to various melting treatments, is described, and tentative explanation of cause of unsoundness occurring in practice is suggested. Bibliography.

BUILDING MATERIALS

Sound Absorbing. Sound Insulation and Sound Absorption (Schallisolation und Schallabsorption), E. Meyer. V.D.I. Zeit. (Berlin), vol. 74, no. 9, Mar. 1, 1930, pp. 273-279, 19 figs. Report from Heinrich-Hertz-Institut, on electrical apparatus used by that Institute for testing efficiencies of sound-insulating and sound-absorbing materials.

BUILDING STONE

Weathering. The Weathering of Stone. Quarry and Surveyors' and Contractors' Jl. (Lond.), vol. 35, no. 395, Jan. 1930, pp. 18-22. Extracts from 1928 report of Building Research Board covering: efflorescences, their causes, effects and prevention; factors influencing distribution of moisture; evaporation; capillary properties; selective decay; biological agencies in stone decay; action of calcium sulphate; action of frost; remedial measures; cleaning of buildings.

BUILDINGS, STEEL

Welded. Design and Fabrication of Oxy-Acetylene Welded Buildings, H. M. Priest. Am. Welding Soc.—Jl., vol. 9, no. 2, Feb. 1930, pp. 33-43, 13 figs. Preparation of design for oxyacetylene-welded building outlined; importance of locating welds and arranging details so that work is accessible; steel construction of steel frame mill-type building of Union Carbide and Carbon Co. at Niagara Falls in which oxyacetylene welding was used in shop fabrication and in erection; essential consideration for affecting use of oxyacetylene process. Paper read before Int. Acetylene Assn. and Joint Meeting of Am. Welding Soc. and Am. Soc. Civil Engrs.

C

CANAL LOCKS

Floating Trough. Locks Without Consumption of Water Having Floating Pneumatically Operated Admission Basin (Schleuse ohne Wasserverbrauch mit schwimmenden luftbetriebenen Aufnahmebecken), H. Proetel. Bautechnik (Berlin), vol. 7, no. 54, Dec. 13, 1929, pp. 856-858, 5 figs. Principles of construction and operation of floating trough locks; construction and operation cost data.

CANALS

Movable Sections. The Raising of Barton Swing-Aqueduct, and the Renewal of Paths and Rollers, R. D. Brown. Instn. Civ. Engrs.—Selected Eng. Papers (Lond.), no. 67, 1929, 15 pp., 5 figs. Description of swinging section carrying old Bridgewater Canal over Manchester Ship-Canal at Barton, near Manchester; this section which is materially steel-wall tank 19 ft. wide about 7 ft. deep and about 230 ft. long, swings upon turning path, 27 ft. in mean diam. and 32 in. wide; report on repairs and improvements in construction; excerpts from specifications for metals used in paths, rollers, and axle pins; list of construction plant used.

CARS, STREET RAILROAD

Control. Speed, Comfort, and Safety With a New Multipoint Control, C. J. Axtell and R. H. Sjoberg. Gen. Elec. Rev., vol. 33, no. 3, Mar. 1930, pp. 158-163, 7 figs. Newly developed means furnishing at least partial solution of traffic difficulties encountered by street cars; chart showing fast, smooth acceleration secured through use of multi-point control; curves of schedule speed and energy consumption for various rates of acceleration and for various rates of breaking, are given.

CASE HARDENING

CARBURIZING. Mechanism of Carburization. Am. Soc. Steel Treating—Trans., vol. 17, no. 4, Apr. 1930, pp. 588-593, 2 figs. Purpose of carburizing; hardness; carbon content of case; effect of alloy elements; theory of carburizing process; formation of iron carbide; absorption of iron carbide by steel; general carburizing processes. Recommended Practice Committee Release.

CAST IRON

HIGH-TEST. High-Duty Cast Irons, A. E. McRae Smith. Foundry Trade Jl. (Lond.), vol. 42, nos. 701, 702, and 703, Jan. 23, 1930, pp. 59-60, Jan. 30, 1930, pp. 83-87, and (discussion), Feb. 6, 1930, pp. 99-100, 15 figs.

High Strength Cast Iron, E. J. Lowry. Am. Soc. Steel Treating—Trans., vol. 17, no. 4, Apr. 1930, pp. 538-557 and (discussion) 558-562, 26 pp. Author points out that perhaps greatest development in line has been made by European investigators; as a rule textbook information is not representative of cast iron produced today; addition of alloys is no means of producing high-strength cast iron from inferior irons; photo-micrographs are given of various alloy cast irons, also tables giving physical properties.

PROPERTIES. Grey Iron Possesses Valuable Engineering Properties. Foundry, vol. 58, no. 5, Mar. 1, 1930, pp. 107-110 and 142, 17 figs. While tensile strength values of grey cast iron generally are taken from separately cast test bars, considerable work is being done to correlate this with properties that may be expected in castings; close approximation made by casting bar with twice the diameter of average or most important section of casting, and it will have approximately same cooling conditions; various properties of iron, some erroneous impressions of which are corrected.

TESTING. Mass and Skin Effects in Cast Iron, Swift. Foundry Trade Jl. (Lond.), vol. 42, nos. 702 and 703, Jan. 30, 1930, pp. 79-80, Feb. 6, 1930, pp. 106 and 108, 6 figs. Jan. 30: Extent to which mechanical properties of cast iron are affected by transverse section of bar as cast, and by machining to various depths below skin; B.E.S.A. grey iron specifications; tests for tensile strength, crushing strength, Brinell and scleroscope hardness and resistance to abrasion. Feb. 6: Results of tensile and compressive tests carried out upon bars after their diameters had been reduced by turning; metallurgical aspects.

CASTING

CENTRIFUGAL. Centrifugal Castings and their Metallographic Analysis (Schleuderguss und seine metallkundliche untersucbung), M. v. Schwarz and A. Vaetb. Giesserei (Duesseldorf), vol. 17, nos. 8-11, Feb. 21, 1930, pp. 177-182, Feb. 28, pp. 204-208, Mar. 7, pp. 230-234, and Mar. 14, pp. 253-255, 41 figs. in all. Economy and advantages of centrifugal casting are set forth; main processes with horizontal axis; Bill and process with vertical axis; study of phosphorus-rich sand castings; investigation of unannealed centrifugal castings; structure, specific gravity, etc.; annealing tests of centrifugal castings; change in hardness, specific gravity, and bound carbon content.

CASTINGS

DESIGN. Factors Governing More Accurate Design of Castings (Die Bedingtheit Konstruktionsgenauer Formgebung), Riebensahm. Giesserei-Zeitung (Berlin), vol. 27, no. 5, Mar. 1, 1930, pp. 114-115. Author points out difficulties of coordinated working processes in foundry practice as compared with other metal-working practice; it is claimed that relations between casting, mould, and pattern greatly influence quality of castings.

MACROSTRUCTURE OF. Macrostructure of Cast Alloys: Effect of Turbulence due to Gases, R. Genders. Inst. of Metals—Advance Paper, no. 519, for mtg. Mar. 12-13, 1930, 6 pp., 7 figs.; see also Engineering (Lond.), vol. 129, no. 3348, Mar. 14, 1930, pp. 357-358, 7 figs. Communication forms additional section to previous paper in which work was described having object of making possible more general interpretation of macrostructure of cast metals; observations indicate that when ingot of small thickness is cast in mould prepared by application of coating or "dressing" of volatile material, macrostructure is considerably modified by turbulence resulting from evolution of gases between mould and liquid metal.

CEMENT KILNS

ROTARY. The Rotary Kiln in Cement Manufacture, W. Gilbert. Cement and Cement Mfr. (Lond.), vol. 3, no. 1, Jan. 1930, pp. 41-54, 7 figs. Series of articles treat of rotary kiln mainly from point of view of output and fuel economy and explain laws which govern rate of heat transmission from hot gases to raw materials in kiln, and from hot clinker to air passing through cooler. Article also printed in same issue in French, German and Spanish. (To be continued.)

CEMENT MANUFACTURE

RAW MIX. Raw Mix Control in Cement Manufacture, G. W. Jordan. Rock Products, vol. 33, no. 7, Mar. 29, 1930, pp. 55-56, 1 fig. Hydraulic modulus used in mix control; clinker appearance good evidence of quality; connection between silica-flux ratio and lime-silica index; lime-silica index of clinkers for different silica-flux values; essential factors in proportion.

CEMENT TESTING

OBJECT OF. The Testing of Cement, G. Haegermann. Cement and Cement Mfr. (Lond.), vol. 3, no. 1, Jan. 1930, pp. 69-72. Object of testing of cement is determination of principal qualities as constructional material; essential properties of cement are soundness, setting-time, and strength, fineness, volume, and specific gravity are of less importance; experience has shown that soundness and setting-time may be ascertained by testing specimens of neat cement, but strength should be determined by cement-sand mixtures. Article also printed in same issue in French, German, and Spanish.

COAL CARBONIZATION

LOW-TEMPERATURE. Low-Temperature Carbonization of Fuel, with Special Reference to Its Combination With the Production of Electricity (English Practice), E. H. Smythe and E. G. Weeks. Instn. Elec. Engrs.—Jl. (Lond.), vol. 68, no. 398, Feb. 1930, pp. 219-228 and (discussion) 229-236.

Smokeless Fuels (Combustibles sans Fumée), P. Weiss. Chimie et Industrie (Paris), vol. 23, no. 1, Jan. 1930, pp. 2-13, 8 figs. Author describes Abder-Halden process for distilling pulverulent coals, K. S. G. retort, and briquetting process (tar-bonded avoids) as used at several mines in France, and discusses economic results obtained.

COAL MINES AND MINING

STREAM POLLUTION. Sealing Old Workings Prevents Acid Formation and Saves Pipes and Streams, R. D. Leitch and W. P. Yants. Coal Age, vol. 35, no. 2, Feb. 1930, pp. 78-80, 4 figs. Discussion of laboratory work that demonstrates fact that if iron pyrite can be kept out of contact with oxygen of air, sulphates of iron cannot be formed and, consequently, iron oxides and free sulphuric acid will be absent from mine drainage; samples were taken from all available sources, open and sealed, in eight mines in southwest section of Indiana.

COAL PREPARATION

STATUS OF. Present Status of Coal Preparation (Die gegenwaertigen Probleme der Kohlenaufbereitung), K. Glinz. Bergbau (Gelsenkirchen), vol. 42, no. 49, Dec. 5, 1929, pp. 689-693. Theoretical principles underlying preparation; preparation of coarse and fine coals; separation of fusain; dewatering; clay removal; drying; economic measures. From address before 2nd International Conference on Bituminous Coal in Pittsburgh.

COLUMNS

DESIGN. The Design of Column Bases in Single Storey Buildings, G. J. Voce. Structural Engr. (Lond.), vol. 8, no. 1, Jan. 1930, pp. 21-25, 5 figs. Design of steel base; anchor bolts; base angles; base plate; concrete foundations; numerical examples.

FOOTINGS. Design of Steel Slabs for Column Bases, K. G. Merriam. Eng. and Contracting, vol. 69, no. 3, Mar. 1930, pp. 131-134, 5 figs. Report on investigation performed at Worcester Polytechnic Institute in attempt to evolve design method based on experimental evidence obtained with full-sized specimens, and which would be free of uncertainty regarding fundamental assumptions; duplicating action of crumbling footing; deflectometer tests on square slabs; numerical example; experimental check on proposed design method. Agstract of paper presented before Am. Inst. of Steel Construction.

WOODEN, TESTING. Tests of Large Timber Columns and Presentation of the Forest Products Laboratory Column Formula, J. A. Newlin and J. M. Gabagan. U.S. Dept. of Agriculture—Tech. Bul., no. 167, Feb. 1930, 44 pp., 8 figs. Bulletin discusses tests on large structural timbers under following headings: introduction, methods of test, results and discussion, conclusions, and appendix.

COMPRESSORS

RECIPROCATING. Mean Theoretical Back Pressure and Its Relation to Actual Mean Back Pressure in Kilogram per Square Centimeter in Reciprocating Compressors, and Their Mechanical Efficiency (Der mittlere theoretische Gegendruck (pwo) und dessen Beziebungen zum tatsaechlichen mittleren Gegendruck in kg. qcm. bei Kolbenkompressoren, sowie dren mechanische Wirkungsgrade), H. R. Karg. Foerdertechnik und Frachtverkehr (Wittenberg), vol. 23, no. 6, Mar. 14, 1930, pp. 109-114, 9 figs. Efficiency of compressors is discussed and new simple method for graphical determination of efficiency factor is proposed and illustrated by examples.

CONCRETE AGGREGATES

CHARACTERISTICS OF. Effect of Characteristics of Aggregates on the Quality of Concrete, S. Walker. Pit and Quarry, vol. 19, no. 12, Mar. 12, 1930, pp. 75-81. Discussion of aggregate characteristics which are of less importance than proportioning, mixing, placing and curing concrete; significant characteristics of aggregate; soudness and durability; sodium sulphate tests; freezing and thawing tests; miscellaneous deleterious substances; grading of coarse aggregates.

CONCRETE DESIGN

SIMPLIFIED. Reinforced Concrete Design Simplified, J. R. Griffith. Concrete, vol. 36, no. 2, Feb. 1930, pp. 43-46, 2 figs. Construction of charts for design of beams reinforced for compression; quantity comparisons of steel required in beams reinforced for compression.

CONTRACTION OF CONCRETE. Necessity, when Designing Reinforced-Concrete Structures, of Taking into Account the Contraction of Concrete on Setting (Sur la nécessité de tenir compte du retrait du béton à la prise dans le calcul des ouvrages en béton armé), De Sparre. Académie des Sciences—Comptes Rendus (Paris), vol. 189, no. 20, Nov. 12, 1929, pp. 791-793. Author emphasizes importance of allowing for forces set up by concrete on setting; contraction of concrete causes strain, and reinforcement will produce tensile stresses in concrete while bond with concrete is maintained.

CONCRETE MIXING

VARIATIONS IN. Effect of Fineness and Composition on Quantity of Water in Cement, H. Kuhl. Concrete, vol. 36, no. 2, Feb. 1930, pp. 111-116, 6 figs. Variations in concrete of mixes of "wet" consistency using cements of equal standard test strength accredited to fineness of cement; view that cement develops best properties as it is ground finer held in error. Paper read at Assn. of German Portland Cement Mfrs., translated from Zement.

DESIGN OF. The Design of Concrete Mixtures, A. E. Wynn. Concrete and Constr. Eng. (Lond.), vol. 25, no. 1, Jan. 1930, pp. 90-98, no. 2, Feb. 1930, pp. 149-158. Jan.: Details of economies effected by use of water-cement-ratio proportioning; results on recent contracts; advantages to contractor; variations in curves. Feb.: United States specifications; specification of New York Highway Department; methods of testing; ready-mixed concrete.

ADMIXTURES. The Effect of Clay as an Admixture in Concrete, A. N. Vanderlip and H. H. Scofield. Cornell Civ. Eng., vol. 38, no. 5, Feb. 1930, pp. 105-108 and 119, 5 figs. Preliminary report on tests; effects of clay, and of alternate freezing and thawing on strength and permeability of concrete; strength of resulting concrete is reduced by replacing 10 per cent of cement by approximately equal weight of clay. Bibliography.

CONCRETE SLABS

DESIGN. Simplified Method of Designing Slabs with Two Equal Concentrated Loads (Vereinfachte Berechnung von Platten mit Zwei Gleichen Einzellasten), R. Hauer. Bauingenieur (Berlin), vol. 10, no. 45, Nov. 8, 1929, pp. 796-798. Derivation of simplified, approximate formulae satisfying practical needs.

CONSTRUCTION INDUSTRY

GREAT BRITAIN. The Engineering Outlook—Constructional Engineering. Engineering (Lond.), vol. 79, no. 3347, Mar. 7, 1930, pp. 307-309. Both as regards buildings and erection of bridges and other steel structures, construction-engineering industry has had busy year; national unemployment insurance statistics for constructional engineering; apart from home demand, there is valuable export business; especially in Empire countries; statistics on unemployment in general engineering; national unemployment insurance statistics.

COPPER ALLOYS

HEAT CONDUCTIVITY. Thermal Conductivity of Copper Alloys, C. S. Smith. Am. Inst. of Min. and Met. Engrs.—Tech. Pub., no. 291, for mtg. Feb. 1930, 23 pp., 5 figs. Paper contains complete review of all previous work that has been done on copper alloys, and includes detailed description of apparatus and method of procedure used in present research, together with new results obtained on copper-zinc series, which is only one completed at present time; subsequent papers describing other alloys will contain experimental results and discussion only.

COPPER INDUSTRY

PRODUCTION AND CONSUMPTION. Copper Production and Consumption, P. E. Barbour. Eng. and Min. Jl., vol 129, no. 6, Mar. 24, 1930, pp. 303-304, 1 fig. Difference of opinion exists as to whether there is over-production or under-consumption; graph of United States and world production, 1880 to date, with comment on its regularity and post-war depression of 1921; Rhodesia, Congo, and Russia as factors in future production. Abstract of first of three articles in Annalist.

COPPER METALLOGRAPHY

DISCUSSION OF. Directed Stress in Copper Crystals, C. H. Mathewson and E. R. Van Horn. Am. Inst. of Min. and Met. Engrs.—Tech. Pub., no. 301, for mtg. Feb. 1930, 26 pp., 20 figs. Discussion of work of earlier investigators; preparation of single crystals; method of cutting sections on predetermined plants; location of an octahedral plant; location of dodecahedral plant; deformation of oriented sections; deformational bands in unequally strained parts of single crystal; deformation by rolling; deformation by impact. Bibliography.

COPPER REFINING

LEAD IMPURITY. Distribution of Lead Impurity in a Copper-Refining Furnace Bath, J. W. Scott and L. H. DeWald. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 290, for mtg. Feb. 1930, 5 pp., 2 figs. Lead occurs more or less uniformly distributed in bath; tendency to concentrate toward surface as oxidation progresses; initial reduction of lead content is easier when larger amounts of lead are present; oxygen content increases progressively during oxidation period and decreases with depth; lead must be in oxidized condition, to unite with carrier slag; agitation must be effected so that lead may come in contact with carrier slag.

COUPLINGS

FLEXIBLE. Flexible Couplings, W. Staniar. Indus. Eng., vol. 88, no. 2, Feb. 1930, pp. 100-102, 10 figs. Discussion of various types of special couplings which have been devised to avoid bending stresses in shafting and excessive pressures on bearings caused by misalignment; outstanding advantages of several types.

CRANES

FOUNDRY. Improvements in Electric Equipment of Foundry Cranes (Neuerungen bei elektrischen Ausruestungen von Giessereikranen), C. Schiebeler. Giesserei (Duesseldorf), vol. 17, no. 8, Feb. 21, 1930, pp. 186-189, 9 figs. Two new devices are described, namely, connection for precise regulation, and 3-phase double crane motor for rapid raising and lowering of light loads; both of these devices, developed by A.E.G. greatly increase efficiency of crane operation.

CRANKSHAFTS

FATIGUE IN STEEL OF. Fatigue Characteristics of Crankshaft Steel (Ermuedungseigenschaften von Kurbelwellenstahl), K. Matthaes. Maschinenbau (Berlin), vol. 9, no. 4, Feb. 20, 1930, pp. 117-122, 26 figs. Fractures which have actually occurred are investigated as to composition, structure, texture, etc., and with respect to strength characteristics, i.e., notching, bending, and resistance to torsional vibration; conclusions drawn are checked by model experiments.

CRUSHED STONE PLANTS

NEW YORK. A Straight-Line Designed Crushed Stone Plant. Rock Products, vol. 33, no. 7, Mar. 29, 1930, pp. 57-61, 13 figs. Details of Federal Crushed Stone Corp., Buffalo, N.Y., which has limestone crushing and screening operation combining simplicity and economy in first cost with capacity and low operating cost; safety feeding device; duplicate screening system.

D

DAMS, EARTH

CONSTRUCTION. Pishkun Reservoir Enlargement. U.S. Bur. of Reclamation—Specifications, no. 509, 6 pp., 7 figs. on supp. sheet. Statement of equipment and specifications for stripping and plowing foundation for dikes, blasting of construction; embankments of clay, sand, gravel and cobble.

DAMS, ROCK-FILL

LEAKS IN. Finding Leaks in Rock-Filled Dams, L. Rankin. Paper Industry, vol. 11, no. 12, Mar. 1930, pp. 2150-2151. Conservation of water increases output of low-head plants; locating leaks; plugging up leaks.

DIE CASTING

ALLOYS, ZINC BASE. A Note of Zinc-Base Die-Casting Alloys, R. Lancaster and J. G. Berry. Inst. of Metals—Advance Paper, no. 524, 2 pp., 4 figs. Effect of adding small quantities of magnesium to zinc-base alloy, hardened with copper and aluminum, has been examined; there is variation in physical properties, and distinct change in crystalline structure, with successive small additions of magnesium.

DATA ON. Die Casting, A. H. Mundey. Metal Industry (Lond.), vol. 36, no. 2, Jan 10, 1930, pp. 33-34. Results of investigations of large range of alloys for die casting as well as selection of mould materials; gravity die castings preferable when mechanical properties of finished castings are chief consideration and pressure castings are to be preferred when accuracy of dimension and elimination of machining are of first importance; magnesium alloys; aluminum alloys. Paper presented before Coordinated Soc., Birmingham.

DIESEL-ELECTRIC POWER PLANTS

GREAT BRITAIN. Oil Engine Power for Local Generating Stations. Gas and Oil Power, (Lond.), vol. 25, no. 294, Mar. 6, 1930, pp. 101, 1 fig. Arrangement of generating station employing heavy-oil engines to serve town of Bridport, Dorset, and immediate neighbourhood; total output of 362.5 kva.; six-cylinder engine with 12-in. bore and 17-in. stroke, running at 333 r.p.m., and three-cylinder unit with 10-in. bore and 15-in. stroke, which runs at 375 r.p.m.; lubricating and auxiliary equipment.

DIESEL ENGINES

AUTOMOTIVE. High-Speed Oil-Engines, E. C. Madgeburger. Soc. Automative Engrs.—Jl., vol. 26, no. 2, Feb. 1930, pp. 203-214 and (discussion) 214-220, 26 figs. Principal advantages sought in adopting Diesel cycle and developing oil engines to operate at high rotative speeds are discussed; descriptions of number of engines of different classes, slected according to contribution their designs have made to art; particular attention is given to provisions for metering fuel and for supercharging.

DOMES

DESIGN. Analytical Solution of Masonry Domes: Unbalanced Loads, D. C. Coyle. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 4, part 1, Apr. 1930, pp. 809-816, 3 figs. Discussion by A. Floris, and author's closure of discussion of paper published in issue of Aug. 1929; theory of stress distribution in beams with anti-symmetrical wind pressure; meridian and ring stresses; shearing stresses. Bibliography. See Engineering Index 1929, p. 579.

DRAINAGE PUMPING PLANTS

GERMANY. Flood Protection in the Moersbach District between Moers and Repelen (Die Vorflutbeschaffung im Moersbachgebiet zwischen Moers und Repelen), Schuetz and Dischinger. Bautechnik (Berlin), vol. 7, no. 48, Nov. 8, 1929, pp. 737-740, 13 figs. Report on work of left side Lower-Rhine Drainage District near Moers in Germany; details of pumping plant consisting of three vertical-axis centrifugal units having aggregate capacity of 5,800 cu. m. per second when operating against head of 3 m.

E

ELECTRIC CABLES

UNDERGROUND—TEMPERATURE. Earth Temperatures and Their Use in Rating Cables. Nat. Elec. Light Assn.—Pub., no. 021, Dec. 1929, 13 pp., 30 figs. Result of study on earth temperatures throughout United States; as earth temperature is based upon which operating temperatures of cables are determined, complete knowledge of their seasonal changes and variation with depth of duct line is essential; three chief methods of measuring earth temperatures as reported by various companies are described.

ELECTRIC CIRCUIT BREAKERS

COMPRESSED AIR. High Capacity Breakers Without Oil (Hochleistungschalter ohne Oel), J. Biermanns. Elektrotechnische Zeit. (Berlin), vol. 51, no. 9, Feb. 27, 1930, pp. 299-304, 9 figs. Results of further development work on compressed air breaker; 100-kv. breaker with 1,500,000 kva. heating capacity has been built successfully; history of development is reviewed, which has started with water breaker and it is shown why, regardless of favourable results obtained with breaker, A.E.G. has decided upon compressed-air breaker of Ruppel.

ELECTRIC CODES

CANADA. Canadian Electrical Code. Can. Eng. Standards Assn. (Ottawa), part I, 2nd edition, 210 pp., 25 cents. Essential requirements and minimum standards governing electrical installations for buildings, structures and premises, potentials of from 0-5,000 volts.

ELECTRIC CONDENSERS

DESIGN. Design of Condensers for Power-Factor Improvement (Die Ausfuehrungsformen von Kondensatoren zur Verbesserung des Leistungsfaktors), K. Schneider. Elektro Jl. (Charlottenburg), vol. 9, no. 22, Dec. 1929, pp. 227-229. Characteristic features of static phase-displacement condensers as manufactured by A.E.G., S. S. W. Meirowski, von Haetely and Sundyberg.

ELECTRIC CONDUCTORS

ALUMINUM. Aluminum Conductors and Corona. Elec. (Lond.), vol. 104, no. 2696, Jan. 31, 1930, pp. 137-138, 2 figs. Features of aluminum as material for electric conductors are outlined; steel-core aluminum conductors and copper hollow conductors for 220-kv. lines are discussed and compared.

BARE WIRES. Heating and Current-Carrying Capacity of Bare Conductors for Outdoor Service, O. R. Schurig and C. W. Frick. Gen. Elec. Rev., vol. 33, no. 3, Mar. 1930, pp. 141-157, 18 figs. Review of existing and new data on temperature rise of bare conductors under continous loads in both outdoor and indoor locations; formulae for calculation of currents to be carried by conductors limited to given temperature rise; theoretical considerations of heating; effects of conditions of exposure; comparison of calculations and tests and typical computations of current.

ELECTRIC FURNACES

See Furnaces.

ELECTRIC INSULATING MATERIALS

MOULDED. Moulded Insulating Compositions, A. R. Dunton and A. W. Muir. Elecn. (Lond.), vol. 104, no. 2698, Feb. 14, 1930, pp. 192-194, 7 figs. Review of moulded materials of any classification; arc-resisting, heat-resisting, hot service, moderate temperature and normal temperature service materials; concrete mounted reactance coils in cement moulding shop; improved quality and increasing variety; development of new processes.

ELECTRIC LINES

CONSTRUCTION EQUIPMENT. Handling Reel in Mountains Easily and Cheaply, J. E. Housley. Elec. World, vol. 95, no. 10, Mar. 8, 1930, p. 495. Delivery of cable reels, containing total of 90 mi. of 500,000-cir. mils steel-reinforced aluminum cable, to mountainous regions, was greatly simplified by use of two rebuilt farm wagons; inaccessible country through which reels had to be transported rendered some economical and satisfactory expedient advisable and rebuilt wagons did job; details of construction given.

POLES, CONCRETE. Transmission Line Poles. Concrete and Constr. Eng. (Lond.), vol. 25, no. 2, Feb. 1930, p. 147. Cost data on and description of spun concrete poles, with electrically welded reinforcement skeletons, used to carry 10,000-volt overhead ring-main in city of Waterford; poles of hollow tubular cross section were manufactured at Beton Schleuderwerke, Erlangen, Germany.

Concrete Supports for Rural and Trunk Lines. Elecn. (Lond.), vol. 104, no. 2696, Jan. 31, 1930, pp. 124-126, 7 figs. Correspondent reports on neat appearance; extensive use on continent; centrifugal process; methods of carriage in Italy and France.

TOWERS. Suggestion for Calculation of Tower Foundations (Vorschlag zur Berechnung von Mastfundamenten), T. Mueller. Elektro Jl. (Charlottenburg), vol. 9, no. 22, Dec. 1929, pp. 221-227, 8 figs. Supporting strength in relation to ground pressure is investigated; four equations are developed and compiled in curves; investigation lead to enlarging of concrete content for larger foundations whereas content in small foundations can be made less; experimental check on method is suggested.

ELECTRIC LINES, HIGH TENSION

LIGHTNING. Lightning Investigations on Transmission Lines, W. W. Lewis and C. M. Foust. Gen. Elec. Rev., vol. 33, no. 3, Mar. 1930, pp. 185-198, 20 figs. Surge voltage investigations of 1926 and 1927 are reviewed; data work in 1928 and 1929 are given; crest values of surge voltage due to lightning and switching; trip-outs caused by lightning, and flashed insulator strings; wave front and wave shape; attenuation; effect of overhead ground wires in reducing surge voltages; lightning stroke recorders; field intensity recorder and rate of change of field intensity record. Paper presented before Am. Inst. Elec. Engrs.

LOSSES. Transmission Losses of Long-Distance Electric Power Lines (Die Uebertragungsverluste von langen Fernleitungen), L. Leng. Elektrotechnische Zeit. (Berlin), vol. 51, no. 8, Feb. 20, 1930, pp. 278-283, 4 figs. Mathematical analysis and numerical examples.

ELECTRIC MANUFACTURING INDUSTRY

CANADA. Annual Review of the Canadian Electrical Industry for the Year 1929. Elec. News (Toronto), vol. 39, nos. 3, and 4, Feb. 1, 1930, pp. 34-37, Feb. 15, 1930, pp. 49-52, 6 figs. Progress and improvements in industry shown by installations: new movable blade turbines, welded steel generators and motors, large synchronous condensers, much new equipment, considerable construction and large increase in business by Canadian Electrical Manufacturers.

ELECTRIC MANUFACTURING PLANTS

TESTING LABORATORIES. High Voltage Research Laboratory. Engineering (Lond.), vol. 79, no. 3347, Mar. 7, 1930, pp. 312-315, 15 figs. Particulars of laboratory of Metropolitan-Vickers Electrical Co. of Manchester; first part is known as surge laboratory; later important addition, known as main laboratory; consists of building adjoining surge laboratory, these two are furnished, between them, with power-frequency equipment capable of giving voltage of 1,000,000; 1,000,000 volt transformer set is made up of two 500,000 volt, 500 kv.a., 50 cycle transformers.

ELECTRIC MEASUREMENTS

ALTERNATING CURRENT. Some Accessory Apparatus for Precise Measurements of Alternating Current, R. S. J. Spilsbury and A. H. M. Arnold. Instn. of Elec. Engrs.—Advance Paper (Lond.), Nov. 25. 1929, 9 pp., 4 figs. Description of apparatus for obtaining for purposes of measurement voltage proportional to, and in phase with, given alternating current; defects in water-cooled tube resistors in use at National Physical Laboratory; defects have led to construction of air-cooled resistors for moderate currents, and current transformers with nickel-iron cores for heavy currents; points in their design; tests showing satisfactory performance.

ELECTRIC MOTORS

PHASE CHANGING. Changing Motors from Two-Phase to Three-Phase, A. C. Roe. Indus. Eng., vol. 88, no. 3, Mar. 1930, pp. 149-151, 5 figs. General discussion pertaining to change-over of two-phase motor or generator to operate as three-phase machine; phase insulation; illustrated description of several windings.

ELECTRIC NETWORKS

SHORT CIRCUIT CALCULATION. Practical Method for Calculation of Permanent Short-Circuit Current in Networks with Single Supply (Praktische Methode zur Berechnung des Dauerkurzschlusstroms einfach gespeister Netze), F. Ollendorff. Elektrotechnische Zeit. (Berlin), vol. 51, no. 8, Feb. 20, 1930, pp. 269-274, 4 figs. Short-circuit over section resistances is discussed; numerical examples given. (Concluded.)

ELECTRIC POWER GENERATION

UNITED STATES. Recent Developments of Electric Power, E. W. Rice, Jr. Blast Furnace and Steel Plant, vol. 18, no. 3, Mar. 1930, pp. 478-480 and 483. Great savings in fuel and reductions in weight of equipment required both for generation and transmission of power have been accomplished; internal combustion engine; electricity in manufacture; use of water power, steam turbine electric units; Emmet mercury vapour process; transmission lines.

ELECTRIC POWER SUPPLY

RURAL, GREAT BRITAIN. The Bedford Rural Electrification Scheme. Engineer (Lond.), vol. 149, no. 3868, Feb. 28, 1930, pp. 237 Technical scheme for development of demonstrated area is based upon supply of electricity in bulk obtained from Bedford; it involves construction in main area of network of 56 mi. of three-phase, 11,000-volt overhead transmission lines.

ELECTRIC RAILROADS

GERMANY. Construction of the Jungfernheide-Siemensstadt-Gartenfeld Railway Branch (Der Bau der Zweigbahn Jungfernheide-Siemensstadt-Gartenfeld), A. Proelss. Bauingenieur (Berlin), vol. 11, no. 1, Jan. 3, 1930, pp. 1-15- 35 figs. Reasons for construction of this branch of rapid-transit system of Berlin; description of rigid frame trestle bents, several steel bridges, railway stations, signal system, etc.

ELECTRIC RECTIFIERS

REVIEW. Rectification of Large Alternating Current Capacities (Gleichrichtung grosser Wechselstromleistungen), E. Orlich. Elektrotechnische Zeit. (Berlin), vol. 51, no. 4, Jan. 23, 1930, pp. 122-126. Problem is discussed and historically reviewed; present means for direct and indirect transformation are enumerated; notes on present-day rectifier equipment; advantages, disadvantages, and range of application of system are outlined and future outlook is speculated upon.

JET WAVE. The Jet-Wave Rectifier—The Experimental and Theoretical Basis of its Design, J. Hartmann. Instn. Elec. Engrs.—Advance Paper (Lond.), April 17, 1929, 25 pp., 34 figs. Jet-wave rectifier, purely mechanical device which, in course of last 15 years has been developed into means for high-powered rectification, is discussed; it is shown how rectifier can be designed on basis of prototypes, and especially on result of investigations with regard to theoretical relations between their qualities; general properties of jet-wave rectifier, and anticipations with regard to its future development, are given.

ELECTRIC TRANSFORMERS

TESTING. Transformer Tests, A. A. Fredericks. Power, vol. 71, no. 10, Mar. 11, 1930, pp. 388-391, 10 figs. Simple tests that may be applied to transformers to determine polarity of leads, condition of oil and insulation, and tightness of tank, and to locate leaks in cooling coils; connections for correct polarity.

CURRENT. Omits Instrument Transformer without Impairing Service. Elec. World, vo . 95, no. 8, Feb. 22, 1930, pp. 399-400. Southern California Edison Co. has followed practice of using bushing-type current transformers for ammeters, indicating watt-meters and relays in its smaller substations on 66-kv. network; reliability and resulting economy over use of oil-filled or air-insulated current transformers has been proved and company felt justified in adopting same practice in its large and important 220/66-kv. substations.

CURRENT, TESTING. A New Null Method of Testing Instrument Transformers, and Its Application, G. F. Shotter. Instn. of Elec. Engrs.—Advance Paper (Lond.), Nov. 18, 1929, 15 pp., 19 figs. Common methods and author's new method are described; technical points are discussed and examples given illustrating simple derivation of ratio and phase-angle error of current and potential transformers; accuracy of method is dealt with, tests on hole-type current transformer; and number of standard transformers required is discussed; advantages and applications in connection with testing of power transformers.

TAP CHANGERS. Load Control under Abnormal Conditions, C. R. Fugill. Elec. World, vol. 95, no. 8, Feb. 22, 1930, pp. 386-391, 9 figs. Tap-changing transformer has proved useful in development of interconnections of Guanajuato and Chapala power systems, because it gives satisfactory voltage and phase-angle control without excessive cost; method of analysis and description of operation applicable to many interconnection situations involving use of tap changers.

ELECTRIC WELDING

See Welding.

ELECTROPLATING

PROTECTIVE VALUE. Protective Value of Some Electro-Deposited Coatings, L. Davies and L. Wright. Inst. of Metals—Advance Paper, no. 517, for mtg. Mar. 12 and 13, 1930, 12 pp., 5 figs. Investigations carried out during year 1929 on large number of specimens of steel, brass, phosphor-bronze, and copper; specimens were plated with cadmium, zinc, nickel, and chromium of thicknesses frequently specified or recommended; and their comparative behaviour to corrosion sprays of salt and sulphuric acid are dealt with. Bibliography.

ENGINES

VIBRATIONS. Practical Determination of Torsional Vibration in an Engine Installation Which May Be Simplified to a Two-Mass System, F. P. Porter. Applied Mechanics (A.S.M.E. Trans.), vol. 51, no. 30, Sept.-Dec. 1929, pp. 239-263, 27 figs. Practical solution is given for torsional vibration in shafting of reciprocating-engine installation which may be reduced mathematically to simple two-mass system; methods for computing damped vibrations in installations where damping forces follow various laws; particular attention is given to damping forces caused by marine propeller, elastic hysteresis, and friction damper; example of computations for engine installations that have been investigated.

EXCAVATING MACHINERY

BUCKET WHEEL. Time Studies of Steam- and Electric-Bucket Excavators in the Styrian Erz Mountains (Zeitaufhahmen an Dampf und Elektro-Loeffelbaggern am steirischen Erzberg), H. Mayr. Berg und Huettenmaennisches Jahrbuch (Vienna), vol. 78, no. 1, Feb. 15, 1930, pp. 12-20. Types and operation of excavators are discussed and time studies and performance formulae derived therefrom; electric excavators show 108 per cent better performance than steam excavators under similar conditions; costs and operating expenses are compared and conditions influencing first cost are discussed.

F

FLOORS

CONCRETE SLABS. Eight Floors Erected in Nine Days, E. Eberhard. Am. Architect, vol. 137, no. 2582, Apr. 1930, pp. 32-33, 4 figs. Report on system which consists of two types of slabs, one for floors and another for ceilings, used in conjunction with ordinary supporting members of steel construction set 2 ft. 6 in. o.c.

FLOW OF FLUIDS

BOUNDARY-LAYER THEORY. The Boundary Layer as a Means of Controlling the Flow of Liquids and Gases, O. Schrenk. Nat. Advisory Committee for Aeronautics—Tech. Memo., no. 555, Mar. 1930, 22 pp., 8 figs.

PIPES. The Hydraulic Mean Depth as a Basis for Form Comparison in the Flow of Fluids in Pipes, J. Caldwell. Roy. Tech. College—Jl. (Glasgow), vol. 2, part 2, Jan. 1930, pp. 203-220, 6 figs. Experiments of Stanton and Pannell, Schiller, Davies and White and others on smooth brass pipe, suggested that hydraulic mean depth is sufficient criterion for geometric form of pipe; experiments herein described show that this is true only in special cases; theory of resistance to streamline flow in pipe with eccentric ring section.

FLOW OF WATER

CHARTS. Water-Flow Chart, S. C. Mifflen. Eng. and Min. Jl., vol. 129, no. 5, Mar. 8, 1930, p. 240. Chart is applicable to flow of water through average cast-iron and wrought-iron piles in fair interior condition; for new pipe, chart will show too low discharge and too high friction loss; example of use is given in descriptive text.

FORGING

HYDRAULIC. Power Control in Hydraulic Forging, V. Tatarinoff. Heat Treating and Forging, vol. 16, no. 3, Mar. 1930, pp. 321-324, 11 figs. Discussion of important factors in obtaining greatest possible economy of production in hydraulically operated forging plant; reduction of water leakage in hydraulic machinery and piping; decrease of water pressure losses in pipe line; proper utilization of pumping plant in close accordance with actual water consumption by presses; stopping of pumps when no press is working.

FORGINGS

STEEL. Properties of Heavy Forged Pieces (Werkstoffeigenschaften schwerer Schmiedestuecke), M. Ulrich. Maschinenbau (Berlin), vol. 9, no. 4, Feb. 20, 1930, pp. 135-136, 13 figs. Analytic discussion of processes in structure which takes place in casting of ingot and which are of influence in judging characteristics of large forged-steel workpieces; various typical cases are illustrated.

FURNACES

ANNEALING, CONTINUOUS. Automatic Furnace Simplifies Annealing, W. M. Hepburn. Heat Treating and Forging, vol. 16, no. 3, Mar. 1930, pp. 374-375 and 382, 4 figs. Annealing equipment of Mullens Manufacturing Co., of Salem, Ohio, manufacturers of sheet-metal stampings, including full line of automobile parts, such as bodies, doors, panels, pillar panels, cowls, tonneau sides, and backs, etc., is described.

HEATING-TREATING, ELECTRIC. Electric Heat-Treatment of Metals, W. J. Millar and A. G. Robiette. Metallurgia (Manchester), vol. 1, nos. 1 and 2, Nov. 1929, pp. 32-33, and Dec. 1929, pp. 57-58, and 74, 4 figs. Nov.: Discussion of furnace design and operating practice. Dec.: Additional features of furnaces of recent design; examples of steels and their treatment, carburization and nitridation.

STEEL-MAKING, ELECTRIC. 30-Ton Electric Steel-Melting Furnace. Engineering (Lond.), vol. 79, no. 3348, Mar. 14, 1930, p. 360. Furnace constructed by Watson's Metallurgists, Ltd., Sheffield, is operated on Greaves-Etchells system; special feature is that heat is applied both above and below bath in order to obtain even temperature throughout mass of molten metal.

G

GEARS AND GEARING

HIGH-SPEED. High-Speed Gears, E. N. Twogood. Engrs.' Soc. of West. Penn.—Proc., vol. 45, no. 7, Oct. 1929, pp. 297-308 and (discussion), 308-323, 2 figs. Design and manufacture of gears which operate at greater than 4,000 pitchline velocity are discussed; history and origin of gears briefly reviewed; design of pinion; separate effects on tooth contact of both bending and torsion; effect combination of two has on tooth contact; methods of manufacture and inspection are outlined; accuracy of hob necessary; method of checking uniformity of spaces of helical or spur gear developed by F. L. Pearson.

GENEVA STOP. Geneva Stop Drives (Sternradgetriebe), K. Hoecken. V.D.I. Zeit. (Berlin), vol. 74, no. 9, Mar. 1, 1930, pp. 265-271, 18 figs. Theory is developed from angular speed of Geneva stop and acceleration is calculated; results are presented in graph and two nomograms are developed for practical use; method of calculation for design of elements; examples of some unknown forms of inside gear and rack drives and special case of drive with zero time of rest are given.

GEOPHYSICAL EXPLORATION

ELECTRIC. Depth of Investigation Attainable by Potential Methods of Electrical Exploration, C. Schlumberger and M. Schlumberger. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 315, for mtg. Feb. 1930, 16 pp., 2 figs. Object of paper is to clarify idea of depth attainable by electrical measurements; authors show how it is possible to regulate this depth and to obtain electrical drilling from surface observations; they consider also difficulties encountered in deep measurements and indicate how it is possible to reach greater depths than those of industrial interest. Bibliography.

MAGNETIC, COLORADO. Geophysical Investigation at Caribou, Colorado, C. A. Heiland, and J. A. Malkovsky. Colo. School of Mines Mag., vol. 20, no. 2, Feb. 1930, pp. 13-16 and 40, 4 figs. Geology of northern magnetic deposits, Caribou, Boulder County, Colo.; geodetic survey; relationship of topography, geology, and magnetic disturbance; earth-magnetic measurements; graphical representation; conclusions drawn from magnetic maps. Extracts from U.S. Bur. of Mines—Tech. Paper, no. 439, indexed in Engineering Index 1929, p. 884.

RADIO. Absorption of Electromagnetic Induction and Radiation by Rocks, A. S. Eve. Am. Inst. of Min. and Met. Engrs.—Tech. Pub., no. 316, for mtg. Feb. 1930, 11 pp., 1 fig. Paper gives brief summary of theory on radiation waves and describes experiments by United States Bureau of Mines and by Canadian Geological Survey at Mammoth Cave, Kentucky; Dr. D. A. Keys, Dr. F. W. Lee and author did experimental work, and Dr. L. V. King some of theoretical work.

GYPSUM DEPOSITS

CANADA. Hydration Factors in Gypsum Deposits of the Maritime Provinces, H. B. Bailey. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 308, for mtg. Feb. 1930, 11 pp., 1 fig. Notes on study of geological relation of gypsum to anhydrite, with particular reference to deposits of Nova Scotia and New Brunswick; paper is not concerned with general theories of original deposition and no opinion is expressed as to whether gypsum or anhydrite was first deposited from evaporating sea water; for purposes of study, block of formation is regarded as block of anhydrite which has become partly hydrated into gypsum.

H

HEAT INSULATING MATERIAL

SLAG WOOL. Heat Insulation by Means of Slag Wool (Waermeschutz mittels Schlackenwoole), C. Fabry. Waerme (Berlin), vol. 53, no. 7, Feb. 15, 1930, pp. 107-108, 1 fig. Properties of heat-insulating materials are discussed, and advantages of slag-wool insulation set forth; it is claimed that this material fulfills all requirements of good and durable insulating material.

HIGH BUILDINGS

DESIGN. Steel Framing Simplicity in 53-Storey Lincoln Building, A. N. Van Vleck. Eng. News-Rec., vol. 104, no. 10, Mar. 6, 1930, pp. 388-391, 7 figs. Design of steel framing of Lincoln Building, New York City, including tower 160 by 66 ft.; all setbacks are made on column lines and tower is of economically rentable size; special construction includes eccentrically loaded trusses over entrance hall and slab wing plates on column bases; wind design and standard wind connections; transferring column load into truss by direct bearing, thus eliminating large gusset plates. See editorial comment on p. 386.

WIND BRACING. Wind on Tall Buildings, E. E. Seelye. Eng. News-Rec., vol. 103, no. 12, Mar. 20, 1930, pp. 481-483, 7 figs. Outline of workable method of computing lateral stresses involving shear distribution, on basis of relative stiffness of wind bents and of column-to-beam connections; deformation of floor-bents and of column; deflection of wind bent under lateral load.

HIGHWAY SYSTEMS

ONTARIO. Highway Construction in York County, H. C. Rose. Can. Engr. (Toronto), vol. 58, no. 9, Mar. 4, 1930, pp. 82-83. Development of permanent pavement system under Toronto and York Roads Commission; types of pavement comprising 260 mi. in system and average construction costs. Paper presented before Annual Conference on Road Construction.

HYDRAULICS

PROGRESS IN. Fifty Years' Progress in Hydraulics, L. F. Moody and B. R. VanLeer. Mech. Eng., vol. 52, no. 4, Apr. 1930, pp. 366-367. Introduction to contributions, indexed separately, dealing with theoretical hydraulics, water measurement, water hammer, pumps, hydraulic turbines, hydro-electric developments, with brief remarks by authors on these subjects.

HYDRO-ELECTRIC POWER DEVELOPMENTS

UNITED STATES. New Capacity—202,000 Kva. in 1929, 471,490 Kva. in 1930. Elec. West, vol. 64, no. 2, Feb. 1, 1930, pp. 65-68, 2 figs. Western power companies develop 98,250 kva. in hydro plants during past year; current year's program calls for 218,190 kva. in water power plants; additions to hydro-electric generating plants in 1929-1930, and to generating capacity in 11 western states by districts, 1924-1930, are listed.

INDIA. The Punjab Hydro-electric Scheme, A. O'Brien. Engineer (Lond.), vol. 149, no. 3868, Feb. 28, 1930, pp. 234-235. In Himalayas in little State of Mandi, first water-power scheme of Punjab is advancing steadily; for construction purposes two complete hydro-electric plants had to be developed, distributing 1,200 kw. of power to various points of working; when tunnel is completed, water from Uhl will pass through it and by effect of its being dropped down pipe line for 2,000 ft., 36,000 kw. of electric energy will be developed at power house; should first instalment of Mandi project be successful, future will see immense extensions.

BRITISH COLUMBIA. Ruskin Development. Elec. News (Toronto), vol. 39, no. 3, Feb. 1, 1930, pp. 29-33, 8 figs. Development is under active construction on Stave River, B.C. to have 47,000-hp. unit running this year; ultimate capacity 188,000 hp.; boring of tunnels; construction features; equipment; transmission lines; program of expansion; notes on dam.

IRELAND. The Shannon Power Development in the Irish Free State, A. R. C. Markl. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 4, part 1, Apr. 1930, pp. 727-741, 7 figs. Outline of civil engineering part of construction; equipment and methods used in building head-race of power plant, detailed account of methods used in excavation and building embankments; operation of multiple-bucket excavators; bank-building machines.

SWITZERLAND. The Etzel Hydro-electric Project (Das projektierte Etzelwerk), H. Eggenberger. Schweizerische Bauzeitung (Zurich), vol. 94, no. 24, Dec. 14, 1929, pp. 299-304, 7 figs. Outline of project on Sihl River near Einsiedeln, Switzerland, involving construction of gravity dam 28 m. high to utilize run-off from watershed, 156 sq. km. in area; plant, which is to operate under maximum head of 483 m., will develop 110,000 hp. and is estimated to cost 62,000,000 francs.

RHINE RIVER. European Low-Head Hydro-Electric Developments, A. V. Karpov. Power, vol. 71, no. 13, Apr. 1, 1930, pp. 515-517, 5 figs. Description of Ryborg-Schworstadt and Kembs plants located on River Rhine; former is designed for four 35,000-hp. Kaplan turbines to operate under 35-ft. head and latter includes five 36,000-hp. propeller turbines for 54-ft. head; in Kembs project spillway is built into plant, but at Ryborg-Schworstadt spillway is in dam adjoining plant and is controlled by four gates, 39 ft. high by 80 ft. wide, Kaplan and propeller turbines; comparative data of both plants is given.

HYDRO-ELECTRIC POWER PLANTS

MASSACHUSETTS. Hydraulic and Mechanical Features of Bellows Falls Hydro-Electric Plant of the New England Power System, E. A. Dow. Boston Soc. of Civil Engrs.—Jl., vol. 17, no. 3, Mar. 1930, pp. 71-92 and (discussion) 92-97, 16 figs. Description of new plant developing 60,000 hp. at 60-ft. head, using three turbines with combined discharge of 10,000 second-feet; details of M.A.N. roller gates made up of steel cylinders 13½ ft. in diam. and 121 ft. long; power house location and substructure; draft-tube design; frequency control; generating units; water metering equipment.

TEMPORARY. Providing Construction Power with a Small Temporary Plant. Contract Rec. (Toronto), vol. 44, no. 12, Mar. 19, 1930, pp. 345-347, 7 figs. Description of temporary 2,500-hp. hydro-electric plant at Spruce Falls, on Swan River, Saskatchewan, which was constructed by Churchill River Power Co. to supply construction power for its main development 12 mi. away, at Island Falls on Churchill River; power house is equipped with two vertical waterwheel driven generators rated 1,000 kva., 400 r.p.m., 600-volt, 3-phase, 60-cycle.

ICE CONTROL. Ice as Affecting Power Plants, F. C. Shenehon, J. R. Freeman, D. W. Mead, L. C. Sabin and W. T. Walker. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 4, part 1, Apr. 1930, pp. 743-759. Review of research on ice problems of hydro-electric plants with special reference to work on surface, middle and bottom ice formations. Bibliography.

HYDROLOGY

VALLEYS. Water Supply from Rainfall on Valley Floors, A. L. Sonderegger. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 4, part 1, Apr. 1930, pp. 787-800, 4 figs. Discussion by C. H. Lee, of paper published in issue of May 1929; report on observations made by writer at 24 wells in valleys of San Diego County, Calif., before and after first heavy storm of season; determination of rainfall penetration from soil moisture tests; comparison with mountain run-off; rainfall-run-off curves; development of formula for converting observed rise of water-table into equivalent depth of water. See Engineering Index 1929, p. 970.

I

INDUSTRIAL MANAGEMENT

GERMANY. Ten Years of Work of Germany Industrial Management Society (Zehn Jahre beitsgemeinschaft Deutscher Betriebsingenieure) F. Ludwig. V.D.I. Zeit. (Berlin), vol. 74, no. 10, Mar. 8, 1930, p. 313. Review of work of German societies in shop management, labour relations, accident prevention, industrial organization, etc.

INDUSTRIAL PLANTS

STEEL FRAME. A New AEG Manufacturing Plant (Eine neue Fabrikationshalle der AEG), E. Heideck. Bauingenieur (Berlin), vol. 10, no. 49/50, Dec. 6, 1929, pp. 900-905, 5 figs. Structural features of steel-frame building, housing transformer assembling plant at Oberschoenewide near Berlin, measuring 93.5 m. in length, 33 m. in width and 21.5 m. in height; details of rectangular frames 31.2 m. in span.

INTERNAL COMBUSTION ENGINES

HISTORY. Oil- and Gas-Engine Development, L. H. Morrison. Mech. Eng., vol. 52, no. 4, Apr. 1930, pp. 347-352, 8 figs. Birth of internal-combustion engine in United States was practically coincident with founding of American Society of Mechanical Engineers; that internal-combustion engine found wide field of application soon after 1880 is traceable to two factors: (1) engine was modified to permit it to burn gasoline; (2) broadening of Pennsylvania oil-field limits, and necessity of finding economical pumping power; gasoline and gas-engine development; natural-gas and blast-furnace gas engines; early ventures in oil engines; story of Diesel; low-compression oil engines.

IRON-MOLYBDENUM ALLOYS

DIFFUSION IN. Case-Hardening of Metals by Diffusion (Die Oberflaechenveredlung der Metalle durch Diffusion), G. Grube and F. Lieberwirth. Zeit. fuer anorganische und allgemeine Chemie (Leipzig) (Special number), vol. 188, Mar. 8, 1930, pp. 274-289, 10 figs. Fourth report from laboratories of Stuttgart Institute of Technology dealing with diffusion of molybdenum in solid iron; production of homogeneous iron-molybdenum alloys by diffusion; acid corrosion of sintered iron and molybdenum alloys.

IRRIGATION

CALIFORNIA. Progress and Results on One of Best Irrigation Projects. Eng. News-Rec., vol. 104, no. 12, Mar. 20, 1930, p. 487. Excerpts from report on management of 21,000-acre Orland Reclamation Project in California.

IRRIGATION STRUCTURES

SPECIFICATIONS. Earthwork, Tunnels, and Structures—North Branch Canal Division No. 3. U.S. Bur. of Reclamation—Specifications, no. 508, 1930, 28 pp., 17 figs. on supp. sheets. Statement of equipment; specifications for earthwork, concrete siphons etc.; testing siphons; bridge approaches; tunnels; concrete mixing.

J

JIGS AND FIXTURES

WELDED. Application of Arc Welding in Construction of Jigs and Fixtures (Anwendung der Lichtbogenschweissung im Vorrichtungsbau), O. Kienzle. Maschinenbau (Berlin), vol. 9, no. 1, Jan. 2, 1930, pp. 17-19, 13 figs. Advantages of welded equipment over cast-iron models are light weight, more rigidity, less machining, possibility of using scrap material, and lower cost of manufacture.

Arc-Welded Jigs, Fixtures and Machine Tools, J. R. Weaver. Am. Welding Soc.—Jl., vol. 9, no. 2, Feb. 1930, pp. 7-18, 13 figs. Advantages of arc-welded construction for jigs, fixtures, and special machine tools are discussed; methods employed by Westinghouse Electric Manufacturing Co. are described; great saving in time with welded construction; method of preparing sketches by tool designers; outline of how jigs are actually manufactured.

L

LEAD FATIGUE

ATMOSPHERIC ACTION. Atmospheric Action in Relation to Fatigue in Lead, B. P. Haigh. Inst. of Metals—Advance Paper, no. 521, for mtg., Mar. 12-13, 1930, 11 pp., 9 figs. Account of number of fatigue tests carried out under abnormal conditions, specially devised to study action of air in relation of fatigue in lead, it being believed that this action is representative of chemical and mechanical action; fatigue fracture of lead is intercrystalline only round margin; and in general, interior surface of fatigue fracture differs in character from marg n al zone.

LEVEES

CONSTRUCTION, KENTUCKY. Industrial Railways Build Levees in the Reelfot District. Pub. Works, vol. 61, no. 2, Feb. 1930, pp. 66-67, 4 figs. Practice of Levee District located 50 mi. south of Cairo, Ill.; narrow-gauge cars used to haul material from hills near one end of contract nearly mile long, and drag-line for placing it on levee; layout of borrow pit trackage; method of building enlargement.

CONSTRUCTION. Tower-Excavator Performance and Costs on Three Types of Levee, M. W. Gilland. Eng. News Rec., vol. 104, no. 13, Mar. 27, 1930, pp. 510-516, 10 figs. See editorial comment on p. 509. Report on Mississippi River levee-construction practice; tower-excavator set-up for levee enlargement; tower dimensions and equipment for tower excavator; performance and costs on new levee, set-over levee and levee enlargement; possibilities of improvement to meet conditions imposed by new superflood levee section; cost summary of four tower excavator operations in Vicksburg district; camp operations and equipment upkeep.

LEVELLING

MANUAL OF. Manual of First-Order Levelling, H. G. Avers. U.S. Coast and Geodetic Survey—Special Publication, no. 140, 1929, 90 pp., 18 figs. partly on supp. plates. General instructions in revised form; methods employed by U.S. Coast and Geodetic Survey in executing first-order levelling and in making office computations; organization and management of party and procedure in field; errors of levelling.

LIGHTNING ARRESTERS

THYRITE. New Lightning Arresters. Engineer (Lond.), vol. 149, no. 3868, Feb. 28, 1930, pp. 239. For use in lightning arresters new material, called Thyrite which has property of increasing or decreasing its resistance as voltage is decreased or increased, has been developed by General Electric Company of America; advantages claimed for new arresters are small size, low installation cost, small weight, and predictability of results to be expected for any given condition.

LOCOMOTIVES

DIESEL. Hydraulic Couplings for Internal Combustion Locomotives. Engineer (Lond.), vol. 149, no. 3870, Mar. 14, 1930, p. 298, 3 figs. Details of this useful power-transmitting device, specially designed for locomotives driven by internal-combustion engines and similar drives; coupling is transmission gear of pump-turbine type, which consists essentially of impeller driven by engine and runner attached to driven shaft.

New 2-6-2 Diesel Locomotive for Chile. Ry. Gaz. (Lond.), vol. 52, no. 10, Mar. 7, 1930, pp. 343-344, 3 figs. Constructed for service on 2 ft. 6 in. gauge and for duties hitherto performed by steam locomotives; engine which develops 300 hp. and 1,000 r.p.m., is mounted directly over centre coupled wheels; six-cylinder McLaren-Benz four-stroke cycle, solid injection, cold starting engine with overhead valve gear, having cylinders 205 mm. bore by 270 mm. stroke; driving wheels 2 ft. 9 in. total wheel base 20 ft.; fuel consumption 0.45 lb. per B.hp. per hr.; four-speed transmission; cooling systems; starting arrangements.

The 1,200-Hp. Diesel Compressed-Air Locomotive of the German Governmental Railroad (Die 1,200 PS-Diesel-Druckluftlokomotive der Deutschen Reichsbahn), Witte and R. P. Wagner. V.D.I. Zeit. (Berlin), vol. 74, no. 10, Mar. 8, 1930, pp. 289-296, 31 figs. Detailed description of 4-6-4 1,000-hp. and 1,200-hp., 80-km. per hr. locomotive; pressure of operating air is 6.5 atm. of 330 deg. cent.; tractive effort is 12,000 kg.; driving wheel diameter 1,600 mm.; service weight 124,600 kg.; plan drawing of engine is given.

STEAM-TURBINE. 2,000-hp. Krupp Turbine Locomotive. Engineering (Lond.), vol. 129, no. 3346, Feb. 28, 1930, p. 280, 4 figs. partly on supp. plates. Principal dimensions are given; length including tender 76 ft. 9 in.; weight in running order, 111 tons; boiler is designed to supply steam at pressure of 15 atmos.; main turbines and transmission gearing are of Zoelly type, manufactured by Escher, Wyss and Co.; condenser, of surface type, has cooling surface of 220 sq. m.

VALVE GEARS. Valve Control of Renaud System Tested on Single-Expansion Superheated Mikado Locomotive of the French State Railroad (Distribution par soupapes systême Renaud en essai sur une locomotive Mikado à simple expansion et à surchauffe des Chemins de Fer de l'Etat), M. Nasse. Revue Générale des Chemins de Fer (Paris), vol. 48, no. 6, Dec. 1929, pp. 459-473, 20 figs. System is detailed, test results and diagrams are given.

LUBRICANTS

CUTTING. Characteristics and Selection of Cutting Fluids. Machy. (Lond.), vol. 35, no. 908, Mar. 6, 1930, pp. 729-735, 2 figs. Functions of cutting fluids are described; types of fluid employed for cutting; properties of specific oils and emulsions; aqueous solutions; objections to use of emulsions.

LUMBER

DRYING. Artificial Drying of Wood (Zur kuenstlichen Trocknung des Holzes), F. Moll. V.D.I. (Berlin), vol. 74, no. 11, Mar. 15, 1930, pp. 343-344, 1 fig. Physical principles of current methods of lumber drying and seasoning; construction and operating practice of lumber kilns.

LUMBER MILLS

DESIGN. Standardized Design of Lumber Yard on Wheels, T. D. Perry. Wood-Worker, vol. 48, no. 12, Feb. 1930, pp. 48-50, 8 figs. Article describes installation of factory lumber yard on wheels, where problem presented was that of providing trackage for about 300 kiln cars, equivalent to about 1,000,000 ft. of lumber.

M

MACHINE TOOLS

HYDRALIC DRIVE. Hele-Shaw Beacham Patent Variable Speed Hydraulic Transmission. Machy. (Lond.), vol 35, no. 905, Feb. 13, 1930, pp. 649-651, 9 figs. Description of new pump of entirely different design from original Hele-Shaw pump; most noticeable changes are to be found in inward operation of pistons instead of outward, and in employment of stationary crank; system consists of pump and hydraulic motor or pump and ram; pump employed in transmission constructed with variable and reversible stroke; hydraulic motor or ram has fixed capacity corresponding to definite speed of rotation or movement.

DESIGN. Calculation of Frames of Presses, Punches, Automatics, Shears, etc. (Die Berechung der Rahmenkoerper von Pressen, Stanzen Automaten, Scheren, etc.), O. Rieger. Maschinen Konstrukteur (Munich), vol. 63, no. 4, Feb. 25, 1930, pp. 83-83, 4 figs. Mathematical design analysis.

MACHINERY

NOISE ELIMINATION IN. Prevention and Elimination of Machine Noises (Maschinengeraeusche, ihre Verhinderung und Beseitigung), K. Wachwitz Tonindustrie-Zeitung (Berlin), vol. 53, no. 97, Dec. 5, 1929, pp. 1707-1708. Measures employed to prevent or dampen noises and vibrations in machinery used in clayworking, cement, and lime industries are discussed, and sound-insulating materials described.

MATERIALS HANDLING

INDUSTRIAL PLANTS. Auxiliary Devices Insure Safe Delivery of Goods in Materials Handling Systems, J. C. Siegesmund. Indus. Eng., vol. 88, no. 2, Feb. 1930, pp. 87-89, 6 figs. Continued description of application and use of auxiliary devices that are employed in Eli Lilly and Co., Indianapolis, Ind., in conjunction with other elements of materials-handling systems that enable delivery of finished fragile products to stock room and shipping platform with comparative safety; flow charts of conveyor systems are given.

EQUIPMENT. Correct Engineering Principles in Selecting Handling Equipment Result in Real Economies, H. V. Coes. Matls. Handling and Distribution, vol. 3, no. 4, Jan. 1930, pp. 27-31, 11 figs. Article aims to point out some of fundamental principles of materials handling and their effect upon production plant operation and design and economic production; table listing 50 typical installations of material-handling equipment; fundamental principles of new and existing plant operation.

MERCURY-VAPOUR PROCESS

Test Data. Results of Mercury Vapour Cycle at Hartford, W. L. R. Emmet. Power Plant Eng., vol. 34, no. 7, Apr. 1, 1930, p. 378, 2 figs. Figures indicate 8,900 B.t.u. per net kw-hr. is possible; cross-section of plant and details of boiler drum; data on performance of 10,000-kw. mercury installation.

METALS

Cold Working. On the Distribution of Hardness Produced by Cold Working, W. P. Sykes and A. C. Ellsworth. Am. Soc. Steel Treating—Trans., vol. 17, no. 4, Apr. 1930, pp. 509-518 and (discussion) 518-526, 17 figs. Preliminary study of progress of hardening throughout section produced by cold working; three materials, differing considerably in hardness, are reduced by cold swaging; hardness measurements are taken at various depths below surface of round section after each of series of reductions; effects of starting diameter and original hardness upon distribution of final hardness are reported.

Cold Working of Metals, J. W. Berry. Roy. Aeronautical Soc.—Jl. (Lond.), vol. 34, no. 230, Feb. 1930, pp. 210-211. Cold working of metals from first stages is explained, including cold raising, spinning and pushing in and pulling out process, hot spinning process, stamping, and drop stamping by double-acting press; size and shape of blanks. Abstract.

Conductivity. Constant Relation Between Thermal and Electric Conductivities of Metals (Rapport constant des conductibilités thermique et électrique des métaux), A. Grebel. Chaleur et Industrie (Paris), vol. 10, no. 116, Dec. 1929, pp. 569-571, 2 figs. Comparative study based on curves and tables of Bureau des Longitudes, and Landbolt-Bernstein tables.

Deformation. Problem of Plasticity—Deformation at Low Temperature (Zur frage der Plastizitaet. Verformung bei tiefen Temperaturen), M. Polanyi and E. Schmid. Mitteilungen der deutschen Materialpruefungsanstalten (Berlin), no. 10, 1930, pp. 101-104, 5 figs. Study of different forms of plasticity; elastic limit of zinc and cadmium crystals at low temperatures; deformation at minimum temperatures.

METALS TESTING

Creep. Creep Stress Determination, W. Rohn. Metallurgist (Supp. to Engineer, Lond.), Feb. 1930, pp. 22-23, 2 figs. Author propounds novel method of making creep tests; he bases his ideas on fact that creep limit varies rapidly with temperature so that it would be more satisfactory to determine limiting creep temperature for given stress than creep stress for given temperature; method should prove of very great value, especially where approximate guide to creep properties of material is required. Abstract translated from German.

Stresses. Stresses Due to Forging and Heat Treatment (Schmiedespannungen, Verguetungsspannungen und Waermespannungen), G. Sachs. Mitteilungen der deutschen Materialpruefungstalten (Berlin), no. 10, 1930, pp. 43-48, 22 figs. Methods of testing to determine effect of treatment on metals, such as forging, hardening, annealing, quenching, etc.; results of tests to determine stresses in round bars of steel at 0.55 deg. cent.; comparison of effect of different treatments.

Temper. The Pile Temper Testing Machine, R. G. Johnston. Metal Industry (Lond.), vol. 36, no. 11, Mar. 14, 1930, pp. 293-296, 4 figs. Explanation of construction and operation of machine for testing temper of metals and alloys; analysis of results obtained.

Wear. Theory of Wear (Ueber die Abnutzungstheorie), H. Friedrich. Maschinenbau (Berlin), vol. 9, no. 4, Feb. 20, 1930, pp. 129-131, 4 figs. Comparisons is made between abrasion by friction and by machinery, i.e., grinding, filing, sawing, etc., in order to find explanation for theory of wear; experiments on abrasion-testing machine; comparison of calculated and measured values.

MINES AND MINING

Cementing. Preparation and Resistance of Cement and Gypsum Plasters in Wet Copper Mines, T. E. Smith. Eng. and Min. Jl., vol. 129, no. 5, Mar. 8, 1930, pp. 248-249. Description of experiments conducted at mines in Butte district of Montana, water in most of which contains mixture of free sulphuric acid and soluble sulphates; portland cement will not set in water containing copper, but remains friable and porous; certain gypsum products were found to give satisfactory results.

British Columbia. British Columbia in 1929. Min. Jl. (Lond.), vol. 168, no. 4927, Jan. 25, 1930, p. 23. Brief general review, with production estimate by J. D. Galloway; extension of milling capacity; activity in exploration and development.

MOTOR TRUCKS

Six-Wheel. Recent Improvements in Mechanical Transport Vehicles, N. G. Duckett. Eng. Jl. (Montreal), vol. 13, no. 2, Feb. 1930, pp. 90-95, 7 figs. Development of multi-wheeled cross-country commercial type of motor trucks; action by British War Office to supersede solid-tire type vehicle and introduce 1½-ton subsidy-type motor truck; their specifications; truck; War Department patented suspension; overall non-skid chains; use of skis with six-wheelers; comparison between War Department rear suspension and other forms in general use throughout America; improved form of front-axle springing; performance formula.

N

NICKEL ALLOYS

Castings. Nickel Casting Alloys, J. McNeil. Metal Industry (Lond.), vol. 36, no. 10, March 7, 1930, pp. 275-278. Physical properties of nickel brasses and nickel silvers are considered; founding; uses; nickel high-tensile brasses; nickel bronzes; high nickel-copper alloys; founding; nickel-chromium and nickel-chromium-alloys. (To be concluded.) Paper presented before Co-ordinating Committee at Birmingham.

NOZZLES, STEAM

Research, Great Britain. Sixth Report of the Steam Nozzles Research Committee. Engineering (Lond.), vol. 129, nos. 3346 and 3348, Feb. 28, 1930, pp. 296-298 and (discussion) pp. 291-292, and Mar. 14, pp. 361-362, 20 figs. Account of following series of tests which form continuation of work since presentation of fifth report; test of straight rectangular convergent nozzle of 3 in. by ¼ in. opening; effect of entrance conditions in straight nozzles; impulse nozzles with increased radius of curvature; effect of entrance conditions in curved nozzles; impulse nozzle under increases steam temperature; test of 2-in. Parsons nozzle.

O

OCCUPATIONAL DISEASES

Lead-Poisoning. Industrial Diseases and Compensation, M. R. Mayers. Safety Eng., vol. 59, no. 2, Feb. 1930, pp. 88, 90 and 92. Findings of lead-poisoning investigation; difficulties arising regarding lead-poisoning cases are lack of standardization of terminology and diagnosis, and difficulty in establishing etiologic relationship between disability and exposure to lead. (Concluded.) Paper read before Int. Assn. of Indus. Accident Boards and Commissions.

OFFICE BUILDINGS

Heightening. Adding Storeys to a Steel-Frame Chicago Bank Building, M. Rosner. Eng. News-Rec., vol. 104, no. 13, Mar. 27, 1930, pp. 516-518, 6 figs. Report on alterations and additions to Northern Trust Company's four-storey building, occupying area 72 by 190 ft.; additions include two new storeys over entire area, with large penthouse extending two storeys above roof; tall unbraced columns strengthened; girders and cantilevers in framing; condition of steel and foundations.

OIL FIELDS

Alberta. The Oil Fields of Alberta, E. H. C. Craig. Oil Weekly, vol. 56, no. 11, Feb. 28, 1930, pp. 70 and 72. Brief general account of Turner Valley and Wainwright fields; Turner Vzlley has 40 producing wells; 33 yield crude gasoline and 19 produce crude oil of various grades; wells in Wainwright field produce heavy oil in small quantities; geological note and theory as to source of oil. Abstract of paper read before Instn. of Petroleum Technologists.

OIL WELL PRODUCTION

Flooding. Valuation of Flood Oil Properties, E. A. Stephenson and I. G. Grettum. Am. Inst. of Min. and Met. Engrs.—Tech. Pub., no. 323, for mtg. Feb. 1930, 20 pp., 13 figs. Discussion of flooding method of oil well production, as practiced in Bradford field of Pennsylvania; geological structure of fields; flooding practice; factors considered in valuation methods; flooding methods; recovery of oil per acre; daily or yearly production rate per well; operating cost, usually expressed as unit cost per barrel; expected price per barrel; discount factor for converting expected income into present net worth.

ORE CRUSHING AND GRINDING

Ball Milling. A Laboratory Investigation of Ball Milling, Z. M. Gow, A. B. Campbell and W. H. Coghill. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 326, for mtg. Feb. 1930, 26 pp., 22 figs. Paper deals with both diameter and speed and proposes to show laws which apply to some laboratory ball mills, ranging in diameter from 18 to 42 in., run at various speeds; correlation of power, speed, and grinding rate of respective mills is shown by curves of markedly significant similarity; mechanics and theory of ball milling; mathematical derivation of new equation of ball path; grinding tests; data and discussion. Bibliography.

ORE TREATMENT

Flotation. Chemical Reactions in Flotation, A. T. Taggart, T. C. Taylor and A. F. Knoll. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 312, for mtg. Feb. 1930, 33 pp., 5 figs. Paper by Taggart and Gaudin was published in Am. Inst. Min. Engrs. Trans. vol. 68, 1922; present paper offers different definition of adsorption and sets up generalization that simple chemical reaction underlies functioning of flotation reagents which control mineral collection, when these reagents are soluble in and act from solution in water of pulp; frothing and collecting agents; tests are described and discussed. Bibliography.

Classification. Classifier Efficiency, an Experimental Study, A. W. Fahrenwald. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 275, for mtg. Feb. 1930, 14 pp., 3 figs. Relation of classifier efficiency to grinding efficiency; critical consideration of size analysis as basis of measuring classifier efficiency; experimental method developed; experimental data; enumeration of conclusions drawn from results of experiments.

P

PAVEMENTS

Asphalt. Recent Developments in Asphalt Paving, F. P. Smith. Pub. Works, vol. 61, no. 3, Mar. 1930, pp. 87-90, 5 figs. Review of recent improved practice as to cold-laid asphalt, foundations, thickness, plant and methods of manufacture, construction and maintenance.

Bituminous Macadam. Reconstruction of Highways in Massachusetts, F. E. Cassidy. Pub. Works, vol. 61, no. 2, Feb. 1930, pp. 63-65, 3 figs. Report on reconstruction of 4½-mi. section of Mohawk Trail en route from Boston to North Adams, which called for standard bituminous asphalt-macadam of penetration type, 24 ft. wide; stone in wearing course coarser than that in base course, giving rough wearing surface; adapting foundation to wider pavement and modified alignment; handling traffic.

Concrete, Testing. A Study of Tests of Cylinders and Cores Taken from Concrete Roads in Texas during 1928, J. A. Focht. Univ. of Texas Bul., no. 2922, June 8, 1929, 18 pp., 21 figs. Report on tests of 8,000 concrete cylinders, and 1,000 cores taken from concrete roads; methods of sampling and laboratory procedure; data are presented in graphic forms.

Rubber. Use of Rubber Pavements (L'emploi du caoutchouc dans les revêtements de chaussées), J. Thomas. Génie Civil (Paris), vol. 96, no. 2482, Mar. 8, 1930, pp. 236-239, 10 figs. Features of rubber pavements experimented with in Metropolitan cities of France, United States and Great Britain with special reference to Gaisman type of rubber pavement tried out in Paris.

PIERS, STEEL

Costa Rica. The New Steel Pier in the Port of Puntarenas (Die neue Eiserne Mole in Hafen von Puntarenas), H. Schott. Bauingenieur (Berlin), vol. 10, no. 49/50, Dec. 6, 1929, pp. 881-887, 11 figs. Design and construction of L-shaped pier about 500 m. total length, built at railroad terminal of Puntarenas, Costa Rica; details of steel bents of supporting testles, screw-base tubular piles, etc.

POWER GENERATION

Polar Seas. Extracting Heat and Power from Ice Water. Power, vol. 71, no. 10, Mar. 11, 1930, pp. 400-402, 6 figs. Novel scheme for utilizing heat in Arctic lakes and rivers is proposed by Barjot of Montreal, Canada, in which ice water is used as "fuel" to vaporize hydrocarbon, and vapour after passing through turbine is condensed by blocks of frozen brine; typical river-flow curves showing deficit of available water power in winter months; diagrammatic sketch of proposed plant for generation of power from heat in ice water.

POWER PLANTS

Interconnection. Load Division in Interconnections, E. C. M. Stahl. Elec. World, vol. 95, no. 9, Mar. 1, 1930, pp. 434-438, 8 figs. Problem of obtaining most economical division of load among interconnected generating stations becomes more involved as number of stations in system increases; in practice boilers and turbines are grouped in separate stations; each station will have limiting ranges of operation which depend on total system variation in load, degree of reliability of feeders, importance of local load and size of interconnecting lines, as well as station's economy characteristics; Brooklyn Edison Co. practice is quoted.

PRESSURE VESSELS

Welding. The Strength and Design of Fusion Welds for Unfired Pressure Vessels, L. W. Schuster. (Engineering (Lond.), vol. 79, nos. 3348, 3349 and 3350, Mar. 14, 1930, pp. 362-364, Mar. 21, pp. 394-396, and (discussion) 353-354 and 386-387, and Mar. 28, pp. 427-428, 12 figs. Investigation into fusion welding undertaken by author's company with view to determine true worth of legitimate claims arising from more recent development of fusion welding, and to place application, as applied to pressure vessels, on sage and rational basis; findings do not in any way apply to welding of structures other than pressure vessels. Paper read before Instn. Engrs.

PULVERIZED COAL

Combustion of. Thermodynamics of Powdered Coal Combustion, P. Rosin. Power Plant Eng., vol. 34, no. 6, Mar. 15, 1930, pp. 326-329, 2 figs. Investigations of thermal considerations show dust firing to be velocity problem; table giving burning time and rate of heat liberation; combustion period rarely exceeds 4 sec.; meaning of combustion time; empirical law holds only for limited range; heat absorbing capacity of boiler; curves showing heat transfer in 1,000 sq. m. (10,760 sq. ft.) boiler. Paper presented before Int. Conference on Bituminous Coals.

PUMPING STATIONS

Oshawa, Ont. Waterworks Pumping Station Equipment, W. C. Smith. Contract Rec. (Toronto), vol. 43, no. 11, Mar. 12, 1930, pp. 293-296 and 327, 2 figs. History and description of waterworks of Oshawa, Ont., serving population of 30,000; total costs and operating costs of several varieties of plant installation including filter pump.

PUMPS

Gas. Two-Stroke Cycle Gas Displacement Pump. Engineering (Lond.), vol. 129, no. 3350, Mar. 28, 1930, pp. 404-406, 3 figs. Details of pump constructed by Hodges Brothers, Basin Ironworks, Exeter, to designs of S. P. Christie, who claims that it is simple and reliable and can be operated for long periods with but few, and relatively inexpensive, renewals; consists of vertical combustion chamber connected to horizontal play pipe terminating, at one end, in old boiler, which acts as air vessel; part of water delivered into air vessel from play pipe is discharged through horizontal pipe lying by side of play pipe and connected by bend to vertical pipe.

R

RAILROAD TRACKS

Spring Supports. Measurements of Vertical Movements of Rails (Messung senkrechter Schienenbewegungen), A. Wettl. Organ fuer die Fortschritte des Eisenbahnwesens (Berlin), vol. 84, no. 21, Nov. 1, 1929, pp. 457-459, 2 figs. Description of electric apparatus especially designed for use in Wirth experimental study of spring-supported railroad tracks.

RAILROADS

Canada. Connections with the Hudson Bay Railway. Engineering (Lond.), vol. 79, no. 3348, Mar. 14, 1930, p. 355. Since decision of Canadian Government to press forward construction of Hudson Bay railway and shipping route through Hudson Strait to Port Churchill, Manitoba, number of plans have been crystallizing, aim of which is to bring existing lines of transportation into closer connection with new railway.

RAIN AND RAINFALL

Intensity. Frequency and Intensity of Excessive Rainfalls at Boston, Massachusetts, C. W. Sherman. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 4, part 1, Apr. 1930, pp. 717-726, 2 figs. Study of records of rain gauge at Chestnut Hill Reservoir covering term of 50 years, and durations of heavy rain up to 72 hours; curves of intensity corresponding to any period of time for various frequencies are derived and discussed; application of general formula to other localities.

REFRIGERATION

Plant Design. The Design of Modern Refrigerating Plant, B. C. Oldham. Ice and Cold Storage (Lond.), vol. 33, no. 383, Feb. 1930, pp. 30-33, 3 figs. Results of theoretical research work, which was performed by author, concerning refrigerating capacity and power requirements tables giving thermodynamic properties of super-heated ammonia and carbon dioxide gas; indicator diagrams on modern machines; description of electric indicator adapted to totally enclosed refrigerating machines; dry and wet compression. Abstract of paper presented before Brit. Assn. of Refrigeration.

RESERVOIRS

Concrete. Concrete Reservoirs and Tanks, W. S. Gray. Concrete and Constr. Eng. (Lond.), vols. 24 and 25, nos. 12 and 2, Dec. 1929, pp. 725-732, Feb. 1930, p. 135, 14 figs. Dec.: Principles of design of L-shaped concrete retaining walls: reinforcement of wall slab; design of long projection of base. Feb.: Joints in wall; details of horizontal reinforcement at corners; construction of floor; types of joints in reservoir and tank floors. (To be continued.)

RETAINING WALLS

Design. Marine Structures in Reinforced Concrete, R. N. Stroyer. Concrete and Constr. Eng. (Lond.), vol. 24, no. 12, Dec. 1929, pp. 709-719, 8 figs. Derivation and discussion of author's formula for reduction in bending moments on flexible walls in reinforced-concrete; tables and charts.

RIVETS

Testing. Permissible Stresses on Rivets in Tension, C. R. Young and W. B. Dunbar. Univ. of Toronto, School of Eng. Research—Bul., no. 8, 1928, section no. 16, pp. 389-418, 15 figs. Report on University of Toronto tests on rivets (1) in pure tension, (2) subjected to combination of tension and flexure, and (3) subjected to combination of tension, shear and flexure; extension of rivets; permissible stresses for tension with flexure.

ROAD CONSTRUCTION

Cold Weather. Winter Paving with Asphaltic Concrete on Macadam Base, W. H. Flood. Eng. News Rec., vol. 104, no. 11, pp. 446-448, 3 figs. See editorial comment on pp. 429-430. Report on construction, under extreme exposure to cold of asphalt pavement section of Leif Eriksen drive along lake front in Chicago; 67,000 sq. yds. of 2 in. asphalt surfacing was laid in eight days; six rollers following on heels of extra-size spreading and raking crews got asphalt down hot; mixture and mixing procedure; progress, working force. Abstract of paper read before Ill. Soc. of Engrs.

ROAD FOUNDATIONS

Treatment of. Treatment of Subgrades with Bituminous Materials, C. A. Hogentogler and H. Aaron. Roads and Streets, vol. 70, no. 2, Feb. 1930, pp. 77-82, 5 figs. Theory of subgrade stabilization; its practical application and function of bituminous treatments with respect to stage construction; influence of internal friction and cohesion on stability; what admixtures may do; expansion depends upon both capillary properties and degree of cohesion possessed by soil; frost heave apt to be important in permeable silts. Paper presented before Asphalt Paving Conference.

ROADS

Specifications. Tunnels and Roads, Owyhee Project, Oregon-Idaho. U.S. Bur. of Reclamation—Specifications, no. 505, 1930, 37 pp., 9 figs. on supp. sheets. Statement of equipment and electric power requirements; specifications for earthwork; tunnels; concrete mixing.

Low Cost. Some Conservation in Low-Cost Roads, W. Huber. Can. Engr. (Toronto), vol. 58, no. 9, Mar. 4, 1930, pp. 91-92. Factors affecting durability of road and need for conservation by surface treatment; new retread type of road and method of construction. Paper presented before Annual Conference on Road Construction.

ROADS, EARTH

Sand-Clay. Surface Treated Sand-Clay Roads in Georgia and Florida, B. P. McWhorter. Roads and Streets, vol. 70, no. 2, Feb. 1930, pp. 73-76, 4 figs. Report on methods of constructing sand-clay base for surface treating and materials and methods used in treatment; prime coat; application of seal coat; blading crushed slag; spreading crushed stone cover. Paper presented before Asphalt Paving Conference.

ROADS, GRAVEL

Canada. Conservation of Road Gravel Supplies, M. R. Parish. Can Engr. (Toronto), vol. 58, no. 9, Mar. 4, 1930, p. 96. Sources of supply and need for conservation; economical application about 600 yds. per mi.; maintenance of gravel roads; educating motorist. Paper presented before Annual Conference on Road Construction.

ROLLING MILLS

Rolling Process. The Rolling of Metals, J. S. Casewell. Engineer (Lond.), vol. 149, nos. 3868, Feb. 28, 1930, pp. 232-234, Mar. 7, pp. 260-262, Mar. 14, pp. 288-289, Mar. 21, pp. 316-318, Mar. 28, pp. 342-344, in all 52 figs.

Tests to Determine Vertical Stresses in the Rolling Process (Versuche zur Emittlung der Vertikalspannungen beim Walzvorgang), E. Siebel. Stahl und Eisen (Duesseldorf), vol. 50, no. 8, Feb. 20, 1930, pp. 233-234, 3 figs. Account of experiment carried out by K. Hubert; conversion of pressure-time curves into pressure-path curves; it is claimed that pressure distribution, as established by Hubert, does not correspond to actual conditions and practically all of his conclusions are incorrect inasmuch as they are based on false evaluations.

S

SEAPLANES

Catapults. Co-operation between Ship and Aircraft (Zusammenarbeiten von Schiff und Flugzeug), Kiwull. Zeit. fuer Flugtechnik und Motorluftschiffahrt (Munich), vol. 20, no. 22, Nov. 28, 1929, pp. 581-582, 3 figs. Brief notes on landing and take-off of seaplanes from ships at sea, and description of necessary catapult arrangement. Abstract of paper read before Wissenschaftliche Gesellschaft fuer Luftfahrt.

SEWAGE PUMPS

Automatic. Automatic Sewage Lifting Plant. Engineer (Lond.), vol. 149, no. 3867, Feb. 21, 1930, p. 224, 1 fig. For automatically removing sewage, which cannot flow away by gravity, self-starting and stopping plant has been introduced by Daniel Adamson and Co., named Eject-o-Pump; apparatus is operated by air pressure-control switch, which is entirely automatic; plants are made with capacities of from 25 to 1,000 gals. per min.

Failure. Gas Pressure Bursts Sludge Pump, C. E. Keefer. Pub. Works, vol. 61, no. 2, Feb. 1930, pp. 56-57, 1 fig. At Back River Works, Baltimore, casing of 8-in. pump, which was filled with sludge, burst due to gas generated by sludge; laboratory tests indicate that sludge kept in sealed containers will produce pressures as high as 1,400 lbs. per sq. in.

SHEET-METAL TESTING

Drawing Qualities. The Practical Testing of Sheet and Strip for Drawing Operations, L. N. Brown. Metal Stampings, vol. 3, no. 3, Mar. 1930, pp. 239-242 and 270, 4 figs. Discussion of scientific methods for specification of drawing qualities and thickness of strip and sheet; types of testing machines and testing methods; use of load and cup depth to indicate comparable drawing qualities.

SHEET-METAL WORKING

Press Squeezing. The Squeezing Group of Press Operations, E. V. Crane. Metal Stampings, vol. 3 no. 3, Mar. 1930, pp. 221-226 and 248, 4 figs. Discussion of volume changes, flow in metals and pressures involved in squeezing operations.

SNOW REMOVAL

Equipment. International Competition in Snow Removal Equipment (Le concours international d'appareils chasse-neige), J. Thomas. Génie Civil (Paris), vol. 96, no. 2484, Mar. 22, 1930, pp. 277-282, 9 figs. Report on competition held by Touring Club of France, during February 1930; performance of snow plows of various types manufactured by French, Norwegian, and other firms, including rotary plows; use of steam shovels for snow removal.

STEAM

Condensation. Temperature Distribution and Turbulence in Condensation of Superheated Steam in Pipes (Temperaturverteilung und Turbulenz beim Kondensieren von Heissdampf in einem Rohr), M. Jakob, S. Erk, and H. Eck. V.D.I. Zeit. (Berlin), vol. 74, no. 7, Feb. 15, 1930, p. 208. Results of recent experiments, discussed in Technische Mechanik und Thermodynamik, vol. 1, 1930, p. 46, by which it was shown that temperature drop in axis of test pipe decreased when wall cooling was increased have been verified; importance of results of heat-transfer measurements as contribution to turbulence problem, is pointed out.

Superheaten. Steam Properties (Propriété de la vapeur d'eau), R. Martin. Chaleur et Industrie (Paris), vol. 10, no. 116, Dec. 1929, pp. 605-614, 3 figs. Communication of Central Bureau of Rational Heating, France, on specific heat and steaming-up heat in superheated steam for pressures from 1 to 120 kg. at saturation temperature of 550 deg. cent.; curves and tables are given.

STEAM CONDENSERS

Tubes. Modern Aspects of Condenser-Tube Problem (Die neuere Entwicklung der Kondensatorrohrfrage), S. Hirsch. Schiffbau (Berlin), vol. 30, no. 24, Dec. 18, 1929, pp. 596-597, including discussion. Improved methods adopted in Germany for manufacture of brass tubes, particularly hot press method, allowed German manufacturers more rapidly to start upon successful manufacture of nickel tubes when economic conditions had adjusted themselves; nevertheless metallurgical differences between brass and nickel alloy have required considerable research; it is felt the problem of condenser-tube corrosion is now largely solved. Abstract of paper read before Schiffbautechnische Gesellschaft.

STEAM-ELECTRIC POWER PLANTS

New York City. Hell Gate Station Design, W. E. Caldwell. Elec. World, vol. 95, no. 9, Mar. 1, 1930, pp. 444-446, 1 fig. Problems encountered in adding generating capacity to power station are discussed; original design was for comparatively low steam pressure and comparatively small generating units; latest additions involved very large and economical generating units; principles involved in Hell Gate additions are applicable to large and small stations. (To be continued.)

Pittsburgh, Pa. The James H. Reed Station Will Help Duquesne Light Co. serve Pittsburgh District. Power Plant Eng., vol. 34, no. 7, Apr. 1, 1930, pp. 366-373, 14 figs. Description of first unit of station which will have ultimate capacity of 240,000 kw.; 60,000 kw. turbo-generator, and three 31-795-sq. ft., 400 lb. boilers have been installed; flow diagram is given of station; plan of station showing ultimate capacity of four 60,000 kw. units; coal handling and storage; auxiliary wiring scheme is decided advance in power-station design; station auxiliary power supply; building design.

STEAM POWER PLANTS

Economic Pressure. Most Economic Steam Pressure (Der wirtschaftlichste Dampfdruck), P. Gilli. Archiv fuer Waermewirtschaft (Berlin), vol. 11, no. 2, Feb. 1930, pp. 39-45, 14 figs. Discussion as to whether 22, 37 or 100 atmos. is most economic, and whether high pressure should be employed only with back pressure; increase in fuel economy with increase in pressure with regard to live steam temperature, intermediate superheating, machinery efficiency, and size of plant.

Heating and Power. Power from Process and Space Heating Steam, L. A. Harding, Power Plant Eng., vol. 34, no. 7, Apr. 1, 1930, pp. 386-388, 4 figs. Heating water for process work by means of condensing bleeder turbine offers advantages in many plants; multi-stage turbine operation; chart shows operation for all conditions; two-stage water heaters.

High-Pressure, Germany. Development and Prospects of High-Pressure Steam Installations in Germany (Entwicklung und Aussichten der Hochdruckdampfanlagen in Deutschland), X. Mayer. Elektrizitaetswirtschaft (Berlin), vol. 29, no. 502, Feb. 2, 1930, pp. 90-92, 1 fig. Review of high-pressure steam development in Germany since 1922; heating surface and heating surface loads for boilers from 30 to 120 atmos. pressure, are tabulated; heat-economy developments in Germany, United States, and British power plants since 1913, shown in curves.

Industrial, Paper, and Pulp Mills. Crocker, Burbank Station—An Outstanding Example of Balanced Design, P. W. Swain. Power, vol. 71, no. 12, Mar. 25, 1930, pp. 460-464, 10 figs. Three paper mills in Fitchburg, Mass., pool supply of steam and by-product power in single ultra-modern plant; pressure drop from 400 lbs. to 35 lbs. in efficient units, with outlet for all excess by-product power generated, insures effective utilization of fuel energy; illustrated description of equipment and operation; list of principal equipment.

STEAM TURBINES

Back-Pressure. Governing the Operation of Back-Pressure Turbines, R. G. Standerwick. Power, vol. 71, no. 11, Mar. 18, 1930, pp. 431-433, 4 figs. Exhaust or bled steam used for process work is generally required at constant pressure; regulation of this pressure is made automatic by turbine controls; diagram illustrating back-pressure and centrifugal governor.

STEEL

Manufacture, Duplex Process. Practice in Making Duplex Steel, J. E. Carlin. Iron Age, vol. 125, no. 13, Mar. 27, 1930, pp. 925-927. Duplex steel practice is carried out usually in tilting Talbot furnace of 100 to 300 tons capacity; certain refinements have been developed recently and process is now capable of producing steel of any carbon content of quality which rivals that of regular basic open-hearth process; characteristics of slag; proportioning charge.

Metallography. A Heuristic Theory of the Structure of Steel, L. Cammen. Am. Soc. Steel Treating—Trans., vol. 17, no. 4, Apr. 1930, pp. 563-569. According to new theory steel consists, not of aggregation of crystals with amorphous cement in between, but of matrix of extremely fine crystalline matter (so fine that even most powerful microscope does not disclose its structure), in which are embedded now visible crystals of same presumable composition as matrix: theory is said to explain why, at room temperature, steel breaks through crystals and not through cement.

TEMPERATURE EFFECT. Creep of Steel Under Simple and Compound Stresses, R. W. Bailey. Engineering (Lond.), vol. 129, nos. 3345 and 3347, Feb. 21, 1930, pp. 265-266, and Mar. 7, pp. 327-329, 15 figs. Two series of tests are recorded; one was made upon steel tubes strained separately at same temperature by tension and torsion producing equal maximum shear stress; other was made upon lead pipes under internal pressure with superimposed axial loading. Paper read before World Power Conference, Tokio.

TESTING. Endurance Properties of Steel in Steam, T. A. Fuller. Am. Inst. of Min. and Met. Engrs.—Tech. Pub., no. 294, for mtg. Feb. 1930, 13 pp., 15 figs. Description of preliminary experiments; investigation outlined to determine combined effects of steam and temperature; work reported deals chiefly with nickel steel, with one series of tests including nitrided steel; endurance limit of nickel steel is lower in steam than in air at room temperature; endurance limit of 65,000 lbs. per sq. in. was obtained with specimens of nitrided steel.

TOOL. *See Tool Steel.*

STONE QUARRIES AND QUARRYING

QUEBEC. Stone Quarries in Quebec, R. H. Pitcher. Quarry and Surveyors' and Contractors' Jl. (Lond.), vol. 35, no. 396, Feb. 1930, pp. 55-58. Brief account of 29 stone-quarrying operations in Quebec.

STREET LIGHTING

CENTRAL STATIONS. Promotion of Street and Highway Lighting by Central Stations, W. T. Blackwell and H. W. Hardy. Illum. Eng. Soc.—Trans., vol. 25, no. 2, Feb. 1930, pp. 123-141, 1 fig. Policy of one large utility is stated and manner in which plans for financing, installing and operating such systems are prepared and placed in practice is explained; two quite different plans are presented and advantages of each compared; rapid increase in growth of street lighting in communities served by this utility proves success of its policies.

STRUCTURAL STEEL WELDING

CODES. Structural Welding Code Data Applying to the United States. Am. Welding Soc.—Jl., vol. 9, no. 1, Jan. 1930, pp. 65-72. Report of Committee on Building Codes of Society covering cities adopting American Welding Society Code for Fusion Welding and Gas Cutting in Building Construction, and uniform building Code of Pacific Coast Building Officials Conference, cities and towns not having provisions for welding in their Building Codes, and cities revising such codes.

STRUCTURAL STEEL WELDING

ADVANTAGES OF. Strengthening Bridges and Structures by Welding, A. G. Leake. Am. Welding Soc.—Jl., vol. 9, no. 2, Feb. 1930, pp. 18-25, 7 figs. Advantages of welding over riveting for steel structures; replacing stiffener angle which has corroded or web of girder which has deteriorated with balance of girder in perfect condition by arc welding in railway and highway bridges. Paper presented at joint meeting of Am. Welding Soc. and Am. Soc. Civil Engrs.

SUBWAY CONSTRUCTION

LONDON. London Subway Reconstruction. Tramway and Ry. World, (Lond.), vol. 67, no. 8, Feb. 13, 1930, pp. 69-72, 10 figs. Illustrated description of subway reconstruction in which minimum height of 16 ft. 6 in. is to be obtained so as to admit double-deck cars; estimated cost of reconstruction $1,630,000.

SUPERHEATERS

HIGH-TEMPERATURE. Superheater for High Steam Temperatures (Ueberhitzer fuer hohe Dampftemperaturen), F. Muenzinger. Waerme und Kaelte Technik (Muehlhause), vol. 32, nos. 3 and 4, Feb. 15, 1930, pp. 6-10 and Feb. 28, pp. 1-4, 16 figs. It is shown by new method that superheater pipes of SM-steel, even with steam that is clean and free from air, is exposed to strong internal corrosion as soon as steam temperature greatly exceeds 500 deg.; Conclusions are summarized.

SWIMMING POOLS, INDOOR

HAMILTON, ONT. Municipal Swimming Pool at Hamilton, E. H. Darling. Can. Engr. (Toronto), vol. 58, no. 10, Mar. 11, 1930, pp. 311-315, 10 figs. Report on 100,000 gal. exhibition pool constructed for British Empire Games; length 75 ft., width 45 ft., and depth ranging from 3 ft. to 10 ft. 6 in.; pool is equipped with purification plant, heating system, laundry, sanitary conveniences, showers, etc.; underwater illumination; details of gutter; hot air heating system.

T

TESTING MACHINES

FATIGUE. Fatigue Testing Machines (Maschinen fuer Dauerversuche), W. Deutsch. Zeit. fyer Metallkunde (Berlin), vol. 22, no. 2, Feb. 1930, pp. 56-61, 21 figs. Description of various machines for prolonged testing of materials; tension-compression, bending-vibration, and torsional-vibration machines; special machines.

TOOL STEEL

QUENCHING. On the Cause of Quenching Deformation in Tool Steel, D. Hattori. Tohoku Imperial Univ.—Sci. Reports, vol. 18, no. 5, Dec. 1929, pp. 665-698, 34 figs. Results of expriments on deformation produced by quenching prisms and cylinders of various lengths or sections, made of carbon steel, special tool steel, or high-speed steel; cause of this deformation is discussed, comparing it with that of Armco iron; warping is also caused by quenching; deformation and warping are produced by difference of structural change and of thermal expansion at different portions of specimens. (In English.)

Some Notes on the Behaviour of Carbon Tool Steel on Quenching, G. V. Luerssen. Am. Soc. for Steel Treating—Trans., vol. 17, no. 2, Feb. 1930, pp. 161-192 and (discussion), 192-198, 2 figs. Paper is plea for uniform carbon tool steel; emphasizes necessity of uniformity through series of illustrations showing characteristic conditions of quenching, range, and hardness penetration which may exist; convenient type of Metcalf test to determine degree to uniformity; relationship of quenching range and hardness penetration to occurence of soft spots, change of size in hardening and susceptibility to cracking; influence of these characteristics upon actual tool performance.

TRACTORS

CATERPILLAR. Design of Caterpillar Tracks (Die Bauarten der Raupenbandfahrwerke), Friedrich. Foerdertechnik und Frachtverkehr (Wittenberg), vol. 23, no. 6, Mar. 4, 1930, pp. 114-118, 13 figs. Use, application, and advantages of caterpillar drives are discussed; design and construction of parts; discussion of wheel sizes and distribution of strains and stresses in parts.

GEARS, HEAT TREATMENT OF. Case-Hardening Practice for Tractor Gears, J. F. Harper. Am. Mach., vol. 72, no. 11, Mar. 13, 1930, pp. 449-452, 5 figs. Methods employed by Allis-Chalmers Manufacturing Co., for heat-treating gears for Model U tractor units; tractor gears and spline shafts are carburized, hardened, and drawn in electrically-heated units, semi-automatic in operation and with smooth flow of work between units; furnaces operated 24 hrs. a day, 7 days a week; operations outlined.

TUBES

BRASS. Internal Stress and Season Cracking in Brass Tubes, D. K. Crampton. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 297, for mtg. Feb. 1930, 18 pp., 11 figs. Résumé of literature descriptive of investigations; correlation between mercurous nitrate tests and actual season cracking on long-time atmospheric exposure; quantitative effect of type and degree of drawing operations on intensity of internal stress and on tendency to season crack in brass tubes; possibility of drawing high-brass tubes so as to prevent occurrence of harmful stresses. Bibliography.

NON-FERROUS, EXTRUSION OF. The Extrusion Process in the Metal Industry, E. Pfann. Metal Industry (Lond.), vol. 36, no. 3, Jan. 17, 1930, pp. 97-99, 4 figs. Technique of extrusion process and machinery now in use are dealt with; modern conditions and requirements; speed control; extrusion processes being applied to production of articles which were previously rolled and several advantages over rolled process.

TUNNELS

CONSTRUCTION, INDIA. A Practical Note on Tunnelling in Shale and Limestone, R. O. C. Thomson. Government of India—Tech. Paper (Calcutta), no. 274, 1929, 23 pp., 14 figs. General discussion of principles of tunnel construction with special reference to Indian conditions.

TUNNELS, RAILROAD

ENGLISH CHANNEL. The Channel Tunnel. Engineering (Lond.), vol. 129, no. 3349, Mar. 21, 1930, pp. 381-382; see also editorial comment in Engineer (Lond.), vol. 149, no. 3871, Mar. 21, 1930, p. 327. Editorial comment on latest report; economics of tunnel project turn largely upon passenger traffic; engineering features have settled down to approximate form which may be accepted, if further geological examination reveals no unfavourable features; serious feature of project is that traffic would ten to concentrate at tunnel; it would become uneconomical to maintain boats, which would pass out of existence; and great sums expended on harbour facilities and vessels would be lost.

MOFFAT. Completion of Moffat Tunnel of Colorado, C. A. Betts. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 4, part 1, Apr. 1930, pp. 679-716, 12 figs. History and description of methods of construction of railroad tunnel 6.2 mi. long; details of survey methods used over range that rises to 12,000 ft. above sea level and 28,000 ft. above tunnel; plans and equipment of construction camps; tunneling in soft ground for 2½ mi.; use of "Lewis Travelling Cantilever Girder"; ventilation tests for correlation of data on air-friction factors for tunnels of mining size and on factors for standard railroad tunnels; itemized cost data.

TUNNELS, VEHICULAR

HUDSON RIVER. Plan Second Highway Tunnel Under Hudson River. Eng. News Rec., vol. 104, no. 11, Mar. 13, 1930, pp. 454-456, 5 figs. General information and cost estimate for proposed vehicular tunnel near 38th St., New York City, which would be prolongation of cross-town tunnel from Borough of Queens; second Hudson River vehicular tunnel is estimated to cost from $77,000,000 to $95,000,000; expected cross river traffic.

V

VIADUCTS

CONCRETE ARCH. Designing the Hyperion Viaduct at Los Angeles, M. Butler and A. L. Enger. Eng. News-Rec., vol. 104, no. 12, Mar. 20, 1930, pp. 476-478, 7 figs. $1,600,000 continuous concrete arch structure, with spans up to 135 ft. in width, solves difficult traffic problem; stress calculations checked by Beggs machine; two design methods compared.

W

WATER DISTRIBUTION SYSTEMS

PIPE FOR. Choosing Types of Pipe for Iowa Distribution Systems, H. F. Blomquist. Water Works Eng., vol. 83, no. 3, Jan. 29, 1930, p. 176. Comparative discussion of materials for distribution-system pipe of water works. Paper presented before Water Works Conference. Indexed in Engineering Index, 1929, from Can. Engrs., Nov. 26, 1929.

WATER DISTRICTS

PORTLAND, MAINE. History of the Organization of the Portland Water District, D. E. Moulton. New England Water Works Assn.—Jl., vol. 43, no. 4, Dec. 1929, pp. 359-363. Political and financial history of Portland Water District, Portland, Maine, since 1866.

WATER FILTERS

RAPID SAND. The Rapid Sand Filter Bed, J. R. Baylis. Water Works and Sewerage, vol. 77, no. 1, Jan. 1930, pp. 7-10, 2 figs. Chemical treatment and rapid sand filtration; sand beds for rapid sand plants; voids; flocculated matter; filtration by straining and lodgment of particles; loss of head for ¾ in. filter near end of run.

WATER FILTRATION

PRETREATMENT. Preliminary Purification Processes of Polluted Water, L. L. Jenne. Am. Soc. Mun. Improvements—Proc., vol. 35, 1929-1930, pp. 293-312, 3 figs. Comparison of monthly results obtained over period of three years at four Philadelphia filter plants; improvement in turbidity and bacterial content effected by long-time sedimentation as compared with short sedimentation and filtration in either slow or rapid-sand filters. Article indexed in Engineering Index, 1929, from Pub. Works, Dec. 1929.

WATER FILTRATION PLANTS

OTTAWA. Ottawa's Water Purification Problems, W. Gore. Contract Rec. (Toronto), vol. 44, no. 12, Mar. 19, 1930, pp. 343-345, 5 figs. Features of filtration plant and trial filters established for investigation of satisfactory methods of purification for highly coloured Ottawa River water. Paper read before Am. Water Works Assn.

NIAGARA FALLS. Some Unusual Features in the Design of the New Water Filtration Plant at Niagara Falls, F. A. Dallyn. Am. Water Works Assn.—Jl., vol. 22, no. 3, Mar. 1930, pp. 362-365. Proposed filtration plant described is designed primarily for ease in operation; construction will be aided by use of crane to handle control parts and pipes; provision is made for testing different units while in use without interrupting service. Indexed in Engineering Index, 1929, from Contract Rec., Aug. 21, 1929.

WATER METERS

SPECIFICATIONS. Meters, Water (Cold and Hot), Positive Displacement Type for Shipboard Use. U. S. Navy Dept. Specifications, no. 45M2, Dec. 2, 1929, 5 pp. General specifications covering types and classes, material and workmanship, general and detail requirements, method of inspection, tests, packing and marking. Bibliography.

WATER PIPE LINES

CROSS CONNECTIONS. Safeguarding and Eliminating Cross Connections in New York State, C. A. Holmquist and E. Devendorf. Am. Water Works Assn.—Jl., vol. 22, no. 1, Jan. 1930, pp. 103-109. Summary of resolutions adopted by various water-works organization; use of chlorinators as remedial measure.

WATER HAMMER. Oscillations of Pressure in Pipe-Lines during Closure, E. Parry. Instn. Civ. Engrs.—Selected Eng. Papers (Lond.), no. 74, 1929, 18 pp., 7 figs. Theoretical mathematical study by analytic and graphical methods; character and extent of variations produced by combination of elastic and inertia forces; neglect of elastic forces is seldom justified in dealing with comparatively rapid closures; compressibility of water and elasticity of pipe casing; closure by rhythmic steps; closure by uniformly increasing or uniformly decreasing retardations; closure by harmonic retardation; comparison of five different modes of closure.

WATER POWER

CANADA. Water Power Resources of Canada, N. Marr. Eng. Jl. (Montreal), vol. 13, no. 2, Feb. 1930, pp. 75-89, 10 figs. Survey of available and developed water power; outline of development 1900 to 1930; capital invested in water power; coal equivalent of developed water power; total turbine installation by provinces; 7 of transmission systems in provinces of Canada; water power in mineral industries and in pulp and paper industry; water powers available for future development.

WATER SOFTENING

ZEOLITE PROCESS. Trends in Municipal Zeolite Water Softening, W. J. Hughes and H. B. Crane. Am. Water Works Assn.—Jl., vol. 22, no. 1, Jan. 1930, pp. 68-81, 5 figs. Discussion of tendencies; utilization of greater operating economy made possible by more recent zeolites of increased power; use of plant construction which in filter practice has proven its suitability; cost data; estimated cost of three types of softening plant for 10 m.g.d. of 51 p.p.m. effluent; effect of by-passing zeolite softening plant; example of modern installation for Mangum, Okla.

Engineering Studies of Municipal Zeolite Water Softening, H. N. Jenks. Am. Water Works Assn.—Jl., vol. 22, no. 3, Mar. 1930, pp. 342-351 and (discussion) 351-356, 4 figs. Results of preliminary studies made on practical-scale softening apparatus in sanitary engineering laboratory of Iowa State College; restrictions in use of zeolite; program of investigation relating to engineering aspects of municipal zeolite water softening; water-softening capacity studies; regeneration and wash-water studies; underdrain distribution system.

WATER TOWERS

FAILURES. Ice Formed on Outside of Tank Causes Its Collapse, A. H. Fretter. Water Works Eng., vol. 83, no. 5, Feb. 26, 1930, p. 298, 2 figs. Description of failure of 40,000-gal. tank at Medina, Ohio; unequal stresses set up by mass of ice on one side of tank blamed for accident; tree sheared by roof of water tank.

WATER TREATMENT

AERATION. Some Uses of Aeration in Water Purification, M. Pirnie. New England Water Works Assn.—Jl., vol. 43, no. 44, Dec. 1929, pp. 395-398. Report on operation experiences and experimental tests; West Palm Beach, Fla.; Providence, R.I.; Watertown, N.Y., and Danville, Va.

BARIUM ALUMINATE. Barium Aluminate and Its Use in Water Purification (L'aluminate de baryum et son emploi dans l'épuration des eaux), R. Stumper. Chimie et Industrie (Paris), vol. 22, no. 6, Dec. 1929, pp. 1067-1083, 25 figs. Use of barium compounds and of aluminum salts is familiar in water treatment; combination of two reagents as barium aluminate, which would also precipitate calcium and magnesium, therefore, appears attractive; in general precipitation is more complete than with single salts, barium carbonate first formed reacting again with calcium sulphate.

COAGULANTS. Ferric Alumina, A. R. Moberg and E. M. Partridge. Indus. and Eng. Chem., vol. 22, no. 2, Feb. 1930, pp. 163-164. Modern development in field of coagulation; development of new coagulant; nature and properties and results accomplished with ferric alumina.

DECOLORIZATION. Colour Reduction in Storage Reservoirs, C. M. Saville. New England Water Works Assn.—Jl., vol. 43, no. 4, Dec. 1929, pp. 416-442 and (discussion) p. 443, 4 figs. Additional data to previous publication on subject by same author; curves showing relation between colour, rainfall and depletion at Nepaug Reservoir, 1917-1928, and at reservoirs no. 2 and no. 6, 1915-1929; abstracts from reports of F. P. Stearns in connection with water-supply problems of Hartford, Conn.; average and maximum colours of surface water at Wachusett and Sudbury, dams.

TASTE REMOVAL. The Prevention of Chloro-Phenol Tastes in New York State, C. R. Cox. Am. Water Works Assn.—Jl., vol. 21, no. 12, Dec. 1929, pp. 1693-1704. Assistant Engineer of State Department of Health reviews method of removal or destruction of phenolic compounds introduced into streams or lakes with wastes from by-product coke ovens; practice of water works of Buffalo, Rensselaer and Waterloo; superchlorination; ammonia treatment; potassium-permanganate treatment.

WATER WAY TRANSPORTATION

MOTORSHIP. Motorshipping Its Own Map Maker, A. C. Hardy. Motorship, vol. 15, no. 1, Jan. 1930, pp. 21-23, 3 figs. Discussion of how motorship has usurped many trade routes and why it has altered shape of others.

WATER WELLS

POLLUTION. Pollution of Abandoned Well Causes Fond du Lac Typhoid Epidemic. Eng. News-Rec., vol. 104, no. 10, Mar. 6, 1930, pp. 410-411, 2 figs. River relocation allowed sewage and tannery waste to enter old well and pass underground to city wells.

WATERWAYS

ST. LAWRENCE RIVER. Report on the St. Lawrence Waterway Project, H. Holgate and J. A. Jamieson, Southam Press, Montreal, Ltd., 46 pp., 1929. Full text of report to Montreal Board of Trade on economic advantages of proposed St. Lawrence Deep Waterway both from navigation and power viewpoint; international aspects of problem; authors conclude that proposed St. Lawrence Deep Waterway, Lake Ontario to Montreal is unnecessary unceconomic project.

WATER WORKS

CEDAR RAPIDS, IA. The New Water Works of Cedar Rapids, Ia., H. T. Rudgal. Water Works and Sewerage, vol. 77, no. 1, Jan. 1930, pp. 1-4, 7 figs. Construction features of combined pumping station and 12 m.g.d. water softening and filtration plant; layout of construction plant; architectural treatment of building.

CORROSION. Some Water Works Corrosion Problems, I. D. Van Giesen. Am. Water Works Assn.—Jl., vol. 22, no. 1, Jan. 1930, pp. 36-48, 11 figs. Outline of processes of electrolytic, graphic and mutual corrosion, with special reference to corrosion of open tanks and water pipes; features of preventive methods, Indexed in Engineering Index, 1929, from Water Works Eng., Dec. 4, 1929.

WINDSOR, ONT. Windsor and District Water Supply, J. C. Keith. Can. Engr. (Toronto), vol. 58, no. 10, Mar. 1930, pp. 325-327. Excerpts from report on adequate water supply for Windsor, Ont.; problem of filtration; plant extension recommended at cost of $554,000; metering is reducing consumption.

HAMILTON, ONT. Water Supply for City of Hamilton, A. E. Berry. Can. Engr. (Toronto), vol. 58, no. 10, Mar. 11, 1930, pp. 317-318. Report recommends installation of mechanical filtration plant; and program for sewage disposal to decrease contamination in bay.

CANADA. Water Works Statistics. Can. Engr. (Toronto), vol. 58, no. 11, Mar. 18, 1930, pp. 139-170. Supply, pumps, purification, distribution, services, mains, meter rates, names of officials and other reference data on 100 Canadian water works arranged in alphabetical order.

ONTARIO. Water Supply System at North Bay, Ont., W. B. Redfern. Can. Engr. (Toronto), vol. 58, no. 11, Mar. 18, 1930, pp. 116-118 and 130A-130C, 7 figs. Description of new water works for city having population of 16,500; water pumped from Trout Lake to new reservoir; new pump house and concrete reservoir constructed; water mains laid and new pumping plant installed; floor plan of pump house. Paper presented before Am. Water Works Assn.

WEIGHTS AND MEASURES

CONVERSION. The Conversion of Combined Metric Units into British Units. Engineering (Lond.), vol. 129, no. 3338, Jan. 3, 1930, p. 20. Reference is made to article by E. Klapper published in Oct. 18, 1929, issue of this journal, covering table of factors for converting quantities expressed in combined metric units into corresponding quantities expressed in British or American units; as table contained number of errors, it is reprinted in full with certain additions; every care has been taken in checking this table as it now appears, and it is believed to be entirely reliable.

WEIRS, STONEY GATE

SPAIN. Open-Weir Dam in Ebro River (Una presa de compuertas en el Ebro), J. L. Grasset. Ingenieria y Construccion (Madrid), vol. 7, no. 84, Dec. 1929, pp. 621-627, 17 figs. Description of hydro-electric development of Sociedad Salto del Cortijo; 8 km. bend in Ebro river gives fall of 12 m.; derivation tunnel 1,100 m. long from dam to power house; details are given of construction of dam 13.5 m. high, with 7 Stoney gates; supporting piers 3 m. wide, spaced at 18 m. centre to centre; metallic caissons used in placing of concrete foundations.

WELDING

BEST PRACTICES. Best Practices for Welding the Different Metals, O. Trentham. Soc. Automotive Engrs., vol. 27, no. 2, Feb. 1930, p. 257. Preheating gray-iron castings before welding; welding of cast iron also employed for reclaiming defective castings in foundry by filling in cold shuts and blowholes; bronze-welding practice; welding non-ferrous metals described. Abstract.

PROGRESS IN. Extend Applications of Both Welding and Riveting. Iron Trade Rev., vol. 86, no. 1, Jan. 2, 1930, pp. 26-27 and 121, 3 figs. Progress in welding and riveting during 1929 is discussed by various executives.

ELECTRIC WELDING MACHINES. Results of Research in Theory of Arc Welding Machines, A. F. Davis. Am. Welding Soc.—Jl., vol. 9, no. 1, 1930, pp. 62-64, 2 figs. Methods of reducing opening circuit voltage of arc-welding machine to varying voltage demanded by arc; experiments have shown possibility of inseting in arc circuit a device which will produce effects similar to those produced in machine by transformer action of double winding on pole pieces, except that effect will be in opposite direction thus nullifying original transformer action.

GERMANY. Welding. Metallurgist (Supp. to Engineer, Lond.), Feb. 1930, pp. 18-19. Review of group of papers on technology of welding occupying whole of V.D.I. Zeit. for Dec. 7, 1929; contents throw interesting light on position attained by welding in Germany; authors do not entirely agree in their views, while all of them still adopt tone of propagandist, who has to convince those who are at lest still skeptical; it is quite clear that immense development in welding has taken place and that rapid progress is being made.

PRESSURE VESSELS. *See Pressure Vessels.*

WELDS

HEAT TREATMENT. A Contribution to the Study of Influence of Welding Conditions and Subsequent Heat Treatment on the Structure of the Weld, K. Kuetter and V. N. Krivobok. Am. Welding Soc.—Jl., vol. 8, no. 10, Dec. 1929, pp. 40-62, 19 figs. Report presented to Fundamental Research Committee of American Bureau of Welding is given; in study of resistance welds of low-carbon wire, recrystallization experiments show that gas absorption is much less than in electric arc process and probably less than in oxyacetylene welding. Study of metallurgical literature of welding processes given.

TESTING. Examining Arc Welds for Quality, G. C. Ward. Iron Age, vol. 125, Jan. 30, 1930, pp. 369-370, 1 fig. Various methods of inspecting finished welds are discussed; kerosene penetration indicates soundness only; quality of tone cannot distinguish good from fair welds, nor can visual inspection; correct procedure control is indispensable; inspection during welding is necessary.

Testing Welds with Stethoscope. Oxy-Acetylene Tips, vol. 8, no. 6, Jan. 1930, pp. 127-128, 1 fig. Description of new non-destructive method of testing welds which provides effective means for checking quality of welded products; application of stethoscope is development of familiar method of testing soundness of metal part by ring when struck with hammer or sledge.

WIND TUNNELS

FRANCE. The Electrodynamic Balance of the Small Wind Tunnel of the French Service of Aeronautical Research, P. Rebuffet. Nat. Advisory Committee for Aeronautics—Tech. Memo. no. 556, Mar. 1930, 10 pp., 13 figs. Principle of Villey's electrodynamometers is explained; principal difficulties met in installation of these electrodynamometers in small wind tunnel of French service of Aeronautical Research are described covering mechanical, electrical, and thermal, problems; precision of 0.002 to 0.003 of maximum force measured can be obtained. Read before Société de Navigation Aérienne, June 5, 1929.

WIRE ROPE

TESTING. Breaking Strength of Wire Rope Subjected to Bending (Ueber Bruchbiegezahlen von Drahtseilen), L. Klein. Foerdertechnik und Frachtverkehr (Wittenberg), vol. 23, no. 1, Jan. 3, 1930, pp. 1-6, 15 figs. Discussion of tests made by English Wire Rope Committee to determine breaking strength of wire rope subjected to bending; causes for breaks are investigated and proven to be mainly from rearrangement of strands in radial direction on entering groove in sheave.

Tensile and Bending Tests of Wire Rope (Pruefung von Seildraehten durch Zug und Biegeversuche), G. Sachs and H. Sieglerschmidt. Mitteilungen der deutschen Materialpruefungsanstalten (Berlin), no. 10, 1930, pp. 68-78, 30 figs. Composition is given of materials used in tests which include electrolytic copper, bronze, aluminum, electron, electrolytic iron, and steels of different composition; influence of tensile stress, and of strength of wire.

WOOD DISTILLATION

ENGLISH HARDWOOD. Oils from English Hardwood Tar, M. Schofield. Indus. and Eng. Chem., vol. 22, no. 1, Jan. 1930, pp. 63-64. Total yield of oils from tar; phenolic constituents of oils; fractional distillation of tar; colour and odour of fractions. Bibliography. Indexed in Engineering Index, 1929, from Indus. Chemist, Apr. 1929.

WOOD PRESERVATION

CREOSOTING. Comparative Efficiencies of the Components of Creosote Oil as Preservatives for Timber, F. H. Rhodes and F. T. Gardner. Indus. and Eng. Chem., vol. 22, no. 2, Feb. 1930, pp. 167-171, 5 figs. New method for determination of fungicidal powers of preservatives for timber is described; fungicidal powers of various fractions from dead oil, tar acids, and tar bases from creosote oil, and of some of pure components of creosote oil were measured; vapour pressures of various fractions and mixtures of fractions of creosote oil were measured; percentages of certain hydrocarbons in fractions from coal-tar croesote oil were determined. Bibliography.

GREAT BRITAIN. British Wood Preserving Association. Elecn. (Lond.), vol. 104, no. 2696, Jan. 31, 1930, p. 139. Co-operation for study of problems; encouragement of use of home-grown timber; need of fundamental research; improved methods required.

X

X-RAY ANALYSIS

MATERIALS TESTING. X-Ray Densograms in Materials Testing (Roentgendensogramme in der Werkstoffpruefung), M. v. Schwarz. Giesserei (Duesseldorf), vol. 17, no. 2, Jan. 10, 1930, pp. 37-39, 8 figs. Notes on use of densograms for evaluation of X-ray photographs in materials analysis; operation of densograph; examples are given showing application of densograms.

VEIN ENGINEERING. X-Rays in Engineering, V. E. Pullin. Engineer (Lond.), vol. 149, no. 3867, Feb. 1930, pp. 204-207, 12 figs. Author's purpose is to explain possibilities of radiography, defining its limits from engineering point of view and to describe roughly apparatus and its use and methods of engineering radiologist.

Z

ZINC ORE ROASTING

EQUIPMENT CORROSION. The Corrosion of Rabbles in Zinc Concentrate Roasting Furnaces, N. Greenwood, and A. J. Roennfeldt. Australasian Inst. of Min. and Met.—Proc., (Melbourne), no. 75, pp. 99-120, 18 figs. partly on supp. plates. Description of experimental work on Barrier roasting furnaces at Port Pirie, South Australia; it was found that, as structural material for rabbles, alloys high in chromium, but containing no nickel, are superior to chrome-nickel, as corrosion is much less under operating conditions at that plant; tabular analysis of alloy and data on corrosion tests. Full text of paper indexed in Engineering Index 1929, from abstract in Eng. and Min. Jl., Nov. 30, 1929.

ZINC ORE TREATMENT

ELECTROLYTIC. Development of Zinc Electrolysis (Die Entwicklung der Zinkelektrolyse), G. Eger. Zeit. des Oberschlesischen Berg- u. Huettenmaennischen Vereins zu Katowice (Katowice), vol. 68, no. 11, Nov. 1929, pp. 580-587, 1 fig. Historical review and description of experiments, present practice; chloride and zinc-sulphate electrolysis; latest development of zinc-sulphate electrolysis; description of Tainton's process.

ZINC ROLLING MILLS

PRESSURE AND POWER. Rolling Pressure and Power Requirements of a Zinc Rolling Mill (Ueber Walzdruck und Energiebedarf an einem Zinkwalzwerk), G. B. Lobkowitz. Zeit. fuer Metallkunde (Berlin), vol. 22, no. 1, Jan. 1930, pp. 8-13, 9 figs. Results of measurements are given; it is claimed that treatment of zinc is of special interest, as its properties and preparation are to great extent unsolved problems.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostat copies (white printing on a black background) of the articles listed in this section or others on engineering subjects can be obtained from the Engineering Societies Library at a cost of 25c. per page.

When ordering identify the article by giving: the author; the title of the article; the name of the periodical in which it appeared; and the volume and page numbers. A remittance of 25c. a page should accompany the order.

The print's size is limited to 11 by 14 inches, but where possible, two pages up to 7 by 9 inches in size will be photographed on one print, larger magazines require a print per page.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

AERIAL SURVEYING

Application to Engineering Problems. Aerial Surveying as Applied to Engineering Problems, A. M. Narraway. Eng. Jl. (Montreal), vol. 13, no. 3, Mar. 1930, pp. 171-178, 10 figs. Short description of use of stereoscope; practical applications of aerial surveys; mapping; water-power engineering; transmission line location; forestry; railway and road location; geodetic surveying; other applications of aerial engineering.

AIRPLANE ENGINES

Design. Influence of Power-Plant Weight on Performance (Der Einflus des Triebwerksgewichts auf die Flugleistungen), M. Schrenk. Luftfahrtforschung (Munich), vol. 6, no. 4, Feb. 14, 1930, pp. 92-95 and (discussion) 95-96, 4 figs. In preceding article by Kamm (same issue, p. 87) development of engine is urged which is more reliable in operation, but, on the other hand necessarily heavier than most of those now used; present author, as airplane manufacturer, reports effect of such an engine on airplane performance, and suggests means and ways of overcoming disadvantages of heavy power plant.

Small Airplane Engines, N. N. Tilley. Soc. Automobile Engrs.—Jl., vol. 26, no. 3, Mar. 1930, pp. 346-351 and (discussion) 351 and 371, 12 figs. Stating that requirements of airplane power plant are light weight, low fuel and oil consumption, reliability and durability, smooth and flexible operation and compactness, author discusses briefly how these are obtained; greater proportionate weight of accessories, foundry limitations and other considerations than loads and stresses tend to make small airplane engine heavier in proportion to horse power than larger power plants, manufacturing cost being more important than maximum performance in power and weight.

Research. Thermodynamic Aspects of Aeronautical Research (Thermodynamische Aufgaben der Luftfahrtforschung), K. Loehner. Luftfahrtforschung (Munich), vol. 6, no. 4, Feb. 14, 1930, pp. 111-120, 8 figs. Thermodynamics of aircraft engines embraces phenomena occurring in gases due to special influences affecting these engines, such as heat transfer, and auxiliary equipment, such as blowers and exhaust-gas turbines; further development of aircraft Diesel is deemed desirable; results of thermotechnical measurements. Bibliography and table giving saturated-vapour temperatures of fuel mixtures and initial temperature for dry and moisture-containing air.

Vibrations. Vibrations in Airplane Power Plants (Die Schwingungen in Luftfahrzeug Triebwerkanlagen), K. Luerenkaum. Luftfahrtforschung (Munich), vol. 6, no. 4, Feb. 14, 1930, pp. 97-102 and (discussion) 109-110, 9 figs. Oscillations and dynamic stresses which are source of hazard to airplane power plant are studied, but without aid of numerical data, and with special reference to torsional vibrations, which are probably main cause of failures; means of reducing hazard of torsional vibrations are studied.

AIRPLANES

Autogiro. *See Autogiros.*

Design. Theoretical and Experimental Study of Class of Profiles with Constant Centre of Pressure (Etude théorique et expérimentale d'une class de profils à centre de poussée constant), M. Risack. Service Technique de l'Aéronautique—Bul., (Brussels), no. 9, Mar. 1930, pp. 3-22, 10 figs. Résumé of mathematical wing theory; requirements for transforming of circle into customary wing profile; curves and data on wing profiles; some polar curves of bulletin no. 7 have been revised because use of standard wing in tunnel tests has reduced errors due to suspension of air foil.

AIRPORTS

Canada. Airports Have Many Problems in Canada's Far North. Airports, vol. 4, no. 2, Feb. 1930, pp. 28-30, 4 figs. Development of civil and commercial flying has helped development of whole country; distance from manufacturing centres demands elaborate repair shops at airports; describes hangars of Ontario Government Service at Sault Ste. Marie; buildings are constructed over steel girders and uprights with concrete floors and ceilings; describes airport at Pointe-aux-Trembles, constructed of reinforced concrete.

Montreal, Que. Building an Airport at St. Hubert, Que. Canadian Engr. (Toronto), vol. 58, no. 15, Apr. 15, 1930, pp. 489-491, 5 figs. Report on construction of modern airport near Montreal, to serve all types of aircraft, including mooring tower for large British dirigible; 3 runways built of bituminous macadam using Colas emulsified asphalt, are 150 ft. in width and from 1,800 to 2,000 ft. in length; reconditioning macadam road.

AIRSHIPS

Mooring Masts. The St. Hubert Airship Mooring Tower. Engineer (Lond.), vol. 149, no. 3872, Mar. 28, 1930, pp. 358-359, 2 figs. Canadian tower is self-contained structure, anchored to concrete footings; at base there is two-storey building, cruciform in shape, to house mooring winches, heating plant, etc.; it is octagonal structure 171 ft. high, surmounted by projecting telescopic mooring arm to which nose of airship is attached; total height of tower to top of mooring arm is 205 ft.

ALLOYS

Aluminum. *See Aluminum Alloys.*
Bearing Metals. *See Bearing Metals.*
Brass. *See Brass.*
Chromium-Nickel. *See Chromium-Nickel Alloys.*
Copper. *See Copper Alloys.*
Die-Casting. *See Brass.*
Phosphor Bronze. *See Bearing Metals.*

Properties. Thermal Properties of Different Groups of Alloys (Die thermischen Eigenschaften verschiedener Legierungsgruppen), A. Schulze. Giesserei-Zeitung (Berlin), vol. 27, no. 7, Apr. 1, 1930, pp. 177-184, 23 figs. Thermal expansion (dilatometry) and its relation to constitution of alloys is discussed and method of investigation described; relations between heat conductivity and constitution; notes on magnetic properties of alloys and X-ray analysis by which fine structure of alloys is rendered visible.

ALUMINUM ALLOYS

Heat Treatment. Aluminum Alloys Capable of Heat Treatment (Verguetbare Aluminiumlegierungen), W. Fraenkel. Zeit. fuer Metallkunde (Berlin), vol. 2, no. 3, Mar. 1930, pp. 84-89, 15 figs. An example of simple alloy, aluminum with slight copper content, and its heat treatment are discussed; phenomena observed with treatment at ordinary, elevated, and fluctuating temperature; theory of treatment is discussed; main types of important aluminum alloys and their transformation to other and to more complicated systems are described.

ARCHES, CONCRETE

Testing. Laboratory Tests of Reinforced Concrete Arch Ribs, W. M. Wilson. Univ. of Ill.—Eng. Experiment Station—Bul., vol. 7, no. 26, Feb. 25, 1930, 102 pp., 55 figs. Report on investigation with object of comparing measured stresses with stresses computed by elastic theory, both when stresses are produced by loads and when they are produced by abutment movements; specimens used were reinforced concrete, hingeless arch ribs, having span of 17 ft. 6 in. and rise of 4ft. 1/16 in.; measured and theoretical values found to agree closely.

ASPHALT

Mastic. The Principles of the Manufacture of Mastic Asphalt, A. W. Attwooll. Chem. and Industry (Lond.), vol. 49, no. 15, Apr. 11, 1930, pp. 181t-187t. Great distinction between rock and mastic asphalt is that, while in former incorporation of bitumen and mineral base has been effected by nature, in latter it takes place mostly by human agency and as is not unusual, is not nearly so thorough; author illustrates building up of mastic-asphalt specifications and shows that it is admirable material for roofing and floors of factories and buildings and for lining of tanks, ducts, and channels in many chemical engineering problems.

AUTOGIROS

Theory of. Autogiro. Flight (Lond.), vol. 22, no. 14, Apr. 4, 1930, p. 391, 3 figs. Theory of autogiros; many engines may be used; Armstrong-Siddeley "Genet" or "Cirrus III" is advocated for privately owned machines; fuselage of normal construction; autogiro tests on 3,000 mile flight without accidents.

AUTOMOBILE ENGINES

Combustion Chambers. Combustion Chamber Research, H. S. Glyde. Automobile Engr. (Lond.), vol. 20, no. 264, Feb. 1930, pp. 62-65, 13 figs. Results of experiments carried out on series of side valve turbulent heads of constant head throat area but having head clearances varying in steps of 1/16 in. from 0.022 in. to 0.272 in.; in order to investigate possibility of igniting very thin layer of combustible mixture and to obtain information with regard to detonation in small head clearances in Ricardo turbulent head.

Ignition. Coil Ignition, F. W. Lanchester. Instn. Automobile Engrs.—Proc. (Lond.), vol. 23, 1928-29, pp. 214-44 and (discussion) 245-253, 19 figs. Origin of ignition coil; theory of Ruhmikorf coil; number of turns necessary in secondary windings; design of primary condenser; discussion of question of coupling; improved method of operating induction coil; various systems of automatic advance.

AUTOMOBILES

Front-Wheel Drive. Front-Wheel Drives, P. M. Heldt. Soc. Automotive Engrs.—Jl., vol. 26, no. 3, Mar. 1930, pp. 352-360 and (discussion) 360, 8 figs. Engineering consideration leading to former almost universal practice of steering with rear wheels are reviewed, and desire for bodies lower than can be made reason for present interest in front drives.

Riding Qualities. Riding Qualities of Automobiles Determined by Rate of Vibration, J. W. Watson. Automotive Industries, vol. 62, no. 12, Mar. 22, 1930, pp. 470-472. Attainment of higher degree of comfort in cars is possible with reversal of present practice in designing suspension systems; what makes car comfortable otherwise is not that springs are weak or stiff, nor that weight supported by them is light or heavy, but rate at which rider's movement is accelerated or retarded.

AVIATION

Canada. The Northland is Proving to be the Realm of the Airplane, E. L. Chicanot. U.S. Air Services, vol. 15, no. 3, Mar. 1930, pp. 45-48, 3 figs. Review of progress; airplanes adding vast economic realm of northern extremities to Canada; vast amelioration of previous primitive life; base established at waterways; transport of fish by air; Tike transportation of furs.

B

BEAMS

Continuous. Study of Continuous Girders with Special Reference to Plasticity (Der durchlaufende Traeger unter Beruecksichtigung der Plastizitaet), J. H. Schaim. Stahlbau (Supp. to Bautechnik) (Berlin), vol. 3, no. 2, Jan. 24, 1930, pp. 13-15, 4 figs. Report on results of tests made at State Materials Testing Bureau of Berlin-Dahlem; bending, deflection and elongation of two and three span continuous beams.

BEARING METALS

PHOSPHOR-BRONZE. Modern Bearing Metals with Special Regard to Phosphor Bronze (Neure Lagermetalle, unter besonderer Beruecksichtigung von Phosphorbronze), D. Schulz. Automobiltechnische Zeit. (Berlin), vol. 33, no. 9, Mar. 31, 1930, pp. 224-225. Results of tests of Caro bronze bearing metal with 8 to 9 per cent tin content, claimed to be especially well adapted for automobile engines.

BOILERS

FURNACES, COMBUSTION IN. Admission of Combustion Air (Die Technik der Zufuehrung von Verbrennungsluft), R. Fehling. Archiv. fuer Waermewirtschaft (Berlin), vol. 11, no. 4. Apr. 1930, pp. 119-123, 5 figs. Thermal and aerodynamic conditions of combustion-air admission are discussed; nature of turbulence, its influence on combustion, and relation between air admission and heat transfer in furnace.

FURNACES, RADIATION IN. Measurement of Flame Radiation in Boiler Furnaces (Messungen der Flammenstrahlung in Dampfkesselfeurungen), P. Koessler. Zeit. des Bayerischen Revisions-Vereins (Munich), vol. 34, nos. 6 and 7, Mar. 31, 1930, pp. 75-78, and Apr. 15, pp. 95-98, 4 figs. Mar. 31: Fundamentals for calculation of radiation of gases and soot suspensions are briefly set forth, and it is shown that radiation of soot suspensions in flame greatly exceeds that of gases; description of testing equipment. Apr. 15: Tests of traveling-grate stokers.

HIGH-PRESSURE. Foreign Developments in the Use of High Pressure Steam, J. B. Crane. Combustion, vol. 1, no. 10, Apr. 1930, pp. 39-41, 8 figs. Review of development of high-pressure boilers, which has been somewhat different in Europe than in United States. Supplement of paper "Progress in the Use of High Pressure Steam" by authors, presented before Am. Soc. Mech. Engrs., Mar. 25.

PULVERIZED COAL-FIRED. General Operation Experiences with the First Wood Steam Generator, E. W. Smyth. Mech. World, (Manchester), vol. 87, no. 2252, Feb. 28, 1930, pp. 193-195 and (discussion) no. 2254, Mar. 14, 1930, pp. 242-244, 5 figs. Table of results of tests conducted during 1927; slag troubles; tube failures; arrangement of superheater, economizers and soot blowers. Abstract of paper presented before Instn. Mech. Engrs.

TUBES, STRESSES IN. The Thickness of Boiler Tubes, J. G. Docherty. Engineering (Lond.), vol. 129, no. 3354, Apr. 25, 1930, pp. 527-529, 9 figs. Author presents simple method of deducing "equivalent" or "resultant" stress in tubes of any given thickness under given conditions of heat flow and pressure, and gives minimum equivalent stress under these conditions.

BRASS

FOUNDRY PRACTICE. Casting Boiler Accessories in the Penberthy Plant, J. Breakey. Can. Foundryman (Toronto), vol. 21, no. 4. Apr. 1930, pp. 13-15, 4 figs. Methods and equipment employed by Penberthy Injector Co., Windsor, Ont., in making brass parts for steam power plants; all castings are moulded by means of two Tabor jolt-squeeze machines, patterns all being in form of match plates; core making.

SILICON, EFFECT ON. Effects of Silicon on the Properties of Brass, H. W. Gould and K. W Ray. Metals and Alloys, vol. 1, no. 10, Apr. 1930, pp. 455-457, 3 figs. Structure of brass containing silicon has been studied for two copper-zinc ratio series; silicon forms homogeneous alpha solutions with 85-15 brass if present to extent of not more than 2.8 per cent; it does not form homogeneous alpha solutions with 60-40 brass; silicon lowers freezing point of 85-15 and 60-40 brasses when present in amounts up to 10 and 7 per cent respectively; many of silicon brasses are subject to heat treatment.

BRIDGE PIERS

CONSTRUCTION. Deep Caisson Cylinders, in Clusters, Form Stilts to Support Piers of Bridge Approach. Construction Methods, vol. 12, no. 4, Apr. 1930, pp. 34-37, 13 figs. Construction of eight concrete piers for west approach of new passenger bridge of Pennsylvania Railroad across Hackensack River, near Marion, N.J.; special type of substructure employs 4-ft. corrugated shell sunk 80 ft. through core of mud and filled with concrete.

BRIDGES CONCRETE

DESIGN. Computation of Stresses in Bridge Slabs due to Wheel Loads, H. M. Westergaard. Pub. Roads, vol 11, no. 1, Mar. 1930, pp. 1-23, 21 figs. Theoretical mathematical analysis of homogeneous elastic slabs; deirvation of fundamental formulae; solution for slab loaded by concentrated force, expressed by infinite series; Nadai's solution in finite form proved; derivation of formulae for bridge floors; greatest bending moments computed for case of wheel load at centre, two wheel loads on line in direction of span; slab cantilevered from single fixed edge investigated.

BRIDGES, CONCRETE ARCH

CONSTRUCTION. Ingenious Construction on Mill Street Bridge, Watertown, N.Y., E. H. Harder. Eng. News-Rec., vol. 104, no 15, Apr. 10, 1930, pp. 603-605, 6 figs. Structural-steel ribs of 140-ft. concrete arch hung from old bridge during erection and later made hingeless to carry forms and concrete; details of steel rib and of erection and bracing schemes.

FRANCE. The 600-Ft. Concrete Arch Bridge at Brest, France, E. Freyssinet. Am. Concrete Inst.—Proc., vol. 25, 1929, pp. 83-97 and (discussion) 98-99, 10 figs. Report by designer and builder on construction of bridge, located at Plougastel, over River Elorn, which comprises three arches of reinforced concrete of 612-ft. span; arch centreing suspended from haunches; experiments of concrete contraction.

BRIDGES, PLATE GIRDER

COSTS. Unit Prices from Current Construction Bids. Eng. News-Rec., vol. 104, no. 17, Apr. 24, 1930, pp. 709-710, 2 figs. Comparison of bids on Newark Bridge of nine through girder spans, concrete viaducts and approach fills; cost of boardwalk at Jones Beach State Park, N.Y., 40 ft. wide by 3,500 ft. long; sanitary sewers at Dallas, Tex., awarded for $39,768.

BRIDGES, RAILROAD

REINFORCING. Making Old Bridges Stronger, G. A. Haggander. Ry. Age, vol. 88, no. 13, Mar. 29, 1930, pp. 756-760, 9 figs. Practical methods of reinforcing existing structures to extend their life and enable them to carry heavier loadings; strengthening floor systems. Abstract of paper present before West. Soc. Engrs.

BRIDGES, STEEL ARCH

GREAT BRITAIN. Tyne Bridge, Newcastle, D. Anderson. Instn. of Civil Engrs.—Minutes of Proc. (Lond.), vol. 22, no. 4771, 1930, pp. 3-24. Design and construction of combined bridge having two-hinge steel arch of 531-ft. span and rise of 170 ft., roadway 38 ft. wide and two sidewalks 9 ft. each; details of concrete towers; cost 693,808 pounds sterling.

SYDNEY, AUSTRALIA. The Sydney Harbour Bridge. Engineering (Lond.), vol. 129, nos. 3353 and 3354, Apr. 18, 1930, pp. 495-498, and Apr. 25, pp. 533-534, 44 figs. Apr. 18: Erection of bridge approaches was begun in July, 1923; work on bridge proper started in Jan. 1924; it is two-hinged arch with five steel spans at each end, total length of structure being 3,770 ft.; method adopted for constructing main span. Apr. 25: Actual work of erection is being effected by 122-ton creeper cranes; method of carrying out erection will be continued simultaneously from each bank; bridge being built by Dorman, Long and Co.

BRIDGES, STEEL TRUSS

WELDING. The First Arc-Welded Bridge in Europe, S. Bryla. Eng. News-Rec., vol. 104, no. 16, Apr. 17, 1930, pp. 644-645, 6 figs. Description of steel highway bridge erected for Polish government in Lowicz, Poland, 88½ ft. in span; all members built up of plates, channels and angles, using flux-covered electrodes with 180-amp. and 30-volt current; jigs used in fabricating members.

BRIDGES, SUSPENSION

PHILADELPHIA-CAMDEN. Suspension Bridges With Special Reference to the Philadelphia-Camden Bridge, U.S.A., R. Modjeski. Assn. of Chinese and Am. Engrs.—Jl. (Peiping), vol. 10, no. 4, Dec. 1929, pp. 6-21. Evolution of suspension-bridge construction; comparison of suspension bridges constructed between 1882 and 1932; principles of design of suspension bridges; foundations, towers, cable bents, cables, stiffening trusses, erection methods, tests of materials. Paper presented before World Eng. Congress in Tokyo. (In English.)

BRIDGES, WROUGHT IRON

TESTS. Strainmeter Tests of a Railway Bridge, H. R. Garth. Instn. Civil Engrs.—Selected Eng. Papers (Lond.), no. 68, 1929, 15 pp., 36 figs. on supp. plates. Report on Tests of double-track bridge of two square spans 71 ft. 6 in. between bearing-plates, having girders of wrought iron; object of tests was to find distribution of load to all parts of superstructure of each span; test-load used was an engine of "Atlantic" type; value of method of testing.

BUILDINGS

HIGH, ENGINEERING PROBLEMS OF. Engineering Problems of the Modern Skyscraper, D. P. Albert. Universal Engr., vol. 51, no. 2, Feb. 1930, pp. 17-20, 6 figs. Brief history of skyscraper development; description of design features of Chrysler Building; water pumping and elevator equipment.

BUILDINGS, STEEL

ELECTRIC WELDING. Arc-Welded Buildings Permitted in 71 Towns, F. P. McKibben. Elec. World, vol. 95, no. 14, Apr. 5, 1930, pp. 692-694, 2 figs. In last decade it has been shown that welding probably will become real factor in erection of steel-building structures; Austin Co. is now prepared to offer welding as alternative to riveting in any type of building steel erection; for welding buildings where ⅜-in. fillets are used 175 to 200 amp. with arc voltage of 18 to 20 gives satisfactory results for hand welding with 3/16-in. welding wire.

C

CANAL LOCKS

COSTS. Unit Prices From Current Construction Bids. Eng. News-Rec., vol. 104, no. 14, Apr. 3, 1930, pp. 595-596, 2 figs. Unit prices quoted in contracts for reconstructing Twin City Lock at Minneapolis, ten road projects in New Mexico (with actual prices on three jobs); grading and drainage for Mount Vernon highway.

CARS, REFRIGERATOR

MAINTENANCE AND REPAIR. Modern Refrigerator Repair Shop. Ry. Mech. Engr., vol. 104, no. 2, Feb. 1930, pp. 57-61 and 68, 10 figs. Pacific Fruit Express Co. plant at Roseville, Calif. is fully equipped and organized for efficient operation; annual production is 100,000 repaired cars; all work is organized on progressive system; shop machine tools are all electrically operated with direct motor drive.

CAST IRON

PROPERTIES. Gray Iron Possesses Valuable Engineering Properties. Foundry, vol. 58, nos. 7 and 8, Apr. 1, and May 1, 1930, pp. 111-115 and 209-212, 21 figs. Apr. 1: Effect of silicon and carbon in gray iron; tests and casting of test bars; curves showing relation of cooling time to ratio of volume to surface area; tensile strengths of various types of cast iron determined on standard test bars; tensile and transverse strength tests of cast iron in relation to ratio of volume to surface area; stress-strain diagrams for different types of cast iron; tables with data on classification of cast irons on Si plus C content; volume to surface-area relationships; routine tensile tests; various high-strength irons poured in regular practice. May 1: Effects of repeated stressing on cast iron are described; physical properties given and changes in structure discussed; reference made to J. T. MacKenzie's article in proceedings A.S.T.M. 1929.

TESTING. The Effect of Melting Conditions on the Microstructure and Mechanical Strengths of Gray Cast Irons Containing Various Amounts of Carbon and Silicon, A. L. Norbury and E. Morgan. Iron and Steel Inst.—Advance Paper (Lond.), May 1930, 20 pp., 21 figs. Part 1 contains results of experiments on effects of melting conditions, such as superheating, additions of steel, silicides, graphite, gases, and iron oxide; part 2 gives results of tensile, transverse, repeated impact, Brinell drill-hardness, and specific gravity tests on cast irons having total carbon contents between 1.5 and 4.0 per cent, and silicon contents between 0.5 and 10 per cent.

CERAMIC PRODUCTS

CANADA. Canadian Ceramic Products—Raw Materials and Finished Wares, G. M. Hutt. The Ceramic Age, vol. 15, no. 1, Jan. 1930, pp. 42-45. General discussion of deposits of ceramic materials in Canada; heavy clay products; clay products by provinces in 1928; geological survey of following: fire clays, pottery clays, bentonite, feldspar, magnesite, silica, gypsum and limestone, fuels, miscellaneous minerals and chemicals.

CHROMIUM-NICKEL ALLOYS

PROPERTIES. Nickel-Chromium Alloys, J. H. Russell. Metal Industry (Lond.), vol. 36, nos. 14 and 16, Apr. 4, 1930, pp. 377-379, and Apr. 18, pp. 429-431, and (discussion) 431-432. Outstanding features in these alloys as nickel content increases is that they become more resistant to heat; alloys become less liable to oxidation, and maintain good mechanical properties at quite high temperatures; brittle range; heat-resisting nickel-chromium alloys; wire drawing of nickel-chromium rods; production of nickel-chromium tape; castings; industrial-furnace parts. Paper read before Coordinated Societies, Mar. 10.

Some Alloys for Use at High Temperatures, W. Rosenhain and C. H. M. Jenkins. Iron and Steel Inst.—Advance Paper (Lond.), May 1930, 80 pp., 24 figs. Investigations carried out at National Physical Laboratory relates to preparation and mechanical properties of alloys of nickel containing 20 to 40 per cent chromium but certain sections include alloys containing 0 to 60 per cent chromium; development of complex alloys of especially high strength must be regarded as still in preliminary stage although considerable advance has been made.

CHROMIUM STEEL

CHROMIUM-COPPER. Chromium-Copper Structural Steels, J. A. Jones. Iron and Steel Instn. Advance Paper (Lond.), May 1930, 9 pp. Investigation of steels containing 0.3 per cent. carbon, 0.5 to 1 per cent manganese, up to 1.5 per cent chromium and up to 1.2 per cent copper; steels containing chromium in addition to manganese do not offer advantage for structural purposes over usual type of steel containing high manganese only; addition of 0.5 to 1.2 per cent of copper to steels containing up to 1 per cent of copper to steels containing up to 1 per cent of chromium leads to marked improvement in properties.

PROPERTIES. The Properties of Some Steels Containing Chromium, A. R. Page and J. H. Partridge. Iron and Steel Inst.—Advance Paper (Lond.), May 1930, 23 pp., 11 figs. Experiments were originally designed to determine properties of steels suitable for exhaust valves of air-cooled internal-combustion engines; two important properties are: good mechanical strength combined with toughness at ordinary and elevated temperatures, and resistance to oxidation or scaling at temperatures to which exhaust valve may be heated under bad engine conditions; this temperature may reach 800 to 900 deg. cent.

COMBUSTION

SURFACE. Surface Combustion, M. V. Hurst. Foundry Trade Jl. (Lond.), vol. 42, no. 711, Apr. 3, 1930, p. 252, 1 fig. Description of Cox system of surface combustion, the invention of Bone; system utilizes gas from coal, etc., which, mixed with correct proportion of air at pressure of 3 in. of water, is fed to "combustors" formed of granulated material compressed into various shapes, on surface of which mixture burns without visible flame. Abstract of paper read before Junior Instn. of Engrs.

COLUMNS, CONCRETE

TESTING. Reinforced Concrete Column Investigation, W. A. Slater. Am. Concrete Inst.—Jl., vol. 1, no. 6, Apr. 1930, pp. 601-612 and (discussion) 613-615, 3 figs. Progress report of committee 105; tests of plain and reinforced concrete columns in United States, Canada and Europe; programme of tests for column investigation.

COLUMNS, STEEL

TESTING. Transverse Tests of H-Section Column Splices, J. H. Edwards, H. L. Whittemore and A. H. Stang. U.S. Bur. of Standards—Jl. of Research, vol. 4, no. 3, Mar. 1930, pp. 395-413, 18 figs. Plates were welded to outer edge of inside faces of flanges of 3-ft. lengths of 10, 12 and 14-in. H sections, joined in pairs by splice plates bolted to these welded plates to represent spliced section of column for use in steel-frame building; specimens were tested as beams on 66-in. span with loads at quarter points; method of stress analysis suitable for use in designing similar splices is developed.

CONCRETE ABSORPTION

TESTING. Testing Concrete for Absorption, F. Weigel. Am. Concrete Inst.—Proc., vol. 25, 1929, pp. 514-521, and (discussion) 521, 3 figs. It is probable that at no time do hydration products become entirely crystalline and hydrated cement will always contain sufficient quantity of gel to cause cement paste to exhibit properties of colloidal gel; under conditions of high-temperature gel tends to lose water; under conditions of low temperature of high humidity it tends to take on water; tests described seem to bear out these conclusions quite closely. Paper indexed in Engineering Index 1929, p. 487, from Advance Paper for mtg., Feb. 12-14, 1929.

CONCRETE CONSTRUCTION

FIELD CONTROL. Three and One-Half Years Experience of the Detroit Edison Company in Concrete Control, A. S. Douglass and J. S. Nelles. Am. Concrete Inst.—Proc., vol. 25, 1929, pp. 100-151, 36 figs. Detroit Edison Co. in field laboratory has proportioned and controlled all its concrete according to best practice which it was possible to determine; aggregates; first control job; equipment; analysis of costs; variation in consistency; low cement; description of new Delray power plant No. 3; durability; winter methods; advantages of control. Paper indexed in Engineering Index 1929, p. 493, from Advance paper Feb. 12-14, 1929.

CONCRETE CURING

TEMPERATURE EFFECT. Effect of Temperature on the Curing of Concrete, R. A. Foley. Am. Concrete Inst.—Proc., vol. 25, 1929, pp. 556-572, 3 figs. Manager of Superior Products Co., Detroit, Mich. presents general discussion and report on original experimental study; compression-strength curves for specimens of reinforced and plain concrete pipe showing effect of curing temperatures.

CONCRETE MIXING

SALTS, USE OF. British Report on Use of Salts in Concrete Mixing Water, W. N. Thomas. Concrete, vol. 36, no. 4, Apr. 1930, p. 24. Abstract of report by Building Research Board of British Department of Scientific and Industrial Research; sodium chloride and calcium chloride studied; action differs with different brands of cement; corrosive action on steel; recommendations on use of each salt.

WATER-CEMENT RATIO. Water Tables and Curves for Use in Designing and Estimating Concrete Mixtures, H. J. Gilkey. Am. Concrete Inst.—Proc., vol. 25, 1929, pp. 292-313, 4 figs. Tables and graphs covering water-cement ratio by loose or bulk volume, gallons of water per bag of cement, pounds of water per bag of cement, water-cement ratio by absolute volume and ratio of water to cement by weight; for all units, corresponding estimated strengths according to two well-known Abrams equations; strength ratios based upon Abrams curves. Paper previously indexed, in Engineering Index 1929, p. 498, from Advance Paper, Feb. 12-14, 1929.

CONCRETE REINFORCING BARS

SPECIFICATIONS. Standard Specification for Billet-Steel Reinforcing Bars. Eng. Standards Assn. (Ottawa), no. G. 30, Apr. 1930, 10 pp. This specification covers three classes of billet-steel concrete reinforcing bars, namely: plain, deformed, and cold-twisted.

Standard Specifications for Rail-Steel Reinforcing Bars. Can. Eng. Standards Assn. (Ottawa), no. G. 31, Apr. 1930, 11 pp. This specification covers three classes of rail-steel reinforcing bars, namely; plain, deformed, and hot-twisted.

CONCRETE SPECIFICATIONS

DEVELOPMENT OF. The Development of Specifications for Reinforced Concrete, G. J. Eyrick, Jr. Am. Concrete Inst.—Proc. vol. 25, 1929, pp. 622-629 and (discussion) 630-631, 4 figs. General review of evolution of reinforced-concrete specifications in United States; types of cylinder test reports and graphs.

CONSISTOMETERS

NEW TYPE. A. New Consistometer and Its Application to Greases and to Oils at Low Temperatures, R. Bulkley and F. G. Bitner. Rheology—Jl., vol. 1, no. 3, Apr. 1930, pp. 269-282, 8 figs. Construction and method of operation of consistometer alleged to be rugged, simple, speedy, and can be employed for opaque and clear materials of wide range of consistencies; material may be passed through capillary any number of times; determinations of rate of flow are made by passing very small volume through capillary; unworked, as well as worked, consistency may be closely approximated; calibration of capillaries; sources of error; flow-pressure graphs of plastic lubricants.

CONVEYORS

CONTROL. Speed Regulation and Control of Conveyors, A. F. Redman. Cassier's Mech. Handling (Lond.), vol. 17, no. 1, Jan. 1930, pp. 10-16, 16 figs. Improvement in design of conveyor equipment during last few years has made rapid progress, and inclusion of specialized reduction and control gear has become matter of importance; speed variation by electrical means; mechanical reduction gears; "Veratio" gear; Humfrey Sandberg uni-directional clutch; ring of rollers; J.F.S. reduction gear; O.I.V. chain gear; Crofts gear; variable speed transmission by oil-gear.

COOLING TOWERS

CALCULATION OF. Cooling Towers and Spray Ponds and Their Calculation, L. Hansen. Southern Power Jl., vol. 48, no. 2, Feb. 1930, pp. 105-106. Discussion of good judgment in selection of cooling tower or spray pond; atmospheric or natural draft and forced-draft cooling towers; determination of amount of air necessary to cool given quantity of air per minute.

CONCRETE. Reinforced-Concrete Cooling Towers, A. T. J. Gueritte. Structural Engr. (Lond.), vol. 8, no. 3, Mar. 1930, pp. 117-125, and (discussion) no. 4, Apr. 1930, pp. 141-143, 15 figs. Evolution of cooling-tower construction; several modern examples of concrete cooling tower construction in Europe.

COPPER ALLOYS

P. M. G. P. M. G. Metal for Replacing the Bronzes, M. A. Hunter. Heat Treating and Forging, vol. 16, no. 3, Mar. 1930, pp. 344-345. Hardened copper alloy can be utilized in all situations where high tensile strength is required; alloy as cast contains as its major constituents 2 per cent of iron and 3.4 per cent of silicon with 2 per cent of zinc; hardening is presumably due to presence of iron silicide; this compound dissolves at high temperatures in molten copper; on cooling, iron silicide precipitates from solid solution in such manner as to increase hardness of solidified alloy; metal can be readily forged hot.

COPPER ORE TREATMENT

CANADA. Copper Concentration as Applied to Canadian Ores, W. B. Maxwell. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 16, Apr. 18, 1930, pp. 367-371, 1 fig. Discussion of Canadian copper ores, some of which are complex and most of which contain values in gold and silver; milling practice at Britannia plant, at Granby Consolidated Anyox and Allenby plants, and at Noranda concentrator in Quebec; reagent consumption and milling data are given; some cost data on Britannia. Paper read before Empire Min. and Met. Congress in S. Africa.

CRANES

CABLEWAY. Installation of Cableway Cranes (Installation de grue à cables). Génie Civil (Paris), vol. 96, no. 13, Mar. 29, 1930, pp. 301-304, 10 figs. Description of cableway crane installation at Beuthe, to serve triangular area, for Graeflich Schaffgotsche Werke coal mines; span is 290 m. long, steel frame towers are 36.6 m. high and lifting capacity is 14 tons.

ELECTRIC. ALUMINUM-ALLOY. 10-Ton Crane Built of Aluminum Alloy, F. V. Hartman and E. C. Hartmann. Elec. World, vol. 95, no. 11, Mar. 15, 1930, p. 552, 3 figs. New application of strong alloys of aluminum in field of structural engineering is found in 10-ton travelling crane installed in works of United States Aluminum Co., Massena, N.Y.; crane is three-motor, single-hook machine with lift of 22 ft.; girders are constructed of aluminum alloys and have span of 72 ft. 2 in.; built by Alliance Machine Co., Alliance, Ohio.

CULVERTS

CONCRETE. Joint Concrete Culvert Pipe Committee. Am. Concrete Inst.—Proc., vol. 25, 1929, pp. 606-621, 5 figs. Second report on standard specifications for reinforced concrete pipe to be used for railway and highway culverts; tentative standard specifications for materials, design, physical tests and inspection.

CUPOLAS

DESIGN. Main Dimensions of Foundry Shaft Furnaces (Cupolas) (Die Hauptabmessungen von Giessereischachtoefen), B. Osann. Giesserei (Duesseldorf), vol. 17, no. 13, Mar. 28, 1930, pp. 293-297. Different methods of calculating main dimensions are developed and critically evaluated.

CUTTING TOOLS

TUNGSTEN CARBIDE. Alloys With Hardness of Diamonds (Diamantharte Legierungen), S. Malowan. Giesserei-Zeitung (Berlin), vol. 27, no. 8, Apr. 15, 1930, pp. 219-220, 4 figs. Brief note on same alloys used as cutting tools, including tungsten-carbide; Lohmann volomit, consisting of tungsten-cobalt, nickel, and chromium carbides; thoran, which is carbice of thorium and tungsten; and new Widia alloys of Krupp; advantages of hard alloys are set forth.

D

DAMS

DESIGN. Design and Economics of Concrete and Reinforced-Concrete Dams (Entwurf und Witschaftlichkeit von Staumauern aus Beton und Eisenbeton), E. Probst and F. Toelke. V.D.I. Zeit. (Berlin), vol. 74, no. 13, Mar. 29, 1930, pp. 385-394, 44 figs. Function of dams, their cost in comparison with total cost of hydraulic project; general critical review of evolution of dam design, including gravity, flat and arch designs as well as their combinations; buttress design and observations on crack formation in buttresses. (To be concluded.)

DAMS, CONCRETE

CONSTRUCTION. Thomson Dam and Reservoir, H. C. Ash. Am. Concrete Inst.—Proc., vol. 25, 1929, pp. 29-38 and (discussion), 38-46, 7 figs. Description of early construction in which particular attention is given to such details as selection of materials, and mixing, placing and curving of concrete. Paper indexed in Engineering Index 1929, p. 545 from Am. Concrete Inst.—Reprint for mtg., Feb. 12-14, 1929.

EARTHQUAKE RESISTANCE. Earthquake Resistance Provided in Design for Gravity Dam. Eng. News Rec., vol. 104, no. 15 Apr. 10, 1930, pp. 606. See editorial comment on pp. 597. Discussion of earthquake-resistance provisions incorporated in design of Pine Canyon dam, to be built on San Gabriel River as part of water supply project for Pasadena, Calif.; dam, which is of concrete gravity type, straight in plan and 375 ft. above lowest foundation, is designed to resist horizontal earthquake acceleration of 0.1 g.; this necessitates base width 0.8 of height, which adds 9.38 per cent to volume.

DAMS, MULTIPLE ARCH

ITALY. The Lake Salarno Dam (La Diga del Lago Salarno), F. Pagliaro. Annali deo Lavori Pubblici (Rome), vol. 68, Jan. 1930, pp. 15-29, 9 figs. Report on design and construction of reinforced-concrete multiple-arch dam, of curved alignment, for Societa Generale Elettrica dell'Adamello, in upper basin of Oglio River; maximum height of dam is about 38 m., total length along axis of crown is about 265 m.; results of geological investigation of foundation site; tests of materials used in construction; regimen of reservoirs.

DIE CASTING

BRASS ALLOYS FOR. Brass Pressure Die Castings (Der Messing-Pressguss), W. Mueller. Giesserei Zeitung (Berlin), vol. 27. no. 6, Mar. 15, 1930, pp. 155-156, 9 figs. Brass as successor to tin-zinc-aluminum die casting is said to be latest discovery in field of die castings; its advantages are set forth and casting method is described.

DIES

STAMPING. Metal Stamping Dies—Die Layout and Construction, E. E. Clark. Metal Stampings, vol. 3, no. 4, Apr. 1930, pp. 323-328, 10 figs. Discussion of factors affecting choice between built-up and solid types of die construction; including type of tool, materials available and their characteristics, costs, repairs, etc.

STEEL FOR. New Tool and Die Steels Give High Production, O. K. Parmiter. Iron Trade Rev., vol. 86, no. 16, Apr. 17, 1930, pp. 52-54, 4 figs. Desirable properties of chromium-molybdenum-vanadium steel; fields of application; comparative value of die steels; evolution of high-speed steel.

DIESEL-ELECTRIC POWER PLANTS

BRITISH COLUMBIA. The Selection of a Mine or Mill Power Plant, G. R. Frizell. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 14, Apr. 4, 1930, pp. 317-319, 1 fig. Notes on power plant of Base Metals Mining Corp. at Field, B.C.; two 400-hp. six-cylinder, Fairbanks-Morse Diesel engines, each direct connected to 375-kva. alternator; one 180-hp., three-cylinder Fairbanks-Morse Diesel engine direct connect to 150-kva. alternator, with alternator shaft of last mentioned engine extended through outboard bearing and connected through friction clutch to 18-in. x 11-in. x 14-in. right-angle compound air compressor; current gathered is three-phase, 60-cycle, 480 volts.

LA CROSSE, KAN. Nine-Year Operating Record of Diesel Plant. Power Plant Eng., vol. 34, no. 9, May 1, 1930, pp. 502-504, 2 figs. Care in keeping complete records and in analyzing operating costs aids materially in reducing costs of maintenance and operation at Diesel engine plant of La Crosse, Kansas; summary of nine years operating record; table showing operating costs for nine-year period.

SWIFT CURRENT, SASK. Diesel Engines as Electric Load Builders in Swift Current, Sask., C. P. Town. Disel Power, vol. 8, no. 4, Apr. 1930, pp. 190-191, 3 figs. Notes on successful Diesel engine operation in municipal power plant; second-hand 600-hp. Willans and Robinson and new 600-hp. Busch-Sulzer Diesel engines where installed; description of auxiliary equipment and operation.

DIESEL ENGINES

Airless Injection. Recent Developments in the Airless Injection of Fuel in Diesel Engines. Fuel (Lond.), vol. 9, no. 3, Mar. 1930, pp. 130-140, 18 figs. In recents years airless injection has been more and more adopted, since it gives higher thermal efficiency than blast injection by eliminating injection air compressor and power power required to drive it; it also cheapens engine and simplifies attendance; engines with precombustion chambers and with supplementary compression; phenomena in fuel piping; there is tendency to do away with camshaft altogether in two-cycle engines, especially in double-acting engines.

Balancing. Balancing of Oil Engines (Ueber den Massenausgleich von Oelmotoren), F. Schmidt. Werft Reederei Hafen (Berlin), vol. 11, no. 3, Feb. 7, 1930, pp. 49-54, 27 figs.; see also translated abstract in Mar. Engr. and Motorship Bldr , vol. 53, no. 631, Apr. 1930, p. 157. To facilitate task of engine designer in ensuring absence of vibration, author investigates by method of harmonic analysis, balancing reciprocating and rotating masses of Diesel engines having from 3 to 9 cylinders; rigidity of whole engine is of greatest importance to successful balancing; as example, case of 5-cylinder engine, consisting of two blocks of three balanced against each other, is given.

Combustion in. Combustion in Diesel Engines, H. R. Ricardo. Automobile Engr., vol. 20, no. 266, Apr. 1930, pp. 151-156, 18 figs. Discussion of combustion problem in high-speed Diesel engines, operating at piston speeds in excess of 1,500 ft. per min.; factors upon which building up of self-propagating nucleus of flame and spread of flame throughout working fluid depend.

M.A.N. Marine. Large Two-Stroke Double-Acting Oil Engines for Land and Marine Work. Engineer (Lond.), vol. 149, no. 3875, Apr. 18, 1930, pp. 430-431, 4 figs. Installation at Hennigsdorf peak-load substation comprises two 10-cylinder M.A.N. two-stroke double-acting engines operating on airless-injection principle; each has designed output of 11,700 b.hp. at 214 r.p.m.; details are also given of 6-cylinder two-stroke, double-acting, airless-injection engine which is first of this type, and forms one of two sets to be installed in 15-knot, 10,000-ton cargo liner under construction at yard of Yokohama Dock Co. for service of Kishimoto Kisen Kaisha.

Solid-Injection Double-Acting Two-Stroke Diesel Engines, A. Heller. Eng. Progress (Berlin), vol. 11, no. 4, Apr. 1930, pp. 110-112, 2 figs. Engine is one of six which Yokohama Dockyard Co. is installing in three of their ships; bore 23.7 in.; stroke 35.5 in.; speed 130 r.p.m.; b.hp. 3,600-3,750 hp.; M.A.N. scavenging process employs slots in cylinder wall both for exhaust and for admission of scavenge air, so that no valves are necessary; adoption of solid fuel injection for so large outputs represents important stage in development of double acting two-stroke Diesels, possibilities of which M.A.N. were first to put into practice.

E

ELECTRIC CABLES

Aluminum. Experimental Aluminum Transmission Lines. Metallurgist (Supp. to Engineer, Lond.), Mar. 1930, p. 48. In order to test behaviour of aluminum transmission cables under most severe service conditions, experimental line bas been erected on German island of Sylt with fullest possible exposure to gales of North Sea; line has been erected by Lautawerk Aluminum Co., but behaviour of various cables is being observed by State Testing Laboratory at Berlin-Dahlem; results of investigation which have been obtained up to present; examination has so far revealed nothing that could be properly called corrosion.

Testing. Cable Testing with High-Voltage D.C. Current (Kabelpruefung mit hochgespanntem Gleichstrom), Mehlhorn. Elektrotechnik und Maschinenbau (Vienna), vol. 48, no. 9, Mar. 2, 1930, p. 187-191, 6 figs. Operating conditions for voltage doubling connection in cable testing described; it is shown that connection cannot be utilized; in short-circuit operation; improvement is obtained by arranging tubes in parallel to condensers; cable-testing car equipped with this arrangement is described.

ELECTRIC CIRCUIT BREAKERS

Oil. The Harland Oil Circuit Breaker. Engineering (Lond.), vol. 129, no. 3354, Apr. 25, 1930, p. 557, 2 figs. Details of circuit breaker for 6,600- to 11,000-volt draw-out steel-clad truck cubicle; it is completely dirt-proof and vermin-proof, and is fitted with full range of usual interlocks which ensure safety in operation, and with automatic safety shutters, so that no contact with movable parts is possible when carriage is withdrawn.

ELECTRIC FURNACES

Heat-Treating. Heat Treatment Furnaces, A. G. Lobley. Automobile Engr. (Lond.), vol. 20, no. 265, Mar. 1930, pp. 110-111, 4 figs. Two primary advantages of electric furnace are exactitude of control and flexibility; comparison between working costs of electric and gas-fired furnaces; calculated differences of temperature between resisters and furnace.

Small Parts Heated on Time Schedule, W. S. Scott. Iron Age, vol. 125, no. 17, Apr. 24, 1930, pp. 1214-1216, 3 figs. Advantages of electric heat-treating furnaces as determined by Black and Decker Co., Towson, Md., manufacturers of portable electrically driven tools; type of equipment; improvement in quality of work and reduction in cost; production and cost data are given.

The Tangible Advantages of Electric Heat Treatment, W. S. Scott. Iron and Steel Engr., vol. 7, no. 3, Mar. 1930, pp. 118-122. 3 figs. Savings resulting from use of electric heat-treating furnaces are classified according to quality of product; these savings briefly discussed.

ELECTRIC GENERATORS

Voltage Regulation. Voltage Control of Large Alternators, H. W. Taylor. Instn. Elec. Engrs.—Jl. (Lond.), vol. 68, no. 399, Mar. 1930, pp. 317-331 and (discussion) 331-333, 28 figs. Voltage control is considered, with special reference to large high-speed machines being installed in capital stations; deals descriptively with exciter stability and response; alternator stability and response; combined response of alternator and exciter.

ELECTRIC INSULATING MATERIALS

Testing. Testing Insulation Without Destroying It, R. Sparks. Elec. Jl., vol. 27, no. 4, Apr. 1930, pp. 229-230 and 237, 4 figs. Power factor of insulation gives measure of its quality; with Schering bridge, these exceedingly low power-factors can be accurately measured without injuring insulation in any way. Bibliograpby.

ELECTRIC LINES

Towers. Centre-Supported Gin Pole Permits Better Towers, J. E. Housley. Elec. World, vol. 95, no. 12, Mar. 22, 1930, p. 584, 1 fig. Plan for suspending gin pole in centre of tower rather than lasbed to one leg was developed; line was for 150-kv., of 500,000-circ. mil aluminum cable steel-reinforced construction, and 64 single-circuit and 28 double-circuit towers were erected by centred gin pole metbods with entirely satisfactory results.

ELECTRIC LINES, HIGH TENSION

Lightning. Travelling Waves on Transmission Lines—Tests with Artificial Lightning Surges, K. B. McEachron, J. G. Hemstreet, and W. J. Rudge. Gen. Elec. Rev., vol. 33, no. 4, Apr. 1930, pp. 254-263, 16 figs. In 1929. joint investigation witb 100,000-volt impulse generator, for obtaining definite figures for various effects wbicb take place when over-bead circuits are subjected to travelling waves, as begun by General Electric Co. and Consumers Power Co.; results with respect to attenuation; effect of parallel conductors; polarity, length of waves and ground wire; results are given in tables and curves. Paper presented before Am. Inst. Elec. Engrs. previously indexed from Advance Paper, no. 25, for mtg. Jan. 27-31, 1930.

Fault Location. Fault Location Measurements on High-Tension Overhead Lines (Fehlerortmessung an Hochspannungsfeileitungen), H. Poleck. Siemens Zeit. (Berlin), vol. 10, no. 2, Feb. 1930, pp. 88-94, 4 figs. Classification of faults and various methods of location; fundamental line characteristics; mathematical and graphical principles of fault location methods by double measurement of reactive and effective resistance components.

Losses. The Impedance and Power Losses of Three-Phase Overhead Lines, P. D. Morgan and S. Whitehead. Instn. Elec. Engrs. (Lond.), vol. 68, no. 399, Mar. 1930, pp. 367-408 and (discussion) 408-409, 9 figs. Effects of transposing line conductors on operation characteristics, power losses, impedance of line conductor and earth return when one phase is accidentally earthed. Bibliography.

ELECTRIC MANUFACTURING INDUSTRY

Canada. Power Finance and Imperial Preference. H. Quigley. World Power (Lond.), vol. 13, no. 75, Mar. 1930, pp. 238-243. Article restates case, drawn up in previous article, that British electric industry has to fight, in Canada, financial interests directly opposed to fair recognition of its merits; reply is made to some Canadian critics of previous article, and tables are given showing Canadian trade with Great Britain; second half contains statements made in reply to British case, by Directors of Canadian power companies. See reference to previous article in Engineering Index 1929, p. 665.

ELECTRIC RAILROADS

Substations. Lackawanna Electrification Relies Upon Mercury-Arc Rectifiers, E. L. Moreland. Elec. World, vol. 95, no. 14, Apr. 5, 1930, pp. 704-707, 6 figs. Mercury-arc rectifiers are used exclusively; multiple unit trains. total absence of any feeds to sections except through catenarics, 3,000-volt d.c. operation, and supply from three utility companies at four voltages are features discussed; wiring diagrams showing general arrangement of rectifiers, feeders and protective equipment in substation, and comparative efficiency curves of rectifier and motor generator are given. From address before Am. Inst. Elec. Engrs.

ELECTRIC RELAYS

Testing. Testing Network Relays, C. W. Evans. Elec. World, vol. 95, no. 11, Mar. 15, 1930, pp. 550-552, 1 fig. Importance of acceptance and routine tests upon these relays is emphasized; testing and adjusting of electric characteristics of relays is problem for laboratory or test room; test for reverse current and phasing relay test.

ELECTRIC TRANSFORMERS

High Tension. A 60,000-Kva. Three-Phase Transformer. Engineer (Lond.), vol. 149, no. 3872, Mar. 28, 1930, p. 360, 1 fig. Details of 132,000/2,200-volt transformer built by Ferranti, Ltd., for South-East England electricity scheme; it is star-connected on 132,000-volt side and delta connected on 22,000-volt side, and is designed to operate as naturally cooled unit up to output of 30,000.

ELECTRIC WELDING

Arc. Transfer of Electrode Metal in the Welding Arc, A. Hilpert. Welding Engr., vol. 15, no. 4, Apr. 1930, p. 44, 1 fig. Welding arc was photographed in 1927 upon suggestion by author; Society of German Engineers conducted systematic investigation of transfer of metal; shadowgraphs are shown of transfer of molten metal from electrode tip to weld seam; shape changes considerably within 1/100th second, hence it is necessary to operate with very large number of pictures when investigating transfer of working metal in arc welding. Abstract translated from V.D.I. Zeit., 1929.

Welding Iron and Steel by Electric Arc, O. A. Tiiton. Welding, vol. 1, nos. 4 and 5, Feb. 1930, pp. 229-231, and Mar., pp. 314-317, 9 figs. Feb.: Fundamental principles and various applications are discussed; data pertaining to electrodes and fillets; potential of welding current; capacity of welding equipment. Mar.: Important factors for obtaining good welds; fabrication costs; training welding operators.

Resistance. Design of Resistance Welding Machines, W. E. Smith. Welding Engr., vol. 15, no. 2, Feb. 1930, pp. 55-56, 2 figs. Strength of parts, method of applying pressure, elimination of magnetic losses, and insulation, are some of factors to be considered.

Riveting and Upsetting Operations by Resistance Welding, A. E. Hackett. Welding, vol. 1, no. 5, Mar. 1930, pp. 301-304, 9 figs. Examples of application of resistance welding process to alloy-steel studs, propeller sbaft, and ventilating fan; use of electric welding machine for cutting steel cables.

EVAPORATION FORMULAE

Insolation. Evaporation as a Function of Insolation, B. Richardson. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 5, May 1930, pp. 945-960. Study of effect of insolation, or exposure to rays of sun; measurement of quantity of radiant heat imparted by sun and sky to water and bottom of reservoir; insolation as recorded by United States Weather Bureau pyrheliometer; insolation computed as geometric problem; insolation by tracing radiant heat energy; comparison between observed and computed evaporation show discrepancies ranging from fraction of one per cent to about 30 pei cent.

F

FEEDWATER TREATMENT

High-Pressure System. Development of a High-Pressure System for Boiler Water Conditioning, A. A. Markson. Combustion, vol. 1, no. 10, Apr. 1930, pp. 27-30 and 34, 3 figs. Description of high-pressure system, using Hall phosphate treatment, as developed at Kip's Bay Station of New York Steam Corporation and later installed at Station A, operated by same company; theoretical aspects of work are fully discussed, and equipment and operation described in some detail; definite conclusions offered based on nearly 12 months experience. Abstract of paper presented before Am. Soc. Mech. Engrs.

Phosphate Treatment. Phosphate Treatment of Boiler Water, E. P. Price. Combustion, vol. 1, no. 7, Jan. 1930, pp. 35-38, 5 figs. Brief review of principal difficulties incident to rapid changes in operating practice and results of experiments conducted on strictly commercial bases extending over period of two and one-balf years; description of feedwater testing apparatus.

Softening. Experience Witb Zeolite and Acid at Beacon St. Plant, J. H. Walker and L. F. Collins. Power, vol. 71, no. 14, Apr. 8, 1930, pp. 552-555, 3 figs. Discussion of operation of zeolite feedwater treating system installed in plant of Detroit Edison Co., which has been in operation for 3½ years; diagram of feedwater system; table of water analyses at various points in cycle; table giving annual operating cost of feedwater treating system.

FIREBRICK

Testing. Cold Crushing Strength of Fire Brick, H. K. Mitra. Am. Ceramic Soc.—Jl., vol. 13, no. 2, Feb. 1930, pp. 85-87, 9 figs. Purpose of this investigation was to determine cold crushing strength of firebrick in three directions, flat, edge, and endwise; possible mathematical relationsbip between values of tbese crushing strengths, and best procedure for testing fire-brick.

FOUNDATIONS

Construction. A Practical Method for Bracing Deep Wall Trenches. Am. Contractor, vol. 51, no. 14, Apr. 5, 1930, pp. 15-17, 5 figs. Thin walled steel pipe sections, which remain as integral part of retaining or foundation wall, provide means for bracing trench lining and permit uninterrupted concrete placement; results of tests made on deep trench struts, sbowing penetration into walers.

FUELS

CALORIFIC VALUE. Determination of Calorific Values of Liquid and Gaseous Fuels (Etwas ueber Heizwertbestimmungen fluessiger und gasfoermiger Brennstoff). Waerme and Kaelte Technik (Muehlhausen), vol. 32, no. 5, Mar. 18, 1930, pp. 4-6. Brief discussion of methods and their reliability, and precautions to be observed in measuring calorific values of liquid and gaseous fuels.

FURNACES

MELTING, OIL-FIRED. Schury Furnace (Der Schury-Ofen), F. Brocke. Giesserei-Zeitung (Berlin), vol. 27, no. 7, Apr. 1, 1930, pp. 195-197, 4 figs. Description of German patented steel-melting furnace especially well adapted for foundries with fluctuating load; advantages include short heating and melting period which, together, require only 5½ to 6 hrs.; it is a hearth furnace with regenerator, and can be fired with tar, tar oil, or other oils; comparison of heat balance of this intermittent furnace with that of continuous gas-fired open-hearth furnace.

MELTING, PULVERIZED-COAL. Melting Iron in the Rotary Furnace (La fusion de la fonte au four rotatif), C. Bouvard. Fonderie Moderne (Paris), vol. 23, Dec. 10, 1929, pp. 575-580, 3 figs. Processes of melting iron; advantages of pulverized-coal-fired rotary furnace lie in attaining very high temperatures without oxidation of metal; securing quality of finished iron differing very little from constituents of charge; possible diminution of carbon contents due to elevated temperatures; furnace heated by pulverized coal.

G

GAS INDUSTRY

CANADA. Canadian Gas Industry Sets New Records, A. Hewitt. Am. Gas Assn.—Monthly, vol. 12, no. 3, Mar. 1930, pp. 108 and 137. Production in 1929 reached over 36 billion cu. ft.; annual sales have increased 80 per cent; development of use of gas for domestic purposes.

GEARS

GRINDING. Some Developments in the Art of Gear Grinding. Engineer (Lond.), vol. 149, no. 3874, Apr. 11, 1930, pp. 397-400, 7 figs. Methods and equipment employed at works of Gear Grinding Co., Birmingham, which receives from makers of different equipment cut and hardened spur wheels, and returns them with flanks and roots and teeth finished by grinding to high degree of accuracy; it also undertakes grinding of multiple-spline shafts; grinding process employed consists of traversing through gaps of work abrasive wheel, shape of which is maintained by means of three diamonds in form requisite to give correct shape and thickness to teeth.

REDUCTION. Reduction Gears, J. A. MacMurchy. Elec. Jl., vol. 27, no. 4, Apr. 1930, pp. 213 and 227. High-grade gear of present day is as reliable as any other machine built; with proper lubrication of bearings and gear teeth, modern reduction gear system will outlast either driving or driven apparatus.

GEOLOGY

NOVA SCOTIA. Horton-Windsor District, Nova Scotia, W. A. Bell. Canada Dept. of Mines—Geol. Survey (Ottawa), no. 2176, 1929, 263 pp., and index, 14 figs. I map and 36 plates. Report of investigation concerned primarily with detailed faunal study of Windsor series, of carboniferous age, in type area in vicinity of Windsor, Nova Scotia; purpose was to so illustrate and describe faunas that they might be readily identical in other localities, and to fix their stratigraphic position more precisely than heretofore.

GEOPHYSICAL EXPLORATION, ELECTRIC

QUEBEC. Practical Results of Electrical Prospecting at Abana, J. B. DeMille. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 14, Apr. 4, 1930, pp. 314-316, 3 figs. Review of electrical survey involving three days' field work in July, 1927, on property of Abana Mines, Ltd., in northwestern Quebec; indication, according to field engineer's report quoted, gave definite results; later underground development has to large extent proved accuracy of possibilities indicated.

GLIDING

DYNAMIC. Observations of Dynamic Gliding (Beobachtungen ueber dynamischen Segelflug) L. Prandtl. Zeit. fuer Flugtechnik und Motorluftschiffahrt (Munich), vol. 21, no. 5, Mar. 14, 1930, p. 116, 2 figs. Description is given of how seabirds (brown albatrosses) actually soar on ocean surface, based on author's observations on voyage from Yokohama to Honolulu.

GOLD MINES AND MINING

ONTARIO. Howey Gold Mines, R. M. P. Hamilton. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 8, Feb. 21, 1930, pp. 176-179, 5 figs. Notes on rapid development of gold mine in Red Lake district; use of airplanes has been important factor; two years after discovery of property, shaft was down 600 ft. and about 12,000 ft. of lateral work had been done on four levels; ore developed over average 15 foot wide running better than $7.00 in gold; flow sheet and details of mill are given.

H

HEAT-INSULATING MATERIALS

MASONITE. The Masonite Process, R. M. Boehm. Indus. and Eng. Chem., vol. 22, no. 5, May 1930, pp. 493-497, 5 figs. History of process used by Masonite Corp., Laurel, Mass., for manufacture of insulating board by exploding wood chips under 1,000 lbs. per sq. in. steam pressure; description of products including Insulation Board, Insulation Lath, Quarterboard, and Presdwood.

HEAT TRANSMISSION

RESEARCH. Studies in Heat Transmission, A. P. Colburn and O. A. Hougen. Indus. and Eng. Chem., vol. 22, no. 5, May 1930, pp. 522-539, 20 figs. Measurement of fluid and surface temperatures; flow of heat through tubular gas condenser, heat-transmission coefficients were measured separately for water film, metal, condensate layer, and adjoining gas film; flow of fluids at low velocities.

HYDRAULIC TURBINES

DESIGN. Features of New Low-Head Hydraulic Turbine Design, H. J. Muth. Power, vol. 71, no. 17, Apr. 29, 1930, pp. 664-667, 9 figs. New development in low-head hydraulic turbine design and power house construction that provides flexibility between turbine unit and power house structure and reduces cost of construction is described.

KAPLAN. Hydro Efficiency Increase 10 per cent, C. L. Dowell. Elec. World, vol. 95, no. 14, Apr. 5, 1930, pp. 684-686, 6 figs. Subjected to severe tests of its ability to perform efficiently and continuously, first Kaplan automatic adjustable blade waterwheel installed in America has successfully completed more than nine months service at Lake Walk Plant of Central Power and Light Co.; flow of Devil's River was extremely low; performance curve based on 33-ft. net head and 277 r.p.m. are given; efficiency and horsepower curves are compared.

VIBRATIONS. On the Vibration of Draft Tube of Water Turbine, S. Uchimaru and S. Kito. Tokyo Imperial Univ. Faculty of Eng.—Jl. (Tokyo), vol. 18, no. 8, Feb. 1930, pp. 213-270, 39 figs. Theoretical mathematical analysis of causes and methods of preventing of vibrations of draft tubes, of hydraulic turbines running on part load, based on theory of vibration of columnar vortex confined in cylindrical space; also report on experiments on vibrations of cylindrical draft tubes; effect of placing disc at bottom of tube; effect of introduction of air into draft tube. (In English.)

HYDRO-ELECTRIC POWER PLANTS

BRITISH COLUMBIA. Alouette. Power Engr. (Lond.), vol. 25, no. 289, Apr. 1930, pp. 145-152, 14 figs. Description of automatic hydro-electric plant operated in conjunction with power system of British Columbia Power Corporation Ltd.; general layout; map showing location of Alouette Plant in relation to Vancouver; turbine construction; governing and automatic operation; graphs showing efficiency of turbine and alternator in relation to load.

QUEBEC. Burroughs Falls, J. R. Desloover. Elec. News, vol. 39, no. 7, Apr. 1, 1930, pp. 31-34, 6 figs. New 2,000-kva. automatic plant of Southern Canada Power Company in Province of Quebec has horizontal unit which may be used as synchronous condenser; wooden headgate; wood stave penstock; notes on surge tanks are given.

Construction Methods of Small Power Plant at Difficult Site, H. L. Mahaffy. Contract Rec. (Toronto), vol. 44, no. 13, Mar. 26, 1930, pp. 361-365, 12 figs. Report on construction of hydro-electric undertaking of Southern Canada Power Co., on Nigger River, 32 mi. from Sherbrooke, Que., including 5-ft. wood stave penstock, 2,200 ft. long; also gravity concrete dam 62 ft. high; features of horizontal shaft Francis type turbine, of 2,000 hp. capacity and of electrical equipment.

SASKATCHEWAN. 44,000-hp. Hydro-Electric Plant on the Churchill River, Canada. Engineering (Lond.), vol. 129, no. 3351, Apr. 4, 1930, pp. 442-443. Main unit will operate at 163.6 r.p.m., and head will be 60 ft.; turbines will be directly connected to three 12,000-kva., three-phase 60-cycle generators; power will be generated at 6,600 volts and stepped up to 110,000 volts for transmission to Flin Flon and Sherritt Gordon mines; dam is gravity-type concrete structure with four gate-controlled under sluices.

I

ICE INDUSTRY

UNITED STATES. The Ice Industry Today, C. C. Small. Ice and Refrig., vol. 78, no. 1, Jan. 1930, p. 10, General discussion of present standing of ice industry; effect of commercial refrigeration; outlook of business conditions. Paper presented before Am. Soc. of Refrig. Engrs.

ICE PLANTS

DESIGN. Advantages of Two Suction Pressures for Ice Plant, G. T. Voorhees. Ice and Refrig., vol. 78, nos. 1, 2, 3, and 4, Jan., Feb., Mar., and April, 1930, pp. 66-67, 156-157, 264-266, and 353-356, 6 figs. Jan.: Forecooler's part in power economy; old method's seasonable reduction thereof eliminated by new process; analysis of high suction effort and how to utilize it with all types of compression apparatus; indicator diagram showing condenser pressures in hot and cold months. Feb.: Forecooler's part in power economy; old method's seasonable reduction thereof eliminated by new process; analysis of high suction effort and how to utilize it with all types of compression apparatus; comparative indicated compressor horsepower diagram, reproduced at exact size, is given. Mar.: Diagram of suction pressure in pounds per square inch gauge for solving power problems. April: Diagrammatic illustration of can forecooler cycle; indicator diagrams for various clearances; displacement and power chart, no clearance, for ammonia compressors, also tons of refrigeration per ton of ice.

INSTITUTE OF METALS

GREAT BRITAIN. The Institute of Metals—Presidential Address, R. Seligman. Mech. World (Manchester), vol. 87, no. 2257, Apr. 4, 1930, pp. 315-317. Abstract of address before Inst. of Metals, previously indexed, from Advance Paper, no. 527, for mtg. Mar. 12-13, 1930.

INTERNAL-COMBUSTION ENGINES

ELECTRIC DYNAMOMETERS FOR. Electrical Dynamometers for Testing Internal-Combustion Engines. Engineering (Lond.), vol. 129, no. 3351, Apr. 4, 1930, pp. 438-439, 5 figs. Details of dynamometers exhibited by Highfield Electrical Co. at British Industries Fair; two types were shown, one known as production type and other as research type; latter is of enclosed protected type armature being specially constructed to withstand high speeds up to 6,000 r.p.m.; in production type power developed by engine is returned in form of electrical energy to mains, thus greatly reducing operating costs.

(*See also Airplane Engines; Automobile Engines; Diesel Engines.*)

IRON DEPOSITS

CANADA. Canadian Mineral Resources. Elec. Rev. (Lond.), vol. 106, no. 2730, Mar. 21, 1930, p. 536. Ontario has produced more than 5 million tons of iron ore and concentrates since 1869, but for several years practically all iron ore fed into blast furnaces of this country has come from United States and Newfoundland; reason for this condition is not that Canadian iron ore is very low in iron content, but that ores of Minnesota, whence most of Canadian imports come, are richer than those commonly used in other countries; imported material cheaper.

IRON AND STEEL PLANTS

FUEL ECONOMY IN. Developments in Fuel Economy at Skinningrove, F. Bainbridge. Iron and Steel Inst.—Advance Paper (Lond.), May 1930, 23 pp., 8 figs. Attempt is made to bring into balance outputs of various producing departments at Skinningrove to make available greater quantities of surplus gas by installation of automatic burners on stoves and boilers, further quantities so liberated being made use of in production of steel; economies have also been achieved by application of coke-oven gas to open-hearth furnace through water-cooled ports or burners.

L

LEAD ORE TREATMENT

ROASTING. Roasting and Sintering of Lead Ore in a Rotary Furnace (Grillage et Agglomération du minerai de plomb au four rotatif), N. C. Kyriacou. Revue de Métallurgie (Paris), vol. 27, no. 1, Jan. 1930, pp. 49-53, 2 figs. Discussion of theory and development of rotary roasting furnace; details of Kyriacou system of rotary furnace.

LEAD-ZINC MINES AND MINING

NOVA SCOTIA. The Stirling Mine, J. Nolan. Canadian Min. Jl. (Gardenvale, Que.), vol 51, no. 18, May 2, 1930, pp. 413-415, 1 figs. Description of mine on Cape Breton island, 36 mi. east of St. Peters and 40 mi. southwest of Sydney; float rock was found in stream in 1914; work on deposit began in 1915; prospecting work; drilling by American Zinc Co., and by New Jersey Zinc Co.; property is now in hands of British Metal Co., who completed 250-ton oil-flotation mill; brief note on silver-lead prospect 18 mi. to north.

LEAD-ZINC ORE TREATMENT

AUSTRALIA. Metallurgical Practice at the Broken Hill South, New South Wales. Eng. and Min. Jl., vol. 129, no. 7, Apr. 7, 1930, pp. 349-350, 3 figs. Brief description of practice at plant milling 7,000 long tons per 128-hr. week of crude ore averaging 14 per cent lead, 5.0 oz. silver per ton and 11½ per cent zinc; gangue minerals are quartz, quartzite, calcite, rhodonite and garnet; screen analysis of ball mills feed and discharge; analysis of zinc concentrate; flow sheet and milling data on differential lead flotation, zinc flotation, and general mill-recovery statement; reagent consumption; no costs data are given.

FLOTATION. Treatment of Old Mill Tailings by Flotation (Tratamiento de Antiguos Jales de Concentracion por Flotacion), C. Bruchhold. Boletin Minero (Mexico, D. F.), vol. 28, no. 4, Oct. 1929, pp. 262-268, 1 fig. on supp. plate. Notes on plant of San Nicolas Mining and Milling Co. at Vacas, Durango; old mill tailings pile has about 218,000 tons of oxide and sulphide material, more or less caked and cemented by exposure; average content of material treated during three months of 1929 was 212 grams silver per ton, 3.4 per cent lead and 8.2 per cent zinc; flow sheet, operation, and equipment are described; milling cost $2.17 per ton.

Utah. Metallurgical Control at the Tooele Concentrator, O. E. Keough. Min. and Met., vol. 11, no. 280, Apr. 1930, pp. 202-205. Description of routine tests by which technical control is maintained; twice each year tests are correlated with mill operation. Reference is made to complete description of plant as indexed in Engineering Index 1929, p. 1063, from Eng. and Min. Jl., Aug. 24, 1929.

LIGHTING

Industrial. Daylighting Industrial Buildings, A. J. Martin. Am. Architect, vol. 137, no. 2583, May 1930, pp. 36-37, 4 figs. General discussion with curves illustrating principles of daylighting; light cut off by obstructions; increase of daylighting on lower floors; increasing height of windows at lower storeys; treating walls of obstruction to reflect more light.

Modern Methods of Factory Lighting. Cassier's Mech. Handling (Lond.), vol. 17, no. 2, Feb. 1930, pp. 51-52, 3 figs. Discussion of good illumination which is essential to operatives' safety; elimination of glare; three lighting systems are discussed.

LIGNITE DEPOSITS

Ontario. Onakawana Lignite, W. S. Dyer. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 12, Mar. 21, 1930, pp. 271-273, 3 figs. Notes on lignite deposits on Abitibi River; progress in exploration by drill holes; description of lignite seams; comment on analyses of samples, which show high moisture content but less than 7 per cent ash in over 65 per cent of seam. Abstract of paper presented before Can. Inst. of Min. and Met.

LIGHTNING ARRESTERS

Thyrite. Thyrite: A New Material for Lightning Arresters, K. B. McEachron. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 5, May 1930, pp. 350-353, 7 figs. Original of paper presented before Am. Inst. Elec. Engrs., previously indexed from Power Plant Eng., Apr. 1930, and Gen. Elec. Rev., Feb. 1930.

LIQUID AIR

Containers for. Theory and Design of Metal Vacuum Jacket Containers for Liquified Gases, Especially Liquid Hydrogen (Theorie und Konstruktion der Vakuummantegefaesse aus Metall fuer verfluessigte Gase), etc., W. Meissner. Zeit. fuer die Gesamte Kaelte-Industrie (Berlin), vol. 37, no. 3, Mar. 1930, pp. 41-48, 7 figs. Discussion of heat supply through conductivity of metal and through radiation; heat transfer through conductivity of remaining gas; description of container used in German National Physico Technical Institute; result of test with liquid hydrogen and liquid air to determine relation between evaporation and supplied heat are tabulated.

LOCKS

Electric Control. Electrical Operation of the World's Largest Lock on the Welland Canal, A. L. Mudge. Elec. News, vol. 39, no. 6, Mar. 15, 1930, pp. 45-49, 6 figs. Equipment for electric operation of lock no. 8; general plan of cable layout and specifications of power requirements; control of motors; remote control; indicating lights; water level indication.

LOCOMOTIVE REPAIR SHOPS

Point St. Charles, Que. Point St. Charles Shops of the Canadian National. Ry. Mech. Engr., vol. 104, no. 3, Mar. 1930, pp. 117-124 and 130, 9 figs. Modern locomotives repair shop placed in operation last July turns out average of 36 class repairs per month; three-page list of machine tools and shop equipment is given; natural and artificial lighting, electric welding circuits, overhead travelling cranes, piping, floors and machine foundations, heating system, and present production and forces, are discussed.

LOCOMOTIVE TERMINALS

Hamilton, Ont. New Locomotive Terminal, Toronto, Hamilton and Buffalo Railway. Can. Ry. and Mar. World, vol. 384, Feb. 1930, pp. 65 and 80-82, 2 figs. Illustrated description of proposed layout of modern locomotive terminal.

LOCOMOTIVES

Canadian Pacific. Powerful Canadian Pacific Locomotives. Ry. Jl., vol. 36, no. 3, Mar. 1930, pp. 16-17, 2 figs. Brief description of 2-10-4 type locomotives to be used for heavy grades and winter service in Canadian Rockies; cylinders 25½ by 32 in.; diam. of drivers 63 in.; boiler pressure 275 lbs. per sq. in.; tractive effort, with booster, 89,200 lbs.; weight of engine and tender, 752,500 lbs.; o.a. length 98 ft., 1¾ in.

Electric. A 7,200 Horse-Power Single-Phase Locomotive. Engineer (Lond.), vol. 149, no. 3872, Mar. 28, 1930, p. 359. 1 fig. For Swiss Federal Railways Oerlikon Company is building what is believed to be largest locomotive so far constructed in Europe; it is described as 1 Bo 1 plus 1 Bo 1 Bo 1 type of engine, symbol 1 meaning one carrying axle, and symbol Bo two driving axles with individual drive.

Electric Locomotive Built by Railroad, R. L. Kimball. Ry. Age, vol. 88, no. 16, Apr. 19, 1930, pp. 911-912, 3 figs. Piedmont and Northern completed and placed in service 100-ton, 1,500-volt, d.c. lcoomotive; equipment includes eight traction motors, Westinghouse type 562-D5; forced ventilation; battery control; electrically heated cab; K-14-D Westinghouse air brakes; 2 Westinghouse two-stage 75-C compressors; and pedestal mounted motorman's brake valves; inclined catenary type of construction used; total length over knuckles, 64 ft. 10 in.; total height 15 ft. 9½ in.; total wheelbase 54 ft. 6½ in.; continuous tractive force, 18,550 lbs.

Permissible Storage-Battery Locomotives and Power Trucks, L. C. Illsley, E. J. Gleim, and H. B. Brunot. U.S. Bur. of Mines—Bul. 313, 1929, 120 pp., 49 figs. Essential data in regard to construction of approved storage-battery locomotives and power trucks; where number of approvals have been granted to one manufacturer they have been grouped for clearness and brevity; paper has been prepared in three separate sections as follows: Jeffrey-type locomotives and power trucks; Mancha-type locomotives and power trucks; approved locomotives representing product of six manufacturers.

Low-Grade Fuel Used in. Screenings Successfully Burned in C. and E. I. Road Test. Ry. Mech. Engr., vol. 104, no. 3, Mar. 1930, pp. 131-135 and 144, 8 figs. Chicago and Eastern Illinois recently conducted some carefully supervised road tests of steam locomotives which demonstrated that with mechanical stoker equipment and Hulson tuyère-type grates, it is entirely feasible to burn 1¼-in. screenings at slightly reduced efficiency as compared with mine-run coal; graphs and tabular data are given.

LUBRICATING OIL

Germ Process. Outline Advantages of Germ Process, B. H. Lincoln. Oil and Gas Jl., vol. 28, no. 42, Mar. 6, 1930, pp. 62 and 236, 1 fig. Small percentages of fatty acid in mineral lubricating oils greatly reduce coefficient of friction; blending fatty acids with mineral oils was called germ process, by analogy, because when suitable acid is dissolved in mineral oils it gives latter life and activity as more perfect instrument of lubrication. Bibliography.

M

MACHINE TOOLS

Fabrication by Welding. Machine Tools Fabricated by Welding, T. H. Booth. Welding, vol. 1, no. 5, Mar. 1930, pp. 321-323, 9 figs. Use of arc-welding machine by Buffalo Forge Co.; brief account of economies effected.

MATERIALS HANDLING

Foundries. Compact Foundry Handling System, S. G. Koon. Iron Age, vol. 125, no. 15, Apr. 10, 1930, pp. 1069-1072, 6 figs. Combination of vertical hoop handling sand and horizontal loop handling moulds and castings in operation in iron foundry of General Electric Co., Pittsfield, Mass., for last year; it is said to have been productive of gratifying results in lowering cost of making castings and at same time improving their quality; approximately half of moulding and of service force, for given production of casting, was eliminated by this system.

Mechanical Handling Operations at Foundry of a Large Motor Works. G. F. Zimmer. Cassier's Mech. Handling (Lond.), vol. 17, nos. 1, and 2, Jan. 1930, pp. 3-4, and Feb., pp. 35-38, 6 figs. Jan.: Description of handling machinery employed at foundry of Morris Motors, Ltd., Conventry; system is most complete of its type in country, no operation being carried out by manual labour that can be performed by mechanical appliances. Feb.: Preparation of moulding sand; conveyor details; handling of cores; diagram of flight scraper conveyor negotiating horizontal and vertical paths.

Machine Shops. Handling Materials by Modern Methods. Machy. (.N.Y.), vol. 36, no. 7, Mar. 1930, pp. 540-544, 9 figs. Important developments in efficient handling and transporting of materials and work in progress in machine shops; cooperation between builders and users of material-handling equipment; types of foot-lift trucks; advantages of foot-lift trucks; Gantry crane for shop use; examples of efficient equipment; new materials-handling methods in forge shop; methods in large electrical manufacturing plant.

Railroad Repair Shops. Handling and Distributing Materials at Railroad Shops, F. A. Westbrook. Matls. Handling and Distribution, vol. 4, no. 1, Apr. 1930, pp. 26-30, 11 figs. Illustrated description of systems for handling and distributing materials in general repair shops and storehouse of New Haven at Readville, Mass.; issuance of supplies to shop; materials handling in locomotive shop.

METAL WORKING PLANTS

Canada. Machine and Erection Shops of Galt Firm are Interesting, J. Breakey. Can. Machy. (Toronto), vol. 41, nos. 5 and 6, Mar. 6, 1930, pp. 35-39, Mar. 20, pp. 39-42, 12 figs. Description of plant of Babcock-Wilcox and Goldie McCulloch, Ltd., Galt, Ont., for manufacture of boilers, pumps, steam engines, turbines, air compressors, condensers, etc.

METALS

Cold-Working. Textures of Cold-Worked Metals (Texturen kaltverformter Metalle), F. Wever and W. E. Schmid. Zeit. fuer Metallkunde (Berlin), vol. 22, no. 4, Apr. 1930, pp. 133-140, 20 figs. X-ray analysis of aluminum and iron was carried out in order to clear up conflicting theories in earlier studies of texture of rolled material; analysis was made of a homogeneous flow phenomenon, the parallel-piped plane deformation, similar to rolling process; behaviour of crystallites in deformation process is discussed on basis of well-known law of slip and bending in single crystal.

Endurance Testing. Endurance Testing Machine for Alternating Torsional Load (Dauerpruefmaschine fuer Torsionswechselbelastung), W. Spaeth. Werkzeugmaschine (Berlin), vol. 34, no. 3, Feb. 15, 1930, pp. 45-49, 3 figs. Description of equipment of Losenhausenwerk Duesseldorf, employing, swinging motor for drive, which allows for quick and exact execution of various tests.

Wear Testing. Recent Research in Wear of Materials (Neue Ergebnisse auf dem Gebiet der Verschleissforschung), M. Fink. Organ fuer die Fortschritte des Eisenbahnwesens (Berlin), vol. 84, no. 20, Oct. 15, 1929, pp. 405-412, 11 figs. Report on recent cooperative abrasion tests of various steels and copper, with special reference to oxidation process accompanying rapid wear of materials; mechanism of corrugation formation on rails.

METALS CORROSION

Cyclic Stresses. Influence of Cyclic Stresses on Corrosion, D. J. McAdam, Jr. Am. Inst. of Min. and Met. Engrs.—Tech. Pub., no. 329, Feb. 1930, 42 pp., 17 figs. Paper discusses influence of cyclic stress on corrosion of carbon and ordinary alloy steels, corrosion-resisting steels, monel metal and aluminum alloys; damage due to corrosion is estimated by comparing fatigue limit of previously corroded specimen with endurance limit of metal; lowering of fatigue limit represents damage caused by corrosion, either with or without cyclic stress; results are expressed in diagrams. Bibliography.

MICA

Report on. Mica, H. S. Spence. Canada Dept. of Mines—Mines Branch (Ottawa), no. 701, 1929, 134 pp. and index, 10 figs., 21 plates, 2 maps and classification chart in pocket. Report embodying condensed data of importance, from earlier publications, review of present status of mica industry in Canada, and presentation of available information relating to mica and mica industry throughout world. Bibliography and patent data.

MICROSCOPES

Engineering Applications of. The Microscope as Applied to Engineering, J. S. G. Primrose. Manchester Assn. Engrs.—Trans. (Manchester), 1928-1929, pp. 13-20 and (discussion) 20-34, 3 figs. Development in design of microscopes and their application in engineering workshops for purposes of making fine measurements and in metallurgical research for determining microstructure of steel.

MINE HOISTS, ELECTRIC

Forced Ventilation. Forced Ventilation Raises Safe Rating of Mine Hoists, C. Lee. Coal Age, vol. 35, no. 3, Mar. 1930, pp. 149-150, 2 figs. Description of duplicate electric shaft hoists at Kincaid mines of Peabody Coal Co., Tovey, Ill.; Ilgner Ward-Leonard type, rated 675 hp., 550 volts, 65 r.p.m., and flywheel set 550 kw., 695 r.p.m.; rating of hoist was based on rise of 49 deg. Cent. above room temperature of 25 deg. Cent.; in original installation, natural circulation was depended upon for cooling equipment; increase in capacity of plant made it necessary to increase cooling facilities by installation of blower supplying 7,000 cu. ft. of air per minute.

Automatic Control. Miami's Automatic Hoist, F. R. Grant. Eng. and Min. Jl., vol. 129, no. 7, Apr. 7, 1930, pp. 347-348, 4 figs. Brief description of equipment and control, put in operation July 1929; hoist is started by skp tender at loading station, who controls mechanism for loading skip; switch then causes one of reversing contactors for pilot motor to close, after which acceleration of hoist is entirely automatic; it is then automatically retarded and finally brought to rest at correct dumping position; speed characteristic of hoist during retardation period can be varied by changing shape of cam.

MINERAL INDUSTRY

Canada. 12.6 Percent Gain in Production of Structural Materials. Contract Rec. (Toronto), vol. 44, no. 15, Apr. 9, 1930, pp. 416-420, Statistical data on Canada's mineral development, with special reference to coal, copper, nickel, cement, asbestos, clay products, stone, sand and gravel, lime, gypsum, bituminous sands and sand-lime brick.

MINERAL INDUSTRY

Saskatchewan. Saskatchewan's Minerals. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 12, Mar. 21, 1930, pp. 273-274. Abstract of annual report of Department of Railways, Labour and Industries shows increased output in 12 months ending April 30, 1929; most striking increase is in value of sodium sulphate produced; notes on clay, sand and gravel, and volcanic ash; briquetting of lignite.

MINES AND MINING

Aerial Transportation. Aircraft's Importance to Mining Industry, R. Joyce. Min. Rev., vol. 32, no. 7, Apr. 15, 1930, p. 9. Brief article, dealing largely with activities in Western Canada and elsewhere, featuring use of Boeing airplanes with 425-hp. Wasp engines. capable of speed of 133 mi. per hr. and rate of climb of 1,000 ft. per min.

DEEP, VENTILATION. Temperature and Ventilation Deep-Level Mines, E. C. Ranson. Eng. and Min. Jl., vol. 129. no. 8, Apr. 24, 1930, pp. 390-391. At greatest depths reached in mines of Witwatersrand, in South Africa, rise in rock temperature is about one degree fahr. per 219 split at temperature much less than 10 deg. below virgin rock temperature at that point; principal cooling influences are enumerated as evaporation of moisture, air movement, and practical mining methods. Brief abstract of paper read before Empire Min. and Met. Congress, in Africa.

NOVA SCOTIA. Mining Operations in Nova Scotia During 1929, S. C. Mifflen. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 5, Jan. 31, 1930, pp. 108-109, 2 figs. Brief general review; coal production largest since World War; electrification of coal mines; increased iron and steel production; Stirling copper-lead-zinc mine in Richmond County; tin prospecting; other copper prospects; slight development of gold mines; 1,000,000 tons gypsum produced; Malagash salt mine; diatomaceous earth; oil-shale distillation.

PUMPING. High Lift Pumping, W. G. C. Nixon. Eng. and Min. Jl., vol. 129, no. 8, Apr. 24, 1930. p. 392. Brief note on pumping costs at Randfontein Estates, lifting 4,000,000 gals. per 24 hrs. from 19th level, 2,600 ft. to surface with centrifugal pumps Abstract from paper read before Empire Min. and Met. Congress, in Africa.

QUEBEC. Preliminary Statement on the Mineral Production in Province of Quebec During the Year 1929. Quebec Bur. of Mines—Dept. of Highways and Mines, 1930 (Quebec), 10 pp. Production of mines and quarries of Province of Quebec during 1929 valued at $44,814,921; tabulation of substances, 1929 quantities and values produced, and 1928 values; metallic ores; non-metallic minerals; building materials.

YUKON TERRITORY. The Mining Industry in Yukon 1929, W. E. Cockfield. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 7, Feb. 14, 1930, pp. 150-152, 2 figs. Brief general review, indicating satisfactory progress; Klondike output slightly reduced; lode gold mining; Mayo district; new ore-bodies found; southern Yukon; transportation much improved.

MINING EXPLORATION

BRITISH COLUMBIA. Prospecting in Northwestern British Columbia, F. A. Kerr. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 15, Apr. 11, 1930, pp. 336-340, 5 figs. Practical instructions for outfitting, travelling and camping in new mining area.

River Navigation and the Prospector, F. A. Kerr. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 6, Feb. 7, 1930, pp. 128-132, 6 figs. General notes on some essentials of transportation in northern British Columbia; comment on wrecks on river during 1928; flat-bottom boats are best; advantages of motor appliances; types of motor required; fuel supply; notes on other necessary equipment.

The Significance of Recent Discoveries in Northwestern B.C., F. A. Kerr. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 10, Mar. 7, 1930, pp. 222-227, 6 figs. Mineral areas well defined; abundance of mineralized outcrops; characteristics of mineralized zones; significance of rusty outcrops; structural trends; conditions favourable to mineral deposition; sources of placer gold.

CANADA. Help the Prospector—and Help Canada, R. C. Rowe. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 15, Apr. 11, 1930, pp. 341-342. Analysis of some factors underlying economic structure of Canada; development of mineral resources depends entirely upon prospector; and prospector, to carry on his work, must have public support.

MINING INDUSTRY

CANADA. Ontario's Mining and Canada's Business, C. McCrea. Can. Min. Jl., (Quebec), vol. 51, no. 17, Apr. 25, 1930, pp. 391-392. Broad review of interrelation of mining and other industries; Sudbury camp is cited as leading example with output of $414,000,000, of which $120,000.000 paid out as dividends; gold mines as colonizers; lignite; chromite. Abstract of address before Canadian Inst. of Min. and Met.

MOULDS, FOUNDRY

ASBESTOS. Production of Asbestos Permanent Moulds (Die Herstellung von Asbestdauerformen), G. Wolf. Giesserei Zeitung (Berlin), vol. 7, no. 6, Mar. 15, 1930, p. 154. Requirements of non-metallic moulds are briefly set forth; best moulding materials is claimed to be asbestos powder alone or mixed with other materials.

MOLYBDENUM MINES AND MINING

QUEBEC. A Northern Quebec Molybdenite Mine. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 11. Mar. 14, 1930, pp. 246-247. Brief article giving details of operations of Molybdenite Reduction Company; property is situated in southwest corner of township of La Corne, about 25 miles south of Amos, Que. and was known some ten years ago as Eureka mine.

MUNICIPAL ENGINEERING

ONTARIO. Water and Sewerage Systems in Ontario, A. E. Berry. Canadian Engr. (Toronto), vol. 58. no. 15, Apr. 15, 1930, pp. 494-496. Review covering activities in field of water purification and sewage disposal in province of Ontario during 1929; newly constructed and proposed water works, sewage disposal plants and sewerage systems.

N

NATURAL GAS

ALBERTA. Waste Gas in Turner Valley, A. W. G. Wilson. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 12, Mar. 21, 1930. pp. 276-278. Report of committee appointed by Provincial Government; wastage takes place through operations, under license, of about 40 producing companies; obvious solution is either to reduce production to point where all products can be utilized, or to curtail production by introduction of conservation methods designed to protect rights of individual operators, to increase recovery of valuable constituents and to reduce present waste as far as possible.

NOISE MEASUREMENT

INSTRUMENT FOR. Noise Recorder (Thorybometer) [Ein Laermzaehler (Thorybometer)], H. Dold and H. Thiele. Gesundheits-Ingenieur (Munich), vol. 53, no. 1, Jan. 4, 1930, pp. 13-14, 2 figs. Noise number is suggested as unit for noise measurements; noise recorder or thorybometer is equipment by which noise is measured by quantity of oxy-hydrogen gas electrically developed in accordance with noise produced.

O

OIL FIELDS

ALBERTA. The Oil Fields of Alberta, E. H. C. Craig. Petroleum Times (Lond.), vol. 23, nos. 579 and 580, Feb. 15, 1930, pp. 277-278, and Feb. 22, pp. 322 and 324, 2 figs. Article previously indexed from Oil Weekly, Feb. 28, 1930.

ORE CRUSHING AND GRINDING

CLOSED-CIRCUIT. Grinding and Classification—Batch Closed-circuit Grinding, A. W. Fahrenwald. U.S. Bur. of Mines—Report of Investigations, no. 2990, Feb. 1930, 11 pp., 5 figs. on supp. plates. Description of laboratory closed-circuit grind technic designed to simulate plant closed-circuit grinding practice; experimental data are given.

ORE CRUSHING MACHINERY

FOUNDATIONS. Novel Crusher Foundation Proves Economical and Efficient. Eng. and Min. Jl., vol. 129, no. 8, Apr. 1930, p. 406, 3 figs. Brief note on installation of 37,000-lb. crushing unit directly above steel ore bin at Santiago mine in State of Morelos, Mexico; set of Traylor rolls is supported on two concrete columns, 38 ft. high and 15 in. thick, to keep weight of unit off ore bin.

ORE SAMPLING

METAL CONTENT. Sampling for Determination of Average Metal Content of Crude Ores and Success of Treatment (Ueber Probenahme zur Ermittlung des Durchschnittsmetallgehaltes von Roherzen und des Aufbereitungserfolges), E. Barnitzke. Metall und Erz (Halle), vol. 27, nos. 3 and 7, 1st Feb. no., pp. 53-56, and 1st Apr. no., pp. 179-187, 7 figs. Suggestions for taking samples; theory of sampling of well-mixed and of unmixed material; comparison of usual sampling methods; factors influencing reliability of sample; practical conclusions.

ORE TREATMENT

FLOTATION. Flotation Research, G. L. Landolt, E. G. Hill and A. Lowy. Eng. and Min. Jl., vol. 129, no. 7, Apr. 7, 1930, pp. 351-352, 2 figs. Notes on investigation to find which of various constituents of commercial cresylic acid were responsible for its flotative properties, and to ascertain relative flotabilities of those components that were affected; value of crude cresylic acid as frothing and collecting agent for galena or sphlerite depends apparently to large extent upon proportion of meta-cresol which it contains, and therefore upon its source.

Possibilities of Ammonia in Complex-Ore Flotation, F. G. Bacon. Eng. and Min. Jl., vol. 129, no. 8, Apr. 24, 1930, p. 404. Brief article, noting similarity between action of cyanide and of ammonia as flotation reagent; present cheapness of ammonia in tank car lots should permit saving of reagent expense; examples of behaviour of ammonia, with different ores, are given.

THICKENING. Thickening of Flotation Pulps (Concentracion de pulpas de flotacion), E. G. Howe. Ingenieria Internacional (New York), vol. 18, no. 2, Feb. 1930, pp. 92-94, 4 figs. Recent installations of equipment show trend to greater tonnage at lower costs; examples of pulp thickeners are given; discussion of types and their advantages; opinion is expressed favouring adaptability of baffled spitzkasten of large area to thickening of flotation pulps. Spanish translation of article indexed in Engineering Index 1929, p. 1341, from Eng. and Min. Jl. Jan. 26, 1930.

P

PAVEMENTS

CONCRETE. Special Characteristics of Concrete for Pavements, F. H. Jackson. Am. Concrete Inst.—Proc., vol. 25, 1929, pp. 768-775, and (discussion) 776-777. Discussion of forces which operate to destroy concrete pavements; author considers kind of structure; destructive agencies; weathering; scaling; traffic loads; surface wear; quality of pavement concrete as affected by construction methods. Part of symposium on Standards of Performance of Concrete for Various Uses.

PETROLEUM GEOLOGY

CANADA. Oil in Ontario and Quebec, C. Spearman. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 9, Feb. 28, 1930, pp. 205-207, 1 fig. Notes on possibilities of discovering commercial accumulations of oil and gas in certain paleozoic areas.

PHOSPHOR BRONZE

See Bearing Metals.

PHOTO-ELECTRIC CELLS

CHARACTERISTICS. The Photo-Electric Cell, C. G. Lemon. Television (Lond.), vol. 3, no. 25, Mar. 1930, pp. 23-25, 7 figs. Operating characteristics and general principles; characteristic curves, hook-ups, notes on conductance per lumen and on application are given.

PILE DRIVING

METHODS. Rapid Driving of 2,600 Wood Piles on a Chicago Building, J. D. Levin. Eng. News-Rec., vol. 104, no. 16, Apr. 17, 1930, p. 657, 1 fig. Report on methods of driving piles, during winter, on site of new building of Montgomery Ward and Co.; description of welded pile-driving rigs.

PILES

DESIGN. The Design of Piles, G. B. R. Pimm. Instn. of Civil Engrs.—Selected Eng. Papers (Lond.), no. 78, 1929, pp. 3-16, 4 figs. Relationship between impact and static loading; momentary loading and continuous loading; effect of form and materials of pile on its supporting power; justification for design of piles of specific form; stability of piles, alone among engineering structures, is determined by testing perilously near to destruction, and there is no reason why this should be done when means are available for calculating dimensions upon same principles as are employed in other structures.

PIPE, CONCRETE

CENTRIFUGAL CASTING. Centrifugally Spun Reinforced Concrete Pipe at Tacoma, Washington, W. A. Kunigk. Am. Water Works Assn.—Jl., vol. 22, no. 4, Apr. 1930, pp. 453-461. Report on manufacture of 7,542 lin. ft. of 63 in. and 7,010 lin. ft. of 51 in. diam. centrifugally spun, reinforced-concrete pipe; specifications; laying of pipe.

PIPE, WOOD STAVE

PATCHING. Patching Wood Stave Pipe, B. G. Davis. West. City, vol. 6, no. 4, Apr. 1930, pp. 25-26, 4 figs. Résumé of six years' experience with great variety of leaks.

PLATES

STRESSES IN. Web Stresses in Smooth Plates Subjected to Shearing Load (Ausbeulerscheinungen an ebenen auf Schub beanspruchten Platten), F. Bollenrath. Luftfahrtforschung (Munich), vol. 6, no. 1, Dec. 12, 1929, pp. 1-17, 37 figs. Results of tests on thin, plane, elastic plates fixed in two edges parallel to one another and subjected to load sheared in opposite direction but of equal forces, distributed equally over both edges. Bibliography.

PRESSURE VESSELS

ELECTRIC WELDING OF. Arc Welding at a Large Boiler Works. Engineer (Lond.), vol. 149, no. 3872, Mar. 28, 1930, pp. 344-345, 6 figs. Particulars of English electric welding installation in Thompson Bros. tank shops at Bilston; examples are given of welding chemical vessel tested to pressure of 1,500 lbs. per sq. in.; and welded rotary drier; installation is composed of 12 welding sets, each consisting of 10-hp. squirrel-cage induction motor coupled to steel-frame welding generator capable of giving from 250 to 300 amperes at 30 volts.

PULVERIZED COAL

FIRING WITH. Pulverized Fuel Firing, A. H. Hayes. World Power (Lond.), vol. 13, no. 76, Apr. 1930, pp. 382 and 385. Direct firing versus storage system; rise to prominence of pulverized-fuel firing for boilers has been accompanied by more or less constant controversy as to respective methods of dealing with fuel after grinding; survey of direct system and of storage system is made with view to ascertaining their relative methods for any given set of conditions.

PUMPING STATIONS, ELECTRIC

AUTOMATIC. Automatic Pumping Stations, K. Thuerlemann. Brown Boveri Rev. (Baden), vol. 17, no. 2, Feb. 1930, pp. 67-78, 28 figs. Chief designs of plants installed by Brown Boveri and Co.; most important diagrams of connections for various kinds of current and for different control; description of equipment and photographs of some complete pumping stations.

PUMPING STATIONS, DIESEL

TEXAS. Oil Power for Irrigation Along the Rio Grande, O. Adams. Power, vol. 71, no. 14, Apr. 8, 1930, pp. 556-557, 4 figs. Discussion of economical plant operation of Hidalgo Water Improvement District no. 4, Edinburg, Texas; plant contains 360-hp. Fairbanks-Morse Diesel engines, each equipped with slow-down devices; engines direct connected to 30-in. centrifugal pumps which handles water at rate of 23,300 gals. per minute against total maximum head of 40 ft., with pump efficiency of 84½ per cent; table of plant operation.

PUMPS

AIR-LIFT. Conveying Materials by Means of Air-Lift Pumps, F. Schildberger. Eng. Progress (Berlin), vol. 11, no. 4, Apr. 1930, pp. 100-103, 7 figs. Air-lift pumps operate in manner similar to that of pneumatic conveyors for grain, coal, sawdust, and similar goods, though with difference that air used is under compression instead of under vacuum; although mechanical efficiency of air-lift pumps is low, their absolute operating dependability and all-round freedom from trouble have made them indispensabie, particularly where rough operating conditions prevail; examples of practical application.

WATER HAMMER IN DISCHARGE PIPES. Water Hammer in Discharge Mains of Pumps (Druckstoesse in Pumpensteigleitungen), O. Schnyder. Schweizerische Bauzeitung (Zurich), vol. 94, nos. 22 and 23, Nov. 30, 1929, pp. 271-273, Dec. 7, 1929, pp. 283-286, 20 figs. Mathematical theory of water hammer in discharge pipes of pumps; charts for determination of pressure variations caused by sudden closure; features of special conical valves and other devices for minimizing water hammer, developed and manufactured by L. von Roll Eisenwerke Clus.

PUMPS, AIR LIFT

WATER. Pumping Water With Air Lifts. Power Plant Eng., vol. 34, no. 9, May 1930, pp. 511-512, 5 figs. General principles, calculating of air required and general discussion of type used; curves for simplifying air lift calculations; air lifts in sandy soil.

PUMPS, CENTRIFUGAL

DREDGING. Dredging with Centrifugal Pump, W. A. T. Gilmour. Can. Eng. (Toronto), vol. 58, no. 12, Mar. 25, 1930, p. 439, 2 figs. Wood trash pump attached to automobile chassis employed for dredging creek at Stouffville, Ont.

R

RAIL MOTOR CARS

STEAM. New Articulated Steam Rail Cars for Egyptian State Railways. Ry. Gaz. (Lond.), vol. 52, no. 13, Mar. 28, 1930, pp. 475-478 and 480, 11 figs. Cars built by Birmingham Railway Carriage and Wagon Co.; engine is Yorkshire type; it is of three-cylinder vertical double-acting balances type; cylinders are 5 ft. diam. by 8 in. stroke; steam distribution effected by Joy valve gear operating piston valves; engine develops 150 B.hp. on jack shaft at 308 m.h.p ; principal dimensions are length over cowcatchers 101 ft. 7 in.; engine truck wheelbase 7 ft.; weight on rail at engine truck 30 tons.

RAILROAD CONSTRUCTION

KANSAS CITY SOUTHERN. New K.C.S. Line Completes Ownership to Gulf Ports. Ry. Age, vol. 88, no. 16, Apr. 19, 1930, pp. 907-910, 6 figs. Kansas City Southern opened new line 13.27 mi. long between Grandview, Mo., and Leeds, near Kansas City; shortest rail route from Kansas City to Gulf of Mexico at Port Arthur, Tex., and to Beaumont, and Orange, and Lake Charles, La.; three principal structures on line are reinforced-concrete viaducts over United States Highway No. 50 and Flying Field road, and steel viaduct on Mile 14; old and new alignments and profiles, showing improvement in grade over old line are given.

RAILROAD SIGNALS AND SIGNALING

CENTRAL CONTROL. D. & R. G. W Installs Centralized Traffic Control on 32 Miles od Single Track Line, B. W. Molis. Ry. Signaling, vol. 23, no. 2, Feb. 1930, pp. 48-50, 4 figs. Denver and Rio Grande Western installed centralized control signal system between Provo, Utah, and Midvale as parts of 1929 improvement programme; running time of freight trains reduced over one minute per mile of road; traffic and character of line; general Railway Signal Company's unit-wire type of centralized-control system is used to control power operated switches and signals which direct train movements.

COLOUR-LIGHT. Colour-Light Automatic Block Signals and Automatic Interlocking Installed on Janesville Line of the Milwaukee, L. B. Porter. Ry. Signaling, vol. 23, no. 4, Apr. 1930, pp. 141-144, 8 figs. Recent 18-mile installation includes trial sections of different methods of power supply for signals and track circuits; description of equipment and control scheme; lighting system and power supply.

INTERLOCKING. D. & H. Installs Unique Interlocking Arrangement for Switching Layout, A. H. Rice. Ry. Signaling, vol. 23, no. 3, Mar. 1930, pp. 95-97, 2 figs. Delaware and Hudson has recently completed interesting application of four-power switch machines and signals in main line approaching passenger station layout at Albany, N.Y.; complete installation cost $8,242 and permits savings in wages and operating expenses of $5,550 annually; installation pays for itself in 18 months; layout of switches and location of power machines.

Unique Interlocker, L. Wyant. Ry. Signaling, vol. 23, no. 2, Feb. 1930, pp. 61-64, 6 figs. Description of 42-lever electric interlocking plant including new and novel type of control machine, recently placed in service by Chicago, Rock Island & Pacific at Blue Island, Ill , near Chicago; track layout and traffic; features of new interlocking machine; basis for eliminating mechanical locking; storage-battery power supply.

TRACK CIRCUITS. Alternating Current Track Circuits. Am. Ry. Assn.—Signal Sec., Am. Ry. Signaling Principles and Practice, 1930, 64 pp., 38 figs. Alternating current track circuits on steam roads; bonding of track circuits; insulated rail joints; d.c. and a c. track circuits on electric roads using d.c. propulsion; a.c. track circuits on electric roads using a.c. propulsion; track-circuit formulae and their derivation; instructions for adjustment, maintenance, and operation of a.c. track circuits.

RAILROAD STATIONS

TORONTO. Trainshed, Toronto Union Station. Can. Ry. and Mar. World, no. 386, Apr. 1930, pp. 197-198, 2 figs. Brief discussion of construction features of trainshed which is 1,200 ft. long by 145 ft. wide and approximately 21 ft. 4 in. high; outstanding feature of trainshed is lighting scheme.

RAILROAD TERMINALS

WAREHOUSES. D. L. and W. Builds Large Terminal Warehouse. Ry. Age, vol. 88, no. 14, Apr. 5, 1930, pp. 816-820, 7 figs. Illustrated description of one of largest and most up-to-date railway terminal warehouses in country which is located in Jersey City, and which provides 1,240,000 sq. ft. of floor space for general storage, light manufacturing and l.c.l. freight handling; building is of reinforced concrete; floors are designed for heavy service; typical section through warehouse and viaducts showing details of construction; track viaducts; sawtooth platforms on first floor; upper floors are largely for storage; method of construction; facilities offer advantages to shippers.

Design of Lackawanna's Reinforced-Concrete Freight Terminal Warehouse at Jersey City, M. Hirschthal. Eng. News Rec., vol. 104, no. 13, Mar. 27, 1930, pp. 519-524, 7 figs. Design and construction of eight-storey structure, 848 x 162 ft., flanked by flat-slab viaducts carrying tracks and trackways forming part of extensive terminal development; concrete crib retaining wall used to hold fills.

RAILROADS

SNOW REMOVAL. B. T. U's. vs. Blizzard, S. C. Parker. Am. Gas. Jl., vol. 132, no. 2, Feb. 1930, pp. 46-47, 3 figs. Description of gas burners developed for purpose of keeping railroad switchpoints cleared during severe winter snows; notes on application of system in use of 376 burners in Chicago railroad yards.

REFUSE DISPOSAL

COLOGNE, GERMANY. Scientific and Constant Attention to Details in Refuse Collection and Disposal at Cologne, Germany, G. A. Soper. Am. City, vol. 42, no. 4, Apr. 1930, pp. 93-96, 8 figs. General description of municipal refuse disposal system; location of cans; regulation of contents of cans; dumping facilities for trailers; separation of refuse; incinerator units; by-products; disposal of fine screenings; cost data.

SWITZERLAND. The Disposal of Domestic Refuse by Incineration, A. Weigel. Eng. Progress, vol. 11, no. 4, Apr. 1930, pp. 104-109, 8 figs. Description of new refuse-disposal plant of city of Zurich erected by Bamag-Meguin A.-G. in accordance with system developed by Heenan and Froude of Worcester; refuse pretreatment; furnace plant; utilization of heat.

REFUSE INCINERATORS

ELMIRA, N.Y. Modern Incineration Solves Another Garbage Problem, M. W. Wipfler. Am. City, vol. 42, no. 5, May 1930, pp. 101-105, 4 figs. Problem of garbage committee in selecting site; layout of plant 60 ft. sq. and 60 ft. high costing $7,900; method of operation of plant and collection of garbage.

SARNIA, ONT. Construction of Incinerator at Sarnia, Ont., W. B. Batty. Can. Engr. (Toronto), vol. 58, no. 14, Apr. 8, 1930, pp. 473-474, 1 fig. Description of two-cell Hankin high-temperature type incinerator having guaranteed capacity of 25 tons of garbage in 10 hours; plant equipped with forced draft at 300 deg. fahr.; temperature of 1,900 deg. fahr. in combustion chamber.

STEAM GENERATION. Utilization of City Refuse for Heat Production (Die waermetechnische Ausnuetzung des staedtischen Muells), H. Koschmieder. Gesundheits-Ingenieur (Munich), vol. 53, no. 3, Jan. 11, 1930, pp. 17-21, 3 figs. Data of calorific value of city refuse; features of several systems of refuse utilization, including those of Doerr, Herbertz, and Humboldt methods of preparation for increasing calorific value.

RESERVOIRS

SILT REMOVAL. Silting and Life of Southwestern Reservoirs, R. G. Hemphill. Am. Soc. Civil Engrs.—Proc., vol. 56, no. 5, May 1930, pp. 967-979. Paper cites records of silt load of several of principal streams of Southwest to indicate importance of silt problem and necessity for comprehensive study of it; descriptions of methods used, records obtained, and some tentative conclusions drawn from investigation of silt in Texas streams, which is now entering its sixth year; removing silt from reservoirs; prevention of silting; estimating effective life of reservoirs.

ROAD MACHINERY

DESIGN. Design Developments in Road Machinery, G. S. Brady. Product Eng., vol. 1, no. 2, Feb. 1930, pp. 58-59, 6 figs. Four years have made remarkable changes in design of road-building and allied machinery, of which more than $10,000,000 worth are sold annually in United States and large quantities exported; brief discussion of recent developments and description of specific machines.

ROAD MATERIALS

COLD EMULSIONS. Asphalt Emulsions for Low-Cost Roads, H. L. Bowlby. Contract Rec. (Toronto), vol. 44, no. 13, Mar. 26, 1930, pp. 371-373, 4 figs. British practice indicates that cold application of emulsified asphalts is meeting with complete success; methods employed; use of emulsions with gravels.

ROADS

SNOW REMOVAL. Keeping Ontario Highways Open for Winter Motor Vehicle Traffic. Can. Ry. and Mar. World, no. 384, Feb. 1930, pp. 106-107, 5 figs. Description of equipment and methods employed for snow removal of Ontario highways.

ROADS, ASPHALT

DESIGN. Rational Design of Asphaltic-Oil Roads, H. G. Nevitt. Eng. News Rec., vol. 104, no. 17, Apr. 24, 1930, pp. 686-689, 2 figs. Review and appraisal of previous formulae and statement of improved formula for determining oil content for various materials in surface-mixed asphaltic-oil roads, with tables and charts of values of factors in formula.

ROADS, CONCRETE

RESURFACING. Bituminous Surface for Concrete Roads, W. H. Sharp. Can. Engr. (Toronto), vol. 58, no. 12, Mar. 25, 1930, pp. 437-438. Resurfacing concrete roads with bituminous wearing surfaces, in Connecticut; with various types of premixed bituminous pavements; causes of failure; experiments with Colprovia; semi-rigid type pavements. Paper presented before Asphalt Paving Conference.

RUBBER

STRENGTH. The Tensile Strength of Java Plantation Rubber, O. de Vries and R. Riebl. India-Rubber Jl. (Lond.), vol. 79, no. 12, Mar. 22, 1930, pp. 419-420. Tables are given supplementing statistics published in same magazine in 1927-1928 investigating supposed deterioration in tensile strength of plantation rubber; both sets of figures show steady increase in tensile strength and no deterioration.

S

SCREW THREADS

GAUGES. Improved Screw-Thread Measuring Equipment (Verbessertes Gewindemessgeraet), F. Goepel. Zeit. fuer Instrumentenkunde (Berlin), vol. 50, no. 1, Jan. 1930, pp. 33-42, 10 figs. partly on supp. plate. Measuring equipment described in Zeitschrift fuer Feinmechanik und Praezision, 1924, has been improved; improved equipment and its applications are described.

SEWAGE DISPOSAL

REVIEW. Engineering Applications of Trade Waste Treatment Processes, H. N. Jenks. Surveyor (Lond.), vol. 77, no. 1990, Mar. 14, 1930, pp. 351-353, 3 figs. Review of engineering practice in separation of solids from liquid, disposal of solids, and stabilization of liquid residue; effectiveness of mechanical aeration; value of stage treatment; diagram showing use of typical time-oxygen demand curve for computing probable oxygen requirements throughout stream-flow sewage treatment plant; probable pumping requirements for mechanical aeration of domestic sewage containing trade waste; stream-flow aeration tanks; declogable biologic filters.

SLUDGE DIGESTION. The Progress of Separate Sludge Digestion, C. A. Smith. Mun. Sanitation, vol. 1, no. 2, Feb. 1930, pp. 70-73, 3 figs. Definitions of terms; history of sludge digestion; structural design progress; mechanical transfer of sludge preferred; research developments; opposite reactions; advantages.

STREAM FLOW AERATION. Sewage Treatment by Stream-Flow Aeration, H. N. Jenks, and M. Levine. Engineering (Lond.), vol. 129, no. 3353, Apr. 18, 1930, p. 504. Improvement in activated-sludge method based on application of stream-flow principle; effect of recirculation on retention period; efficiency effect of biologic staging; cost of construction. Abstract of report no. 1248 of U.S. Pub. Health Reports, indexed in Engineering Index 1929, p. 1656, from Water Works and Sewerage, Sept. 1929.

SEWAGE DISPOSAL PLANTS

BLACKSBURG, VA. Initial Operation of Imhoff Tank and Contact Beds at Blacksburg, Va., F. H. Fish. Indus. and Eng. Chem., vol. 22, no. 5, May 1930, pp. 511-513, 3 figs. Description and operation of plant equipped with rectangular Imhoff tank 31 x 41 ft. and 27 ft. depth inside; character and amount of sewage; analyses of effluent and water supply.

COLUMBUS, OHIO. Activated Sludge Process for Columbus, Ohio Water Works and Sewerage, vol. 77, no. 3, Mar. 1930, p. 78. Engineering features and costs of two plans submitted for preventing pollution of Scioto River.

PRIVATE, GERMANY. Instructions for Examination and Licensing of Private Sewerage Installation (Richtlinien fuer die Beurteilung und Zulassung von Hausklaergruben und Grundstueckskläeranlagen). Gesundheits-Ingenieur (Munich), vol. 53, no. 7, Feb. 15, 1930, pp. 105-110, 7 figs. Rules on treatment and disposal of sewage and wastes from small private plants, as formulated by Landesanstalt fuer Wasser, Boden und Lufthygiene in Berlin-Dahlem.

SEWER SIPHONS

DOUBLE. Construction of a Double Sewer Siphon Under the Rhine near Cologne (Der Bau eines Schutzwasser-Doppelduekers under dem Rhein bei Koeln), O. Werken. Bautechnik (Berlin), vol. 8, no. 10, Mar. 7, 1930, pp. 137-139, 3 figs. General discussion of conditions which led to adoption of project involving construction of twin sewer siphon, 1.85 m. interior diam., to be laid at depth of 17 m. under water. (To be continued.)

SHAPERS

HYDRAULICALLY-DRIVEN. Hydraulically-Driven Shaping Machine. Engineer (Lond.), vol. 149, no. 3872, Mar. 28, 1930, p. 360, 2 figs. Details of new shaper by Lange and Greilen, of Halle, Germany; reciprocating head of machine is actuated directly by oil pressure, and oil pressure is also used for traverse of table, and serves as means of speed regulation; machine is driven primarily by flanged electric motor.

SHEARS

CANADA. Build Huge Shear in Canada. Can. Foundryman (Toronto), vol. 21, no. 2, Feb. 1930, p. 2, 1 fig. John Bertram & Sons Co. have completed shearing machine which is largest machine of its type ever made in Canada; it will shear through bar of mild steel 22 in. wide, ¾ in. thick; extra rigidity had to be embodied in design, and, for this purpose, cover plate is tied into frame and is provided with tie bars having double nuts on each end.

SHEET METAL WORKING

STAMPING. Flow Phenomena in Deep Drawing of Sheet Metal and Cause of Crack Formation in Stampings (Fliesserscheinungen bei Tiefstanzblechen, etc.), I. Fetschenko-Tschopiwski and M. Opalko. Zeit des Oberschlesichen Berg. u. Huettenmaennischen Vereins Zu Katowice (Katowice), vol. 69, no. 4, Apr. 1930, pp. 182-184, 16 figs. on supp. plates. Flow lines appear on surface of sheet metal as result of process and these have influence on punching quality and crack formation by Erichsen tests; this test is not always dependable; supplementary test for determining stamping quality of materials is described.

SHEET PILING

DESIGN. Design of Anchored Sheet Piling Walls (Die Berechnung verankerter Bohlwerke), Lohmeyer. Bautechnik (Berlin), vol. 7, no. 5, Jan. 31, 1930, pp. 60-65, 10 figs. Theoretical mathematical analysis of stresses in sheet piling walls, lower portion of which is embedded in ground and top of which is braced and anchored; problem is varied by assuming or not assuming fixedness at lower end of wall.

SIPHON SPILLWAYS

SMALL. Small Siphon Spillway Serves City Distribution Reservoir, J. R. Grant. Eng. News-Rec., vol. 104, no. 18, p. 726, 2 figs. Description of siphon spillway of compact design recently built to discharge 100 sec.-ft. overflow from Vancouver Heights distributing reservoir at Vancouver, B.C.; design check secured by means of quarter size test model.

SILVER MINES AND MINING

BRITISH COLUMBIA. Silver Producing Mines of British Columbia, V. L. Eardley-Wilmot. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 6, Feb. 7, 1930, pp. 134-135. Largest silver producers in British Columbia are mines in which silver content is low and metal is of only secondary importance; Sullivan mine is largest individual producer of silver in British Empire; Slocan and Boundary silver-lead mines; notes on coast and northern silver producers.

STEAM ACCUMULATORS

PEAK LOAD USES OF. Steam Storage in Its Relation to the Peak Load Problem in Industrial Steam Plant, E. G. Ritchie. S. Wales Inst. of Engrs.—Proc., vol. 46, no. 2, Mar. 13, 1930, pp. 69-89, 9 figs. Discussion of "bottle-neck" effect in industry; limitations of boiler equipment; effect of steam-pressure variations; thermal flywheel; Ruths steam-storage system; steam storage and industrial peak load; other systems of thermal storage; steam storage in steel works, and at coal mines; steam storage in relation to efficient operation of waste-heat boilers.

STEAM CONDENSERS

CORROSION. The Prevention of Trouble due to Aquatic Growths in Condenser Systems. D. V. Onslow. World Power (Lond.), vol. 13, no. 76, Apr. 1930, pp. 379-381. Article is based on replies received by British Electrical and Allied Industries Research Association to their questionnaire sent to manufacturers of condensers and to large users of condensing plant with regard to troubles caused by accumulation of mussels and other aquatic growths in condenser tubes.

STEAM-ELECTRIC POWER PLANTS

GREAT BRITAIN. The Extension Plant at Leicester. Elec. Times (Lond.), vol. 77, no. 2000, Feb. 20, 1930, pp. 373-377, 11 figs. New section will contain four water-tube boilers, two 25,000-kw. generating sets, two house service turbo-generator sets of 1,500 kw. each; steam pressure is 350 lbs. per sq. in. and there is no re-superheating; large boilers of 180,000 lbs. per hour for two hours on overload are used together with steel tube economizers, Murray water-tubewalls and ashpit water screen; coal storage and reclaiming plant, new 25,000-kw. English Electric turbo set and exciter, switchgear etc., are illustrated.

Reconstruction of Lots Road Power Station. Engineering (Lond.), vol. 129, no. 3351, Apr. 4, 1930, pp. 443-444, 2 figs. Account of reconstruction of station in Chelsea from which most of electric energy required for London underground railways is derived; four cross-drum marine-type boilers, with output of 50,000 lbs. of steam each, and operating at 200 lbs. and 700 deg. fahr., were erected; three of 6,000-kw. sets have been removed, their place being taken by equal number of 15,000-kw. machines; further 15,000-kw. unit is in course of erection; as result of this reconstruction, capacity of station will be raised from 48,000 to 105,000 kw.

MILWAUKEE. Lakeside's Second High-Pressure Unit, T. Wilson. Power, vol. 71, no. 16, Apr. 22, 1930, pp. 618-621, 7 figs. Station's nine-year record of operating economy is expected to be further enhanced by added 1,300 lbs. unit; feedwater flow and steam flow are maintained coincident; water level checked by means of periscope; flue gas mill drying improves boiler room efficiency and reduces investment.

STEAM ENGINES

TRACTION TYPE. The Development of the Locomobile, H. Scharbau. Eng. Progress (Berlin), vol. 11, no. 1, Jan. 1930, pp. 1-4, 9 figs. Review of development from early model to modern superheated type; modern locomobile for combined power and heat supply.

UNIFLOW. New Vertical Uniflow Engine. Plant Eng., vol. 34, no. 8, Apr. 15, 1930, pp. 464-466, 5 figs. Illustrated discussion of Skinner 3-cylinder, vertical uniflow engine equipped with expansion-compensating, double-seat pippet admission valves; sectional and end elevation views are given; description of valve arrangement and operation.

STEAM PIPE LINES

EXPANSION IN. Study of Design of Steam Pipe Line with Regard to Expansion (Etude d'un tracé de tuyauterie à vapeur au point de vue de la dilatation), H. Carlier. Chaleur et Industrie (Paris), vol. 11, no. 120, Apr. 1930, pp. 174-177, 13 figs. Study of elastic deformations; importance of investigation of supports is set forth.

HIGH-PRESSURE. Measurement of Fatigue of High-Pressure Steam Pipe Lines (La mesure de la fatigue des tuyautcries de vapeur à haute pression), F. L. Atthalin. Technique Moderne (Paris), vol. 22, no. 8, Apr. 15, 1930, pp. 274-278, 10 figs. Experimental study of additional strength due to oval shape of cross-section in bends; results of tests are recommended for application in 44-kg., 450-deg. cent. pipe-line system in Issy-les-Moulineaux power plant.

STEAM POWER PLANTS

HIGH-PRESSURE. High Pressure and Temperature in Power Generation, G. A. Orrok. World Power (Lond.), vol. 13, no. 74, Feb. 1930, pp. 185-186 and 189. Article deals with progress in thermal efficiency of central stations; emphasizes reasons and itemizes causes which have brought gratifying results; indications of commercial efficiency as compared with thermal efficiency are given and progress in system economy through interconnection and community interest is stressed. Paper presented before World Power Conference, Tokyo.

The Power Plant of I.C.I., Ltd., H. A. Humphrey, D. M. Buist, and J. W. Babsall. Elec. Rev. (Lond.), vol. 106, no. 2730, Mar. 21, 1930, pp. 562-563 and (discussion) 563. Account of pulverized-fuel, high-pressure, high-temperature, industrial plant installed by Imperial Chemical Industries, Ltd., for supplying steam and electricity to Billingham-on-Tees factory of Synthetic Ammonia and Nitrates, Ltd.; steam pressure is 800 lbs. per sq. in. gauge; maximum temperature of 856 deg. fahr. Extracts from paper read before Instn. Elec. Engrs.

INDUSTRIAL DESIGN. Trend in Design and Operation of Industrial Plants with Special Reference to Furnace Volume, H. Kreisinger. Engrs.' Soc. of West. Penn.—Proc., vol. 45, no. 9, Dec. 1929, pp. 426-440 and (discussion) 441-450, 5 figs. Trend in industrial plants is toward larger steam-generating units; special advantages of high pressures; discussion of fuels burned, furnace design, and process of combustion.

STEAM TURBINES

MARINE. The Design of Single-Reduction Gearing for Compound Turbines, T. Gardner. Engineering (Lond.), vol. 129, no. 3353, Apr. 18, 1930, pp. 500-502. Notes refer to usual arrangement of geared steam turbines, such as are used in high-powered destroyers or flotilla leaders in which reduction of weight to minimum combined with maximum loading of power elements, is primary consideration.

STEEL

CHROMIUM. *See Chromium Steel.*

COLD DRAWING. Selection of Sheet Steel for Deep Drawing, W. H. Graves. Am. Mach., vol. 72, no. 18, May 1, 1930, pp. 718-719, 3 figs. Criteria for workability and physical properties discussed; Erichsen and Rockwell tests for no. 19 gauge steel; specifications of steel for extra deep drawing and deep drawing recommended.

CREEP AT HIGH TEMPERATURES. Creep of Steel at High Temperatures, F. H. Norton. Brit. Non-Ferrous Metals Research Ass.—Bul., no. 28, Mar. 1930, pp. 15-18. Author's object is to provide engineers with data on safe stresses for various steels, especially at high temperatures.

MANUFACTURE—DUPLEX PROCESS. Duplex Practice, J. E. Carlin. Am. Soc. Steel Treating—Trans., vol. 17, no. 5, May 1930, pp. 631-637. Article is prompted by fact that duplex process embodies two features whose successful utilization will very materially assist in changing basic open-hearth process from art to science; these two features are change of slag by use of tilting furnace and deoxidation with carbon; as long as slag contains iron oxide, oxidation is predominant; if oxidizing slag is replaced by neutral one made up of lime and spar, it should be possible to reduce remaining oxide by residual or additional carbon.

NITRIDED ANNEALING OF. Annealing or Softening of Nitrided Steels by Chemical Decomposition of the Nitrides, W. J. Merten. Am. Soc. Steel Treating—Trans., vol. 17, no. 5, May 1930, pp. 638-644 and (discussion), 644-645, 4 figs. Method of softening nitrided case of aluminum-molybdenum and aluminum-chromium nitriding steels by chemical decomposition of nitrides in fused sodium-potassium chloride bath; temperature of bath is low; points out service conditions under which nitrided steel parts do not perform satisfactorily since, due to atmospheric conditions, deterioration by chemical reactions are inevitable.

QUENCHING. A Study of the Quenching of Steels, H. J. French. Am. Soc. Steel Treating—Trans., vol. 17, no. 5, May 1930, pp. 646-727, and (discussion) 728-730, 54 figs. Paper is based upon researches carried out by author and former associates at U.S. Bureau of Standards; description of test methods; characteristics of cooling curves obtained in different coolants; effects of size and shape of sample upon cooling of steels; consideration is given to both centre and surface cooling in different coolants, and data for centre cooling are summarized graphically and in equations.

STEEL CASTINGS

ALLOY-STEEL. Alloyed Steel Castings in Theory and Practice (Legierter Stahlguss in Theorie und Praxis), A. Rys. Stahl und Eisen (Duesseldorf), vol. 50, no. 14, Apr. 3, 1930, pp. 423-438, 56 figs. Improvements of ingot steel to meet present mechanical, physical, and chemical requirements. by addition of alloying elements; investigation of different alloy-steel castings to determine strength, high-temperature resistance, effect of heat treatment, endurance, corrosion resistance, impact hardness, etc.; magnetic and non-magnetic acid- and heat-resisting steels.

HEAT TREATMENT OF. Continuous Equipment for Heat-Treating Steel Castings, A. C. Jones. Fuels and Furnaces, vol. 8, no. 4, Apr. 1930, pp. 475-478, 4 figs. Two continuous, oil-fired, pusher-type furnaces used in heat-treating steel castings; heat to 1,650 deg. fahr., quench in air and draw at 1,225 deg. fahr.

TEMPERATURE EFFECT. Strength of Steel Castings at Elevated Temperature with Special Regard to Influence of Nickel (Die Dauerstandfestigheit von Stahlguss bei erhoehten Temperaturen), A. Thum and H. Holdt. Giesserei (Duesseldorf), vol. 17, no. 14, Apr. 4, 1930, pp. 333-339, 10 figs. Results of tests on steel castings with varying nickel content in annealed and unannealed state to determine impact and notch hardness, tensile strength, elastic limit, elongation and shrinkage at temperatures ranging from 20 to 500 deg. cent.; nickel content up to 1.5 per cent improves all properties.

STEEL FOUNDING

COPPER MOULDS. The Casting of Steel in a Water-Cooled Copper Ingot Mould, W. Oertel. Iron and Steel Industry (Lond.), vol. 3, no. 5, Feb. 1930, pp. 137-139 and (discussion) 140-141, 8 figs. Paper deals with investigation of properties of some steels cast in water-cooled copper ingot moulds, including mechanical strength, crystalline structure, and, to some extent, hardness ranges of quenched specimens; number of times specimens could be quenched without cracking, and resulting magnetic properties, are also dealt with. Abstract of report no. 145, of Verein duetscher Eisenhuettenleute, indexed in Engineering Index 1929, p. 1772, from Stahl u. Eisen, May 9.

PLANT FOR LARGE CASTINGS. Plant for Making Large Steel Castings, C. Longenecker. Blast Furnace and Steel Plant, vol. 18, no. 4, Apr. 1930, pp. 622-623 and 626, 5 figs. Description of plants of Ohio Steel Foundry Co., Lima and Springfield, Ohio; at Springfield plant, steel is melted in electric furnaces; at

Lima, melting is done in open hearth furnaces; metal of which castings are composed is either straight carbon or alloy steel; output of Lima plant is approximately 2,200 tons of castings per month; smaller castings are manufactured at Springfield plant which has monthly capacity of 600 tons of small electric steel castings and 100 tons of heat and corrosion-resisting castings.

Rustless Castings. Make Rustless Steel Castings. Iron Age, vol. 125, no. 14, Apr. 3, 1930, pp. 993-996, 6 figs. Specialized foundry for manufacture of heat-resisting alloy castings, designed as model plant built by Ohio Steel Foundry Co. at Springfield, Ohio; foundry has capacity of 100 tons of castings per month; centrifugal castings machine, designed by company, for making pipe 4 to 16 in. in diam., is included in equipment; foundry building is steel frame structure 200 ft. long and 100 ft. wide; melting is done in 1-ton standard type Swindell electric furnace; usual furnace heat is 2,500 lbs.; gas-fired ovens dry moulds and cores.

STEEL STRUCTURES

Design. Some Moot Points in Steelwork Design, C. S. Gray. Structural Engr. (Lond.), vol. 8, no. 4, Apr. 1930, pp. 155-166, 21 figs. Discussion of end reactions on I beams, concentrated loads and shear stresses in I beams, riveting of flange plates to I sections, principal stresses in I beams, diagonal compression, stiffeners of plate girders.

STOKERS

Travelling-Grate. Recent Developments in Travelling-Grate Stokers (Die neuere Entwicklung der Wanderrostfeuerung), Presser. Archiv fuer Waermewirtschaft (Berlin), vol. 11, no. 4, Apr. 1930, pp. 131-136 ,18 figs. Review of recent improvements; chain-grate stoker and experiences made with it outside of Germany; results obtained with forced-draft zone grate, and suggestions for improvement; influence of coal burned per unit grate area on temperature of firebars; prospects for travelling-grate stokers.

STOVES

Manufacture. The Guelph Stove Plant of the T. Eaton Co., J. Breakey. Can. Foundryman (Toronto), vol. 21, no. 1, Jan. 1930, pp. 9-12, 7 figs. Methods and equipment of stove foundry at Guelph, Ont.; details of moulding machines; and iron and coke supplies.

STREET RAILROAD TRACKS

Construction. A Successful Reinforced Concrete Base for Street Railway Tracks, I. O. Mall. Concrete, vol. 36, no. 4, Apr. 1930, pp. 13-18, 6 figs. Roadbed design of 4 mi. of single track in Canal Street, New Orleans; description of roadbed slab and resilient anchor plate or diaphragm; filling with asphalt and testing of diaphragm; provision for temperature changes; use of granite block along rails; construction of track.

Design. Track Without Ties, I. O. Mall. Elec. Ry. Jl., vol. 74, no. 3, Mar. 1930, pp. 154-157, 9 figs. Design adopted after prolonged experimentation has little resemblance to usual types; reinforced-concrete foundation acts as unit to hold rails in position; first cost is $75,000 per mile; maintenance cost is estimated at less than $100 per mile per year; diagram illustrating details of double anchorage unit for use under castings of special work.

STREET RAILROADS

Snow Removal. Snow Fighting Methods Used in Toronto, J. Metcalf. Elec. Traction, vol. 26, no. 2, Feb. 1930, pp. 57-59, 6 figs. Operating department of Toronto transportation commission charged with responsibility of snow removal; efficient apparatus employed.

STRUCTURAL STEEL

High-Grade. Improvements in Structural Steel, E. H. Schulz and H. Buchholtz. Metallurgist (Supp. to Engineer, Lond.), Mar. 1930, pp. 38-39. Survey of developments in structural steel; "Union Baustahl," developed at research institute of Vereinigte Stahlwerke A.G., is as good as silicon steel and there is no lowering of its properties in large sections; high copper content renders it resistant to rusting; it has been used considerably for heavy bridge construction, and found very satisfactory; results of aging tests; possibility of using it for forgings was investigated with very encouraging results. Abstract translated from V.D.I. Zeit., Nov. 2, 1929, indexed in Engineering Index 1929, p. 1807.

Welding. Arc Welding of Structural Steel, J. J. Wallace. Am. Welding Soc.—Jl., vol. 9, no. 3, Mar. 1930, pp. 61-66, 6 figs. Experiences of Joliet Engineering Co., Joliet, Ill., in use of arc welding for fabrication of trusses, towers, porch rails, gates, etc.

Strength Investigations on Welded Beam Connections, C. H. Jennings and A. A. Jakkula. Am. Welding Soc.—Jl., vol. 9, no. 4, Apr. 1930, pp. 22-41, 19 figs. Investigation of strength of flexible connections; properties of various beam connections were determined; design and preparation of test specimens; discussion of results.

STUCCO

Concrete. Standards of Performance of Concrete for Stucco, W. D. M. Allan. Am. Concrete Inst.—Proc., vol. 25, 1929, pp. 794-800. Discussion is limited to requirements for portland-cement stucco materials and does not touch on workmanship or construction details; durability; workability; watertightness; resistance to frost action; freedom from discoloration; freedom from crazing; windproofness and fire resistance. Part of symposium on Standards of Performance of Concrete for Various Uses. Paper indexed in Engineering Index 1929, p. 1810, from Advance Paper, for mtg. Feb. 12-14, 1929.

SUPERHEATERS

High-Temperature. Superheaters for High Steam Temperatures (Ueberhitzer fuer hohe Dampftemperaturen), W. Orth. Waerme (Berlin), vol. 53, no. 12, Mar. 22, 1930, pp. 227-229, 7 figs. New method is described showing that superheater tubes of SM steel are subject to internal corrosion even when steam is free from impurities and air, when steam temperature of 500 deg. cent. is exceeded; suggestions are given for design of superheaters for steam temperatures.

SURVEYING

Canada. The Engineer's Work in Surveying and Mapping, F. H. Peters. Eng. Instn. of Canada—Jl. (Montreal), vol. 13, no. 4, Apr. 1930, pp. 235-264 and (discussion) p. 283, 13 figs. Report of progress of geodetic and topographic surveying in Canada; mapping using vertical aerial photographs; phototopographic methods; four-mile maps using oblique aerial photographs; method of making marine charts; Canada's contribution to international map of world.

Triangulation, Canada. Progress in Triangulation During 1929, C. H. Ney. Can. Engr. (Toronto), vol. 58, no. 12, Mar. 25, 1930, pp. 425-426. Abstract of report of Geodetic Committee of Association of Dominion Land Surveyors, presented at annual convention; activities of divisions of triangulation, geodetic astronomy, levelling, etc.

T

TRACTORS

Manufacture of. All-Modern Equipment Produces Allis-Chalmers Tractor, W. Watson. Am. Mach., vol. 72, no. 11, Mar. 13, 1930, pp. 436-443, 13 figs. Description of machine tools used in new Allis-Chalmers Manufacturing Co. designed for production of 50 Model U tractors per day; special-purpose equipment and tooling predominate; analysis of equipment employed on different operations is given; layout of floor plans; transportation of parts by means of Louden overhead monorail system.

TUBES

Cold-Working. Study of Cold-Worked, Thick-Walled Tubes With Special Regard to Changes in Properties of Materials (Untersuchungen an kaltgereckten, dickwandigen Rohren, unter besonderer Beruecksichtigung der Veraenderungen der Werkstoffeigenschaften), H. Klein, Mitteilungen aus dem Wilhelm-Institute fuer Eisenforschung (Duesseldorf), vol. 11, no. 20, 1929, pp. 331-341, 13 figs. Theory of thick-walled hollow cylinders; calculation of stresses in such cylinders for elastic failure of materials; tests were carried out on specimen tubes of nickel-chromium and nickel-tungsten steel and of unalloyed steel.

TUNNELS, RAILROAD

English Channel. Channel Tunnel Gets Indorsement. Eng. News-Rec., vol. 104, no. 16, Apr. 17, 1930, pp. 659-660, 3 figs. Majority of committee appointed to consider practicability of 36-mi. link under water between England and France gives cautious and qualified approval; no difficult technical problems; cost would exceed $150,000,000; proposed tunnel plan; military aspects. See editorial comment on pp. 636-637, entitled Channel Tunnel Prospects are Poor.

Repair. Railroad Tunnel Refloored under Traffic when Walls Settle. Eng. News-Rec., vol. 104, no. 17, Apr. 24, 1930, pp. 689-690, 2 figs. Report on repairing tunnel no. 4 on main line of Southern Pacific Railway, leading out of San Francisco to south; concrete invert reconstructed with 12 in. I-beam reinforcing, under double track carrying more than 100 trains per day.

TUNNELS, VEHICULAR

Detroit. Tunnel Lining of Welded Steel, S. A. Thoresen. Iron Age, vol. 125, no. 14, Apr. 3, 1930, pp 985-989, 4 figs. Feature of Detroit-Windsor vehicular tunnel, largest shield-driven tunnel, lined with structural steel instead of conventional segments of heavy cast iron; relative advantages of cast iron and steel; design of steel lining; fabrication by pressing and welding; steel lining proves flexible when erected; comparison of weight and cost.

TURBO-GENERATORS

Breakdown of. Mechanical Degree of Safety in Large Turbo-Generators, H. Ricklu. Engineering (Lond.), vol. 129, no. 3350, Mar. 28, 1930, pp. 421-423, 4 figs. Serious accidents to 3,000-r.p.m. turbo-rotors have been reported during last two years; some of these have occurred at as early a stage as during overspeed tests at works in question, and others after plant had been in operation, sometimes after long period of service; cause of breakdowns appears to reside in certain properties of material. Abstract of paper read before World Power Conference in Tokyo.

V

VIADUCTS, STEEL

Reconstruction. Reconstruction of Liskeard Viaduct; and Scheme for Reconstruction of the Approach Spans of Royal Albert Bridge, Saltash, H. D. Smith. Instn. Civil Engrs.—Minutes of Proc., no. 4760, 1930, pp. 3-17, 9 figs. Reconstruction of concrete-steel viaduct up to 135 ft. in height, having 12 spans up to 66 ft. in length; reconstruction of railroad bridge carrying single line of Great Western Railway over river Tamar at height of 100 ft.

W

WATER BACTERIOLOGY

Study. The Relation of Direct Bact. Coli and Bact. Aerogenes Counts to Sources of Pollution, F. O. Tonney and R. E. Noble. Am. Water Works Assn.—Jl., vol. 22, no. 4, Apr. 1930, pp. 488-500 and (discussion) 500-501. Results of original study which showed that direct plating method with cyanide-citrate agar offers easy and reliable means of obtaining separate Bact. coli and Bact. aerogenes indices, also numerical ratio of organisms to each other, thus presenting new and more exact routine information on which to base sanitary judgment of water supplies. Bibliography. Paper presented before Water Purification Division of Toronto Convention.

WATER PIPE LINES

Pressure. High-Pressure Hydraulic Pipe Lines, F. G. Schranz. Baldwin Locomotives, vol. 8, no. 4, Apr. 1930, pp. 63-64, 4 figs. Discussion of high pressures in pipe lines; table giving characteristics of various grades and sizes of pipe used for hydraulic pipe lines; precautions to be taken in design and co-operation of high-pressure.

WATER POWER

Canada. Water Power Resources in the Dominion. Can. Engr. (Toronto), vol. 58, no. 14, Apr. 8, 1930, pp. 467-470. Review of available and developed water power resources of Canada, issued by Dominion Water Power and Reclamation Service of Department of Interior of Canada; central electric station industry; pulp and paper industry; capital invested in water power; statistics of developed water power distribution by industries and per 1,000 population, and developed power utilized in central electric station industry.

WATER TREATMENT

Iola, Kansas. Building Small Purification Plant at a Minimum Cost in Restricted Area, M. P. Hatcher. Water Works Eng., vol. 83, no. 8, Apr. 9, 1930, pp. 487-488 and 525, 1 fig. Description of new plant of Iola, Kans., having total capacity of 2,000,000 gals. per day; aeration and carbonation; method of handling lime and alum. Abstract from paper read before Am. Water Works Assn.

WATER WELLS

Water Wells. Wells as a Source of Municipal Water Supply, W. Kiersted, Jr., Am. Water Works Assn.—Jl., vol. 22, no. 4, Apr. 1930, pp. 470-479. Statistical data on use of wells as sources of water supply in United States; preliminary investigations; spacing of wells; importance of continuous records; Amarillo, Texas, operating results; comparison of modes of pumping wells.

WATER WORKS

Sioux Falls, S.D. Wells, Iron Removal Plant and Diesel Pumping Equipment at Sioux Falls, S.D., F. G. Gordon. Am. Water Works Assn.—Jl., vol. 22, no. 4, Apr. 1930, pp. 480-487, 1 fig. Description of water works deriving supply from two large circular, open wells, each 50 ft. in diameter, and from five closed wells of type patented by Maury.

WELDS

Stresses in. The Theory of Stresses in Welds, L. C. Bibber. Am. Welding Soc.—Jl., vol. 9, no. 4, Apr. 1930, pp. 104-137, 36 figs. Certain theories regarding strength of welds as affected by quantity and disposition of weld metal; design data and tables that will enable designers and draftsmen to use this information.

WIRE

Machines for Forming. Wire and Strip Metal Forming Machines. Machy. Market (Lond.), no. 1537, Apr. 18, 1930, p. 21, 2 figs. Description of improved four-slide automatic wire-forming machine and single-blow cold-heading machine built by E. White of Windsor Works, Redditch; machine will head wire up to 2½ times diameter of wire at single blow.

Z

ZINC ORE TREATMENT

Electrolytic. Status of Electrolytic Metallurgy of Zinc According to Latest Literature (L'état actuel de la métallurgie électrolytique du zinc d'après les dernière publications), A. Sanson. Revue de Métallurgie (Paris), vol. 27, no. 3, Mar. 1930, pp. 125-132, 7 figs. Details of Tainton process and plant in Kellogg, Idaho; results of tests; roasting, filtration, and purification; advantages of Tainton process.

Waelz Process. Zinciferous Slags and the Waelz Process (Zinkhaltige Schlacken und das Waelzverfahren), W. Stahl. Chemiker-Zeitung (Koethen), vol. 53, no. 8, Jan. 25, 1930, p. 79. Method of recovering zinc by roasting slag with coke in rotary kilns is described; during this process deposits containing considerable proportion of metallic iron are formed in them.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostat copies (white printing on a black background) of the articles listed in this section or others on engineering subjects can be obtained from the Engineering Societies Library at a cost of 25c. per page.

When ordering identify the article by giving: the author; the title of the article; the name of the periodical in which it appeared; and the volume and page numbers. A remittance of 25c. a page should accompany the order.

The print's size is limited to 11 by 14 inches, but where possible, two pages up to 7 by 9 inches in size will be photographed on one print, larger magazines require a print per page.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

AERIAL SURVEYING

Air Photography. Air Photography Surveys, J. Durward. Roy. Aeronautical Soc.—Jl. (Southampton), vol. 34, no. 34, no. 232, Apr. 1930, pp. 344-358, 7 figs. Various methods and phases of aerial photography and surveying are described; vertical photographs; aerial camera mounting; overlapping, mosaic and oblique photographs; vertical and oblique stereoscopic photographs; interpretation of air photographs; survey flying organization; procedure on air photo-survey reconnaissance; air-photograph cadastral mapping.

AERONAUTICAL INSTRUMENTS

Artificial Horizon. The Artificial Horizon, E. A. Sperry. Am. Soc. Mech. Engrs.—Advance Paper for mtg., May 19 to 22, 1930, 3 pp., 2 figs. Description of instrument developed recently to aid blind flying; through use of gyroscope gravity device is constructed with very slow rate of motion that will maintain horizontal position in airplane with sufficient accuracy to make most useful instrument; test data for instrument are given.

AIR COMPRESSORS

High-Pressure. High-Pressure Air Compressors. Engineering (Lond.), vol. 129, no. 3353, Apr. 18, 1930, pp. 506-507, 6 figs. G. and J. Weir, Ltd., have completed series of high-pressure air compressors, for manufacture on production basis with attendant advantages of interchangeability and decreased costs; of this series, some account is given and examples are shown.

AIRPLANE ENGINES

Design. Trend in Aircraft Engine Development, H. Caminez. Am. Soc. Mech. Engrs.—Advance Paper, for mtg. May 19-22, 1930, 10 pp. Enumeration of important factors determining performance; detailed comparison of air and water cooling; large European water-cooled engine develops one hp. per 1.2 cu. in. and weighs 0.80 lb. per hp.; difference between military and commercial engine; possibilities of Diesel cycle.

Diesel. Development of the Junkers-Diesel Aircraft Engine, Gasterstaedt. Nat. Advisory Committee for Aeronautics—Tech. Memorandum, no. 565, May 1930, 20 pp., 20 figs. Design and performance of 650-hp. 2-cycle engine; details of fuel injection and scavenging systems; vibration test.

Manufacture. Automotive Methods and Practices Involved in Aircraft Engines, O. E. Szekely. Am. Soc. Mech. Engrs.—Advence Paper for mtg., June 9-12, 1930, 13 pp., 6 figs. Comparison between cost of standard parts in automobile manufacturing and cost of parts in airplane manufacturing; metals that enter in automobile manufacturing can be secured in market at apparently very much lower price than when it is known they are intended for use in airplanes; relations are illustrated by formulae and graphs.

Supercharging. The Present Status of Superchargers for Aviation Engines, S. A. Moss. Am. Soc. Mech. Engrs.—Advance Paper for mtg. May 19-22, 1930, 4 pp. Review of application and possibilities of centrifugal superchargers; typical designs are illustrated and discussed; geared and exhaust drive types; manufacture at River Works of General Electric Co., Lynn, Mass.

Vibration. Vibration Characteristics of Aircraft-Engine Crankshafts, F. L. Prescott. Am. Soc. Mech. Engrs.—Advance Paper for mtg., May 19, to 22 1930, 11 pp., 22 figs. Report on tests with recording torsiometer by Material Division of United States Air Corps at McCook Field, Dayton, O.; diagrams show record of torsional vibration of Liberty crankshaft with metal and wood propellers; method of determining acceleration from records. Bibliography.

AIRPLANES

Autogiros. *See Autogiros.*

Design. Aeronautical Progress, 1914-1930, R. V. Southwell. Engineer (Lond.), vol. 149, no. 3878, May 9, 1930, pp. 512-514; see also Engineering (Lond.), vol. 129, no. 3356, May 9, 1930, pp. 611-613. Author maintains that kernel of present knowledge of aerodynamic theory is contained in lectures delivered in 1912 and 1914, by Mallock and Lanchester, respectively; in past 16 years safety has been attained; what mainly delays comfort is noise; aero-dynamic efficiency is slightly improved in spite of increased speeds; range has been multiplied by 13, rate of climb by 3, altitude by nearly 3, speed by nearly 4; structural design has not fallen behind. Paper read before Instn. Civ. Engrs., May 6, 1930.

Light Alloys For. Some Characteristics of Light Alloys for Aircraft, H. W. Gillett. Am. Soc. Mech. Engrs.—Advance Paper, for mtg., May 19 to 22, 1930, 6 pp. Description of various light alloys that might be used to advantage in aircraft construction; their advantages and drawbacks; cost and data; brief notes on forging and casting. Bibliography.

AIRSHIPS

Mooring Masts. Airship Mooring-Strain Indicator. Engineering (Lond.), vol. 129, no. 3355, May 2, 1930, pp. 584-585, 4 figs. At mast in Cardington, forces are transmitted through steel mooring tube, bending of which is measure of their magnitude; to measure bending two electric strain gauges are mounted on outer tube which is co-axial with mooring tube but not exposed to stress; spring-controlled plungers extending radially inwards from gauges rest on outer surface of mooring tube, so that any bending of latter is transmitted to gauges by inward or outward movement of plungers.

ALLOY STEELS

Properties. Physical Properties of Pure Chromium and Tungsten Steels (Die physikalischen Eigenschaften von reinen Chromund Wolframstaehlen), F. Staeblein. V.D.I. Zeit. (Berlin), vol. 74, no. 17, Apr. 1930, p. 541. Notes on specific gravity, specific resistance, magnetic properties, thermal conductivity and heat expansion of alloys containing about 25 per cent chromium or tungsten. Indexed in Engineering Index, 1929, p. 151, from Archiv fuer das Eisenhuettenwesen (Duesseldorf), Oct. 1929.

ALLOYS

Aluminum. *See Aluminum Alloys.*
Brass. *See Brass.*
Copper. *See Copper Alloys.*
Light. *See Airplanes, Light Alloys for.*

ALUMINUM ALLOYS

Light. Recent Progress in Light Aluminum Alloys (Les récents progrès des alliages légers d'aluminium), L. Guillet. Génie Civil (Paris), vol. 96, no. 19, May 10, 1930, pp. 449-454, 5 figs. Properties of aluminum-silicon-magnesium, and aluminum-copper alloys, also of alloys of aluminum-copper-silicon with or without manganese.

Properties. Brinell Hardness, Elastic Limit, and Tensile Strength of Commercial Aluminum Alloys (Brinellhaerte, Elastizitaetsgrenze und Zugfestigkeit verguetharer Aluminiumlegierungen), P. Melchior. Zeit. fuer Metallkunde (Berlin), vol. 22, no. 5, May 1930, pp. 175-176, 3 figs. Results of author's investigation of relations between Brinell hardness, elastic limit and tensile strength, as reported by H. Bohner, indexed in Engineering Index, p. 157, from Nov. 1929, issue of same journal.

AQUEDUCTS

New York City. New York to Rebuild Century-Old Croton Aqueduct as a Safety Measure, W. W. Brush. Water Works Eng., vol. 83, no. 11, May 21, 1930, pp. 736-738 and 851, 8 figs. Chief Engineer of Department of Water Supply, Gas and Electricity of New York City states that city must have added water soon and Croton system offers best temporary supply; typical sections of old Croton Aqueduct; formation of cracks in old Croton Aqueduct; life of masonry aqueducts.

ARCHES

Stresses. Dependability of the Theory of Concrete Arches, H. Cross. Univ. of Illinois—Eng. Experiment Station—Bul., vol. 27, no. 29, Mar. 18, 1930, pp. 1-34, 11 figs. Study of effect on moments and thrusts resulting from uncertainty as to physical action, under load, of different parts of arch; limit of uncertainty involved in these assumptions; sources of stress in arch; moments at crown and at springings produced by load; temperature change and abutment rotations; departure of stresses in any arch from values given by analysis can scarcely be greater than variations in quality of concrete.

AUTOGIROS

Characteristics of. The Autogiro: Its Characteristics and Accomplishments, H. F. Pitcairn. Franklin Inst.—Jl., vol. 209, no. 5, May 1930, pp. 571-584, 9 figs. Description of development and advantages of autogiro; safety and performance, horizontal speed 120 m.p.h. with 225 hp.; vertical descent 12 ft. per second.

AUTOMOTIVE FUELS

Volatility. Effective Volatility under Driving Conditions, J. E. Miller and G. G. Brown. Indus. and Eng. Chem., vol. 22, no. 6, June 1930, pp. 653-662, 16 figs. Definition of effective volatility under driving conditions and indication of how it may be determined from equilibrium volatility on A.S.T.M. distillation data.

Relation between Atmospheric Temperature, Fuel Volatility, and Engine Performance, C. L. Nickols and G. G. Brown. Indus. and Eng. Chem., vol. 22, no. 6, June 1930, pp. 662-671, 14 figs. Relation of effective volatility to engine performance; A.S.T.M. distillation characteristics required for satisfactory performance under different conditions of atmospheric temperature are suggested.

B

BEAMS

Concrete Tee. Simplified Formula for the Design of Reinforced Concrete Tee Beams, R. W. Reynolds. Engineering (Lond.), vol. 129, no. 3356, May 9, 1930, pp. 591-592, 4 figs. Formulae given are advocated for rapid economic and accurate design, making full use of maximum stresses which are to be permitted.

Concrete-Tile. Test of Composite Beams and Slabs of Hollow Tile and Concrete, D. E. Parsons and A. H. Stang. U.S. Bur. of Standards—Jl. of Research, vol. 4, no. 6, June 1930, pp. 815-849, 23 figs. Sixty reinforced beams or slabs, 12 of concrete and 48 composite beams representing portions of concrete and hollow tile slabs, were fabricated and tested in laboratory to determine value of tiles in assisting concrete to resist shear and bending; results of beam tests indicated that one row of tiles was equivalent in resisting shear to concrete rib of same depth and having width of 1.6 to 2.4 ins.; strength in shear of bond between concrete and hollow tile was affected by factors influencing compressive strength of concrete.

BEARINGS

Friction in. Experimental Research on the Friction of Pivots, A. Jaquerod, L. Defossez, and H. Muegeli. Nat. Advisory Committee for Aeronautics—Tech. Memorandum, no. 566, May 1930, 54 pp., 15 figs. Report on friction experiments with horizontal and vertical pivots, dry and lubricated; graphs show influence of speed and load, viscosity and aging of oil; interpretation of results; comparison with several theories on friction. Bibliography.

Tests on Friction in Journal and Roller Bearings (Versuche ueber die Reibung in Gleit- und Rollenlagern), E. Schneider. Petroleum (Berlin), vol. 26, nos. 7 and 11, Feb. 12, 1930, pp. 221-236, and Mar. 12, 1930, pp. 337-348, 16 figs. Study is based on so-called hydrodynamic theory of bearing friction. Feb. 12: Results of main tests on journal bearings; theoretical considerations, testing methods, and equipment employed. Mar. 12: Tests on friction of roller bearings; evaluation of results. Bibliography.

BERYLLIUM DEPOSITS

MANITOBA. Tin, Lithium and Beryllium Deposits of Southeast Manitoba, J. F. Wright. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 22, May 30, 1930, pp. 514-517, 4 figs. Tin, lithium and beryllium deposits attracting most attention are in that part of Oiseau River area along Winnipeg river east of Pointe de Bois and north to Shatford and Bernic lakes; general geology; general features of pegmatites; tin deposits; lithium deposits; beryllium deposits; summary of economic features; some of pegmatites of district may be in demand in future as source of feldspar.

BLASTING

MISFIRES. How Leakage of Current from an Electric Shot-Firing Circuit Causes Misfires, L. C. Ilsley, A. B. Hooker and D. H. Zellers. U.S. Bur. of Mines—Tech. Paper no. 471, 1930, 16 pp., 12 figs. Report covers tests at Pittsburgh Experiment Station of U.S. Bureau of Mines, that may be helpful in explaining probable cause and in preventing such misfires; firing characteristics of common type of electric detonator; limitations of portable blasting machines; theory of leakage of current from shot-firing circuit; preliminary measurements of leakage; laboratory tests; field tests; leakage through leg-wire coverings; limits of firing current used.

BOILERS

COMBUSTION CONTROL. Automatic Combustion Control for Boiler Furnaces, G. R. Bamber. Inst. Mech. Engrs.—Proc. (Lond.), no. 5, Dec. 1929, pp. 1099-1113, 1 fig. Automatic control of combustion in boiler furnaces is departure of comparatively few years' standing; it owes its development chiefly to United States, although two noteworthy systems are due respectively to Germany and Czechoslovakia; test figures given may be regarded as typical of improvement brought about by installation of automatic control apparatus; they relate to battery of boilers at railway repair works at Cassel, Germany, fitted with Askania control.

DESIGN, FRANCE. Evolution in the Products of French Babcock and Wilcox Co. during 10 years (L'évolution dans les fabrications de la Société française des Constructions Babcock et Wilcox, depuis dix annés). Chaleur et Industrie (Lond.), Apr. 1930, (Special No.) pp. 163-171, 19 figs. Description and sketches of various types of boilers and equipment; sectional W.I.F. boiler; marine boiler; vertical-type Ladd Belleville; superheaters; automatic stokers; air pre-heaters; pulverized fuel.

FURNACES, RADIATION IN. Some Modern Boiler Problems, Petire. Engineering (Lond.), vol. 129, no. 3358, May 23, 1930, pp. 673-674. Editorial comment on report to Manchester Steam Users Assn., dealing with radiation problem; author proposes to base theory of radiation in boiler furnaces on fact that strong absorption bands in infra-red region characterize spectra both of carbon oxide and water vapour; view accords well with experiments of Callendar and Julius; solution of high-temperature boiler problem may be as much matter of eliminating every possibility of defective circulation as it is of improvement of materials.

BRASS

METALLURGY OF. The Effects of Silicon on the Properties of Brass, H. W. Gould and K. W. Ray. Metals and Alloys, vol. 1, no. 11, May 1930, pp. 502-507, 22 figs. Description of tests for specific gravity, hardness, impact breaking strength, tensile strength, percentage elongation, and corrosion resistance made on series of brasses containing varying percentages of silicon; microphotographs, tables, and graph interpret results.

BRIDGE ABUTMENTS

BEARINGS. End Bearings of Bridge Allow for Shifting of Abutments. Eng. News-Rec., vol. 104, no. 22, May 29, 1930, pp. 898-900, 4 figs. Bridge expansion bearings providing for possible extensive shifting of abutments in unstable ground, as well as for normal expansion and contraction of truss spans, form feature of new Sorlie memorial highway bridge built across Red River, between Grand Forks, N.D., and East Grand Forks, Minn.; sliding joint in bridge floor provides for 2 ft. movement of abutment, if shifted by flowing bank.

SINGLE-SPAN. Abutments of a Single-Span Bridge (Widerlager einer Sandversatzsturzbruecke). Zement (Charlottenburg), vol. 19, no. 3, Jan. 16, 1930, pp. 58-60, 4 figs. Construction of abutments for bridge of coal mine under especially unfavourable surface conditions; it was necessary to place foundations 25 ft. below surface since upper layer consisted mostly of soft sandy clay; abutments rest on reinforced-concrete foundations 1.50 and 2.00 m. thick; brick lining and asphalt isolation protect structure against aggressive waters; heavy reinforced-concrete beams, 1.10 m. long, distribute stresses to foundations.

BRIDGE PIERS

CONSTRUCTION. Construction Problems of Lake Union Bridge Substructure, G. W. Crocker. West. Construction News, vol. 5, no. 9, May 10, 1930, pp. 228-232, 8 figs. Report on construction of concrete bridge pier having base 99 ft. long, 64 ft. wide, and 33 ft. deep; in 64 ft. of water; driving of sheet piling; design of struts and wales; plan of cofferdams; jetting equipment; pile driving; pier excavation; leads and gunwales for driving 100 to 130 ft. Douglas fir piles; concreting.

BRIDGES

FLOORS. La Salle Street Bridge, Chicago, Splendid Example of Modern Timber Floor Construction. Wood Preserving News, vol. 8, no. 5, May 1930, pp. 60-62, 3 figs. Floor arrangement consists in main of plank subfloor laid transversely on stringer, and on top of that second layer of tongue and groove strips laid longitudinally; this construction gives very wide distribution of load to subfloor, thus cutting down its thickness and, consequently, weight.

BRIDGES, CONCRETE ARCH

CZECHOSLOVAKIA. New Arch Bridge in Prague (Eine neue Bogenbruecke in Prag), F. Emperger. Tonindustrie-Zeitung (Berlin), vol. 54, no. 22, Mar. 17, 1930, pp. 369 and 371-372, 8 figs. Details of bridge crossing Moldan River, total length 225 m., width 16 m.; road is 10.4 m. wide, with footpath 2.8 m. on each side; it has 4 spans, width of two centre spans 47.2, and outer spans 43.5 m. each; methods of concrete construction are described.

DESIGN. The Design of Masonry Arch Bridges, E. C. Seibert. Arch. Rec., vol. 67, no. 5, May 1930, pp. 403-410, 11 figs. General discussion of structural design and principles of architectural treatment of masonry arch bridges.

BRIDGES, FRAME

DESIGN. A Simplified Method for the Design of Single Span Frame Bridges, G. H. Hargreaves. Surveyor (Lond.), vol. 77, no. 1996, Apr. 25, 1930, pp. 499-501, 10 figs. Discussion by A. C. Hughes and C. S. Gray of paper previously indexed from Instn. Mun. and County Engrs.—Jl. Dec. 24, 1929.

BRIDGES, RAILROAD

RECONSTRUCTION. The Re-Girdering of the Lower Sone Bridge; East Indian State Railway. Engineering (Lond.), vol. 129, no. 3355, May 2, 1930, pp. 562-566 and 23 figs. partly on supp. plates. Reconstruction work was commenced in 1925, old up-track bridge being replaced by mild-steel girders carrying railway track overhead and concrete roadway 16 ft. wide beneath; replacement of old downtrack bridge was undertaken in 1929, and forms subject of this article; total net cost of regirdering was 187,500 pounds.

BRIDGES, STEEL ARCH

HUNGARY. New Tied Arch Design for the Gyoer Road Bridge (Neuartige Verwendung des Versteiften Stabbogens bei der Strassenbruecke in Gyoer), J. Beke. Bauingenieur (Berlin), vol. 11, no. 2, Jan. 10, 1930, pp. 21-25, 8 figs. Description of steel road bridge consisting of main span of 296.8 ft. and two side spans of 57.6 ft.; characteristic feature of design is prolongation of stiffening girder of central arch in form of cantilevers to carry roadway over side spans; suitability of this system for special cases in which height of roadway above lower edges of bridge was limited to about 1 m. by stipulated headroom under bridge and incline at approaches.

SYDNEY, AUSTRALIA. Progress on Sydney Harbour Bridge. Eng. News-Rec., vol. 104, no. 19, May 8, 1930, pp. 761-762, 5 figs. Progress report on steel erection; about half of 28 panels in 1,650-ft. steel arch are in place; cantilever erection without falsework; main boom of erection traveller is mounted on transverse track and serves both trusses; anchorage tunnel is U-shaped so that cables are continuous from one top chord to other.

STRENGTHENING. Reinforcement in Place of the Stoney Creek Arch Bridge, P. B. Motley. Eng. Jl. (Montreal), vol. 13, no. 5, May 1930, pp. 309-314 and (discussion) 314-315, 10 figs. Report on reinforcement, with new arch, of steel railroad bridge, built for Canadian Pacific in 1893, which consists of 336 ft. three hinged arch, on which are supported plate girder spans which extend to abutments at both ends of bridge, making structure 486 ft. long; erecting new arch ribs by cantilever trusses without loading old bridge.

BRIDGES, STEEL TRUSS

LONGVIEW, WASH. The 1,200 Ft. Cantilever Bridge at Longview, Wash., C. E. Paine. Eng. News-Rec., vol. 104, no. 20, May 15, 1930, pp. 803-806, 4 figs. Design and construction of longest cantilever structure in United States, having main span of 1,200 ft. and anchor arms 760 ft. long; clearances above mean low water are 185 ft. at channel pier and 195 ft. at centre of main span; bridge carries 27 ft. roadway and two 3 ft. sidewalks; progress of work.

MONTREAL. Fabrication and Erection of the Superstructure of the Montreal-South Shore Bridge, L. R. Wilson. Eng. Jl. (Montreal), vol. 13, no. 5, May 1930, pp. 323-327, 2 figs. Discussion by P. L. Pratley of paper indexed from issue of Jan. 1930.

BRIDGES, SUSPENSION

FOOTBRIDGE ROPES. Manufacturing of High-Modulus Footbridge Ropes for Fort Lee Hudson River Bridge, C. C. Sunderland. Eng. News Rec., vol. 104, no. 18, May, 1930, pp. 714-718, 8 figs. Modulus of elasticity of 6 x 37 rope increased from 12,000,000 to 18,000,000 pounds per sq. in. by prestressing to 125 per cent of working stress; process applied also to strands for main cables of Grand'Mere and St. Johns Bridges; equipment layout for prestressing wire ropes in lengths up to 3,750 ft.; stress-strain diagram of rope before and after multiple stressing; effect of multiple stressing on experimental 1½ in. strand.

BUILDING MATERIALS

SOUND ABSORBING. Tests of Sound Insulation in Trondhjem Hospital, Norway (Lydisolasjonsmalinger I Trondhjems Sykehus), J. Holtsmark. Teknisk Ukeblad (Oslo), vol. 77, no. 19, May 8, 1930, pp. 202-204, 2 figs. Test was carried out to find best sound-absorbing material; results show that non-homogeneous walls are best; composition wall using celotex gave best sound insulation of all materials tried.

BUILDINGS

VIBRATIONS. Vibration Phenomena in High Building (Schwingungserscheinungen an einem Hochhaus), H. Reiher. V.D.I. Zeit. (Berlin), vol. 74, no. 19, May 10, 1930, pp. 601-604, 7 figs. Report on observations made by department of acoustics and thermodynamics of Stuttgart Institute of Technology; records of vibrations registered by Geiger instrument on each storey of tower light 8-storey reinforced concrete building; resonance curve of tower; effect of manufacturing machinery on vibrations in building; eliminating resonance, with its consequent ill-effects on health of workers, by changing speed of steam engine.

BUILDING, STEEL

PROTECTIVE COATINGS. Rust Prevention: Effect of Wall Materials on Steel Parts of Steel-Frame Buildings (Rostschutz, etc.), A. Guttmann. Stahlbau (Supp. to Bautechnik, Berlin), vol. 3, no. 2, Jan. 24, 1930, pp. 15-16. Protection afforded by dense concrete to steel reinforcement is no criterion of that afforded by porous materials used for curtain walls to steel of steel-frame buildings; high rate of shrinkage of cellular concretes combined with low tensile strength renders cracks inevitable if panels be rigidly held by steel frames; complete protection from corrosion can be achieved only by coating steelwork with paint or cement.

BUILDINGS, STEEL-CONCRETE

FAILURE. Steel Cores for Four-Storey Concrete Building Collapse During Erection. Eng. News-Rec., vol. 104, no. 22, May 29, 1930, pp. 909-910, 2 figs. Derrick being dismantled on new Gottfield bakery building in New York falls, dragging all columns on 100 by 225 ft. site to ground; description of accident.

C

CADMIUM

PLATING WITH. Cadmium as a Protection Against Corrosion (Cadmium als Korrosionsschutz), A Siemens. Zeit fuer Elektrochemie (Berlin), vol. 36, no. 2, Feb. 1930, pp. 101-105; see also translated article in Metal Industry (Lond.), vol. 36, no. 18, May 2, 1930, pp. 481-483. Review giving data and numerous references on production, physical and chemical properties, and methods of applying metal in form of protective coating, especially by electrodeposition.

CAMS

DIFFERENTIAL. Differential Cam Mechanism. Machinery (Lond.), vol. 36, no. 191, May 22, 1930, pp. 233-234, 4 figs. Description and sketches of mechanism for bobbin winding machine; analysis of motion and diagram showing variation of combined throw of cams.

CANALS

WELLAND. The Welland Ship Canal. Engineering (Lond.), vol. 129, no 3356, May 9, 1930, pp. 592-595, 24 figs. partly on supp. plates. Intake and discharge valves for locks of Welland Ship Canal are of Taintor-gate (sector) type, and have been standardized throughout locks to three designs; operating gear has been similarly standardized; description of typical intake and modifications introduced in order to cover requirements of valves for other points. (Continuation of serial.)

CARS

PASSENGER—STEEL. On the Question of All Steel Coaches. Comparison with Vehicles Built of Wood (Subject VIII for Discussion at the Eleventh Session of the International Railway Congress Association), D. Daehnick. Int. Railway Congress Assn.—Bul (English Edition, Brussels), vol. 12, no. 2, Feb. 1930, pp. 635-664, 28 figs. Report covers German cars; advantages of all-metal method of construction; types of cars in service, in construction or being designed; table of recent all-steel, semi-steel and wooden coaches.

CASTINGS

SHRINKAGE AND PIPING. Shrinkage and Piping (Schwindung und Lunkerung—Sschwindmass), W. Claus. Giesserei (Duesseldorf), vol. 17, no. 19, May 9, 1930, pp. 440-455, 20 figs. Problems of iron, steel, and non-ferrous-metal foundries; piping of tin bronze, 10:90 and aluminum bronze 10:90; simple linear shrinkage coefficient; linear shrinkage calculated from cubic shrinkage coefficient; Claus-Gooderitz theory of shrinkage; values for pure aluminum, copper, pure iron, carbon steels, and cast iron.

CEMENT, PORTLAND

HYDRATION. The Rate of Hydration of Cement Clinker, F. O. Anderegg and D. S. Hubbell. Am. Soc. Testing Matls.—Advance Paper No. 63, for mtg. June 23-27, 1930, 7 pp., 2 figs. Part II: Standard portland cement particles were found to be approaching apparently complete hydration in 9 months while at 12 months hydration was practically finished. Part III: Hydration rate of tricalcium aluminate was found quite high, particles of dimension of 25 microns being three-quarters hydrated in 3 hours; tricalcium-silicate particles required 7 days for similar degree of hydration while with dicalcium silicate this amount of hydration was reached after 5.5. months.

CERAMIC INDUSTRY

CANADA. The Ceramic Industry of Canada, R. J. Montgomery. Ceramic Soc. (Lond.), vol. 29, no. 5, May 1930, pp. 103-106. Brief account of developments in manufacture of ceramic products; production statistics for 1929.

CHAINS

STRENGTH OF. Rings, Link and Hooks—Discrepancies between Theory and Practice, A. G. Thompson. Colliery Guardian (Lond.), vol. 140, nos. 3616 and 3617, Apr. 17, 1930, pp. 1463-1465, and Apr. 25, pp. 1561-1562, 7 figs. Notes on tests, mathematical discussion, graphs, and formulae; conclusion is that apparent discrepancy is definitely solved by dispersion, and that other mathematical refinements are of little practical importance.

CHROMIUM-MANGANESE STEEL

DRAWING QUALITIES OF. Rustless Chromium-Manganese Steels Have Deep-Drawing Qualities, F. M. Becket. Iron Age, vol. 125, no. 20, May 15, 1930, pp. 1468-1470, 6 figs. Description of composition and physical properties of stainless chromium-manganese steels of improved deep-drawing qualities; effect of manganese on strength, ductility, toughness, and hardness of low-carbon steel with 17 to 18 per cent chromium; composition ranges, cr 17 to 18 and mn 5 to 7 per cent; addition of copper increases deep drawing properties. Abstract of paper read before Am. Iron and Steel Inst.

CIVIL ENGINEERING EDUCATION

GERMANY. Instruction in the Civil Engineering Departments of German Institutes of Technology (Die Ausbildung an den Bauingenieurabteilungen der deutschen Technischen Hochschulen), O. Ammann. V.D.I. Zeit. (Berlin), vol. 47, no. 18, May 3, 1930, pp. 561-564, 2 figs. General discussion of curricula and methods of instruction, with special reference to limitation of specialization, extension of scientific preparation reducing numbers of lectures and study periods, facilitating transfers from one institution to another, uniform examinations, etc.

COAL HANDLING

EQUIPMENT FOR. Aerial Coal Transporter with Travelling Tower. Engineering (Lond.), vol. 129, no. 3357, May 16, 1930, pp. 629-630, 25 figs., partly on p. 638 and supp. plate. Storage plant of large capacity of aerial-transporter type has been built at pit bank of Hohenzollern coal mines of Graeflich Schaffgotschasche mines at Beuthen, Silesia, by J. Pohlig A. G.; installation embodies fixed tower with moving one working over arc.

COAL MINES AND MINING

UNDERGROUND TRANSPORTATION. Economical Mine Haulage, J. Rusen. Coal Min., vol. 7, no. 2, Feb. 1930, pp. 77-80, 5 figs. Discussion of various factors affecting cost of electric haulage in coal mines; standardization of equipment; maintenance and repair of equipment and tracks; timbering; lighting; side tracks; lubrication; use of sand on grades; automatic mine doors; cooperation of haulage boss and machine boss or electrician with mine foreman.

COAL PULVERIZERS

TESTS OF. Grinding Tests with a Tube Mill Without an Air Separator (Mahlversuche an einer sichterlose Rohrmuehle), Grosse, Foerderreuther and Rammler. Zement (Charlottenburg), vol. 19, nos. 9 and 10, Feb. 27, 1930, pp. 189-194 and Mar. 6, pp. 214-217, 7 figs. Experiments were made to find relation between fineness, power consumption, output, load limit, and moisture of powdered coal; mill was three-compartment compeb (solo mill) mill; coal samples were taken from mill in certain time intervals for sieve analysis; it was possible to calculate composition of coal powder from single test on one standard sieve.

COAL WASHING

THEORY. The Laws of Motion of Particles in a Fluid, R. G. Lunnon. Instn. Min. and Met.—Trans. (Lond.), vol. 38, 1928-1929, pp. 402-413 and (discussion) 413-420, 4 figs. Mathematical discussion, with formulae and graphs; stream lines for sphere; laws of resistance; application to gravity separation; irregular particles; effects of acceleration. Bibliography. Article indexed in Engineering Index 1929, p 469, from various sources.

COLUMNS

DESIGN. Designer Certification and Column Formulae in New York Building Code, W.L. Unger and J. C. Schulze. Eng. News-Rec., vol. 104, no. 19, May 8, 1930, pp. 779-780, 1 fig. Discussion of importance of competent design and supervision under conditions set up in revised building code of New York City; comparison of column formulae.

COLUMNS, CONCRETE

STEEL CORE. Tests on Columns With High Tensile Steel Reinforcement (Versuche an Saeulen mit hochwertiger Stahlbewehrung), R. Saliger. Beton u. Eisen (Berlin), vol. 29, no. 1, Jan. 5, 1930, pp. 7-12, 11 figs. In lower storeys of high buildings, steel columns with fireproofing concrete encasement only are employed; in Bauer method of obtaining strength in reinforced-concrete columns of smaller section, reinforcement consists of fabricated framework of verticals secured near ends by horizontal bands and surrounded by spiral reinforcement or perforated metal sheath, delivered at site as single unit.

CONCRETE

SLAG. Behaviour of Concrete at High Temperatures with Special Regard to Concrete Containing Blast-Furnace Slag (Verhalten von Beton bei hohen Temperaturen unter besonderer Beruecksichtigung von hochofen-schlackenhaltigem Beton), R. Gruen and H. Beckmann. Archiv fuer das Eisenhuettenwesen (Duesseldorf), vol. 3, no. 11, May 1930, pp. 677-683 and (discussion) 683, 11 figs. Investigation of portland blast-furnace cement and different aggregates, including blast-furnace slag, and concrete made therefrom, to determine chemical and physical behaviour at temperatures up to 1,200 deg. cent.

SURFACE TREATMENT. The Treatment of Monolithic Concrete Surfaces, N. C. Johnson. Am. Concrete Inst.—Jl., vol. 1, no. 7, May 1930, pp. 717-730 and (discussion) 730-731, 7 figs. Discussion of methods of treatment of form-cast surfaces; wash and float work; costs; bush hammering or tooling of concrete surfaces; machine grinding of surfaces; hand grinding and acid treatments of concrete surfaces; painting concrete surfaces; veneers of mortar; economic advantages of veneered surfaces over form-cast concrete; chemical surfacing of monolithic concrete; examples of chemical surfacing work.

CONCRETE CONSTRUCTION

RAPID. Rapid Construction in Reinforced Concrete (Rasches Baustempo im Eisenbetonbau), W. Petry. Bauingenieur (Berlin), vol. 11, no. 3, Jan. 17, 1930, pp. 35-39, 17 figs. Speed with which reinforced-concrete buildings can be erected is illustrated by construction photographs, and attention is drawn to use of rapid-hardening cements, sliding forms, and other agencies by means of which work has been accelerated.

SUBAQUEOUS. Pouring Concrete Under Water (Unterwasserschuettbeton), W. Nakonz. Bautechnik (Berlin), vol. 8, no. 3, Jan. 17, 1930, pp. 35-36, 6 figs. Methods of placing concrete under water by means of travelling chute and funnel, and number of funnels fixed laterally but capable of being raised as work proceeds; advantages and disadvantages of two methods are compared, and necessary precautions discussed.

CONCRETE CURING

TESTS. Some Tests of Concrete Masonry Units Cured with High Pressure Steam, P. M. Woodworth. Am. Concrete Inst.—Jl., vol. 1, no. 4, Feb. 1930, pp.504-511, 3 figs. Technical Engineer, Cement Products Bureau, Portland Cement Association reports on effect of high pressure steam curing on early and ultimate strength, strength as affected by time interval between moulding and curing; effect of curing and condition at test on strength of vibrated concrete tile; shrinkage of concrete masonry panels; units cured in high pressure steam developed strength at two days greatly in excess of strength obtained at 28 days by moist curing or low pressure steam curing.

CONCRETE DESIGN

METHODS FOR. Design of Structural Members Under Eccentric Compression (Verfahrenzur Berechnung von Konstruktionslgiedern mit aussenmittiger Druckbeanspruchung), S. Szegoe. Beton u. Eisen (Berlin), vol. 29, no. 1, Jan. 5, 1930, pp. 18-20. Simple methods for designing reinforced-concrete structural members to resist eccentric compression; application illustrated by numerical examples of continuous beams and frameworks; it is stated that all tables and nomograms generally used in designing reinforced-concrete structures can be replaced by two formulae and one table here presented.

CONCRETE MIXING

COLD WEATHER. Winter Concreting Methods, R. C. Johnson. Am. Concrete Inst.—Jl., vol. 1, no. 4, Feb. 1930, pp. 397-406, 2 figs. Report of Committee 604 on recommended practice for use in building construction; effect of curing conditions on the strength of concrete; strength for different temperatures; freezing of concrete; winter protection plant; heating materials; period of protection; stripping of forms.

CONCRETE SLABS

DESIGN. Design of Reinforced Concrete Slabs, W. L. Scott. Concrete and Constr. Eng. (Lond.), vol. 25, nos. 3 and 4, Mar. 1930, pp. 167-177, and Apr. pp. 221-231, 16 figs. Mar.: Theoretical mathematical analysis of thin rectangular slabs supported along their edges, with special reference to solution developed by Pigeaud; methods of calculating bending moments; calculation of shear on slab panels; effect of panel shapes and shapes of loaded areas. Apr.: Comparison of bending moments as load-spread increases; numerical example illustrating use of graphs. (To be continued.)

CONVEYORS

PNEUMATIC. Handling Raw Materials by Pneumatic Conveying. Ceramic Industry, vol. 14, no. 5, May 1930, pp. 541-543, and 546, 7 figs. Handling types of pneumatic conveyors are described; chief advantages of pneumatic conveying are, improved labour conditions through elimination of dust and fume hazards; reduction of labour costs through elimination of manual handling, reduction of wasted material through elimination of spillage; conservation of space through compactness of collecting station and conveying pipelines, and flexibility.

SCREW. Economical Portable Screw Conveyor for Handling Sacks. Concrete, vol. 36, no. 5, May 1930, pp. 118-119, 2 figs. Description of conveying equipment by Clark Tructractor Co. consisting of two parallel tubular screws which are turned toward each other by power head; material may be carried forward at speed of 90 ft. per min.; capacity of conveyor is about 1,200 sacks per hr.; joints may be turned.

COPPER ALLOYS

COPPER-NICKEL. British Standard Specification for Nickel-Copper (Cupro-nickel) Sheets and Strip. Brit. Eng. Standards Assn. (Lond.), no. 374, Apr. 1930, 7 pp. Standard specifications covering quality of material, chemical test, freedom from defects, dimensions, provision of test pieces, mechanical tests, re-tests, inspection, and testing facilities.

COPPER-ZINC. Heat Treating of Zinc-Copper Alloys (Ueber den Verguetungsvorgang in Zink-Kupferlegierungen), M. Hansen. Zeit. fuer Metallkunde (Berlin), vol. 22, no. 5, May 1930, pp. 149-154, 8 figs. Trend in aging of quenched zinc-copper alloys is shown in resistance-time curve; influence of temperature, composition, and speed of cooling; change in hardness of quenched alloys in relation to aging temperature and composition.

The Significance of Hardness Values for Some Copper-Zinc Alloys, C. H. Davis and E. L. Munson. Am. Soc. Testing Matls.—Advance Paper no. 49, for mtg. June 23-27, 1930, 7 pp., 6 figs. Effect of grain size on hardness of both annealed and cold-worked alpha-phase copper-zinc alloys has been observed; significance of variables which affect hardness values is shown by series of curves.

HARDENING. Hardening of Copper-Silver, Beryllium-Copper, and Zinc-Copper Alloys (Beitrag zum Haertungsproblem von Kupfer-Silber, Beryllium-Kupfer- und Zink-Kupfer-Legierungen), M. Haas and D. Uno. Zeit. fuer Metalkunde (Berlin), vol. 22, no. 5, May 1930, pp. 154-158, 11 figs. With aid of structure analysis, dilatometry, and measurement of electric conductivity, trend of hardening is followed. Bibliography.

PROPERTIES. Copper and Copper Alloys, W. H. Bassett. Nat. Elec. Light Assn.—Bul., vol. 17, no. 5, May 1930, pp. 275-278, 7 figs. Properties of copper drawing practice; copper alloys used in transmission work; tables showing comparative physical properties of steel and everdur; comparative properties of copper and copper alloys; comparison of beryllium alloys with copper-tin and copper-cadmium alloys; curves showing copper-beryllium alloys and strength and conductivity of 0.125 diam. wire of 0 to 1.6 per cent beryllium.

SPECIFICATIONS. Report of the Special Committee on Promotion of General Use of Specifications for Copper Alloys in Ingot Form. Am. Soc. Testing Matls.—Advance Paper No. 29, for mtg. June 23-27, 1930, 3 pp. Tabulation of specifications clearly developed fact that it is possible to greatly reduce number of alloys now used in industry; there are 40 different specifications for one of most widely used alloys of industry, namely, 85 per cent copper, 5 per cent tin, 5 per cent lead, and 5 per cent zinc; it is certain that these 40 specifications could be condensed into one.

COPPER-NICKEL INDUSTRY

ONTARIO. The Copper-Nickel Industry of Ontario, T. W. Gibson. Min. Jl. (Lond.), vol. 169, no. 4937, Apr. 5, 1930, p. 281. Large lenses of mixed pyrrhotite and chalcopyrite occurring at contact of norite and granite, or greenstone, in Sudbury area of Ontario, provide about 90 per cent of nickel requirements of world; ores contain about 3 per cent of nickel and 1.50 or 1.75 per cent of copper; appreciable quantities of gold, silver, and platinum metals; 1,476,604 short tons treated in 1928; two successful operating companies; brief historical review and development notes.

COPPER STEEL

PROPERTIES. Mechanical Properties of Copper-Bearing Steel with Special Regard to Heat Treatment (Ueber die mechanischen Eigenschaften kupferlegierter Staehle unter besonderer Breuecksichtigung der Waermebehandlung), F. Nehl. Stahl und Eisen (Duesseldorf), vol. 50, no. 20, May 15, 1930, pp. 678-686, 15 figs. Properties of copper steels; corrosion resistance; improvement in strength properties, especially yield point and heat resistance, by suitable heat treatment; dispersion hardening; use of copper steel as building material, for forgings, and for castings.

COPPER-ZINC MINES AND MINING

MANITOBA. "Manitoba Metal," R. H. Channing, Jr. Eng. and Min. Jl., vol. 120, no. 9, May 8, 1930, pp. 446-447, 4 figs. Summary description of property of Hudson Bay Mining & Smelting Co., in northern Manitoba; 18,000,000 tons proven ore, to be mined by underground and open pit methods; upon completion of hydro-electric power plant, production will be 3,000 tons of ore daily; flotation plant; roasting of zinc concentrate; electrolytic zinc plant; copper smelter; water supply. Abstract from company report.

COUPLINGS

FLEXIBLE. What's What in Flexible Couplings, F. A. Annett. Power, vol. 71, no. 19, May 13, 1930, pp. 742-744, 16 figs. Continued illustrated description of several types of flexible couplings.

CRANES

ALUMINUM-ALLOY. Crane Built of Strong Aluminum Alloy, F. V. Harman and E. F. Hartman. Iron Age, vol. 125, no. 23, June 5, 1930, pp. 1689-1690, 4 figs. Crane described is 3-motor, single-hook machine with lift of 22 ft.; bridge is fabricated from two double-web girders spaced 7 ft. on centres; girders are constructed of strong aluminum alloys and have span of 72 ft. 2 in.; aluminum was used also in walkway, handrails, and operator's cage; bridge girders frame into cast steel carriages at their end, and one-piece cast-steel trolley carrying hoisting mechanism is mounted on girder rails.

CUTTING TOOLS

TUNGSTEN CARBIDE. Tungsten Carbide Tools, R. D. Prosser. Am. Soc. Steel Treating—Trans., vol. 17, no. 6, June 1930, pp. 749-764, 12 figs. Great interest aroused by development of cemented tungsten carbide at Krupp Works has resulted in considerable discussion of freak or trick results obtainable with these tools; author confines himself principally to description of some of results being obtained in everyday actual production work; definite and practical advice as to methods of application, grinding, and use which should be employed to take full advantage of remarkable properties of these tools.

D

DAMS

ALGERIA. The Wad Fodda and Ghrib Dams. Extension of Port of Algiers (Barrages de l'Oued Fodda et du Ghrib. Les travaux d'extension du port d'Alger), Truffot. Annales des Ponts et Chaussées (Paris), no. 1, Jan.-Feb. 1930, pp. 41-64, 8 figs. Descriptive report based on notes made during trip of April 1929; Wad Fodda gravity concrete dam, 93 m. high, is located between Algiers and Oran; Ghrib rock-filled dam, 65 m. high, is located near Dolfusville; new construction in port of Algiers included over 3,000 m. of new piers and seawalls, up to 18 m. in height, made of precast concrete blocks.

DAMS, CONCRETE

CONSTRUCTION. Concreting Methods at the Chute à Caron Dam, I. E. Burks. Am. Concrete Inst.—Jl., vol. 1, no. 4, Feb. 1930, pp. 315-358, 34 figs. Description of methods used in construction of gravity concrete dam, 200 ft. high and 3,015 ft. long, on Saguenay river, about 80 miles above its mouth at St. Lawrence; prospecting for materials at 30 deg. below, under 4 ft. of snow; how materials were sampled, chosen, transported, heated and proportioned; how concrete was mixed, conveyed, deposited, protected; use of large aggregate with big gap in sizes to prevent raveling in stock piles and bins, harshness and segregation after mixing; stiff mix placed with vibrators.

DAMS, CONCRETE ARCH

CONSTRUCTION. Extensive Chuting Plant on a Large Dam, K. L. Parker. Contractors and Engrs. Monthly, vol. 20, no. 4, Apr. 1930, pp. 72-74, 2 figs. Report on construction of Chalaveras River concrete-arch dam, 1,500 ft. long, 160 ft. high, 40 mi. east of Stockton, Calif.; excavation; handling aggregate and cement; concrete chutes; electric power used; construction camp.

DIE CASTING

ALUMINUM ALLOYS FOR. Designing for Aluminum Die Castings, D. B. Hobbs. Product Eng., vol. 1, no. 2, Feb. 1930, pp. 60-62, 6 figs. Die-casting process consists in forcing molten metal under considerable pressure into steel dies; main characteristics of die castings, their extreme accuracy, uniformity, and superior finish are result of not only method by which castings are made but also fine art developed in die construction; fact that aluminum alloys have higher melting point than lead, tin, and zinc alloys required development of special alloy steel dies; general description of casting process.

DIESEL-ELECTRIC POWER PLANTS

COSTS. Report on Oil Engine Power Cost for 1929. Am. Soc. Mech. Engrs.—Advance paper, for Nat. Oil and Gas Power mtg., June 12-14, 1930, 21 pp. Report contains information covering 36 oil engine plants; tabular data covering lubricating oil, fuel oil, maintenace, and power cost.

DESIGN. Diesel Power-Plant Layouts, E. W. Hammond, Am. Soc. Mech. Engrs.—Advance Paper, for Nat. Oil and Gas Power mtg., June 12-14, 1930, 7 pp. Information applies to Diesel power plants in general; consideration of plant site, plant equipment, buildings and foundations, plant layout, cooling-water system, fuel-oil system, starting air supply, and auxiliaries.

QUEBEC. Oldest Commercial Canadian Plant Adds Large Stationary Diesel, G. H. Johnson. Elec. News (Toronto), vol. 39, no. 10, May 15, 1930, pp. 43-45, 3 figs. Pembroke Electric Light Co. have installed 1.250 hp. Diesel engine direct connected to 60 cycle generator to take care of short daily peak during late autumn and early winter months; with generator efficiency of 92½ per cent and when operating at or near full load, engine will produce slightly in excess of 13 kw.-hr. per Imperial gallon of fuel oil; fuel cost per kilowatt hour will run approximately 73 cents.

DIESEL ENGINES

COMPRESSORLESS. Compressorless Double-Acting Two-Cycle Diesel Engines of 12,000 hp. (Kompressorlose doppelwiekende Zweitakt-Dieselmotoren von 12,000 PS), W. Laudahn. V.D.I. Zeit. (Berlin), vol. 74, no. 15,, Apr. 19 1930, pp. 489-496, 19 figs. Description of operation, installation, and design of M.A.N. engines for Diesel-electric power plant; sketches show principal details.

COUPLINGS. Vulcan Gearing and Hydraulic Couplings. Mar. Engr. and Motorship Bldr. (Lond.), vol. 53, no. 632, May 1930, pp. 175-179, 10 figs. Flexible hydraulic clutch or coupling, originated by inventions of H. Foettinger, has extended in scope of its application by patents granted to Gustav Bauer; principle of hydraulic coupling and some practical and special installations.

HIGH-SPEED. Development of High-Speed Heavy Oil Engines (La Réalisation des moteurs; Rapides à Huile Lourde), E. Marcotte. Arts et Métiers (Paris), vol. 83, no. 113, Feb. 1930, pp. 33-47, 10 figs. Discussion of factors controlling design and performance; thermodynamics of different cycles; injection; pulverized fuel turbulence; volumetric efficiency; carburation possibilities; notes on Junkers and M.A.N. designs. Bibliography.

The Design of High-Speed Heavy-Oil Engines, Ricardo. Engineering (Lond.), vol. 129, no 3356, May 9, 1930, pp. 607-608. Editorial comment on paper read before Diesel Engine Users' Assn., previously indexed from Shipbldr., Apr. 1930; it may be doubted whether speeds much above present limit are practicable with engines of two conventional types; essential condition for high speed and details of Ricardo-Brotherhood type of engine; there appears to be no sound reason why engines of this airless-injection type should not successfully be applied to rail cars and even heavy commercial vehicles.

TESTING. Results of Tests on Diesel Engines of Peak-Load Plant in Henningsdorf (Ergebnisse von Versuchen an den Dieselmotoren des Spitzenkraftwerkes Hennigsdorf), W. Laudahn. V.D.I. Zeit (Berlin), vol 74, no. 18, May 3, 1930, pp. 570-575, 10 figs. Tests were carried out by Maschinenfabrik Augsburg-Nuernberg on compressorless double-acting two-stroke Diesel of 12,000 hp. built for Hennigsdorf Plant of Maerkischen Elektricitaetswerke; results are tabulated and critically analyzed.

VIBRATIONS. Calculation of Torsional Vibrations in Diesel-Engine Installations (Zur Berechnung von Dreshschwingungen bei Dieselmotorenanlagen), E. Goeller. V.D.I. Zeit. (Berlin), vol. 74, no. 16, Apr. 19, 1930, pp. 497-498, 6 figs. Development of two simplified formulae for calculating frequencies of systems, "engine—single mass" and "engine—two single masses"; graphs show relations of variables; numerical example.

E

ECONOMIZERS

VALUE OF. The Economizer in Boiler Installations, G. E. Tansley. Iron and Coal Trades Rev. (Lond.), vol. 120, no. 3244, May 2, 1930, p. 721. Value of economizer as investment; tabular comparison of ordinary investment of 2,000 pounds sterling and investment of same amount in steam economizer; boiler outlet-gas temperatures and gas velocities; economizer in relation to boiler pressure. Abstract of paper read before North of England Inst. of Min. and Mech. Engrs.

ELECTRIC CABLES

FAULT LOCATION. Making Bridge Measurements with Voltage, F. E. Reeves. Elec. World, vol. 95, no. 19, May 10, 1930, p. 928. Boston Edison Co. has made successful bridge measurements using kenotron sets on several faults, two of which were made at about 30,000 volts with intermittent fault current; greatest error was 512 ft. in cable whose total length was 27,270 ft.

LEAD SHEATHING. Flow Characteristics of Some Lead Cable Sheath at Temperatures Above Atmospheric, C. L. Clark, and C. Upthegrove. Am. Soc. Mech. Engrs.—Advance Paper for mtg., no. 1, June 9 to 12, 1930, 5 pp., 10 figs. Investigation on three types of lead sheath differing only in antimony content, respectively, 0.06, 0.6, and 1.2 per cent; at room temperature compositions elongated at more or less fixed rates with loads as low as 245 lbs. per sq. in.; increasing antimony content not results in decrease in rate of flow at lower temperatures but in lowered resistance to creep; at temperature of 80 to 120 deg. cent. higher antimony contents result in decrease in rate of creep.

RUBBER INSULATED. Relations of D.C. and A.C. High- and Low-Voltage Measurements on Rubber Cable, C. L. Kasson. Am. Inst. Elec. Engrs.—Advance Paper for mtg., May 7 to 10, 1930, 5 pp., 12 figs. Results and comparison of d.c. and a.c. measurements on 10,000-volt rubber insulated lead-covered cable at room temperatures; results confirm and extend those already presented by author before American Institute of Electrical Engineers in paper, High Voltage Measurements on Cables and Insulators; and those in paper entitled D.C. High and Low Voltage Measurements on Cables and Insulators.

UNDERGROUND—TEMPERATURE. The Calculation of Cable Temperatures in Subway Ducts, W. B. Kirke. Am. Inst. Elec. Engrs.—Advance Paper, for mtg. May 7 to 10, 1930, 13 pp., 14 figs. Comprehensive survey of problem of cable temperatures by consolidating information on cable temperature characteristics with equally important problem of ascertaining characteristics of duct structure when cable circuits are subjected to cycle loads usually found in practice; information herein presented to subject of duct bank temperatures is result of investigation in metropolitan New York district which was carried on for several years under widely varying conditions.

ELECTRIC CAPACITORS

PHASE DEFECT ANGLE. Phase Defect Angle of an Air Capacitor, W. B. Kouwehnoven and C. L. Lemmon. Am. Inst. of Elec. Engrs.—Advance Paper, for mtg. May 7 to 10, 1930, 7 pp., 4 figs. Investigation to determine conditions of atmosphere under which air capacitor may be regarded as having zero loss; measurements were made of effect of humidity at temperatures from 60 deg. fahr. to 100 deg. fahr. humidity varied from 40 to 95 per cent approximately; conduction was zero and phase defect angle of air capacitor was less than three seconds for values of humidity below 90 per cent; effect of introduction of ions and dust particles into condenser chamber.

ELECTRIC CIRCUIT BREAKERS

OIL. New Development in British Switchgear. Elecn. (Lond.), vol. 104, no. 2711, May 16, 1930, pp 608-610, 3 figs. Oil circuit breakers of high rupturing capacity; short-circuit tests; tank and top plate; operating mechanism; contacts and bushings; venting and insulation; tables of short-circuit tests at 13,200 volts and 600 amp. and oscillograms tests are given.

ELECTRIC CONDENSERS

DISCHARGE. Successive Unidirectional Condenser Discharge, S. Sano. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 5, May 1930, pp. 370-373, 9 figs. Phenomenon of successive unidirectional discharges of condenser across gap placed between its terminals, when condenser is connected in series with inductance having such constant that resonance occurs in system when supplied with alternating e.m.f., is described; application of system as generator of successive unidirectional voltage impulses is discussed.

ELECTRIC CONDUITS

UNDERGROUND. Underground Conduits Connects Superpower System, J. E. Gruner. Elec. Light and Power, vol. 8, no. 3, Mar. 1930, pp. 38-41, 9 figs. Transmission lines are being constructed which, together with existing lines, will form complete loop connecting three steam generating plants and two water-power plants operated by Union Electric Light and Power Co. and its subsidiaries; 66-kv. two-circuit underground transmission lines described, constructed across city of St. Louis, will form part of this superpower ring.

ELECTRIC EQUIPMENT

VOLTAGE. Preferred Voltage Ratings for A.C. Systems and Equipment. Nat. Elec. Light Assn.—Pub., no. 043, Apr. 1930, 13 pp. Tables included are preferred voltage ratings for a.c. systems and equipment as agreed upon by Joint Committee of National Electrical Manufacturers Association and National Electric Light Association; notes on application of tables, historical summary, basic principles, committee personnel, tables of preferred voltage ratings and Report of NEMA-NELA Joint Committee on preferred voltage ratings for a.c. systems and equipment.

ELECTRIC FURNACES

ARC. Industrial Electric Heating, N. R. Stansel. Gen. Elec. Rev., vol. 33, no. 5, May 1930, pp. 316-322, 14 figs. Characteristic curves of furnace circuit; diagrams of connections and typical three-phase transformer design; characteristic curves of standard reactors.

Heat-Treating. Electric and Fuel Costs for Four Heat-Treating Installations, W. S. Scott. Elec. World, vol. 95, no. 20, May 17, 1930, pp. 996-997. Comparative heat-treating costs for hardening and tempering of axes, automobile axles, shovels, and hardening of ball bearing races.

Melting. Electric Melting Improves Quality and Cuts Cost. Elec. World, vol. 95, no. 19, May 10, 1930, pp. 948-949, 1 fig. First vertical-ring induction furnace for melting nickel-silver in Naugatuck Valley went into service year ago; results obtained have been so satisfactory as to improved quality of alloy and melting costs that four furnaces are now in operation and five more have been purchased; lining life has increased from 400 heats to more than 800 heats, or about 500,000 lbs. per lining; on this basis cost for lining is $1.40 per ton and is not likely $2 per ton of metal poured.

ELECTRIC GENERATORS

Shaft Straightening. Straightening a 15-Ton Shaft Without Shop Facilities, G. E. Decker and C. G. Heckman. Elec. West, vol. 64, no. 5, May 1, 1930, pp. 240-242, 4 figs. Field methods and equipment effectively reduce 0.021-in. curvature in 35-ft. vertical generator shaft; problem arose when 28,000-kv. vertical unit at Big Creek No. 3 hydro-electric generating plant of Southern California Edison Co. developed vibration which requires its removal from service.

Alternating Current. Reduction of Eddy Current Losses by the Inverted Turn Transposition and the Twisted Lead Transposition, J. M. Lyons. Am. Inst. of Elec. Engrs.—Advance Paper, for mtg. May 7 to 10, 1930, 13 pp., 19 figs. Theory underlying determination of extra copper lcsses in armature windings carrying alternating currents; extension of study of inverted turn transposition to special case of three-phase windings having two phases connected in series to form single-phase winding and third phase left idle; formulae and tables to show what reductions in copper losses may be expected; formulae and tables.

The Calculation of Alternator Swing Curves. The Step-by-Step Method, F. R. Longley. Am. Inst. Elec. Engrs.—Advance Paper, for mtg. May 7 to 10, 1930, 22 pp., 19 figs. Explanation of step-by-step calculations of synchronous rotor oscillations and other transients, when faults or other sudden changes take place; general formulae for calculations where any number of salient or non-salient pole machines are operating at various points on impedance network; simplified example; numerical calculations of swing curve. Bibliography.

Assembly. Record Unit Assembled Under Difficulties at Southern California Hydro Plant, J. P. Stratford. Elec. West, vol. 64, no. 3, Mar. 1, 1930, pp. 136-137, 3 figs. Assembly of 25,000 kva. unit in San Francisquito power plant No. 1 is described; shaft has maximum diameter of 38 in. and weighs 40.5 tons, while cast steel rotor spider has outside diameter of 208¾ ins. and weighs 74.7 tons; to expand rotor hub to permit insertion of shaft it was necessary to raise temperature of rotor to 125 deg. cent.; three means of heating were employed, magnetic induction, hot air and radiation.

Direct Current. Voltage Irregularities in D.C. Generators, J. T. Fetsch. Am. Inst. Elec. Engrs.—Advance Paper, for mtg. May 7 to 10, 1930, 17 pp., 40 figs. Description of irregularities, cause of their occurrence, magnitude of their values, their effect on radio circuits, and problem encountered in their measurement; method for measurement of these voltage irregularities by use of oscillograph, blocking condenser, and current transformer; oscillograph records taken under various electrical and mechanical conditions are given and these records are made; conclusions as to features desirable in d.c. generators.

Speed Measurement. Determination of Generator Speed and Retardation During Loss Measurements, O. E. Charlton and W. D. Ketchum. Am. Inst. Elec. Engrs.—Advance Paper, for mtg. May 7 to 10, 1930, 6 pp., 7 figs. Instrument developed to make graphic records of generator revolutions and time as generator slows down under action of its losses during retardation tests; construction of speed-time curves from records; principle of numerical differentiation and its application to determination of slope of speed-time curve is pointed out; example illustrating application of this principle is included in paper. Bibliography.

ELECTRIC LIGHT AND LIGHTING

Modern Tendencies. Modern Tendencies in Illumination, W. Cary. Elec. Jl., vol. 27, no. 3, Mar. 1930, pp. 131-135, 7 figs. Illumination as discerned from early use of electric lamps is discussed; possibilities of electric incandescent lamp in all its forms and obligations are given; notes on automatic control of lighting; colour; dividends from lighting; highway lighting awaits state legislation; good street lighting at $2.50 per capita; airport lighting; windowless building; aesthetic lighting; ultra-violet light; electric eye; illumination engineering.

ELECTRIC LINES

Towers. A New Transmission Line Construction. Post Type Towers, P. H. Thomas. Am. Inst. Elec. Engrs.—Advance Paper for mtg. May 7-10, 1930, 6 pp., 7 figs. Construction to secure sturdy and simple tower, not sensitive to irregularities in footing conditions; generally applicable where horizontal arrangement of conductors is feasible; wide base structure secured has substantially no resultant uplift on footings offering large saving in foundation costs; this together with lesser material and erecting costs and ease with which it is adapted to varying ground conditions make it very economical type of tower.

ELECTRIC LINES, HIGH TENSION

Overhead. Electric Transmission Lines (Om Kraftoverforinger), J. C. Holst. Fjarde Nordiska Elektroteknikermotet—Foredrag I (Helsingfors), 1929, pp.67-81, 19 figs. Construction of overhead electric transmission lines, mostly 60 kv. and larger, is discussed; design of poles; materials employed; line connectors, insulators, snow load, sag, protection against corrosion, construction of lines and machinery employed. Paper read at Fourth Northern Congress for Electrotechnic in Finland, June 1929.

Studies in. Transmission Research and Design with the Field as a Laboratory, F. E. Andrews and C. L. Stroup. An. Inst. Elec. Engrs.—Advance Paper for mtg., May 7 to 10, 1930, 10 pp., 9 figs. Improvements in design of wood-pole lines of 33,000-volt class, have been developed and applied and which, it is believed, will greatly reduce characteristic troubles; explanation of flashovers on wood structures; facts found in field investigations which form basis for improvements adopted, and method used fo field investigations and analysis of troubles; studies and investigations given in reference, deal primarily with matter of insulation. Bibliography.

Circle Diagrams. A Proof that the Induction Motor Circle Diagram Applies to the Transmission Line, F. Creedy. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 5, May 1930, pp. 381-385, 5 figs. It is shown that circle diagram for induction motor, is in reality applicable to general network, however complicated, and therefore to transmission line; double-frequency power diagram is criticized as needlessly complicated and constructions applied to all quantities of interest in transmission line. Bibliography.

Grounding. Arcing Grounds and Effect of Neutral Grounding Impedance, J. E. Clem. Am. Inst. of Elec. Engrs.—Advance Paper for mtg., May 7 to 10, 1930, 19 pp., 21 figs. Review and extension of theory of overvoltages due to arcing grounds because of increasing tendency to use impedances between neutral point and ground; analysis for three-phase circuit is newly developed for case in which there is impedance between neutral and ground; method of determining various reductions or damping factors; relation of overvoltages on non-grounded and effectively grounded system; criterion for determining whether or not system is grounded is proposed. Bibliography.

Protection. Calculation of Protection of a Transmission Line by Ground Conductors, H. B. Dwight. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 5, May 1930, pp. 354-357, 6 figs. Calculation of degree of protection afforded by ground conductors on assumption of sudden disappearance of vertical potential gradient caused by charged cloud; formulae are given for protective ratio due to one and two ground conductors; it is shown that for any number of ground conductors, it is not necessary to compute charges on power conductors.

Fused Grading Shields, H. A. Frey and E. M. Skipper. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 5, May 1930, pp. 393-396, 5 figs. Fused grading shield was developed primarily to reduce number of outages due to insulator flashovers on transmission lines; fused grading shields in later practice lines provides means of obtaining reduced insulation without increasing outages; laboratory and field data showing characteristics of device and results of several years of operating experience.

ELECTRIC MACHINERY, SYNCHRONOUS

Hunting. Effect of Armature Resistance Upon Hunting of Synchronous Machines, C. F. Wagner. Am. Inst. of Elec. Engrs.—Advance Paper for mtg., May 7 to 10, 1930, 14 pp., 13 figs. New proof is given for relation previously derived by Nickle and Pierce whicb states that macbine without amortisseur windings is stable for certain operating angles; arguments are presented which sbow that any standard type of damper installed in generators for other incidental reasons, possesses property of preventing spontaneous hunting except for most abnormal conditions met in practice. Bibliography.

ELECTRIC MOTORS, INDUCTION

Performance. Synchronous Motor Effects in Induction Machines, E. E. Dreese. Am. Inst. Elec. Engrs.—Advance Paper, for mtg. May 7 to 10, 1930, 8 pp., 14 figs. It is found that certain combination of phases, rotor slots, and poles cause motor to run as synchronous motor at some intermediate speed between zero and normal no-load induction motor speed; this synchronous motor effect in induction machines is shown to be due to locking of harmonic fields, generated by rotor windings; method of avoiding tbis trouble by proper selection of number of rotor slots is given.

ELECTRIC NETWORKS

Analyzers. The M.I.T. Network Analyzer—Design and Application to Power System Problems, H. L. Hazen, O. R. Schurig and M. F. Gardner. Am. Inst. Elec. Engrs.—Advance Paper, for mtg. May 7 to 10, 1930, 12 pp., 6 figs. Analyzer, a static miniature a.c. power system, constructed jointly by Massachusetts Institute of Technology and General Electric Co. for computation of actual power networks is described and its operation outlined; fields of its application include study of normal operating conditions, stability, and short circuits; example illustrating its application to solution of normal operation problem is given. Bibliograpby.

ELECTRIC RECTIFIERS

Mercury Arc. Mercury Arc Rectifiers Meet Transportation Demands, C. E. Baker. Elec. Ry. Jl., vol. 74, no. 6, June 1930, pp. 311-314, 4 figs. Development in design and manufacture have made possible construction of rectifiers of large ratings and high voltages; these machines are now suitable for installations where synchronous converters previously were considered necessary; air-tight seals essential to operation; many large rectifier installations made.

ELECTRIC RESISTORS

Shunt. Shunt Resistors for Reactors, F. H. Kierstead, H. L. Rorden and L. V. Bewley. Am. Inst. of Elec. Engrs.—Advance Paper for mtg., May 7 to 10, 1930, 17 pp., 27 figs. Effect of resistors shunting current-limiting reactors on impulse behaviour of typical system employing them; typical system is reduced, without loss of essential generality, to comparatively simple analytic network, and impulse behaviour of this network is calculated mathematically; through use of shunting resistor some beneficial results are obtained. Bibliography.

ELECTRIC TRANSFORMERS

Design. Effect of Transient Voltage on Power Transformer Design, K. K. Palueff. Am. Inst. Elec. Engrs.—Advance Paper for mtg., May 7 to 10, 1930, 12 pp., 19 figs. Results of theoretical and oscillographic study of transient voltage phenomena in shell type and core type transformers with neutral isolated from ground, also with neutral grounded through impedances of different characteristics; grounding device, called impedor, can be designed to have impedance at operating frequency equal to any desired value and to act at transient voltage frequencies as if its impedance were practically zero. Bibliography.

Windings. Transformer Ratio and Differential Leakage of Distributed Windings, R. E. Hellmund and C. G. Veinott. Am. Inst. Elec. Engrs.—Advance Paper, for mtg. May 7 to 10, 1930, 10 pp., 14 figs. Paper develops in as simple manner as possible necessity for concept of differential leakage wbere transformer action takes place between two equally distributed windings and transformer ratio in case of such unequally distributed windings is also given. Bibliograpby.

Transformer Ratio and Differential Leakage of Distributed Windings, R. E. Hellmund and C. G. Veinott. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 6, June 1930, pp. 474-478, 9 figs. Paper previously indexed from Advance Paper, for mtg. May 7 to 10, 1930.

ELECTRIC WELDING

Flash Welding Machines. New Heavy-Duty Flash Welding Machines. AEG Progress (Berlin), vol. 6, no. 3, Mar. 1930, pp. 98-100, 3 figs. Invention about 15 years ago of flash butt-welding process opened way to welding of objects of fairly large cross-sections economically by agency of electricity; from this time onwards, electric process commenced to force forge-welding method entirely into background; flash butt-welding machinery and table of results of strength testing.

ENAMELING PLANTS

Ontario. They Can Make Anything in Enameled Ware. Ceramic Industry, vol. 14, no. 4, Apr. 1930, pp. 432-434, 436, 438, 440 and 442, 21 figs. Plant design, equipment and operation of General Steel Wares, Ltd., at London, Ont.

ENGINEERING

Canada. Canadian Development and the Engineer. C. H. Mitchell. Can. Engr. (Toronto), vol. 58, no. 18, May 6, 1930, pp. 557-558. Engineering development in Canada during past 50 years discussed in report presented at Fiftieth Anniversary of American Society of Mechanical Engineers, Washington, D.C.; valuable natural resources only partially developed; land and water transportation.

ENGINEERING EDUCATION

Specialization. Specialized Education and Its Vices, D. B. Keyes. Scientific Monthly, June 1930, pp. 538-540. Author argues that broad training in fundamental sciences is far superior to premature specialization for boy wbo wishes to do industrial research.

ENGINEERING RESEARCH

Technique and. The Influence of Technique on Research, F. A. Freeth. Engineering (Lond.), vol. 129, no. 3357, May 16, 1930, pp. 640-641; see also Engineer (Lond.), vol. 149, no. 3879, May 16, 1930, pp. 541-542. Number of maxims are laid down which have been means of stimulating discovery in past; examination of importance of technique to those engaged in study of metals. Abstract of paper read before Inst. of Metals.

F

FLOORS, GYPSUM

APPLICATION. Use Pre-cast Gypsum Floors and Ceilings in New York. Am. Contractor, vol. 51, no. 17, Apr. 26, 1930, pp. 13-15, 2 figs. Manner of applying precast gypsum slabs for floor and ceiling construction in nineteen-storey New York apartment house building; considerable saving and early completion date because material could be used in extremely cold weather, with little or no winter protection.

FLOORS

RUBBER COVERINGS. Rubber Floor Coverings Compared to Other Floor Coverings (Gummifussboden im Vergleich mit anderen Fussbodenarten), F. J. Schoeps. Gummi-Zeitung (Berlin), vol. 44, no. 20, Feb. 14, 1930, pp. 1044-1046. Advantages of rubber floor coverings are, their sound-damping and heat-insulating properties; disadvantage is high price; table is given showing comparison of different floor materials for gymnasiums and their adaptability viewed from twelve different aspects.

FLOW OF WATER

MEASUREMENT. Comparative Water-Discharge Measurements of the Walchensee Hydro-electric Plants (Vergleichs-Wassermessungen am Walchenseewerk). O. Kirschmer. V.D.I. Zeit. (Berlin), vol. 74, no. 17, Apr. 26, 1930, pp. 521-528, 19 figs. Report on results of comparative determination of discharge of penstock, 2.25 m. in diameter, by means of following methods and instruments: (1) Allen salt-velocity method, (2) Ott current meter, (3) Pilot tube of British make, and (4) the Gibson time-pressure method; discharge ranged from 2.5 to 8.2 cu. m. per sec.; results show considerable discrepancies and indicate reliability of current meters of propeller type.

FORGINGS

STEEL. Snow Flakes in Alloy Steel Forgings, H. H. Ashdown. Iron Age, vol. 125, no. 19, May 8, 1930, pp. 1380-1381 and 1429, 3 figs. Description of "snow flake" phenomenon occurring mostly in nickel-chrome alloys, including those containing molybdenum and occasionally in tool-steel forgings in large section; origin is in ingot and mass action ultimate cause; heat treatment will not cure it.

FORMING MACHINES

ROTARY. Rotary Forming, C. V. Lundeen. Am. Mach., vol. 72, no. 23, June 5, 1930, pp. 912-913, 4 figs. Description of design and operation of forming machines at Hawthorne plant of Western Electric Co.; in forming small parts of many designs, roller method has advantages over punch press; output from 18,000 to 43,200 per hour.

FUELS

OIL. *See Oil Fuel.*
PULVERIZED COAL. *See Pulverized Coal.*

G

GAUGES

TAPER. Checking a Taper Gauge. Machy. (Lond.), vol. 36, no. 920, May 29, 1930, p. 263, 2 figs. Description of method of checking angle and diameter of tapered discs; master taper gauge with setting discs in place for checking working gauges of male bevel-side taper type.

GALVANIZING

HOT. Bending Resistance of Hot Sheet Galvanizing (Biegefaehigkeit von Zink-Ueberzuegen), H. Bablik. Zeit. fuer Metallkunde (Berlin), vol. 22, no. 5, May 1930, pp. 171-173, 10 figs. This process is assurance against corrosion only when coating is non-porous and when it does not break under bending stress; based on tests, author seeks to show that, it is not thickness of whole coating, but presence or thickness of iron-zinc layer that has influence on bending strength.

GAS ENGINES

INDUSTRIAL POWER PLANTS. The World's Biggest Gas Engines. Power, vol. 71, no. 19, May 13, 1930, pp. 736-738, 5 figs. Illinois Steel Company has added to gas-electric power plant two 6,600-kw. units operating at 83⅓ r.p.m. on blast furnace gas; physical dimensions and weights of gas-electric units are given.

GEARS

BURNISHING. Three Master Gears Employed for Burnishing Pinions, C. H. Logue and C. O. Hersam. Automotive Industries, vol. 62, no. 19, May 10, 1930, pp. 722-723 and 737, 4 figs. Description of new process and machine built by Hersam and Sherwood, Philadelphia, Pa., in which pinion is constrained to definite relation with its apex point, but it is left free otherwise to move and finds its own natural operating position; 60 to 90 pinions may be burnished; burnishing gears is expected to produce about 20,000 pinions before replacement.
TOOTH MEASUREMENT. Constant Chord Gauging, W. A. J. Chapman. Am. Mach., vol. 72, no. 19, May 8, 1930, pp. 753-754, 3 figs. Constant-chord method differs from means of tooth measurement now in use solely in computations involved; substitution of constant for variable measurements of gears; since pitch and pressure angle are uniform in set or train of gears, whereas tooth number usually differs, measurements are greatly simplified by possibility of using constant dimensions for chordal length and depth.

GOLD DEPOSITS

ALASKA. The Gold Resources of Alaska, P. S. Smith. Economic Geology, vol. 25, no. 2, Mar.-Apr. 1930, pp. 176-196, 3 figs. Brief historical note of gold mining in Alaska; tabular production statistics of placer gold and lode gold, 1880 to 1929, total value $380,838,000; general description of placer gold deposits; reserves estimated as $360,000,000 or more; general features of lode gold deposits; facts are not available for estimate of lode gold reserves, but it is considered quite possible that reserve of lode gold far exceeds that of placers; tabular summaries of principal placer and lode regions and districts of Alaska. Bibliography.

GRINDING MACHINES

GEAR. Grinding Helical Gears. Automobile Engr. (Lond.), vol. 20, no. 267, May 1930, pp. 184-185, 3 figs. Description of design and operation of a new machine particularly for automobile work built by Maag Gear Co. Ltd., Zurich; special feature is means for setting wheel heads over desired spiral angle with simple method of imparting additional rolling motion to gear to follow spiral.
PNEUMATIC. New Air Grinder for Use in Diemaking. Machy. (Lond.), vol. 36, no 916, May 1, 1930, pp. 133-134, 5 figs. Description of design and use of tool built by Madison-Kipp Corp., in United States; capable of finishing irregularly curved surfaces in die-casting dies rapidly, and also for touching up such surfaces to correct any distortion produced in hardening; simple speeds in excess of 40,000 r.p.m. obtainable for grinding wheels of very small sizes.

H

HEAT INSULATION

LAWS, APPLICATION OF. Heat Insulation, A. B. Winterbottom. Instn. Mech. Engr.—Prod. (Lond.), no. 5, Dec. 1929, pp. 1075-1086, 2 figs. Paper is devoted first to laws which govern flow of heat through insulation, and their application, and second, to survey of practical requirements, and of types of insulation developed to meet them.

HEAT-TRANSMISSION

SURFACE. Surfaces Conductances as Affected by Air Velocity, Temperature, and Character of Surface, F. B. Rowley, A. B. Algren, and J. L. Blackshaw. Heat Piping and Air Conditioning, vol. 2, no. 6, June 1930, pp. 501-508, 22 figs. Investigation is part of cooperative research programme between American Society of Heating and Ventilating Engineers and University of Minnesota; object is to determine effect of air velocity, temperature, and surface characteristics on heat transmission from surfaces; apparatus and method of testing; graphical representation of results for various types of surfaces. Presented before Am. Soc. of Heat and Vent. Engrs.

HEATING AND VENTILATION

BUILDINGS. Analysis of Heat Required for Buildings, X. Y. Zero. Blast Furnace and Steel Plant, vol. 18, no. 5, May 1930, pp. 797-801. Concise explanation of procedure for determining amount of heat which must be supplied to maintain building at desired temperature; estimating size of rooms, glass, doors, and pipes, carpenters rule; effect of paint; cost.

HIGH BUILDINGS

CONSTRUCTION. Building a 71-Storey Skyscraper in 33 Weeks. Eng. News-Rec., vol. 104, no. 20, May 15, 1930, pp. 800-803, 5 figs. Construction speed on Manhattan Company building in New York accomplished by extensive organization of job and coordinating subcontractors; materials expedited from source to job; steel shipped from five shops to meet schedule; general construction schedule; steel schedule.

HOISTS

BRAKES FOR. Centrifugal Brakes, A. W. Knight. Mech. World (Manchester), vol. 87, no. 2261, May 2, 1930, pp. 410-413, 3 figs. Design and calculation of new types of centrifugal brakes suitable for controlling lowering speeds of electric lifting gears; example of brake for 20-ton electric crab is followed through.

HYDRAULIC MACHINERY

SPECIFIC SPEED. Specific Speed and Other Characteristics of Hydraulic Turbines, Centrifugal Pumps, Windmills, and Propellers as Dimensionless Characteristics of Physics of Similitude (Die spezifischen Drehzahlen und die anderen Kenngroessen der Wasserturbinen, etc.), M. Weber. Schiffbau (Berlin), vol. 31, nos. 4 and 7, Feb. 19, 1930, pp. 73-80, Apr. 2, 156-161, 11 figs. Feb. 19: Principles governing specific speed; law of similitude as applied to derivation of dimensionless specific speed and other values. Apr. 2: Derivation of dimensionless characteristics and their relations to one another for this type of machinery and related flow problems.

HYDRO-ELECTRIC POWER DEVELOPMENTS

ALABAMA. Lower Tallassee Development, F. E. Hale. Elec. Light and Power, vol. 8, no. 5, May 1930, pp. 39-41, 6 figs. New Lower Tallassee development was made possible because of arrangements made between Alabama Power Co. and Mt. Vernon-Woodberry Mills Co. which built dam about 25 ft. high at upper edge of falls and power house at lower end; power generation in new plant is accomplished by two 29,000 kva. 100 r.p.m. and one 10,000 kva., 3-phase, 180 r.p.m. generators supplying power at 13,800 volts to main transformer bank.
BRITISH COLUMBIA. B.C. Power Corpn. Has Contributed Vastly to Provincial Prosperity. Elec. News, vol. 39, no. 8, Apr. 15, 1930, pp. 77-82. 10 figs. In 1928 British Columbia Power Corp. was formed to take over operation and control of B.C.E.R. Company and all its subsidiary interests; British Columbia in common with rest of Pacific Coast suffered from shortage of water in December 1929; by organizing some 14 private generating plants in lumber mills and elsewhere, B.C. Electric Railway Co. was able to get past emergency with minimum amount of inconvenience; notes on remote possibility of future shortage, Ruskin development, Bridge river development, transportation, cheap fares and motor coaches.

British Columbia's Water Powers, J. T. Johnston. Elec. News (Toronto), vol. 39, no. 8, Apr. 15, 1930, pp. 72-76, 6 figs. Water-power resources of British Columbia are estimated at 1,930,000 hp. minimum and 5,100,000 for six months; large proportion of power resources of this province are of high head variety; 560,000 hp. developed and 4,500,000 hp. undeveloped.

Northern B.C. Power Company. Elec. News (Toronto), vol. 39, no. 8, Apr. 15, 1930, p. 92, 1 fig. Making plans for growing power needs of Stewart and Prince Rupert, B.C.; to meet growing needs of Prince Rupert, Northern B.C. Power Co. has decided to develop Falls river and transmit power to Prince Rupert over 45-mi. 66 kv. transmission line; proposed development which will have initial head of 194 ft. and ultimate of 252 ft. takes advantage of natural fall of some 160 ft. in Falls and Ecstall river; 32,000 hp. capacity available.

Powell River Company, J. A. Lundie. Elec. News (Toronto), vol. 39, no. 8, Apr. 15, 1930, pp. 99-102, 6 figs. Notes on development on Powell River, penstocks, paper machines. harbour and townsite, grinders, Lois River development, temporary and permanent dam and foot wood stave pipe lines; $8,000,000 extension programme now under way for Pacific Coast's largest newsprint mill; to harness 44,000 hp. in new development at Lois River.
CANADA. Hydro-electric Development in Canada. Elec. Rev. (Lond.), vol. 106, no. 2735, Apr. 25, 1930, pp. 801-802. Total capacity of new installations brought into operation during year amounted to 378,400 hp.: expenditure in building construction in Canada in 1929 outlay involving probably more than $75,000,000, not less than $320,000,000 will be required to complete plans for next three years.

HYDRO-ELECTRIC POWER PLANTS

BRITISH COLUMBIA. Automatic Hydro-electric Plant Proves Its Economies C. W. Colvin. Elec. West, vol. 64, no. 3, Mar. 1, 1930, pp. 128-129. More than year of satisfactory operation of 10,000-kva. fully automatic Alouette hydro-electric generating plant has convinced British Columbia Electric Railway Co. that added expense incurred in providing additional equipment required for fully automatic operation was more than justified.

Big Developments by the West Kootenay Power and Light Co. Elec. News (Toronto), vol. 39, no. 8, Apr. 15, 1930, pp. 83-88, 10 figs. Large hydro-electric plants and numerous other sites adjacent to British Columbia's mining districts; among other projects; 300,000 hp. to be developed on Pend d'Oreille River; plant operates under average head of 70 ft. and contains two I.P. Morris 60-in. vertical, Francis turbines; 8,000 hp. at 180 r.p.m.; two Allis-Chalmers, Francis, 65-in. turbines, each 180 r.p.m., 9,000 hp.; totaling 34,000 hp.; generators are four C.G.E. 7,500-kva., 2,200 volt. three-phase 60-cycle machines.

The Rapid Expansion of East Kootenay Power Company's System, G. E. Elkington. Elec. News (Toronto), vol. 39, no. 8, Apr. 15, 1930, pp. 89-91, 5 figs. Expansion is due chiefly to rich metal ores in Kimberly district and large coal deposits around Crow's Nest pass in Southern British Columbia; notes on system and equipment; maps of transmission system; data regarding sentinel steam plant; total output of plant will be available for 7 months in year, and for remaining 5 months, two-thirds of this will be available in average years; when development is completed company will have available 37,000 kw. of hydro power and 10,000 kw. steam power.

Ice Control. Ice Problems in Power Development, J. Murphy. Can. Engr. (Lond.), vol. 58, no. 21, May 27, 1930, pp. 607-611. Abstract of paper presented at World Power Conference, Tokyo; frazil ice and its formation; employment of electrical heating apparatus at power house screens.

HYDROMETALLURGY

Electrolysis. Status of Electrolysis as a Metallurgical Process, T. H. Donahue. Am. Electrochem. Soc.—Advance Paper, no. 57-20, for mtg. May 29-31, 1930, pp. 213-232. Brief review of status of copper, zinc, lead, cadmium, silver, bismuth and nickel; difficulties of present electrolytic processes are examined; importance of precious metal by-products is emphasized; improvements in process and possible introduction of new methods are discussed; many novel industrial applications of electrolytic methods to above and to other metals are suggested.

I

INDUSTRIAL MANAGEMENT

Production Control. Production Planning in Stamping Plants, J. W. Hallock. Metal Stampings, vol. 3, no. 5, May 1930, pp 423-426 and 470. Economies of die, tool, jig, and fixture practice, factors to be considered and equations for solution of problems involving fixture costs.

See also Airplanes.

Small Plants. Management of the Small Manufacturing Plant: Its Characteristics and Advantages, C. Field. Am. Soc. Mech. Engrs.—Advance Paper, for mtg. June 9 to 12, 1930, 7 pp., 1 fig. Having ascertained that small plants greatly predominate, paper suggests two reasons: differences of plants in each of their activities are evaluated, and form composite figure having great influence on plant's chances of success; in discussing personnel, relative versatility is stressed, also advantage enjoyed by small plant in having higher incentive of part ownership for higher executive and immediate interrelation between effort and resulting bonuses among subordinate keymen. Bibliography.

INSPECTION

Optical Instruments for. Optical Aids to Engineering Inspection, A. F. C. Pollard. Inspection (Lond.), vol. 1, no. 2, Apr. 1930, pp. 79-102 and (discussion) pp. 103-113, 30 figs. Various types of optical instruments of use in inspection of manufactured products are described and their use is discussed.

INTERNAL-COMBUSTION ENGINES

Exhaust From. The Final State of a Gas Discharged from a Reservoir into a Space under Constant Pressure, F. Modugno. Shipbldr. (Lond.), vol. 37, no. 238, Apr. 1930, pp. 475-476; see also Shipbldg. and Shipg. Rec. (Lond.), vol. 35, no. 16, Apr. 17, 1930, p. 501. Mathematical investigation based on laws of adiabatic expansion, of changes which occur in physical constants, such as pressure volume and temperature of gas discharged from one vessel into another, based on assumption that pressure in second vessel remains constant. Paper presented before Instn. Naval Architects, Apr. 1930.

Inertia Forces in. Inertia Forces in Reciprocating Engines, V. Jensen. Mar. Engr. and Motorship Bldr. (Lond.), vol. 53, no. 632, May 1930, pp. 189-190, 2 figs. For exact calculation of well-designed and proportioned connecting-rod bolts, it is necessary to determine inertia forces in reciprocating parts of engine; simple graphical method for calculation of these forces is explained.

Supercharging Compressors. New Compressor of High Output (Un nouveau compresseur volumétrique à grand débit), R. C. Faroux. Vie Automobile (Paris), vol. 26, no. 942, Mar. 25, 1930, pp. 117-119, 4 figs. Brief review of various systems of compressors; description of design and performance of P.Z. volumetric type; calculations for example of 20 litres output at 2,000 r.p.m., weighing 22 kg.; with regard to supercharging advantages.

(*See also Airplane Engines; Diesel Engines; Gas Engines; Oil Engines.*)

L

LIGHTNING ARRESTERS

Hydro-electric Systems. Lightning Arresters on Hydro-electric Systems, G. C. Dill. Elec. Jl., vol. 27, no. 5, May, 1930, pp. 287-289, 8 figs. Speed and voltage curves when load on 220-kv. system is suddenly disconnected; upper curve shows voltage rise with constant flux linkages on generator field; dotted curve shows how voltage rise is limited by opening main field breaker at end of 0.2 seconds; arresters should be protected from over-voltage during generator over-speed.

LIGHTNING RESEARCH

Measurement. Measuring the Effects of Actual Lightning Surges on Transmission Lines, C. L. Fortescue. Elec. Jl., vol. 27, no. 3, Mar. 1930, pp. 161-167, 14 figs. Results of tests made on 5-mi. line between Rankin and Wilmerding, Pa., with Dufour-type cathode-ray oscillograph and small 50-kv. surge generator on 66-kv. transmission line between Pittsfield and Turner Falls using stationary Dufour oscillograph and portable surge generator of 400,000 volts, and on 220-kv. Roseland-Bushkill line of Public Service Electric & Gas Co. in New Jersey; tests of arrangements, oscillographs and curves, and analysis of tests. (Concluded.)

LITHIUM DEPOSITS

Manitoba. Tin, Lithium and Beryllium Deposits of Southeast Manitoba, J. F. Wright, Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 22, May 30, 1930, pp. 514-517, 4 figs. Tin, lithium and beryllium deposits attracting most attention are in that part of Oiseau River area along Winnipeg River east of Pointe de Bois and North to Shatford and Bernic lakes; general geology; general features of pegmatites; tin deposits; lithium deposits; beryllium deposits; summary of economic features; some of pegmatites of district may be in demand in future as source of feldspar.

LOCOMOTIVES

Alloy Steels for. Alloy Steels for Locomotive Construction, W. A. Johnson. Instn. Mech. Engrs.—Proc. (Lond.), no. 5, Dec. 1929, pp. 1087-1097, 1 fig. Alloy steels are particularly susceptible to heat treatment and wide range of properties is possible with given composition; drilling of forgings offers advantages; savings in weight are possible by more extensive adoption of steel of high tensile strength; it is shown that in case of locomotive considered, this amounts to 4 tons approximately, or 7 per cent of static weight of engine, and effect on dynamic hammer blow is shown to be more pronounced.

Electric. Electric Locomotives for Main Line Traction, G. Bianchi. Int. Ry. Congress Assn.—Bul. (English Edition, Brussels), vol. 12, no. 5, May 1930, pp. 1410-1421. Classification of electric locomotives; types of transmission from motor to wheels; arrangement of trucks and bodies; wheel arrangements; lubrication; current collecting devices; lightning arresters; circuit breakers; transformers; traction motors; matters relating especially to locomotives for use in mountainous country; multiple-unit rail motors.

Switching and Transfer Locomotives, P. A. McGee. Ry. Elec. Engr., vol. 21, no. 5, May 1930, pp. 141-143, 4 figs. Illinois Central adopts locomotives with special weight transfer compensating features; nature of switching and transfer service; side elevation of locomotive showing structural details and principal dimensions; weight transfer compensation; locomotive characteristics; principal characteristics of locomotive units are given.

Manufacture, Heat Treatment in. The Heat Treatment of Locomotive Parts, W. A. Stanier. Instn. Mech. Engrs.—Proc. (Lond.), no. 5, Dec. 1929, pp. 1069-1073, 4 figs. At Swindon it is now practice to treat all steel stampings and forgings so that structure of each part is in best condition to resist strains and stresses to which it will be subjected in service; plant consists of vertical furnace with chamber 16 ft. 3 in. long and 2 ft. 2 in. diam., gas-fired; in addition there is horizontal three-chamber furnace; micro-photographs are shown illustrating structure of axle steel in various conditions.

New Types. Locomotives of New Types; in Particular Turbine Locomotives and Internal Combustion Motor Locomotives, P. Koller. Int. Ry. Congress Assn.—Bul. (English Edition, Brussels), vol. 12, no. 5, May 1930, pp. 1383-1390. Report deals with construction, efficiency, use and repair of new types of locomotives, with particular reference to turbine and internal combustion.

Three-Cylinder. Examples of Recent Three-Cylinder Locomotives of Various Types. Ry. Mech. Engr., vol. 104, no. 5, May 1930, p. 261. Specifications concerning general dimensions, weights, and proportions of 16 various railroads.

LUBRICANTS

Progress in. Heavy Oils and Lubricants, W. Lee. Instn. of Petroleum Technologists—Jl. (Lond.), vol. 16, no. 81, Apr. 1930, pp. 266-280 and 2 supp. pp. Review of progress during 1928-1929; no new process introduced for production of heavy distillates or treatment to make them available as lubricant; increased use of Edeleanu liquid sulphur-dioxide process, applied to production of lubricants; production of heavy lubricants by polymerization; recovery of used oils; oxidation resistance; correlation between laboratory carbon tests and engine conditions; transformer oil tests. Bibliography.

LUBRICATING OIL

Automotive. The Significant Properties of Automotive Lubricants, H. C. Mougey. Am. Soc. Testing Matls.—Advance Paper for mtg., Mar. 19, 1930, 10 pp., 1 fig. Methods of determining properties of automotive lubricants are discussed; principal significant properties in order of their importance are: viscosity, stability, oiliness (under certain conditions).

LUBRICATION

Centralized System. Centralized Lubricating System Developed by Farfall. Automotive Industries, vol. 62, no. 19, May 10, 1930, pp. 734-735, 3 figs. Centralized high-pressure lubricating system, designed for all types of machinery and also applicable to automotive vehicles, made by Farfall Co. of Detroit; metering-type unit operates under pressure up to 2,000 lbs.; cross-section of automobile type of lubricator; model 300 pump assembly in section.

M

MACHINE TOOLS

Hydraulic Feeds. The Hydraulic Operation of Machine Tools. Engineer (Lond.), vol. 149, no. 3877, May 2, 1930, pp. 491-492. Editorial remarks on advantages of hydraulic transmission; that its possibilities are being realized by makers of machine tools was evident to all who inspected machinery exhibited at Leipzig Fair.

METALS

Calorizing. Heat Enduring Metals for Furnace Construction, B. J. Sayles. Fuels and Furnaces, vol. 8, no. 5, May 1930, pp. 699-701. Article deals mainly with calorizing process in which aluminum is driven into surface layer of another metal, usually mild steel, to form surface iron-aluminum alloy; this alloy is immune to oxidation up to maximum metal temperatures of 1,650 deg. fahr.

Cold Rolling. Cold Roll Forming of Metals, D. A. Johnston. Metal Stampings, vol. 3, no. 5, May 1930, pp. 429-434, 6 figs. Design of rolls with reference to least distortion of metal, hardening and grinding, life and replacement, etc.

Cutting. Surface Conditions with Machining Operations, Especially with Turning (Das Oberflaechenaussehen bei der spanabhebenden Bearbeitung insbesondere beim Drehen), F. Rapatz. Archiv. fuer das Eisenhuettenwesen (Duesseldorf), vol. 3, no. 11, May 1930, pp. 717-720, 17 figs. partly on supp. plates. Influence of cutting speed, strength, structure, wedge angle, etc., is discussed; reference is made to so-called Whitaker ring.

Testing. Recent Progress in Tests for Automotive Materials, H. F. Moore. Am. Soc. Testing Matls.—Advance Paper for mtg., Mar. 19, 1930, 10 pp., 2 figs. Viewpoint which author presents is that of testing engineer in university laboratory; tests for elastic strength; and creep strength; fracture; impact tests; tenderness of metals; understressing tests; ductility and non-destructive tests; corrosion and strength.

Specimens for Torsion Tests of Metals, R. L. Templin and R. L. Moore. Am. Soc. Testing Matls.—Advance Paper No. 50, for mtg. June 23-27, 1930, 10 pp., 6 figs. Tests to determine influence of form and size of specimen upon results obtained in torsion tests; merits of hollow cylindrical specimens, having different ratios of diameter to wall thickness and length to diameter as well as those of hollow section were investigated; comparative results from hollow and solid specimens show little variation in values of modulus of elasticity in shear; data are given on influence of specimen proportions upon values of shearing yield point obtained from autographic diagrams.

Theory of. Recent Advances in the Theory of Metals, R. H. Fowler. Engineering (Lond.), vol. 129, no. 3356, May 9, 1930, pp. 595-597. Author concerns himself mainly with particular applications and results of quantum mechanics, without which no real progress could be made in theory of metals. Review of Kelvin lecture before Instn. Elec. Engrs., May 1, 1930.

MINES AND MINING

Electric Power—British Columbia. Electricity in Mining, F. W. MacNeil. Elec. News (Toronto), vol. 39, no. 8, Apr. 15, 1930, pp. 93-95, 3 figs. Province of British Columbia, producing 23½ per cent of Dominion's mineral wealth, uses considerable electric power in its many famous mines; short note on power supply to principal mines are given.

N

NATURAL GAS INDUSTRY

Canada. Utilization of Gas From Turner Valley, J. Bilterijst. Can. Engr. (Toronto), vol. 58, no. 18, May 16, 1930, pp. 543-549, 1 fig. Geological features pointing to existence of large potential oil and gas resources in foothills of Rockies in Alberta; gas now wasted must be conserved; feasibility of transmission to Ontario asserted; nature of reservoir; drilling methods; marketable volume of gas. (To be continued.)

O

OIL ENGINES

Automotive. Ignition by Compression or Spark for Automotive Heavy Oil Engine (Selbstzuendung oder Fremdzuendung im Fahrzeugschweroelmotor), A. E. Thiemann. Automobil-Rundschau (Berlin), vol. 32, no. 9, May 1, 1930, pp. 183-186, 4 figs. Comparison of various designs using compression ignition and electric ignition; sketches show details of Hesselman and Leroy engines; injection and combustion phenomena are discussed.

OIL FIELDS

Alberta. Utilization of Gas From Turner Valley, J. Bilterijst. Can. Engr. (Toronto), vol. 58, no. 18, May 16, 1930, pp. 543-549, 1 fig. Geological features pointing to existence of large potential oil and gas resources in foothills of Rockies in

Alberta; gas now wasted must be conserved; feasibility of transmission to Ontario asserted; nature of reservoir; drilling methods; marketable volume of gas. (To be continued.)

CANADA. Oil and Gas Developments in Western Canada During 1929, G. S. Hume. Instn. of Petroleum Technologists—Jl., (Lond.), vol. 16, no. 81, Apr. 1930, pp. 350-353. Summary of oil-well and gas-well drilling activity; completions and flow rates.

OIL FUEL

CHOICE OF. Choice of Liquid Fuels (Die Auswahl der fluessigen Brennstoffe), E. W. Steinitz. Papier-Fabrikant (Berlin), vol. 28, no. 10, Mar. 9, 1930, pp. 154-158, 4 figs. Calorific value and specific gravity are unsuitable as criteria for evaluation of liquid fuels; volatility as shown by distillation curve is of greater value for this purpose; various types of motor fuels and Diesel oils, their distillation curves, anti-knocking properties, and comparative prices are briefly discussed.

P

PHOTO-ELASTICITY

PHENOMENA INVOLVED IN. Phenomena Involved in Photo-elasticity, R. W. Baud. Elec. Jl., vol. 27, no. 5, May 1930, pp. 303-305, 8 figs. Note on natural and polarized light; optical behaviour of isotropic and anisotropic material; formation of isoclinics; formation of colour fringes are given.

PHOTO-ELECTRIC CELLS

SPECIAL APPLICATIONS. Photo-Cells for Special Applications, H. C. Rentschler. Electronics, vol. 1, no. 1, Apr. 1930, pp. 29-30. Short note on performance of photo-electric cells and three principal uses: (1) applications where device must faithfully follow exact variation in light intensity; (2) such applications as simply require trigger action; (3) to integrate light intensity over given time.

PIERS, MASONRY

CALCULATION OF. Calculation of Masonry Piers Under Eccentric Loading (Beitrag zur Berechnung von exzentrisch beanspruchten Mauerpfeilern), H. Gottfeldt. Bauingenieur (Berlin), vol. 11, no. 3, Jan. 17, 1930, pp. 48-49, 5 figs. Author establishes expressions for relation between maximum extreme fibre compressive stress in pier after failure in tension zone due to eccentric loading and tensile and compressive extreme fibre stresses before failure; stability of masonry pier is dependent not only on magnitude of tensile stress but on ratio of this stress to compressive.

PILE DRIVING

EXPERIENCES WITH. Experiences with the Driving of Reinforced-Concrete Piles (Erfahrungen beim Einrammen von Eisenbetonpfaehlen). Zement (Charlottenburg), vol. 19, no. 9, Feb. 27, 1930, pp. 201-203. 3 figs. Method of testing supporting power of unknown ground by driving only one test pile cannot be recommended; stresses in ground, which arise when piles are driven close together, must be taken into consideration; ground must be tested much deeper than necessary foundation depth in order to determine smallest possible distance between piles without overloading; it is advised to drive piles again after several several weeks when all stresses are neutralized.

PIPE, CONCRETE

MANUFACTURE. Developments in the Manufacture and Use of Concrete Pipe, M. W. Loving. Am. Concrete Inst.—Jl., vol. 1, no. 7, May 1930, pp. 732-747, 8 figs. Evolution and modern methods of manufacture of plain and reinforced concrete pipe; use of concrete pipe in culverts, irrigation, water supply and force mains; results of condition survey of 191 reinforced concrete pipe sewers in 43 cities and large industrial plants in United States.

POWER GENERATION

DEVELOPMENTS IN. Power Production—Past, Present and Future, F. C. Lee. Instn. Mech. Engrs.,—Proc. (Lond.), no. 5, Dec. 1929, pp. 1045-1054. After brief review of historical development of prime movers, following questions are discussed: how it came about that before end of seventeenth century so little development was possible, and that from dawn of eighteenth century to present time such extraordinary progress has been made; what are possible limits of efficiency of present methods and whether there are sources of energy that have not yet been developed.

PULVERIZED COAL

FIRING WITH. Pulverized-Coal Firing (Kohlenstaubfeuerung), A. Krenn. Montanistiche Rundschau (Berlin), vol. 22, nos. 5, 6, 7, and 8, Mar. 1, 1930, pp. 97-112, Mar. 16, pp. 125-132, Apr. 1, pp. 149-156, and Apr. 16, pp. 181-188, 25 figs. Systematic presentation of present status of pulverized-coal firing; physicochemical and thermodynamic principles; technical details; types of pulverized-coal boilers, and equipment. Bibliography.

PUMPS

CENTRIFUGAL, ELECTRICALLY DRIVEN. Induction Motors for the Dirve of Vertical Pumps. AEG Progress (Berlin), vol. 6, no. 3, Mar. 1930, pp. 94-97, 8 figs. Great flexibility of electric motor and especially its application as vertical motor has in recent years definitely promoted development of vertical-pattern centrifugal pump; typical pump installations are illustrated and described.

GAS-DISPLACEMENT. Two-Stroke Cycle Gas-Displacement Pump. Water and Water Eng. (Lond.), vol. 32, no. 377, May 20, 1930, pp. 218-220, 4 figs. Description of Christie large volume, low-head pump; pump consists of vertical stand pipe mounted on tee piece, one end of which leads to suction box fitted with sixteen 5-in. suction valves, submerged in tank; the other communicating with 60 ft. play pipe terminating in boiler; pump is capable of suction lift of 8 or 10 ft.; thermal efficiency of 14 per cent has been attained.

SUBMERGED-MOTOR. Evolution of Submerged Motor Pumps (Die Entwicklung der Tauchpumpen), H. Sauveur. V.D.I. Zeit. (Berlin), vol. 74, no. 17, Apr. 26, 1930, pp. 530-532, 9 figs. Features of early and later types, with special reference to Garvenswerke, Arutuenoff; Siemens-Schuckertwerke, Reed Cooper, and other makes.

R

RAIL MOTOR CARS

DATA ON. On the Question of Rail Motor Cars (Subject XX for Discussion at the Eleventh Session of the International Railway Congress Association), Z. Zavadjil. Int. Railway Congress Ass.—Bul. (English Edition, Brussels), vol. 12, no. 2, Feb. 1930, pp. 443-490, 12 figs. Report covers data concerning cars of all countries of Europe, except France; types and principal data of rail motor-cars in service; table giving weights and power of rail motor-cars; organization of service, method of use; economic results of operation of rail motor-cars.

RAILROAD TIES

CONCRETE. Experiments with Reinforced-Concrete Twin Ties (Versuche mit Eisenbeton-Zwillingsschwellen), R. Otzen. Zement (Charlottenburg), vol. 19, nos. 8 and 9, Feb. 20, 1930, pp. 174-177 and Feb. 27, pp. 196-199, 12 figs. Different kinds of reinforced-concrete ties were tested in laboratory for their behaviour when exposed to different continuous and intermittent pressures; impressions, elastic and permanent, were measured; twin-tie showed 50 per cent less change in form than transverse tie; pressure and deformation of roadbed is very much decreased; data are given for calculation of "form-factor" and best tie dimensions.

PRESERVATION. Getting More Service out of Crossties. Ry. Eng. and Maintenance, vol. 26, no. 6, June 1930, pp. 261-263, 1 fig. Ways to improve quality, obtain longer service life and insure permanent supply of timber were studied by producers and consumers at convention of National Association of Railroad Tie Producers held in Memphis, Tenn.

STEEL VS. WOODEN. Steel vs. Wooden Ties (Eisen oder Holzschwelle?), R. Vogel. Stahl und Eisen (Duesseldorf), vol. 50, no. 21, May 22, 1930, pp. 722-729, 7 figs. It is shown that German Government Railroad steel ties are from technical and economic viewpoint not alone on par with wooden ties employed, but in many respects superior.

ROAD MATERIALS

EMULSIONS. Characteristics, Manufacture and Practical Uses of Asphalt Emulsion (Wesen, fabriksmaessige Herstellung und praktische Verwendung von Asphaltemulsionen), Graefe and Fleck. Petroleum (Berlin), vol. 26, no. 12, Mar. 19, 1930, pp. 357-361. Three methods of applying cold asphalts for road surfaces are discussed: (1) surface treatment; (2) penetration process; (3) mixing process.

ROADS

CEMENT-BOUND. Cement-Bound Roads, R. A. B. Smith. Concrete and Constr. Eng. (Lond.), vol. 25, no. 3, Mar. 1930, pp. 184-192, 2 figs. Review of construction practice and costs of cement-bound road surface with special reference to experience of County Mayo, Ireland; half-width and full-width construction; details of centre joint in half-width work.

ROLLS

SHEET-MILL. Tin and Sheet-Mill Rolls, Their Treatment, Performance and Premature Failure in Service, E. R. Mort. Iron and Steel Inst.—Advance Paper, May 1930, 20 pp., 14 figs. Sheet plant to which data relate comprises 16 hot mills of single-stand type; there are no roughing stands, all bars being broken down and finished off on one pair of rolls; generally speaking, harder rolls expand more than mild ones; as body length increases, concavity decreases, converse being case with increase of diameters; pack lengths extend, so should concavity; lighter gauge, less concavity required.

S

SCREWS

MANUFACTURE. Screws Made in Modern Plant, C. B. Phillips. Iron Age, vol. 125, no. 19, May 8, 1930, pp. 1377-1379, 5 figs. Description of manufacturing process and equipment at Rockford, Ill., plant of Elco Tool & Screw Corp., makers of wood screws, machine screws, cap, and lag screws, from small ones up to ½ in. in dia., and such finishes as bare polished, plated with cadmium, copper, brass, nickel or chromium, blued, oxidized, parkerized or raven black.

SEAWALLS

MARSEILLES, FRANCE. "A Chaise" Type of Seawall of Deposited Blocks Provided with Tenons and Mortises (Mur de quai "à chaise" en blocs arrimés munis de tenons et Mortaises), Sainflou. Annales des Ponts et Chaussées (Paris), no. 1, Jan./Feb. 1930, pp. 26-40, 8 figs. Design and construction of new seawall in Port of Marseilles, about 10 m. high and 190 m. long; so-called "à chaise" seawalls have short heel sloping seaward; concrete block dimensions were up to 4.5 by 3 by 2.7 m.

SEWAGE DISPOSAL

CHLORINATION. Efficiency and Cost of Sewage Disinfection, J. W. Ellms and G. T. Pond. Mun. Sanitation, vol. 1, no. 5, May 1930, pp. 266-268, 2 figs. Analyses of raw sewages and effluents; volumes of sewage chlorinated and amount of chlorine applied; effect of disinfection; cost of disinfection of sewage effluents.

UNITED STATES. Recent Trends and Comparative Costs of Sewage Disposal, F. H. Bulot. Water Works and Sewerage, vol. 77, no. 5, May 1930, pp. 155-159. Analysis of 48 sewage treatment plants show increasing use of mechanical equipment; types of treatment; construction and operating cost data; sewage treatment plants constructed during six-year period 1924 to 1930; gas collection; chlorination; sludge disposal; unit costs.

SEWER TUNNELS

OWENSBORO, KY. Driving Sewer Tunnels Through Quicksand under Air, V. J. Brown. Water Works and Sewerage, vol. 77, no. 5, May 1930, pp. 143-146. 8 figs. Detailed description of experience of Owensboro, Ky.; designer took advantage of stiffest material located by borings; mining operations; mining through buried dump; excavation procedure; shaft construction; arrangement of concrete forms; organization of crews.

SHAFTING

VIBRATIONS. Critical Vibrations in Shafting, M. Doucet. Shipbldr. (Lond.), vol. 37, no. 238, Apr. 1930, pp. 465-466, 2 figs. Simple methods for calculating critical speeds in line shafting and in turbine shaft; hypothesis is given that shaft may be divided into sections carrying at each extremity concentrated mass; system of such masses is dynamically equivalent to given system. Translated abstract of paper presented before Association Technique Maritime et Aéronautique.

SHEET METAL

TESTING. Stamping Test for Metal Plates (Les essais d'emboutissage des tôles), R. Cazaud. Aciers Spéciaux, Métaux et Alliages (Paris), vol. 5, no. 53, Jan. 1930, pp. 6-14, 19 figs. Description of test used for controlling annealing, and different types of testing machines employed.

SPRINGS

HELICAL. Further Research on Helical Springs of Round and Square Wire, A. M. Wahl. Am. Soc. Mech. Engrs.—Advance Paper, no. 24, for mtg. June 9 to 12, 1930, 8 pp., 21 figs. Proposed method of calculating stress in helical springs of square or rectangular wire is to use approximate formula, based on St. Venant's results for torsion of rectangular wire, and multiply by correction factor based on spring index; it is suggested that this new formula replaces those commonly given in handbooks, which may lead to considerable error in certain cases. See Engineering Index 1929, p. 1709.

STEAM-ELECTRIC POWER PLANTS

DESIGN. Power Station Betterment. Nat. Elec. Light Assn.—Pub. No. 044, May 1930, 6 pp., 13 figs. Report indicates station betterments possible through modernization by addition of new equipment or remodeling of old; four examples of station betterment by minor capital expenditures are given, intended to show what can be done toward increasing capacity or improving economy with existing apparatus; substantial rebuilding; modernization of boiler house; modification of heat balance; increase in boiler capacity by use of larger stokers and water walls.

ENGLAND. Extensions at Kingston-Upon-Thames. Elecn. (Lond.), vol. 104, no. 2706, Apr 11, 1930, p. 457, 2 figs. Present extension comprises additions to boiler house; foundations, etc.; boiler, turbo-alternator, switchgear, and cables; foundations for boiler, owing to nature of ground, presented some difficulties; boiler plant is of Stirling five-drum type, with patent integral superheater and Green's tri-tube economizer; capable of producing 50,000 lbs. of steam per hour with extremely large overload capacity; turbo alternator of Brush Ljungström type has output of 3,000 kw. at steam pressure of 225 lbs.

SASKATCHEWAN. New Saskatoon Power Station of the Government of Saskatchewan. Power House, vol. 24, no. 2, Feb. 1930, pp. 41-51, 27 figs. Illustrated description of equipment in new public utility power station; boiler plant; feed water system; coal and ash handling equipment; electrical data; list of equipment is given.

STEAM ENGINES

HIGH-PRESSURE. The Steam Engine as the High-Pressure Prime Mover, J. F. Ferguson. Power, vol. 71, no. 19, May 13, 1930, pp. 745-746. For industrial use, author foresees prime movers of reciprocating type, adapted to moderate, high, or extreme initial pressure.

GOVERNORS. Governor Gear for High-Speed Reciprocating Steam Engine. Engineering (Lond.), vol. 129, no. 3355, May 2, 1930, pp. 570-571, 6 figs. Account of construction and operating of governor; operation is such that sheave centre is altered relatively to centre of shaft when variation of load occurs; regulation of both valves simultaneously by governor enables receiver pressure to be maintained practically uniform degree at all loads.

STEAM POWER PLANTS

DESIGN. Power Plant Development, C. F. Hirshfeld. Blast Furnace and Steel Plant, vol. 18, no. 5, May 1930, pp. 812-816, 9 figs. Changes in power-plant design and operation in last few years; graphs show increase in total steam temperatures, in physical size of boiler units, in steaming capacities of boiler units, and in main unit turbine sizes; thermal economy of plants operating on 50-60 per cent annual load factor; output per boiler unit 800,000 lbs. thermal gains by regenerative feed heating; theoretical heat consumption per kw-hr. at different pressures and temperatures; efficiency at various temperatures of heated feedwater and with varying number of extraction points; high-pressure equipment.

HIGH-PRESSURE. Modern Problems of High-Pressure Steam (Neuzeitliche Probleme der Hochdruckdampftechnik), S. Loeffler. Waerme (Berlin), Vol. 53, no. 15, Apr. 12, 1930, pp. 281-284, 10 figs. Sankey diagram and layout of high-pressure steam plant with author's boiler are presented; influence of pump performance on efficiency; heat utilization at different pressures, live steam, and intermediate superheating temperatures; comparison of high-pressure steam plants of this type with and without economizers. This paper, which was contribution to Stodola Festschrift, represents last work of deceased author.

PULVERIZED-COAL-FIRED. Experience Pooled in Pulverized Fuel Burning. Power House, vol. 24, no. 2, Feb. 1930, pp. 55-56. Summary of pulverized-fuel practice has been issued by National Electric Light Association in which personal investigation statements from users and statements from manufacturers are given; coal fineness, sampling methods; boiler operation; burner and furnace operation.

STEAM TURBINES

TESTING. Consumption Tests of Turbines with Reheating of Feedwater; Flow of Hot Water Through Nozzle (Essais de consommation des turbines à réchauffage de l'eau d'alimentation), M. Hentsch. Science et Industrie (Paris), vol. 14, no. 192, Jan. 1930, pp. 4-6, 4 figs. Analysis of measurements and tests with standard nozzle placed in pipe system.

STEEL

CHROMIUM-MANGANESE. *See Chromium-Manganese Steel.*

COPPER. *See Copper Steel.*

HEAT TREATMENT, ELECTRIC. Electric Heating of Metals (Ein Erbtzungsverfahren fuer Metalle auf elektrischem. Wege), F. Staeblein. Stahl u. Eisen (Duesseldorf), vol. 50, no. 9, Feb. 27, 1930, pp. 263-264, 1 fig.; see also translated abstract in Metallurgist (Supp. to Engineer, Lond.), Apr. 25, 1930, p. 61, Electric method of heating metal pieces under water was described by inventor of process, P. Hoho, in Elec. Rev., Feb. 1 and 8, 1929; his description of phenomena and effects produced has been confirmed by trials made at Kaiser Wilhelm Institut fuer Eisenforschung at Duesseldorf and also by author; diagram is shown illustrating application of method to hardening of head of steel rail.

STEEL CASTINGS

TEMPERATURE EFFECT. The Effect of Low Temperatures Upon the Impact Resistance of Steel Castings, R. W. Moffatt. Can. Jl. of Research (Ottawa), vol. 2, no. 5, May 1930, pp. 327-340, 26 figs. partly on supp. plates. Investigation deals with steel castings and forgings; low, medium, and high carbon-steel castings and alloys of vanadium, nickel, and vanadium-nickel steel castings were examined; temperatures varied from room temperatures to temperatures well below zero deg. fahr.; impact resistance of metals decreased for temperatures below freezing point; by proper heat treatment of steel castings impact resistance at 40 deg. may be brought over 300 per cent higher than that of untreated metal at that temperature.

STREAM POLLUTION

CANADA. Pollution of Canadian Inland Waters. Can. Engr. (Lond.), vol. 58, no. 21, May 27, 1930, pp. 615-618. Report covering activities of public-health engineering division of department of Pensions and Health with regard to supervision of quality of drinking water for vessels navigating inland waters, during 1929; water supplies on trains.

T

TANKS, CONCRETE

DESIGN. Reinforced Concrete Tanks, W. S. Gray. Concrete and Constr. Eng. (Lond.), vol. 25, no. 4, Apr. 1930, pp. 257-264, 11 figs. Elementary theory of design with examples; stability of tanks in wet ground; circular tanks in wet ground; moments in uniformly loaded circular slabs fixed at circumference; stresses in narrow rectangular tanks in good ground.

TEXTILE MACHINERY

GEARING. Improving Gear Performance on Textile Machinery, P. S. Huntley. Textile World, vol. 77, no. 18, May 3, 1930, pp. 96-97, 4 figs. Discussion of good gear performance which requires exact alignment of studs or shafts that carry gears, true running of gear on stud or shaft, correct meshing of gears, and intelligent oiling; gears with cast teeth; types of oilers.

TEXTILE MILLS

ELECTRIC MOTORS FOR. Style of Enclosure for Textile Motors. AEG Progress (Berlin), vol. 6, no. 3, Mar. 1930, pp. 52-54, 8 figs. In textile industry large quantities of dust and fluff in atmosphere render service conditions extremely unfavourable; various method of protecting motors are described and illustrated.

WASTE-HEAT UTILIZATION. Heating Water for Process Work in Textile Mills, C. L. Hubbard. Textile World, vol. 77, no. 14, Apr. 5, 1930, pp. 2024-2027 and 2075, 13 figs. Discussion of economy of using exhaust steam for heating waters in textile mills; description of various types of heaters for heating large quantities of water and proper equipment layout to insure best results; explanation of methods; whereby waste heat of Diesel engines may be utilized for heating water for textile processes.

Waste Heat Economy in Textile Mills. AEG Progress (Berlin), vol. 6, no. 3, Mar. 1930, pp. 49-51, 5 figs. General notes on study of process and consequent development of equipment by AEG advantageous for steam consumption, for producing moist atmosphere, for heating and for drying plants of weaving, bleaching, printing, dyeing, and dressing mills.

TIN DEPOSITS

NOVA SCOTIA. Tin Lodes in Nova Scotia, E. H. Davidson. Min. Mag. (Lond.), vol. 42, no. 1, Jan. 1930, pp. 20-23, 4 figs. Notes on geology of Gold River area, Lunenberg County, Nova Scotia, where both tin and gold deposits are found; molybdenite deposit is mentioned.

TOLERANCES

HOLE CENTRES. Limiting Dimensions on Centres of Components and Gauges, L. E. Bunnett. Machy. (Lond.), vol. 36, no. 914, Apr. 17, 1930, pp. 87-88, 2 figs. On dimensions of hole centres number of points arise which call for careful consideration and calculation before deciding upon tolerances; by examination of actual example author shows that clearance holes may be too small if certain limits are used and further that gauging may be made practically impossible.

TRANSFORMER OIL TESTING

BUILT IN CASE. Transformer Oil Tester Built in Case. Elec. World, vol. 95, no. 19, May 10, 1930, p. 938, 1 fig. Glass utensils used for testing may not be perfectly clean; small amount of water in relatively inconsiderable quantity of tested oil is liable to introduce an out-of-proportion large per cent error; uncertainties may be avoided with arrangement described in March 27 issue of Elektrotechnische Zeit. according to which small, simple and inexpensive set of electrodes is built directly into each transformer as permanent part thereof.

TUNNELS

CROSS-SECTION RECORDING. Direct Recording of Cross Section of Civil Engineering Works. Engineer (Lond.), vol. 149, no. 3879, May 16, 1930, p. 555, 2 figs. Instrument, which was used with marked success in taking of cross-sections in which 15-mi. rock tunnel of Lochaber water power scheme, consists of rigid framework pivoted on plane table in which ball bearing is fixed; device enables very accurate diagrams to be made.

V

VALVES AND VALVE GEARS

HYDRAULIC. 42-Inch Internal Differential Needle Valves for Yakima River Crossing Wasteway. U.S. Bur. Reclamation—Specifications No. 511, 1930, 10 pp., numerous figs. on 15 supp. sheets. Description of valves connected to steel-lined vertical shaft from concrete-lined tunnel under Yakima River, used to discharge, into Yakima River, excess water that may enter canal; valve will be operated by electric motor operated from storage battery, and controlled by means of float switches; valves will be operated under head of 383 ft.

VOLTAGE REGULATORS

PROTECTION. Overvoltage Protection of Induction Regulators, E. R. Wolfert. Elec. Jl., vol. 27, no. 5, May 1930, pp. 284-286, 3 figs. Lightning arresters should be used to protect induction regulators against surges from lightning, switching, or interruption of exciting current; notes on factory tests; effect of interrupting exciting current; protection against surges.

W

WATER CHLORINATION

CONTROL. Operating Experiences with a New Automatic Residual Chlorine Recorder and Controller, J. W. Cutler and F. W. Green. Am. Water Works Ass.—Jl., vol. 22, no. 6, June 1930, pp. 755-766, 7 figs. Description of new Wallace and Tiernan photoelectric cell unit for automatic control of chlorination; report on satisfactory experience with this unit installed at Little Falls, N.J., plant of Passaic Consolidated Water Co.

WATER METERS

TESTING. Water-Meter Testing Periods, G. Read. Can. Engr. (Toronto), vol. 58, no. 18, May 6, 1930, pp. 549-550. Meter and Service Superintendent, Los Angeles Dept. of Water and Power, reports on registration tests of 900 meters, in continuous service from one to ten years, which were taken out at random and tested at shop on same rates of delivery as were used when they were new. Paper read before Calif. Section of Am. Water Works Assn., Indexed in Engineering Index, 1929, p. 1930, from Hydraulic Eng., Dec. 1929, and Water Works Eng., Dec. 4, 1929.

WATER PIPE LINES

BRIDGES. Concrete Arch Bridge Carries Pipe Lines, F. M. Preston. Can. Engr. (Toronto), vol. 58, no. 21, May 27, 1930, pp. 605-606, 5 figs. Main features of three-hinge arch of reinforced concrete, constructed to carry water pipe line across estuary near Victoria, B.C.; crossing is 177 ft. in span and includes arch span of 66 ft.

STEEL. A Summarization of Experience and Current Practice in Certain Phases of Steel Plate Pipe Line Construction, G. H. Fenkell, W. E. Foss, G. W. Fuller, J. A. Jensen, J. F. Lahoon, E. E. Lanpher, A. V. Ruggles, J. F. Skinner. Am. Water Works Assn.—Jl., vol. 22, no. 5, May 1930, pp. 579-596. Summary of practical experience with reference to quality of steel, mill inspection of both sides of plate, special quality of metal, thickness of plate, cleaning of pipe, coating, corrosion experience, temperature strain, life of steel pipe.

WATER SOFTENING

MARION, OHIO. Operating Experiences with a New Water Softening Plant at Marion, Ohio, M. E. Flentje and C. Whysall. Am. Water Works Assn.—Jl., vol. 22, no. 6, June 1930, pp. 778-785, 2 figs. Plant described is unusual because of extreme hardness of water being treated; use of all-steel construction above ground; application of double carbonation to produce effluent of low alkalinity. Indexed in Engineering Index 1929, p. 1936, from Hydraulic Eng., Sept. 1929.

WATER TREATMENT

COAGULATION. Coagulation. Water Works and Sewerage, vol. 77, no. 5, May 1930, pp. 147-151, 6 figs. Structure of gelatinous precipitates difficult to determine; formation of calcium-carbonate precipitate on surface of limewater; precipitation of hydrous aluminum oxide; negative ions precipitated with hydrous aluminum oxide; coagulants in removing objectionable substances from water.

WATER WORKS

WINDSOR, ONT. Report on Windsor Water Works System, R. L. Dobbin. Can. Engr. (Lond.), vol. 58, no. 21, May 27, 1930, pp. 607-611. Report dealing with questions affecting distribution system consisting of 97 mi. of mains 4 to 24 in. in diam.; longevity of system; system of arriving at rates for metered and unmetered water.

WATER WORKS MANAGEMENT

EFFICIENCY IN. Elements of Efficiency in Water Works Operation, A. Kanneberg. Am. Water Works Assn.—Jl., vol. 22, no. 3, May 1930, pp. 630-645. Application of various principles of efficiency to problems of water works management; variations of motive power; rules and regulations; free water service; rates; retirement reserves and funds offsetting same; selling water service outside city's corporate limits; main extension policies; equipment.

WELDS

TESTING. Fatigue Tests of Fillet Welds, R. E. Petersen and C. H. Jennings. Am. Soc. Testing Matls.—Advance Paper No. 40, for mtg. June 23-27, 1930, 10 pp., 8 figs. Test data covering effects of machining, spacing and size of weld; tests were all made on rotating cantilever specimens 1 in. in diam.; it was found that fatigue strength of fillet weld could not be increased appreciably by machining radius at base of weld; spacing was found to reduce fatigue strength considerably.

WIRE ROPE

PRE-STRESSING. Manufacturing High-Modulus Footbridge Ropes for Fort Lee Hudson River Bridge, C. C. Sunderland. Eng. News Rec., vol. 104, no. 18, May, 1930, pp. 714-718, 8 figs. Modulus of elasticity of 6 x 37 rope increased from 12,000,000 to 18,000,000 pounds per sq. in. by pre-stressing to 125 per cent of working stress; process applied also to strands for main cables of Grand'Mere and St. Johns Bridges; equipment layout for pre-stressing wire ropes in lengths up to 3,750 ft.; stress-strain diagram of rope before and after multiple stressing; effect of multiple stressing on experimental 1½ in. strand.

WOOD

WATER PENETRATION. The Penetration of Water Vapour Into Wood, L. M. Pidgeon and O. Maass. Can. Jl. of Research (Ottawa), vol. 2, no. 5, May 1930, pp. 318-326, 3 figs. Rate of diffusion of water vapour through wood has been studied through comparison of time taken for samples of various thickness to become saturated; comparative numerical values have been obtained of rate of diffusion of water vapour through spruce and pine in various directions through heartwood and sapwood, and through samples of different lengths.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostat copies (white printing on a black background) of the articles listed in this section or others on engineering subjects can be obtained from the Engineering Societies Library at a cost of 25c. per page.

When ordering identify the article by giving: the author; the title of the article; the name of the periodical in which it appeared; and the volume and page numbers. A remittance of 25c. a page should accompany the order.

The print's size is limited to 11 by 14 inches, but where possible, two pages up to 7 by 9 inches in size will be photographed on one print, larger magazines require a print per page.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

AERIAL PHOTOGRAPHY

Geological Surveys. Prospecting by Air, M. S. Kennedy. West. Flying, vol. 7, no. 6, June 1930, pp. 57-59, 4 figs. Notes on application of aerial mapping; cost per sq. mi. was found to average $10: outline of developing and printing procedure and equipment.

Mapping. Making Aerial Mapping Pay, H. A. Erickson. Aviation, vol. 28, no. 23, June 7, 1930, pp. 1125-1127, 3 figs. Description of experiences and procedure in making survey of 2,200 sq. miles in four counties adjacent to Salinas; job was completed in 10 weeks; two K-5 aerial cameras were used; flying strips were 75 miles long; notes on cost of materials.

Use of. Utilization of Aerial Photography (L'Exploitation de la photographie aérienne), L. Poncelet. Conquête de l'Air (Paris), vol. 26, no. 5, May 1930, p. 387-394, 13 figs. Notes on fundamental optics and description of apparatus for transforming aerial photographs, and of cartographic machines built by Aérotopographe G.m.b.H., C. Zeiss, Hugershoff, H. Wild, and Nistri.

AERIAL TRANSPORTATION

Australia. The Perth-Adelaide Air Service, E. J. Hart. Aircraft (Melbourne), vol. 8, no. 7, Mar. 31, 1930, pp. 266-278, 15 figs. Description of operation and facilities of 1,453 mi. of air service; notes on schedules, passenger booking, and main arrangements; airports; geography.

France. Aeronautical Policy of France; Near Future of Civil Aviation (La Politique aéronautique de la France—Le proche avenir de l'aviation civile, M. Laurent-Eynac. Aérophile (Paris), vol. 38, no. 7-8, Apr. 15, 1930, pp. 97 and 99-102, 3 figs. Discussion of profitability of air lines; maps show routes of French lines to Asia, Africa and Latin America.

Future of. The Future of Air Transportation, T. G. Lanphier. Mech. Eng., vol. 52, no. 6, June 1930, p. 596. Important thing at present is to recognize limitations of air transportation and to stay within those limits, while at same time striving continuously to overcome obstacles which prevent air travel from safest, most reliable, most comfortable, and quickest and most convenient method of transportation.

Government Regulation. The Law and the Operator, H. Mirkil. Aviation, vol. 28, no. 24, June 14, 1930, pp. 1175-1176. Discussion of liabilities imposed by law on carriers of passengers for hire; operators of passenger-carrying aircraft will more and more come to be regarded as common carriers under law.

Radio Communication. Radiophone Communication on Air Passenger and Main Routes. Radio Eng., vol. 10, no. 6, June 1930, pp. 51-52. Short description of Boeing block-signal system of San Francisco-Chicago and Seattle-Los Angeles air-mail express passenger routes; equipment, which is described is effective at altitudes as high as 14,000 ft. and at ranges as distant as 200 miles.

Two-Way Communication in Air Transport Service, H. Hoover, Jr. Aero Digest, vol. 16, no. 5, May 1930, pp. 57, 260 and 262, 1 fig. Principles of operation are outlined; schematic diagram of airway showing communication networks between aircraft, airports, and weather observers. (Concluded.)

Voice or Code in Aircraft Radio, W. G. Logue. Aviation, vol. 28, no. 25, June 21, 1930, pp. 1213-1216. Advantages of telegraph apparatus are pointed out; performance and operation of telephone and telegraph equipment are discussed; radio telephone apparatus in plane now costs more than three times as much as two way telegraph apparatus capable of working same or greater distances, and radio telephone ground transmitters now cost from one-third to one-fourth more than ground telegraph equipment; data on weight are given.

AERONAUTICAL EDUCATION

Ground Schools. American Ground Schools, M. F. Eddy. West. Flying, vol. 7, no. 6, June 1930, pp. 50-53, and 130, 3 figs. Discussion of ground school organization and operation; notes on instructors and students; class schedules.

AERONAUTICS

Economics. Economics and the Aircraft Industry, H. P. Pattison, Jr. Aviation, vol. 28, no. 22, May 31, 1930, pp. 1088-1092. Review of events and papers presented before American Society of Mechanical Engineers, Aeronautic Division, at Dayton, Ohio; discussion of design, engines, production and aerodynamics.

AIR CONDITIONING

Research. The Possibilities of Conditioning Air for Comfort, L. L. Lewis. Ice and Refrig., vol. 78, no. 6, June 1930, pp. 490-492, 6 figs. See also Refrigeration, vol. 47, no. 6, June 1930, pp. 46 and 48. Results of research of American Society of Heating and Ventilating Engineers; use of air conditioning in theatres, department stores, and hotels; waste heat of thermodynamic cycle; classification of heat; first attempt at air conditioning. Paper read before Am. Inst. of Refrig.

AIR MAIL SERVICE

Ship-to-Shore. Ship to Shore Air Mail Service, C. H. Gale. Aviation, vol. 28, no. 22, May 31, 1930, pp. 1084-1087, 4 figs. Account of early experiments and present-day operation by French Line and North German Lloyd; rates for mail are given.

AIRPLANE DESIGN

Performance Calculation. The Climb of the Commercial Airplane, J. G. Lee. Airway Age, vol. 11, no. 5, May 1930, pp. 646-649, 5 figs. Analysis of factors affecting rate and angle of climb weight, power, wing area, span, and parasite resistance; graphs show power curves for typical cabin monoplane; comparative rates of climb and comparative angles of climb for typical cabin and light planes; fundamental difference between light plane and cabin plane.

AIRPLANE ENGINES

Diesel. Research of the National Advisory Committee for Aeronautics on Aircraft Diesel Engines, C. Kemper. Am. Soc. Mech. Engrs.—Advance Paper for mtg., June 12 to 14, 1930, 7 pp. Résumé of progress in investigation of fundamental factors controlling injection and combustion: drop size, rate of injection, spray dispersion and distribution, temperature, and air density and turbulence. Bibliography.

Design. Airplane Engine Development and Operating Reliability, R. Chilton. Soc. Automotive Engrs.—Jl., vol. 26, no. 6, June 1930, pp. 771-781, 3 figs. Practically all parts failures in engines are from fatigue originating at small local defects in material or from resonant vibrations which carry stresses beyond safe fatigue limit of material; notes on performance and supercharging; means of measuring torsional vibration; valve springs and valves.

Spark-Ignition Used in Fuel-Spray Aero Engine Recently Demonstrated. Diesel Power, vol. 8, no. 6, June 1930, pp. 306-307, 3 figs. Discussion of hammer-spray injection; principles of Diesel spark-injected aircraft engines; advantages and disadvantages of fuel-injection spark-ignition type of engine.

Maintenance and Repair. Maintenance of Aircraft Engines and Accessories, H. C. Downey. Airway Age, vol. 11, no. 5, May 1930, pp. 654-656, 5 figs. Outline of methods and problems in overhaul at Panama Air Depot, France Field, Canal Zone; notes on wear of principal parts and on method of boring Curtiss bearings; data for setting valves on D-12 engines. (To be concluded.)

Manufacture. Making Rolls-Royce Aero Engines. Machy. (N.Y.), vol. 36, no. 923, June 19, 1930, pp. 353-357, 37 figs. Manufacturing operations at airplane-engine plant of Rolls-Royce, Ltd., Derby, England.

Parts. Stringent Requirements for Aircraft Engine Parts, W. F. Wise. Soc. Automotive Engrs.—Jl., vol. 26, no. 6, June 1930, pp. 782-784, and 795. Review of requirements which make manufacture of aircraft engine parts more costly than that of automobile engine parts; notes on guarding against localized stresses; non-ferrous metals and alloys; checking heat treatment.

Supercharging. The Supercharging and Compounding of Aero Engines, H. R. Ricardo. Engineering (Lond.), vol. 129, no. 3360, June 6, 1930, pp. 738-739. Editorial review of Wilbur lecture read before Royal Aeronautical Society; to obtain substantial increase of power at ground level by means of supercharging, poppet type of exhaust valve must be abandoned; in its stead author suggests use of single-sleeve valve; compounding on these lines should result in material improvement in economy as well as in reduction in weight.

Geared Centrifugal Superchargers for Airplane Engines, S. A. Moss. Aviation Eng., vol. 3, no. 5, May 1930, pp. 10-14, 5 figs. Article previously indexed from Am. Soc. Mech. Engrs.—Advance Paper, for mtg. May 19-22, 1930.

Testing. Engine Testing Laboratory, C. M. Young. Aviation Eng., vol. 3, no. 5, May 1930, pp. 7-9, 3 figs. Description of equipment and procedure used by Dept. of Commerce, Aeronautics Branch, for type testing aircraft engines; specifications of engine requirements call for 50-hr. endurance tests.

Throttling. Aircraft Engine Wear Elimination by Throttling (Motorschonung durch Drosseln), Schatzke. Zeit. fuer Flugtechnik und Motorluftschiffahrt (Munich), vol. 21, no. 7, Apr. 14, 1930, pp. 164-175, 21 figs.; see brief translated abstract in Automotive Abstracts, vol. 8, no. 6, June 20, 1930, p. 104. Throttling has strong effect on engine life and decrease of strains in engines has definite effect; author recognizes costs involved in research method, and suggests temporary method which amounts to using of similar aircraft engines now in operation under constant conditions for each engine; varying conditions assigned to each plane will show effect upon engine wear of each condition.

AIRPLANE INDUSTRY

Canada. Surveying the Aircraft Industry of Canada in 1930. Can. Machy. (Toronto), vol. 41, no. 13, June 26, 1930, pp. 111-114, 3 figs. Brief summaries of facts regarding each of plants in Canada now producing airplanes and engines, and indication of rapid growth of this industry.

AIRPLANE MANUFACTURE

Welding. Two Fundamentals of Aircraft Welding, K. Perkins. Acetylene Jl., vol. 32, no. 1, July 1930, p. 22. Abstract of paper read before Int. Acetylene Assn. previously indexed from Flying, Jan. 1930.

AIRPLANE MATERIALS

A.S.T.M. Papers. Aviation Materials—Reviewed in Broad Symposium. Iron Age, vol. 126, no. 1, July 3, 1930, pp. 19-22 and 60. Brief review of papers presented at convention of American Society for Testing Materials at Atlantic City chiefly on metals in aircraft construction; notes on scope of aircraft industry.

Tubing. Identification of Aircraft Tubing by Rockwell Test, H. Knerr. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 342, June 1930, 8 pp., 6 figs. Description of experiments with machine developed for production testing of aircraft tubing; notes on physical properties of carbon and chrome-molybdenum steel.

AIRPLANE PROPELLERS

Vibrations. Contribution to the Theory of Propeller Vibrations, F. Liebers. Nat. Advisory Committee for Aeronautics—Tech. Memorandum, no. 568, June 1930, 23 pp., 5 figs. Calculation of torsional frequencies of revolving bars with allowance for air forces; bending frequencies of revolving straight and tapered bars; Rayleigh's principle of variation; error estimation and accuracy of results; application of theory to screw propellers for airplanes. Translated from Zeit. fuer Technische Physik, vol. 10, 1929.

AIRPLANES

Radio Apparatus. Transmission Characteristic of Airplane Horizontal Trailing Antennas (Ueber die Sendecharakteristik von Flugzeugschleppantennen), G. Sudeck. Zeit. fuer Hochfrequenztechnik (Berlin), vol. 35, no. 3, Mar. 1930, pp. 89-98, 9 figs. Theoretical fundamentals and equations for transmitting characteristics; experimental investigations; comparison of test results witb theory and previous investigations. Bibliography.

STABILITY. Moments of Gyration and Flying Stability (Moments de giration et stabilité de route), A. Lapresle. Aérophile (Paris), vol. 38, nos. 5-6 and 7-8, Mar. 15, 1930, pp. 85-88, and Apr. 15, pp. 115-117, 12 figs. Effect of flat turns on spinning illustrated by graphs. (Concluded.)

AIRPORTS

BEACONS. The Winnipeg Airway Beacon. Engineering (Lond.), vol. 129, no. 3359, May 30, 1930, p. 701. In connection with night flying operations, what is believed to be largest air beacon in British Empire and third largest in world, was augurated on Mar. 3 last; it is erected on roof of large new department store of Hudson Bay Co. at Winnipeg; light provided is about 200 ft. from ground, and main structure of beacon is surmounted by 24-in. Novalux directional beacon; light is provided by special 1,000-watt lamp operating on 115 volts, and giving 1,712,000 beam candle power.

A Turned-Reed Course Indicator for the Four- and Twelve-Course Aircraft Radio Range, F. W. Dunmore. Inst. Radio Engrs.—Proc., vol. 18, no. 6, June 1930, pp. 963-982, 15 figs. For 12-course radio range system, in which three modulation frequencies are used, type of reed indicator has been developed to indicate when aircraft is on any one of 12 courses, and if off, approximately how many degrees and whether to right or left.

CONSTRUCTION. Airport Development and the Highway Engineer, P. A. Fellows. Roads and Streets, vol. 70, no. 7, July 1930, pp. 241-244. Abstract of paper read before Engineers' Club of Philadelphia, previously indexed from Pub. Works, Apr. 1930.

COSTS. Unit Prices from Current Construction Bids. Eng. News-Rec., vol. 104, no. 20, May 15, 1930, pp. 829-830, 3 figs. New York airport bids on nine structural items; timber supports for cotton bales, New Orleans; concrete paving in Maryland; enlarging Morena rock fill dam and spillway for San Diego, details of spillway gates.

MONTREAL. The Airport at St. Hubert, Montreal, Quebec. Engineering (Lond.), vol. 129, no. 3363, June 27, 1930, pp. 842-844, 1 fig. Layout as planned, consists of three runways radiating from central point at angles of 120 deg. to suit all directions of wind; runways are 150 ft. in width, and from 1,800 to 2,000 ft. in length; particulars of mooring mast; movable platform landing stage is provided on passenger platform, connecting over guard rail with airship's gangway.

RUNWAYS SURFACING. Oil Separators Runways at Valley Stream, W. S. Bartlett. Airports, vol. 4, no. 6, June 1930, pp. 23-25, 3 figs. Discussion of construction methods and materials used by Stone & Webster Engineering Corp., in surfacing Curtis-Wright airport at Valley Stream; data on oil application and drainage.

AIRWAYS

TRANSOCEANIC. The Seadrome on Ocean Airways, E. R. Armstrong. Engrs. and Eng., vol. 47, no. 3, Mar. 1930, pp. 49-53, 7 figs. Article previously indexed from Airways, Jan. 1930.

ALLOY STEEL

MECHANICAL PROPERTIES. The Relative Merits of Some Different Alloy Steels with Respect to Certain Mechanical Properties, B. Stoughton and W. E. Harvey. Am. Soc. Testing Matls.—Advance Paper, no. 35, June 23-27, 1930, 16 pp. Taking as basis about 50 binary or ternary alloy steels whose chemical analysis and mechanical properties have been published, 1,800 numerical calculations were made grading steels in order of their relative standing according to numerical value of product of some function of their strength multiplied by function of their ductility or according to values of strength multiplied by function of their ductility or according to values of strength multiplied by Izod impact value.

ALUMINUM

SOLDERING. Soldering Aluminum, P. N. Emigh. Power Plant Eng., vol. 34, no. 11, June 1, 1930, pp. 642-643, 4 figs. Practical discussion of special flux, correct solder, and methods employed.

WELDING. Fusion Welding of Aluminum. Am. Mach., vol. 72, no. 22, May 29, 1930, p. 885, 5 figs. Sketches explain characteristics of oxyacetylene flames; table gives approximate size of tips and relative gas pressures used in welding aluminum of different thicknesses; use and composition of fluxes and rods is described.

AUTOMOBILE INDUSTRY

STANDARDIZATION, CANADA. The Necessity of Standardization in Canada, H. D. Allee. Soc. Automotive Engrs.—Jl., vol. 26, no. 6, June 1930, pp. 791-793 and (discussion) 793-795. Forms of standardization that are applicable to Canadian automotive industry and by which manufacturers can profit are pointed out; effect of export trade and tariff, service parts for overseas, relative size of market in Canada and United States.

B

AUTOMOTIVE ENGINES

DESIGN. Requirements of Airplanes and Automobiles (Der Leistungsbedarf des Flugszeuges und des Kraftwagens: ein Lehrreicher Vergleich), O. Schwager. Deutsche Motor Zeit. (Dresden), vol. 7, no. 6, June 1930, pp. 294-298. Discussion of characteristic differences in power application in automobiles and airplanes; notes on means of controlling power output and their different roles in airplane and automobile-engine design.

BALLOONS, CAPTIVE

OBSERVATION, INSTRUCTION IN. Ground Instruction in Observation for Captive Balloon Observers (L'instruction d'observation donnée en salle aux Elèves-Observateurs en ballon captif), Neant. Revue des Forces Aériennes (Paris), no. 10, May 1930, pp. 524-552, 8 figs. Outline of ground instruction subjects and methods for training military observers; description of exercises in perspective drawing, mapping, and relief plan work.

DESIGN AND PERFORMANCE. Notes on Captive Balloons for Observation (Note sur les ballons captifs d'observation), P. Jouglard. Revue des Forces Aériennes (Paris), no. 9, Apr. 1930, pp. 455-461, 2 figs. Discussion of design and performance requirements of captive balloons; table gives sketches and data for principal types.

BELTS AND BELTING

HORSEPOWER. Belt Horsepower Charts. Product Eng., vol. 1, no. 5, May 1930, pp. 249-250, 2 figs. Chart shows graphically various quantities in belt or chain transmission.

BLAST FURNACE PRACTICE

FUEL ECONOMY. Heat Value, Flow of Heat and Gas as Physical Bases of Metallurgical Processes (Waermewertigkeit, Waerme- und Gasfluss, etc.), H. Bansen. Stahl und Eisen (Duesseldorf), vol. 50, no. 24, June 12, 1930, pp. 841-842, 2 figs. Discussion of paper previously indexed from May 15 issue of this journal.

INDIA. Charcoal Blast-Furnace Practice in Mysore, B. Viswanath. Min. and Met., vol. 11, no. 283, July 1930, pp. 332-335. Notes on plant at Bhadravati, 2,000 ft. above sea level in Shimoga district of Mysore, British India; ore from Kemmangundi hill is mixture of limonite and hematite, with low silica; limestone from quarries near Gangur, 8 mi. distant; analyses of raw materials; furnace dimensions; operating data; average daily production is about 65 tons pig iron.

BOILER FIRING

COMPARISONS. Modern Stokers Compared with Pulverized-Coal Firing (Der neuzeitliche Stoker und sein Vergleich mit der Kohlenstaubfeuerung), J. W. Armour. Archiv. fuer Waermewirtschaft (Berlin), vol. 11, no. 6, June 1930, pp. 201-202, 3 figs. German abstract of paper read before Second International Conference on Bituminous Coal, 1928, indexed in Engineering Index, 1929, p. 261, from Combustion, May 1929, and Steam Coal Buyer, June 1929.

BOILER OPERATION

LOAD FLUCTUATIONS. Causes and Effects of Load Fluctuations in Boiler Operation (Ursachen und Folgen der Belastungsschwankungen im Kesselbetrieb), E. Praetorius. Zeit. des Bayerischen Revisions-Vereins (Munich), vol. 34, nos. 10 and 11, May 31, 1930, pp. 143-146 and June 15, pp. 160-161, 17 figs. May 31: Notes on pressure fluctuations. June 15: Preventive measures; equalization of fluctuations. (Concluded.)

BOILER PLATES

CRACKING. Fractures in Boiler Metal, A. E. White and R. Schneidewind. Am. Soc. of Mech. Engrs.—Advance Paper, for mtg. June 9-12, 1930, 19 pp., 63 figs. Examinations, which were to large extent metallographic in nature, have led to some generalizations and classification of cracks and fractures as related to causes of failures; types of failure and their metallographic characteristics; material presented consists of short review of literature on boiler-metal failures, detailed description of fractures in boiler metal due to known causes, and description of actual failures in service.

BOILERS

FEEDWATER TREATMENT. *See Feedwater Treatment.*

HIGH PRESSURE. The Design and Results of a 600 lb. per Sq. In. Boiler Installation, W. Nithsdale. Mech. World (Manchester), vol. 87, nos. 2260 and 2261, Apr. 25, 1930, pp. 395-396, and May 2, pp. 407-409, 5 figs. Abstracts of paper read before Instn. Mech. Engrs., previously indexed from Engineering (Lond.), Mar. 28, 1930. (To be continued.)

HIGH PRESSURE (LOEFFLER). Problems Involved in Operation with Super-Pressure Steam, St. Loeffler. Mech. Eng., vol. 52, no. 6, June 1930, pp. 601-604, 10 figs. Particulars of new studies on steam-pumping boilers without economizers as designed particularly for marine installations. Translated from author's contribution to commemorative volume prepared for A. Stodola's 70th birthday.

HUMMING AND SMOKING. Elimination of Boiler Humming and Smoking (Beseitigung von Kesselbrummen und Rauchen), W. Weck. Zeit. des Bayerischen Vereins (Munich), vol. 34, no. 10, May 31, 1930, pp. 149-151. Scientific measures for overcoming humming and smoking have been developed and successfully applied; details of Weck air regulator supplemented by flaps and walls for improving air distribution.

LOAD FLUCTUATIONS. Causes and Effects of Load Fluctuations in Boiler Operation (Ursachen und Folgen der Belastungsschwankungen im Kesselbetrieb), E. Praetorius. Zeit der Bayerischen Revisions Vereins (Munich), vol. 34, nos. 7 and 9, Apr. 15. 1930. pp. 91-93, and May 15, pp. 126-128, 10 figs. Among causes of fluctuation are day and night changes, seasonal changes, influence of weather, turning off and on of steam-consuming equipment; disadvantages of load fluctuation are enumerated; preventive measures include elastic firing, heat, storage, etc. (To be continued.)

OIL BURNING. Comparative Performance of a Large Boiler Using Oil and Natural-Gas Fuels, F. G. Philo. Am. Soc. Mech. Engrs.—Advance Paper, for mtg. June 9-12, 1930, 11 pp., 31 figs. Boiler tested was Babcock and Wilcox cross-drum, straight-tube type with interdeck superheater; furnace was completely inclosed by Bailey type water-cooled walls; Babcock and Wilcox air heater was of tubular construction; Peabody combination oil and gas burners were used; highest rate of output at which boiler was tested was 450,751 lbs. of steam per hour, which represented operation of 3,416-hp. boiler at 413.2 per cent of rating.

PULVERIZED COAL FIRED, DRAFT CONTROL. Tests on Pulverized-Coal Boiler with Draft Shut-off (Versuche an einer Kohlenstaubfeuerung mit Zugsperre), K. Jaroschek. Archiv fuer Waermewirtschaft (Berlin), vol. 11, no. 6, June 1930, pp. 214-217, 5 figs. Results of comparative tests on vertical-tube boiler of 830 sq. m. heating surface and suction draft installation, to determine advantages of built-in draft shut-off.

TESTING. Tests of the Resistance to Repeated Pressure of Forged, Riveted, and Welded Boiler Shells, H. F. Moore. Am. Soc. Mech. Engrs.—Advance Paper, no. 15, for mtg. June 9-12, 1930, 6 pp., 7 figs. Comparative tests on standard A.S.M.E. riveted drum, manganese-steel riveted drum, forged seamless-steel shell, two-forge-and-hammer-welded shells, and eight fusion-welded (metallic-arc) shells, well above allowable working pressure; under repeated stress properly made welded joints are stronger than plates themselves when weakened by stress raisers such as small holes or surface defects; data on strength of drum heads.

WATER TUBE, JAPAN. Development of Water Tube Boilers in Japan, M. Kamo. Far East. Rev. (Shanghai), vol. 26, no. 5, May 1930, pp. 225-230, 5 figs. Types of boilers used in Japan on marine vessels and for stationary plants with special reference to Takuma boiler.

WOOD WASTE FIRED. Boiler Settings for Burning Refuse Wood, C. S. Gladden. Am. Soc. of Mech. Engrs.—Advance Paper for mtg., June 9-12, 1930, 13 pp., 14 figs. Some recent developments in design of boiler furnaces for burning green or wet refuse wood; experiences influencing development of furnaces for burning dry refuse wood; factor influencing design of wood-burning furnaces.

BOLTS AND NUTS

MANUFACTURE. Bolts, Nuts and Rivets from Pacific Coast Steel, C. A. Handschin. West. Machy. World, vol. 21, no. 5, May 1930, pp. 173-178, 13 figs. Description of manufacturing process, equipment and operations at San Francisco plant of Pacific Coast Steel Corp.; production capacity is 1,500 tons per month of bolts, nuts, rivets, cap and set screws, railroad track bolts and spikes, and special forgings; bolt and nut department requires 2,500 tons raw material monthly.

Manufacture and Heat Treatment of Screws and Bolts, C. B. Phillips. Wire and Wire Products, vol. 6, no. 5, June 1930, pp. 227-229 and 233-235, 4 figs. Methods and special machines used to produce output automatically and of high quality.

BRIDGE CONSTRUCTION

COSTS. Unit Prices from Current Construction Bids. Eng. News Rec., vol. 104, no. 24, June 12, 1930, pp. 997-998, 1 fig. Unit bids on high-level concrete highway viaduct on Jersey meadow; ties for New York subways and approaches and superstructure for McKees Rocks bridge, Pittsburgh, awarded in three contracts totaling $4,868.233.

BRIDGES, CONCRETE TRESTLE

AUSTRALIA. Road Bridge Over Loddon River at Eddington, Victoria, M. G. Dempster. Commonwealth Engr. (Melbourne), vol. 17, no. 9, Apr. 1930, pp. 337-340, 4 figs. Report on construction of reinforced-concrete trestle bridge 680 ft. long.

BRIDGES, CONCRETE ARCH

GERMANY. The High Bridge Over the Ammer River at Echelsbach (Upper Bavaria), Longest Span Reinforced Concrete Bridge of Germany (Die Hochbruecke ueber die Ammer bei Echelsbach (Oberbayern), die weitestgespannte Eisenbetonbriecke Deutschlands), R. Gerhart. Beton u. Eisen (Berlin), vol. 29, no. 6, Mar. 1930, pp. 89-97, 20 figs. Design and construction of bridge having single arch 130 m. long; outline of Melan-Spangenberg system of bridge; design and construction; report on tests of bridge elements.

BUILDING MATERIALS

HEAT INSULATION. Investigation of the Heat Insulation Properties of Building Construction, H. Krueger and A. Eriksson. Heat., Piping and Air Conditioning, vol. 2, no. 7, July 1930, pp. 563-565, 1 fig. Conductivity values for concrete and frame construction, brick walls, and windows as determined by recent investigations are given; investigations also included two tests on cork.

BUILDINGS STEEL-CONCRETE

FAILURE. Derrick Causes Structural Collapse. Am. Contractor, vol. 51, no. 23, June 7, 1930, p. 15, 1 fig. Note covers subject of item previously indexed from Eng. News-Rec., May 29, 1930.

C

CAISSONS

CONCRETE. Precast Concrete Caissons for Piers and Docks Floated into Place, P. W. Leisner. Concrete, vol. 36, no. 5, May 1930, pp. 30-32, 5 figs. Methods of placing 400 large caissons, covering about 4½ linear miles in harbour structures of port of Gdynia, Poland; largest caissons were 105 ft. long, 23 ft. wide and 35 ft. deep, divided into nine cells by vertical cross walls; width of bottom, or base, was 30 ft.; weight was about 1,200 long tons; most of caissons were made standard length of 60 ft., divided into five cells by vertical cross walls.

CARBON DIOXIDE

REFRIGERATING SYSTEMS. Cooling with Carbon Dioxide, A. N. Changler. Heat., Piping and Air Conditioning, vol. 2, no. 7, July 1930, pp. 572-574, 5 figs. Discussion of equipment layout of carbon-dioxide systems for air conditioning theatres, department stores, or office buildings; carbon-dioxide condensers; carbon-dioxide receiver and pipe connections; layout of carbon-dioxide system arranged for single-effect operation; water-cooling apparatus.

REFRIGERANT. Developments in the Production of Solid Carbon Dioxide, R. Lloyd. Cold Storage (Lond.), vol. 33, no. 387, June 19, 1930, pp. 166-167. Discussion of physical properties and sources of carbon dioxide.

CAST IRON

HEAT TREATMENT. Heat Treatment of Cylinder and Alloy Irons, F. J. Walls and A. Hartwell, Jr. Fuels and Furnaces, vol. 8, no. 7, July 1930, pp. 969-971, 7 figs. Discussion of relief of stresses and physical changes in cylinder irons with various heat treatments; some effects of heat treatment on chromium-molybdenum and chromium-nickel-manganese cast irons. Abstract of paper presented before Am. Foundrymen's Assn.

CEMENT CRACKING

INVESTIGATION OF. Occurrence of Radial Cracks in Cement Pats Scored in Air After Previous Storage in Water (Das Auftreten von Kantenrissen an Zementkuchen, etc.), H. Burchartz. Zement (Berlin), vol. 19, no. 12, Mar. 20, 1930, pp. 265-266; see also brief translated abstract in Bldg. Sci. Abstracts (Lond.), vol. 3, no. 4, Apr. 1930, pp. 127-128. Investigation of radial shrinkage cracks appearing in cement pats prepared for cold-water soundness test after they have been removed from water, which are occasionally mistaken for indications of unsoundness; pats with thick edges had more cracks than standard pats, and drier paste discs more than specimens gauged with standard amount of water.

CEMENT INDUSTRY

BRAZIL. Development of the Cement Industry in Brazil (Entwicklungsaussichten der Zementindustrie in Brasilien). Zement (Berlin), vol. 19, no. 12, Mar. 20, 1930, p. 295. Brief review of industry; two new factories are planned.

CEMENT PLANT

CALIFORNIA. California's Largest Cement Mill Kept Up-to-date. Rock Products, vol. 23, no. 13, June 21, 1930, pp. 41-48, 20 figs. Plant of Santa Cruz Portland Cement Co., Davenport, Calif., is described; no. 7 Symons stone crusher has capacity of 170 tons; Hardinge Mills are fed by 18-in. belt conveyor.

CEMENT, PORTLAND

FINENESS. Influence of the Fineness of Portland Cement on its Properties, P. Filossofow. Pit and Quarry, vol. 20, no. 6, June 18, 1930, pp. 46-48, 6 figs. Translated from article indexed in Engineering Index 1929, from Tonindustrie Zeitung, Sept. 9, 1929.

CEMENT SETTING

FAILURES, CAUSE OF. Mixing Water as the Cause of Faulty Setting (Anmachewasser als Ursache einer Abbindestoerung), Haegermann. Zement (Berlin), vol. 19, no. 12, Mar. 20, 1930, pp. 264-265; see also brief translated abstract in Bldg. Sci. Abstracts (Lond.). vol. 3, no. 4, Apr. 1930, p. 123. Failures of batch of concrete to harden satisfactorily was traced to use of purified effluent of artificial fertilizer factory as mixing water; water contained nitrogen pentoxide which varied considerably in amount from day to day; it was found on investigation that contamination with nitrogen pentoxide up to 0.75 per cent produced no harmful results, but that larger quantities seriously retarded setting.

CHIMNEYS

DUST NUISANCE. Problems Relating to the Prevention of Nuisance from Fumes and Dust from Power Stations, M. W. Travers. Inst. of Fuel—Jl. (Lond.), vol. 3, no. 11, Apr. 1930, pp. 292-299 and (discussion) 300-302, 3 figs. Methods of preventing evolution of oxides of sulphur and dust from power-plant chimneys; results of investigations upon individuals for sulphur-dioxide detection.

CHROMIUM PLATING

VALUE OF. The Value of Deposited Chromium as a Corrosion Preventative, L. Wright. Chem. and Industry (Lond.), vol. 49, no. 23, June 6, 1930, p. 473. Main developments in chromium plating during last four years have been realization of limitations of deposited chromium and exploration of its uses as engineering asset dependent upon its physical properties rather than its chemical.

CITY PLANNING

ZONING. Zoning Legislation in the United States, N. L. Knauss. U.S. Bur. Standards —Division of Bldg. and Housing, Apr. 1930, 51 pp. Review of zoning development in past 30 years; standard state zoning enabling acts; tabulation of zoning legislation by states and years.

COAL

BRIQUETTING. Coal Briquetting without Binder (Zur Frage der Brikettierung von Steinkohlenstaub ohne Bindemittel), R. Uloth and W. Swietoslawski. Zeit. des Oberschlesischen Bergu. Huettenmaennischen Vereins zu Katowice (Katowice), vol. 69, no. 5, May 1930, pp. 244-254, 6 figs. Discussion of possibility of coal briquetting without binder; author contends that laboratory method developed by Swietoslawski and assistants is unsuitable in practice but method developed by M. Dunkel may be used; W. Swietoslawski answers, defending his work. Bibliography.

HANDLING. *See Steam Power Plants.*

PREPARATION. Fitting Preparation to Meet Market Demands, J. B. Morrow. Coal Age, vol. 35, no. 6, June 1930, pp. 362-364, and 367, 1 fig. Visual inspection on 2½ x 4 in. or 1 x 2½ in. sizes is not sufficiently dependable or accurate enough for control purposes; only real determinant for extraneous matter is float-and-sink test in heavy characteristics of coal; percentage of refuse; quality and use of final product; capacity of plant; climatic conditions; available mill site; there are many places where air methods are applicable and economical, but wet process offers lower ash and greater uniformity in market product. Abstract of paper presented before Rocky Mountain Coal Min. Inst.

COAL CARBONIZATION, LOW TEMPERATURE

GREAT BRITAIN. The Economics and Commercial Development of Low Temperature Carbonization in Great Britain, C. H. Lander. Colliery Guardian (Lond.), vol. 140, no. 3626, June 27, 1930, pp. 2402-2403. Factors influencing commercial success of different processes discussed are: type of coal available, and its cost; type of products for which there is local market, and prices obtainable; type of plant that will yield suitable products from available coal and in most remunerative proportions; costs of erecting and working plant. From paper before World Power Conference, Berlin.

COAL DISTILLATION

PROGRESS IN. Progress in Coal Utilization (Ueber Fortschritte auf dem Gebeite der Kohlenverwertung), H. Pichler. V.D.I. Zeit .(Berlin), vol. 74, no. 22, May 31, 1930, pp. 720-722, 1 fig. General review of modern processes for chemical refinement of coal with special reference to coal liquefaction, hydrogenation, etc.

COAL MINES AND MINING

ENGINEERING. Engineering Objectives in Planning and Development of Wildwood Mines, J. H. Fletcher. Coal Age, vol. 35, no. 5, May 1930, pp. 268-270. Notes on engineering work done preparatory to design of completely mechanized mine to recover 40,000,000 tons of coal in Thick Freeport seam in tract in Allegheny County, 15 mi. north of Pittsburgh.

MECHANIZATION. Report of Investigation of the Underground Conveying and Loading of Coal by Mechanical Means, R. Clive. Instn. of Min. Engrs.—Trans. (Lond.), vol. 78, part 5, Apr. 1930, pp. 305-338 and (discussion) 339-399, 21 figs. Report was prepared by special committee of Midland Inst. of Min. Engrs., collaborating with other organizations; discussion was at meetings of various institutes; matter was indexed in Engineering Index, 1929, p. 452, from many sources; also in 1930 from Iron and Coal Trades Rev., Feb. 28, and Mar. 7, 1930.

COAL RESOURCES

AUSTRALIA. A Report on the Coal Resources of the Commonwealth of Australia. Standards Assn. of Australia—Power Survey Report (Sydney), no. PS. 3, Dec. 1929, 169 pp., 60 figs. Report covers character of deposits in various parts of Australia; geographical distribution, chemical analysis of various kinds; output, markets and chief uses.

COLD STORAGE PLANTS

DESIGN. An Analysis of Terminal Cold Storage Design, M. Hyde. Cold Storage (Lond.), vol. 33, no. 387, June 19, 1930, pp. 179-181, 6 figs. Structural requirements of new Jacksonville, Fla., project; use of artificial atmospheres; present-day construction; foundations; wall construction. (To be continued.)

HALIFAX. Canadian Cold Storage Plant Uses Quick Freezing, A. E. Macdonald. Heat. Piping and Air Conditioning, vol. 2, no. 7, July 1930, pp. 593-596, 8 figs. Illustrated description of plant and equipment at Halifax Ocean Terminals, operated by Nova Scotia Public Cold Storage Terminals, Limited; 50 tons of ice daily; power plant equipment; fish processing procedure.

CONCRETE AGGREGATES

CONCRETE AGGREGATES. The "Missing Link" in Concrete Aggregate, L. C. Gilbert and H. F. Kriege. Rock Products, vol. 23, no. 13, June 21, 1930, pp. 55-58, 4 figs. Failure to regard aggregate in its entirety, as concrete-making ingredient, is responsible for much of difference of opinion that exists regarding concrete-making properties of various kinds of aggregate; aggregate between ¼-in. and 10-mesh sizes is responsible for as much variation in concrete strengths as are variations in types of aggregates.

ADMIXTURES. Use of Concrete in Hydraulic Structures. Elec. West, vol. 64, no. 6, May 15, 1930, pp. 372-389, 29 figs. Report of subcommittee on use of concrete in hydraulic structures of Pacific Coast Electrical Assn.; description of various forms of diatomaceous earth and volcanic ash, and their effect on workability, chemical reaction, strength and permeability; experiences of three California companies in constructing of concrete bench flumes in various localities and under different circumstances; transportation facilities, aggregate plants, concrete plants, forms, reinforcing and methods of placing concrete.

CONCRETE COLOURING

RECOMMENDATIONS FOR. The Colouration of Concrete, R. Wilson. Contract Rec. (Toronto), vol. 44, no. 23, June 4, 1930, pp. 691-693. Associate chemist of research laboratory of Portland Cement Association gives recommendations for producing tinted effects; colouring with pigments; cause of non-permanency of colour; penetration processes; paints. Report of Am. Concrete Institute's Committee No. 703.

CONCRETE, HAYDITE

TESTS OF. Tests of Plain and Reinforced Haydite Concrete, F. E. Richart and V. P. Jensen. Am. Soc. for Testing Matls.—Advance Paper, no. 68, for mtg. June 23-27, 1930, 20 pp., 2 figs. Structural properties of poured Haydite concrete, such as is being used in building construction; mixtures include concretes made with fine and coarse Haydite aggregates, natural sand and coarse Haydite, and, for comparison, sand and gravel or broken limestone; studies were made of properties of aggregates, workability, yield, unit weight, compressive strength and modulus of elasticity of concrete, and resistance to bond and diagonal tension in beams.

CONCRETE SPECIFICATIONS

SIMPLIFIED. Simplified Specifications for Quality Controlled Structural Concrete. Concrete, vol. 36, no. 5, May 1930, pp. 23-24. Short form of quality-control specifications for structural concrete, suitable for inclusion as part of general specification at point where concrete work is covered.

CONVEYORS

BELT. Care and and Operation of Conveyor Belts and Equipment, J. W. Schaffner. Power Transmission, vol. 36, no. 5, May 1930, p. 28. Discussion of causes of poor belt elevator service; elimination of danger of static electricity. (Continuation of serial.)

CENTRALIZED CONTROL. Intricate Conveyor System has Centralized Controls, C. K. Prevear. Iron Trade Rev., vol. 86, no. 23, June 5, 1930, pp. 75-79, 10 figs. Description of conveyors and handling devices used in warehouse of merchandising department of Western Electric Co., Kearny, N.J.; live roller curve, sorting mechanisms, alligator switches, lowerators; cross-section showing elevations of two warehouse buildings. Paper presented at A.S.M.E. Materials Handling meeting in Chicago, Mar. 5-7.

FORGE SHOPS. *See Forge Shops.*

D

DIESEL ENGINES

AUTOMOTIVE. Diesel Engine for Motor Vehicles and Its Economy (Der Dieselmotor fuer Kraftfahrzeuge und seine Wirtschaftlichkeit), Wawrziniok. Automobiltechnische Zeit. (Berlin), vo. 33, no. 17, June 20, 1930, pp. 416-420, 4 figs. General discussion of factors controlling economy; combustion chamber design and injection principle; tables give fuel specification and data on design and performance of Diesel and carburetor engines; operating economy of M.A.N. Diesel and M.A N. gasoline truck is compared.

The Diesel Engine as Applied to Road Transport, W. H. Goddard. World Power (Lond.), vol. 13, no. 77, May 1930. pp. 439-444, 8 figs. It is evident that Diesel engine is destined, in near future, to occupy very important place not only in Great Britain but in most parts of civilized world; full description of technical details of Diesel engine and its performance as compared with that of gasoline engine.

Trend in Design of Diesel Engines, O. Nonnenbruch. Oil and Gas Jl., vol. 29, no. 3, June 5, 1930, pp. T-122 A. Brief article, with special reference to engines for petroleum pipe line main pumping stations; manufacturers seem to lean towards weight of about 3 to 3½ lbs. per cu. in. cylinder displacement.

FUEL INJECTION. Some Effects of Air and Fuel Oil Temperatures on Spray Penetration and Dispersion, A. G. Gelalles. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 338, May 1930, 11 pp., 6 figs. Spray records and curves plotted from records show that changed properties of air and fuel under high temperatures decreased penetration and increased dispersion of oil sprays. Bibliography.

Factors in Nozzle Design in the Light of Recent Oil-Spray Research, P. H. Schweitzer. Am. Soc. for Mech. Engrs.—Advance Paper, for mtg. June 12-14, 1930, 6 pp., 12 figs. Discussion of Diesel spray-nozzle constructions with special reference to following: metering, timing, injecting, and spraying.

HIGH SPEED. Injection Systems for High-Speed Diesel Engines, L. Hausfelder. Diesel Power, vol. 8, no. 6, June 1930, pp. 311-313, 2 figs. Illustrated description of design features of constant-stroke fuel pumps; port-controlled pumps. (Continuation of serial.)

SUPERCHARGING. The Compounding and Supercharging of Diesel Engines, M. Gautier. Shipbldr. (Lond.), vol. 37, no. 238, Apr. 1930, pp. 432-433. Paper presented before Association Technique Maritime et Aéronautique, indexed in Engineering Index 1929, p. 568, from Bul. Technique du Bureau Veritas, July and Aug. 1929.

MAINTENANCE AND REPAIR. Diesel Engine Upkeep. Power Plant Eng., vol. 34, no. 12, June 15, 1930, pp. 699-701, 5 figs. Piston upkeep is dependent upon operating conditions of other engine parts; high temperatures complicate problem; repair and upkeep methods; withdrawal and replacement. (Continuation of serial.)

SUPERCHARGING. Supercharging Diesel Engines (La suralimentation des moteurs Diesel), A. Rateau. Génie Civil (Paris), vol. 96, no. 7, Feb. 15, 1930, pp. 160-165, 7 figs.; see also translated abstract in Power Engr. (Lond.), vol. 25, no. 290, May 1930, p. 203. Prefatory note, explaining importance of author's work on supercharging of airplane and Diesel engines is followed by reprint of article contributed to Revue Générale des Sciences shortly before author's death; he considers that it is possible to maintain supercharging pressure equal to 2¼ times mean back pressure at exhaust in four-stroke Diesel on normal load.

VIBRATIONS. Torsional Vibrations and Critical Speeds in Diesel Generators. V. L. Maleev. Power, vol. 71, no. 22, June 3, 1930, pp. 861-864, 2 figs. Practical outline of method of figuring critical speeds produced by torsional vibration of crankshafts of Diesel engines direct-connected to a.c. generators; how design of Diesel, particularly of its flywheel, is influenced by requirements of parallel operation.

DIESEL LOCOMOTIVES

COMPRESSED AIR TRANSMISSION. The Diesel Compressed-Air Locomotive, J. Geiger. Eng. Progress (Berlin), vol. 11, no. 5, May1930. pp. 117-120, 5 figs. Description of design and performance of Diesel-compressed-air locomotive, built for German Railroad Company by M.A.N., Augsburg Works, and Maschinenfabrik Esslingen; at speed of 60 km. 37 mi.) per hr., Diesel-compressed-air locomotive consumed 12 per cent less fuel per ton and mile than Diesel-electric locomotive under same conditions; vertical 6-cylinder M.A.N. Diesel engine with airless injection is direct-connected to two-cylinder air compressor of single-stage double-acting type; sketch showing section through air compressor.

E

ELECTRIC CABLES

IONIZATION. Ionization Studies in Paper-Insulated Cables, C. L. Dawes and P. H. Humphries. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 766-775, 12 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

ELECTRIC CIRCUIT BREAKERS

EXPANSION. Expansion Breaker (Der Expansionsschalter), F. Kesselring. Elektrotechnische Zeit. (Berlin), vol. 51, no. 14, Apr. 3, 1930, pp. 499-508, 31 figs. Principle of breaker is derived from fundamentals of liquid breaker; thermodynamic and electric processes during passage of current through zero are studied and design is outlined; comparison between expansion and compressed air breakers.

ELECTRIC CIRCUITS

ANALYSIS. Operating Diagrams for Symmetrical Networks (Betriebsdiagramme fuer Symmetrische Kettenleiter), T. Watanabe. Elektrische Nachrichten Technik (Berlin), vol. 7, no. 4, 1930, pp. 153-166, 25 figs. Theoretical mathematical high-frequency electric circuit analysis.

ELECTRIC CONDUCTORS

MEASUREMENTS. Study of Alternating Current Energy and Voltage in Case of Conductors of Oblong Cross Section (Untersuchungen ueber Wechselstromleistung und- spannung bei Leiterstuecken von ausgedehenten Querschnitt), W. Wangen. Elektrotechnik und Maschinenbau (Vienna), vol. 48, no. 17, Apr. 27, 1930, pp. 381-389, 6 figs. It is shown that in case of two conductors of oblong cross-section, coefficients of self and mutual impendance exist and that voltages of each conductor measured with voltage measuring wires can be presented as linear, homogeneous function of total of currents by means of this coefficient; exemplification.

ELECTRIC FURNACES

HEAT TREATING. Electrical Equipment for Heat Treating, C. L. Fisher. Heat Treating and Forging, vol. 16, no. 6, June 1930, pp. 775-777, 6 figs. Description of different types of furnaces and methods of automatically controlling them.

ELECTRIC GENERATORS

VENTILATION. Ventilation of Revolving-Field Salient-Pole Alternators, C. J. Fechheimer. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 548-575, 51 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

ELECTRIC HEATING

EXHIBITION, LEIPZIG. Electric Heating at the Leipzig Fair—1930 (Elektrowaerme auf der Leipziger Messe 1930), Moertzsch. Elektrizitaetswirtschaft (Berlin), vo. 29, no. 504, Mar. 1930, pp. 135-141, 14 figs. Practically all large concerns have taken up manufacturing of heating equipment; tendency towards adaptation and fulfilment of practical wishes of housewives was visible in this year's exhibits; industrial heating and special furnaces.

INDUSTRIAL. Industrial Electric Heating. World Power (Lond.), vol. 13, no. 78, June 1930, pp. 550-551. Consideration of indirect heating by resistances; discussion of working costs; efficiency of oven space.

ELECTRIC INSULATING MATERIALS

PUNCTURE. Three Regions of Dielectric Breakdown, P. H. Moon and A. S. Norcross. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 755-765, 10 figs. Paper previously indexed from Am. Inst. Elec. Engrs.—Jl., Feb. 1930.

ELECTRIC LINES, HIGH TENSION

FAULT LOCATION. Fault-Location Measuring Equipment for High-Tension Transmission Lines (Das Fehlerortmessgeraet fuer Hochspannungsfreileitungen), H. Poleck. Siemens-Zeit. (Berlin), vol. 10, no. 3, Mar. 1930, pp. 153-162, 8 figs. Description of equipment with outside source of measuring frequency, which answers practical requirements, and usefulness of which has been proven in practical tests on high-voltage networks.

ELECTRIC MACHINERY

INDUCED VOLTAGES. Induced Voltage of Electrical Machines, L. V. Bewley. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 456-466, 5 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

SYNCHRONOUS. Transient Torque-Angle Characteristics of Synchronous Machines, W. V. Lyon and H. E. Edgerton. Am. Inst. Elec. Engrs. Trans., vol. 49, no. 2, Apr. 1930, pp. 686-699, 12 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

Three-Phase Short Circuit Synchronous Machines, R. E. Doherty and C. A. Nickle. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 700-714, 16 figs. Paper previously indexed from Advance Paper. for mtg. Jan. 27-31, 1930.

THEORY. Generalized Theory of Electrical Machinery, G. Kron. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 666-685, 31 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

ELECTRIC MOTORS

STARTING. Starting Performance of Salient-Pole Synchronous Motors, T. M. Linville. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, pp. 531-546, 20 figs. Paper previously indexed from Am. Inst. Elec. Engrs.—Jl., Feb. 1930.

ELECTRIC POWER SUPPLY

CHICAGO. System Connections and Inter-Connections Chicago District, G. M. Armbrust and T. G. LeClair. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 582-596, 13 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

DETROIT. The Fundamental Plan of Power Supply of the Detroit Edison Company, S. M. Dean. Am. Inst. Elec. Engrs.—Trans., vol. 49, no 2, Apr. 1930, pp. 597-604, 4 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

PHILADELPHIA. Fundamental Plan of Power Supply in the Philadelphia Area, R. Bailey. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 605-620, 6 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

ELECTRIC SWITCHGEAR

METAL-CLAD. The Metal-Clad Switchgear at State Line Station, A. M. Rossman. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 397-403, 8 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

ELECTRIC SYMBOLS

STANDARDIZATION. Symbols and Designations for Testing and Calculation in Electricity-Supply Practice (Begriffe und Bezeichnungen fuer Untersuchungen und Berechnungen auf dem Gebeit der Elektrizitaetswirtschaft), W. Windel. Electrotechnische Zeit. (Berlin), vol. 51, no. 21, May 22, 1930, pp. 738-741. Proposed standardization of terms and symbols in field of electric supply practice are listed.

ELECTRIC TRANSFORMERS

AUTO. Inversion Currents and Voltages in Auto-Transformers, A. Boyajian. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 810-822, 12 figs. Paper previously indexed from Am. Inst. Elec. Engrs.—Jl., Feb. 1930.

LOADING. Loading Transformers by Temperature, V. M. Montsinger. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 776-792, 21 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

LOSSES. No-Load Current of Network Transformers (Der Leerlaufstrom der Netztransformatoren), J. Wahlig. Elektrizitaetswirtschaft (Berlin), vol. 29, no. 505, Apr. 1, 1930, pp. 168-170, 2 figs. Analysis of no-load and magnetizing current under various load conditions, and their relation to no-load losses; voltage wave oscillogram of 10-kva. transformer.

OPERATION. Operating Transformers by Temperature, W. M. Dann. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 793-797. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

POLE. Pole Transformers (Oszloptranszformatorallomasok), L. Jozsef. Elektrotechnik (Budapest), vol. 23, no. 3/4, Feb. 15, 1930, pp. 23-30, 13 figs. Explanation of complaints against transformer stations; favourable results of service with separately mounted high-tension fuses and transformers erected with oil switches; new design of disconnectable high-tension fuses with wire protection by celluloid tube.

ELECTRIC WELDING

ARC PROCESS. Industrial Progress, H. M. French. Min. and Met., vol. 11, no. 283, July 1930, pp. 352-354, 5 figs. Metallic arc, carbon arc, atomic hydrogen arc, and shielded-arc methods are brifly described; major applications of each are noted.

Cathode Energy of the Iron Arc, G. E. Doan. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 723-734, 2 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

RESISTANCE. Resistance Welding, B. T. Mottinger. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 524-530, 11 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

Electric Resistance Welding (A villamos ellenallashegesztes es a toemeggyartas), B. Jozsef. Elektrotechnika (Budapest), vol. 23, no. 7/8, Apr. 15, 1930, pp. 70-74, 10 figs. Development of electric resistance welding; new designs of electric welding machines operating with pilgrim-step; advantages of use of such machines in mass manufacturing.

ELEVATORS

CAPACITY. The Traffic Capacity of Elevators, G. F. Draffin. Instn. Engrs. Australia—Jl. (Sydney), vol. 2, no. 5, May 1930, pp. 164-169, 4 figs. Effect of elevators of large building on both its initial cost and its rental value is such as to warrant more careful choice of elevator ratings than is usual; method of analysis is given to enable this choice to be satisfactorily made and example is worked out; while curves and tables of design data are given, it is pointed out that accuracy of results will depend very largely on experience of designer; this experience can only be gained by continual recording and systematic tabulation of data from existing installations.

ENGINEERING

BUSINESS RELATIONS. American Business—And the Engineer, R. P. Shorts. Mich. Engr., vol. 48, no. 1, Mar. 1930, pp. 20-26. Interdependency of industries; problem of capital and labour; importance of industrial research and contribution of engineers.

RESEARCH. Engineering Research, A. D. Bailey. Combustion, vol. 1, no. 11, May 1930, pp. 24-29, 8 figs. Extent and rapidity of industrial progress depends upon efficiency and scope of research activities; emphasis is placed upon better organization of widespread work that is being done by principal engineering and trade associations, private corporations and other agencies; discussion of research activities by federal organization.

SCIENCE RELATIONSHIP. The Relationship Between Science and Engineering, G. Dunn. Mech. Eng., vol. 52, no. 6, June 1930, p. 595. Engineering is profession, born about 1750, child of industrial era; of many kinds of art, engineer deals only with those that are useful; sciences of mathematics, mechanics, physics, and chemistry have their art of engineering, which is art of economic application of these sciences to purpose of man. From address before Alumni of Columbia University, Feb. 12, 1930.

ENGINEERING EDUCATION

UNIVERSITY. Our Universities. Engineer (Lond.), vol. 149, no. 3878, May 9, 1930, p. 522. Editorial comment on education problems contained in report of University Grants Committee; it is stated that universities should not, as they now do, refuse promotion to men of recognized teaching ability because they have not won international reputations by books and articles in learned periodicals.

ENGINEERS

GOVERNMENT ACTIVITIES. Engineering and the Art of Government, L. W. Wallace. Mich. Engr., vol. 48, no. 1, Mar. 1930, pp. 51-59. Part engineering is playing in activities of government is shown by review of organized engineering services in various executive departments of United States and extent of function of each.

The Engineer in Government, F. C. Emerson. Mich. Engr., vol. 48, no. 1, Mar. 1930, pp. 27-35. Reasons from experience of author as engineer and State governor, in support of proposition that training, experience and necessary qualifications of successful engineers, fit him in many ways for fine service in field of government; fundamental qualities essential for good public official.

REGISTRATION. The Registration of Engineers. Engineer (Lond.), vol. 149, no. 3881, May 30, 1930, pp. 605-606. Editorial comment on symposium of papers read before Société des Ingénieurs Civils de France; it seemed to be agreed that universities should still be allowed to confer their own degrees and diplomas and those awards should qualify possessors to call themselves engineers; desire to control use of title, engineer, is largely sentimental; man who has devoted many years to his education and training does not like to be classed with engine driver and mechanic; he feels that some means of distinguishing between the highly trained and untrained should exist.

The Registration of Engineers in Canada. Engineering (Lond.), vol. 129, no. 3361, June 13, 1930, p. 768. Registration institutions for engineers exist in all provinces except Saskatchewan, while in five of them registration or membership of these bodies is compulsory; in British Columbia, where procedure followed for this purpose may be taken as typical of rest, Association of Professional Engineers was established in 1920.

Remuneration. Who should Pay the Engineer? J. P. Ferris. Mech. Eng., vol. 52, no. 6, June 1930, pp. 615-617. Manufacturing public is accustomed to obtaining valuable engineering services without cost; author believes that important step lies in building up by industry of consulting engineering profession; manufacturers should include as much as possible of cost of engineering services rendered in their quotations; proposed change should benefit every one except manufacturer who has been asking for excessive engineering service without placing orders in sufficient volume to pay for it.

EVAPORATION

Formulae. Vapour Pressure and Heat Vaporization, P. G. Nutting. Indus. and Eng. Chem., vol. 22, no. 7, July 1930, p. 771. Development for formulae for determination of relation between heat of vaporization and temperature.

EVAPORATORS

Marine. A New Type of Marine Evaporator. Engineer (Lond.). vol. 149, no. 3882, June 6, 1930, p. 641, 1 fig. New type with revolving disc-shaped elements is manufactured under Englisch-Clarke, Chapman patents by Clarke, Chapman and Co.; in ordinary type common fault is separating out of salt from sea water which adheres to outer surfaces of tubes and interferes with heat transmission; this defect is claimed to be entirely overcome in new type of evaporator as salt is deposited in relatively loose incrustation which is easily removed from revolving elements by stationary scrapers.

EXCAVATING MACHINERY

Power Requirements. Choosing Power for Crane and Shovel, W. G. Wall. Motive Power, vol. 1, no. 1, Feb. 1930, pp. 15-16, 3 figs. Discussion of power selection for excavating and hoisting machinery; torque curves showing relation between Diesel and gasoline engine characteristics.

EXPLOSIVES

Colloidal Powders. Laws of Combustion of Colloidal Powders (sur la loi de combustion des poudres colloïdales), H. Muraour and G. Aunis. Académie des Sciences—Comptes Rendus (Paris), vol. 190, no. 8. Feb. 24, 1930, pp. 485-488, 1 fig.; see also brief translated abstract in Chem. and Industry (Lond.), vol. 49, no. 20, May 16, 1930, p. 442. From results of experiments carried out with powder free from solvent and containing 13 per cent nitrogen in bomb of 150 c.c. capacity, giving rise to pressures of 54 to 4,310 kg. per sq. cm. is calculated.

EXTENSOMETERS

Development of. Development of a Method of Measuring Concentrated Stresses, J. F. Quereau. Mech. Eng., vol. 52, no. 6, June 1930, pp. 611-613, 4 figs. Results of investigation conducted for purpose of developing high-sensivity lateral extensometer for use in measuring concentrated stresses such as are encountered at edges of holes, notches, and fillets.

F

FEEDWATER ANALYSIS

Method of. Operation and Control of Boiler Feed Water Purification Systems, S. T. Powell. Am. Gas. Assn.—Proc., 1929, pp. 1088-1094, 6 figs. Method of analyses applicable to feedwater; routine tests for control of boiler feedwater and concentrated boiler waters; determination of alkali carbonate and hydroxide in presence of one another; determination of phosphate.

New Meter. A New Water Purity Meter. Mar. Engr. and Motorship Bldr. (Lond.), vol. 53, no. 633, June 1930, pp. 212-213, 3 figs. Evershed and Vignoles Ltd., produce electric indicating and recording pattern dionic salinometer operated from ship's mains for use with water-tube boilers; indicator consists of especially constructed indicating ohmmeter in metal case.

FEEDWATER TREATMENT

Boiler Developments. Modern Boiler Developments and Feed Water Treatment, W. S. Coates. Chem. and Industry (Lond.), vol. 49, no. 20, May 16, 1930, pp. 230T-232T, 2 figs. Notes on boiler-water conditioning. (Continuation of serial.)

Modern Boiler Developments and Feed Water Treatment, W. S. Coates. Chem. and Industry (Lond.), vol. 49, no. 21, May 23, 1930, pp. 242T-244T. Instability of sodium carbonate in boiler water; trisodium phosphate; experiences with phosphate conditioning. (Concluded.)

Conditioning. Water Conditioning and Power Plant Chemistry. Elec. West, vol. 64, no. 6, May 15, 1930, pp. 455-459. Prime Movers Committee Report containing statement of requirements for current boiler-water conditioning; description of more recent short methods of analysis for routine control; carry-over of impurities from boilers; system of water conditioning in use at Seal Beach station of Los Angeles Gas and Electric Corp.

High Pressure System. Development of a High Pressure System for Boiler Water Conditioning, A. H. Markson. Combustion, vol. 1, no. 11, May 1930, pp. 45-46. Discussion by R. E. Hall of paper presented before Am. Soc. Mech. Engrs., previously indexed from Apr. 1930 issue of same journal.

Methods. Boiler Feedwater Purification Methods, H. A. Kuljian. Power Plant Eng., vol. 34, no. 11, June 1, 1930, pp. 614-616, 3 figs. Continuous and intermittent precipitation water softeners and zeolite softeners; types, methods of control, and operation. (Continuation of serial.)

Softening. Salt Content in Feedwater (Salzgehalt im Speisewasser), R. Klein. Waerme (Berlin), vol. 53, no. 21, May 24, 1930, pp. 377-382. Influence of salt content on brine deposit on boiler; softening of carbonate- and sulphate-rich raw water according to four different processes; brine and heat losses occurring herewith are studied and examples cited.

Salt Content in Feedwater (Salzgehalt im Speisewasser), R. Klein. Waerme (Berlin), vol. 53, no. 22, May 31, 1930, p. 398-402, 10 figs. Determination of amount of brine; losses due to salt removal from feedwater; reduction of salt content. (Concluded.)

FLOORS, STEEL

Welding. Welded Steel Floor Construction, L. H. Miller. Iron and Steel of Canada (Gardenvale, Que.), vol. 13, no. 5, May 1930, pp. 99-101 and 121, 2 figs. Abstract of paper previously indexed from Am. Welding Soc.—Jl., May 1930.

FLOW METERS

Slide Rules. Slide Rule Simplifies Orifice-Flow Calculations, H. G. Hyland. Power, vol. 71, no. 25, June 24, 1930, pp. 997-999, 4 figs. To facilitate calculations of orific diameters and in design of scale where extreme accuracy is not required, flow-meter slide rule has been designed which takes care of practically all of variables entering into calculations; operating instructions.

FLOW OF AIR

Orifices. The Flow of Air Through Circular Orifices with Rounded Approach Discharging into the Atmosphere, J. A. Polson, J. G. Lowther, and B. J. Wilson. Univ. of Ill.—Eng. Experiment Station—Bul., no. 207, vol. 27, no. 39, May 27, 1930, 52 pp., 12 figs. Study of flow of air through orifices by precision method, to determine coefficients to be applied to Fliegner's formula; ordinary atmospheric air was compressed and stored in weighing tank with no attempt to remove moisture or control humidity; with rounded approach, diameters of smallest orifice sections varied from ¼ in to 1 in.; weight of air discharged agrees very closely with Fliegner's formula. Bibliography.

FLOW OF FLUIDS

Measurement. Rules for Volume Measurements with Uncalibrated Nozzles and Measuring Diaphragms at Less than Sound Velocity (Regeln fuer die Mengenmessung mit ungeeichten Duesen und Messraendern bei Unterschallgeschwindigkeit). Archiv fuer Waermewirtschaft (Berlin), vol. 11, no. 6, June 1930, pp. 220-223, 10 figs. It is claimed that volume of flow can be measured with German standard nozzles and diaphragms without calibration; these two measuring instruments and their operation are discussed.

Pipes. Formula for Loss of Head in Cylindrical Pipe (Note sur la formule de la perte de charge dans les tuyaux cylindriques), A. Schlag. Revue Universelle des Mines de la Métallurgie des Travaux Publics (Paris), vol. 73, no. 6, Mar. 15, 1930, pp. 163-166, 3 figs. Factors which influence resistance to flow; formula for calculation of losses and how it is applied.

FLOW OF WATER

Theoretical Discussion. Flow of Water Made Clearer (Ein Beitrag zur Klaerung der Wasserbewegung), A. Reuther. Gesundheits Ingenieur (Munich), vol. 53, nos. 11, 12 and 13, Mar. 15, 1930, pp. 164-167, Mar. 22, pp. 180-185 and Mar. 29, pp. 194-202, 42 figs. Theoretical discussion deriving simplified formulae to account for flow of water, liquids and gases as well granular materials; flow of water in natural streams and other open channels; flow of liquids from orifices and over weirs; movement of underground waters.

FORGE SHOP PRACTICE

Description of. Forge and Foregemen (Forgeage des métaux autres que l'acier). Arts et Métiers (Paris), vol. 83, no. 113, Feb. 1930, pp. 53-55, 17 figs. General description of drop-forging practice, design of dies and fixtures; crankshaft forging; axle, hub and wheel dies; notes on non-ferrous forgings; sketch shows layout of forge shops; proerties of die materials.

Die Pressing. Die-Pressed Parts Reduce Production Costs, H. Chase. Am. Machinist, vol. 72, no. 21, May 22, 1930, pp. 835-837, 3 figs. Description of advantages of die-pressing and application to specific cases; die-pressed parts of brass or bronze have tensile strength of 45,000 to 46,000 lbs. per sq. in.; brass castings from 27,000 to 33,000 lbs. per sq. in.: comparison of cost with casting.

FOREMEN

Importance of. Keystone of the Industrial Arch, A. H. Rodrick. Iron Age, vol. 125, no. 26, June 26, 1930, pp. 1877-1878 and 1930-1941. Increased recognition of importance of foreman; major activities controlled by foremen; functions and responsibilities of foremen.

Training. Foreman Training that Works, R. G. Adair. Factory and Indus. Mgmt., vol. 80, no. 1, July 1930, pp. 85-86, 88 and 90. Subjects for meetings on prevention of waste of machinery and equipment through improper operations, inadequate maintenance and makeshift repairs, misuse of small items and through study of cost sheet.

Foremen Training by the Conference Method, E. B. Luce. Am. Gas Assn.—Proc., 1929, pp. 68-72, 1 fig. Informational, instructional and conference type of educational procedure; variations in conference methods and cautions to be exercised; topic analysis and case analysis methods discussed.

FOUNDATIONS

Vibrations. Present Status of Research in Field of Machinery and Foundation Vibrations (Der heutige Stand der Forschungen auf dem Gebeite der Maschinen und Fundamentschwingungen), Nolle. Archiv fuer Waermewirtschaft (Berlin), vol. 11, no. 6, June 1930, pp. 207-210, 6 figs. Study is based on works of Blaess, Geiger, Beyer, Ehlers, Hort, Rausch, Noelle, Reuter, Lupberger, Zeuner, and Marguerre, read before Vereingung der Elektrizitaetswerke, Apr. 25, 1929, and of Kayser, published in V.D.I. Zeit., 1929; critical speed and balancing of rotors; formula for oscillation; determination of vibratory properties of different foundations.

FOUNDRIES

Materials Handling. Materials Handling and Storage in Foundry Operations, W. M. Booth. Am. Foundrymen's Assn.—Trans., vol. 1, no. 6, June 1930, pp. 168-185. Three general rules for improving materials handling in foundry are: General use of electricity or mechanical power; routing work through plant in as nearly straight line as possible; waist-high movement of all materials involving lahour.

Material Handling in the Small Foundry. Mech. Handling (Lond.), vol. 17, no. 5, May 1930, pp. 159-160. Advances in non-ferrous foundry practice and subject of material handling in small foundries were main topic of discussion at meeting of Ohio Foundries Association, Inc., held at Dayton, Ohio.

FURNACES, MELTING

Pulverized Coal. Some Features of the Pulverized Coal Fired Air Furnace, E. F. Wilson. Am. Foundrymen's Assn.—Trans. and Bul., vol. 1, no. 5, May 1930, pp. 1-40, 4 figs. Main headings of discussion are: design; materials of construction; methods of furnace construction; calculation of mixtures; features affecting oxidation; furnace operation; test methods to determine heat progress; doping melt; pouring melt; features of combustion; powdered coal combustion; fuels; bath reactions, and modification of air furnaces. Bibliography.

FURNITURE MANUFACTURE

Factory Methods. Modern Chair Factory Methods, F. L. Booth. Wood-Worker, vol. 29, no. 4, June, 1930, pp. 40-41, 5 figs. Consistent progress made by B. L. Marble Chair Co., Bedford, Ohio, due to policy of using only up-to-date equipment and methods; brief description of plant and equipment is given.

G

GALVANIZING

Dross Reduction. Temperature of Galvanizing Bath Affects Dross Production, W. G. Imhoff. Iron Trade Rev., vol. 86, no. 25, June 19, 1930, pp. 65-66, 3 figs. Discussion of differences in dross under various operating conditions and temperatures; microphotographs show dross differences due to carbon content; notes on operating temperature and kettle life.

Specifications. Report of Sectional Committee on Zinc Coating of Iron and Steel. Am. Soc. Testing Matls.—Advance Paper, no. 31, for mtg. June 23-27, 1930, 14 pp. Report of technical committee on specifications for zinc coating on structural steel shapes, plates and bars and their products; proposed standard specifications for zinc (hot galvanized) coatings on structural steel shapes, plates and bars and their products.

GAS MANUFACTURE

Fundamental Problems. Production Conference Studies Fundamental Problems. Am. Gas Jl., vol. 132, no. 6, June 1930, pp. 59-62 and 67-71. Brief abstracts of papers before American Gas Association: Carbureting water gas with "bunker C" oil, J. V. Richards; Actifier air disposal in boilers and gas producers, M. T. Herreid; Reforming petroleum still gas, R. G. Rincliffe; Tests of cooking coals, A. D. Davis, and A. C. Fieldner; Cost of reforming of refinery still gases, C. A. Schlegel; Coke as domestic heating fuel, P. Nickolls; Economic interrelationship of petroleum and gas industries, H. J. Nichols, Jr.; Mixing and distributing butane-air gas at North Manchester, Ind., L. C. Heavner, etc.

GAS PLANTS, BUTANE-AIR

Indiana. Operating Results of Butane-Air Gas Plant in Small Indiana Town, L. C. Heavner. Natl. Petroleum News, vol. 22, no. 23, June 4, 1930, pp. 81-82 and 84-86, 3 figs. Description of installation of new types of plant at North Manchester, Indiana, small town that had never been supplied with gas; project was experimental, to obtain operating and cost data to determine whether company was warranted in applying for franchises and installing similar plants in smaller towns of its territory, not now served with gas; detailed figures are given. Read before Am. Gas Assn.

GASOLINE

SULPHUR CONTENT. Ghost of Sulphur in Gasoline Costs Americans 50 Millions a Year, G. Egloff, C. D. Lowry, Jr., and P. Truesdell. Nat. Petroleum News, vol. 22, nos. 24 and 25, June 11, 1930, pp. 41 and 43, and June 18, pp. 69 and 71-72. June 11: Argument for raising sulphur limitation in motor gasoline specifications; high cost of treating gasoline, to keep within 0.10 per cent limit, comes out of pockets of American motorists; no evidence published, except few laboratory tests, to prove danger of high sulphur gasolines. June 18: It is stated that gasolines with up to 0.7 per cent sulphur have been marketed without complaint; various opinions are quoted; data on corrosion.

GASOLINE FILLING STATIONS

NEW PUMP. Expands Gasoline Pump Output from 10 to 500 Units a Day, F. L. Prentiss. Iron Age, vol. 125, no. 25, June 19, 1930, pp. 1805-1809, 5 figs. Description of manufacturing process and equipment at plant of Ferro Machine and Foundry Co., Cleveland; pump is of rotary type and is driven through flexible coupling and stuffing box located within bracket; specified pumpage of 15 gals. per min.

GASOLINE TANKS

LOSSES. Filling and Storage Losses From Pressure Containers, H. C. Boardman. Water Tower, vol. 16, no. 8, Apr. 1930, pp. 4-6, 4 figs. Theoretical discussion leading to following statements about pressure storage: filling losses for given vapour pressure are greatest first time pressure container is filled; if pressure container could be operated under partial vacuum its effectiveness in preventing evaporation losses would be greatly increased.

GEARS AND GEARING

JOHNSTONE TAYLOR. Gearing, Johnstone Taylor. Mech. World (Manchester), vol. 87, no. 2265, May 30, 1930, pp. 512-514, 8 figs. Supports for double helical gears; arrangement of turbine gears; elements of design of spiral level gears. (Continuation of serial.)

LUBRICATION. Lubrication of Gears, H. S. Trecartin. Power Transmission, vol. 36, no. 5, May 1930, pp. 23-24, 2 figs. Rubbing action between gear teeth is cause of friction; gear life directly proportional to quality of lubricant; metallic contact should be eliminated; selecting the lubricant.

MANUFACTURE. Manufacture of Herringbone Bevel Gears (Die Herstellung von Kegelraedern mit Pfeilversahnung,) M. Coenen. Automobil-Rundschau (Berlin), vol. 32, no. 11, June 1, 1930, pp. 222-224, 11 figs. Outline of advantages of herringbone bevel gears in manufacture and operation; small gears run almost noiseless at 15,000 r.p.m.; sketches illustrate working principle of automatic cutter built by J. E. Reinecker A.-G., Chemnitz-Gahlenz.

MANUFACTURE, ENGLAND. The Works of Messrs. David Brown and Sons (Huddersfield), Limited. Engineering (Lond.), vol. 129, nos. 3355 and 3359, May 2, 1930, pp. 559-561, and May 30, pp. 693-696, 29 figs. on p. 574, and supp. plates. Works have grown from small establishment, supplying cast gear wheels, to buildings covering 12 acres and employing 1,500 hands; all classes of gear manufacture were undertaken prior to 1914 but following development of D.B.S. worm gear, important expansion took place in development of this type of gearing; and works were largely concentrated on this product; general arrangement of shops; methods and equipment employed in manufacture.

NON-METALLIC. Micarta Non-Metallic Gears in the Steel Mill Industry, T. C. Roantree. Assn. of Iron and Steel Elec. Engrs.—Proc. for Yrs. 1928-1929, pp. 407-409. Indexed in Engineering Index 1928, p. 865, from Iron and Steel Engr., Oct. 1928.

NON-UNIFORM ROTATION. Eccentrically Driven Gear Arrangement (Das exzentrisch angetriebene Raeddrknie), K. Hoecken. V.D.I. Zeit. (Berlin), vol. 74, no. 16, Apr. 19, 1930, pp. 509-512, 4 figs. Theoretical investigation of mechanism for non-uniform rotation with reverse movement; formulae for dimensioning various gears; movement and velocities illustrated by graphs and diagrams.

PLANETARY. Planetary Trains with Two Internal Gears, W. Richarss. Machy. (Lond.), vol. 36, no. 922, June 12, 1930, pp. 331-334, 5 figs. Description of various designs with two internal gears; planetary reduction gear having fixed and driven internal gears with train arm as driver; planetary reduction gear in which train arm is eccentric and driver and driven rotate in same directions; planetary reduction gear in which train arm is eccentric and driver and driven rotate in opposite directions: data reduction ratios are given in tables.

SPUR. Theoretical Considerations in the Design of Spur Gear Teeth, F. A. Mickle. Product Eng., vol. 1, no. 7, July 1930, pp. 314-316, 2 figs. Calculations which indicate that fundamental principle laid down in Lewis formula is correct.

GEOLOGY

ARIZONA. The Pre-Cambrian Greenstone Complex of the Jerome Quadrangle, C. Lausen. Jl. of Geology, vol. 38, no. 2, Feb.-Mar. 1930, pp. 174-183, 2 figs. In Jerome quadrangle are series of greenstones varying in composition from andesites to rhyolites, principally former, which are pre-cambrian in age; these greenstones have been included with Yavapai schist series, but detailed mapping shows them to rest uncomformably on upturned and eroded edges of schist; structural features of this complex and contact action of pre-cambrian granitic masses are described; copper deposits are mentioned, but not discussed. Bibliography.

CALIFORNIA. Recent Sands of California, R. D. Reed. Jl. of Geology, vol. 28, no. 3, Apr.-May 1930, pp. 220-245, 15 figs. Study of recent sands collected from California deserts, beaches, and stream channels reveals widespread occurrence of feature that is interpreted as immaturity; attention is called to possible importance of this factor in interpretation of certain cretaceous and tertiary sedimentary formations. Bibliography.

VALUE TO INDUSTRY. The Value of Geology to Industry, L. Reinecke. S. African Min. and Eng. Jl. (Johannesburg), vol. 41, no. 2009, Mar. 29. 1930, pp. 109-111. Review of main lines along which science of geology has been applied to economic problems; survey of structural materials; geology and civil engineering; ore deposition and ore finding; limitations of geophysical prospecting; more funds for geological survey urged. Presidential address before Geol. Soc. of S. Africa.

GLASS

MANUFACTURE. Modern Plant Glass Manufacture (Neuzeitliche Spiegelglasherstellung), L. von Reis. V.D.I. Zeit. (Berlin), vol. 74, no. 26, June 28, 1930, pp. 899-905, 27 figs. Statistical data on consumption of plate glass in Europe and America; comparative study of European and American manufacturing methods with special reference to Bicheroux process and methods developed by Libbey-Owens Sheet-Glass Co., Henry Ford Motor Co., Pittsburgh Plate Glass Co., and General Motors Co.

SILICA. The Rate of Crystal Growth in Technical Soda-Lime-Silica Glasses, A. Dietzel. Glass Industry, vol. 11, nos. 5 and 6, May 1930, pp. 106-113, and June, pp. 132-137, 37 figs. Translated from Sprechsaal, 1929, indexed in Engineering Index 1929, p. 888. (To be continued.)

THERMAL EXPANSION. Measuring Expansion of Several Glasses with Help of a Recording Apparatus (Ueber Ausdehnungsmessungen an einigen Glaesern mit Hilfe einer selbstregistrierenden Apparatur), W. M. Cohn. Sprechsaal (Coburg), vol. 63, no. 16, Apr. 17, 1930, pp. 287-289, 5 figs. Apparatus will photographically record expansion of glass with temperature; limiting temperature of operation is 900 deg.; it was used to determine average linear coefficient of expansion, transformation temperatures, and softening points of 8 typical glasses of wide variation in chemical composition; heating rate was 2 to 3 deg. per min. (To be continued.)

GREENHOUSES

HEATING. Economic Utilization of Condensation Heat of Electric Power Plants in Large Greenhouses (Wirtschaftliche Ausnutzung der Kondensationswaerme eletrischer Kraftwerke in grossen Gewaechschausanlagen) Grossbruchhaus. Elektrizitaetswirtschaft (Berlin), vol. 29, no. 508, May 2, 1930, pp. 243-247, 6 figs. Present status of waste-heat utilization in power plants; heating of greenhouses with condensation heat; construction of greenhouse; examples of design of large installation for heating of greenhouse of 700,000 sq. m. surface with waste heat of 50,000-kw. steam turbine; numerical data.

GRINDING MACHINES

HEALD. Eccentric Feed Mechanism for Internal Grinder, L. L. Roberts. Machy. (N.Y.), vol. 36, no. 10, June 1930, pp. 761-762, 2 figs. Description and sketches of eccentric feed mechanism operated by differential gearing for Heald cylinder grinder.

ROLL. Roll Grinding Precision. Abrasive Industry, vol. 11, no. 6, June 1930, pp. 29-31, 4 figs. Description of new machines of Churchill Machine Tool Co., Ltd., Manchester; cambering mechanism for concave, convex cambers, and transverse mechanism hydraulically operated; separate motors for wheel, workhead, and traverse; smaller model to grind rolls up to 40 in. in diameter, and larger models for 60 and 72 in.

SURFACE. Surface Grinding Machine Design Reveals Production Grinding Development, F. B. Jacobs. Abrasive Industry, vol. 11, no. 6, June 1930, pp. 22-25, 8 figs. Description of steps in development of surface grinding; sketches show features of several designs; travelling grinding-wheel head; principle of guide-bar grinding; oscillating wheel head and stationary platen; rotary platen surface grinding machine.

GRINDING WHEELS

PRODUCTION CONTROL. The Right Handling Equipment, Central Dispatching, Bonus for Truckers and Cost Curves Crashed, B. A. Hildebrant. Factory and Indus. Mgmt., vol. 79, no. 6, June, 1930, pp. 1343-1345, 5 figs. Method used by Morton Co., Worcester, Mass., in manufacture of grinding wheels for materials handling, dispatching, and production control.

GUNNERY

AIRCRAFT. Shooting from Airplanes at Aerial Objective (Le tir en avion sur objectif aérien), Devèze. Revue des Forces Aériennes (Paris), no. 10, May 1930, pp. 594-604, 5 figs. Description of large (8 m. x 50 m.) cotton targets which are towed in vertical or horizontal position by airplanes; notes on value for ballistic studies.

GYPSUM PLASTER

RESEARCH. Anhydrite Plasters and Cements, A. E. Flynn. Can. Min. and Met. Bul. (Montreal), no. 218, June 1930, pp. 810-833, 1 fig. Results of researches at Nova Scotia Technical College; technology of gypsum plasters; scope of investigations; experimental methods; other materials used; test of anhydrite from different deposits; amount of catalyzer necessary; method of adding catalyzer; fineness of grinding; ageing; effects of foreign material; artificial anhydrite; chemically pure calcium sulphate; calcined anhydrite; porosity; cellular insulating plaster; hydration tests; weight of set plaster. Read before Min. Soc. of Nova Scotia.

H

HIGH SPEED STEEL

PROPERTIES OF. Mechanical Properties of High-Speed Steel at Elevated Temperatures, A. R. Page. Metallurgia (Lond.), vol. 1, no. 6. Apr. 1930, pp. 239-241, 9 figs. Report of research to determine properties; all tests were carried out under definite standard set of conditions; while results obtained are not absolute, it is claimed that they are comparative and give idea of variation in properties when material is heated.

HIGHWAY ACCIDENT PREVENTION

HIGHWAY ACCIDENT PREVENTION. The Human Side of Traffic Accidents. Nat. Safety Council—Trans., vol. 3, of mtg. Sept. 30 to Oct. 4, 1929, pp. 82-101. Papers presented before Public Safety Division by J. S. Kemper, C. M. Anderson, J. D. Robertson, and C. A. Whitmer.

Public Safety Division. Nat. Safety Council—Trans., vol. 3, of mtg. Sept. 30-Oct. 4, 1929, pp. 3-22. Papers presented before Public Safety Division, by P. Hoffman, L. I. Dublin, H. A. Locke, and F. E. Shortemeier.

HIGHWAY SYSTEMS

PERU. Central Southern Trunk Highway (La troncal del Medio-Sur), J. A. de Izcue. Informaciones y Memorias de la Sociedad de Ingenieros del Peru (Lima), vol. 32, no. 2, Feb. 1930, pp. 61-72, 1 fig. Notes on main highway designed to give outlet to coast from departments of Ayacucho, Apruimac and Cuzco, entire system comprises 821 km. of which 375 km. practically completed; zone of more than 40,000 sq. km. will be served.

How We Should Meet the Problem of Building Our Roads (Como debemos afrontar le ejecucion de nuestros caminos), C. Romero Sotomayor. Informaciones y Memorias de la Sociedad de Ingenieros del Peru (Lima), vol. 31, no. 10, Oct. 1929, pp. 627-647, 3 figs. Broad discussion of problems of road construction in different regions of Peru.

HYDRAULIC MACHINERY

DESIGN. Hydraulics in Design, J. P. Ferris. Machine Design, vol. 2, no. 3, Mar. 1930, pp. 27-34, 10 figs. Description of development and various applications of hydraulic principle in machine design; characteristics of nine basic systems of hydraulic power transmission are given in tabular form and illustrated by sketches.

Hydraulics in Design, J. P. Ferris. Machine Design, vol. 2. nos. 5 and 6, May 1930, pp. 35-39 and 53, June, pp. 26-28 and 53, 15 figs. May: Machines utilizing action; volumetric motor-multiple and pump-multiple plungers; diagram of hydraulic drive for tire conveyor honing machine with hydraulic reciprocation of hones; welding machine and shaper-planer with hydraulic table drive. June: Automatic drilling machine with hydraulic feed and hydraulic indexing of table; machine for assembling bushings; boring; facing machine equipped with three hydraulic feeding motions. (Continuation of serial.)

NOTES ON. Notes on Hydraulic Power Systems and Piping, E. W. Sylvester. Heat. Piping and Air Conditioning, vol. 2, no. 7, July 1930, pp. 579-582, 5 figs. Design, installation, and operation of hydraulic power systems which apply in general to applications of hydraulic power.

HYDRAULIC TURBINES

DESIGN. Graph for Quick Determination of Principal Dimensions of Hydraulic Turbines (Graphique pour la détermination rapide des dimensions principales des roues de turbines hydrauliques), M. Mathieu. Arts et Métiers (Paris), no. 116, May 1930, pp. 200-202, 1 fig. Graph and explanatory note are given.

JAPAN. Water Turbine Development in Japan, M. Tazawa. Far East. Rev. (Shanghai), vol. 26, no. 4, Apr. 1930, pp. 167-173 and 175, 19 figs. Invention and development of water turbine; advent of hydro-electric plant; early hydro-electric prime mover and American manufactured turbines; importation of European wheels during early period and growth of home supply in Japan; why American turbines were displaced by European rivals; domination of imported turbines and its effect on Japan's industry; revival of demand for American turbines, and premature collapse of import projects; post-war conditions. (To be continued.)

Water Turbine Development in Japan, M. Tazawa. Far East. Rev. (Shanghai), vol. 26, no. 5, May 1930, pp. 232-237, 9 figs. Distribution of hydro-electric plants in Japan and their generating capacity; foreign makes dominate large capacity turbine market; competition among foreign suppliers; setback to foreign turbine makers and comeback of Japanese manufacturer; changes of turbine types and effect of American wheels on Japanese design; how hydro firms select their turbines; and competition among international makers; research work by Japanese turbine makers, and progress in their manufacturing methods. (Continuation of serial.)

Manufacture. Contributions to Hydraulic Power Development by Pennsylvania Manufacturers: S. Morgan Smith Co., B. E. Smith. Pa. Elec. Assn.—Proc., Sept. 1929, pp. 71-76, 9 figs. During 1928, year marked by many important activities in field of hydraulic power developments, S. Morgan Smith Co. was awarded number of large contracts for turbines; total output involved in these contracts, including orders placed with Canadian associates, S. Morgan Smith-Inglis Co., amounts to more than 1,000,000 hp.; features of equipment are described.

HYDRODYNAMICS

Hydrodynamics. On the Resistance of Water to a Rapidly Moving Sphere, M. Masima and S. Sasaki. Tokyo Imperial Univ.—Faculty of Eng.—Jl. (Tokyo), vol. 18, no. 10, Mar. 1930, pp. 247-256, 4 figs. Report on measuring velocities of bullets fired down vertically into wooden tank filed with water. (In English.)

HYDRO-ELECTRIC POWER PLANTS

Control. Automatic Hydraulic Regulatory and Safety Devices. Elec. West. vol. 64, no. 6, May 15, 1930, pp. 331-337, 7 figs. Hydraulic Power Committee Report on devices in use in hydro-electric developments as separate or distinct units in contrast to those which are found in automatic or semi-automatic plants and are more or less intimately associated with automatic equipment for operation of plant.

Germany. Power Utilization of Flow at Hengstey Lake (Die ausnutzung der Laufwasserkraefte am Hengsteysee), O. Spetzler. V.D.I. Zeit. (Berlin), vol. 74, no. 23, June 7. 1930, pp. 761-766, 9 figs. Description of two low-head hydro-electric power plants, constructed by Ruhrverband Essen at Hengstey and Stiftsmuehle: Hengstey plant, equipped with three Kaplan vertical axis turbines, produces 4,200 hp. at head of 4.85 m.; Stiftsmuehle plant, which is also equipped with three Kaplan turbines vertical axis develop 37.20 hp. at head of 3.3 m.; details of plant equipment.

Maintenance and Repair. Maintenance of Hydraulic Works. Elec. West, vol. 64, no. 6, May 15, 1930, pp. 359-361, 1 fig. Report of subcommittee on maintenance of hydraulic works of Pacific Coast Electrical Assn.; standard of maintenance; maintenance of efficiency and capacity; maintenance programme; replacement of units; new designs.

Operation. Hydraulic Plant Operating Problems. Elec. West, vol. 64, no. 6, May 15, 1930, pp. 370-372. Report of subcommittee on hydraulic plant operating problems of Pacific Coast Electrical Assn.; comments by superintendents, foremen and operators on following subjects: storage reservoirs, water conduits, long distant water level gauges, penstocks, turbines, draft tubes, impulse water wheels; recommendations for improvements in design, manufacture and construction to help prevent occurrence of operating troubles.

HYDRO-ELECTRIC POWER DEVELOPMENTS

Scotland. The Lochaber Water-Power Scheme and Its Geological Aspect, B. A. Peach. Instn. of Min. Engrs.—Trans. (Newcastle-Upon-Tyne), vol. 79, part 1, Mar. 1930, pp. 43-44. Discussion of paper previously indexed from various sources.

I

INDUSTRIAL TRUCKS

Electric. Combination of Different Types of Materials Handling Equipment, C. B. Crockett. Iron Age, vol. 125, no. 25, June 19, 1930, pp. 1810-1813, 6 figs. Outline of advantages obtained by use of electric trucks for handling materials at plant of Link-Belt Co., Chicago; data on reduction of labour costs in cupola charging.

INTERNAL COMBUSTION ENGINES

Corrosion Prevention. Fuel Economy in Internal-Combustion Engines Through Prevention of Water Scale and Corrosion in Cooling-Water Chambers (Wege zur Brennstoffersparnis bei Explosionsmotoren durch Wasserstein und Rostverhuetung in den Kuehlwasserraeumen), H. Balcke. Brennstoff und Waermewirtschaft (Halle), vol. 12, no. 9/10, May 1930, pp. 113-123, 7 figs. Account of experimental investigations; character of scale and rust, and their deleterious effect and means of combatting them; description of GAV process developed by M. Groeck, which makes use of reagent which dissolves scale and removes rust without damaging action of acid.

Fuels. Fuels for Internal-Combustion Engines, H. E. Degler. Motive Power, vol. 1, nos. 1, 2 and 3, Feb. 1930, pp. 9-12 and 44, Mar., pp. 15-17 and 42, and Apr., pp. 15-17, 11 figs. Feb.: Classification, fuel-aix mixtures, pressures, fuel consumption of solid and gaseous fuels; data on gaseous fuels. Mar.: Uses and limitations of liquid fuels and their classification; factor in carburetor and manifold design; table illustrating typical analyses of liquid fuels. Apr.: Conclusions concerning proper selection of liquid fuels; typical performance curves of Diesel engine operating on fuel oil.

Lubrication. Efficient Lubrication Depends Upon Correcting Mechanical Deficiencies, O. Adams. Motive Power, vol. 1, nos. 2 and 3, Mar. 1930, pp. 26-28 and 46-47, and Apr., pp. 28-32, 17 figs. Mar.: Success of engine of present-day design is dependent upon intelligent application of certain protecting devices, methods of operation and lubrication; engine problems analyzed; engine reconditioning; advantages of ground cylinder; smooth finish and oil film. Apr.: Importance of proper piston-ring design for effective internal-combustion-engine lubrication; double seal rings now used; analysis of piston-ring leakage; construction of ring; oil pumping.

Marine, Carburetors. Downdraft Carburetion, E. H. Shepard. Motive Power, vol. 1, no. 2, Mar. 1930. pp. 21-22 and 44, 6 figs. Paper presented before Soc. Automotive Engrs. previously indexed from Feb. 1930, issue of their Journal.

IRON AND STEEL PLANTS

Waste Heat Utilization. The Utilization of Waste Heat in the Steel Industry, C. W. E. Clarke. Fuels and Furnaces, vol. 8, no. 6, June 1930, pp. 827-830. Discussion of practical possibilities for utilization of waste heat in steel plant; sources of waste heat; qualities of various gases; use of blast furnace gas in conjunction with pulverized coal; various heat requirements. Abstract of paper read before Am. Iron and Steel Inst., previously indexed from Advance Paper, for mtg. May 9.

IRRIGATION

Seepage. Pumping Seepage Water From Wells for Irrigation, E. H. Neal. Eng. News-Rec., vol. 104, no. 25, June 19, 1930, p. 1020. Abstract of report read at annual meeting of American Society of Agricultural Engineers, describing experimental installation of four wells, in Boise River valley, in southwestern Idaho, to relieve water-logged land and furnish supplemental irrigation supply.

IRRIGATION UTILITIES

Usefulness of. Commercial Irrigation Companies W. A. Hutchins. U.S. Dept. of Agriculture—Tech. Bul., no. 177, Mar. 1930, 40 pp. Conclusions as to present usefulness of commercial companies as means of irrigation development, as permanent irrigation-utility investment, and as means of best serving interests of water users; classification of commercial companies; contribution of commercial enterprises to irrigation development; why commercial company investments have been generally unprofitable; internal features of irrigation utilities. Bibliography.

J

JAPANNING

Developments in. Developments in the Use of Ovens for Baked Finishes, W. J. Miskella. Fuels and Furnaces, vol. 8, no. 6, June 1930, pp. 821-822, 1 fig. Discussion of recent developments in baked japanning field; new synthetic undercoats for application under lacquer finishes; baking process, wherein two coats of japan are applied with one bake.

L

LEAD DEPOSITS

Missouri. An Alnoite Pipe, its Contact Phenomena, and Ore Deposition Near Avon, Missouri, J. T. Singewald, Jr., and C. Milton. Jl. of Geology, vol. 38, no. 1, Jan.-Feb. 1930, pp. 54-66, 6 figs. Pipe of augite-free alnoite has intruded Bonneterre dolomite with explosive violence and assimilation of much dolomite; solutions entered fractures in dolomite at periphery of pipe and deposited same ore and gangue minerals that occur in southeastern Missouri disseminated lead deposits; there is no evidence to indicate that igneous pipe had any relation to this mineralization other than that its locus provided channels of circulation for mineralizing solutions. Bibliography.

LOCOMOTIVES

Design. Railway Motive Power, a Few Points on the Present Trend of Design, W. E. Barnes. Can. Ry. and Mar. World (Toronto), no. 388, June 1930, pp. 352-354. Discussion of problems encountered by locomotive designer; design features of various locomotive parts are considered.

Fuel Economy. Fuel Association Work Commended by Railroad Officers. Ry. Mech. Engr., vol. 104, no. 6, June 1930, pp. 325-329, 2 figs. Chicago convention told that savings through fuel economy are largely offset by increased taxes; committee reports concerning new locomotive economy devices, and Diesel locomotives.

LUBRICANTS

Graphite. Graphite Greases (Grasas grafitadas), C. F. Hickethier. Ingenieria (Buenos Aires), vol. 34, no. 5, May 1930, pp. 178-180, Graphite is most important solid lubricant; it is used in natural state and in combination with oils or lubricating greases; analyses of typical natural graphites, and of Acheson artificial amorphous graphite; graphite grease specifications.

Oils and Greases. Lubricating Oils, Greases, and Cutting Oils, J. S. Gander. Mech. World (Manchester), vol. 87, no. 2264, p. 473. Essential properties of lubricating oils are: body to prevent metallic surfaces from coming into contact; should be as fluid as possible and have minimum coefficient of friction; freedom from corrosive acids; contain no materials liable to produce oxidation or gumming; must not be easily thinned by heat or thickened by cold. (Continuation of serial.)

M

MACHINE SHOP PRACTICE

Details of. Are Precision Machines Sound Investments? H. A. Laystrom. Machy. (N.Y.), vol. 36, no. 10, June 1930, pp. 808-808A. Detailed analysis of number of jobs handled in shop of Quality Hardware & Machine Corp., Chicago, Ill., demonstrates advantages of precision machines.

MACHINE TOOLS

Electric Drive. Recent Developments in Electric Drives of Machine Tools on the Continent. Machy. (Lond.), vol. 36, no. 925, July 3, 1930, pp. 444-447, 5 figs. Control system for large lathe; electric drive for portal milling machine; electrical control arrangements for heavy boring and turning mill; turning and grinding machine for large rotors employing 13 motors; electric drive of planers.

MAGNETIC CIRCUITS

Units. Magnetic Circuit Units, A. E. Kennelly. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 486-510, 2 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

MATERIALS HANDLING

Equipment. Bucket Elevators, Bucket Hoists, and Belt Conveyors (Skopelevatorer, Skophissar och remtransportorer), E. Dahlin. Teknisk Tidskrift (Stockholm), vol. 60, no. 20, May 17, 1930, (Mekanik), pp. 61-67, 6 figs. Bucket elevators and conveyors are discussed; applications, efficiency and cost of construction and installation. (To be continued.)

METALLURGICAL ENGINEERING EDUCATION

South Africa. Mining and Metallurgical Education in South Africa, G. H. Stanley, and G. A. Watermeyer. Empire Min. Rev. (Johannesburg), no. 2, Apr. 1930, pp. 67-68. See also abstract in S. African Min. and Eng. Jl., Special No., Apr. 1930, p. 97. Review of development of provision of trained technical staff from within South Africa itself since stabilization of mining industry by Cecil Rhodes in 1888; co-operative efforts in 1902; at University of Witwatersrand, emphasis is laid on practical works. Abstract of paper read before Empire Min. and Met. Congress.

METALS

Corrosion. Corrosion and Stress. Metallurgist (Supp. to Engineer, Lond.), June 1930, pp. 82-93. Emphasis is laid on importance of fact that stress is important factor in regard to corrosion; perhaps most striking evidence in that direction is associated with what has come to be known as corrosion fatigue following upon original discovery made by Haigh and subsequently very fully worked out by McAdam, that fatigue resistance of great majority of metals and alloys becomes very seriously reduced if surface of test piece is exposed to such mildly corrosive conditions as are produced by gentle stream of tap water.

Fatigue. Fatigue and Fatigue Testing. Metallurgist (Supp. to Engineer, Lond.), May 1930, pp. 75-76. Review of discussion on impact testing by A. Thum and S. Berg, previously indexed from V.D.I. Zeit., Feb. 15, 1930, under classification of Impact Testing, Notched Bar; question of fatigue under impact is regarded in Germany as very real one; danger of blows is believed to be increased when they occur at high frequency as is case with fast-running machines, and it is supposed that they may lead to serious shortening of life of machine. (Continuation of serial.)

MINE HOISTS

Failures. Notes on a Winding Accident at Mainsforth Colliery, Co. Durham, December 31st, 1928, C. Howson. Instn. of Min. Engrs. Trans. (Lond.), vol. 79, part 1, Mar. 1930, pp. 2-8 and (discussion) 8-10, 7 figs. Full text of paper previously indexed from Colliery Guardian, Feb. 28, 1930, and Iron and Coal Trades Rev., Feb. 28, 1930.

MINE LIGHTING

Mine Lighting. Efficiency and Rapidity of Mine Working in Relation to Lighting Intensity (Guete und Schnelligkeit der Bergeauslesung in Abhaengigkeit von der Beleuchtungsstaerke), C. Koerfer. Glueckauf (Essen), vol. 66, no. 15, Apr. 12, 1930, pp. 508-511, 7 figs. Results of tests carried out by Society for Inspection of Rubr Mines, to study influence of lighting on safety and bealth of miners as well as on efficiency of mining operations.

MINERAL DEPOSITS

IDAHO. Geology and Ore Deposits of the Seafoam, Alder Creek, Little Smoky, and Willow Creek Mining Districts, Custer and Camas Counties, Idaho, C. P. Ross. Univ. of Idaho—Bur. of Mines and Geol.—Pampblet, no. 33, Mar. 1930, 26 pp., 9 figs. on supp. plates. Seafoam, in nortbwestern Custer county; silver, gold and lead; sbear zones and replacements in dolomitic limestone; Alder Creek, west of Mackay; contact metamorpbic; copper, with some gold and silver; Little Smoky and Willow Creek, in Camas county, on border of Blaine; shear zones, large replacements; lead, zinc, silver and gold; general geology; principal deposits and mines of each district; production data.

Geology and Ore Deposits of the Clark Fork District, Idaho, A. L. Anderson. Idaho Bur. of Mines and Geol.—Bul., no. 12, Mar. 1930, 128 pp. and index, 26 figs. on supp. plates and 3 maps. Report on area along Clark Fork of Columbia river in northern Idaho, 35 mi. north of Coeur d'Alene district; general geology; deposits are mainly replacement veins resembling those of Coeur d'Alene district and also some veins filling fissures; silver and lead are chief values, with small amounts of zinc; copper occurs in distinct veins; gold veins also occur, distinct from both of others; descriptions of deposits, and of principal mines and prospects.

MINERAL RESOURCES

RHODESIA. Tbe Southern Rbodesian Prospecting Concession. S. African Min. and Eng. Jl. (Johannesburg), vol. 41, no. 2016, May 17, 1930, pp. 311-312, 1 map. Map shows area reserved from pegging and to be granted for exclusive prospecting purposes upon suitable terms to company to be registered for purpose; 9,000 sq. mi., bounded on nortb by 20tb parallel of soutb latitude, as far as longitude 31 deg. east; geological features; granite gneiss country has possibilities both with regard to gold and base metals; Umkondo beds bave already been worked for copper in Bikita district.

MINES AND MINING

EQUIPMENT. The Purchases of Mechanical Equipment for Mines, D. S. Hines. Can. Min. and Met. Bul.—Jl., no. 218, June 1930, pp. 764-774. Discussion of problems and difficulties encountered in purchasing procedure; requisition; inquiry; order; price; terms, sales tax; shipment or delivery; insurance; inspection; customs; general remarks. Read before Min. Soc. of Nova Scotia.

EQUIPMENT SALVAGING. Systematic Control of Materials in Underground Mines (Die planmaessige Erfassung der Betriebsstoffwirtschaft untertage), A Kuenze. Glueckauf (Essen), vol. 66, no. 15, Apr. 12, 1930, pp. 497-508. Economy of salvaging materials and equipment is set forth; stationary iron and steel equipment; scrap material; mine timbering; organization of salvaging scbeme; functions of stores department.

FIRST AID. First Aid Organization on tbe Witwatersrand Gold Mines, H. T. H. Butt. S. African Min. and Eng. Jl. (Johannesburg), Special No., Apr. 1930, pp. 71-72. See also abstract in Empire Min. Rev., no. 2, Apr. 1930, pp. 45-46. Organization on military lines; initial treatment on spot; collection of casualties at ambulance depot; sending down line to dressing station, or to hospital if serious; pivot of underground first aid is boss-boy, mostly recruited from Portuguese natives; above him are medical officer and ambulance officer, both full time officials, and underground and shaft ambulance officers, plus volunteers. Abstract of paper read before Empire Min. and Met. Congress.

ONTARIO. Mining in Ontario, T. W. Gibson. Empire Min. Rev. (Johannesburg), no. 2, Apr. 1930, p. 18. See also brief abstract in S. African Min. and Eng. Jl., Special No., Apr. 1930, p. 105. Chief gold areas are Porcupine and Kirkland Lake, located in 1929 and 1911; notes on principal producers and outputs; use of airplane, outboard motor, geophysical methods and radio in mining exploration; reported new gold belt, from Red Lake east to Fort Hope; increased activity in Sudbury copper nickel region. Abstract of paper read before Empire Min. and Met. Congress.

MINING ENGINEERING EDUCATION

COLORADO. Tbe Experimental Mine, J. B. Read, and J. Underhill. Colorado School of Mines—Quarterly, vol. 25, no. 2, Apr. 1930, 20 pp., 22 figs. Edgar mine at Idabo Springs, Colorado, is maintained by Colorado School of Mines for undergraduate work in mining which cannot be taught in classroom or in regular college laboratories; mine is property of North American Mining Company, whicb has leased all upper workings of mine, for long period, to Colorado School of Mines for essentially its sole use; equipment; use of mine by other colleges and by industries.

SOUTH AFRICA. Mining and Metallurgical Education in South Africa, G. H. Stanley, and G. A. Watermeyer. Empire Min. Rev. (Johannesburg), no. 2, Apr. 1930, pp. 67-68. See also abstract in S. African Min. and Eng. Jl., Special No., Apr. 1930, p. 97. Review of development of provision of trained technical staff from witbin Soutb Africa itself since stabilization of mining industry by Cecil Rbodes in 1888; co-operative efforts in 1902, at University of Witwatersrand, empbasis is laid on practical works. Abstract of paper read before Empire Min. and Met. Congress.

MINING INDUSTRY

CANADA. Review of the Mining of Canada, C. Camsell. Empire Min. Rev. (Johannesburg), no. 2, Apr. 1930, pp. 17-18. See also brief abstract in S. African Min. and Eng. Jl., Special No. Apr. 1930, pp. 105-106. Every province in Dominion, except Prince Edward Island, contributes to mineral output; total value increased from $164,420,877 in 1900 to $273,446,864 in 1928; increase in chemical manufacturing plants; Canada ranks third in world production of gold and of silver, and fourth in lead and copper; controls nickel market and supplies 90 per cent of world requirements. Abstract of paper read before Empire Min. and Met. Congress.

MINING LAWS AND LEGISLATION

SOUTH AFRICA. Mines and Works Regulations Revised. S. African Min. and Eng. Jl. (Johannesburg), vol. 41, nos. 2011 and 2013, Apr. 12, 1930, pp. 179-181 and 183, Apr. 26, pp. 223-225. Apr. 12: Specification of Scbeduled Persons to whom issue of certificates of competency may be issued; hoisting practice; signalling; travelling ways, ventilation; dust-allaying; drilling and blasting safeguards; control of gold. Apr. 26: Electrical regulations; exemptions; boilers; responsibility; accidents; blasting certificates.

MOTORBOAT ENGINES

LYCOMING. Lycoming Enters Marine Field with 40 hp. Engine. Automotive Industries, vol. 62, no. 25, June 21, 1930, pp. 950-951. Description of Model UA, 4-cylinder marine engine witb reverse gear and front-mounted generating and starting unit.

MOTOR TRUCK TRANSPORTATION

GREAT BRITAIN. Supplying 300 Shops. Motor Transport (Lond.), vol. 50, no. 1317, June 9, 1930, pp. 682-684. Outline of activities of traffic department of Birmingbam Co-operative Society; organization; drivers: notes on class of work undertaken; safety maintenance and service; blank forms illustrate record system.

N

NATURAL GASOLINE INDUSTRY

REVIEW OF. Great Outlet for Stabilized Naturals and More Storage Capacity Needed, W. K. Warren. Nat. Petroleum News, vol. 22, no. 22, May 28, 1930, pp. 88, 93 and 97, 3 figs. Review of industry since 1916; relations between producers and refiners who may use more or less natural gasoline for blending; price concessions to ensure constant use; inconspicuous storage as remedy for movement of distress gasoline; prediction that Mid-Continent natural gasoline industry will market stabilized product. Read before Natural Gasoline Assn. of America.

NATURAL GASOLINE SPECIFICATIONS

REFINER'S VIEWPOINT. Natural Gasoline Specifications From the Refiner's Viewpoint, M. H. Nolan. Nat. Petroleum News, vol. 22, no. 22, May 28, 1930, pp. 47-48. Paper is based on opinions expressed in interviews with several representative members of Natural Gasoline Assn.; average refiner is averse to giving up gravity and recovery as specifications if they could be included witb points on Engler curve; factors are enumerated that would render natural gasoline of greater utility to refiner for blending purposes.

NATURAL GASOLINE TRANSPORTATION

EVAPORATION LOSSES. Equip Tank Cars for Gauging Witbout Removing Dome to Lessen Outage, E. Kaye. Nat. Petroleum News, vol. 22, no. 22, May 28, 1930, pp. 85-87. Outage is not only transportation loss, but also includes plant losses, loading losses, and unloading losses; total of losses is estimated at 6 per cent of gasoline transported in tank cars, or about $7,000,000 yearly; discussion of losses and of methods of diminishing losses, with special reference to gauging devices. Read before Natural Gasoline Assn. of America.

NOISE

MEASURING INSTRUMENTS. Tbe Analysis and Measurement of Noise Emitted by Machinery, B. A. G. Churcher and A. J. King. Instn. Elec. Engrs.—Jl. (Lond.), vol. 68, no. 402, June 1930, pp. 780-787. Discussion of paper previously indexed from Jan. 1930 issue of same journal.

O

OIL FIELDS

WATERS. The Water Problem in Oil and Gas Fields, W. P. Campbell. Eng. Jl., vol. 13, no. 6, June 1930, pp. 364-369, 9 figs. Water problem creates difficulties in well drilling, in production, and in proper abandoning of unproductive wells; discussion of oil sands; definitions of top, middle or intermediate, lenticular, edge, and bottom waters, all of which are capable of making trouble; water sand records; sampling of water in sands; water analysis; grapbic classification of water; cementing of wells to shut off water.

OIL WELL DRILLING

CALIFORNIA. Uniform Penetration in Orderly Development of Oil Zones, C. C. Thoms. California Oil Fields, vol. 14, no. 9, Mar. 1929, pp. 5-20, 3 supp. plates. Partial analysis of development of one structure, Ventura Avenue dome of Ventura anticline, submitted with hope that facts brougbt out and conclusions drawn may induce discussion and study as to best practical method of oil field development; history of development; gas-bearing sands; saturation; water conditions; enumeration of conclusions as to best metbod of drilling and producing.

P

PAVEMENTS, CONCRETE

CONSTRUCTION CONTROL. Control of Materials and Mixtures for Concrete for Pavements, R. W. Crum. Highway Researcb Board—Proc., of mtg. Dec. 12-13, 1929, pp. 276-318 and (discussion) 318-330, 26 figs. Description of methods used by Iowa Higbway Commission to produce concrete for pavements high in strength, uniform in quality, and is of definite, predetermined composition; determination of specific gravity of aggregate particles and moisture in aggregates; measurement of aggregates; inspection of weigbing devices; measurement of water; field tests; time of opening pavement; effect of proportions; crushing strengths from moulded specimens and drilled cores; relation between transverse and crushing strength.

PETROLEUM INDUSTRY

UNITED STATES. Stabilization of American Oil Industry, J. E. Jones. Pan-Am. Geologist, vol. 53, no. 3, Apr. 1930, pp. 183-196, 1 fig. Analysis and discussion of situation with respect to crude oil supply and demand in United States; tabular statistical data, Jan. 1916 to Dec. 1929; fundamental factors, or bases, of determining supply and demand are domestic production, imports, exports, and stocks; domestic over-production is regarded as myth, except for short periods and locally; over supply exists primarily because of imports; remedy is suggested.

PETROLEUM PRODUCTS

OXIDATION. Catalytic Oxidation of Paraffin and Mineral Oil (Ueber die katalytische Oxydation von Paraffin und Mineraloel), E. Zerner. Chemiker Zeitung (Koethen), vol. 54, nos. 27 and 29, Apr. 2, 1930, pp. 257-259 and Apr. 9, pp. 279-281. Apr. 2: Oxidation of paraffin; reaction products and yields. Apr. 9: Oxidation of mineral oils; oxidation in alkaline medium; conclusions.

PIPE LINES

PROTECTIVE COATINGS. Procedure in Making Surveys of Soils, D. E. Dickey and H. Hayes. Oil and Gas Jl., vol. 29, no. 3, June 5, 1930, p. T-75, 2 figs. Brief review of literature on research on pipe line corrosion; outline of practice of oil company in California in soil survey and final selection of coatings for portions of line requiring protection. Bibliography.

WELDING. Electric Arc Welding of Pipe Lines, C. M. Taylor. Oil and Gas Jl., vol. 29, no. 3, June 5, 1930, pp. T-76 and T-79, 1 fig. Brief review of development since introduction of electric arc welding in pipe line industry about two years ago; explanation of approved practice; bell and spigot joints; firing line and bell bole units; river crossings.

PLATINUM MINES AND MINING

SOUTH AFRICA. Potgietersrust Platinums, Ltd. Notes on the Metbod employed in Mining tbe Zwartfontein Central Ore Body, K. Richardson. S. African Min. and Eng. Jl. (Johannesburg), Special no., Apr. 1930, pp. 89 and 91. See also brief abstract in Empire Min. Rev., no. 2, Apr. 1930, pp. 62-63. Prospecting disclosed shoot of good values in pyroxenites 300 ft. long by 90 ft. across at widest point; shaft showed persistence in deptb; 1,000 tons per ft. of deptb developed between surface and 100 ft. level in tbree shoots; mine costs 115.3 d. per ton. Brief abstract of paper read before Empire Min. and Met. Congress.

PIPE LINES

WOODEN. Pipe Perfect After 73 Years' Use. Oil and Gas Jl., vol. 29, no. 3, June 5, 1930, p. T-76, 1 fig. Brief article describes metbod of constructing gas pipe line in Marietta, Ohio, in 1856 and 1857; white pine logs turned to 6 in. outside diameter and bored to 2 in. inside diameter; bell end bored to 4 in. diameter about 4 in. in and other end turned to fit bell; tarred inside and out; joints made by dipping end in hot tar and driving into belled end, on wbicb iron band bad been shrunk.

PORCELAIN EXHIBITIONS

PARIS. Porcelain Exhibition in Paris (Die Porzellan-Ausstellung in Paris). Sprecbsaal (Coburg), vol. 63, no. 7, Feb. 13, 1930, pp. 117-118, 5 figs.; see also translated abstract in Am. Ceramic Soc.—Jl., vol. 13, no. 6, June 1930, p. 406. Exhibition embraces about 2,000 art objects of different epochs beginning from 1675 to 1914, most of which come from museums and private collections.

POTASH MINES AND MINING

SHAFT CEMENTING. Use of Chemical Cementing Process in Rendering Impervious Liquor Dike in Shaft Sinking at the Potash Mines Sachsen-Weimar in Unterbreizbach (Rboen) [Die Anwendung des chemiscben Verfestigungsverfabrens bei der Abdichtung eines Laugendammes und bei Schachtdichtungsarbeiten auf dem Kaliwerk Sachsen- Weimar in Unterbreizbach (Rhoen)], A. Lohmann. Kali (Halle), vol. 24, no. 6, Mar. 15, 1930, pp. 81-85, 6 figs. Ordinary methods of dike construction did not stop seepage but pumping in silicate and aluminate solutions made effective seal.

POWER PLANTS

DESIGN. Modern Power—Basic Principles, Design and Application, F. T. Morse. South Power Jl., vol. 48, no. 6, June 1930, pp. 41-47, 8 figs. Discussion of problems developed in electric power generation and distribution by variable load which is characteristic of all public utility systems; careful explanation of various terms used is given, and methods employed by leading utilities in meeting various problems are discussed.

STEAM AND DIESEL COMBINED. Joint Use of Diesel and Steam Engine to Balance Heat and Power, E. J. Kates. Am. Soc. Mech. Engr.—Advance Paper for Nat. Oil and Gas Power mtg., June 12-14, 1930, 14 pp., 6 figs. Purpose is to increase efficiency of steam utilization; simplified examples are used to show effect of Diesel power on overall thermal economy and upon overall costs; conclusions of two specific studies of heat and power supply involving joint use of Diesel and steam engines, and brief description of two actual applications.

PRESSURE VESSELS

WELDING. The Strength and Design of Fusion Welds for Unfired Pressure Vessels, L. W. Schuster. Mech. World (Manchester), vol. 87, nos. 2264, 2267 and 2268, May 23, 1930. pp. 484-487, June 13, pp. 551-553, and June 20, pp. 585-588, 12 figs. Abstract of paper presented before Instn. Mech. Engrs., previously indexed from Engineering, Mar. 14, 21, and 28, 1930.

PUMPS, CENTRIFUGAL

HIGH CAPACITY. Development of Storage Pumps (Der Entwicklungsstand der Speicherpumpen), W. Hahn. V.D.I. Zeit. (Berlin), vol. 74, no. 25, June 21, 1930, pp. 881-886, 15 figs. General discussion of functions, design, and installation of large-capacity pumps for pumped storage power plants with special reference to Herdecke hydro-electric plant; tests with models; special features of Herdecke pump; station equipped with two-stage adjustable guide vane centrifugal pump having capacity of 13.16 cu. m. per sec., working against total head of 160 m. with speed of 300 r.p.m.

PYRITES

UTILIZATION OF. The Utilization of Pyrites in Pulp and Acid Manufacture, H. Freeman. Can. Min. and Met. Bul. (Montreal), no. 216, Apr. 1930, pp. 471-476. About $3,000,000 worth of sulphur is consumed annually in Canadian pulp mills and acid plants, all of which is imported from United States; reasons for preferred use of sulphur; considerations in favour of pyrite; installation for burning pyrite concentrate; cleaning and cooling of gases.

R

RADIATORS

HEAT CAPACITY. Practical Determination of Heat Capacity of Radiators (Die praktische Bewertung der Waermeleistung von Heizkoerpern), R. Meisterhans. Gesundheits-Ingenieur, (Munich), vol. 53, no. 11, Mar. 15, 1930, pp. 161-164, 8 figs. Mathematical discussion presenting simplified practical method for determining radiation from radiator with special reference to ribbed radiators.

RADIO AMPLIFIERS

NEUTRALIZED AMPLIFIER CASCADE. Theory of Neutralized Amplifier Cascade (Theorie neutralisierter Verstaerkerketten), R. Fledtkeller. Zeit. fuer Hochfrequenztechnik (Berlin), vol. 35, no. 2, Feb. 1930, pp. 45-55, 7 figs. Anode retroaction can be removed in resistance-coupled amplifier cascade according to neutralization principle when as neutralization impedance series of condenser, inductance and resistance are connected between grids of two consecutive tubes; amplification curve of neutralized cascade is calculated.

RADIO AMPLIFIERS. Presentation of Frequency Relations of Transformer Hook-ups for Audio Frequency Amplification (Ein Beitrag zur Darstellung der Frequenzabhaengigkeit von Transformatorschaltungen fuer Nierderfrequenzverstaerkung), H. Kafka. Zeit. fuer Hochfrequenztechnik (Berlin), vol. 35, no. 2, Feb. 1930, pp. 56-60, 2 figs. Sample method of graphical presentation; Philips transformer connected to A 415 tube is given as example.

RADIO CIRCUITS

ANALYSIS. Phase Relations and Start of Oscillations in Two-Tube System According to Leithaeuser-Heegner Hook-up (Phasenverhaeltnisse und Schwingungseinsatz bei einem Zweiroehrensystem nach Art der Leithaeuser-Heegner-Schaltung), M. von Ardenne and K. Schlesinger. Zeit. fuer Hochfrequenztechnik (Berlin), vol. 35, no. 2, Feb. 1930, pp. 60-67, 11 figs. Simple mathematical form for substitute resistance is developed; from study of vector equation and connection of hook-up with oscillating circuit, conditions for auto-excitation are developed; experiments and test results are described.

RADIO RECEIVING APPARATUS

HETERODYNE RECEPTION. Study of Processes in Heterodyne Reception (Untersuchung der Vorgaenge beim Ueberlagerungsempfang), F. Vilbig. Telegraphen und Fernsprech-technik (Berlin), vol. 19, nos. 4 and 5, Apr. 1930, pp. 109-120, and May 1930, pp. 141-145, 32 figs. Theoretical mathematical analysis of principles in neutrodyne and superheterodyne radio receiving apparatus.

RADIO TELEPHONE

TRANSOCEANIC. Transoceanic Telphone Service—Short-Wave Equipment, A. A. Oswald. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, April 1930, pp. 629-637, 9 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

RADIO WAVES, SHORT

MEASUREMENT. Methods for Frequency Measurement of Short Waves (Einige Methoden zur Frequenzmessung von kurzen Wellen), H. Moegel. Elektrische Nachrichten Technik (Berlin), vol. 7, no. 4, Apr. 1930, pp. 133-140, 11 figs. Measurement with standard circuit and minor galvonometer; improved measuring method; application of quartz resonator for direct frequency control at sender. Bibliography.

RAILROADS

MECHANICAL ENGINEERING. Proceedings of the Session of the American Railway Association—Division 5—Mechanical, for mtg. June 25-28, 1929, published by Association, 30 Vesey Street, New York, 1188 pp., diagrs. and figs., including Appendix covering historical record of standards and recommended practice. Committee reports on draft gear tests of Purdue University; design of shops and terminals; specifications and tests for materials; brake equipment; wheels; lubrication; construction; arbitration; tank cars; loading rules; research; apprentices; electric rolling stock; locmotive design and construction; utilization of locomotives.

FRANCE. Report on State Railways of France for Year 1928 (Résultats Obtenus en 1928 sur le Réseau des Chemins de Fer de l'Etat en France). Revue Générale des Chemins de Fer (Paris), vol. 49, no. 1, Jan. 1930, pp. 33-42. Summary of statistical data, in tabular form, on operation, rolling stock, new construction, revenue and expenditure, etc.

PYRENEES MOUNTAINS. The Problem of Transpyrenean Railroads and the Penetration of European Lines into Spain (La Question des Transpyrénéens et celle de la pénétration de la voie Européenne en Espagne), M. Garau. Revue Générale des Chemins de Fer (Paris), vol. 49, no. 4, Apr. 1930, pp. 301-324, 19 figs. Historical sketch of development of railroad communication across Franco-Spanish border; description of recently completed railroad lines between Bedous and Canfranc and Aix-les-Thermes and Puigcerda; outline of proposed railroad developments between French border and Barcelona.

RESERVOIRS

ECONOMICS. Economics of Reservoirs, P. Hansen. Water Works Eng., vol. 83, no. 12, June 18, 1930, pp. 943-944 and 982, 3 figs. Economics of impounding reservoirs; storage capacity should be provided for periods of from ten to thirty years; filtered water-storage; proper allowance for fire reserve.

ROAD CONSTRUCTION

IRELAND. Concrete and Asphalt Road Surfacing in an Urban Area, R. E. L. Clarke. Instn. Mun. and County Engrs.—Jl., vol. 56, no. 23, May 13, 1930, pp. 1201-1221, 7 figs. Methods of constructing asphalt and concrete roads in Ireland; classes of road foundations; important conditions in laying concrete roads.

ROAD DESIGN

FROST. A Method of Analysis of Data on Frost Occurrence for Use in Highway Design, J. A. Sourwine. Pub. Roads, vol. 11, no. 3, May 1930, pp. 51-60, 8 figs. Paper presents method of determination of probable ground freezing occurrence from past records; critical initial air temperature for ground freezing selected as 23 deg. Fahr.; relation established between minimum temperature in air and soil; frequency of minimum temperatures; duration of cold periods; index map showing most adverse conditions of frost occurrence, considering intensity, frequency, and duration.

ROADS

FROST DAMAGE. Mitigating Frost Action on Road Surfaces. Eng. News-Rec., vol. 104, no. 25, June 19, 1930, pp. 1021-1023, 7 figs. Discussion of causes influencing frost action and means employed to overcome its damaging effects; surface damage from freezing and thawing; frost heavy of surface-treated macadam; granular sub-bases; drains and backfilled trenches; repairing frost heaves. Extract from Am. Road Bldrs. Assn.

LOW COST. Stone Conservation in Low-Cost Roads, W. Huber. Quarry and Surveyors' and Contractors' Jl. (Lond.), no. 400, June 1930, pp. 217-218. Abstract of article previously indexed from Can. Engr., Mar. 4, 1930.

SAND ENCROACHMENT. Construction and Safeguarding of Roads Located Upon Shifting Sands (Construccion y defensa de calzadas trazadas sobre arenas erraticas), V. Alcedan. Informaciones y memorias de la Sociedad de Ingenieros del Peru (Lima), vol. 31, no. 10, pp. 648-658, 9 figs. General considerations; origin of dunes and shifting sands of Peruvian coast; theory of sand movement; natural slope, and changes due to wind and gravity; coast mountain range fixed dunes; wind effects on roads built upon sand; protection of road surface; methods of keeping sand off roads. Read before National Technical Road Conference.

ROCK DRILLING

COLOMBO HARBOUR. Rock Drilling Colombo Harbour. Engineer (Lond), vol. 149, no. 3882, June 6, 1930, p. 640, 1 fig. Rather unusual proposition in way of rock drilling has developed in scheme for deepening harbour at Colombo, Ceylon, which, it is hoped, has been met by equipment by Climax Rock Drill and Engineering Works; for purpose of drilling rock preparatory to blasting, Company has supplied equipment of three drilling units, air compressor, and drill steel sharpening machine.

S

SAND AND GRAVEL PLANTS

ILLINOIS. Revamping a New Gravel Plant for Efficiency and Output. Rock Products, vol. 23, no. 13, June 21, 1930, pp. 49-54, 26 figs. Design, layout, equipment and operation of plant of Material Service Corp., Lockport, Ill.

OHIO. Unique Sand and Gravel Dredging Operation. Rock Products, vol. 23, no. 12, June 7, 1930, pp. 73-74, 3 figs. Plant of Muskingum River Gravel Co., Zanesville, Ohio, equipped with 120-hp. 8½ x 10½-in., 500-r.p.m. Fairbanks-Morse Diesel engine through Cutler-Hammer magnetic clutch; Falk flexible coupling is used at Symons crusher so that it may easily be disconnected when desired, but arrangement is such that 100 per cent crushed gravel may be produced when desired.

SHEET STEEL

HEAT TREATMENT. Normalizing Steel Sheets in the Continuous Furnace, R. Whitfield. Fuels and Furnaces, vol. 8, no. 6, June 1930, pp. 801-804. Discussion of use of continuous normalizing furnace for heat treatment of steel sheets to impart physical properties required in sheet to be used in subsequent deep drawing operations. Abstract of paper read before Brit. Iron and Steel Inst., May 1-2, 1930, previously indexed from various sources.

SHIP DESIGN

STABILITY. The Automatic Stabilization of Ships. Engineer (Lond.), vol. 149, no. 3882, June 6, 1930, pp. 625-628, 9 figs. Examples of application of Schlick stabilizer; system was unsatisfactory, not because of miscalculation, but because of fixed weight at fixed distance as means of supplying required precessional moment was wrong in principle; development of idea was taken up by Sperry Gyroscope Co. who did not, however, endeavour to perfect Schlick principle but instead struck out on line of its own characterized by new method of controlling precession. (Continuation of serial.)

SILVER MINES AND MINING

ONTARIO. Gowganda Silver Area, A. D. Campbell. Can. Min. and Met. Bul. (Montreal), no. 216, Apr. 1930, pp. 453-480, 8 figs. Gowganda silver area is about 55 mi. northwest from Cobalt; mines have produced since 1909; discussion of how ore shoots occur, in comparatively small areas of extensive calcite veins in Nipissing diabase; some silver has been found in Huronian and Keewatin rocks above diabase sill, and more may be found; notes on milling of silver ores at plant of Castle-Trethewey Mines.

SMOKE ABATEMENT

DISCUSSION. A Catalyst, A. E. Winter. Coal and Coal Trade Jl., vol. 61, no. 22, May 29, 1930, p. 347. Correspondence item on use of catalyst for increasing sales by treating coal for prevention of soot, smoke, and clinker; discussion of combustion and cause of smoke; possibilities in partial elimination of smoke by catalytic treatment of coal.

EXPERIMENTS. Use of Purified Flue Gases in Carbon-Dioxide Fertilizer (Die Verwendung von gereinigten Rauchgasen zur Kohlensaeuereduengung), F. Riedel. Gesundheits-Ingenieur (Munich), vol. 53, no. 17, Apr. 26, 1930, pp. 257-261, 6 figs. Discussion of beneficial effects of carbon-dioxide fertilizing; results of experiments in large greenhouses and in open fields; bearing of method upon smoke abatement; carbon-dioxide fertilization may eliminate damage caused by smoke and may cause high yields of crops.

SPRINGS

DESIGN. General Considerations in Designing Mechanical Springs, A. M. Wahl. Machine Design, vol. 2, no. 5, May 1930, pp. 26-31, 12 figs. Outline of method for determining working stresses in spring based on tensile and fatigue properties of material; graphs show distribution of stresses over cross section of springs of large index and results of stress test on helical spring: numerical example for valve spring is given. (To be continued.)

FEATURES. Spring vs. Weights, R. G. Standerwick. Gen. Elec. Rev., vol. 33, no. 6, June 1930, pp. 341-344, 5 figs. Author points out limiting features of dead weights and describes how these limits restrict their useful application in many cases; interesting features of springs and some of general laws.

STEAM

HIGH PRESSURE. Steam Conditions and Cycles, J. N. Waite. Elec. Rev. (Lond.), vol. 106, no. 2740, May 30, 1930, pp. 1003-1005. Case for high initial temperatures, high pressures, and resuperheating in electric power stations.

Higher Steam Pressures and Temperatures. Nat. Elec. Light Assn.—Report, no. 053, May 1930, 8 pp., 5 figs. Report discusses thermal economies resulting from use of steam pressures between 500 and 1,500 lbs. and of steam temperatures above 750 deg. fahr.; construction costs and operating results in their relation to steam conditions, and properties of various alloys at high temperatures.

STEAM ACCUMULATORS

RUTHS. Ruths' Storage Equipment for Peak-Load Power Generation in Berlin (Ruthsspeicher fuer Spitzenkrafterzeugung in Berlin), E. Schulz and Gropp. Elektrizitaetswirtschaft (Berlin), vol. 29, no. 505, Apr. 1, 1930, pp. 153-162, 16 figs. Ruths storage equipment of Charlottenburg plant of Berlin municipal electricity works is described; notes on dimensions; possibilities of equipment; method of operation; reliable experience for future developments; costs.

STEAM CHARTS

FOR STEAM CYCLE. The Heat Content-Pressure Diagrams, L. Holdredge. South. Power Jl., vol. 48, no. 6, June 1930, pp. 56-59, 1 fig. Diagram intended to cover complete steam cycle, much broader range than does Mollier diagram, in solution of thermo-dynamic problems; its use offers easy graphical methods of determination.

STEAM CONDENSERS

DESIGN. Condenser Design and Operation, A. J. German. Pac. Mar. Rev., vol. 27, no. 6, June 1930, pp. 232-233. Progress in condenser design during past few years has been directed along following lines; first, better steam distribution over tube nest, thus making larger percentage of tube surface area effective in heat transfer; second, removal of non-condensable gases by better arrangement of baffles and lanes.

SURFACE. Study of Circulating Water Consumption in Surface Condensers (Etude sur la consommation d'eau de circulation dans les condenseurs par surface), A. Risler. Revue d'Electricité et de Mécanique (Paris), no. 10, Mar./Apr. 1930, pp. 38X-X41, 1 fig. Mathematical data, curves, and tables.

STEAM-ELECTRIC POWER PLANTS

BERLIN. West Power Plant of the Berlin Municipal Electricity Works (Das Kraftwerk West der Berliner Staedtische Elektrizitaetswerke Akt. Ges.). M. Rehmer. Elektrotechnische Zeit. (Berlin), vol. 51, nos. 14 and 16, Apr. 3, 1930, pp. 485-498, and Apr. 17, pp. 557-570, 85 figs. Introductory notes to future increase of current consumption and consequent development in design of new West plant; installed capacity is 228,000 kv. in 6 units of 34,000 kw. and 2 house turbines generators of 12,000 kw. each; notes on boiler engine and plant equipment.

CONTROL. Thermal Supervisory Equipment of High-Pressure Steam Installation in Simmering Power Plants of Vienna Municipal Electricity Works (Die waermetechnischen Ueberwachungsanlagen der Hochdruckdampfanlage im Kraftwerk Simmering der Wiener Staedtischen Elektrizitaetswerke), R. Mokesch. Elektrotechnik und Maschinenbau (Vienna), vol. 48, no. 16, Apr. 20, 1930, pp. 364-369, 9 figs. Measuring and supervisory equipment of boiler and turbine installation of plant containing 2 units of 17,800 kva. and 25,000 kva. respectively and operating at steam pressure of 35 atmos. at 420 deg. cent.

STEAM POWER PLANTS

ASH SEPARATORS. Recovering Unburnt Fuel From Ash Pit Refuse, D. Brownlie. Combustion, vol. 1, no. 11, May 1930, pp. 40-44, 6 figs. Recovery of unburnt fuel from ash-pit refuse has been practiced to considerable extent in Great Britain and in certain European countries; in England, practice seems to have found particular application in connection with gas-plant operation; author describes two of most extensively used processes and presents data relative to economic aspects of typical gas-plant and steam-plant installations.

DESIGN. Steam Generation and Utilization, L. C. Edgar. Assn. of Iron and Steel Elec. Engrs.—Proc. for Yrs. 1928-1929, pp. 697-698. Indexed in Engineering Index 1929, p. 1739, from Iron and Steel Engr., June 1929.

EFFICIENCY. Comparison of Steam Station Performance, A. G. Christie. Power Plant Eng., vol. 34, no. 12, June 15, 1930, pp. 672-675, 4 figs. Presentation of expression for station performance and comparison; discussion of question and problems arising from new method of expressing station performance; "Parsons Line" does not consider capacity factor, which has many advantages; input-output curves for three phases of large coal fired central station are given.

STEAM POWER PLANTS, INDUSTRIAL

PAPER AND PULP MILLS. Heat and Power Problems, R. W. Crute. Paper Mill, vol. 53, no. 22, May 31, 1930, pp. 36-38. Determination of proper pressure to use in steam power plant of paper mill; advantages of high-pressure steam. Paper presented before Am. Pulp and Paper Mill Superintendents Assn.

STEAMSHIPS, TURBINE

BREMEN. Express Liner Bremen (Der Vierschrauben Turbinen-Schnelldampfer Bremen), P. Biedermann, W. Koch and H. Hein. Werft-Reederei-Hafen (Berlin), vol. 11, no. 10, May 28, 1930, pp. 197-216, 22 figs. and numerous figs on 6 supp. plates. Detailed report of shipbuilding aspects of design and equipment by P. Biedermann and H. Hein and of main and auxiliary propelling machinery, by W. Koch, previously indexed from V.D.I. Zeit., May 24, 1930, and other sources.

STREAM POLLUTION

WATER ANALYSIS. Methods of River-Water Analysis (Zur Methodik der Flusswasseruntersuchung), Ilzhoefer. Gesundheits-Ingenieur (Munich), vol. 53, no. 14, Apr. 5, 1930, pp. 209. Report from Department of Hygiene of University of Munich, presenting data on pollution of rivers Isar and Lech by sewage of Munich and Augsburg; details of methods of sampling and of physical, chemical, and bacteriological analyses.

STRUCTURAL STEEL

OXYACETYLENE CUTTING. An Investigation of the Failure of Flame-Cut Wind-Bracing Brackets, W. J. Krefeld. Columbia Univ. Eng. Testing Lab., no. 3, July, 1929, 133 pp., 45 plates; see also abstract in Eng. News-Rec., vol. 104, no. 17, Apr. 24, 1930, pp. 684-685, 4 figs. Study of broken wind-bracing brackets; metallographic examination; effects of formative processes; detection and measurement of strain; strains produced by punching; local heating etc.; impact; hardness; static bend; tension and drop tests; evidence of brittleness in wind-bracing brackets flame-cut after punching; remedies suggested. Bibliography.

T

TELEPHONE LINES

INDUCTIVE INTERFERENCE. Telephone Interference from A-C. Generators, J. J. Smith. Am. Inst. Elec. Engrs.—Trans., vol. 49, no. 2, Apr. 1930, pp. 798-809, 3 figs. Paper previously indexed from Advance Paper, for mtg. Jan. 27-31, 1930.

POLES. Calculation of Wooden Line Poles (Beitraege zur Berechnung hoelzerner Leitungsmasten), K. Winnig. Telegraphen und Fernsprech-Technik (Berlin), vol. 19, no. 5, May 1930, pp. 133-141, 11 figs. Notes on calculation of single pole with bending and combined buckling and bending loads, graphs and curves.

TEXTILE MACHINERY

ELECTRIC DRIVE. The Electrical Drive of Weaving Sheds Equipped with Plain Cotton Looms, R. H. Wilmot. Metropolitan Vickers Gaz. (Manchester), vol. 12, no. 205, Apr. 1930, pp. 85-90, 2 figs. Advantages and disadvantages of various methods of driving weaving sheds; cleanliness of product and atmosphere; description of modern methods of electrical drive of weaving sheds. (To be continued.)

TIMBER SPECIFICATIONS

TIMBER SPECIFICATIONS. Report of Committee K-7 on Timber. Am. Soc. Testing Matls.—Advance Paper, no. 80, for mtg. June 23-27, 1930, 81 pp., 10 figs. Report of Subcommittee on timber preservatives, and on moisture content of timber; proposed revised standard specifications for structural wood joists, planks, beams, stringers and posts; notes on working stresses for structural grades of American lumber standards; proposed tentative specifications for timber piles; revised standard method of test for coke residue of creosote oil; proposed tentative definitions of terms relating to timber preservatives.

TRACTORS

DESIGN. Some Problems Encountered in the Design of Track-Type Tractors, H. S. Eberhard. Motive Power, vol. 1, no. 5, June 1930, pp. 20-22 and 32-33, 5 figs. Design and operating problems; dust exclusion is important factor; tractor operated on 111 per cent slopes; heat treatment; charcoal burning tractor. Abstract of paper presented before Soc. Automotive Engrs.

TRAFFIC CONTROL

PROBLEMS. Traffic Problems. Nat. Safety Council—Trans., vol. 3, of mtg. Sept. 30-Oct. 4, 1929, pp. 57-81. Papers presented before Public Safety Division by H. S. Simpson, R. Kingery, and H. M. Gould.

PHOTOELECTRIC CELLS. Bridge Traffic Controlled by Photo-Electric Cells, B. Cooper. Eng. News Rec., vol. 104, no. 24, June 12, 1930, pp. 974-975, 3 figs. Article previously indexed from Electronics, June, 1930.

TUNGSTEN CARBIDE

CUTTING TOOLS. Users of Tungsten Carbide Report Variety of Experiences, F. C. Spencer. Iron Trade Rev., vol. 86, no. 25, June 19, 1930, pp. 73-75. Advantages and shortcomings are revealed by replies to questionnaire of subcommittee on tungsten-carbide cutting materials of American Society of Mechanical Engineers; suggestions for improvement in machine tool design.

TUNNELS

CONCRETE LINING. Repairs to Concrete Lining of Truckee Canal Tunnels, W. H. Nalder. New Reclamation Era, vol. 21, no. 4, Apr. 1930, pp. 64-65. Description of methods used and cost data.

CONSTRUCTION, PERU. Peruvian Method of Highway and Railroad Tunnel Construction (Metodo Peruano para la Construccion de tuneles para carreteras o ferrocarriles), D. Castagnola. Informaciones y Memorias de la Sociedad de Ingenieros del Peru (Lima), vol. 31, no. 10, Oct. 1929, pp. 613-618, 6 figs. on supp. plates. Construction costs of 19 tunnels by hand drilling were lower than similar jobs with portable gasoline-driven compressors; top heading 1.6 by 1.8 meters; widening to full arch; removal of rock to grade in two benches; average costs 14 to 18 Peruvian pounds per meter of finished tunnel 4 by 5 meters; no cost details. Read before National Technical Road Conference.

SURVEYING. Recording Instruments for Determining Distance between Tunnel Walls with Reference to Clearance Limit (Appareil enregistreur de la distance des parios des souterrains par rapport au gabarit de chargement etc.), Virot. Revue Générale des Chemins de Fer (Paris), vol. 49, no. 3, Mar. 1930, pp. 197-204, 9 figs. Detailed description of Pichon instruments for surveying interior profile of tunnel sections to determine actual clearance at critical points; instrument is mounted on small rail truck carrying gear of recording apparatus; method of use and samples of graphical records obtained.

V

VACUUM TUBES

DIODE. Theory of Diode Tubes and Generation of Electric Oscillations of Ultra-Low Frequency (Theorie der Zweielektrodenroehren und Erzeugung elektrischer Schwingungen von extra niedriger Frequenz), Y. Ito. Zeit. fuer Hochfrequenztechnik (Berlin), vol. 35, no. 2, Feb. 1930, pp. 67-75, 24 figs. Notes on self-excitation, principle of feed-back and its mathematical equation; amplitude of self-excitation oscillations and their stability, performance of tube as generator, simple a.c. hook-ups, frequency of self-excited oscillations, limit of generated frequencies; examples are given.

VIADUCTS

NEW JERSEY. High Viaduct 3 Miles Long Will Complete Gap in Holland Tunnel Road. Eng. News Rec., vol. 104, no. 24, June 12, 1930, pp. 973-974, 2 figs. Outline of plans and structural features of elevated steel structure costing nearly twenty million dollars, including two duplicate fixed-span cantilever bridges with clearance of 135 ft., over Passaic and Hackensack Rivers, each with main span of 550 ft.

VIBRATIONS

DAMPING. Steady Forced Vibration as Influenced by Damping. L. S. Jacobsen. Am. Soc. Mech. Engrs.—Advance Paper no. 12, for mtg. June 9 to 12, 1930, 10 pp. 11 figs. General method of obtaining approximate solutions of steady forced vibration of damped system, of one degree of freedom, for case of sinusoidally varying disturbing forces; approximation consists in expressing all damping terms of original differential equation by single equivalent damping term, proportional to first power of velocity of motion; discussion of experimental results at Stanford University; comparison of Den Hartog's exact theory and the approximate theory.

W

WATER SOFTENING

UNITED STATES. Progress and Trends in Water Softening, C. P. Hoover. Eng. News-Rec., vol. 104, no. 21, May 22, 1930, pp. 843-846, 5 figs. Review of recent progress; greater degree of softening now obtained; excess-lime method followed by carbonation; combination of zeolite and lime-soda softening; chemistry of water softening; pneumatic conveying equipment for handling of chemicals; carbonation plant at Columbus, Ohio; continuous sludge removal equipment at St. Louis, Mo.; lime feeders and slakers at Marion, Ind. See editorial comment, pp. 832.

WATER WORKS

MANAGEMENT. The Round Table. Water Works Eng., vol. 83, no. 12, June 18, 1930, pp. 951-952 and 981. Discussion of following questions: when street grades are changed is cost of lowering water mains, hydrants and services borne by water department (or company) or by city; in case of damage to private property through water leakage who is responsible.

WATER WORKS ENGINEERING

UNITED STATES. Water Purification Dominant Topic. Eng. News Rec., vol. 104, no. 24, June 12, 1930, pp. 980-984, 1 fig. Report on proceedings and short abstracts of many papers before American Water Works Association at St. Louis, on making water better, wells, pumps, pipe, finance, airport supplies, etc.

WELDING

APPLICATIONS. Salvaging Expensive Parts, A. Eyles. Welding Engr., vol. 15, no. 5, May 1930, pp. 45-46, 11 figs. Description of procedure for typical welding repair jobs; use of fluxes in welding and its alloys; welding ruptured copper steam pipe; gas welding cast-iron parts; rivet-heater electrodes built up by welding.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostat copies (white printing on a black background) of the articles listed in this section or others on engineering subjects can be obtained from the Engineering Societies Library at a cost of 25c. per page.

When ordering identify the article by giving: the author; the title of the article; the name of the periodical in which it appeared; and the volume and page numbers. A remittance of 25c. a page should accompany the order.

The print's size is limited to 11 by 14 inches, but where possible, two pages up to 7 by 9 inches in size will be photographed on one print, larger magazines require a print per page.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

ABRASIVE MATERIALS

MANUFACTURE. Metal Abrasives, A. B. McDaniel. Metals and Alloys, vol. 1, no. 13, July 1930, p. 614, 1 fig. Review of manufacture, uses and research on grit, shot and sand of iron and steel for abrasive and cleaning purpose data on shot and grit production in United States and on export and import are given.

AERIAL PHOTOGRAPHY

METHODS AND EQUIPMENT. Air Photography, F. C. V. Laws. Roy. Air Force Quarterly (Lond.), vol. 1, no. 3, July 1930, pp. 524-533, 18 figs. partly on supp. plates. Outline of methods and equipment for aerial photography used by Royal Air Force; notes on training of personnel and use of air photographs.

AERIAL TRANSPORTATION

GERMANY. German Commercial Air Transport, M. Wronsky. Inst. of Transport—Jl. (Lond.), vol. 11, no. 7, May 1930, pp. 304-322. General review of present developments and objects of German commercial flying.

GREAT BRITAIN. The Achievements and Possibilities of Air Transport, F. H. Page. Inst. of Transport—Jl., vol. 11, no. 8, June 1930, pp. 371-379. Brief notes on commercial aviation; airplane development, night flying, airship transport, private flying, military aircraft, relationship of aerial to other forms of transportation.

RADIO COMMUNICATION. Two-Way Radio Communication in Air Transport Service, H. Hoover, Jr. Aero Digest, vol. 16, no. 4, Apr. 1930, pp. 62-63 and 278, 5 figs. Brief review of developments; wave bands and antennas are discussed regarding distance; radio telephone equipment now commercially available weighs about 150 lbs., including power supply; power of 50 watts, if fully modulated appears to fulfill all requirements on plane; while 400 watts if fully modulated will cover requirements on ground.

Air Transportation, P. Goldsborough. Am. Soc. Mech. Engrs.—Advance Paper, June 9-12, 1930, 5 pp. Description of importance of radio for safety; review of latest developments in equipment and application.

SOUTH AMERICA. What Can Aviation Do For Central and South America? R. V. Wright. Am. Soc. Mech. Engrs.—Advance Paper for mtg., May 19-22, 1930, 10 pp. Outline of possibilities for airlines in developing resources; relations between United States and Latin America are reviewed, with data on population, transportation facilities and commerce; list of airlines and mileage.

AERONAUTICS

EUROPE. Trend of Aeronautics in Europe, A. H. G. Fokker. Aero Digest, vol. 16, no. 4, Apr. 1930, pp. 67 and 226. Discussion of factors of design and operation affecting economy; comparison of conditions in United States of America and Europe; trend in Europe back to wood and fabric; limit (500 horsepower) has about been reached in efficiency of air-cooled engines.

AIR COMPRESSORS

MAINTENANCE AND REPAIR. Care and Maintenance of 8½-inch C.C. Compressor, C. D. Nicholls. Railroad Herald, vol. 34, no. 6, May 1930, pp. 28-32. Practical discussion of proper methods to be employed in maintenance and repair of locomotive air compressors. Presented before Southeastern Air Brake Club.

AIR CONDITIONING

REFRIGERATION. Cooling and Heating With One Unit, E. Guarini. Ice and Cold Storage (Lond.), vol. 33, no. 386, Mar. 1930, pp. 122-123, 2 figs. Use of electrically driven refrigerating machines in inhabited premises for heating in winter and for cooling in summer; heating effected by use of electric aerotherms; cost of heating and cooling. Abstract of address before Belgian Soc. of Electricians.

AIRPLANE ENGINES

DESIGN. Developments of Aircraft Engines From 1912 to 1930 (Gli sviluppi del motore di aviazione dal 1912 al 1930), G. Lauro. Atti del Sindacato Provinciale Fascista Ingegneri di Milano (Milan), vol. 8, no. 4, Apr. 1930, pp. 135-154, 31 figs. Comparative study of airplane engine of Italian design; critical discussion of mechanical, metallurgical, and thermodynamical aspects; table giving specifications and performance data for Isotta Fraschini engines; notes on possibilities of future developments.

The Development and Progress of the Aero Engine, H. R. Ricardo. Flight (Lond.), vol. 22, no. 23, June 6, 1930, pp. 616-620; see also Aeroplane (Lond.), vol. 38, no. 23, June 4, 1930, pp. 1075-1076, 1078 and 1080, 4 figs. Review of development and outline of possibilities of improved designs; data on fuel consumption and weight; air vs. water-cooling; supercharging; notes on sleeve-valve performance; exhaust at pressure of 300 lbs. per sq. in. can be used in low-pressure cylinder; data on compression ignition. Abstract of Wilbur Wright Memorial Lecture presented before Roy. Aeronautical Soc.

DIESEL. Diesel Engine in Aviation (El Motor Diesel en la Aviacion), C. Ordonyez. Revista de Ingenieria Industrial (Madrid), vol. 1, no. 2, June 1930, pp. 11-19, 14 figs. Aviation pilot discusses development of Maybach, Beardsmore, Sunbeam, Packard, Junkers and Garuffa types; injection, lucrication, starting, and operation.

The Oil Engine in Aeronautics, E. E. Wilson. Am. Soc. Mech. Engrs.—Advance Paper, June 12-14, 1930, 5 pp., 1 fig. Discussion of requirements of aeronautic engines in general, manner in which these requirements have been met, influence of these requirements on application of oil engine to aeronautics and possibilities of future; advantages of oil and gasoline engines are compared; graph shows displacement-weight relations in aircraft engines.

LIQUID-COOLED. Water-Cooled Aero Engines (Six-Years' Progress), A. J. Rowledge. Roy. Aeronautical Soc.—Jl. (Lond.), vol. 34, no. 235, July 1930, pp. 578-590 and (discussion) 590-602, 9 figs. Discussion of design and development of water-cooled engines of various makes; data on Rolls Royce engines; notes on variable pitch propeller and supercharging; in units of more than 500 hp. liquid cooling seems to be superior to air-cooling.

TESTING. All Major Parts Contribute to Failure in A.T.C. Aircraft Engine Tests. Automotive Industries, vol. 63, no. 4, July 26, 1930, pp. 118-121 and 132, 5 figs. Outline of type test procedure and requirements for approved type certificate of Department of Commerce; notes on equipment of aircraft engine testing laboratory of Aeronautics Branch, Department of Commerce, at Arlington, Va.; principal causes for failures are discussed.

AIRPLANE INDUSTRY

DESIGN, ETC. Airplane Design, Manufacture, and Sales—Commercial vs. Military, R. B. Beisel. Am. Soc. Mech. Engrs.—Advance Paper, for mtg. May 19-22, 1930, 5 pp. Commercial industry differs materially from military; paper discusses these differences from general standpoints of design, manufacture, and sale; it would be much more difficult for commercial builder to enter military field than for maker of military airplanes to successfully enter general commercial field.

AIRPLANE MAINTENANCE AND REPAIR

SERVICING. Airplane Servicing From the Operator's Point of View, R. C. Marshall. Am. Soc. Mech. Engrs.—Advance Paper for mtg., May 8, 1930, 9 pp. Description of procedure and methods in overhauling engines and planes used by Thompson Aeronautical Corp., Cleveland, Ohio; notes on machine shop work and equipment; block test data.

AIRPLANE MANUFACTURE

MASS PRODUCTION. Problems of Airplane Quantity Production, R. S. Damon. Am. Soc. Mech. Engrs.—Advance Paper for mtg., May 19-22, 1930, 6 pp. Maximum production to date is 25 machines per week and with total runs, extending over more than one season, not exceeding 700 machines per model; notes on management and production organization to improve efficiency; cost factors are discussed with regard to possible reduction.

AIRPLANE PROPELLERS

LIGHT REFLECTION. Luminous Reflections of Rotating Propellers (Riflessione luminosa delle eliche in rotazione), V. S. Kulebakin. Notiziario Tecnico Di Aeronautica (Rome), vol. 6, no. 3, Mar. 1930, pp. 235-242, 12 figs. Experiments on light-reflecting properties of propellers for elimination of disturbing effects during night landings; dull dark colour gives best results. Translated from Zeit. fuer Flugtechnik und Motorluftschiffarht.

AIRPLANE WINGS

WIND TUNNEL TESTING. Air Forces and Air-Force Moments at Large Angles of Attack and How They Are Affected by the Shape of the Wing, R. Fuchs and W. Schmidt. Nat. Advisory Committee for Aeronautics—Tech. Memorandums, no. 573, July 1930, pp. 1-20, 48 figs. Article previously indexed from Zeit. fuer Flugtechnik und Motorluftschiffahrt (Munich), Jan. 14, 1930.

AIRPLANES

FRAMEWORK. Building the Framework of the Moth Plane, F. C. Duston. Machy. (N.Y.), vol. 36, no. 12, Aug. 1930, pp. 970-972, 4 figs. Outline of procedure of Moth Aircraft Corp. followed in building wooden framework for wings, fins, ailerons, and similar parts, and application of fabric covering to these elements; notes on doping and painting of fabric.

FUSELAGES. Constructing Fuselages for Airplanes. Machy. (Lond.), vol. 36, no. 922, June 12, 1930, pp. 321-325, 5 figs. Notes on properties and proportions of tubing used; autogenous-welding practice; construction of important details; saving in weight by using alloy steel; strength and toughness; fittings for fuselage.

ICE FORMATION. The Formation of Ice on Aircraft, V. O. Clapp. U. S. Naval Inst.—Proc., vol. 56, no. 330, Aug. 1930, pp. 743-744. Conditions under which ice formations occur; data obtained in sixty altitude flights.

MAINTENANCE AND REPAIR. Equipment for the Aircraft Service Station, E. W. Fair. Aviation, vol. 29, no. 1, July 5, 1930, pp. 20-22, 3 figs. Descriptions of tools and machines necessary for efficient and profitable operation of small or large service; table gives primary small tools used for general maintenance in aircraft service stations shop.

Maintenance at Roosevelt Field, N.Y. Airway Age, vol. 11, no. 7, July 1930, pp. 934-937, 11 figs. Outline of system of records and inspection used by Roosevelt Field Corp. of Minneola, L.I.; blank forms of airplane flight and others are given; data on overhaul periods and expenses.

PILOTS. *See Aviators.*

RADIO APPARATUS. Aircraft Radio Receivers and Broadcast Service, J. C. Hromada. Airway Age, vol. 11, no. 7, July 1930, pp. 922-925, 6 figs. Outline of requirements of aircraft receivers and description of equipment built by Western Electric, Radiomarine Corp. of America and other companies; notes on electric circuits, power supply, etc.

TESTING. Aerodynamic Research Flying, S. Scott-Hall. Roy. Air Force Quarterly (Lond.), vol. 1, no. 2, Apr. 1930, pp. 281-290. Discussion of methods for determination of aerodynamic characteristics of airplane; notes on instruments for measuring air speeds, acceleration and current recorders.

Duration Flights During 1929, H. B. Hendrickson. Aero Digest, vol. 16, no. 4, Apr. 1930, pp. 64-65 and 272, 274, 276 and 278. Description of outstanding events in 1929 and equipment; graph of record refueling flights and graph of solo duration flights.

WELDING. *See Welding.*

AIRPORTS

LIGHTING. Careful Planning Pays in Airport Lighting, F. S. Peterson. Elec. World, vol. 96, no. 6, Aug. 9, 1930, pp. 259-260, 3 figs. Care used in preliminary study and planning; centralized remote control and underground distribution are features of Denver's airport lighting.

MANAGEMENT. Management and Operation of a Large Airport, W. D. Waterman. Am. Soc. Mech. Engrs.—Advance Paper, May 1930, 5 pp. Outline of relations of airport management with transport companies operating large fleets, with air-service operators having fleets of taxi and charter planes, with schools, with dealers and distributors, with manufacturers, with private owners of airplanes, with individual owners of single airplanes or small fleets for business purposes, and with general public; figures are given showing how successful business has been built at Los Angeles Metropolitan Airport.

RUNWAYS. Two-Course Asphalt Surfacing for Airport Runways, N. H. Angell. Eng. News-Rec., vol. 105, no. 6, Aug. 7, 1930, pp. 215-217, 4 figs. Description of two-course asphaltic surfacing, designed to meet unusually rigid specifications for runways of United Airports, recently completed at Burbank, Calif.; surface hardness under temperature changes controlled by mixed-in-place base course and premixed topping; grading of aggregate for plant-mixed course.

AIRSHIPS

HULL STRESS. The Strength of Transverse Frames of Rigid Airships, H. M. Lyon. Roy. Aeronautical Soc.—Jl. (Lond.), no. 234, June 1930, pp. 497-556, 14 figs. Mathematical investigation of methods which may be used to estimate loads in members and deflections at joints of frame under system of external loads in plane of frame, and in case of space frame, of forces perpendicular to plane of symmetry of frame.

R. 101. New British Dirigible R. 101 (Le nouveau dirigeable anglais "R. 101"), G. Delanghe. Le Génie Civil (Paris), vol. 96, no. 26, June 1930, pp. 621-629, 17 figs. Brief review of airship development and types; description of design of 142,000 cu. m. dirigible; sketches show structural details.

AIRWAY LIGHTING

BEACONS. Luminous Signals for Aerial Communications (Senyales luminosas para comunicaciones aereas). Revista Electrotecnica (Buenos Aires), vol. 16, no. 2, Feb. 1930, pp. 78-87, 14 figs. Most important factors in airway light signal systems are greatest possible range, lowest power consumption, and distinguishability from other light beams; mathematical discussion of luminosity; description of equipment; notes on practice on Berlin-Hanover and Berlin-Konigsberg routes.

ALIGNMENT CHARTS

NOMOGRAPHY. A Short Monograph on Nomography, F. M. Wood. Eng. Jl. (Montreal), vol. 13, no. 8, Aug. 1930, pp. 507-518, 1 fig. Systems of two parallel and one curved scale; equations containing four variables; binary scales; cases with more than four variables. (Continuation of serial.)

ALLOYS

ALUMINUM. *See Aluminum Alloys.*

BEARING METALS. *See Bearing Metals.*

CAST IRON. *See Cast Iron.*

ALUMINUM ALLOYS

BRONZE. Aluminum Bronze—A Corrosion Resistant Alloy, R. J. Anderson. Metallurgia (Lond.), vol. 2, no. 8, June 1930, pp. 57-60. Brief review of development of aluminum bronze, known prior to 1860, but formerly too costly for use as engineering material of construction; compositions and mechanical properties; resistance to corrosion by various media; applications under corrosive conditions. Bibliography.

CORROSION. Some Factors Contributing to Corrosion of Aluminum, M. I. Makushenko. Tzvetniye Metalli (Moscow), no. 3, Mar. 1930, pp. 348-365, 37 figs. Report on experimental study made at laboratory of Krassny Viborzhetz plant, in Leningrad, on corrosive effect of river water, acid solutions, cooked rice, etc., upon aluminum ware and samples of aluminum plate. (In Russian.)

TESTING. Flow Tests Under Constant Pressure on Aluminum and Alpax (Essais de coulabilité, sous pression constante, de l'aluminium et de l'alpax), A. Courty. Académie des Sciences—Comptes Rendus (Paris), vol. 190, no. 15, Apr. 14, 1930, pp. 936-938. Pressure of molten metal is kept constant by flap-valve arrangement in form of thin lead sheet; values obtained by this method check well; refinement with alkali, repeated fusions, duration of heating and overheating have only insignificant influence upon fluidity of alpax, in contrast to their influence upon its mechanical properties.

AUTOMOTIVE FUELS

DETONATION. Atmospheric Conditions and Knock Testing, D. B. Brooks, N. R. White and H. H. Allen. Soc. Automotive Engrs.—Jl., vol. 27, no. 1, July 1930, pp. 56-64 and (discussion) 64-68, 11 figs. Study of effect of barometric pressure, air temperature and humidity on both absolute and relative detonation of fuel; ratings being obtained in terms of benzol and of tetraethyl lead in straight-run Pennsylvania-base gasoline and in terms of isooctane in normal heptane in some cases.

AVIATION

BLIND FLYING. For Flying Equipment. Aircraft (Melbourne), vol. 8, no. 9, June 30, 1930, pp. 374, 376, 378, 380, 382, 384 and 386. On September 24, 1929, demonstrations under Guggenheim Fund's direction proved conclusively that aircraft can take-off and land by instruments alone; advantages of gyroscope; test plane equipped with Radio Frequency Laboratory standard aircraft receiver and vibrating reed indicator; aural type radio beacon, purposes of which was to direct incoming aeroplane to vicinity of field, visual type of localizer beacon to lead pilot to exact point on aerodrome and ground receiving and transmitting set.

INDIA. Calcutta-Singapore Air Route. Roy. Air Force Quarterly (Lond.), vol. 1, no. 3, July 1930, pp. 473-482. Description of survey cruise by two flying boats of supermarine type, each equipped with two Napier Lion engines.

SWEDEN. Civil Aviation in Sweden, H. C. Plummer. Aero Digest, vol. 16, no. 4, Apr. 1930, pp. 54-55, 246 and 250, 4 figs. Description of commercial aviation progress in Sweden; data on rates, equipment, routes and finances of Aktb. Aerotransport, only Swedish aeronautical transportation unit.

AVIATORS

TRAINING. Training Master Pilots, G. Myers. Airway Age, vol. 11, no. 6, June 1930, pp. 798-800. Outline of education methods of Boeing School of Aeronautics; notes on progress checks; instrument flying, types of planes, etc.

B

BEARING METALS

DEVELOPMENTS. Bearing Metals and Bearings, W. M. Corse. Am. Soc. for Steel Treating—Trans., vol. 18, no. 2, Aug. 1930, pp. 179-203.

BEARINGS

ROLLER. Testing of Tapered Roller Bearings (Die Pruefung von Kegelrollenlagern), G. Oehler. Werkstattstechnik (Berlin), vol. 24, no. 9, May 1, 1930, pp. 244-247, 20 figs. Description of new test methods for tapered roller bearings; actual measurements show conformity of various test methods; graphs give data on thickness, blackness, and hardness of outer races.

BELTS AND BELTING

RUBBER. Stretch in Rubber Transmission Belting, C. W. Staacke. Am. Soc. Testing Matls.—Advance Paper, no. 103, for mtg. June 23-27, 1930, 13 pp., 7 figs. Investigations were made to determine proper amount of inelastic stretch to remove from belting during vulcanization process when using given fabric; eight identical samples of 6-in. 4-ply belting were given amounts of stretch varying from zero to 11.6 per cent; in case of this particular construction belt stretched between 7 and 8 per cent during vulcanization will render satisfactory service.

BOILER CORROSION

PREVENTION. Keeping Heating Surfaces Clean for Increasing Efficiency of Boiler Plants (Sauberhaltung der Heizflaechen zur Hebung der Wirtschaftlichkeit von Dampfkesselanlagen), H. Schlicke. Papier-Fabrikant (Berlin), vol. 28, no. 24, June 15, 1930, pp. 402-404. Abstract of paper previously indexed from Waerme, Dec. 21, 1929.

BOILER FURNACES

DESIGN. Modern Boiler Furnace Plant. Eng. and Boiler House Rev. (Lond.), vol. 43, no. 10, Apr. 1930, 16 pp. between pp. 596-623, 20 figs. Review of recent developments in design of plant for combustion and control of fuel in boiler house; diagrammatic view of Babcock and Wilcox ash-handling plant; Howden-Buell burner and distributor; diagrammatic view of Hydrojet system of ash handling.

BOILERS

DESIGN. Increase in Efficiency of Boilers and Its Influence on Parts of Steam (Die Leistungssteigerung von Kesseln und ihr Einfluss auf den Dampfpreis), H. Maas. Zeit. des Bayerischen Revisions-Vereins (Munich), vol. 34, nos. 11 and 12, June 15, 1930, pp. 153-154 and June 30, pp. 170-172, 3 figs. Conditions governing increase in efficiency; tests of performance with increasing steam output; economic considerations and advantages; based on practical examples investigation is made as to whether increase in capacity of boiler effects reduction in cost of steam generation.

BOILERS, HIGH PRESSURE

BENSON. The Benson Steam Generators at Gartenfeld, Berlin, C. H. Vickers. Eng. and Boiler House Rev. (Lond.), vol. 44, no. 1, July 1930, pp. 34 and 36, 2 figs. Discussion of Benson generating process; general layout of plant of Siemens-Schuckert.

BOILER MANUFACTURE

WELDING. Reliability of Materials Analysis in Welded Seams of Boiler Parts (Die Zuverlaessigkeit der Feststellungen der Werkstoffeigenschaften in Schwessnaehten der Kesselteile), E. Helfrich. Zeit. des Bayerischen Revisions-Vereins (Munich), vol. 34, no. 11, June 15, 1930, pp. 155-157. It is claimed that properties of weld cannot be determined from weld specimen and therefore determination of properties in specimen is not reliable criterion.

BOILERS

PULVERIZED COAL FIRED. General Operation Experiences with the First "Wood" Steam Generator, E. W. Smythe. Instn. Mech. Engrs.—Proc. (Lond.), no. 1, Jan. 1930, pp. 73-106, 30 figs. Abstract of paper previously indexed from Engineering, Jan. 31, and Engineer, Jan. 31 and Feb. 7, 1930.

Pulverized Coal-Firing Systems Compared, A. E. Grunert. Elec. World, vol. 96, no. 5, Aug. 2, 1930, pp. 208-209. Abstract of article previously indexed from Am. Soc. Mech. Engrs.—Advance Paper for mtg., June 9-12, 1930.

BOILER TUBES

HEAT EXPANSION. Influence of Heat Expansion of Boiler-Tube Nests on Movement of Boiler Drums (Ueber den Einfluss der Waermedehnung von Rohrbuendeln auf die Bewegung von Kesseltrommeln), Ebel. Waerme (Berlin), vol. 53, no. 24, June 14, 1930, pp. 437-443, 8 figs. It is experimentally shown that heat expansion of tubes not only fluctuates in direction of gas path, but that it can assume different values in horizontal direction of boiler, that is perpendicular to gas path; causes of this phenomenon are explained.

BRIDGES, CONCRETE

COSTS. Extensive Bridge and Approach Project in Rochester. Eng. News-Rec., vol. 105, no. 2, July 10, 1930, pp. 79-80, 2 figs. Descriptions and unit cost bids on construction of multiple-arch reinforced concrete bridge in Rochester, N.Y., having main span 300 ft. long and 150 ft. wide; main four highway concrete bridges in New Jersey and Kansas.

BRIDGES, HIGHWAY

NEW YORK-NEW JERSEY. Interstate Crossings between New York and New Jersey with Particular Reference to the Hudson River Bridge Between Fort Washington and Fort Lee, O. H. Ammann. New York Railroad Club—Proc., vol. 40, no. 6, May 1930, pp. 9250-9259, 5 figs. Financing and building of interstate crossings by Port Authority; necessity of bridges at links in highway system; two Arthur Kill bridges; Kill Van Kull bridge; Hudson River bridge.

BRIDGES, SUSPENSION

HUDSON RIVER. An Account of the Major Construction Operations on the Hudson River Bridge, M. B. Case. New York Railroad Club—Proc., vol. 40, no. 6, May 1930, pp. 9260-9269, 5 figs. General discussion of methods employed in construction; cable spinning.

BRIQUETTING PRESSES

CAST IRON SCRAP. Briquetting Cast-Iron Springs, F. J. Walls. Am. Mach., vol. 73, no. 6, Aug. 7, 1930, pp. 245-249, 7 figs. Description of design and performance of hydraulic briquetting machine built by Southwark Foundry and Machine Company of Philadelphia, and installed at plant of Wilson Foundry and Machine Company, Pontiac, Mich.; notes on use of briquettes in cupola.

C

CABLEWAYS

DESIGN. Computation of Shape of Aerial Cableways Traversed by Moving Loads (Del calcolo della configurazione delle funi portanti aeree percorse da carichi mobili), G. Piazzo. Ingegnere (Rome), vol. 4, no. 5, May 1930, pp. 312-314, 1 fig. Theoretical mathematical discussion, with numerical examples illustrating use of formulae in case of supports differing in elevation.

CADMIUM PLATING

IMMERSION. The Deposition of Cadmium on Small Iron and Steel Parts by Immersion, C. H. Proctor. Metal Cleaning and Finishing, vol. 2, no. 6, June 1930, pp. 491-493. General outline of procedure for applying cadmium coatings by immersion on small iron and steel parts, including such data as cleaning, acid dipping, cadmium immersion, and drying.

CARBON DIOXIDE

REFRIGERANT. Carbon Dioxide—By-product or Waste Materials, C. L. Jones. Chem. and Met. Eng., vol. 37, no. 7, July 1930, pp. 416-417. Factors affecting by-product carbon-dioxide recovery may be conveniently grouped as technological and economic factors; sound development of solid carbon-dioxide industry will depend to large extent on thoughtful and conservative handling of those supplies of by-product carbon dioxide that can be exploited on firm economic basis, and no others.

CARS, STREET RAILROAD

BERLIN. New Trailers of Berlin Street Railroad (Neue Beiwagen der Berliner Strassenbahn), E. Kindler. Verkehrs Technik (Berlin), no. 20, May 16, 1930, pp. 244-247, 12 figs. Description of new trailers with two and four axles, centre entrance and level floor; sketches show floor plans and constructional details, brake and suspension arrangement.

CAST IRON

ALLOY. High-Quality Cast Iron in Modern Engineering Practice, A. B. Everest. Engineering (Lond.), vol. 130, no. 3365, July 11, 1930, pp. 56-58, 6 figs. Brief survey of use of alloy additions in cast iron, it is seen that wherever high strength and good wearing qualities, together with improved machinability are desired, there are strong grounds for increased application of alloy iron, and use of special elements enables foundryman to give engineer more uniform and more reliable product with improved life and service. Paper read before Rugby Eng. Soc., Jan. 15, 1930.

CELLULOSE SWELLING

PHENOMENA. Swelling Phenomena with Cellulose Esters (Quellungsvorgaenge bei Celluloseestern), A. Eichengruen. Zeit. fuer Angewandte Chemie (Berlin), vol. 43, no. II, Mar. I5, 1930, pp. 236-237; see also brief translated abstract in Textile Inst.—Jl., vol. 21, no. 6, June 1930, p. 325A. Compact forms may be prepared from cellulose derivatives by placing finely powdered material mixed with filling material in hot moulds at 150-180 deg. and subjecting to strong pressure; similar results may be obtained if cellulose derivative is heated under pressure and sprayed in molten state into moulds; swollen cellulose ester may be moulded without softening and filling materials.

CHROMIUM PLATING

CURRENT DENSITY. Effect of Current Density Upon the Hardness of Electro-deposited Chromium, R. J. Piersol. Am. Electrochem. Soc.—Trans., vol. 56, 1929, pp. 371-376 and (discussion), 376-377. Article indexed in Engineering Index, 1929, p. 400, from Am. Electrochem. Soc.—Advance Paper no. 26 for mtg. Sept. 19-21, 1929; also Metal Cleaning and Finishing, Oct. 1929, and Metallurgist, Oct. 25, 1929.

CITY PLANNING

ITALY. Planning of the City of Aquila, Italy, after the Earthquake of 1915 (Le plan d'aménagement de la Ville D'Aquila, Italie après le tremblement de terre de I915), G. Tian. Génie Civil (Paris), vol. 97, no. 1, July 5, 1930, pp. 16-18, 1 fig. Features of changes made in plan and building ordinances of town of 25,000 inhabitants, located 215 km. south of Rome, in Abruzzi mountains.

COAL CARBONIZATION, LOW TEMPERATURE

GREAT BRITAIN. The Economics and Commercial Development of Low-Temperature Carbonization—Progress in Great Britain, C. H. Lander. Iron and Coal Trades Rev. (Lond.), vol. 121, no. 3256, July 25, 1930, pp. 115-117. Abstract of paper read before World Power Conference, Berlin, previously indexed from Colliery Guardian, June 27, 1930.

COAL INDUSTRY

SOUTH AFRICA. The Coal Industry of South Africa, T. Coulter. Chem., Met. and Min. Soc. of S. Africa—Jl. (Johannesburg), vol. 30, no. 9, Mar. 1930, pp. 261-281 and (discussion) 281. Historical data; geology; description of coal fields; quality of coals; coking coal; mining methods; by-products; grading regulations; marketing and distributing; freight rates and prices; production statistics; available reserves; future of coal industry.

D

DIE CASTING

PROBLEMS OF. Die Casting (Spritzguss), A. Lion. Giesserei-Zeitung (Berlin), vo. 27, no. 13, July 1, 1930, pp. 353-362, 26 figs. Die casting vs. chill casting; problem of deaeration; moulding materials; die-casting machines; compressed-air casting machines; die-casting alloys. (To be continued.)

DIESEL-ELECTRIC LOCOMOTIVES

INDIA. Diesel-Electric Locomotive Design. Gas and Oil Power (Lond.), vol. 25, no. 297, June 5, 1930, pp. 163-165, 4 figs. Description of two units for service in India; mechanical construction; engine speed control; cooling systems; starting arrangements; electric equipment.

DIESEL-ELECTRIC POWER PLANTS

ARGENTINA. New Type of Diesel Engine (Un Nuevo Tipe de motor Diesel), J. Kremzar. Revista Electrotechnica (Buenos Aires), vol. I6, no. I, Jan. 1930, pp. 13-18, 5 figs. Notes on installation of two 4-cycle tandem 2-cylinder double-acting compressorless horizontal engines at Puente Chico electric power station of Argentina sanitary works; cylinders 850 mm., stroke 1,250 mm., speed 125 r.p.m.; generators are also described; data on official tests to comply with contract guarantees.

GERMANY. Large Compressorless M.A.N. Diesel Engines of the Hennigsdorf Peak-Load Plant, Berlin (Die kompressorlosen MAN-Grossdiesel-motoren des Umspannwerks Hennigsdorf), W. Laudahn. Breenstoff und Waermewirtschaft (Halle), vol. 12, no. 11/12, June 1/2, 1920, pp. 135-140, 7 figs. Brief description of power plant with details of 9-cylinder, 11,700-s.h.p. engines and results of tests; mechanical efficiency at full load is 92 per cent that of steam reciprocating machine; speed 215 r.p.m.; weight 292 tons.

Diesel Plant Hennigsdorf of Maerkisches Elektricitaets Works (Dieselwerk Henningsdorf der Maerkisches Elektricitaetswerk Aktiengesellschaft), G. Warrekmann. Elektrizitaetswirtschaft (Berlin), vol. 29, no. 509, June, I930, pp. 258-262, 5 figs. Discussion of peak-load problem; actual impediments which until now have been in way of economical use of Diesel as peak-load engines; difficulties overcome by design of high-speed large Diesel plant in Hennigsdorf and experiences in construction and operation.

SURVEY OF. Present Status and Probable Progress of Diesel Engines (Stato attuale e progressi probabili del motore Diesel), M. Mainardis. Energia Elettrica (Milan), vol. 7, no. 5, May 1930, pp. 405-410, 3 figs. General survey of present day Diesel engineering, with special reference to increase in efficiency and economy; economic study of Diesel-electric versus steam-electric power generation; economy of Diesel-electric stations at present rates for electric power; typical cost data per kilowatt hour for several types of Diesel-electric plants.

DIESEL ENGINES

AIR COMPRESSORS. The Diesel Engine Air Compressor, R. J. Walter. Power Engr., vol. 25, no. 291, June 1930, pp. 222-223, 1 fig. Practical discussion concerning common defects in connection with blast compressors of Diesel engines.

CRANKSHAFTS. Turning and Grinding Large Diesel Engine Crankshafts. West. Machy. World, vol. 21, no. 6, June 1930, pp. 225-227, 5 figs. Methods and equipment used by Atlas Imperial Diesel Engine Co., Oakland, Calif., manufacturers of crankshafts for 3-, 4- and 6-cylinder engines.

DISCUSSION. Diesel Engine Operation, Maintenance and Repair, C. H. Bushnell. N.Y., John Wiley & Sons, 1930; 285 pp., illus., diagrs., tables, cloth; $3.50. Clearly written, concise discussion from point of view of operating engineer; fundamental principles are emphasized and much practical information and advice given. Eng. Soc. Lib., N.Y.

DOUBLE-ACTING. High Powered Oil Engines for Land Purposes, W. S. Burn. Eng. and Boiler House Rev. (Lond.), vol. 43, no. 9, Mar. 1930, pp. 575-576 and 578, I fig. Extracts of paper previously indexed from Diesel Engine Users' Assn.—Report, Jan. 31, 1930.

FUEL INJECTION. Oil Spray Research Suggests Basic Factors for Designing Diesel Engine Nozzle, E. B. Neil. Automotive Industries, vol. 63, no. 2, July 12, 1930, pp. 56-61, 9 figs. Graphs show fuel aspects in oil-engine developments from papers of A.S.M.E.; relation between drop size and injection pressure; Riehm's curves for relation between dynamic pressure and penetration; N.A.C.A. curves for relation between injection pressure and penetration; relation of spray momentum to penetration; distribution of spray injected into compressed air at 200 lbs. per sq. in.

Fuel Spray Penetration Decreases Under Heat, A. G. Gelalles. Automotive Industries, vol. 63, no. 5, Aug. 2, 1930, p. 165. Article previously indexed from Nat. Advisory Committee for Aeronautics—Tech., May 1930.

FULLAGAR. 2,500 H.P. Fullagar-Diesel Stationary Engine. Engineering (Lond.), vol. 130, no. 3364, July 4, 1930, pp. 7-10, 19 figs. Manufacture of Fullagar engine for land use was taken up by English Electric Co. at their Rugby Works; engine illustrated has cylinder bore of 19 in. and piston stroke of 22 in.; rated power is developed at 200 r.p.m.; it is of enclosed type, in common with those of smaller range; crankcase is in five main sections.

HIGH SPEED. Performance of a High-Speed Compression-Ignition Engine Using Multiple Orifice Fuel Injection Nozzles, J. A. Spanogle and H. H. Foster. Nat. Advisory Committee for Aeronautics—Tech. Notes, no. 344, June 1930, 18 pp., 26 figs. on supp. plates. Investigation to determine relative performance of single-cylinder, high-speed, compression-ignition engine when using fuel-injection valve nozzles with different numbers, sizes, and directions of round orifices; test results are presented in form of curves and chart which lists nozzles and gives dimensions of orifices and performance obtained.

M.A.N. Double-Acting M.A.N. Two-Stroke Diesel Engine in Hennigsdorf Peak-Load Power Plant Near Berlin (Die doppeltwirkenden MAN-Zweitakt Dieselmotoren im Umspannwerk Henningsdorf bei Berlin), W. Laudahn. Werft-Reederei-Hafen (Berlin), vol. 1I, no. 9, May 7, 1930, pp. 177-182, 11 figs. Particulars of 10-cylinder compressorless engines of 11,700 s.hp.; piston stroke, 900 mm.; speed, 215 r.p.m.; weight, 292 tons; results of tests.

MAINTENANCE AND REPAIR. Diesel Engine Upkeep. Power Plant Eng., vol. 34, no. 14, July 15, 1930, pp. 807-809, 6 figs. Piston rings in Diesel engines require extra car because of high temperature and pressure; detection and overcoming leaky rings and faulty action; fitting rings; checking operation and wear; overcoming gas leakage. (Continuation of serial.)

MARINE. The Heavy Oil Engine For Yachts and Small Craft, J. Calderwood. Junior Instn. of Engrs.—Jl. and Rec. of Trans., (Lond.), vol. 39, 1928-29, pp. 396-413, 11 figs. Article indexed in Engineering Index, 1929, p. 571, from Inst. Marine Engrs.—Trans., Feb. 1929.

MARINE, DOUBLE-ACTING. Double-Acting Two-Cycle Diesel Engine for Ship Propulsion (El motor Diesel de dos tiempos y doble efecto para la propulsión de buques), E. Becker. Ingenieria y Construcción (Madrid), vol. 8, no. 87, Mar. 1930 pp. 120-126, 12 figs. Torque diagram; torsional vibration; balancing; bending vibration; constructional details. (Concluded.) Indexed in Engineering Index 1929, p. 573, from Engineer, June 28, 1929.

RATING STANDARDIZATION. Can We Standardize Diesel Ratings? H. E. Brelsford. Log, vol. I5, no. 4, July 1930, pp. 7-8 and 34. Abstract of paper presented before Am. Soc. Mech. Engrs., previously indexed from Oil and Gas Power (A.S.M.E. Trans.), Sept.-Dec. I929.

SUPERCHARGING. Increasing the Power of Diesel Engines by Supercharging, M. Rotter. Power, vol. 72, no. 3, July 15, 1930, p. 111. Outline of several systems, pointing out advantages and deficiencies of each. Abstract of paper presented before Am. Soc. Mech. Engrs.

Compounding and Supercharging of Diesel Engines (La Question du Compoundage et de la Suralimentation du Moteur Diesel), M. Gautier. Association Technique Maritime et Aéronautique—Bul. (Paris), no. 33, 1929, pp. 471-497 and (discussion) 498-500, 19 figs. Paper indexed in Engineering Index 1929, p. 568, from Bul. Technique du Bureau Veritas, July and Aug. 1929.

UNITED STATES. Development of the Stationary Diesel in America, J. Kuttner. Gas and Oil Power (Lond.), vol. 25, no. 298, July 3, 1930, pp. 185-186. Effect of competition on progress; need for user education; costs capable of reduction; indefinite classification; private stations in majority; cost comparisons; artificial price maintenance. Abstract of paper presented before World Power Conference, Berlin.

DOCKS, FLOATING

LONDON. Tilbury Passenger Landing Stage. Engineer (Lond.), vol. 150, no. 3887, July 11, 1930, pp. 28-31, 8 figs. Stage which is carried on 63 pontoons has total length over end pontoons of 1,131 ft., and overall length, including fenders, of 1,142 ft. with width of 80 ft.; pontoons are built up of mild steel plates; I5 ft. wide and are arranged parallel with one another; communication between stage and shore is effected by means of five bridges.

DOORS

SPECIFICATIONS. The Specification of Stock Doors, W. E. Griffee. Contract Rec. and Eng. Rev. (Toronto), vol. 44, no. 29, July 16, 1930, p. 863. Instructions on selection and ordering of stock doors.

E

ECONOMIZERS

EXHAUST-GAS UTILIZATION. Feedwater and Air Preheating by Exhaust Gases (Speisewasser und Luftvorwaermung durch Abgase), Harraeus. Feuerungstechnik (Leipzig), vol. 18, no. 9/10, May 15, I930, pp. 84-97, 3 figs. Influence of preheating on boiler plants; exhaust-gas utilization for feedwater and air preheating; different arrangements of economizer and air preheater.

ELECTRIC ARCS

EXTINCTION IN LIQUIDS. Extinction of Electric Arc in Liquids (Die Loeschung eines elektrischen Lichtbogens in Fluessigkeiten), F. Kesselring. Wissenschaftliche Veroeffentlichungen aus dem Siemens-Konzern (Berlin), vol. 9, Mar. 22, 1930, pp. 200-208, 4 figs. It is shown that for extinction of arcs in liquids variations of temperature of vapour atmosphere and Wilson effect going with it, are responsible.

OIL. Electric and Gas-Analytic Investigations of Arcs in Oil (Elektrische und gasanalytische Untersuchungen von Lichtbogen in Oel), A. V. Engel. Wissenschaftliche Veroefftenlichungen aus dem Siemens-Konzern (Berlin), vol. 9, Mar. 22, 1930, pp. 7-41, 26 figs. Previous investigations; electric properties at arc discharges in oil; gas quantity of stationary and interrupted arcs; composition of gas; measurements on oil calorimeter; oil vapour contents of gas bubbles; spectroscopic analysis; energy balance and gas temperature.

ELECTRIC CABLES

HIGH TENSION, DESIGN. High-Voltage Cables (Ueber Hochspannungskabel), F. Schrottle. Siemens Zeit. (Berlin), vol. 10, no. 6, June 1930, pp. 337-342, 7 figs. Design of compound and oil cables; with voltages from 30 to 100 kv., it is shown why manufacture of 100-kv. compound cable could not have been carried out successfully; curves showing relation between insulation thickness and voltage; electric safety factor; disruptive strength depending on duration of closing of circuit, dielectric losses of 100-kv. cable.

TELEPHONE. Aerial Communication Cable for Power Plants (Fernmelde Luftkabel fuer Kraftwerke), C. Straubel and G. Werner. Siemens Zeit. (Berlin), vol. I0, no. 6, June 1930, pp. 342-347, 17 figs. Self-supporting aerial telephone cable for installation along transmission lines and its equipment; development in Siemens plant has extended over 20 years and experience in practical application is given.

ELECTRIC DRIVE

DEVELOPMENT OF. Lines of Development of Economical Electric Drive in Industry (Entwicklungslinien des wirtschaftlichen elektromortoischen Antriebes in der Industrie), R. Bingel. V.D.I. Zeit. (Berlin), vol. 74, no. 24, June 14, 1930, pp. 848-864, 43 figs. Historical review; general lines of development is traced by examples of one-phase and multi-phase drives in various manufacturing industries; importance of co-ordination between industries and manufacturers for further development of drives of machine tools.

ELECTRIC EQUIPMENT

FAULT LOCATION. Testing for Trouble and Locating Faults in Electrical Equipment, M. Phillips. Power Plant Eng., vol. 35, no. 15, Aug. 1, 1930, pp. 867-869, 4 figs. Testing insulation resistance by means of Megger Periodic inspection to anticipate grounds, shorts and opens, important part of plant routine; description of two main types of tests; details of testing; troubles in control equipment.

HIGH TENSION. Transformers, Switchgear and Metering Transformers (Transformatoren, Schaltgeraete und Messwandler fuer 220,000 V), F. Titze. Siemens Zeit. (Berlin), vol. 10, no. 6, June 1930, pp. 356-364, 12 figs. Equipment used in 220-kv. transmission from Rheinland to Vorarlberg, of Rheinisch Westphalische Elektrizitaetswerke, is illustrated and described.

ELECTRIC FURNACES

FOUNDRY. Automatic Regulation of Electric Furnaces in the Foundry (La régulation automatique des fours électriques de fonderie), A. Levasseur. Revue Générale de l'Electricité (Paris), vol. 27, no. 17, Apr. 26, 1930, pp. 665-670, 7 figs. Advantages of automatic regulation; variation of input power in relation to resistance; pyrometric regulation; automatic regulation of electrode furnaces.

HEAT TREATING. Electric Salt or Lead-Bath Furnaces (Elektrisch Salzoder Bleibns doefen), H. Illies. Feuerungstechnik (Leipzig), vol. 18, no. 9/10, May 15, 1930, pp. 81-82, 3 figs. Advantages and possibilities of steel hardening in salt and lead baths; Russ electric crucible furnace; lead-bath furnace of Hoskins Electric Furnaces Co.; electric pot furnace of American Electric Furnace Co.

Heat-Treating Furnaces Distributed in Line of Machine Shop Production, H. E. Scarborough. Iron Age, vol. 126, no. 6, Aug. 7, 1930, pp. 357-359, 2 figs. Description of operation and layout of heat treating facilities at plant of Caterpillar Tractor Co., at Peoria, Ill.; 24 General Electric furnaces with total connected load of 2,745 kw. are used; plant will average between 8 and 10 lbs. of heat-treated parts per kilowatt hour.

ELECTRIC GENERATORS

VOLTAGE CONTROL. Requirements of 20 Processes That Generator-Voltage Control Meets, S. Martin, Jr. Elec. World, vol. 96, nos. 4 and 6, July 26, 1930, pp. 172-176 and Aug. 9, 1930, pp. 266-269, 9 figs. Advantages of generator voltage control of motors from 3 to 7,000 hp., i.e., on mule haul and car dumper, stokers, cable stranding machines, power shovels and draglines, mine hoists, blast furnace skip hoists, dredges, printing machinery, vertical lift bridges, high-speed elevators, freight elevators, paper machines, pulp grinders, rewinders and other specialties.

ELECTRIC INSULATORS

RESEARCH LABORATORIES. The Research Laboratories of Steatite and Porcelain Products, Ltd. World Power (Lond.), vol. 14, no. 79, July 1930, pp. 47-50 and 53, 8 figs. General description of laboratories and equipment for manufacture and testing of electrical insulators.

ELECTRIC LINES, HIGH TENSION

PROTECTION. Theory and Application of Relay Systems, I. T. Monseth and P. H. Robinson. Elec. Jl., vol. 27, no. 7, July 1930, pp. 411-415, 9 figs. Notes on application of fundamental short-circuit calculations; three-phase short-circuit calculations; machine reactances; zero-sequence network; two-winding transformers. (To be continued.)

ELECTRIC LOCOMOTIVES

ITALY. Direct Current Locomotives of 3,000 Volt, Series E 625 and E 626 (I locomotori a corrente continue a 3,000 volt gruppi E 625 ed E 626), G. Bianchi and S. Elena. Rivista Tecnica delle Ferrovie Italiane (Rome), vol. 37, no. 5, May 15, 1930, pp. 189-250, 52 figs. and numerous figs. on 5 supp. plates. Detailed description of mechanical and electrical equipment of electric locomotives used on Foggie-Benevento line; also results of tests and operating experience; discussion of deficiencies detected and suggestions for improvements.

ELECTRIC MACHINERY

ALTERNATING CURRENT. Behaviour of Asynchronous and Synchronous Machinery in Case of Asymmetrical Voltage (Verhalten der Asynchron und der Synchronmaschine bei unsymmetrischer Spannung), M. Liwschitz. Wissenschaftliche Veroeffentlichungen aus dem Siemens-Konzern (Berlin), vol. 9, Mar. 22, 1930, pp. 167-178, 12 figs. Equation for apparent resistance of system of opposite rotary motion of asynchronous machine fed at both ends is developed; it is shown how asymmetrical excitation of asynchronous machines can be considered; experiments of 10,000-kv. reactive generator and comparison of results with calculations.

ELECTRIC NETWORKS

INTERCONNECTED. Recent Problems of Electric Power Supply on Large Scale (Neuzeitliche Aufgaben der elektrischen Grossversorgung), A. Menge. V.D.I. Zeit. (Berlin), vol. 74, no. 24, June 14, 1930, pp. 837-847, 16 figs. Birds-eye view of present status and problems; advantages of closed operation for safety and economy; equipment of network for safe and quick elimination of trouble; measures for load distribution; voltage control; interconnection of large network systems and technical means in coupling of systems of different frequency. Paper read before World Power Conference, Berlin.

ELECTRIC POWER SUPPLY

EUROPE. Europe's Superpower Lines (Europas Grosskraftlinien), O. Oliven. V.D.I. Zeit. (Berlin), vol. 74, no. 25, June 21, 1930, pp. 875-879, 1 fig. Author proposes 400-kv. power line system embracing all countries of continental Europe and extending from Lisbon in Portugal to Rowtov in Ukrainia, and from Oslo in Norway to El Bassan in Albania; discussion of advantages of such system, geographical, climatic, and astronomical factors. Paper read at Second World Power Conference.

UNITED STATES. Recent Studies in Generation and Distribution of Power, F. C. Hanker. Inst. Elec. Engrs. of Japan—Jl. (Tokyo), no. 502, May 1930, pp. 437-444. Developments of generation and transmission of electric power in United States; improvements in design of generating apparatus, factors, affecting stability problem and methods for considering them in calculations. (In English.)

ELECTRIC RESEARCH LABORATORIES

HEINRICH HERTZ. Heinrich Hertz Institute for Oscillation Research (Das Heinrich-Hertz-Institut fuer Schwingungsforschung), K. W. Wagner. Elektrische Nachrichten-Technik (Berlin), vol. 7, no. 5, May 1930, pp. 174-191, 23 figs. Viewpoints which have led to erection; field of activities pertains to general electrical engineering, telephony, telegraphy, radio, high frequency and acoustics; detailed description of building, mechanical, and electrical equipment.

ELECTRIC RECTIFIERS, MERCURY-ARC

BACK FIRING. Origin and Combating of Back Firing in Large Rectifiers (Die Entstehung und Bekaempfung der Rueckzuendungen in Grossgleichrichtern), J. von Issendorff, M. Schenkel and R. Seeliger. Wissenschaftliche Veroeffentlichungen aus dem Siemens-Kozern (Berlin), vol. 9, Mar. 22, 1930, pp. 73-114, 28 figs. Characteristics of back fire; general theory of arc discharge; development of arc discharge at d.c. voltage loading of discharge spacing; glow discharge is fore-runner of arc discharge, stimulating arc formation, residue charges, and back current; relation between back-fire and residue charges; removal of residue charges.

ELECTRIC TRANSFORMERS, CURRENT

CONNECTION. Only Two Current Transformers Needed with Open-Delta Regulators, E. R. Wolfert. Elec. Jl., vol. 27, no. 7, July 1930, p. 387, 1 fig. Comparison of old and new methods of connecting current transformers to any open-delta regulator system; method of bringing currents into proper phase relationship is graphically illustrated.

ELECTRIC WELDING

ARC. Graphical Analysis of Metal Transfer Processes in the Electric Arc (Ueber die graphische Zerlegung der Metalltransporvorgaenge im elektrischen Lichtbogen), P. Flamm. Elektroschweissung (Braunschweig), no. 2, Feb. 1930, pp. 27-30, 2 figs. Arc welding in time process; origin of drops is determined by experiment; of metal electrodes and their fundamentals in conditional diagram; valuation of metal electrodes.

Development in Arc Welding Methods. Can. Engr. (Lond.), vol. 59, no. 4, July 22, 1930, pp. 169-170. General discussion of latest developments in equipment and methods; arc welding in construction of buildings, bridges and machinery; large buildings erected by welding process; summary of advantages for building and machinery construction.

Principles of Steel Mill Practice Applied to Welding, J. B. Austin. Rolling Mill Jl., vol. 4, no. 6, June 1930, pp. 319-322. Abstract of paper read before Assn. of Iron and Steel Elec. Engrs. previously indexed from Iron and Steel Engr., June 1930.

Present Status of Work Testing in Arc Welding Practice (Der heutige Stand der Arbeitspruefung beim Lichtbogenschweissen), W. Fink. Elektroschweissung (Braunschweig), no. 3, Mar. 1930, pp. 45-50, 5 figs. It is claimed that only organized research in way of metallurgical strength testing and design and operation of welding machine can lead to progress in art.

ELECTRODE. Electrode Research, M. Haramiishi. Welding Jl. (Lond.), vol. 27, no. 321, June 1930, pp. 174-177, 17 figs. Abstract of results of investigations of flux-coated and covered electrodes for metallic arc welding.

ELECTRIC WELDING MACHINES

GERMANY. Welding Equipment in Steel Construction (Geraete fuer das Schweissen im Stahlbau), W. Vaas. Elektroschweissung (Braunschweig), no. 2, Feb. 1930, pp. 31-33, 4 figs. Various types of German-made portable and stationary equipment are illustrated and described.

POWER FACTOR. Improvement of Power Factor for Welding Machines (Ueber die Verbesserung des Leistungsfaktors von Schweissmaschinen), J. C. Fritz. Elektroschweissung (Braunschweig), no. 2, Feb. 1930, pp. 34-36, 4 figs. It is shown that improvement can be obtained by parallel connection of condensers; advantages obtained are discussed.

SELECTION. Viewpoints for the Selection of Arc Welding Machines (Gesichtspunkte fuer die Wahl von Lichtbogenschweissmaschinen), G. Falck. Elektroschweissung (Braunsehweig), no. 5, Mar. 1930, pp. 51-55, 10 figs. Fundamental principles in solution; capacity, no-load consumption; efficiency; statical and dynamic characteristics are explained with examples; valuation of arc welding machines is founded on knowledge of these factors.

TESTING. Explanation of Rules for the Valuation and Testing of D.C. Arc Welding Machines (Erlaeuterungen zu den Regeln fuer die Bewertung und Pruefung von Gleichstrom Lichtbogenschweissmaschinen), A. Danz. Elektroschweissung (Braunschweig), no. 5, May 1930, pp. 85-86. Rules developed by professional committee for welding practice of Verband Deutscher Elektrotechnischer are explained.

Rules for Evaluation and Testing of D.C. Arc Welding Machines R.E.S.M./1931 (Regeln fuer die Bewertung und Pruefung von Gleichstrom-Lichtbogenschweissmaschinen R.E.S.M./1931). Elektroschweissung (Braunschweig), no. 5, May 1930, pp. 87-88 Rules developed by professional committee for welding practice of Verband Deutscher Elektrotechnischer are given.

ENGINERING EDUCATION

COMMERCIAL SIDE. The Training of an Engineer, F. W. Burstall. Engineer (Lond.), vol. 149, no. 3884, June 20, 1930, pp. 678-679; see also editorial comment, pp. 689-690. Author claims that commercial side, and more especially aspects of production are hardly touched upon in modern university course; this appears to be side of engineering teaching in Universities which requires to be developed without in any way impairing value of knowledge which is entirely derived from facts of nature; at present only method by which University student can obtain practical knowledge is very limited opportunity offered to him in vacations and perhaps on short period of shop training.

RUSSIA. Technical Training in Russia, J. G. Growther. Elec. Rev. (Lond.), vol. 106, no. 2741, June 6, 1930, pp. 1049-1050. Brief account of training methods and research activities of Electrotechnical Institute, Physico-Technical Institute, and Polytechnic Institute in Leningrad and relationships with industry and State.

ENGINEERING RESEARCH

ENGINEERING RESEARCH. Forschung und Technik; Im Auftrage der Allgemeinen Elektrizitaets-Gesellschaft, W. Petersen. Berlin, Julius Springer, 1930, 576 pp., illus. 40-r.m. Book gives insight into scientific research being carried on in research institutes and by large industrial organizations; specifically, it contains 40 papers upon present problems in various branches of physics, electrical engineering, machine design and transportation, based on recent work of Allgemeine Elektrizitaets Gesellschaft, Berlin, and written by members of its research staff; contents cover wide range and illustrate clearly advantages to industry of systematic scientific research. Eng. Soc. Lib., N.Y.

ENGINEERS

PROFESSIONAL STATUS. The Engineer's Professional Status, W. E. Wickenden. Eng. News-Rec., vol. 105, no. 4, July 24, 1930, pp. 144-145. Profession has no very distinct status, is becoming more undefined as its activities broaden, and licensing has been of little service; suggests society certification of engineers. Abstract of address before Am. Soc. of Civil Engrs.

F

FEEDWATER

ANALYSIS. Oxygen Analysis in the Boiler Room, M. E. Fitze. Power, vol. 72, no. 4, July 22, 1930, pp. 136-139, 3 figs. Description of routine followed at Lakeside Station, where analyses are made hourly of feed-water supply to each boiler.

REGULATION. Automatic Boiler Feedwater Control (Ueber selbsttaetige Kesselspeisewasser regler), H. Luithlen. Sparwirtschaft (Vienna), vol. 8, no. 4, Apr. 1930, pp. 169-174, 5 figs. Float control with mechanical transmission type "Direkt" of Hanneman, Berlin; float control with electric transmission of type "Reubold" of Hanomag; equipment with hydraulic or pneumatic transmission type "Sieger" of Hans Reiser and Co., Cologne, are described.

TREATMENT. The Treatment of Boiler Feedwater, E. P. Fager. Power Age, vol. 7, no. 7, July 1930, pp. 41-42 and 46. General discussion of proper steps to be taken in selection and treatment of feedwater.

High Pressure Feed Systems, D. G. McNair. Elec. Times (Lond.), vol. 77, no. 2017, June 19, 1930, pp. 1235-1237, 2 figs. Methods of maintaining pure, non-corrosive feed supply to high-pressure boilers.

Using Chemicals for Clarifying and Recovering Engine Condensate, A. W. Talbot and E. W. Pace. Power Plant Eng., vol. 34, no. 13, July 1, 1930, p. 746. Oil can be removed from engine condensate by means of chemical reactions which form gelatinous precipitate; only chemical reactions involved are dealt with.

Hot Lime Soda Phosphate of Feed Water for High Pressure Boilers, C. E. Joos. Combustion, vol. 2, no. 1, July 1930, pp. 19-23 and 50, 5 figs. Reasons for care in feedwater treatment; reasons for using more expensive phosphate treatment; how hot lime and soda methods meet requirements.

FLIGHT

See Gliding.

FLOW OF FLUIDS

HYDRAULIC PARADOX. An Hydraulic Paradox. Engineering (Lond.), vol. 129, no. 3362, June 20, 1930, p. 803. It is shown to be possible by perfectly sound and legitimate mathematical analysis to arrive at extraordinary, but impossible, conclusion that mean speed of jet of fluid may be decidedly greater than mean speed of its constituent particles; anomaly arises from faet that there are two perfectly rational, but not necessarily consistent, methods of defining velocities of flow; there is not necessarily any simple relationship between coefficients of discharge and velocities measured in nozzle tester.

STUDY. Application of Hydrodynamic Problem of Fluvial Hydraulics (Application de l'Hydrodynamique à l'étude d'un problème d'Hydraulique Fluviale), E. Doucet. Vie Technique et Industrielle (Paris), vol. 12, no. 129, June 1930, pp. 1367-1373, 8 figs. Theoretical study of distribution of flow velocity in rivers and sewers by means of hydrodynamic equations for viscose fluids; experiments show that theoretically derived formula is correct within 8 per cent.

FLOW OF WATER

EMBANKMENTS. Flow Over Embankments During Floods, D. L. Yarnell and F. A. Nagler. Roads and Streets, vol. 70, no. 7, July 1930, pp. 247-249, 8 figs. Abstract of paper previously indexed from Pub. Roads, Apr. 1930.

Pipes. Loss of Head in Pipes witb Continually Changing Cross-Section (Trykkboidetap i ledninger med kontinuerlig foranderlif tverrsnitt), N. Baashuus Jessen. Teknisk Ukeblad (Oslo), vol. 77, nos. 23 and 24, June 5, 1930, pp. 265-268 and June 12, 1930, pp. 274-276, 6 figs. June 5: Derivation of formulae for determining loss of head. June 12: Use of formulae in practical cases; tabulation of some constants and exponents; three examples are given.

FOUNDRIES

Electric Furnaces. Electric Gray Iron Entirely From Scrap, N. L. Turner. Elec. World, vol. 96, no. 2, July 12, 1930, pp. 68-69. In plant of Beach Foundry, Ltd. of Ottawa, Canada, producing stove parts, point was reached where, witb cupola melting, it was necessary to extend floor space to take care of production; by installing electric furnace for melting, continuous flow of iron was obtained and need of extra floor space for day's run of moulds was overcome; by use of all scrap metal, cost of iron at spout has been reduced, production increased 25 to 30 per cent, and flexibility of method has been proven.

FRAMED STRUCTURES

Earthquake Effect. Tests on Concrete Frames Simulate Effects of Earthquake Action on Buildings. Eng. News-Rec., vol. 105, no. 2, July 10, 1930, p. 55, 1 fig. Report on tests made at University of Illinois to determine action of several details of construction under repeated horizontal loads. Paper read before Int. Eng. Congress at Tokyo.

FUELS

Engineering. Fuel Problems Discussed at Chemical Society Meeting. Fuels and Furnaces, vol. 8, no. 5, May 1930, pp. 643-645. Abstract of papers presented before American Chemical Society; discussion of nature of carbonization and oxidation of carbonized products; mechanism of combustion of pulverized particles; cracking process; formation of hydrocarbons from water gas; gas, coke, and by-product making properties of coal; ash-fusion-point determinations; investigation of peat humus; apparatus for analysis of carbon dioxide and oxygen.

FURNACES

Enameling. Development in Enamel Smelting Furnace Construction, R. D. Cook. Fuels and Furnaces, vol. 8, no. 5, May 1930, pp. 715-716, 3 figs. Operation of furnace, in construction of which, outside of walls and hearth were left exposed to air. Abstract of paper presented before Am. Ceramic Soc.

FURNITURE MANUFACTURE

Metal. Metal Furniture Output Expanding to Meet Wider Popular Appeal, L. Bonney. Iron Age, vol. 126, no. 2, July 10, 1930, pp. 75-77, 4 figs. Brief review of recent developments in design and construction of metal furniture.

Stainless Steel Furniture. Times Trade and Eng. Supp. (Lond.), vol. 26, no. 624, June 21, 1930, p. 354. One of directions in which newer industries have made great progress is production of stainless steel for furniture; some of uses to which it is being put at present time are: all metal furniture, more particularly for office and school use such as desks and chairs, table legs and pedestals, piano fittings, cabinet fittings, etc.

G

GALVANIZING

Continuous. Galvanizing Shops (Galvanische Werkstatt), E. Werner. Werkstattstechnik (Berlin), vol. 24, no. 11, June 1930, pp. 297-303, 3 figs. Outline of principles of construction and operation of electric galvanizing plant for mass production; data on combustion and conductivity of electrolyte sketches show washing equipment.

Prevents Decomposition. Galvanizing Prevents Metallic Decomposition, W. H. Spowers, Jr. Wire, vol. 5, no. 7, July 1930, pp. 268-269 and 289-290. Closer relation between life and rust; pure metal does not oxidize easily; zinc corroded, saves iron; zinc absorbed into metal pores; combined picking and fluxing; how zinc chloride is used.

GAS INDUSTRY

Rationalization. The Rationalization of the Gas Industry, G. Evetts. Gas Jl. (Lond.), vol. 191, no. 3502, July 2, 1930, pp. 31-32. Overcoming obstacles in way of rationalization; legislature difficulties affecting rationalization; tariff problems. (Concluded.)

GASOLINE TANKS

Gasoline Tanks. Oil-Fuel Storage (Aus der Praxis der Betriebsstofflagerung). Petroleum (Berlin), vol. 26, June 25, 1930, (supp.) pp. 1-12. Notes on protection of tanks against gasification; Bowser Xacto Sentry filling stations; measuring apparatus for gasoline filling stations; modern high-duty filling stations; modern gasoline and benzol separator; seamless DWM-Tombak hose in petroleum industry; aluminum coating and foil as protection for tanks in petroleum industry; etc.

GASOLINE TESTING

Significance of. Significance of Tests for Motor Fuels, R. E. Wilson. Soc. Automotive Engrs.—Jl., vol. 27, no. 1, July 1930, pp. 33-41, and (discussion), 42-44, 1 fig. Discussion of various tests in light of extension research work in past few years by various industrial laboratories and U.S. Bureau of Standards; volatility; easy of starting; vapour lock; anti-knock value; gum formation test; corrosion; doctor test; sulphur content; colour stability. Bibliograpby.

GEARS AND GEARING

Efficiency. Can a Machine Reverse if its Efficiency be Less than 50 Per Cent? A. W. Knight. Machy. (Lond.), vol. 36, no. 927, July 17, 1930, pp. 497-499, 5 figs. Discussion of friction effects in spur and worm gears; diagram illustrating how reversal may take place wben efficiency is less than 50 per cent; diagram for determining efficiency of worm gear is given.

Manufacture. Cutting Costs of Production Cleaning, T. L. Wheeler, Jr. West. Machy. World, vol. 21, no. 6, June 1930, pp. 231-235, 7 figs. Cleaning methods used by Warner Gear Co., Muncie, Ind.

Planetary. Planetary Gear Trains with Idler Train Arm, W. Ricbards. Machy. (Lond.), vol. 36, no. 926 and 929, July 10, 1930, pp. 465-469 and July 31, pp. 566-568, 9 figs. Design and calculation of planetary reduction gear; sketches illustrate gear arrangements in whicb driver and driven turn in opposite and in same direction witb fixed and driven internal gears.

Tooth Measurement. Constant Cbord Gauging. Am. Macb., vol. 73, no. 6, Aug. 7, 1930, pp. 250-252, 4 figs. Summary of comments received on W. A. J. Chapman's article published in American Machinist, vol. 72, p. 753; V-jawed caliper can be used with existing gear tables; gear-tooth vernier is proposed to use constant cbord principle without special computations.

GEOLOGY

Australia. The Metamorphic Rocks of North-East Victoria, C. M. Tattam. Geol. Survey of Victoria—Bul. (Melbourne), no. 52, 1929, 61 pp., 18 figs. and 1 map on supp. plate. Report on study of rocks extending soutb southeast about 100 mi. from Murray river in belt about 30 mi. wide.

GEOPHYSICAL EXPLORATION

Electric. The Earth-Resistivity Method of Electrical Prospecting, E. Lancaster-Jones. Min. Mag. (Lond.), vol. 42, no. 6, June 1930, pp. 353-355, 2 figs. Discussion of Gish and Rooney method; field procedure; description of apparatus; consideration of results; application to prospecting for ore. (To be continued.)

GLIDERS

Manufacture. Production of Air Gliders, J. C. Coyle. Indus. Woodworking, vol. 30, no. 11, Aug. 1930, pp. 16, 19 and 22, 6 figs. Woodworking operations included in machining, bending and fabricating of parts used in manufacture of latest type air gliders produced in Alexander Aircraft Co.'s plant.

GLIDING

Hearing. Consideration on Motorless Flight (Considérations sur Le Vol sans Moteur), A. Lafay. Génie Civil (Paris), vol. 96, no. 25, June 21, 1930, pp. 606-607, 4 figs. Importance of sense of hearing for motorless flights is discussed; sketches show microphone arrangement in wings to make air currents audible; cbaracter of sound indicates angle of incidence.

GOLD MINING GEOLOGY

Ontario. Geology of the Fort Hope Gold Area, District of Kenora (Patricia Portion), E. M. Burwash. Ontario Dept. of Mines—Report (Toronto), vol. 38, part 2, 1929, pp. 1-48, 28 figs., maps in pocket. Area lies about 175 mi. due north of Nipigon, on Lake Superior; early explorations; geology along routes; general data and geology of area; economic interest of regions centres in gold deposits; notes on Fort Hope, Hargreaves, Irish-Wording and Northern Aerial Minerals Exploration Co. mining properties; iron formation of Miminiska Lake.

GRINDING

Refinements in. Refinements in Finishing Cylindrical Bores, J. W. Hindes and J. G. Young. Am. Soc. of Mech. Engrs.—Advance Paper, for mtg., June 9-12, 1930, 9 pp. Limitations of boring, reaming, burnishing, and broaching are reviewed; general outline of grinding practice; description of operation and advantages of hone; notes on coolant and abrasive.

H

HANGARS

Braunschweig. Airplane Hangars of the Braunschweig Airport (Flugzeighallen des Braunschweiger Flughafens), H. Maushake. Stahlbau (Berlin), vol. 3, no. 11, May 30, 1930, pp. 124-127, 6 figs. Design and construction of steel-frame structures 200 m. long, 30 m. wide, with head room of 6.6 and 9.6 m.; structural details of steelwork.

Construction. Hangar Construction Simplified. Flight (Lond.), vol. 22, no. 29, July 18, 1930, pp. 804-806, 11 figs. Form of construction of novel hangar is "segmental roof" but better described as "segmental lattice" construction; hangar is 150 ft. long by 80 ft. wide; door 62 ft. wide by 18 ft. high; advantages of this type given; may be set up temporarily or made permanent; details of framework, covering, and foundation.

Friederichshafen. New Airship Hangar at Friederichshafen (Die neue Luftschiffhalle in Friedrichshafen), C. Scharnow. Stahlbau (Berlin), vol. 3, no. 6, Mar. 21, 1930, pp. 61-68, 20 figs. Design and construction of steel-frame structure 248.5 m. long about 51 m. wide; framed three-hinge arcb-ribs, 46 m. high, are spaced 10 m. apart; main structural features of several other similar structures in Great Britain, India, and United States.

HARDNESS TESTING

Conversion Tables. New Conversion Tables Show Relations Among Hardness Tests, T. N. Holden, Jr. Iron Age, vol. 126, no. 2, July 10, 1930, pp. 80-81. Table compares hardness obtained with Rockwell using three loads, 150, 100, and 60 kg. with Brinell, diamond penetrator, and scleroscope results.

HEAT INSULATION

Heat Insulation. The Insulation of Heated and Cooled Surfaces, J. S. F. Gard and R. S. Robinson. Ice and Cold Storage (Lond.), vol. 33, no. 388, July 1930, pp. 170-177, 13 figs. Calculations with external surface conditions; relative efficiency; temperature drop in pipe lines; comparison between various grades; cost of application and saving effected; advantages other than heat saving; domestic applications. (Continuation of serial.)

HIGH BUILDINGS

Foundations. Foundation Construction for Giant Office Building. Contractors' and Engrs.' Monthly, vol. 20, no. 5, May 1930, pp. 72-76, 5 figs. Account of excavation and foundation construction of 85-storey Empire State Building on site of Waldorf Astoria Hotel, New York City.

Wind Bracing. High Wind Pressures on Tall Structures, A. M. Thomas. World Power (Lond.), vol. 14, no. 79, July 1930, pp. 23-32, 5 figs. Attempt is made to estimate by statistical methods probable frequency and magnitude of bigh wind pressures over British Isles; variation of wind velocity with height is considered and three equations expressing this variation are given; using one of tbem, probable frequencies of high wind pressures at various heights are calculated, and final results are embodied in series of curves.

HYDRAULIC MACHINERY

Specific Speed. Specific Speed and Other Characteristics of Hydraulic Turbines, Centrifugal Pumps, Windmills, and Propellers as Dimensionless Characteristics of Physics of Similitude (Die spezifischen Drehzahlen und die anderen Kenngroessen der Wasserturbinen, Kreiselpumpen, Windraeder und Propeller als dimensionsfreie Kenngroessen der Aehnlichkeitsphysik), M. Weber. Schiffbau (Berlin), vol. 31, no. 9, May 7, 1930, pp. 207-209. Characteristic values for bydraulic turbines; special cases are described. (Continuation of serial.)

HYDRAULIC TURBINES

Design. A Contribution to the Design of a Propeller Turbine of Axial Flow Type, K. Kanesige. Soc. of Mech. Engrs.—Jl. (Tokyo), vol. 32, no. 151, Nov. 1929, pp. 440-453, 8 figs. New method for determination of chief dimensions of axial flow water turbine of propeller type, except runner itself, which is to be designed under given condition; its characteristic features are: introduction of index number whicb represents characteristics of guide apparatus into ordinary design formulae, provision of diagrams which may enable turbine designers to select some numerical coefficients with special reference to cavitation phenomena and hydraulic efficiency of runner. (In Japanese.)

Efficiency. Modern Hydro-electric Power Plants (Det moderna Vattenkraftverket), H. O. Dahl. Teknisk Tidskrift (Stockholm), vol. 60, no. 24, June 14, 1930, pp. 369-371. Mechanical equipment is discussed; hydraulic turbines, their efficiency and development.

Low-Pressure. Gefallvermehrung bei Niederdruck-Wasserkraftanlagen, R. Gelbert. (Mitteilungen aus dem Gebiete des Wasserbaues und der Baugrundforschung, heft 2). Berlin, Wilhelm Ernst & Sohn, 1930; 22 pp., illus., diagrs., tables, 3.60 r.m. Book presents results of tests of methods of increasing head of low-pressure hydraulic turbines proposed by John R. Freeman; this method consists in introducing part of surplus water, escaping over dam, into draft tube of turbine, where it reduces discharge pressure and thus increases effective head. Eng. Soc. Lib., N.Y.

Propeller. On the Hydraulic Efficiency of Propeller Turbines and Propeller Pumps, F. Numachi. Tohoku Imperial Univ.—Tech. Reports (Sendai), vol. 9, no. 2, 1930, pp. 231-253, 20 figs. Theoretical study of variations of hydraulic efficiency of propeller turbine and of propeller pump with respect to coefficient of peripheral velocity of rotation, coefficient of axial velocity of flow and ratio of outer diameter to inner diameter of wheel. (In English.)

Regulation. Hydraulic Turbine Governors, F. Johnstone-Taylor. Water and Water Eng. (Lond.), vol. 32, no. 378, June 20, 1930, pp. 277 and 279-281, 2 figs. General principles of automatic operation; Escher Wyss system; Woodward system; synchronizing motor or speed matcher; motor-driven ball heads.

Testing. Low-Head Francis Turbines for Swedish Hydro Plant, G. Willock. Power, vol. 72, no. 6, Aug. 5, 1930, pp. 218-220, 4 figs. Description of two 15,600-hp. Francis turbines, set in reinforced concrete spiral casing of special design operate under head of 64.5 ft. which developed 93.2 per cent efficiency on test; water was measured by current meters. See also Engineering Index 1929, p. 953.

HYDRO-ELECTRIC POWER DEVELOPMENTS

Arizona. Salt River Project, Arizona, T. A. Hayden. West. Construction News, vol. 5, no. 12, June 25, 1930, pp. 294-302, 11 figs. Description of irrigation and hydro-electric development by Salt River Valley Water Users' Association including six large dams, Roosevelt Dam among them. (To be continued.)

Canada. Hydro-Electric Industry of Canada, G. G. Gale. Eng. Jl. (Montreal), vol. 13, no. 7, July 1930, pp. 445-452, 8 figs. History of early developments; improvement in transmission networks, interconnection of stations and systems;

examples of centralized control; consolidation of operation organizations; standardization of electric equipment. Paper presented before Second World Power Conference, Berlin.

Water Power Resources of Canada and Their Development, J. T. Johnston. Eng. Jl. (Montreal), vol. 13, no. 7, July 1930, pp. 407-424, 12 figs. and one supp. map. Available and developed water power in Canada; developments between 1924 and 1930; capital investment; coal equivalent of developed water power; distribution in various industries; review by Provinces. Paper presented before Second World Power Conference, Berlin.

HYDRO-ELECTRIC POWER PLANTS

AUTOMATIC. New Nova Scotia Plant Equipped with Automatic Turbines, K. E. Whitman. Elec. News (Toronto), vol. 39, no. 13, July 1, 1930, pp. 31-34, and 44, 5 figs. Detailed description of plant at Tusket Falls, Nova Scotia.

CANADA. Recent Trends in Water Power Development in Canada, T. H. Hogg. Eng. Jl. (Montreal), vol. 13, no. 7, July 1930, pp. 425-434, 15 figs. Important recent developments in methods of design and construction of hydro-electric power plants and their equipment discussed under intakes, dams, tunnels, draft tubes, waterwheels, governors, bearings, automatic plants, layout of electric equipment, generators, transformers, and storage. Paper presented before Second World Power Conference, Berlin.

GERMANY. The Schluchsee Hydro-Electric Plant (Das Schluchseewerk), A. Eisenlohr. Bautechnik (Berlin), vol. 8, no. 17, Apr. 18, 1930, pp. 259-263, 14 figs. Description of hydro-electric development in Schwarzwald region in Rhine River basin, utilizing storage in natural mountain lake by means of series of tunnels; total useful head of some 600 m. utilized in three stages, developing total of 500,000,000 kw. hrs. per annum; report on construction of tunnels, small dams, power houses, etc.

The Affoldern and Bringhausen Power Plants in the Edertal Dam District (Die Kraftwerkbauten Affoldern und Bringhausen im Gebiete der Edertalsperre), K. Volk. Siemens Zeit. (Berlin), vol. 10, no. 6, June 1930, pp. 404-414, 15 figs. Description of two correlated hydro-electric plants consisting of concrete weir about 10 m. high and earth embankment 3.7 km. long, these two forming reservoirs of 2,200,000 cu. m. capacity; Bringhausen plant is of pumped storage type, water being pumped from upper end of Affoldern reservoir to an artificial reservoir, located about 300 m. above tail-water, and having capacity of 760,000 cu. m.; construction methods, electrical equipment.

GREAT BRITAIN. Lead Mining under Helvellyn. Metropolitan Vicker Gaz. (Manchester), vol. 12, no. 207, June 1930, pp. 128-133, 9 figs. Object of power development has been to make most efficient use of water power available to provide for growing demand of mine for electric energy; pipe line, 21-in. bore and 1,530 ft. long, conducts water to power house, where it supplies two Turgo impulse wheels, direct connected to alternators of 110 kw. and 250 kw. capacity, respectively.

MEXICO. An Automatic Hydro-Electric Power Station in Mexico. Metropolitan Vickers Gaz. (Manchester), vol. 12, no. 207, June 1930, pp. 135-137, 5 figs. Function of station is to utilize available evergy from variable water supply to generate electricity for supply to Necaxa, Noncolco line; two generating sets are installed, one of 3,800-kw. and other of 1,570-kw. capacity together with automatic control gear by means of which all operations otherwise requiring skilled attention are carried out; station requires attendance only of simplest nature.

REMOTE CONTROL. Remote Control at Muskoka Hydro Plant. Can. Engr. (Toronto), vol. 59, no. 1, July 1, 1930, pp. 111-112, 3 figs. Operation features of control of Trethewey Falls Station of Ontario Hydro-Electric Power Commission which is centralized with Hanna chute and South Falls on one station.

I

INDUSTRIAL HEATING

GAS VS. ELECTRIC. Relative Places of Gas and Electricity in Industrial Heating, R. A. Hadfield and R. J. Sarjant. World Power (Lond.), vol. 14, no. 79, July 1930, pp. 19-20. Authors analyze different advantages of electric and gas-fired furnaces in iron and steel industry; each form of energy has its merits, and individual needs can alone decide which should best be employed. Abstract of paper read before World Power Conference, Berlin.

INDUSTRIAL PLANTS

MATERIALS HANDLING. Mass Production Conveyed, J. E. McBride. Black and White, vol. 2, no. 6, Aug. 1930, pp. 17, 19-22, 2 figs. Discussion of mass production in automobile industry; brief description of materials handling methods employed.

POWER COSTS. Power Costs in Industrial Plants and Their Calculation (Energiekosten in Betriebswirtschaft und Abrechnung), F. Landsberg. Waerme (Berlin), vol. 53, no. 25, June 21, 1930, pp. 489-492, 2 figs. Method of cost accounting to determine economy of power generation and financial aspects of power economics for enterprise as a whole.

INTERNAL COMBUSTION ENGINES

DESIGN. Two-Stroke Engines, Some Experiments on a New Type, J. W. Robertson. Automobile Engr. (Lond.), vol. 20, no. 269, July 1930, pp. 267-272, 18 figs. Discussion of two-stroke development and characteristics; detailed description of design and performance of experimental sleeve unit; lower part of sleeve forms charging piston; 28 b.hp. per litre at 2,800 r.p.m.; good idling at 500 r.p.m.

VIBRATIONS. Calculations of Forced Torsional Vibrations of Multiple Mass System With Particular Regard to Internal Combustion Engines (Die Berechnung erzwungener Drehschwingungen von Mehrmassensystem en, mit besonderer Beruecksichtigung der Verhaeltnisse bei Motorenanlagen), H. Behrens. Zeit. fuer Flugtechnik und Motorluftschiffahrt (Munich), vol. 21, no. 12, June 28, 1930, pp. 297-304, 27 figs. Formulae for reducing system with arbitrary number of masses and exciting moments to one equivalent mass and one equivalent moment; simplified solution for multi-mass system which consists of masses of same size; examples and graphs illustrate procedure.

IRON DEPOSITS

ONTARIO. Beardmore-Nezah Gold Area, Ontario, G. B. Langford. Economic Geology, vol. 25, no. 3, May 1930, pp. 251-269, 8 figs. Area lies 45 mi. north of Lake Superior; topography; general geology; structure; Timiskaming iron formations; no commercial ore bodies developed; gold in fissure veins; fault fractures formed following intrusion of Algoman porphyries; origin of veins; very little development has been done in this area, except by prospectors; two shafts have been sunk, and it is reported that vein has been followed to depth of 200 ft. with mineable grade and width. Bibliography.

IRON AND STEEL INDUSTRY

JAPAN. Japan's Steel Industry Has Become Our Best Scrap Customer Abroad, G. S. Herrick. Iron Age, vol. 126, no. 2, July 10, 1930, pp. 84-86 and 131, 5 figs. Statistical analysis of production imports and exports showing that in 1929, Japan imported 208,260 tons of steel scrap from United States alone and bought for importation only 79,875 tons of light gauge black sheets.

L

LIGNITE

DRYING. Operating Experiences in Drying Department of Briquet Factory and Recommendations for Control of Drying Process (Betriebserfahrungen im Trockendienst einer Brikettfabrik und Vorschlaege zur Ueberwachung des Trockenprozesses), M. Mayer and Mittelsteiner. Braunkohle (Halle), vol. 29, nos 27 and 28, July 5, 1930, pp. 577-580 and July 12, pp. 601-608, 6 figs. General aspects for applying drying process; drying in draft without sifting; partially fractionated drying with different sifting methods.

RESEARCH. Lignite Research and Pollen Analysis (Braunkohlenforschung und Pollenanalytik), F. Kirchheimer. Braunkohle (Halle), vol. 29, no. 21, May 24, 1930, pp. 448-463, 10 figs. Microfloral, especially pollen-analytical, method as aid in lignite research is discussed. Bibliography.

LIGNITE DEPOSITS

ONTARIO. The Lignite Deposit at Onakawana, Moose River Basin, Ontario, W. S. Dyer. Can. Min. and Met. Bul. (Montreal), no. 219, July 1930, pp. 884-906, 10 figs. partly on supp. plates. Full amplified text of paper previously indexed from abstract in Can. Min. Jl., Mar. 21, 1930.

LOCOMOTIVES

GERMANY. Theory of Steam Locomotive on Experimental Basis (Theorie der Dampflokomotive auf versuchsmaessiger Grundlage), H. Nordmann. Organ fuer die Fortschritte des Eisenbahnwesens (Berlin), vol. 85, no. 10, May 15, 1930, pp. 225-270, 79 figs. Detailed discussion of theoretical and practical basis of locomotive design; combustion problems and boiler efficiency; effect of steam pressure and degree of superheating; steam consumption and efficiency of engine; cylinder arrangement, compound arrangement, etc.; coal consumption, thermal efficiency and output characteristics of locomotive as unit.

Structural Design of State Railway Locomotives (Die konstruktive Durchbildung der Reichsbanlokomotiven), R. P. Wagner and F. Witte. Organ fuer die Fortschritte des Eisenbahnwesens (Berlin), vol. 85, no. 6-7, Mar. 20, 1930, pp. 94-109, 16 figs. Classification of types is given and principal details are discussed and illustrated by sketches.

HIGH PRESSURE. High-Pressure Locomotive. Times Trade and Eng. Supp. (Lond.), vol. 26, no. 627, July 12, 1930, p. 428. Constructed for German Railways Co. on Schwartzkopff-Loeffler system; compared with ordinary low-pressure super-heated locomotive, it is expected to show saving in coal and water of over 40 per cent; pressure in high-pressure circuit and at inlet to high-pressure cylinders is maintained at 1,420-1,700 lbs. per sq. in. gauge, after which steam leaves at pressure of 256 lbs. per sq. in. and passes through centrifugal oil separator to feedwater heater, and to chamber of heat exchanger.

UNITED STATES. On the Question of Locomotives of New Types; in Particular Turbine Locomotives and Internal Combustion Motor Locomotives (Subject V for Discussion at the Eleventh Session of the International Railway Congress Association), A. Lipetz. Int. Ry. Congress Assn.—Bul. (Lond.), vol. 12, no. 7, July 1930, pp. 1683-1700, 12 figs. Design characteristics, dimensions, and operating data of turbine and internal combustion motor locomotives; locomotives with watertube fire-boxes.

WEIGHT DISTRIBUTION. Weight Transfer Compensation for Locomotives, B. D. Wheeler. Elec. Jl., vol. 27, no. 7, July 1930, p. 394, 1 fig. To overcome difficulty, scheme of compensation has been developed by which two motors of truck are connected in series and leading motor operated on short field.

LUBRICANTS

CUTTING. Machinery's Data Sheets 181 and 182. Machy. (N.Y.), vol. 36, no. 11, July 1930, p. 888A. Practice in the use of cutting fluids; number of users for each class of fluid for operations on cast iron, brass, copper and aluminum.

LUMBER INDUSTRY

NEW ZEALAND. New Zealand Lumber Imports Increase in 1929, W. L. Lowrie. Commerce Reports, no. 28, July 14, 1930, pp. 100-102. Analysis of statistics showing that hardwood imports are slightly reduced; softwood imports increase; bulk of hardwood imports come from Australia; about 63 per cent of softwood imports come from United States.

M

MACHINE TOOL INDUSTRY

GERMANY. German Engineering Practice in the Light of the Leipzig Fair (Deutsche Technik 1930 im Spiegel der Leipziger Messe), H. Schelelmann. Giesserei-Zeitung (Berlin), vol. 27, no. 13, July 1, 1930, pp. 347-353, 10 figs. Review of developments in past decade with special regard to machine tools, woodworking machines, etc., outstanding examples of which are described; discussion of extent to which American fabrication methods can be applied in Germany; lessons to be learned by foundrymen.

MACHINE TOOLS

REDUCING COSTS. Machine Tools From the User's Point of View, H. C. Armitage. Machy. (Lond.), vol. 35, nos. 909-910, Mar. 14, 1930, pp. 782-785, Mar. 20, pp. 817-820, and Mar. 27, pp. 849-851, 14 figs. Mar. 14: Cost reduction by installation of new machine tools; manufacturing costs, feeds and speeds, waste handling time; capital recovery after machine purchase. Mar. 20: Bar automatics; centre lathes; drilling machines. Mar. 27: Gear-cutting machines; grinding machines; milling machines; chucking capstans and turret lathes; chucking automatics; electric welding machines. From paper read before Manchester Assn. of Engrs.

REVIEW. Shop Equipment Review. Am. Machinist, vol. 73, no. 3, July 17, 1930, pp. 73-147. Semi-annual résumé of machinery, tools, mechanisms, parts, and materials described in shop equipment news sections of American Machinist during six months of 1930, and also similar résumé of Engineering Workshop equipment sections of European edition for December, 1929, to May, 1930, inclusive.

SPECIFICATIONS. Manufacture of Machine Tools for Wood and Metal Working (Tie Uebereinstimmung in der Herstellung von Werkzeugmaschinen fuer Holz- und Metallbearbeitung), W. Iwascheff. Werkstattstechnik (Berlin), vol. 24, no. 8, Apr. 15, 1930, pp. 213-214. Discussion of suggestions for accuracy of woodworking machines; comparison with metal-working machine shows need for closer tolerances.

MATERIALS HANDLING

MATERIALS HANDLING. Bucket Elevators, Bucket Hoists and Belt Conveyors (Skopelevatorer, Skophissar Och Remtransportoerer), E. Dahlin. Teknisk Tidskrift (Stockholm), vol. 60, no. 25, June 21, 1930, pp. 76-81, 3 figs. Operating costs, wear, maintenance cost, life, safety of operation, and cost calculations. (Concluded.)

PNEUMATIC. Simplified Computations for Branching Ducts and Description of Simple Device for Determination of Proper Rising Speed of Various Conveyed Materials (Vereinfachte Berechnung verzweigter Rohleitungen, etc.), R. Karg. Gesundheits-Ingenieur (Munich), vol. 53, no. 20, May 17, 1930, pp. 305-308, 1 fig.

Velocity of Suspended Substances and Its Determination for Pneumatic Conveying of Material (Die Schwebegeschwindigkeit und deren zuverlaessige Ermittlung fuer pneumatische Materialtransporte), H. R. Karg. Foerdertechnik und Frachtverkehr (Wittenberg), vol. 23, no. 10, May 9, 1930, pp. 191-193, 2 figs. Method for finding correct velocity for pneumatically conveyed materials is described.

METALLURGY

METALLURGY. Some Factors of Solidification in Relation to Metallurgical and Geological Problems. Chem. Met. and Min. Soc. of S. Africa—Jl. (Johannesburg), vol. 30, no. 10, Apr. 1930, pp. 292-301 and (discussion), 301-303. Broad discussion of behaviour of metals in cooling and solidification; physical reactions in cupellation of bullion; solidification of ore metals and minerals from molten magma; segregation.

METALS

AGE HARDENING. Age-Hardening, M. L. V. Gayler. Metallurgist (Supp. to Engineer, Lond.), June 1930, pp. 91-93. Of theories put forward to explain age hardening, one which has gained most ground is precipitation theory which attributes age hardening to precipitation, in highly dispersed state, of particles from super-saturated solid solution; facts which have been established regarding changes which take place during age hardening are strong confirmation that hardening is due to precipitation of highly dispersed particles.

CORROSION TESTING. New Process for Simultaneous Corrosion Testing of Different Metals (Ein neues Verfahren zur gleichzeitigen Korrosionskurzpruefung verschiedener Metalle), G. Gollnow. Giesserei (Duesseldorf), vol. 17, no. 27, July 4, 1930, p. 665, 2 figs. Details of electric process and equipment for measurement of corrosion of metals in solutions, developed by Toedt.

FATIGUE. Fatigue Strength and Tensile and Rupture Strength, W. Kuntze. Metallurgist (Supp. to Engineer, Lond.), June 1930, pp. 94-95. According to author rupture strength plays important part in fatigue phenomena; this property is defined as tensile strength when all deformation is prevented; procedure is to measure breaking tensile stress of number of specimens having circular notches of different depths and to extrapolate curve of maximum stress against area at base of notch to zero area. Translated abstract previously indexed from V.D.I. Zeit., Feb. 22, 1930.

FLOW. Flow Pressure of Metals and Alloys at Various Temperatures, V. P. Shishokin. Tzvetniye Metalli (Moscow), no. 5, May 1930, pp. 662-671, 4 figs. Results of experimental study of flow pressure of metals having low melting point, including tin, lead, cadmium, bismuth, etc.; empirical law of variation of flow pressure with temperature is derived; temperature coefficient of flow pressure is numerically equal to temperature coefficient of Brinell hardness. (In Russian.)

MINING ENGINEERING EDUCATION

WASHINGTON. Washington College Offers Thorough Training, A. E. Drucker. Min. Jl., vol. 14, no. 1, May 30, 1930, pp. 7-8, 2 figs. Dean of School of Mines and Geology, at Pullman, Wash., gives outline description; instruction is given in all branches of mining, metallurgy and geology, with ample opportunity for selection of specialized field.

MINING GEOLOGY

ONTARIO. Geology of the Area between Favourable Lake and Sandy Lake, District of Kenora (Patricia Portion), M. E. Hurst. Ontario Dept. of Mines—Report (Toronto), vol. 38, part 2, 1929, pp. 49-84, 29 figs., map in pocket. Area 230 mi. north of Hudson or Sioux Lookout station; topography, climate, resources, etc.; general geology; mineralization is confined to beds of Keewatin-Timiskaming rocks, at or near contacts, in quartz veins in gabbro or greenstone, and along fractures in acidic volcanics; notes on properties with ores carying gold, silver, lead, zinc and copper.

MINES AND MINING

ACCIDENTS. Mining Accidents in 1928, T. F. Sutherland, G. E. Cole, D. G. Sinclair, J. G. McMillan and A. R. Webster. Ontario Dept. of Mines—Report (Toronto), vol. 38, part 1, 1929, pp. 184-187. Tabular statistics; notes on prosecutions for violation of Safety Regulations.

ONTARIO. Mines of Ontario in 1928, D. G. Sinclair, R. H. Cleland, E. C. Keeley, G. S. Jarrett and A. R. Webster. Ontario Dept. of Mines—Report (Toronto), vol. 38, part 1, 1929, pp. 69-183. Table contains names of all operating properties and works inspected in 1928; lists of principal stone quarries and clay pits are added; notes on activities of principal operators, including cost data and mill statistics in some cases.

Statistical Review of Ontario's Mineral Industry in 1928, W. R. Rogers and A. C. Young. Ontario Department of Mines—Report (Toronto), vol. 38, part 1, 1929, pp. 1-65. Tabular production statistics.

MINERS' PHTHISIS

SOUTH AFRICA. Miners' Phthisis on the Witwatersrand, L. G. Irvine and A. Mavrogordato. Empire Min. and Met. Congress (S. Africa),—Advance Paper for mtg. Apr. 1930, 15 pp. and tabular data on supp. plate; see also abstract in Iron and Coal Trades Rev. (Lond.), vol. 120, no. 3243, Apr. 25, 1930, p. 677. Miners' phthisis and silicosis are used as equivalent terms; important factors concerned are silica dust and tuberculous infection; discussion of what has been done in matter of detection and prevention, and of results accomplished; statistical data for South Africa.

MOTOR BUS DESIGN

TREND OF. The Trend of Motorcoach Design, F. R. Fageol. Soc. Automotive Engrs.—Jl., vol. 27, no. 1, July 1930, pp. 18-21, and (discussion) 21-23, 3 figs. Discussion of body types and sizes; notes on Diesel engine possibilities and speed and driver control devices.

MOTOR TRUCKS

FRANCE. Motor Trucks in France (Das Lastauto in Frankreich), K. Bilau. Automobil Rundschau (Berlin), vol. 32, no. 9, May 1, 1930, p. 182; see also brief translated abstract in Automotive Abstracts, vol. 8, no. 6, June 20, 1930, p. 113. Registration of 350,000 trucks last year shows that one-third of all vehicles belong in this class; 3-and 5-ton types lead field; War Department now concentrates on development of 13-ton type to be used in trans-Sahara transportation; another field of research involves use of inferior fuels.

MOTORSHIPS, DIESEL

"BRITANNIC." The Twin-Screw Passenger Line "Britannic". Shipbldr. (Newcastle-on-Tyne), vol. 37, no. 241, July 1930, pp. 590-614, 45 figs. Similar description previously indexed from various sources.

The Largest British Motorship. Shipbldg. and Shipg. Rec. (Lond.), vol. 35, no. 26, June 26, 1930, pp. 803-812, 9 figs. Similar description previously indexed from various sources.

MOULDING MACHINES

FOUNDRY. Methods of Moulding Castings for Stoves, Heating Apparatus, and Various Builders' Castings, H. Magdelenat. Foundry Trade Jl. (Lond.), vol. 43, no. 725, July 10, 1930, pp. 24-27, 10 figs. Description of methods of moulding pedestal stove, certain cooking range parts; skylight frame and sink; plan and elevation of Rosieres-Bachon continuous moulding machine lay-out; notes on sand preparation; labour; production and wages.

Rational Non-Ferrous Foundry Practice [Rationelle Metallgiesserei Praxis—Das kastenlose Formen (Amerikaguss)]. Zeit. fuer die Gesamte Giessereipraxis (Berlin), vol. 51, no. 26, June 29, 1930 (Metall.), pp. 105-107, 11 figs. Flaskless moulding practice is discussed.

MOVING PICTURES

SOUND. Sound Motion-Picture Photography, J. P. Livadary. Electronics, vol. 1, no. 5, Aug. 1930, pp. 240-242, 5 figs. Fundamental principles underlying sound motion-picture photography; variable density method of sound recording is considered and most definitions are derived from theoretical considerations rather than arbitrary assumptions.

The Sound-Picture Industry Abroad, F. S. Irby. Electronics, vol. 1, no. 4, July 1930, p. 193. Statistics data and table.

N

NATURAL GAS WELLS

PRESSURE REGULATION. Practical Pressure Regulation, T. H. Beals. Natural Gas, vol. 11, no. 6, June 1930, pp. 14-15 and 56. Importance of pressure control; types of well pressure-control devices; classification of regulation; difficulties encountered in effort to obtain proper regulation. Paper read before Southwestern Gas Measurement Short Course.

O

OIL ENGINES

OPERATION. A Low-Compression Heavy-Oil Engine. Motor Transport (Lond.), vol. 51, no. 1323, July 21, 1930, pp. 93-95, 2 figs. Hesselman power unit has electric ignition and special features to insure thorough mixing of fuel and air; fuel pumps and nozzles; special piston design.

OIL FIELDS

EQUIPMENT STANDARDIZATION. Reports of Meetings held by Committees on the Standardization of Oil Field Equipment. Am. Petroleum Inst.—Standardization Bul., no. 104, of mtg. Dec. 2-5, 1929, pp. 1-143, 91 figs. Reports of meetings held by various A.P.I. committees on standardization of oil field equipment during tenth annual meeting of Institute, Stevens Hotel, Chicago, Ill.

WASTE DISPOSAL. Long Beach Waste Handled By Unit Disposal System, B. Mills. Oil Weekly, vol. 58, no. 1, June 20, 1930, pp. 26-27, 3 figs. Method of disposal of 60,000,000 bbls. of rotary mud, tank bottoms, and general field waste in less than 3½ years at cost of less than one-half cent per barrel has been made in Long Beach field by Oil Operators, Incorporated.

OIL SHALES

ESTHONIA. Esthonian Shale as Source of Oil (Der estlaendische Brennschiefer als Oelquelle), H. Von Winkler. Petroleum (Berlin), vol. 26, no. 27, July 2, 1930, pp. 737-740. Shale of this district is known as "kuckersit"; although Esthonian shale is one of richest sources of gasoline in old and new world, it has disadvantage of large coke residues; account of methods which have been employed successfully and otherwise for recovery of oil from these shales; in succeeding article, pp. 740-745, review is given by C. Gaebert of work on Esthonian shale, published by F. Wassermann and edited by author of above article.

OIL WELL DRILLING

CORE. Orientation of Cores, G. A. Macready. Am. Assn. of Petroleum Geologists—Bul., vol. 14, no. 5, May 1930, pp. 559-578, 11 figs. Orientation of cores should be of great value in geological investigations of subsurface structures; historical development of orientation of cores since early German method of seventies is reviewed, recent California practice is touched on, and investigations by writer since 1918 are described. (Bibliography.)

CROOKED HOLES. Crooked-Hole Problems in the Gulf Coast District, P. C. Murphy and S. A. Judson. Am. Assn. of Petroleum Geologists—Bul., vol. 14, no. 5, May 1930, pp. 595-605, 3 figs. Abstract of article previously indexed from Oil and Gas Jl., Mar. 27, 1930.

DEEP. Review of Drilling Below 5,000 Feet in West Texas, R. A. Jones. Oil Weekly, vol. 57, no. 12, June 6, 1930, pp. 28-30, 110, 112, and 114, 1 fig. Important features of University 1-B completed at depth of 8,525 ft.; production of well; geology of section, tests below 5,000 ft.

DIESEL ENGINES. Diesel Engine Drills Deepest Cable Tool Well. Oil Field Eng., vol. 8, no. 1, July 1930, pp. 30-31, 3 figs. Using gas oil as fuel, consumption has been held below 42 gals. per day with one type of Diesel engine, while second varied from 30 to 50 gals. per day.

EQUIPMENT. Largest Electric Drilling Equipment in Oklahoma City Field, W. A. Sawdon. Oil Field Eng., vol. 8, no. 1, July 1930, pp. 18-19 and 39, 4 figs. Importance of calibrating ammeters; results of test made on electric power consumption and time taken in pulling out from depth of 3,160 ft. in Hall and Brisco well Lindsey No. 1.

FISHING. The Use of Acids in Fishing Jobs, S. Klinghoffer. Petroleum Times(Lond.), vol. 23, no. 598, June 28, 1930, p. 1136. In discussing reported advocacy in United States of use of acids for freeing boreholes of tightly-wedged pieces of iron, in cases where customary mechanical fishing practice has proved unavailing, author states that while he does not wish to discourage such important pioneer work, facts as stated in America do not tally with his own experience in laboratory and in practice. Abstract translated from Petroleum, date not specified.

GASOLINE ENGINES. Gasoline Unit Complete 7,818-Ft. Well. Oil Field Eng., vol. 8, no. 1, July 1930, pp. 37-39, 4 figs. Six-cylinder engine, transmission, clutches and brake mounted as unit drills deep cable tool well to pay sand.

WIRE ROPE. Wire Rope Service—How to Increase It, C. A. Perryman. Oil Field Eng., vol. 8, no. 1, July 1930, pp. 16-17. Proper diameter of line exceeding 45,000 ft. long is 1 in.; ways of prolonging life of cable; safe working load; special points to be guarded in drilling practice.

P

PAINT

TESTING. Practical Test for Determining the Hiding Power of Paints, H. A. Gardner, G. G. Sward and S. A. Levy. Metal Cleaning and Finishing, vol. 2, no. 6, June 1930, pp. 537-538. Outline of method of determining hiding power of paint by brushing out paint upon surface of checkerboard linoleum made up of black and white blocks. Abstract of paper presented before Am. Soc. Testing Matls., previously indexed from advance paper.

PATENT LAW

UNITED STATES. Extent of Permissible Monopoly in Patents, L. T. Parker. Power Plant Eng., vol. 34, no. 10, May 15, 1930, pp. 573-574. Review of present laws and high court decisions involving rights of patentees.

PAVEMENTS

ASPHALT. Six Varieties of Cold Laid Asphalt Pavements, A. W. Dow. Contract Rec. and Eng. Rev. (Toronto), vol. 44, no. 30, July 23, 1930, pp. 896-898. Details of types of road surfacing that have become popular and are increasing in use; asphalt amiesite type, cut back asphalt binders, emulsified asphalt binders, colprovia type, macasphalt type.

PETROLEUM ANALYSIS

STANDARDIZATION. Report of the Special A.P.I. Committee on Standard Procedure for Measuring, Sampling, and Testing of Crude Oil, Held at Stevens Hotel, Chicago, Ill., Dec. 4, 1929. Am. Petroleum Inst.—Standardization Bul., no. 104, of mtg. Dec. 2-5, 1929, pp. 144-150. Report as indicated; report of sub-committee on "uniform tank measurements and gauge tables" (group 1.)

PETROLEUM ENGINEERING

EDUCATION. Educating Engineers for the Petroleum Industry, J. F. Dodge. Oil Field Eng., vol. 8, no. 1, July 1930, pp. 43-44. Author believes that recent division of petroleum engineering field into development and production engineering is ill-advised and premature.

PETROLEUM INDUSTRY

RUSSIA. Five-Year Plan for the Development of the Petroleum Industry of U.S.S.R. Gorniy Journal (Moscow), vol. 105, no. 10, Nov. 1929, pp. 1671-1702. General review of present status of petroleum industry in Russia with special reference to available resources, exploration, and new drilling, production of petroleum and natural gas; petroleum refining; financial problems, scientific management of petroleum industry; cost data. (In Russian.)

PETROLEUM PIPE LINES

RUSSIA. Selection of Alignment for the Emba Petroleum Pipe Lines, A. Bondaryevsky. Azerbayjanskoye Nephtyanoye Khozyaistvo (Baku), no. 5, May 1930, pp. 21-30, 1 fig. Comparative discussion of following routes: Dossor-Stalingrad, on Volga, 640 km., Dossor-Saratov, on Volga, 667 km., Dossor-Samara, on Volga, 670 km., and Dossor-Aktyubinsk on Orenburg-Tashkent railroad, 442 km.; author favours last mentioned route for main pipe line with capacity of 2½ million tons per annum, in contrast with Russian government plan for 2 million ton pipe lines to Volga and half million ton line to Aktyubinsk. (In Russian.)

PETROLEUM REFINING

BY-PRODUCTS. Petroleum Residuals and By-Products, A. E. Dunstan. Petroleum Times (Lond.), vol. 23, no. 598, June 28, 1930, pp. 1123-1126. Discussion of utilization of acid sludge, petroleum coke, asphalt residues, and waste gases for power purposes. Abstract of paper read before Second World Power Conference, at Berlin.

Edeleanu Process. Anti-Knock Motor Fuel, L. Edeleanuand W. Grote. Petroleum Times (Lond.), vol. 23, no. 568, June 28, 1930, p. 1148. Advantages of use of liquid sulphur dioxide in refining are stressed; summary of results of experiments with motor fuels of different origins; authors point out that character of cracked gasoline and properties of crude oil from which it originates are important in determining quality of products prepared by their method; where high-boiling fraction over 175 deg. cent. is high in aromatics, anti-knock value of resulting motor fuel will be higher. Abstract translated from Brennstoffchemie, June 1, 1930.

PHOTO-ELECTRIC CELLS

Applications. Automatic Control With Photo-Electric Cells, E. H. Vedder. Elec. Jl., vol. 27, no. 7, July 1930, pp. 407-410, 12 figs. Application of light relay other than automatic control in industry is outlined; examples of controlling light in factory; photo-cell indications of breakage in paper manufacture, flashover protection of electric generators, automatic counting etc. are given.

Electric Oscillations in Photo-electric Cells and Their Application in Reading Machines for the Blind (Bemerkungen ueber die elektrischen Schwingungen in den Photozellen und ihre Anwendung bei den Lesemaschinen fuer Blinde), B. L. Rosing. Zeit. fuer Technische Physik (Leipzig), vol. 11, no. 6, 1930, pp. 178-182, 10 figs. Mechanism of photo cell discharges and action of resistance, capacity and self-induction coefficients on same; oscillations and experimental tests; action of exposure, complete characteristics of photo cells of Elster, Geitel and Karolus.

No Rain Checks Needed for this Ceremony, F. H. Gulliksen. Elec. Jl., vol. 27, no. 7, July 1930, pp. 398-399, 3 figs. Application of photocells of control of crane in lifting of corner stone of new Westinghouse Engineering Laboratory; speaker's table was located indoors several hundred feet away.

Photo-Electric Cell and Its Applications (La cellule photoélectrique et ses applications), L. Dunoyer. Technique Moderne (Paris), vol. 22, nos. 4, 5 and 6, Feb. 15, 1930, pp. 137-144, Mar. 1, pp. 179-182 and Mar. 15, pp. 212-219, 37 figs. Manufacture and properties of photo-electric cells; measurement of photo-electric currents; application of photo-electric cells in telephotography, television, sound, and talking picture practice.

PIG IRON

Hematite. Change in Properties of Hematite Pig Iron Cast in First Charge (Aenderung der Eigenschaften des in erster Schmelzungvergossenen Haematiroheisens), E. Piwowarsky. Stahl und Eisen (Duesseldorf), vol. 50, no. 27, July 3, 1930, pp. 966-968. Temperature losses during transport of ladle from blast furnace to mixer; changes in chemical composition and strength are traced up to finished product; difference in behaviour of specimens cast in chill and in sand.

PIPE

Centrifugal Casting. Chemical Composition and Mechanical Properties of Centrifugal Castings, J. E. Hurst. Metallurgia (Lond.), vol. 2, nos. 7 and 8, Mar. 1930, pp. 13-16 and June, pp. 54-56 and 53, 11 figs. May: Applications of centrifugal casting, to pipe and to drums and cylinders for piston rings, cylinder liners, etc.; British Eng. Standards Assn. Specification as to chemical composition; distribution of constituents; tendency to segregations; microstructure; mechanical properties; data on bursting, collapsing, bending, tensile, and transverse tests. June: Impact tests; Brinell hardness; sand-spun pipe; piston ring and cylinder testing.

PIPE LINES

Wood Stave. Specifications of Construction of Wood Stave Pipe Line (Technische Vorschriften fuer Herstellung einer Holzrohrleitung aus Dauben und Spannringen), Schubert. Gas und Wasserfach (Munich), vol. 73, no. 21, May 24, 1930, pp. 489-499, 8 figs. Text of privately proposed standard specifications, principally for underground pipe lines.

PLATINUM ORE TREATMENT

Transvaal. The Production of Platinum Concentrates from Transvaal Ores, T. K. Prentice. Chem., Met. and Min. Soc. of S. Africa—Jl. (Johannesburg), vol. 30, no. 8, Feb. 1930, pp. 244-245. Author's reply to discussion of paper indexed in Engineering Index 1929, p. 1427, from various sources.

POWER PLANTS

Design. Kraftwerks-Bauten. Berlin, Siemens-Schuckert, 1929; 137 pp., plates. Price not indicated. Portfolio of photographs and plans of number of electric power plants recently built by Siemens-Schuckert works; layout and construction of buildings is considered, not equipment; brief data about capacity and equipment are given, with references to more comprehensive published description. Eng. Soc. Lib., N.Y.

Diesel-Electric. Influence of Peak-Load Plants on Economy of Large Power Plants (Einfluss Spitzenkraftwerken auf die Wirtschaftlichkeit von Grosskraftwerken), M. Gercke. Waerme (Berlin), vol. 53, no. 24, June 14, 1930, pp. 482-485, 1 fig. Economy in use of peak-load Diesel engines is illustrated by results obtained in number of German plants; influence of separation of basic and peak load and economic effect of absorption of peak load with special regard to use of Diesel engines are discussed based on American and German studies.

Diesel Power Replaces Steam at Public Utility Plant. Power Plant Eng., vol. 34, no. 15, Aug. 1, 1930, pp. 865-866, 3 figs. Low repair cost characterized operation of Consolidated Public Utility Co.'s plant; installation uses pressure lubrication; low repair record.

Steam vs. Hydro-electric. Hydro Yields to Steam on Economic Grounds, F. B. Lewis. Elec. World, vol. 95, no. 25, June 21, 1930, pp. 1298-1299, 1 fig. At zero load factor annual cost of steam power is less than that of water power; under steam-plant efficiencies and fuel costs obtainable some years ago, additional output expense of steam production, with increased load factor, caused total steam costs to exceed water-power costs, except at relatively small load factors.

Cheap Steam Power Checks Hydro-Expansion, A. H. Markwart. Elec. World, vol. 95, no. 25, June 21, 1930, pp. 1271-1273, 2 figs. Present trend of water-power development costs is upward, because as general thing remaining sites cost more to develop and are less accessible than those sites which have already been developed; influence of price of oil; natural gas going to waste; whole economic trend is toward 100 per cent steam for new installations, unless some very favourable hydro presents itself.

POWER RESOURCES

Canada. Energy Resources of Canada, B. F. Haanel. Can. Chem. and Met., vol. 14, no. 7, July 1930, pp. 203-207. Factors controlling the development and utilization of water-power, raw coal, gas and oil.

POWER TRANSMISSION

Short Centre Drive. Power Transmission With Centre Drives, R. Salmonsen. Power Plant Eng., vol. 34, no. 41, July 15, 1930, pp. 817-820, 5 figs. Details, speeds, and efficiencies of silent chain, V-belt, and flat belt.

PULVERIZED LIGNITE

Italy. Utilization of Pulverized Lignite, etc. (Utilizzazione del polverino di lignite con la combustione a polvere), U. Legnaioli. Elettrotecnica (Milan), vol. 17, no. 14, May 15, 1930, pp. 326-333, 18 figs. Practice of steam-electric plants of Castelnuovo dei Sabbioni (Arezzo) in firing with Valdarno pulverized lignite, originally containing 50 per cent moisture and 17 per cent ashes; B.W. boilers of plant generate steam at 13 atmospheres pressure; 4.3 kg. of fuel produced 1 kw. hr. of electric power.

PUMPS

Water Hammer. Overpressure in Delivery Main (Surpression Provoquée par l'arrêt d'un groupe moto-pompe dans la conduite de refoulement), L. Escande. Académie des Sciences—Comptes Rendus (Paris), vol. 190, no. 14, Apr. 7, 1930, pp. 855-857; see also brief translated abstract in Water and Water Eng. (Lond.), vol. 32, no. 378, June 20, 1930, p. 297. Calculations to determine overpressure in forced main caused by stoppage of motor-pump unit in case of abrupt throwing out of gear; from characteristics of pump, author plots curves; from which he deduces law of variation of pump delivery.

PUMPS, CENTRIFUGAL

Corrosion. Corrosion in Centrifugal Pumps, C. H. S. Tupholme. Power Plant Eng., vol. 34, no. 10, May 15, 1930, pp. 571-572. Discussion of chemical, mechanical and electrolytic changes which cause trouble.

Pumps, Centrifugal. From Centrifugal to Axial Flow Pumps, I. Hatakeyama. Soc. of Mech. Engrs.—Jl. (Tokyo), vol. 32, no. 151, Nov. 1929, pp. 434-439, 10 figs. Development of Inokuty's centrifugal pump is described statistically, and then, brief explanation is given about different kinds of pumps, from centrifugal to axial flow according to their specific speed together with some results of experiments, such as determination of best form of cross section of spiral casings, influence of mechanical losses upon small pumps, and flow of water in delivery pipe of axial flow pump. (In Japanese.)

PUMPS, FEEDWATER

Centrifugal. Centrifugal Feed Pumps for High-Pressure Boilers (Kreiselpumpen zum Speisen von Hochdruckkesseln), G. Weyland. V.D.I. Zeit. (Berlin), vol. 74, no. 15, Apr. 12, 1930, pp. 467-471, 14 figs.; see also brief translated abstract Power Engr. (Lond.), vol. 25, no. 292, July 1930, pp. 287-288. Stress is laid on importance of reliability in feed pumps for extra-high-pressure boilers; circulating pump, used in Mannheim plant to circulate water through superheater during starting period until steam is available from boiler, can be subjected to pressures up to 100 atmos. and temperatures to 310 cent.; it runs at 1,450 r.p.m. and delivers 40 tons per hr.

Centrifugal Pumps (Kreiselpumpen), G. Weyland. Waerme (Berlin), vol. 53, no. 24, June 14, 1930, pp. 473-481, 29 figs. Their application to feed of superpressure boilers is discussed; economic advantages of high feedwater preheating; proper design of hot-water pumps; necessity of reliable feedwater pumps for superpressure boilers, and experiences with such pumps; heating of feed water by flow through pump; condensate return to boiler without any special pump.

Turbine. Centrifugal Feed Pumps for High-Pressure Boilers, G. Weyland. Engineer (Lond.), vol. 149, no. 3883, June 13, 1930, pp. 666-667, 10 figs. Details of turbine-driven pump which automatically comes into operation when electrically driven pump working in conjunction with it is stopped; characteristics of 10-stage Klein Schanzlin and Becker pump with different blades, both designed for same maximum output at highest pressure; turbine-driven feed pump for hot water with output of 180 to 240 metric tons per hr. from Mannheim power station, and turbine, and motor-driven pump built for Benson boiler installation at Berlin Gartenfeld works of Siemens-Schuckert Co.

PULVERIZED COAL

Combustion. Pulverized-Fuel Problems, L. K. Ramzin. Iron and Coal Trades Rev. (Lond.), vol. 121, no. 3256, July 25, 1930, p. 127. Pulverized combustion affords greatest economy of fuel; non-caking fuels with high content of voltaile matter would be burnt to most advantage in pulverized form; profitability of powdered fuel furnace tends to increase smaller content of volatile matter in fuel; relative merits of centralized and unit systems of pulverized-fuel firing.

Dust Problem. Coal-Dust Problem (Betraege zur Kohlenstaubfrage), F. Prockat. Glasers Annalen (Berlin), vol. 106, nos. 8 and 12, Apr. 15, 1930, pp. 93-97 and June 15, pp. 151-154, 14 figs. Mathematical analysis; blow tests with coal dust; precipitation of dust, analysis of grain size, surface formation of coal, and absolute determination of surface; blow tests with slate, coal, and mixtures of both. (To be continued.)

PULVERIZED COKE

Properties. Pulverizing Properties of Coke in Relation to Its Tar Content (Die Mahlbarkeit des Schwelkokses in Abhaengigkeit von seinem Teergehalt), Rosenthal. Archiv fuer Waermewirtschaft (Berlin), vol. 11, no. 5, May 1930, pp. 169-172, 9 figs. Influence which govern pulverization are discussed, including influence of grain size, water content, and hardness; laboratory tests show that friability of coke depends upon tar residue content.

PULVERIZED LIGNITE

Drying. Preparation of Pulverized Lignite with Pneumatic Circulation Drying (Herstellung von Braunkohlenstaub mit der pneumatischen Umlauftrocknung), P. Rosin and E. Rammler. Braunkohle (Halle), vol. 29, no. 26, June 28, 1930, pp. 557-563, 11 figs. Circulation drying is pneumatic process according to which transport and drying of wet products in suspension are affected by hot gases which circulate at high speed through pipe system; details of circulating drier.

PRESSURE VESSELS

Welding. *See Welding.*

R

RADIO BEACONS

France. Radio Beacons of Bobigny for Aerial Navigation (Le radiophare de Bobigny pour la navigation aérienne), M. Clériot. Aéronautique (Paris), no. 133, June 1930, pp. 221-226, 12 figs. Radio beacons for aviation are new in France; article, after outlining general principles, characteristics, intensity of reception, sensitivity, and stability, etc., gives detailed description of 1-kw. beacon in Bobigny 5 km. from Bourget, employing 7 amp. in antenna.

RADIO EXHIBITION

Atlantic City. Engineering Trends in Receiving Sets at Atlantic City, K. Henney. Electronics, vol. 1, no. 4, July 1930, pp. 176-177, 3 figs. Short note on exhibit at Radio Manufacturers Association trade show at Atlantic City, public-address systems; tone control; new tubes.

RADIO SIGNALS AND SIGNALING

Trans-Oceanic. Vacuum-Tube Applications and Relay Circuits in Trans-Oceanic Photo-Radio, R. H. Ranger. Electronics, vol. 1, no. 5, Aug. 1930, pp. 224-226, 4 figs. Use of tone over circuits as means of indicating on and off conditions and use of vacuum-tube apparatus to put this tone on line and to take tone off and make it perform necessary on and off functions at receiving point; steps taken in complete photo-radio set-up, and adaptation of some principles to other fields.

RADIO TELEPHONE

Ship to Shore. Radio Telephone Service to Ships at Sea, W. Wilson and L. Espenschied. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 7, July 1930, pp. 542-546, 6 figs. Paper previously indexed from Advance Paper for mtg. May 7 to 10, 1930.

RADIO WAVES

Short. Very Short Radio Waves, A. B. Page. Electronics, vol. 1, no. 4, July 1930, pp. 173-175, 4 figs. Some possibilities of four-element tubes for other than radio or medical purposes; biological experiments.

RAILROAD TERMINALS, FREIGHT

Hamilton, Ont. New Freight Terminal at Hamilton Opened by Canada Steamship Lines, Ltd. Can. Ry. and Mar. World (Toronto), no. 389, July 1930, pp. 477-479, 4 figs. Design and features of freight terminal on bay front are discussed; general layout plans are illustrated.

RAYON MANUFACTURE

Review of. The Hollow Rayons and Synthetic Yarns, C. E. Mullin and F. H. Cadwell. Textile Colorists, vol. 52, no. 617, May 1930, pp. 317-319. Review of recent research covering manufacture of hollow fibres and apparatus. Bibliography.

Manufacture of Acetate Silk According to Wet Spinning Process (Ueber die Herstellung von Azetatseide nach dem Nasspinnverfahren), F. Ohl. Kunststoffe (Munich), vol. 20, no. 6, June 1930, pp. 122-125, 3 figs. Review of experimental research and patents covering wet process of acetate-silk manufacture; advantages and difficulties are set forth, and recommendations made for proper application of process.

RAYON SIZING

MIXTURES. Sizing Rayon and Rayon Mixtures, R. W. Pinault. Black and White, vol. 2, no. 6, Aug. 1930, pp. 26-29. Sizing rayon has much in common with cotton sizing, but has also resulted in many improvements in old-time sizing methods; soluble starches; use of finishing compounds; finishing cotton-rayon mixtures.

REFRACTORY MATERIALS

ABRASION TESTING. A Progress Report on the Development of an Abrasion Test for Refractories at High Temperatures, J. B. Shaw, G. J. Blair, and M. C. Shaw. Am. Ceramic Soc.—Jl., vol. 13, no. 7, July 1930, pp. 427-436, 8 figs. Method developed consists of steel chisel point moving back and forth over faces of brick clamped together; eleven bricks are tested at one time; chisel is actuated by means of jack hammer and is water-cooled; data show that principle is correct and capable of differentiating between brick of varying resistances to abrasion at temperatures as high as 1,350 deg. cent.

REFRIGERATION

DESIGN. Some Considerations in the Design of Modern Refrigerating Plant, B. C. Oldham. Brit. Assn. of Refrig.—Proc. (Lond.), vol. 26, no. 2, 1929-30, pp. 5-34 and (discussion) 35-61. Article previously indexed from Ice and Cold Storage, Feb. 1930.

REFRIGERATING PLANTS

TEMPERATURE REGULATION. Temperature Conditions in Automatic Refrigerating Plants (Temperaturverlauf in automatisch gesteuerten Kuehlanlagen), S. Jung. Zeit. fuer die gesamte Kaelte-Industrie (Berlin), vol. 37, no. 6, June 1930, pp. 101-110, 11 figs. Report of investigation undertaken to determine sensitivity and efficiency of temperature-regulating instruments for refrigerating plants; numerous existing plants were investigated and results are discussed.

REFUSE INCINERATORS

BIARRITZ. Incineration of Garbage (l'incinération des ordures ménagères), E. Marcotte. Revue Industrielle (Paris), vol. 60, no. 225, June 1930, pp. 358-369, 22 figs. Description of plant at Biarritz; agricultural and industrial utilization; utilization of refuse from Paris district; types of incinerators, with special reference to Bréchot incinerator and results of tests.

RESERVOIRS, STORAGE

CANADA. How the Cabonga Storage Reservoir Was Constructed, W. B. Hutcheson. Contract Rec. and Eng. Rev. (Toronto), vol. 44, no. 29, July 16, 1930, pp. 861-863. Description of control scheme for half million horsepower on Gatineau River in Quebec, involving storage of 45,000,000 cu. ft. by means of dam 797 ft. long and 26 ft. high; tractor haulage with 20 ton loads.

RIVERS

IMPROVEMENT. Experiments on Effect of Oblique Groynes on Concave Side of River Bend (Versuche ueber die Wirkung inklinanter Buhnen in einer konkaven Flusskruemmung), E. Riepe. Bautechnik (Berlin), vol. 8, no. 25, June 10, 1930, pp. 389-399, 24 figs. Review of previous studies on hydraulic groynes in straight river reaches and report on special experiments performed at hydraulic laboratory of Braunschweig Institute of Technology; photographs of hydraulic models showing eddies and contours of deposition of debris.

ROAD CONSTRUCTION

NOTES ON. Notes on Country Road Construction and Maintenance, T. H. Cross. Jr. Instn. of Engrs.—Jl. and Rec. of Trans. (Lond.), vol. 39, 1928-29, pp. 389-395. Brief description of early Roman roads in Great Britain; methods of constructing water-bound-roads, tarred roads, and concrete roads; road planning.

ROAD MATERIALS

BITUMINOUS. Direct Recovery of Tars by Fractional Condensation, F. Cooke. Gas World (Lond.), vol. 93, no. 2396, July 5, 1930, (Coking Sec.), pp. 13-17. Discussion of paper read before Coke Oven Mgrs. Assn., previously indexed from Mar. 1 issue of same journal.

ROCKET PROPULSION

EFFICIENCY. Propulsion by Reaction, M. Roy. Nat. Advisory Committee for Aeronautics—Tech. Memorandum, no. 571, June 1930, 19 pp., 4 figs. Mathematical investigation of efficiency of propulsion systems of rocket and propeller type; sketch shows propeller arrangement with reaction nozzles at tips of blades. From Technique Aéronautique, Jan. 15, 1930.

S

SEAPLANES

LANDING. Theory of Landing Shock of Seaplanes (Theorie des Landestosses von Seeflugzeugen), W. Pabst. Zeit. fuer Flugtechnik und Motorluftschiffahrt (Muenchen), vol. 21, no. 9, May 14, 1930, pp. 217-226, 14 figs. Brief review of physical laws applicable to landing in waves; experimental determination of accelerated mass of water; mathematical analysis of conditions with flat-bottom pontoons; discussion of pontoons with keel; graphs show effect of keel angle on impact and other relations.

Landing on Ice With Pontoon Equipped Plane (Naogot om Islandning med Flottoerflygplan). Flygning (Stockholm), vol. 8, no. 6, June 1930, pp. 128-129, 2 figs. Brief analysis of forces induced by landing shock and notes on strength of pontoon structure.

Aircraft Seamanship, L. A. Moebus. Aero Digest, vol. 16, no. 4, Apr. 1930, pp. 68-70, 11 figs. Handling of various types of seaplanes in take-off and landing is described and illustrated by sketches; conditions of wind and water require special manœuvres.

SEWAGE DISPOSAL

SLUDGE REMOVAL. New Sludge-Removal Apparatus Developed at Milwaukee, D. W. Townsend and J. Brower. Eng. News-Rec., vol. 105, no. 2, July 10, 1930, pp. 63-65, 3 figs. Description of patented apparatus consisting of four revolving pipe arms with proportioned multiple inlets, designed to minimize interference with sedimentation; settling periods for various activated-sludge concentrations; operating data of settling tanks.

SEWERS

TORONTO, ONT. The Toronto Sewerage System, G. Phelps. Eng. Jl. (Montreal), vol. 13, no. 8, Aug. 1930, pp. 504-507, 4 figs. General description of system serving population of 606,000 having total length of 719 miles; construction methods used in recently completed large sewers.

SHAFTS AND SHAFTING

DESIGN. Approximate Calculation of Shaft (Die Ueberschlaegliche Berechnung von Wellen), W. Vogel. Werkstattstechnik (Berlin), vol. 24, no. 11, June 1930, pp. 304-306, 1 fig. Justification and need of approximate method of computation is discussed; compilation of formulae in tabular form; chart is given which permits reading of diameter of shaft for any torque.

SHEET METAL WORKING

DRILL JIGS. Applications of Drill Jigs to Metal Stampings, C. Sczalanczy. Metal Stampings, vol. 3, no. 7, July 1930, pp. 655-658, 5 figs. Typical single and multiple drill jigs used to advantage in metal stamping plants for production of small diameter holes.

WELDING. Gas-Welded Sheet Metal Products. Welding, vol. 1, no. 9, July 1930, pp. 619-622, 9 figs. Use of welding in manufacture of hospital equipment, metal furniture, metal doors, and sash, steel barrels, sheet metal in airplane manufacture, and for other types of products.

SILICA GEL

CHLORINE ADSORPTION. Adsorption of Chlorine by Silica Gel (Ueber die adsorption von Chlor an Kieselgel), A. Magnus and A. Mueller. Zeit. fuer Physikalische Chemie—Abteilung A (Leipzig), vol. 149, no. 4, June 1930, pp. 241-260, 5 figs. Report on experimental study made in department of physical chemistry, University of Frankfort-on-Main; adsorption isotherms at 0.20 and 40 deg. cent. were determined by means of glass apparatus without cocks and without mercury; free chlorine was condensed in tubes of small diameter and weighed.

REFRIGERANT. Silica-Gel Refrigerating System (Das Silica Gel-Kuehlsystem), Zeit. fuer Eis und Kaelte Industrie (Vienna), vol. 23, no. 4, Apr. 1930, pp. 39-40, 1 fig. Silica-Gel system is described.

SMOKE ABATEMENT

NASHVILLE. Mechanical and Human Elements, G. C. Fisher. Black Diamond, vol. 85, no. 1, July 5, 1930, pp. 21-23. Article previously indexed from Fuels and Steam Power (A.S.M.E. Trans.), Jan.-Apr. 1930.

OBSERVATIONS. Behaviour of Humid Air in Motion (Das Verhalten feuchter Luft in Bewegung), R. Schwanda. Gesundheits-Ingenieur (Munich), vol. 53, no. 15, Apr. 12, 1930, pp. 225-227, 1 fig. Observations of certain paradoxical phenomena in action of smoke condensers; explanation attempted and further lines of research indicated.

Smoke, Causes, Inconveniences, Remedies (La Fumée, Causes, Inconvénients, Remèdes), Varinois. Revue Industrielle (Paris), vol. 60, no. 2249, Apr. 1930, pp. 230-237, 3 figs. Notes on corrosion resulting from chimney gases; tables showing smoke conditions in Chicago in 1912; action of smoke on stone, and metal, on vegetation, influence on health, economic aspects, carbonization, injection of secondary air, etc. Bibliography.

PITTSBURGH. Sulphur Dioxide in the Air at the Pittsburgh Experiment Station of the U.S. Bureau of Mines, E. G. Meiter and C. E. Traubert. U.S. Bur. of Mines—Report of Investigations, no. 3005, June 1930, 5 pp. Daily sulphur dioxide content of air at Pittsburgh Experiment Station of Bureau of Mines was determined by Bureau at request of Committee D-14 on Screen Wire Cloth of American Society of Testing Materials; purpose of investigation was to obtain data for use in interpreting screen-corrosion tests, which were conducted simultaneously and jointly by committee and Bureau of Mines.

SOILS

FROST HEAVING. The Mechanics of Frost Heaving, S. Taber. Jl. of Geology, vol. 38, no. 4, May-June 1930, pp. 303-317, 5 figs. Report on field observations and experiments indicating that soils, when subjected to freezing, under normal conditions, usually behave as open systems; excessive heaving results when water is pulled through soil to build up layers of segregated ice; heaving is limited by tensile stress that may be developed in water and by downward growth of ice crystals in soil voids.

SPINNING MACHINERY

REGULATORS. Knowledge of Technological Processes as Basis for Development of Regulators for Industrial Machinery Exemplified on Ring Spinners (Die Erkenntnis technologischer Arbeitsvorgaenge Grundlage fuer die Durchbildung von Arbeitsmaschinenreglern), F. Oertel. Wissenschaftliche Veroeffentlichungen aus dem Siemens-Konzern (Berlin), vol. 9, Mar. 22, 1920, pp. 266-289, 22 figs. Development of regulator code; construction and performance of regulator; reasons for charges in rotary speed; adjustability of built-in regulator; dimensional changes; spinning process from practical example; operating problems.

STATICALLY INDETERMINATE STRUCTURES

STRESSES. Doubly-Asymmetrical Portal with Fixed Supports (Il Portale Doppio Dissimmetrico con i Piedritti Incastrati), O. Belluzzi. Annali dei Labori Pubblici (Rome), vol. 68, no. 3, Mar. 1930, pp. 196-211, 13 figs. Theoretical mathematical discussion presenting solution of certain cases of loading for this type of statically indeterminate structures; numerical examples.

STEAM

HIGH PRESSURE. High Pressure and Highly Superheated Steam in Power Plants (Hochgespannter und hochueberhitzer Dampf in Kraftanlagen), Marguerre. V.D.I. Zeit. (Berlin), vol. 74, no. 24, June 14, 1930, pp. 789-797, 26 figs. Economic aspects of high-pressure steam in back-pressure and condensation installations; influence of initial steam temperature and problems of intermediary heating; problems of design and operation of high-pressure boilers; standard designs and special designs of boilers; feed pump engines; high-pressure locomotives. Paper read before World Power Conference, Berlin.

STEAM CONDENSERS

ANALYSIS OF TROUBLE. An Analysis of Condenser Trouble, G. Smith. Pac. Mar. Rev., vol. 27, no. 7, July 1930, pp. 286-287, 4 figs. Discussion of steam and water circulation of main condenser of intercoastal ship. (Continuation of serial.)

STEAM-ELECTRIC POWER PLANTS

BRAZIL. The Sulzer Boiler Plant with Pulverized Coal Firing in the New Power Plant of Cia. Energia Electrica Rio Grandense at Porto Alegre (Rio Grande Do Sul), Brazil. Sulzer Tech. Rev., no. 2, July 1930, pp. 15-22, 7 figs. Unfavourable qualities of Brazilian coal; description of plant equipped with two 5,000-kw. turbo-alternator, 6,600 volts, 50 cycles, and five Sulzer upright water-tube boilers, of single-bank type, with pulverized-coal firing superheaters and economizers.

GERMANY. Super Power Plant Finkenheerd, with Special Regard to Heat Economics (Das Grosskraftwerk Finkenheerd unter besonderer Beruecksichtigung der Waermewirtschaft), G. Warrelmann. V.D.I. Zeit. (Berlin), vol. 74, no. 22, May 31, 1930, pp. 709-719, 24 figs. partly on supp. plate. Growing importance of lignite as fuel for electric power generation; development of electric power supply in Province of Brandenburg; reasonsfor early application of hot air for combustion, mechanical grates and high-pressure steam; description of plant which will have final output of 400,000 kw.

ITALY. Present Status and Probable Progress in Large Steam Electric Plants of Italy (Stato attuale e progressi probabili delle grandi centrali a vapore in Italia), P. Ferrerio. Energia Elettrica (Milan), vol. 7, no. 5, May 1930, pp. 392-404, 1 fig. General survey of steam electric power generation in Italy; tabulated parallel descriptions of steam-electric power plants of Genoa, Turbigo, Venice, Piacenza, Leghorn and Naples; study of costs.

PEAK LOADS. Extension of Charlottenburg Plant to Peak-Load Plant (Ausbau des Kraftwerks Charlottenburg zum Spitzenwerk), W. Stender and E. Frank. Siemens Zeit. (Berlin), I vol. 10, no. 6, June 1930, pp. 369-376, 11 figs. Extension is to provide for peak load of Berlin network to extent of 40,000 kw. during 3 hours and 67,000-kw.-hr. total supply; 16 Ruth accumulators of 5,000 cu. m. and storage capacity of 610 kg.-tons of steam at 0.5 to 16 atm. are installed; description of equipment, wiring diagrams, etc.

STEAM ENGINES

LUBRICATION. Eliminating Engine Cylinder Lubrication. Power Plant Eng., vol. 34, no. 14, July 15, 1930, pp. 825-826, 3 figs. Details of method of breaking in steam engines to operate without cylinder lubrication.

STEAM HEATING

SATURATED VS. SUPERHEATED STEAM. Superheated vs. Wet Steam for Heating Plants (Heiss oder Sattdampf fuer Heizungsanlagen), F. Kaiser. Archiv fuer Waermewirtschaft (Berlin), vol. 11, no. 7, July 1930, pp. 247-250, 7 figs. Article previously indexed from Zeit. des Bayerischen Revisions-Vereins, July 15 and 31, 1929.

STEAM, HIGH PRESSURE

ECONOMICS OF. The Economics of High-Pressure Steam, G. A. Orrok. Engineering (Lond.), vol. 130, no. 3364, July 4, 1930, pp. 23-26, 2 figs. Paper presented before World Power Conference, previously indexed from World Power, July 1930.

The Economics of High Pressure Steam, G. A. Orrok. World Power (Lond.), vol. 14, no. 79, July 1930, pp. 63-64, 2 figs. Thermodynamic consideration of steam at high pressures; curves illustrating efficiencies of Carnot and regenerative cycles, also efficiency of practical central-station cycle; curves showing savings due to increase of pressure and temperature. Paper read before World Power Conference, Berlin.

STEAM POWER PLANTS

ASH HANDLING. Ash Handling in Boiler Rooms (La Manutention des Cendres dans les Chaufferies), M. Boulvin. Annales de l'Association des Ingénieurs Sortis Des Ecoles Spéciales De Gand (Ghent), vol. 19, 1929, pp. 307-330, 22 figs. General description of systems, with special regard to mechanical and continuous methods.

DESIGN. Modern Steam Generation, P. E. Rycroft. Eng. and Boiler House Rev. (Lond.), vol. 43, no. 7, Jan. 1930, pp. 414 and 417-418. Extracts from instructive statistical review of steam generating practice during recent years, showing danger of departing from orthodox practice too rapidly; details of British electric power stations' steam plants having overall thermal efficiencies of over 21 per cent; table showing technical details of some of more important British power stations in course of construction (November, 1929).

EFFICIENCY. Subdivision and Efficiency Grading of Steam Power Plants (Die Unterteilung und Leistungsvertileung von dampfkraftanlagen), W. Pauer. Waerme (Berlin), vol. 53, no. 24, June 14, 1930, pp. 449-451, 2 figs. Graphic method is described with which it is possible, with given load curve of plant, to determine best performance, at two plants with known cost curves; general recommendations for this useful subdivision into base-load and peak-load plants are given.

EQUIPMENT TESTING. Acceptance Tests (Abnahmeversuche), K. Jaroschek. Waerme (Berlin), vol. 53, no. 24, June 14, 1930, pp. 434-436. Purpose of significance of acceptance tests; preparation and performance of tests for boilers, turbines, etc.

FUEL ECONOMY. Fuel Economy as a Function of Financing and Operating Economy (Waermewirtschaft als Teil der Finanz und Betriebswirtschaft), F. Wartenberg. Archiv fuer Waermewirtschaft (Berlin), vol. 11, no. 5, May 1930, pp. 153-156, 4 figs. Commercial and technical aspects of fuel economy in relation to plant management; it is claimed that very small plants do not require high-salaried manager; but for larger plants, employment of heat engineer will probably prove profitable; functions of heat engineer are outlined.

Optimum of Boiler Heating Surface (Das Optimum der Kesselheizflaeche), F. Wartenberg. Archiv. fuer Waermewirtschaft und Dampfkesselwesen (Berlin), vol. 11, no. 7, July 1930, pp. 239-242, 6 figs. Method of calculating optimum value of heating surface; it is claimed that radiation represents best form of heat transfer; influence of air preheating on heat radiation; use of economizers and air preheaters.

GREAT BRITAIN. Annual Progress Review. Eng. and Boiler House Rev. (Lond.), vol. 43, no. 7, Jan. 1930, pp. 395-404, 17 figs. Résumé of power-plant development during past year with special reference to: water purification, boilers, operating control, and auxiliaries.

HIGH PRESSURE. High-Pressure Steam for Power and Process at Billingham. Power Engr. (Lond.), vol. 25, no. 292, July 1930, pp. 261-279, 33 figs. and supp. plate; see also editorial comment on pp. 253-254. Outline of large and important extension plant of Synthetic Ammonia and Nitrated, Ltd., at Billingham-on-Tees; general illustrated description of equipment and piping is given; plant-lay-out prints are also included.

Balanced Electric and Process Steam Loads in New High-Pressure Power Plant. Power Plant Eng., vol. 34, no. 13, July 1, 1930, pp. 734-740, 12 figs. Waldorf Paper Products Co. of St. Paul goes to 650 lbs. pressure to balance power and steam loads; new $750,000 power plant has two 13,460 sq. ft. pulverized-coal-fired boilers with water walls and air heaters, 12,000 cu. ft. steam accumulator and 4,500 kw. of generating capacity in two units; complete details of equipment arrangement and heat balance for output of 225 tons per day.

Loeffler High-Pressure Steam (Loeffler-Hochdruckdampf), K. Rochel. Waerme (Berlin), vol. 53, no. 24, June 24, 1930, pp. 486-487, 3 figs. Description of extension to super-pressure power plant of Karolin pit of Witkowitz bituminous coal mines.

INDUSTRIAL, FUEL ECONOMY. Some Economies Effected in Old Industrial Boiler Plants, J. S. Gander. Eng. and Boiler House Rev. (Lond.), vol. 43, no. 9, Mar. 1930, pp. 538, 541-542 and 545, 2 figs. Discussion of experiences of two specific installations, in which improved arrangement chiefly concerns cost and handling of fuel, efficiency of steam supply and maintenance charges.

INDUSTRIAL, TEXTILE MILLS. Experience with Industrial Combined Heating and Power Plant (Erfahrungen mit einem Industrie-Heizkraftwerk), R. Schallhart. Elektrizitaetswirtschaft (Berlin), vol. 29, no. 509, June 1, 1930, pp. 274-282, 7 figs. Description of plant for larger textile mill; coupling of power and heating systems; cost of generation of steam and current; influence of fluctuation and rationalization on power economics; depreciation and efficiency.

LIGNITE FIRED. Operation of Lignite Plant and Central Station at Boehlen (Aus dem Betrieb des Braunkohlen und Grosskraftwerkes Boehlen), H. Zeuner. Archiv fuer Waermewirtschaft (Berlin), vol. 11, no. 5, May 1930, pp. 157-162, 7 figs. Description of lignite briquetting plant and power station; utilization of vapours from briquet-plant driers for recovery of water for boiler operation; utilization of flue gases as protection against explosions in pulverizing plant; operating experiences with pulverized-coal-fired boilers; measuring instruments and electric equipment.

OPERATION. Boiler House Practice, F. Johnstone Taylor. Elecn. (Lond.), vol. 105, no. 2718, July 4, 1930, pp. 20-23, 8 figs. Stacks and draft systems in modern power stations; importance of draft installation; dust and grit extraction; suction fans; flue-gas washing; removal of sulphurous acid.

PRESSURE REGULATION. Regulation for Pressure and Heating Steam, C. L. Hubbard. Power Plant Eng., vol. 34, no. 13, July 1, 1930, pp. 769-771, 3 figs. General discussion of floating auxiliary turbine, reducing valves, sizes and connections.

PULVERIZED COAL FIRED. Description of New Steam Generators at Derby Station, D. Brownlie. Combustion, vol. 2, no. 1, July 1930, pp. 36-38 and 48, 7 figs. Station is cited as notable example of comparatively small plant that embodies very latest practice throughout; boiler plant, including two new units, has total capacity of approximately 400,000 lbs. of steam per hr.; five pulverized fuel-fired units occupy same aggregate floor space previously occupied by eleven stoker-fired units, but have nearly double steaming capacity.

Pulverized Fuel Firing as Affecting Economic Boiler House Operation, G. H. Lake. Colliery Guardian (Lond.), vol. 140, no. 3623, June 6, 1930, pp. 2127-2129. Review of factors which affect economic steam production and influence of these factors in trend of modern boiler house design. Abstracts of paper read before Mun. Elec. Assn.

Pulverized-Fuel Firing as Affecting Economic Boiler-House Operation, G. H. Lake. Elec. Rev. (Lond.), vol. 106, no. 2741, June 6, 1930, pp. 1081-1082 and (discussion) 1082-1083. Reviews of certain factors which affect economic steam production and their influence on trend of modern boiler-house design. Abstract of paper read before Incorporated Mun. Elec. Assn.

STEAM PROPERTIES

GASES. The Thermal Properties of Gases, W. L. Baufre. Combustion, vol. 2, no. 1, July 1930, pp. 31-35 and 50, 4 figs. Thermal properties of perfect gas; specific heats of real gases; specific heats of gases under constant pressure; entropy of real gases.

STEAM TURBINES

APPLICATION. Economic Considerations in the Application of Modern Steam Turbines to Power Generation, A. G. Christie. Mech. Eng., vol. 52, no. 8, Aug. 1930, pp. 757-766, 13 figs. Current practice; data on costs, floor space, and economic performances; and analyses of reheating problems and of economic rating of turbine casings. (Concluded.)

DESIGN. Recent Large Steam Turbines (Neuere Grosse Dampfturbinen), K. Baumann. V.D.I. Zeit. (Berlin), vol. 74, no. 24, June 14, 1930, pp. 805-832, 19 figs. Review of development and discussion of important factors of design; data on reliability, operating conditions and losses; typical makes of large steam turbines are described. Paper read before World Power Conference, Berlin.

Design Problems of Ideal Turbines (Die Grenzturbine als Gestaltungsproblem), E. A. Kraft. Maschinenbau (Berlin), vol. 9, no. 12, June 19, 1930, pp. 401-405, 10 figs. Importance of proper dimensioning of last stage is discussed; description of designs of discs 2,000 mm. in diam. at 3,000 r.p.m.; data on efficiency of turbine gears.

Starting Speed, Operating Safety and Economy of Steam-Turbine Units (Betriebsbereitschaft, Betriebsicherheit und Wirtschaftlichkeit der Dampfturbosaetze), M. Blaensdorf. Waerme (Berlin), vol. 53, no. 27, July 5, 1930, pp. 521-524, 7 figs. These three factors which have influenced design of steam turbines to greatest extent, are discussed, and examples are given showing how these properties have been effected in large modern turbine sets; one of largest in Europe has attained efficiency of 87.7 per cent.

Application of Turbines to Power Generation, A. G. Christie. Power, vol. 72, no. 6, Aug. 5, 1930, pp. 108-211, 7 figs. Abstract of paper presented before World Power Conference, previously indexed from Power Plant Eng., July 1, 1930.

Richardsons, Westgarth-Brown Boveri Turbines. Eng. and Boiler House Rev. (Lond.), vol. 43, no. 10, Apr. 1930, pp. 659-661, 2 figs. Design features incorporated in reaction turbine manufactured by above concern.

EFFICIENCY. Indicated Efficiency of Single-Stage Steam Turbine (Der indizierte Guetegrad von einstufigen Dampfturbinen), W. Riedel. Maschinen-Konstrukteur (Munich), vol. 63, no. 6, Mar. 25, 1930, pp. 118-121, 5 figs. Graphical and mathematical method for determining and comparing efficiency of turbine as function of various ratios of peripheral velocity and velocity at which steam leaves nozzles.

Definition for Thermodynamic Efficiency of Steam Turbines (Definition du rendement thermodynamique des turbines à vapeur), G. Darrieus. Revue Générale de l'Electricité (Paris), vol. 27, no. 25, June 21, 1930, pp. 963-968, 4 figs. Study, which will be presented at next Stockholm meeting of International Electric Commission, points out that in order to be generalized, definition for thermodynamic efficiency should be based on description of usable energy as conceived by Maxwell, Kelvin, Gibbs and Gouy.

EUROPE. European Developments in Kaplan and Propeller Turbines, A. V. Karpov. Power, vol. 72, no. 3, July 15, 1930, pp. 108-110, 8 figs. Part of report made by author after trip through Europe; cavitation problems are of such importance in application of propeller and Kaplan turbines that laboratories have been built in which to study these phenomena; studies have also been extended to Francis-type runners. Abstract of report before Am. Inst. of Elec. Engrs. in Toronto.

GERMANY. Large Turbines of 3,000 Revolutions per Minute (Grossturbinen mit 3,000 U/min.), N. Kasparek. Siemens Zeit. (Berlin), vol. 10, no. 6, June 1930, pp. 376-380, 10 figs. Equipment of 24,000 kw. rated capacity and 30,000 kw. overload capacity built by Siemens and Schuckert for Gerstein Werk of Vereinigten Elektrizitaetswerke Westfalen, are illustrated and described.

HIGH PRESSURE. Turbines for High Pressure Industrial Plants of the Future, I. H. Melan. Power Plant Eng., vol. 34, no. 14, July 15, 1930, pp. 804-806, 4 figs. Advantages of turbines for pressures up to 3,200 lbs.; simplicity, safety, ease of control, and extraction and high efficiency; three-dimensional graphs of turbine efficiency, which is function of Parsons characteristic and steam flow.

RUTHS. Development and Design of the Ruths Turbine (Ruthsturbine Entwicklung und Aufbau), J. Landau. Waerme (Berlin), vol. 53, nos. 23 and 25, June 7, 1930, pp. 409-415 and June 21, pp. 495-500, 24 figs. History of development during years 1920 to 1930, and description of new design of large-scale turbine; behaviour of Ruths turbine for peak-load service and for momentary reserve under different operating conditions.

STARTING. Spindle Turning Gears for Steam Turbines. Power Plant Eng., vol. 34, no. 10, May 15, 1930, pp. 553-555, 4 figs. Starting time of large turbines more than halved by motor-driven equipment which turns spindle at about 25 r.p.m. during warming-up period; plan and sectional views illustrating motor-operated spindle turning gear.

STEAMSHIPS, TURBINE

EMPRESS OF BRITAIN. Steamship Empress of Britain Launched for Canadian Pacific Steamships, Ltd. Can. Ry. and Mar. World (Toronto), no. 389, July 1930, pp. 467-470, 1 fig. Similar description previously indexed from Shipbldg. and Shipg. Rec., June 12, 1930.

NEUMARK. New Cargo Steamers of Hamburg-American Line Built in Kiel (Die Kieler Frachtdampfer-Neubauten der Hamburg-Amerika Linie), H. Herner. Schiffbau (Berlin), vol. 31, no. 9, May 7, 1930, pp. 197-206, 10 figs. Eight vessels, two at Kiel, are being built to utilize discarded machinery of four ships of Albert Ballin class which were converted to higher-speed vessels; Neumark, first of these to be completed, has o.a. length of 152.75 m.; gross tonnage, 11,000; turbines and boilers are those formerly installed in S.S. Hamburg; with total output of 6,200 s.hp., fully loaded, ship has speed of 14.8 knots.

STEAMSHIPS, TURBO-ELECTRIC

VIRGINIA. Some Data on Electric Propulsion. Nautical Gaz., vol. 119, no. 6, Aug. 9, 1930, pp. 21-22. Excerpts from article previously indexed in Eng. Index 1929, p. 1758, from Inst. Mar. Engrs.—Trans., vol. 41, Nov. 1929, pp. 687-701 and discussion 702-720, 5 figs. partly on supp. plates.

STEEL

HEAT TREATMENT. Heat Treatment of Steel and Use of Special Steel in the Machine Industry (Om Varmebehandling av Stal), N. H. Aall. Teknisk Ukeblad, vol. 77, no. 27, July 3, 1930, pp. 304-306. Discussion of plain carbon steel vs. alloy steel with regard to satisfactory control of physical properties by proper heat treatment; ratio of chilling speed to crystallization speed permits conclusions as to whether carbon or alloy steel is more economic.

The Effect of the Rate of Cooling on Steel, J. M. Robertson. Chem. Age (Lond.), vol. 23, no. 575, July 5, 1930 (Met. Sec.), pp. 1-2. Discussion of accepted theories of effect of heat treatment on steel; original theory of relations of martensite, troostite and sorbite to each other and to normal iron-carbon diagram; four series of structures obtained by different methods of cooling.

STEEL FOUNDRIES

RESEARCH. Research and Promotion Will Aid Castings Industry, R. L. Wensley. Steel (formerly Iron Trade Rev.), vol. 87, no. 2, July 10, 1930, pp. 50-51 and 60. Conditions in industry; need for co-operative effort and correction of internal malpractices; advertising for wider markets; advantage of made mark.

STEEL MANUFACTURE

CHEMISTRY. Estimation of Reaction Possibilities in Manufacture of Steel with Aid of Physico-Chemical Data (Die Beurteilung der Reaktionsmoeglichkeiten bei der Stahlerzeugung, etc.), H. Schenck. Stahl und Eisen (Duesseldorf), vol. 27, no. 3, July 3, 1930, pp. 953-965 and (discussion) 966, 20 figs. Notes on "actual" and "best" utilization values of reactions and their relations to extent and trend of chemical conversion; total concentration and concentration of free slag constituents; bearing of best utilization values of manganese, phosphorus and sulphur reactions on slag composition and temperature; conclusions with regard to oxygen absorption of metals.

STOKERS

EFFICIENCY COMBUSTION. Some Elements of Efficiency Combustion, T. A. Marsh. Black Diamond, vol. 85, no. 2, July 12, 1930, pp. 15-16. Abstract of paper read before Midwest Bituminous Coal Conference, previously indexed from Steam Coal Buyer, May 1930.

LIGNITE FIRED. High-Duty Stoker for Slow-Burning Fuels (Hochleistungsrost fuer schwer zuendende Brennstoffe), Berner. Waerme (Berlin), vol. 53, no. 24, June 14, 1930, pp. 431-433. New firing system, developed by Arbatsky, for lignite, is described with which, by acceleration of drying and ignition, specific grate efficiency of 2.75 million kg-cal. per sq. m.-hr. is obtained, and output of 125 tons per hr. of steam.

PEAT FIRING. Mechanical Stokers for Burning of Peat, N. M. Savellov and N. A. Semenenko. Izvestiya Teplotechnickeskovo Instituta (Moscow), no. 1 (54), 1930, pp. 32-57, 29 figs. Report to All-Russia Thermo-Technical Convention treating of peat as fuel and describing design and operation of three classes of mechanical and semi-mechanical stokers, developed in Russia; results of tests presented in tabular form. (In Russian.)

The Kirsch Mechanical Stoker for Burning Peat, M. M. Schegloyev and N. V. Zeitz. Izvestiya Teplotechnicheskovo Instituta (Moscow), no. 1 (54), 1930, pp. 3-11, 8 figs. History of development and features of mechanical stokers invented more than ten years ago; results of tests made in 1929 prove economy and efficiency of Kirsch design; construction cost data. (In Russian.)

UNDERFEED. Firing of Tertiary Bituminous Coal on Underfeed Stokers (Verfeuerung tertiaerer Bitumenkohlen auf Unterschubrosten), B. Kretzschmar. Archiv fuer Waermewirtschaft (Berlin), vol. 11, no. 5, May 1930, p. 168. Notes on properties and firing of coals from Dutch East Indian islands, Borneo, and Sumatra; these coals have high gas and water content, and are very soft; experiences with burning this coal on underfeed stokers under water-tube boilers on ships of Royal Dutch line.

WASTE FUEL. Burning Waste Fuel With Underfeed Stokers, R. A. Foresman and D. J. Mosshart. Power Plant Eng., vol. 34, no. 15, Aug. 1, 1930, pp. 860-861, 2 figs. Bark, wood waste, coke breeze and other fuels can be handled easily in underfeed stokers.

STREAM POLLUTION

STREAM POLLUTION. Trade Effluents and Sewers. Engineering (Lond.), vol. 130, no. 3365, July 11, 1930, pp. 47-48. Editorial review of report issued by Joint Advisory Committee on River Pollution to Ministries of Health and of Agriculture.

SUBWAY CONSTRUCTION

NEW YORK CITY. New York Subway Construction. Eng. News-Rec., vol. 105, no. 6, Aug. 7, 1930, pp. 200-205, 9 figs. Major construction problems and developments in New York's latest subways; features of new subway-construction practices employing recent inventions and equipment developed to meet changed requirements of street maintenance; broad characteristics of subway structure, construction developments, construction problems and contract requirements for third subway system; organization for subway construction; New York subway history. (To be continued.)

SUPERHEATERS

FOR HIGH TEMPERATURES. Superheaters for High Steam Temperatures (Ueberhitzer fuer hohe Dampftemperaturen), O. H. Hartmann. Waerme (Berlin), vol. 53, nos. 24 and 27, June 14, 1930, pp. 463-468, and July 5, pp. 525-528, 19 figs. Experiences with stationary plants in Germany and other countries; superheater requirements; practical tests with new materials; directly heated superheaters.

SUPERHEATERS. Why Superheaters and What Kind? S. H. Daniels. South. Power Jl., vol. 48, no. 7, July 1930, pp. 58-59. Modern pressures and temperatures, boilers and furnaces have placed new emphasis on superheater application and design, an emphasis resulting in improved adaptability and service.

T

TANKS

WELDING. Manufacturing Welded Metal Products, J. C. Coyle. West. Machy. World, vol. 21, no. 6, June 1930, pp. 242-244, 9 figs. Methods used by Eaton Metals Products Co., Denver, Colo., in manufacture of metal containers for petroleum products ranging from 50-gal. oil drums to 100,000-gal. storage tanks.

TEXTILES

WEAVING. Starting Marks—the Bugbear of Silk and Other Weave Rooms, H. E. Wenrich. Textile World, vol. 78, no. 2, July 12, 1930, pp. 34-36 and 40, 3 figs. Methods to prevent starting marks; use of water on woven part of cloth; handling heavy materials. (Continuation of serial.)

TUNGSTEN CARBIDE CUTTING TOOLS

USE OF. Tungsten-Carbide Cutting Materials, F. C. Spencer. Mech. Eng., vol. 52, no. 8, Aug. 1930, pp. 777-780. Summary of data obtained from users and builders of machine tool regarding use of tungsten carbide cutting materials and influence on design of machines. Progress Report No. 2 of Subcommittee on Tungsten-Carbide Cutting Materials of the A.S.M.E. Special Research Committee on the Cutting of Metals.

The Use of Tungsten Carbide as a Cutting Material on Heavy Machine Tools, C. Seller. Mech. Eng., vol. 52, no. 7, July 1930, pp. 683-689, 15 figs. Brief review of experience of early user of tungsten-carbide tools on cast iron; steps taken to introduce this material into machine shop and method used to follow up results obtained; suggestions for grinding procedure, clearance angles, and shapes of tools; difficulties are listed with possible remedies for each; six typical successful applications.

WIDIA. Widia Tungsten Carbide Tools, R. D. Prosser. West. Machy. World, vol. 21, no. 6, June 1930, pp. 236 and 237, 11 figs. Strength, speed, chip pressure, clearance angle, cost and other factors are considered; special applicatives are suggested. (Continuation of serial.)

TURBO-GENERATORS

STARTING. On the Line in 13 Seconds, F. G. Philo. Elec. World, vol. 96, no. 3, July 19, 1930, pp. 110-113, 6 figs. 4,500-kw. turbine-driven house generator may be brought from cold standstill to full speed and voltage in 12.56 secs. to insure continuity of station auxiliary power at Long Beach steam station of Southern California Edison Co., Ltd.

W

WAGE PAYMENT PLANS

BEDAUX. Bedaux Methods (Das Bedaux-Verfahren), G. Schlesinger. Werkstattstechnik (Berlin), vol. 24, no. 13, July 1, 1930, pp. 354-360, 2 figs. Typical Bedaux analysis sheet is given. (Concluded.)

WASTE ELIMINATION

PLANTS. Eliminating Unnecessary Waste in Plant Operation, J. J. Berliner. Metal Stampings, vol. 3, no. 7, July 1930, pp. 613-616 and 652. Importance of managerial control, close supervision, and other factors for eliminating unnecessary waste of materials and labour.

WATER SUPPLY

REGINA, SASKATCHEWAN. Report on Water Supply at Regina, Sask., R. O. Wynne-Roberts and N. Hill. Can. Engr. (Toronto), vol. 59, no. 1, July 1, 1930, pp. 107-109. Preliminary report covering proposals for increasing water supply; alternative projects discussed.

WATER TREATMENT

NEUTRALIZATION. Graphics of Neutralization of Water Acidity (Betraehtungen ueber die Entsaeuerung des Wassers an Hand graphischer Darstellungen), P. Martiny. Gesundheits-Ingenieur (Munich), vol. 53, no. 25, June 21, 1930, pp. 395-396. Table and explanatory discussion supplementary to previously indexed article published in issue of Mar. 29.

WELDING

AIRCRAFT. Procedure Control for Aircraft Welding, H. L. Whittemore, J. J. Crowe and H. H. Moss. Welding, vol. 1, no. 9, July 1930, pp. 589-590 and 595, 3 figs. Discussion of specifications for material and apparatus used; ability of operator; technique used in each operation; inspection of finished product; brief abstracts of Procedure Control for Welding Aircraft Joints—Report by Committee of American Bureau of Welding.

PLANT REPAIRS. Welding in Plant Repairs, H. W. Benton. Power Plant Eng., vol. 34, no. 15, Aug. 1, 1930, pp. 886-888, 4 figs. Use of right methods and equipment by experienced operators cut costs in manufacture and plant upkeep; welding vs. riveting.

PRESSURE VESSELS. Welding of Super Code Pressure Vessels, L. H. Burkhart. Am. Welding Soc.—Jl., vol. 9, no. 6, June 1930, pp. 28-32, 3 figs. Welding procedure for vessels larger than 60 in. di m. for more than 200 lbs. pressure and which may employ unit stress than 8,000 lbs. per sq. in. of weld section: results of tests of procedure.

WIND TUNNELS

AMERICAN. The New American Wind Tunnels, R. M. Wood. Roy. Aeronautical Soc. (Lond.), vol. 34, no. 235, July 1930, pp. 559-568 and (discussion) 568-576, 3 figs. Discussion of fundamentals of wind tunnel design and aerodynamic characteristics; importance of large scale wind tunnel test is outlined; brief description of N.A.C.A. wind tunnels.

TESTING. The Wind-Tunnel as an Engineering Instrument, A. L. Klein. Soc. Automotive Engrs.—Jl., vol. 27, no. 1, July 1930, pp. 87-88, and (discussion) 88-90. Outline of usefulness of wind-tunnel testing; life, drag, centre-of-pressure travel, interference of wings and fuselage, effect of interference drag of minor parts, and statical and dynamical stability; costs of atmospheric and high-pressure tunnels are compared.

WIRE DRAWING

PRACTICE. The World's Wire Drawing Practice, K. B. Lewis. Wire, vol. 5, no. 7, July 1930, pp. 265-266 and 285-289. Methods being used outside of United States, including Canada, Mexico, Great Britain, Sweden, etc. Paper read before Wire Division, Assn. Iron and Steel Elec. Engrs., June 18, 1930.

WIRE ROPE

PRINCIPLES AND USES OF. Principles and Uses of Wire Rope, W. A. Scoble. Metallurgia (Lond.), vol. 1, nos. 5 and 6, vol. 2, no. 8, Mar. 1930, pp. 203-204, and 214, Apr., pp. 254-255, June, pp. 63-64, 11 figs. Mar.: Locked coil ropes; Trulay ropes; length of lay. Apr.: Analytical discussion of rope details, in relation to strength and efficiency. June: Adjusting tendency of certain layers to twist; different fibres used in formation of rope cores; specifications for rope cores. (Continuation of serial.)

WOOD

METAL COATING. Metallized Wood (Das neue Metallholz), P. Martell. Kunststoffe (Munich), vol. 20, no. 6, June 1930, pp. 125-127. Details of process developed by Kaiser-Wilhelm-Institut fuer Eisenforschung based on years of research; among advantages of new metallized wood is its non-flammable properties and its machinability; among its possible uses are manufacture of furniture, pianos, gramophones and loud speakers, journal bearings, etc.; process is said to be simple and inexpensive.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month to month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostat copies (white printing on a black background) of the articles lsited in this section or others on engineering subjects can be obtained from the Engineering Societies Library at a cost of 25c. per page.

When ordering identify the article by giving: the author; the title of the article; the name of the periodical in which it appeared; and the volume and page numbers. A remittance of 25c. a page should accompany the order.

The print's size is limited to 11 by 14 inches, but where possible, two pages up to 7 by 9 inches in size will be photographed on one print, larger magazines require a print per page.

The Library is also prepared to translate articles, to compile lists of references on engineering subjects and render assistance in similar ways. Charges are made sufficient to cover the cost of this work. Correspondence is invited. Information concerning the charge for any specific service will be given those interested. In asking for information please be definite, so that the investigator may understand clearly what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a public reference library of engineering. It is maintained jointly by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
29 West Thirty-ninth Street. New York, N.Y.

A

AIR CONDITIONING

AIR-EXPANSION PROCESS. Colling and Drying Air (Air Conditioning) With Particular Reference to the Air Expansion Process, A. Baumann. Brown Boveri Rev., vol. 17, no. 9, Sept. 1930, pp. 271-282, 14 figs. In private, public, and industrial buildings, direct cooling of air by cold air machine is to be preferred for hygienic, technical, and economic reasons to vapour compression machine; principles of systems are reviewed; Brown Boveri and Co. were pioneers in application of turbo-compressor in refrigerating plants with vapour compression machines and have recently built cold-air machine on turbo principle for gold mines in South Africa; Mollier chart for moist air used for changes in air condition.

AIR PREHEATERS

CONTROL. Control and Safety Devices for Air-Preheater Installations (Regelungs und Sicherheitseinrichtungen an Lufterhitzeranlagen), Harraeus. Feuerungstechnik (Leipzig), vol. 18, no. 13-14, July 15, 1930, pp. 135-138, 13 figs. Devices for regulation of superheated-air temperature; guide channels for flue gases; turning on and off of different air-heated elements; admixture of hot gases or cold air; safety devices against burning of protective elements; cooling of heating gases; coupling of air blower witb governing valves for admission or discharge of heating agent.

AIRPLANE ENGINES

AIR-COOLED. 1,000-Hp. Air-Cooled Engine Will Power Future Aircraft, A. H. R. Fedden. Automotive Industries, vol. 63, no. 9, Aug. 1930, pp. 307-308. Brief review of various types of modern air-cooled engines; notes on supercharging and cowling; future possibilities, particularly of oil engine are outlined. Read before Brit. Inst. Mech. Engrs.

DESIGN. Factors Involved in Developing Light Weight Design, E. A. Ryder Machine Design, vol. 2, no. 7, July 1930, pp. 15-19, 7 figs. Discussion of salient features of ligbt-weight design in Pratt and Whitney engines; physical properties of various materials used in design; table gives specific strength of common materials used in aircraft-engine design.

REDUCTION GEARS. Airplane Engines with Automatically Variable Reduction Gear (Motore di aviazione con demoltiplicatore automaticamente variabile). Ala d'Italia (Milan), vol. 11, no. 8, Aug. 1930, pp. 669-670, 5 figs. Description of 4-cylinder four-cycle experimental rotary engine with pistons acting on individual crankshafts provided with pinions which in turn engage centrally located gear arrangement; sketches and diagrams show principal details; with decreasing air resistance, propeller speed automatically output of engine remaining constant.

TESTING. Engine Performance at Higb Altitudes Studied by the Bureau of Standards, P. M. Heldt. Automotive Industries, vol. 63, no. 8, Aug. 23, 1930, pp. 256-258 and 263, 5 figs. Description of testing facilities for investigations on superchargers, lubricating oils, flame propagation in engine cylinders, effect of humidity on engine operation, ignition phenomena, and combustion at constant pressure; flying heights are simulated by decreasing atmospheric pressure and lowering temperature.

AIRPLANES

AMPHIBIAN. The Saro Flying Cloud. Flight (London), vol. 22, no. 30, July 25, 1930. pp. 831-832, 2 figs. Description of amphibian boat design similar to Cutty Sark and equipped with two Whirlwind engines; length o.a. 47 ft. 9 in.; pay load 1,420 lbs.; maximum speed at sea level 120 m.p.h.; landing speed 55 m.p.h.

ICE-FORMATION PREVENTION. The Prevention of the Ice Hazard on Airplanes, W. C. Geer and M. Scott. Nat. Advisory Committee for Aeronautics—Tech. Note, no. 345, July 1930, 23 pp., 11 figs. Discussion of factors controlling ice formation and outline of possible means of preventing ice; laboratory work done at Cornell University, Ithaca; description of ice-removing overshoe consisting of rubber treated with special oil mixture; inflation by means of compressed air breaks ice on leading edges provided with overshoe.

MILITARY (CAPRONI). The Caproni 90 P.B. Military Airplane (Italian). Nat. Advisory Committee for Aeronautics—Aircraft Circulars No. 121, July 1930, 7 pp., 7 figs. on supp. plates. Giant biplane of 6,000 hp. equipped with six Isotta-Fraschini engines arranged in three tandems; bomb racks are designed for 17,637 lbs.; length 88.39 ft.; height 35.43 ft.; span 114.5; total lifting 5,346.43 sq. ft.; total weight 33,070 lbs.; speed 127.4 mi.-hr. From Aeronautica, Apr. 1930.

MILITARY (COMTE). The Comte A.C. 3" Military Airplane (Swiss). Nat. Advisory Committee for Aeronautics—Aircraft Cir., no. 122, July 1930, 7 pp., 5 figs. on supp. plates. High-wing semi-cantilever monoplane witb two tandem 600-hp. Hispano-Suiza engines; span 85.30 ft.; length 59.05 ft.; wing area 1,011.8 sq. ft.; empty weight 7,496.00 lbs.; armament load or persons 1,669 lbs.; maximum speed with two engines 103 m.p.h.; complete performance data are given. From Aero-Revue, Apr. 1930, and Ailes, May 15, 1930.

PERFORMANCE CALCULATION. A Proof of the Theorem Regarding the Distribution of Lift Over the Span for Minimum Induced Drag, W. F. Durand. Nat. Advisory Committee for Aeronautics—Report No. 349, 13 pp. 8 figs. It is sbown mathematically that elliptical distribution across span gives minimum value of induced drag.

Advance Calculation of Altitude Performance (Die Vorausberechnung der Hochenleistungen), O. Schwager. Flugwesen (Prague), vol. 10, no. 6, 1930, pp. 61-63, 3 figs. Brief discussion of various formulae and comparison with results of test flights.

How Fast is Maximum Speed? E. G. Reid. Aviation, vol. 29, no. 2, Aug. 1930, pp. 86-91, 11 figs. Outline of simplified methods for calculating maximum speed and comparison of advertised figures for group of commercial planes witb figures obtained by actual test for group of typical service planes.

PROPELLERS, VARIABLE-PITCH. Gloster-Hele-Shaw-Beacham Variable-Pitch Airscrew. Machy. (Lond.), vol. 36, no. 931, Aug. 14, 1930, pp. 636-638, 3 figs. Adaptation of this type to requirements of engine; sensitiveness to any change in r.p.m. of engine diagram of variable-pitch gear.

STRESS ANALYSIS. Calculation of Reistance and Static Tests (Calculs de résistance et essais statiques), L. Kirste. Aéronautique (Paris), vol. 12, no. 134, July 1930, pp. 251-252, 1 fig. Outline of standard methods used in France, Germany, United States, England, and Italy for calculating stresses in various types of airplanes under different flying conditions; brief discussion of tests on elasticity, breakdown, and resistance against repeated stresses.

WELDED JOINTS. Metal Joints in Aircraft Construction, T. W. Downes. Welding, vol. 1, no. 10, Aug. 1930, pp. 563-667, 7 figs. Discussion of tecbnique in making joints by each of methods of welding, brazing, and soldering by different welding processes; data on composition of fluxes and strength of welded joints. Abstract of paper presented before Am. Soc. Testing Matls., June 23, 1930.

Strength of Welded Joints in Tubular Members for Aircraft, H. L. Whitteman and W. C. Brueggeman. Nat. Advisory Committee for Aeronautics—Report, no. 348, 1930, pp. 5-41, 31 figs. Investigation on strength, weight, and cost of number of types of welded joints; 40 points were welded under procedure specifications and tested to determine their strengths; weigbt and time required to fabricate each joint.

WINGS, SLOTTED. Practical Experiences with Slotted Wings of Automatic Type (Praktische Erfahrungen mit dam automatischen Spaltflugel), G. Lachmann. Zeit. fuer Flugtechnik und Motorluftschiffahrt (Munich), vol. 21, no. 16, Aug. 28, 1930, pp. 409-419. Description and aerodynamics features of slotted wings and effect on airplane performance; sketches show mechanism of automatic operation.

AIRPLANE WINGS

DESIGN. Span Load Distribution on Two Monoplane Wing Models as Affected by Twist and Sweepback, M. Knight and R. W. Noyes. Nat. Advisory Committee for Aeronautics—Tech. Note, no. 346, July 1930, 7 pp., 12 figs. Discussion of tests made in Atmospheric Wind Tunnel of Langley Memorial Aeronautical Laboratory; data are taken from results of investigation dealing primarily with lateral stability; as presented, they are suitable as aid in structural design of certain monoplane wings.

TAPERED. Calculation of Tapered Monoplane Wings, E. Amstutz. Nat. Advisory Committee for Aeronautics—Tecb Mem., no. 578, Aug. 1930, 20 pp., 16 figs. Analysis of stresses and aerodynamical characteristics of tapered cantilever wings; determination of shape of wing for producing given lift distribution; it is shown that tips of tapered wing are more heavily loaded than middle portion. Translated from Schweizerische Bauzeitung, Apr. 5, 1930, previously indexed.

AIRSHIPS

COMMERCIAL POSSIBILITIES. Tbe Commercial Possibilities of the Airship. Engineer (Lond.), vol. 150, no. 3892, Aug. 15, 1930, pp. 175-176. Editorial comments inspired by recent flight of R 100 from Cardington to Montreal; when it is examined in light of comparable analogy argument popularly developed against possibilities of airship cannot be sustained; cold examination of whole situation leaves writer with no unbounded enthusiasm for commercial possibilities of airship; neither does it leave him with conviction that general public is correct in its superficial impression of facts and features hostile to commercial success.

PRESSURE DISTRIBUTION. Calculation of Pressure Distribution on Airship Hulls, T. Von Karman. Nat. Advisory Committee for Aeronautics—Tech. Memorandum, no. 574, July 1930, 27 pp., 9 figs. Mathematical analysis of air-flow conditions and pressure distribution based on shape of ZR 111, with following simplifications: cars, fins, and rudders removed; all cross-sections replaced by equivalent circular cross-sections; calculations are made for symmetrical case, of flow parallel to axis; unsymmetrical case, or flow at angle to axis.

ALLOYS

ALLOYS. *See Aluminum Alloys.*

BRASS. *See Brass Castings.*

COPPER. *See Copper Alloys.*

HEAT-RESISTING. Behaviour of Heat-Resisting Alloys in Presence of Sulphur and a New Sulphur-Resistant Alloy (Der Verhalten hitzebestaendiger Legierungen gegen Schwefel und eine neue schwefelbestaendiger Legierung), H. Gruber. Stahl und Eisen (Duesseldorf), vol. 50, no. 36, Sept. 4, 1930, p. 1272. Increase of resistance against attack of sulphur compounds by means of aluminum addition (alloy no. 8) is attributed to increase in melting point of sulphide-layer formation and to formation of very thin butgas-impervious skin of aluminum oxide. Abstract from Wilhelm Heraeus 70th Birthday special volume.

ALUMINUM

SHEET, BENDING TEST FOR. The Bending Test for Aluminum Sheet. Metal Industry (Lond.), vol. 37, no. 9, Aug. 29, 1930, pp. 193-195. Scientific application of what used to be considered rough and ready test for selection of aluminum sheet of correct temper for different purposes; American system of grading aluminum sheets according to temper and its comparison with British system.

ALUMINUM ALLOYS

CASTINGS, HEAT TREATMENT OF. Aluminum Alloys for Heat-Treated Casting, R. J. Anderson. Metallurgia (Manchester), vol. 2, no. 10, Aug. 1930, pp. 129-132 and 154, 4 figs. Bulk of present commercial requirements for heat-treated castings can readily be met with relatively few compositions; enumeration and discussion of chief alloys that have been or are used in practice; microstructure as affected by heat treatment; effect of heat treatment on mechanical properties; uses of heat-treated castings.

ARCHES, CONCRETE

FREYSSINET METHOD. Stresses Under the Freyssinet Method of Concrete Arch Construction, J. T. Thompson. Eng. News Rec., vol. 105, no. 8, Aug. 21, 1930, p. 291, 1 fig. Economics and advantages claimed for Freyssinet method; stresses and possible corrections for tbree French arches; comparison of stresses caused by two methods of uncentering 322-ft. concrete arch.

AUTOMOBILE ENGINES

SUPERCHARGING. Supercharging of Internal-Combustion Engine (La suralimentation des moteurs à combustion interne), C. Martinot-Lagarde. Technique Moderne

(Paris), vol. 22, nos. 14 and 15, July 15, 1930, pp. 489-496 and Aug. 1, 1930, pp. 535-537, 23 figs. July 15: Discussion of fundamentals of supercharging and review of principal designs of superchargers; details on Rateau exhaust driven, and Rateau Farman variably geared superchargers; graphs give performance data for both types. Aug. 22: Notes on supercharging of Diesel engines.

The Zoller Supercharger. Autocar (Lond.), vol. 65, no. 1811, July 18, 1930, pp. 130, 4 figs. Notes on design of supercharger driven from crankshaft; mechanical silence is obtained by elimination of gears; sketches show arrangement of blades; output for various sizes varying from 500 to 5,000 ft. deep per revolution for speeds up to 6,000 r.p.m.

AUTOMOTIVE FUELS

ANTI-KNOCK COMPOUNDS. Detonation and Lubricating Oil, R. O. King and H. Moss. Engineering (Lond.), vol. 130, no. 3367, July 25, 1930, pp. 99-101. Review of experimental results; effect of lubricating oil on detonation in practice; effect of lubricating oil and air temperature on matching of fuels of dissimilar composition; application of experimental results to engine lubrication; dispersion and distribution of oil; supercharged engines.

The Use of Water as an Anti-Detonant, G. W. Hobbs and M. L. Fast. Mich. Eng. Experiment Sta.—Bul., no. 31, vol. 1, no. 4, July 1930, 15 pp., 7 figs. Investigation to determine value of water as anti-detonant, and its effect upon actual engine, and ideal cycle, effect of compression ratio upon power efficiency, and air gas ratio.

DETONATION. Methods of Measuring the Anti-Knock Value of Fuels for Internal-Combustion Engines, D. B. Brooks. Motive Power, vol. 1, no. 7, Aug. 1930, pp. 17 and 34. For past two years, Bureau of Standards has been co-operating with seven other laboratories, representing automotive and petroleum industries; programme of tests designed primarily to show how well group of laboratories would agree in rating same set of fuels if they used ideotical equipment and followed same instructions; description of experimental engine. Paper read before Petroleum Technologists of Nat. Petroleum Assn., Washington, D.C.

B

BALANCING MACHINES

THEORY AND DESIGN. Machine for Dynamical Balancing of Rotating Masses (Les machines à équilibrer dynamiquement les pièces tournantes), G. Delanghe. Génie Civil (Paris), vol. 97, no. 8, Aug. 23, 1930, pp. 176-179, 6 figs. Discussion of theory and design of machines built by Mitsubishi; sketches show vibrating bearing of Westinghouse machine.

BEARINGS, BALL

TESTING. Magnetic Hardness Test for Ball Races, H. Sjovall. Metallurgist (Supp. to Engineer, Lond.), Aug. 1930, pp. 121-122, 4 figs. With object of investigating possibilities of developing further methods of magnetic examination, magnetization and hysteresis curves for ordinary ball-bearing steel have been determined; measurements were obtained by ballistic methods with outer races of bearing 1209; results give good idea of manner in which different magnetic properties of steel vary with degree of hardening.

BLAST FURNACES

DESIGN. Technical Progress in Design of High-Capacity Blast Furnaces (Progrès techniques réalisés dans la construction des hauts fourneaux à grande production), M. Derclaye. Revue Universelle des Mines (Liége), vol. 4, nos. 3 and 4, Aug. 1, 1930, pp. 71-80 and Aug. 15, pp. 106-116, 24 figs. Aug. 1: Notes on hearth jackets; mantle brackets, arrangement of columns around furnace; encircling of shaft. Aug.15: Refractory brick; blast-furnace equipment, tuyeres, etc.; charging.

GAS. Mixed Gases Promote Economy in Steelmaking, W. C. Buell, Jr. Steel, vol. 87, no. 8, Aug. 21, 1930, pp. 50, 52, 54 and 56, 2 figs. Data on air preheat and furnace temperature, and blast-furnace-gas preheat; graphs show thermal capacity characteristics of combined air for combustion and blast-furnace gas with gas mixed.

BOILERS

CORROSION. Formation and Properties of Boiler Scale, E. P. Partridge. University of Mich.—Dept. of Eng. Research—Bul., no. 15, June 1930, 170 pp. 21 figs. Complete review of information available up to year 1930 concerning formation and properties of boiler scale; effects of scale upon boiler efficiency and boiler metal temperature; chemical and crystallographic determination of scale constituents; respective solubilities of these constituents in simple solutions, and possibility of calculation equilibria in complex solutions; method and rate of formation of scale; contemporary methods of scale prevention.

DESIGN. Co-efficient of Weakening for Inclined Bolt-Hole Rows of Cylindrical Boilers with Internal Super-pressure (Schwaechungskoeffizient fuer schraege Lochreihen bei zylindrischen Kesseln mit innerem Ueberdruck), A. Korhammer. Waerme (Berlin), vol. 53, no. 29, July 19, 1930, pp. 560-561, 2 figs. Development of graphic process for determination of weakening co-efficients.

FURNACES. Present Status of Boiler Furnaces (Ueberblick ueber den derzeitigen Stand der Dampfkesselfeuerungen), O. Nerfer. Zeit. des Bayerischen Revisions-Vereins (Munich), vol. 34, nos. 14 and 15, July 31, 1930, pp. 200-202 and Aug. 15, pp. 213-216. Brief discussion of different fuels and their properties during combustion, followed by notes on design of furnaces and stokers for their use.

Progress in Stoker and Furnace Construction and Results of Tests on Modern Furnaces (Ueber Fortschritte im Rost und Feuerungsbau und Versuchsergebnisse an modernen Feuerungen), R. Schulze. Brennstoff und Waermewirtschaft (Halle), vol. 12, nos. 13-14, July 1-2, 1930, pp. 168-174, 5 figs. By comparison of some entirely modern boiler installations with other 4 to 6 years old, it is shown to what extent modern stokers and furnaces are superior to older types.

HIGH-PRESSURE, FITTINGS FOR. Fittings for Super-Pressure Boilers for 130 Atm. and 500 Deg. Cent. (Armaturen bei Hoechstdruckkesseln), Belohlavek. Waerme (Berlin), vol. 53, no. 28, July 12, 1930, pp. 544-547, 8 figs. Fittings described are employed in all Loeffler boilers and have given satisfaction over period of several years operation.

HIGH PRESSURE (LOEFFLER). Loeffler Boilers Improved. Elec. World, vol. 96, no. 4, July 26, 1930, p. 164, 1 fig. Loeffler boiler for operation at 1,700-lbs. pressure and steam temperature of 932 deg. fahr. was installed at Vitkovice steel works in Czechoslovakia in 1927; success of this boiler led to installation of two more, each with rating of 100,000 lbs. of steam per hr.

Loeffler Boilers in Stationary Plants and on Ships (Der Loeffler-Kessel in ortsfesten und Schiffsanlagen),. F. Englert. Zeit. des Bayerischen Revisions-Vereins (Munich), vol. 34, nos. 14 and 15, July 31, 1930, pp. 195-200 and Aug. 15, pp. 209-213, 11 figs. Influence of increase in pressure and temperature on operating conditions and economy of steam power plants; it is shown that Loeffler boiler offers satisfactory solution both technically and economically of problem of superpressure boilers for all fields of application; examples of Loeffler boiler installations are illustrated.

LANCASHIRE. An Improved Lancashire Boiler. Mech. World (Lond.), vol. 88, no. 2279, Sept. 5, 1930, pp. 218-219, 2 figs. Improved Boiler by D. Adamson and Co. was described in this journal, Feb. 10, 1928; brick side flues were eliminated, being replaced by tubes; principle has been further developed in new installation; thermal efficiency by test was 83.24 per cent which compares with usual efficiencies of Lancashire boilers of 60 to 70 per cent; plant is much smaller, more compact, less costly in installation and upkeep, and no high chimney is required.

BOULDER DAM PROJECT

RAILROAD CONSTRUCTION. Boulder Dam Construction Railroad. New Reclamation Era, vol. 21, no. 8, Aug. 1930, pp. 156-157. Outline of projects proposed, including funicular railroad, which will extend from top of canyon, on Nevada side, at elevation 1425, down to elevation 690 at power plant location, below dam; cost estimate, surveys, and work schedules.

BRASS CASTINGS

LEAD CONTENT. Lead in Cast Brass and Bronze, H. C. Dews. Metallurgia (Manchester), vol. 2, no. 9, July 1930, pp. 81-83, 2 figs. Suspicion as to bad effect of lead in brass and bronze is reflected in specifications; insolubility of lead in brass and bronze makes it liable to segregation and liquidation, both in liquid melt and during freezing of alloy; effect of lead on mechanical properties of brass and bronze; main reason for allowing addition of lead to brass and bronze is that improvement in machinability is gained.

BRIDGE PIERS

FOUNDATIONS. Corrugated Steeel Shells in Bored Holes Form New Type Pier Foundations on P. R.R. Bridge. Eng. News Rec., vol. 105, no. 10, Sept. 4, 1930, pp. 366-368, 6 figs. Description of novel method of sinking wells, 80 ft. deep, through Hackensack meadow muck for approach piers of passenger-line crossing over Hackensack river; combination open and pneumatic corrugated steel shells 48 in. and 54 in. in diam. sunk in bored holes belled out to 11 ft. and 12 ft. 3 in. at bottom; detail of piers, boring auger, shaft, muck locks on shells.

KILL VAN KULL. The Substructure of Kill Van Kull Bridge, New York. Engineering (Lond.), vol. 130, no. 3371, Aug. 22, 1930, pp. 227-228, 26 figs. partly on p. 236 and supp. plates. Substructure comprises abutments for arch span, and piers for approaches; two abutments are of concrete and granite masonry, founded upon bed rock and were constructed by use of cofferdams and with floating plant equipment; approach piers are of reinforced concrete, and consist of shafts founded upon footings which rest on bed rock for some piers and on gravel for others.

STRENGTHENING. Repairing the Klodnitz Bridges at Laband (Die Instandsetzung der Klodnitzbruecken bei Laband), Roloff. Bautechnik (Berlin), vol. 8, nos. 27 and 29, June 20, 1930, pp. 428-431 and July 4, pp. 457-460, 19 figs. Description of grouting and concreting operation for reinforcing deteriorated masonry pers.

TESTING. The Effect of a Natural Stone Casing upon the Strength of Concrete Piers (Der Einfluss einer Natursteinverkleidung auf die Festigkeit von Betonpfeilern), Gaber. Beton u. Eisen (Berlin), vol. 29, no. 16, Aug. 20, 1930, pp. 296-301, 10 figs. Report on laboratory test of model of concrete pier of Cologne-Muelheim Bridge over Rhine River; comparison of strength of encased and non-encased concrete piers.

BRIDGES, HIGHWAY

GERMANY. Four New Highway Bridges over the Aller River (Vier neue Strassenbruecken ueber die Aller), Jergens and Huch. Zentralblatt der Bauverwaltung (Berlin), vol. 50, no. 34, Aug. 27, 1930, pp. 600-605, 13 figs. Features of bridges built of concrete and steel trusses with single spans up to 43 m. in length; details of bridge bearings.

BRIDGES, MASONRY ARCH

RECONSTRUCTION. Reconstruction of the Saale Bridge at Merseburg (Umbau der Saalebruecke in Merseburg), Schedler. Zentralblatt der Bauverwaltung (Berlin), vol. 50, no. 30, July 30, pp. 537-539, 9 figs. Report on reconstruction of multiple-arch masonry highway bridge, over 70 m. in total length, with maximum arch span of 13 m. clear; details of strengthening of arches with reinforced concrete; total cost of reconstruction 86,000 marks.

BRIDGES, RAILROAD

RECONSTRUCTION. B. and O. Reconstructs 63 Bridges, P. G. Lang, Jr. Ry. Age, vol. 89, no. 11, Sept. 13, 1930, pp. 533-534, 4 figs. Work of reconstructing and strengthening bridges on Baltimore and Ohio, between Fairmont, W.Va., and Lorain, Ohio, affords outstanding example of application of modern construction methods and expeditious prosecution of construction work under unfavourable weather conditions; rating raised 20 per cent on 290 miles of line.

BRIDGES, STEEL

WELDING. Recent Welded Bridges (Neuere geschweisste Bruecken), R. Bernhard. V.D.I. Zeit. (Berlin), vol. 74, no. 35, Aug. 30, 1930, pp. 1201-1207, 23 figs. Report on design and construction practice followed in three recently completed steel truss and plate girder bridges, in Switzerland and Germany, from 10 m. to 52 m. in length; welding details and features of equipment used; description of X-ray equipment used in testing of completed welds.

WELDING—GERMANY. The First Welded Railroad Bridge for Standard Gauge Trains (Die erste geschweisste Eisenbahnbruecke fuer Vollbahnbetrieb), Schaper. Bautechnik (Berlin), vol. 8, no 22, May 3, 1930, pp. 323-325, 6 figs. Report on fabrication and erection of welded-steel truss bridge, for new railroad line near Muenster, having unsupported span of 10 m.; details of X-ray examination of welds including description of X-ray equipment; static and dynamic tests by means of special apparatus.

BUILDINGS, STEEL

ELECTRIC WELDING. Structural Arc Welding, A. F. Davis. Elec. Specifications, vol. 2, no. 2, Aug. 1930, pp. 30-31, 2 figs. Examples of specifications, if followed in fabrication and erection of steel structures, work will go forward in rapid and efficient manner.

BUNKERS, CONCRETE

DESIGN. Determination of Stresses in Plane Girder Systems (Die Spannungsermittlung in Flaechentragwerken), G. Ehlers. Beton u. Eisen (Berlin), vol. 29, nos. 15 and 16, Aug. 5, 1930, pp. 281-286 and Aug. 20, pp. 291-296, 41 figs. Theoretical mathematical discussion of wall slabs acting as girders of great depth, with special reference to design of reinforced-concrete bunkers, troughs, etc.; illustrative examples.

C

CANALS

WELLAND. New Welland Ship Canal Built for Deep-Draft Vessels. Eng. News Rec., vol. 105, no. 10, Sept. 4, 1930, pp. 356-362, 12 figs. Also note editorial comment on pp. 334, 354 and 355. At cost of more than $120,000,000, fourth canal to be built between Lake Erie and Lake Ontario made Lake Ontario accessible to large vessels used on upper lakes by enlarged canal across Niagara Peninsula in Canada; seven locks overcome head requiring 26 locks in old canal; plan and profile of new canal showing its relation to old canal and natural waterways; details of typical lock, lock walls, lock gates, siphon culverts; gate-operating mechanism, etc.

CARBON DIOXIDE

SOLID, PRODUCTION OF. New Method of Solid Carbon Dioxide Production. Cold Storage (Lond.), vol. 33, no. 389, Aug. 21, 1930, pp. 243-244, 2 figs. Description of "Carba" process, which represents advance of former methods in that ice is compressed as it forms, without exposure to atmosphere and without employment of hydraulic or mechanically operated presses; practical difficulties in application of theory.

THERMAL PROPERTIES. A Characteristic Chart for Solid, Liquid, and Gaseous Carbon Dioxide. Refrig. Eng., vol. 20, no. 1, July 1930, p. 33, 2 charts on supp. plates. Two-page Mollier diagram for carbon dioxide is illustrated and explained; table of physical properties of carbon dioxide is also given.

CAR

RETARDERS. Froelich Hydraulic Car Retarder System. Ry. Signaling, vol. 23, no. 9, Sept. 1930, pp. 329-334, 8 figs. Discussion of design and operating characteristics of system, which is first classification yard in Great Britain to be equipped with Froelich system of hydraulic car retarders, involving semi-automatic switch control and number of other salient features; diagram of hydraulic and braking systems is illustrated; mechanical and electrical apparatus.

CAR LIGHTING

GENERATOR BELTS. Belts vs. Positive Drive for Axle Generators, H. K. Williams. Ry. Elec. Engr., vol. 21, no. 9, Sept. 1930, pp. 273-274. Drive used must take into consideration design of generator and control apparatus; lighting system must not unfit car for service; belt-drive difficulty depends upon torque; top speed limits cut-in speed; qualities of belt drive.

CASE HARDENING

Cyanide Bath. Hardening Steel Commercially by Cyaniding Process, E. F. Davis. Steel, vol. 87, nos. 3, 5, and 7, July 17, 1930, pp. 43-46 and 60, July 31, pp. 47-48 and 53, Aug. 14, pp. 48, 50, and 52, 17 figs. July 17: Outline of history of cyanide, properties and advantages of various grades, and mechanism of hardening process. July 31: Discussion of brittleness of cyanided steels and its relation to cyaniding temperature and quenching methods, cyaniding gears and wire; various advantages and disadvantages of cyaniding as a hardening process. Aug. 14: Description of furnaces and pots for cyaniding, aerocase method, fume prevention, cyanide poisoning, and testing cyanide baths.

CAST IRON

Chilling Properties. Factors Affecting the Chilling Properties of Cast Iron, A. L. Norbury. Foundry Trade Jl. (Lond.), vol. 43, no. 726, July 17, 1930, pp. 44-45, 7 figs. Results are given which illustrate differences in chilling properties that may be obtained from iron of same chemical analysis, while other results illustrate sulphur contents and mould temperatures on chilling properties. Paper presented on behalf of Inst. of Brit. Foundrymen to Pan-European Foundry Congress, Liége, June 1930.

Hardness Testing. The 139-Degree Pyramid Hardness Test on Cast Iron, A. L. Norbury. Brit. Cast Iron Research Assn.—Bul. (Birmingham), no. 29, July 1930, pp. 271-274, 4 figs. Comparison of hardness tests on gray cast iron using 10 mm. Brinell ball and 139-deg. pyramid; effect of size of impression on variations between repeat hardness tests or gray cast iron.

Machinability. Machinability of Cast Iron, E. J. Lowry. Am. Soc. Testing Matls.—Proc., part 2, vol. 29, 1929, pp. 126-127. Paper discusses factors which influence machinability; although machinability of cast iron is function of abrasion, hardness, and ductility, hardness alone cannot be considered as true indicator of machinability since it does nto measure abrasive quality of metal; and influence which tends to eliminate abrasiveness increases machinability such as annealing, higher silicon content, higher carbon content, or addition of nickel, titanium, or any other softening alloy.

Meehanite. Properties of Meehanite Metal—A Pearlitic Iron, A. G. Lambert and F. M. Robbins. Can. Foundryman (Toronto), vol. 21, no. 8, Aug. 1930, pp. 13-15, 3 figs. Outline of development, uses and manufacture of meehanite iron; data on composition and physical properties are given. (To be continued.)

CASTINGS

Shrinkage. Shrinkage of Metals and Alloys (Ueber die Schwindung der Metalle und Legierungen), F. Sauerwald. Giesserei (Dusseldorf), vol. 17, no. 33, Aug. 15, 1930, pp. 793-795, 5 figs. Shrinkage in its relation to expansion coefficient and nature of solidification process is discussed.

CEMENT ADMIXTURES

Data on. Effect of Some Salts, Acids, and Organic Substances on Cement and Concrete (Ueber die Einwirkung einiger Salze, Saeuren und organischer Substanzen auf Zement und Beton), R. Gruen. Zeit. fuer Angewandte Chemie (Berlin), vol. 43, no. 24, June 14, 1930, pp. 496-500, 3 figs. Data on effect of chlorides of calcium, aluminum, iron and barium, hydrochloric acid, aldehydes, sugars, etc., upon time of setting, tensile and compressive strength of portland and blast furnace cements; effect of various concentrations of phosphoric and oxalic acids upon concrete. Bibliography.

CEMENT, PORTLAND

Loam Admixtures. Influence of Loam Admixtures in Sand on Mechanical Properties of Portland Cement Mortar (Der Einfluss der Lehmbeimengungen im Sand auf die mechanischen Eigenschaften des Portlandzementmoertels), G. M. Jeltschaninoff. Zement (Charlottenburg), vol. 19, nos. 24 and 25, June 12, 1930, pp. 556-560 and June 19, pp. 580-585. Review of literature on this subject and results of author's tests (1) to compare influence of loam added to sand in dry state with influences of moist admixtures; (2) to verify R. Gruen's theory that dried loam loses its effective influence after prolonged storage; (3) to determine changes in influence with dried loam admixture after prolonged storage in earth.

Specifications. Moduli Versus Lime Satiation for Computing Portland Cement Compounds, H. Kuehl. Rock Products, vol. 33, no. 18, Aug. 30, 1930, pp. 76-77. Author explains why he introduced silicate modulus and iron modulus, and why previously Michaelis introduced hydraulic modulus; he beleives that for present silicate and iron moduli should be retained and only hydraulic modulus should be replaced by degree of lime saturation. Translated from Tonindustrie-Zeitung, Mar. 20, 1930, previously indexed.

CLUTCHES

Design. Design of Clutches for Internal-Combustion Engines, W. J. Pearmain. Motive Power, vol. no. 6, July 1930, pp. 16-19, 8 figs. Factors of design of spring-loaded clutches; formulae are given for clutch-size determination; practical problems are included.

COAL MINES AND MINING

Mechanization. Direct and Indirect Cost Savings with Mechanized Mining, G. B. Southward. Min. Congress Jl., vol. 16, no. 8, Aug. 1930, pp. 654-655. Direct savings are those made with mechanical loaders, scrapers, and other self-loading devices by eliminating hand labour of shoveling coal, and also with conveyor and pit car loaders by reducing amount of hand shoveling required; indirect savings are those which are made in face preparatory work, gathering, main line haulage, and general items of underground operation and maintenance; discussion of factors influencing amount of savings effected in each case.

The Fallacy of Arguments Against Mechanized Loading, G. B. Southward. Min. Congress Jl., vol. 16, no. 9, Sept. 1930, pp. 721-722. Objections to mechanized loading are met by economic necessity for coal mining to keep pace with modern industrial progress.

The Present and Future Application of Mechanized Loading, G. B. Southward. Min. Congress Jl., vol. 16, no. 7, July 1930, pp. 613-614. Statistical data for 1929; 7.1 per cent of bituminous coal production was mined with some form of mechanized loading; other conclusions are deduced from data.

COLUMNS

Buckling. Buckling of Double Struts Having Parabolically Variable Cross-Section Height (Ueber die Knickung eines doppelwandigen Druckstabes mit parabloisch veraenderlicher Querschnittshoehe), A. Lockschin. Zeit. fuer Angewandte Mathematik und Mechanik (Berlin), vol. 10, no. 2, Apr. 1930, pp. 160-166, 9 figs. Theoretical mathematical discussion of stresses in several types of such struts, under various conditions of fixedness at ends.

COMPRESSORS

Gas. A Seven-Stage Gas Compressor. Engineer (Lond.), vol. 150, no. 3890, Aug. 1, 1930, pp. 118-119, 7 figs. partly on p. 120. Fundamental characteristic of Sulzer hyper-compressor is vertical arrangement of cylinders for sixth and seventh stages; these cylinders are operated hydraulically by means of columns of oil; machine supplied to Compagnie de Bethune, Bully-les-Mines, is designed to deal with effective suction intake of 4,000 to 4,500 cu. m. per hr. at final pressure of 1,000 to 1,100 atmospheres.

CONCRETE

Cost. Nomogram for Determination of Cost of Materials of a Concrete of Certain Mix (Nomogramme zur Bestimmung der Materialkosten einer Betonmischung), Pietrowski. Beton u. Eisen (Berlin), vol. 29, no. 16, Aug. 20, 1930, pp. 301-302, 3 figs. Table and nomograms constructed on basis of theoretical analysis.

Mixing. New Principles of Concrete-Proportioning (Neue Grundlagen der Betonzusammensetzung), O. Stern. Zeit. des Oesterreichischen Ingenieur und Architekten Vereines (Vienna), vol. 82, nos. 31/32, and 33/34, Aug. 1, 1930, pp. 255-257, and Aug. 15, pp. 269-272, 5 figs. on supp. plates, nos. XI, XII and XIII. Outline of Abrams rules combined with Spindel's; graphic method of concrete proportioning; outline of theory of four-axis systems; methods of construction of four-axis diagrams with special reference to concrete proportioning diagram for purpose of attaining a definite concrete consistency.

Slabs, Corrugated. General Theory of Corrugated Plates (Allgemeine Theorie der Faltwerke), H. Craemer. Beton u. Eisen (Berlin), vol. 29, no. 15, Aug. 5, 1930, pp. 276-281, 11 figs. Theoretical mathematical discussion of stresses in prismatic and non-prismatic corrugations, including continuous slabs, bunker bottoms, etc.

CONSTRUCTION INDUSTRY

Costs. Unit Prices from Current Construction Bids. Eng. News-Rec., vol. 105, no. 11, Sept. 1930, pp. 437-438. Unit bids on steel highway bridge and approaches over White river at Clarendon, Ark., estimated at about $1,600,000; asphalt or concrete paving, Sutter Co., Calif.

COPPER ALLOYS

Copper-Silicon. Silicon-Copper Alloys and Silicon Manganese-Copper Alloys, E Voce. Inst. of Metals—Advance Paper (Lond.), no. 543, for mtg. Sept. 9-12, 1930, 31 pp., 16 figs. Survey of alloys, studying their mechanical and physical properties in cast, drawn, and rolled conditions, with view to developing and extending their uses; their resistance to corrosion has received attention, especially in light of development in America of alloys of copper with silicon and manganese in connection with chemical plant.

A New Silicon-Zinc-Copper Alloy, E. Vaders. Inst. of Metals—Advance Paper (Lond.), no. 544, for mtg. Sept. 9-12, 1930, 17 pp., 17 figs. Use of silicon as deoxidizer and as alloying constituent in some copper alloys; preparation of silicon-zinc-copper alloys containing 70-90 per cent of copper and up to 6 per cent of silicon-zinc-copper alloys; mechanical and physical properties and uses of these alloys.

COPPER-NICKEL DEPOSITS

New Brunswick. A Nickel-Copper Deposit in New Brunswick, Canada, B. Low. Eng. and Min. Jl., vol. 130, no. 3, Aug. 9, 1930, pp. 115-118, 6 figs. Brief description of geology and summary of exploration work and of electrical and magnetic survey, undertaken in new district; outline of metallurgical research for treating ore.

COPPER REFINING

Electrolytic. Dimensioning of Baths in Electrolytic Plants and Its Influence on Initial Costs (Die dimensionierung von Baedern in elektrolytischen Grossanlagen und ihr Einfluss auf die Anlagekosten), F. Vogel. Metallboerse (Berlin), vol. 20, nos. 58, 60 and 62, July 19, 1930, pp. 1601-1602, July 26, pp. 1656-1658 and Aug. 2, pp. 1714-1715. Discussion is based on experiences of some copper-refining plants; in none of examples cited, with exception of old Great Falls plant, is there any indication that, in design of bath, consideration was given to relation of bath size to entire plant; importance, however, of this factor, was demonstrated.

CRANES

Control. Energy Required for Stopping of Cranes with Swinging Load (Erforderligt arbete for bromsning av kranar med pendlande upphangning av lasten), J. Bjorklund. Teknisk Tidskrift (Stockholm), vol. 60, no. 33, Aug. 16, 1930 (Mekanik), pp. 97-112, 22 figs. Studies of cranes with swinging loads show that braking power needed usually is less and sometimes considerably less than combined kinetic energies of crane and load; method used and formulae derived are compared with Lagrange's equations and are shown to be sufficiently exact for practical purposes.

Design. Crane Runway Columns Reviewed, R. Fleming. Eng. News-Rec., vol 105, no. 10, Sept. 4, 1930, pp. 369-370, 2 figs. General discussion of design of heavy-duty steel cranes; bending-moment diagrams for crane columns; brackets are unsatisfactory for loads over 10 tons.

D

DAMS

Concrete Arch—Montana. Gibson Dam—Sun River Project—Montana, R. Lowry. New Reclamation Era, vol. 21, no. 8, Aug. 1930, pp. 152-156, 3 figs. Description of concrete-arch dam having maximum height of 195 ft., crest length of 960 ft., containing 161,000 cu. yds. of concrete; spillway, consisting of combined circular shaft and tunnel, both 29 ft. 6 in. in diam., is designed to discharge 50,000 sec. ft.; methods of construction and cost data.

Construction—Crushed Stone Plants. Crushing and Grinding Plant at the Esla Dam in the Province of Tamora, Spain (Die Brech und Mahlanlage der Esla Talsperre, Provinz Tamora, Spanien), A. Bonwetsch. V.D.I. Zeit. (Berlin), vol. 74, no. 35, Aug. 30, 1930, pp. 1211-1214, 16 figs. Layout and equipment of crushing plant for granite rock with individual pieces up to 1 ton in weight, having hourly output of 2,000 cu. m.; description of roller mills having capacity of 30 cu. m. per hr.; design of conveyor system having total length of 380 c. with inclines up to 35 per cent.

Gravity—Anchors. Improvement of Gravity Dams by Means of Steel Anchoring Rods (Perfectionnements aux barrages-poids par l'adjonction de tiges en acier), A. Coyne. Génie Civil (Paris), vol. 97, no. 8, Aug. 23, 1930, pp. 186-187, 3 figs. Author proposes use of extension rods imbedded to depth of about 10 m. in bedrock, under dam foundation, and extending as far as top of dam; analysis of effects such system of reinforcement might have on stability of Assuoan Dam, Egypt, and Cheurfas Dams in Algeria.

DIE CASTING

Dies for. Correct Design and Heat Treatment of Steel Dies for Die Castings, R. L. Johnson. Iron Age, vol. 546-548 and 576. Discussion of important points of mechanical design; chemical composition and heat treatment of alloy steel dies; die life is from 15,000 to 200,000 castings.

Practice. Influence of Casting Practice on Physical Properties of Die Casting, C. Pack. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 346, for mtg. Sept. 1930, 14 pp., 7 figs. Outline of some factors in commercial die-casting practice, to which variations in physical properties may be attributed.

Modern Die-Casting Practice, E. V. Pannell. Engineer (London), vol. 150, nos. 3892 and 3893, Aug. 15, 1930, pp. 168-169, and Aug. 22, pp. 193-194, 2 figs. Aug. 15: Survey of present status of art of casting non-ferrous metals by pressure; modern factory devoted to production of die casting will consist mainly of five departments: (1) metal melting, (2) die casting, (3) trimming, (4) enameling and plating, (5) die making, die-casting machines. Aug. 22: Steel moulds or dies used in die-casting industry; metals and alloys

Pressure Castings. Compressed Metals (Les Métaux comprimés), G. Batta and J. Dessent. Revue Universelle des Mines (Liége), vol. 73, no. 5, Mar. 1, 1930, pp. 133-135, 6 figs. Greater resistance has been developed by employing method of making castings under pressure and by compression; these methods impart to non-ferrous alloys properties of laminated material; first process greatly improves quality of metal giving it fine grained structure, but does not remove danger of air bubbles; second method does not have this defect but must be used only on very pure metal, otherwise malleability is reduced and cracks appear.

DIESEL-ELECTRIC LOCOMOTIVES

India. Diesel-Electric Locomotives for the Indian State Railways. World Power (Lond.), vol. 14, no. 80, Aug. 1930, pp. 130-132 and 135, 5 figs. Diesel vs. steam locomotives; mechanical construction; design features and principal data; Diesel engine characteristics; electrical and auxiliary equipment.

DIESEL-ELECTRIC POWER PLANTS

Berlin. Two 11,700-Hp. Diesel Engines Carry Peak Loads, F. J. Taylor. Power Plant Engr., vol. 34, no. 17, Sept. 1, 1930, pp. 979-981, 7 figs. Large Diesel engines installed in Berlin are characterized by compactness, simplicity of design, and effective scavenging; general plan of station showing relative location of two 11,700-hp. M.A.N. engines and auxiliary apparatus; cross sections of engine showing general conformance to standardized M.A.N. design; generators used as phase regulators; compressed-air type coupling.

DIESEL ENGINES

Compressorless. Tests on Compressorless Diesel Engines (Versuche an einer Kompressorlosen Dieselmaschine), F. Schmidt. V.D.I. Zeit. (Berlin), vol. 74, no. 33, Aug. 16, 1930, pp. 1151-1154, 6 figs. Investigation of effect of friction, cooling, and throttling on fuel consumption at different revolutions and load; determination of indicated efficiency and efficiency of ideal engine by means of exact measurement of air quantity; description of test set up and test data are given.

Fuels. New Comparative Tests of Vegetable and Mineral Oils in Diesel Engines (Nouveaux essais comparatifs des huiles végétales et minérales dans les moteurs diesel), M. Gautier. Revue des Combustibles Liquides (Paris), vol. 8, no. 76, June-July 1930, pp. 258-263, 9 figs. Investigation of behaviour of vegetable oil, such as peanut oil and palm oil, in Diesel engines and their effects on engine performance and combustion character.

Maintenance and Repair. Diesel Engine Upkeep. Power Plant Eng., vol. 34, no. 18, Sept. 15, 1930, pp. 1041-1044, 8 figs. Crankshaft repair methods; method of removing lower boxes without taking out shaft; effects of misalignment; description of various methods for checking crankshaft alignment. (Continuation of serial.)

Scavenging. Studies of Diesel Engines—Scavenging and Charging Phenomena in Two-Cycle Engines (Untersuchungen an der Dieselmachine), K. Neumann. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens (Berlin), no. 334, 1930, pp. 1-20, 23 figs. See also V.D.I. Zeit. (Berlin), vol. 74, no. 32. Aug. 9, 1930, ppp. 1109-1119, 13 figs. Experiments with Junkers opposed-piston engine equipped with special scavenging pump; test data are used as basis for mathematical investigation of scavenging phenomena; typical indicator diagrams are given.

Vibrations. Torsional Deflection in Diesel Crankshafts. Power, vol. 72, no. 7, Aug. 12, 1930, pp. 248-250, 6 figs. Outline of results of tests made recently at Oregon State College to determine difference in crankshaft distortion between load and no load.

DIPHENYL

Properties and Uses. Diphenyl May Solve Reheating Problem, G. B. Cunningham. Power, vol. 72, no. 10, Sept. 2, 1930, pp. 374-377, 1 fig. Physical and chemical properties indicate commercial success as medium for reheating steam to full initial temperature in high-pressure plants; table of physical properties of diphenyl is given; diphenyl has been used for two years in oil-refining process; welded piping is preferred; summary of diphenyl's advantages.

DRAINAGE CANALS

Erosion and Silting. Erosion and Silting of Dredged Drainage Ditches, C. E. Ramser. U.S. Dept. of Agric.—Tech. Bul., no. 184, June 1930, 54 pp., 68 figs. partly on supp. plates. Report on measurements and observations made between 1913 and 1921, on 22 dredged drainage ditches in Mississippi, Tennessee and Iowa; relation of velocity to erosion and silting; conditions affecting erosion and silting in channel: vegetation, caving and sloughing banks, backwater, variation in water stages, enlargement of cross section, silt charge in streams, variation in fall of channels, and volume of run-off water; effect of erosion and silting on discharge capacity of channel; application of results.

DURALUMIN

Aging. The Artificial Aging of Duralumin and Super-Duralumin, K. L. Meissner. Inst. of Metals—Advance Paper (Lond.), no. 533, for mtg. Sept. 9-12, 1930, 28 pp., 21 figs. Effect of aging from 50 to 200 deg. cent. upon two commercial duralumin alloys and upon super-duralumin (duralumin with addition of silicon) were investigated; effect of artificial aging consists, after initial softening at lower temperatures, mainly in raising yield point, while tensile strength is influenced only slightly; elongation, flexibility, and other cold-working properties are decreased markedly; tensile strength of super-duralumin is raised, but rise keeps behind that of yield point, relatively.

E

ELECTRIC CABLES

Terminals. Why Buy Single Conductor Cable for Type H Terminals? E. F. Nuezel. Elec. World, vol. 96, no. 9, Aug. 30, 1930 ,pp. 398-399, 7 figs. Construction of type "H" cable lends itself very satisfactory to single-conductor terminal construction which does not necessitate use of single-conductor cable and yet has all of reliability with none of disadvantages of present single-conductor cable methods.

ELECTRIC CIRCUIT BREAKERS

Oil. Calculation of Mechanical Performance of Oil Circuit Breakers, A. C. Schwager. Am. Inst. Elec. Engrs.—Advance Paper, no. 30-149, for mtg. Sept. 2-5, 1930, 8 pp., 18 figs. Methods of calculating mechanical performance of typical rotary type oil circuit breaker, operated by spring actuated motor control; for given spring characteristic motion of breaker is predicted, time required to reach any position and speed at that position is calculated; general formulae are set up; mechanical test is performed on specific breaker and comparison made between calculated and tested results.

ELECTRIC DISCHARGE

Polarity. The Influence of Polarity on High-Voltage-Discharges, F. O. McMillan and E. C. Starr. Am. Inst. of Elec. Engrs.—Advance Paper, no. 155, for mtg. Sept. 2-5, 1930, 11 pp., 18 figs. Experimental investigation in which particular attention is given to those discharges used in high-voltage measurements; theory of formation of Lichtenberg figures is given together with experimental evidence upon which it is based; polarity indicator utilizing visual Lichtenberg figures; explanation of influence of polarity on spark-over is proposed.

ELECTRIC GENERATORS

Design. Large Three-Phase Generators (Grosse Dreiphasen-Generatoren), E. Hunziker. Schweiz. Elektrotechnischer Verein (Association Suisse des Electriciens) —Bul. (Zurich), vol. 21, no. 14, July 22, 1930, pp. 445-455, 9 figs. Present need of increasing capacity of turbo-generator units and generators for hydraulic plants; it is shown how requirements can be met on basis of developments so far; perspectives on basis of experience gained; factors which at present limit further extension of capacity of such generators. Paper read before World Power Conference, Berlin.

ELECTRIC INSULATORS

Porcelain. The Communication System of the Southern California Edison Company, Ltd., R. B. Ashhrook, and F. B. Doolittle. Am. Inst. Elec. Engrs.—Advance Paper, no. 150, for mtg. Sept. 2-5, 1930, 11 pp., 17 figs. General description of Southern California Edison Company's communication system which not only meets requirements of load dispatching but also serves to bring out close co-operation between outlying district forces and division headquarters; detail of development and construction by Company of Serjdetour arrester made public for first time standardized assemblies of telephone equipment.

ELECTRIC LIGHT AND LIGHTING

Design. The Production of Uniform Illumination Over Large Areas, H. R. S. McWhirter. Instn. Elec. Engrs.—Jl. (Lond.), vol. 68, no. 404, Aug. 1930, pp. 1012-1017, 9 figs. It is shown that when planning lighting system for large "working plane" using standardized industrial reflector (B.S.S. No. 232-1926) it is better to place lamps over centres of contiguous rhombuses than over centres of contiguous squares of equal area; new definition is proposed for term of "spacing ratio."

ELECTRIC LINES, HIGH TENSION

Alignment Charts. Transmission Line Nomographs, C. A. Kulmann. Elec. West, vol. 65, no. 3, Sept. 1, 1930, pp. 142-143, 1 fig. Graphical solution for obtaining numerical value of surge admittance in second term of current-characteristic equation.

Calculation. Calculation of Long High-Voltage Transmission Lines (Zur Berechnung langer Hochspannungsleitungen), I. Schwarzkopf. Elektrotechnik und Maschinenbau (Vienna), vol. 48, no. 31, Aug. 3, 1930, pp. 725-728, 3 figs. Method for long lines on principles applied in method for short lines; complex quantities are avoided and method is suitable for planning purposes and for judgment of operating characteristics.

Construction Features. Construction Features of a Long Transmission Line, A. E. Davison. Elec. News (Toronto), vol. 39, nos. 16 and 17, Aug. 15, 1930, pp. 51-53 and Sept. 1, pp. 38-40, 6 figs. Design features and methods of constructing 200-mi. 220,000-volt single-circuit line from point on Ottawa River near Fitzroy Harbour to Leaside, suburb of Toronto.

ELECTRIC MACHINERY

Welding. Electric Welding in Modern Electric Machinery Manufacture (Die Elektroschweissung im modernen Elektromaschinenbau), G. L. Meyfarth. Schweiz. Elektrotechnischer Verein—Bul. (Zurich), vol. 21, no. 16, Aug. 22, 1930, pp. 533-546, 21 figs. Electric arc welding is superior to gas welding as heat transmitted to large work pieces is less and no warping results in good designs; illustrations of welded electric machinery parts are given; economic importance of this manufacturing method for Swiss industry is pointed out.

ELECTRIC MOTOR-GENERATORS

Industrial Application. Industrial Applications of Motor-Generators, E. C. Diffenbach. Power, vol. 72, no. 10, Sept. 2, 1930, pp. 378-381, 7 figs. Motor-generator sets have become one of power-application engineer's most useful tools; they provide methods of control otherwise impossible for wide-range speed adjustment, and for reversing and precision drives; some of advantages of generator-voltage control are listed.

ELECTRIC MOTORS

Alternating Current—Control. A New System of Speed Control for A.C. Motors. Power, vol. 72, no. 8, Aug. 19, 1930, pp. 282-285, 8 figs. Constant-speed squirrel-cage induction motor supplies base speed, while d.c. motor, usually of much smaller size than former, is used to vary speed from base; this system is being used on power house auxiliary applications in several stations; curves illustrating comparative efficiencies of various systems of speed control as applied to coal pulverizers.

Induction. New Single Phase Clutch Type Induction Motor, H. D. Else. Power Plant Eng., vol. 34, no. 18, Sept. 15, 1930, pp. 1052-1053, 4 figs. Description of design features together with operating characteristics of clutch motor placed on market by Westinghouse Electric and Mfg. Co.; advantages of this type of drive.

Protection. Motors Need Not Stop When Voltage Dips, D. W. McLenegan. Elec. World, vol. 96, no. 10, Sept. 6, 1930, pp. 433-436, 2 figs. Time-delay devices are available to prevent instantaneous under-voltage releases from interrupting production when voltage dips momentarily.

Speed Regulation. Speed Controls for D.C. Motors, L. F. Miller. Elec. World, vol. 96, no. 9, Aug. 30, 1930, pp. 400-404, 9 figs. Advantages and disadvantages of each system so as to make possible easier selection of proper method for any desired application.

Squirrel Cage. Current-Displacement Motors (Stromverdraengungsmotoren), F. Niethammer. V.D.I. Zeit. (Berlin), vol. 74, no. 35, Aug. 30, 1930, pp. 1193-1200, 19 figs. Current displacement or double squirrel-cage and eddy current rotor electric motors are discussed; advantageous conditions in starting of these motors, i.e., 4- to 6-fold increased rotor resistance in starting and its small value under actual running conditions, are indicated.

Starting. Large Alternating-Current Motors with Centrifugal Starters, P. Suter. Brown Boveri Rev., vol. 17, no. 9, Sept. 1930, pp. 283-284, 4 figs. Sale of Brown-Boveri motors with centrifugal starters has continuously increased from year to year; altogether some 37,000 motors of this type are now in operation; features of starting and details of starting device are given.

ELECTRIC NETWORKS

Grounding. Critique of Ground Wire Theory, L. V. Bewley. Am. Inst. Elec. Engrs.—Jl., vol. 49, no. 9, Sept. 1930, pp. 780-784, 13 figs. Work of previous investigators is briefly reviewed, and limitations of their premises pointed out; generalized theory of ideal ground wires; probability of line's being hit; method for computing effect of successive reflections to calculation of potentials on line and ground wires; effect of ground wires on attenuation, telephone interference, zero-phase sequence reactance, corona and reduction in surge impedance due to introduction of extra ground wires; three mathematical appendices are given.

Interconnected. Problems Resulting From Interconnection of Electric Networks (Betrachtung einiger durch den Zusammenschloss elektrischer Netze bedingter Probleme), F. Grieb. Schweiz. Elektrotechnischer Verein (Association Suisse des Electriciens)—Bul. (Zurich), vol. 21, no. 15, Aug. 7, 1930, pp. 485-505, 28 figs. Engineering problems to be solved in parallel operation of power systems, i.e., short-circuit and ground protection; stability in normal operation, and in case of trouble; load distribution is discussed and analyzed.

ELECTRIC POWER INDUSTRY

Canada. One Hundred Millions a Year for Power Plant Construction, D. M. Marvin. Elec. News (Toronto), vol. 39, no. 17, Sept. 1, 1930, pp. 41-43, 1 fig. Power projects now under development in Canada will necessitate expenditure of more than one hundred million dollars per year during each of next three years; present turbine installation averages 583 hp. per thousand of population; distribution of water-power sites.

ELECTRIC REACTORS

Design. Calculation of Iron-Core Reactors with Large Time Constant (Die Berechnung von Eisendrosseln mit grosser Zeitkonstante), F. Emde. Elecktrotechnik und Maschinenbau (Vienna), vol. 48, no. 21, May 25, 1930, pp. 521-530, 7 figs. Mathematical design analysis pertaining to development of basical equations; computation of dimensions, and electro-magnetic quantities.

ELECTRIC SUBSTATIONS

Industrial—Lightning Protection. Lightning Protection for Industrial Substations, H. M. Towne. Indus. Eng., vol. 88, no. 8, Aug. 1930, pp. 421-424, 3 figs. Improvements in protective performance of lightning arrester; application of protective equipment to small industrial plants; economies effected by proper application of principles underlying lightning protective problem.

Rectifier. Montreal Tramways Installs Third Automatic Rectifier Substation, M. L. De Angelis. Elec. Ry. Jl., vol. 74, no. 10, Sept. 1930, pp. 577-580, 7 figs. Following successful use of mercury-arc rectifiers with full automatic control for more than three years, Montreal system continues expansion of its power supply with similar equipment, but with many distinctive features; sectional views of rectifier substations which is held to small over-all dimensions without sacrifice of accessibility.

Remote Control. Miniature Remote Control, J. P. Garvin. Elec. Jl., vol. 27, no. 6, June 1930, pp. 327-329, 2 figs. Equipment described extends maximum economical distance between generating plant and substation without supervisory control equipment.

ELECTRIC TESTING APPARATUS

High Tension. Equipment for Testing and Measurement of High-Voltage Installations (Einrichtung zum Pruefen und Messen von Hochspannungsanlagen), K. Taeuber. Elektrotechnische Zeit. (Berlin), vol. 51, no. 32, Aug. 7, 1930, pp. 1125-1128, 6 figs. Testing equipment in use on electrified sections of railroads in Bavaria also can save widespread application for light and power networks; use is made of transformer with resistance on low-tension side; possibilities of small size and portable arrangement of same equipment are discussed.

ELECTRIC TRANSFORMERS

Design. Numerical Conception of Field Strength in Leakage Spacings (Rechnerische Erfassung der Feldstaerken in Streuraeumen), R. Liebold. Elektrotechnik u. Maschinenbau (Vienna), vol. 48, no. 3, Jan. 19, 1930, pp. 53-56, 5 figs. Mathematical development of approximately exact equations for field strength along leakage path of transformers; equations are verified by experiments.

ELECTRIC WAVES

HARMONICS. A Power-Factor Treatment of Non-Sinusoidal Current Waves, F. B. Vogdes. Gen. Elec. Rev., vol. 33, no. 9, Sept. 1930, pp. 519-521, 6 figs. Non-sinusoidal waves resultant of two or more sinusoidal waves with or without d.c. component; mathematical and graphical analysis of sinusoidal and non-sinusoidal waves combined; illustrated by three dimensional vector model.

ENGINEERING RESEARCH LABORATORIES

GREAT BRITAIN. New Engineering Laboratories at University College, Nottingham. Engineer (Lond.), vol. 150, no. 3888, July 18, 1930, p. 71, 6 figs. partly on p. 70. Accounts of chief points of technical interest in laboratories, and illustrating some of principal machinery for power production and distribution.

EVAPORATION

THEORY. Heat Transmission, Diffusion, and Evaporation (Waermeuebergang, Diffusion, und Verdunstung), W. Nusselt. Zeit. fuer Angewandte Mathematik und Mechanik (Berlin), vol. 10, no. 2, Apr. 1930, pp. 105-121, 2 figs. Theoretical mathematical discussion with special reference to study of heat transmission by means of models; evaporation of water under various wind and temperature conditions; application of theory to design of cooling towers.

F

FANS

TESTING. The Characteristics of Two-Blade Propeller Fans, H. L. Dryden and P. S. Balif. U.S. Bur. of Standards—Jl. of Research, vol. 5, no. 1, July 1930, pp. 185-211, 31 figs. Seven 2-blade propeller fans, 8 ft. in diam. and of pitch diam. ratios 0.250, 0.375, 0.500, 0.625, 0.750, 0.938, and 1.063, respectively, were tested in duct especially constructed to simulate operating conditions encountered in cooling towers; each fan was tested for two operating conditions; with fan operating as blower, and with fan exhausting air from duct.

FLOORS, CONCRETE

STEEL CELLS. Steel Cellular-Floor Construction (Stahlzellendecke). Zentralblatt der Bauverwaltung (Berlin), vol. 50, no. 19, May 14, 1930, pp. 358-359, 5 figs. Corrugated steel units described are intended to replace more usual hollow tiles in concrete-floor construction; each weighs about 9 lbs.

FLOW OF STEAM

ORIFICES. Discussion of the Flow of Steam through Orifices and Nozzles and the Pressure Drop in Steam Pipes, G. E. Reed. Nat. District Heat. Assn.—Bul., vol. 15, no. 4, July 15, 1930, pp. 176-185, 4 figs. Paper deals principally with underlying principles of orifices and derivations leading to formula for orifice size calculation; theoretical curve of steam flow through cylindrical orifices is illustrated.

FLOW OF WATER

CURVED CHANNELS. Recent Experiment on Flow of Water in Curved Channels (Neuere Versuche Ueber den Stroemungsvorgang in Gekruemmten Kanaelen), H. Nippert. Bauingenieur (Berlin), vol. 11, no. 5, Jan. 31, 1930, pp. 76-79, 9 figs. Report on author's laboratory experiments made in Department of Hydro-mechanics of Danzig Institute of Technology; distribution of velocity in cross-section of curved circular pipe; eddying, distribution of velocities, and loss of head in rectangular bend and in 90-deg. curves rounded with various radii of curvatures.

FORGINGS

NICKEL ALLOY. Nickel Alloy Steel Forgings, C. McKnight. Am. Soc. for Steel Treating—Trans., vol. 18, no. 2, Aug. 1930, pp. 129-140 and (discussion) 140-146, 5 figs. Large forgings constitute important and constantly increasing field for alloy steel; data published by Society of Automotive Engineers on properties, analysis, and heat treatments of alloy steel are standard, but not applicable to large forgings as based on tests made on one inch bars; paper deals briefly with manufacture, uses, analysis, heat treatment, and properties of nickel alloy steel forgings larger than four inches in diameter or equivalent section.

FURNACES

INDUSTRIAL, OIL-FIRED. Industrial Heating with Heavy Oils (Le chauffage industriel aux huiles lourdes). Technique Moderne (Paris), vol. 22, no. 14, July 15, 1930, pp. 498-502, 5 figs. Discussion of application of heavy oils for various industrial processes; steam generation, heat-treating furnaces, blast furnaces, and ceramic furnaces; advantages, operations, and design of various types of equipment.

MELTING, PULVERIZED-COAL-FIRED. The Rotary Furnace for Iron Founding, A. Le Thomas. Metallurgist (Supp. to Engineer, Lond.), Aug. 1930, pp. 119-120. Analysis of relative merits of new type and of cupola; account of horizontal cylindrical type of melting furnace fired with pulverized coal; flame from pulverized-fuel burner enters through aperture in one of conical ends of furnace; main advantages claimed are that iron produced is practically unaltered by melting process. Abstract translated from Revue de Métallurgie, May 1930.

G

GASOLINE ENGINES

COMBUSTION. Following Combustion in the Gasoline Engine by Chemical Means, L. Withrow, W. G. Lovell and T. A. Boyd. Indus. and Eng. Chem., vol. 22, no. 9, Sept. 1930, pp. 945-951, 11 figs. Measurements have been made of oxygen concentration in gases withdrawn from cylinder of gasoline engine with new and improved sampling valve which was located at different places in combustion chamber and opened at different times during combustion of charge.

GEOPHYSICAL EXPLORATION

ELECTRIC. Geoelectric Prospecting for Ore, A. Zabelli. Min. Jl. (Lond.), vol. 170, no. 4955, Aug. 9, 1930, pp. 641-642. Natural geoelectric currents, and their use in search for sulphur deposits; oscillatory currents artificially produced in ground, and their use in search for insulating minerals such as sulphur and petroleum. Read before International Congress of Mines, Metallurgy and Applied Geology of Liége.

GRINDING WHEELS

BALANCING. New Dynamic Balancing Machine for Grinding Wheels (Eine neue dynamische Soder-Auswuchtmaschine fuer schleifscheiben), D. Hofmann. Werkstattstechnik (Berlin), vol. 24, no. 16, Aug. 15, 1930, pp. 436-440, 17 figs. Principles and operation of machines built by Hessischen Maschinenfabrik Robert Kunze, Darmstadt; grinding wheel is clamped down on rotating disc and after balancing, centre is cast before removing clamps; sketches show principal details.

H

HARDNESS TESTING

PENDULUM TESTS. "Pendulum" Hardness Tests of Commercially Pure Metals, D. A. N. Sandifer. Inst. of Metals—Advance Paper (Lond.), no. 529, for mtg. Sept. 9-12, 1930, 29 pp., 8 figs. Investigation limited to metallic elements; description of 24 metals tested and of hardness tester; conversion to Brinell hardness numbers; definition of time work-hardening capacity; relation between time hardnesses for different pendulum lengths; relation between scale hardness and scale work-hardening capacity; relations between time hardness, Young's modulus, and relative atomic volume; effects of rolling and of impurities.

HEAT-INSULATING MATERIALS

FLOW OF HEAT. Transient Flow of Heat Through Insulation, A. R. Stevenson, Jr. and H. L. Bojer. Refrig. Eng., vol. 20, no. 1, July 1930, pp. 23-29, 5 figs. Theoretical mathematical analysis of heat flow with special application to variation of temperature in refrigerator; tests on transient heat flow; test with box cooled by refrigerating unit; equation for transient temperature when refrigeration is shut off.

HEAT TRANSMISSION

CONVECTION. The Calculation of Convection Heat Transfer, M. Fishenden and O. A. Saunder. Engineering (Lond.) ,vol. 130, no. 3369 and 3370, Aug. 8, 1930, pp. 177-180, and Aug. 15, pp. 193-194, 7 figs. Aug. 8: Application of principle of similarity to convection; forced convection. Aug. 15: Natural convection; vertical planes; effects of shape and position on natural convection. Communication from Fuel Research Division, Dept. of Sci. and Indus. Research.

COOLING TOWERS. Heat Transmission, Diffusion and Evaporation (Waermeuebergang, Diffusion und Verdunstung), W. Nusselt. Zeit. fuer Angewandte Mathematik und Mechanik (Berlin), vol. 10, no. 2, Apr. 1930, pp. 105-121, 2 figs. Theoretical mathematical discussion with special reference to study of heat transmission by means of models; evaporation of water under various wind and temperature conditions; application of theory to design of cooling towers.

HIGH BUILDINGS

STEEL VS. CONCRETE. Steel vs. Reinforced Concrete in Construction of High Buildings (Stahl oder Eosenbeton im Hochhausbau), R. Frab. Montanistische Rundschau (Vienna), vol. 22, no. 14, (Supp.), July 16, 1930, pp. 49-50. Relative merits of two building materials are compared, and conclusion is reached that steel construction is preferable.

HIGH SPEED STEEL

ANNEALING PHENOMENA. Influence of Nickel and Manganese on Properties of High-Speed Steel (Ueber den Einfluss von Nickel und Mangan auf die Eigenschaften von Schnelldrehstahl), V. Ehmcke. Archiv fuer das Eisenhuettenwesen (Duesseldorf), vol. 4, no. 1, July 1930, pp. 23-35, 21 figs.; see also brief abstract in Stahl u. Eisen, vol. 50, no. 32, Aug. 7, 1930, pp. 1131-1132, 21 figs. Contribution to solution of annealing phenomena in high-speed steel and its adaptability as heat-resisting steel; results of hardening and annealing tests; dilatometric tests; influence of nickel and manganese additions.

HYDRO-ELECTRIC POWER DEVELOPMENTS

ONTARIO. Hydro-Electric Power in Ontario. Engineering (Lond.), vol. 130, no. 3370, Aug. 15, 1930, pp. 207-208. Review of 22nd annual report of Hydro-Electric Power Commission of Ontario for year ending October 31, 1929; electricity generated during year was 23 per cent greater than in 1927-28; number of generating stations operated by Commission increased by ten.

HYDRO-ELECTRIC POWER PLANTS

MALAY. The Perak River Hydro-Electric Power Scheme. Engineer (Lond.), vol. 150, no. 3893, Aug. 22, 1930, pp. 190-192, 13 figs. partly on supp. plate and p. 202. With view to supplying its numerous tin mines with power, Perak River Hydro-Electric Power Co. was formed in 1926; Chenderoh power station is situated at point where river flows between two high banks; dam is hollow reinforced-concrete structure of Ambursen type; Taintor gates consist of skin plate bent to radius of 20 ft.; power house contains three vertical-shaft Francis turbines each coupled to 9,000-kw. generator.

NOVA SCOTIA. A Complete Automatic Hydro-Electric System, C. S. Rickards and D. V. Canning. Elec. News (Toronto), vol. 39, no. 17, Sept. 1, 1930, pp. 31-32 and 36, 3 figs. Description of largest automatic plant in Canada; upper station is equipped with two 3,000-hp. turbines and two generators 3,000-kv., 60-cycle, 6,600 volts; details of two other stations also given.

PUMPED STORAGE. The Development of Pump-Fed Storage Power Stations in Germany. Eng. Progress (Berlin), vol. 11, no. 3, Aug. 1930, pp. 205-206, 5 figs. Installations briefly described; Escher-Wyss storage pump for power input of 27,000 hp. for Niederwartha plant; vertical shaft Escher-Wyss storage pump for power input of 8,000 hp. for Leitzach plant; Voith spiral turbine of 48,000 hp. rated capacity for Herdecke plant; Voith-Sulzer pump for power input of 36,000 hp.; Voith-Foettinger hydro-mechanical coupling.

I

IMPACT TESTING

NOTCHED BAR. Critical Investigation of Notched-Bar Test According to Kr K 100 in Regard to Suitability for Testing of Drawn Metals (Kritische Untersuchung des Schlag-Kerb-Faltversuchs nach Kr K 100), F. Saeftel and H. Rudolph. Automobiltechnische Zeit. (Berlin), vol. 33, no. 20, July 1930, pp. 492-496, 4 figs. Discussion of objectionable features of bending test; table shows effect of various factors upon maximum bending angle; notes on dimensions of notches and tools used for making notches.

INDUSTRIAL PLANTS

ELECTRIC POWER FOR. Power Plant for Modern Factories (Une Centrale d'Usine Moderne), P. Mensier. Société des Ingénieurs Civils de France—Mémoires et Compte Rendu des Travaux (Paris), vol. 83, no. 3-4, 1930, pp. 280-324, 18 figs. Notes on economic production of power in factory which consumes large quantities of steam in production process; steam distribution at various pressures; bleeding turbines and boiler feedwater; detailed study of clothing and dyeing plant in Tourcoing in need of 2,000 kw. and steam for heating at 6 and 3 kg. pressure; equipment installed for driving of 1,800-kw. turbo-generator of 30-kg. pressure.

INTERNAL-COMBUSTION ENGINES

AIR FILTERS. The Efficiency of Air Filters for Internal-Combustion Engines, W. E. Gibbs, A. Brandt and M. L. Nathan. Engineering (Lond.), vol. 130, no. 3371, Aug. 22, 1930, pp. 221-223, 7 figs. Principles governing action of air filters; principle of centrifugal separation is employed in two types, cyclone and perforated-baffle type; filters chosen to represent these are representative cyclone model and Visco RM filter; their efficiencies have been determined; superior efficiency of Visco filter is due to much smaller radius of curvature imparted to air stream, combined with greater proximity of depositing surface, which results from closeness of perforated plates to one another.

EFFICIENCY. Investigation on Volumetric Efficiency of Two-Cylinder Two-Cycle Engine with Crankcase Compression (Untersuchung ueber den volumetrischen wirkungsgrad an einem Zweizylinder-Zweitaktmotor mit Kurbelkammergemischpumpe), F. Buchholz, L. Hoffmann, and K. Joachimssohn. Automobiltechnische Zeit. (Berlin), vol. 33, no. 21, July 31, 1930, pp. 505-510, 8 figs. Determination of volumetric efficiency at vacuum of from 0 to 1,200 mm. water between 800 and 2,000 r.p.m. by direct measurement of air quantity and by calculating air quantity from fuel consumption and exhaust-gas analysis.

HIGH-SPEED. Requirements and Problems of High Speed in Piston Engines (Anforderungen und Problems des Schnellaufs bei Kolbenmaschinen), F. Modersohn. Maschinenbau (Berlin), vol. 9, no. 14, July 17, 1930, pp. 465-470, 18 figs. Discussion of factors determining life of vital parts of high-speed engine; materials, accuracy, surface property, and lubrication; typical cases of wear are illustrated by micro-photographs.

TWO-CYCLE. Working Process of High-Speed Two-Cycle Carburetor Engines (Das Arbeitsverfahren raschlaufender Zweitaktvergaser-Maschinen), O. Kluesener. Forschungsarbeiten auf dem Gebiete des Ingenieurwesens (Berlin), no. 334, 1930, pp. 21-46, 47 figs.; see also V.D.I. Zeit. (Berlin), vol. 74, no. 33, Aug. 16, 1930, pp. 1154-1156, 13 figs. Investigation of process in two-cycle engines with crankcase compression; report on scavenging tests and combustion velocity at speeds up to 3,500 r.p.m.; complete thermal budget is given.

WELDING. Welding Practice on Heavy Engines, O. Adams. Welding, vol. 1, no. 10, Aug. 1930, pp. 674-677, 7 figs. Description of repairs to pistons, cylinder heads, and cylinders of gas and Diesel engines; costs of welding, method of preheating, electric arc welding, and bronze welding.

IRON-CHROMIUM ALLOYS

STUDY OF. A Study of the Iron-Chromium-Carbon Constitutional Diagram, V. N. Krivobok and M. A. Grossmann. Am. Soc. for Steel Treating—Trans., vol. 18, no. 1, July 1930, pp. 1-38, 55 figs. Relationships when chromium content is varied from zero up to about 18 per cent; in absence of carbon, increase in chromium caused region of delta iron to merge with alpha region, eliminating gamma iron when chromium was above 14 per cent; in presence of carbon, range of temperature and carbon content in which austenite was associated with delta iron merged with range in which austenite was associated with alpha iron.

IRON FOUNDRIES

LARGE CASTINGS. The Production of Large and Medium-Sized High-Class Iron Castings, W. Scott. Foundry Trade Jl. (Lond.), vol. 43, no. 729, Aug. 7, 1930, pp. 91-96 and 98, 29 figs. Methods used by Close Foundry of Armstrong, Whitworth and Co. for manufacturing marine, Diesel, and steam-turbine castings. Paper read before Inst. of Brit. Foundrymen.

L

LOCOMOTIVES

DESIGN. Steam Locomotive Design: Data and Formulae, E. A. Phillipson. Locomotive (Lond.), vol. 36, nos. 449, 450, 451, 452, 453, 454, 455 and 456, Jan. 15, 1930, pp. 15-17; Feb. 15, pp. 61-63; Mar. 15, pp. 86-90; Apr. 15, pp. 120-123; May 15, pp. 151-152; June 15, pp. 210-211; July 15, pp. 241-244; Aug. 15, pp. 263-265; 5 figs. Jan.: Mathematical calculation of design features dealing with train resistance, resistance due to acceleration, gradient resistance, curve resistance, and natural wind resistance. Feb.: General remarks, definitions, and data; determination of such factors as evaporative heating surface required per i.hp. developed, boiler demand factor, and engine performance data. Mar.: Estimating steam consumption; calorific value and combustion of fuel; grate area. Apr.: Determination of firebox and tube heating surface; superheater surface; table of leading dimensions and design ratios of tank, freight, mixed traffic and passenger express locomotives. May: Discussion of cardinal points of design. June: Consideration of boiler together with mathematical determination of barrel-plate thickness. July: Consideration of boiler riveted joints and firebox plates; relative merits of steel and copper for inner fireboxes; wide versus narrow fireboxes; relative merits of Belpaire and round topped fireboxes. Aug.: Design features of combustion chambers, foundation ring, fusible plug, brick arch, deflector plates, and firebars.

ELECTRIC. Double-Voltage Operation Features Midland Utilities Locomotive, T. F. Perkinson. Elec. Ry. Jl., vol. 74, no. 9, Aug. 1930, pp. 524-525, 2 figs. Service can be given on 1,500 or 600-volt lines on its several subsidiary railways by changes of circuits and minor adjustments; principal data of double-voltage locomotives is listed.

Electric Locomotives with Welded Frame and Trucks (Elektrische Lokomotive mit geschweissten Rahmen und Drehgestellen), W. Reichel. V.D.I. Zeit. (Berlin), vol. 74, no. 23, June 7, 1930, pp. 767-768, 5 figs. Brief description of welded frame construction used for electric locomotives with individual axle drive; outline of principal types of locomotives built by Siemen Schuckert.

Vertical Motors Feature Austrian Locomotives. Elec. Ry. Jl., vol. 74, no. 9, Aug. 1930, pp. 511-512, 5 figs. Locomotive drive of type differing radically from that in use in America has been found successful on lines of Austrian Federal Railways; principal feature is use of vertical motors connected to driving axles through bevel gears; drive is somewhat similar to that brought out short time previously by Midi Railway of France; specifications of high-speed locomotives are listed.

HIGH-PRESSURE. Experimental Multiple Pressure and New Freight Locomotives, Canadian Pacific Ry. Locomotive(Lond.), vol. 35, no. 456, Aug. 15, 1930, pp. 260-261, 1 fig. At Angus Shops of C.P. Ry. in Montreal, three-cylinder locomotive is being constructed which generates high-pressure steam on Schmidt system; 2-10-4 type with high-pressure cylinder 15½ in. by 28 in., and two low-pressure cylinders 24 in. by 30 in.; driving wheels 5 ft. 3 in.; working pressure 275 lbs. per sq. in.; nominal tractive force at 85 per cent boiler pressure, 83,000 lbs.; total weight of engine 466,000 lbs.; engine wheelbase 46 ft. 0½ in.

OIL-ELECTRIC. Economics of the Oil-Engine Locomotive, A. I. Lipetz. Ry. Age, vol. 89, no. 9, Aug. 30, 1930, pp. 451-455, 2 figs. Comparative data from seven railroads for oil-electric and steam locomotives analyzed; road operating costs; effect of high availability; established trends in America. Portion of report on Question V—Locomotives of New Types, presented before Int. Ry. Congress Assn., Madrid, Spain.

VALVE GEARS. A New Locomotive Poppet Valve Gear. Ry. Engr. (Lond.), vol. 51, no. 608, Sept. 1930, pp. 355-357, 2 figs. Perfect timing for all valve events up to 84 per cent cut-off, simple control, and low first cost are among advantages claimed for Holmes Gear, which is illustrated and described.

LUBRICATION

THEORIES. Coefficient of Fluid Friction (Au sujet du coefficient du frottement fluide), Hanocq. Revue Universelle des Mines (Liége), vol. 4, no. 2, July 15, 1930, pp. 33-38, 6 figs. Elementary theory of film lubrication; experimental verification of theory; study of semi-fluid friction; conclusions regarding coefficient of friction. See reference to author's earlier work indexed in Engineering Index 1929, p. 1107.

M

MACHINE TOOLS

HYDRAULIC DRIVE. Machine Tools for Metals Cutting with Hydraulic Drive and Their Calculations (Spanabhebende Werkzeugmaschinen mit Fluessigkeitsgetrieben und deren Berechnung), F. H. Huth. Maschinen-Konstrukteur (Berlin), vol. 63, no. 13, July 10, 1930, pp. 266-269, 8 figs. Description of Blell-Hydro planer and its hydraulic drive; examples for computing dimensions and performance of pump and motor of hydraulic drive.

MATHEMATICS

FAIRING EMPIRICAL SERIES. Smoothing of Empirical Series (Das Glaetten empirisch gefundener Zahlenreihen), A. Willers. Zeit. fuer Angewandte Mathematik und Mechanik (Berlin), vol. 10, no. 2, Apr. 1930, pp. 166-181. Theoretical mathematical discussion on reduction of experimental data.

METALS

DEFORMATION. Some Applications of the Theory of Plastic Deformations of Ductile Metals, A. Nadai. Phys. Rev., vol. 36, no. 4, Aug. 15, 1930, pp. 762-772, 4 figs. Account of principal conditions which are available to express equilibrium of stress in plastic of ductile metals; ease of rotationary symmetry in plastic body; plastic flow in thick-walled cylinder subjected to high internal pressure with and without longitudinal expansion; distribution of stress during yielding for long cylinder and for flat ring, both subjected to radial pressure; spread of yielding and plastic deformation through walls of cylinder.

HARD FACING. The Metallurgy of Welded-on Overlays, M. C. Smith. Welding, vol. 1, no. 10, Aug. 1930, pp. 681-683 and 688, 5 figs. Discussion of structural changes and formation of alloys which take place in hard facing; technique of applying overlay.

MOTORSHIPS, DIESEL-ELECTRIC

CEMENT CARRIERS. Self-Unloading Cement Carrying Vessel for Canadian Cement, A. C. Blackall. Concrete, vol. 37, no. 3, Sept. 1930, pp. 96-98, 4 figs. Description of Diesel-electric 3,150 ton vessel "Cementkarrier" designed for service on Great Lakes, St. Lawrence and Atlantic Coast, recently completed by Furness Shipbuilding Co., Ltd., Haverton Hill-on-Tees, England, for Canada Cement Transport Co., of Montreal; cargo carried in holds of hopper form; cement pumped ashore by electrically driven system.

N

NATURAL GAS PIPE LINES

HIGH PRESSURE. Some Aspects of High-Pressure Natural Gas Transportation, R. S. Lord. West. Soc. of Engrs.—Jl., vol. 35, no. 4, Aug. 1930, pp. 254-275, 10 figs. Merits of natural gas; growth of natural-gas industry; early developments of natural-gas pipe lines; problems of high-pressure distribution.

NON-FERROUS METALS

COLD ROLLING. Modern Practice in the Cold Rolling of Non-Ferrous Metals, C. E. Davies. Metallurgia (Manchester), vol. 2, no. 10, Aug. 1930, pp. 145-146. Copper, brass, nickel, aluminum, and zinc group, precious-metals group, and soft-metals group are handled by machinery and methods that are alike in principle; modifications in detail are governed by different physical properties of individual metals and alloys; outline of brass strip practice.

O

OIL ENGINES

AUTOMOTIVE, HESSELMAN'S. Hesselman's Low-Pressure Crude-Oil Engine (Hesselman's Lagtrycks-Raoljemotor), E. Hubendick. Teknisk Tidskrift (Stockholm), vol. 60, no. 28, July 12, 1930, pp. 417-427, 31 figs. First authentic and complete account of low-pressure petroleum engine to be used in automobiles, small boats, and locomotives; test show saving over gasoline consumption of 30 per cent and in fuel cost of 68 per cent; same capacity fuel tank will carry car 43 per cent farther than gasoline.

New Oil Engine for Motor Vehicles (Neuer Oelmotor fuer Kraftfahrzeuge), A. Heller. V.D.I. Zeit (Berlin), vol. 74, no. 28, July 12, 1930, pp. 970-972, 9 figs. Description of Hesselman high-speed spark-ignition engines; performance curves are given.

Hesselman New Low-Pressure Oil Engine (Hesselmans neuer Niederdruck-Oelmotor), C. A. Fieber. Sparwirtschaft (Vienna), vol. 8, no. 7, July 1930, pp. 327-331, 10 figs. Outline of advantages of Hesselman engine and report on result obtained with four-cylinder engine built by Grazer Waggon und Maschinen-Fabriks-Aktiengesellschaft.

RUSTON AND HORNSBY. The Ruston High-Speed Airless-Injection Oil Engine. Engineering (Lond.), vol. 130, no. 3371, Aug. 22, 1930, p. 247, 6 figs. partly on p. 246. Engine runs at 900 r.p.m. and can be supplied either as stationary model for belt or direct drives, or arranged for fitting in commercial vehicles, tractors, and so on; cylinder heads are separate castings, held down by studs; inlet and exhaust valves are interchangeable, and both are operated from single camshaft located in crankcase.

OPEN HEARTH FURNACES

REGENERATORS. Large-Scale Tests on Experimental Regenerative Chamber (Grossversuche an einer zu Studienzwecken gebauten Regenerativ Kammer), H. Kistner. Stahl und Eisen (Duesseldorf), vol. 50, no. 29, July 17, 1930, pp. 1027-1028. Determination of heat-transfer co-efficient and pressure losses with doubly staggered and non-staggered grade packing. (Concluded.)

P

PAVEMENTS

SPECIFICATIONS. Preparation of Subgrades and Bases for Pavements. Contract Rec. (Toronto), vol. 44, no. 36, Sept. 3, 1930, pp. 1073-1075. Report of subcommittee no. 4 of General Committee No. 11 of American Road Builders' Assn.; backfilling methods; cushion blanket courses; pavement bases; strength requirements; consistency of concrete; time for curing; central mixed concrete.

PILE DRIVING

FORMULAE. Bearing Capacity of Driven Piles (Zur Frage der Tragfaehigkeit von Rammpfaehlen), E. Rausch. Bauingenieur (Berlin), vol. 11, no. 30, July 25, 1930, pp. 514-516, 4 figs. Derivation as new theoretical formula taking into account "spring-back" of pile and impact co-efficients.

PIPE, CAST IRON

CENTRIFUGAL CASTING. Casts Pipe in Eighteen Foot Lengths, P. Dwyer. Foundry, vol. 58, no. 15, Aug. 1, 1930, pp. 104-109, 10 figs. Description of manufacturing process and equipment at plant of National Cast Iron Pipe Co., Birmingham, Ala.; notes on synchronization of operation, tests, and inspection of pipes.

PLANERS

METAL-WORKING—MANUFACTURE. Grinding or Scraping? (Schleifen oder Schaben?), W. Iwascheff. Werkstattstecknik (Berlin), vol. 24, no. 15, Aug. 1, 1930, pp. 405-410, 10 figs. Superiority of grinding as compared to scraping is outlined; characteristics of scraped and ground surfaces are discussed with regard to structure and suitability for lubrication; detailed description of planing and grinding operation on cheeks of planer bed; data on tolerances.

POWER CONFERENCES

BERLIN. The Second World Power Conference, Berlin, 1930 (Von der II. Weltkraftkonferenz, Berlin, 1930), C. Matschoss. V.D.I. Zeit. (Berlin), vol. 74, no. 29, July 19, 1930, pp. 993-1040. Abstract of papers and discussions of general sessions, including addresses by Einstein, Eddington, and others; also report on proceedings of following special sections; Fuels, Steam Power, Internal Combustion Motors, Water Power, Power Storage, Electricity, Use of Various Forms of Power, Standardization and Statistical Methods, etc.

The World Power Conference, Berlin. Engineering (Lond.), vol. 130, nos. 3366 and 3367, July 18, 1930, pp. 91-92, and July 25, pp. 125-126. July 18: Abstracts of selected papers relating, respectively, to liquid and solid fuels and power economics. July 25: Research work; research divided into two definite parts dealing, respectively, with hydrodynamics and kindred matters, and thermodynamics; costs and comparative efficiency of different types of energy.

POWER PLANT EQUIPMENT

ELECTRIC. Minimizing Breakers in Exciter Layouts, J. B. MacLean. Elec. World, vol. 96, no. 9, Aug. 30, 1930, pp. 397, 2 figs. Spare exciter in new power house for Pennsylvania State College has been connected solidly to exciter transfer bus; in two larger plants under construction this same scheme is being used; elimination of switch between exciter transfer bus and spare exciter does not reduce flexibility of field system, since both exciter transfer bus and spare exciter are mutually dependent for emergency operation.

POWER PLANTS

LOAD DESPATCHING. Some Notes on the Centralized Control System of the Victoria Falls and Transvaal Power Company, Limited, J. Falcke. S. African Inst. of Elec. Engrs.—Trans. (Lond.), vol. 21, part 5, May 1930, pp. 105-115, 7 figs. General idea of control diagram and principles upon which system is operated; evolution of centralized control system; office; indicating and recording instruments; summating wattmeters; communication system; compressed air diagram; load graph; duties of control engineer; operating requirements; continuity of supply and protection; reliability of service; transmission system; power factor and interconnection.

STEAM VS. HYDRO-ELECTRIC. What to Build—Steam or Hydro Plants? A. H. Markwart. Elec. West, vol. 65, no. 3, Sept. 1, 1930, pp. 136-139, 3 figs. Method of analysis that has proved to be useful in guiding determination of related economic factors which dictate proportions in which steam and hydro plants should be built to serve growing load in order to realize maximum overall system economy; curves and tables given.

PRESSURE INDICATORS

PRECISION. Precision Measurement of Liquid Pressure. Engineer (Lond.), vol. 150, no. 3890, Aug. 1, 1930, pp. 116-117, 11 figs. That it is possible to construct highly efficient mercury column for high pressures has been proved by Budenburg Gauge Co. who have fitted up standard mercury column at its worksf or pressures up to 300 lbs. per sq. in.; in precision dead weight testers pressure of liquid, usually oil or glycerine, is balanced by weight of loaded piston floating in cylinder.

R

RAIL MOTOR CARS

Gasoline. Petrol Engine Cars for the Brazilian Central Railways, O. Schamberger. AEG Progress (Berlin), vol. 6, no. 8, Aug. 1930, pp. 259-264, 10 figs. Four-axle cars with double-engine equipment of four cylinders with 150 mm. bore and 180 mm. stroke which develop 100 b.hp. at 1,000 r.p.m.; four speed friction clutches; electro-pneumatic train control.

Storage-Battery. Accumulator Driven Rail Vehicles in Europe, P. L. Balbo. Tramway and Ry. World (Lond.), vol. 68, no. 8, Aug. 14, 1930, pp. 75-76. Discussion of problems associated with storage-battery drive as applied to electric-railroad cars and buses; historical review of this type of drive; results of experiments carried out in various cities of Europe. Abstract of paper presented at Congress of Int. Tramways Union at Warsaw.

REFRIGERATING COMPRESSORS

Design. The Design of Compressors, B. C. Oldham. Refrig. Eng., vol. 20, no. 2, Aug. 1920, pp. 83-93, 9 figs. Following design features of compressor cylinder are discussed; valves, piston, speeds, types, frames; special problems of refrigeration cycle; comparison curves of pressure ratios of refrigerants; capacity as related to compressor design; motive power of refrigerants.

REFRIGERATION

Frozen-Brine. Frozen-Brine Refrigeration, D. K. Warner. Ice and Refrig., vol. 79, no. 2, Aug. 1930, pp. 126-127, 2 figs. Application of frozen-brine principle to household refrigeration in place of water ice and its advantages as refrigerant; cost of producing frozen-brine; process is comparable to old ice-cream freezer; will hold refrigerator colder with more constant temperature and humidity.

New Refrigerating and Ice-Making System, D. K. Warner. Ice and Refrig., vol. 79, no. 2, Aug. 1930, pp. 79-82, 6 figs. Principles of new experiments; requirements of ammonia floats; constant humidity refrigerator operated with frozen-brine; improvement on barometric condenser; mechanical refrigerator with varying temperatures. Address delivered before Am. Soc. Refrig. Engrs.

RESERVOIRS

Storage. Eleven-Mile Canyon Reservoir Permits Denver to Use Full Storage of Lake Cheesman, D. D. Gross. Eng News-Rec., vol. 105, no. 11, Sept. 11, 1930, pp. 425-426, 2 figs. Features of proposed storage project including arched dam 112 ft. high, containing 50,000 cu. yds. of concrete; map of storage and sources of water on South Platte River above Denver and irrigated areas.

ROADS, CONCRETE

Joints. Experiments on Concrete Road Joints. Engineering (Lond.), vol. 130, no. 3370, Aug. 15, 1930, p. 210, 7 figs. Survey of defects, which have occurred on road of fairly recent construction carried out by Technical Advisory Committee appointed by Minister of Transport, previously indexed.

ROLLING MILLS

Aluminum. Rolling Mills, Alloying, and Presswork of Aluminium Industrie A.-G., Neuhausen (Die neuen Legierungs-Walz- und Presswerke der Aluminium-Industrie A.-G. Neuhausen), Zeerleder. Schweizerische Bauzeitung (Zurich), vol. 96, no. 2, July 12, 1930, pp. 15-22, 30 figs. Description of layout, operating methods, and equipment of new Swiss aluminum rolling mills; data on capacity of machinery and power requirements are given.

Electric Drive. How Special Motors and Control Solved Continuous Hot-Rolling Problems, R. H. Rogers. Elec. World, vol. 96, no. 8, Aug. 23, 1930, pp. 352-357, 8 figs. Methods used to obtain compact but accessible motor room; purposes served by four-element motor-generators; avoid starting compensators; use of two-in-one roughing-mill motor; motors and control for successive finishing rolls at proper relative speeds, starting roughing-mill speed of finishing-mill motors; regulating relative speeds of six motors within 0.1 per cent; centralized motor control and load and speed indication.

Flow in Rolling. Influence of Lateral Pressure on Deformation in Rolling and on Quality of Material (Der Einfluss des Seitendruckes auf die Formaenderung beim Walzen und die Guete des Werkstoffes), H. Hilterhaus. Stahl und Eisen (Duesseldorf), vol. 50, nos. 34 and 35, Aug. 21, 1930, pp. 1185-1194 and Aug. 28, pp. 1221-1229, 31 figs. Review of different theories on flow of material with rolling; results of author's own tests on three-high mill; evaluation of tests.

Research. Studies of Efficiency and Power Consumption for Different Sections (Untersuchungen zur Feststellung der Leistungsfaehigkeit und des Kraftverbrauches fuer verschiedene Walzprofile), G. Bulle, C. N. Elsen, and A. Knickenberg. Stahl und Eisen (Duesseldorf), vol. 50, no. 32, Aug. 7, 1930, pp. 1121-1126, 12 figs. Time and energy-consumption measurements were carried out on five rolling mills showing that graphic record of structural units of mill could be easily obtained; investigation of energy consumption for determination of starting energy, no-load output, and productive rolling work, by which is understood work that roll motor has to perform in excess of work at no load.

RUBBER MACHINERY

Lathe. Rubber-Making Machinery. Engineering (Lond.), vol. 130, no. 3371, Aug. 22, 1930, pp. 225-227, 4 figs. Machines used in manufacture of circular steel bands on which solid rubber tires for heavy commercial vehicles are formed; lathe specially designed as single-purpose machine for turning, grooving, and serrating of solid tire bands. (Continuation of serial.)

S

SAND BLAST

Nozzles. Capacity and Efficiency of Sand-Blast Nozzles (Leistung und Wirkungsgrad von Sandstrahlduesen), Nettmann and Faber. V.D.I. Zeit. (Berlin), vol. 74, no. 35, Aug. 30, 1930, p. 1200, 2 figs. Abstract of V.D.I. Bulletin on tests of wooden nozzles operated with sand grains of steel shot; erosive effect of blasted materials upon shape of nozzle channel.

SEAPLANES

Design. The Design of Seaplanes, A. Gouge. Aircraft Eng. (Lond.), vol. 2, no. 18, Aug. 1930, pp. 202-206, 16 figs. Article discusses strength, stability and water and flying qualities of both seaplanes and flying boats; curves illustrate lift and drag characteristics and pressure distribution.

SEWAGE PUMPING STATIONS

Germany. The Ruhrverband Sewage Pumping Plants at Dahlhausen and Essen-Steele (Die Abwasserpumpwerke des Ruhrverbandes in Dahlhausen und Essen-Steel), F. Fries. Technische Gemeindeblatt (Berlin), vol. 33, nos. 4 and 5, Feb. 20, 1930, pp. 44-48 and Mar. 5, pp. 52-55, 25 figs. Description of pumping and treatment plants for sanitary and storm sewage of small communities; pumping capacities are 1.3 cu. m. per sec. and 2.3 cu. m. per sec., respectively; plants are housed in circular structure and are equipped with centrifugal pumps electrically driven; Hume concrete pipe is used.

SHAFTS AND SHAFTING

Stresses in. Shaft Stresses Due to Torsional Impact, W. A. Tuplin. Engineer (London), vol. 150, no. 3890, Aug. 1, 1930, pp. 112-115, 5 figs. Loss of kinetic energy when two masses rotating at different speeds are suddenly connected is determined by considerations of angular momentum; calculations assume that whole of lost kinetic energy is transformed into torsional strain energy of shafts; in practice there will be other strains; however methods outlined give stresses which are higher than true values and therefore err on safe side.

SHEET PILING

Germany. A New Krupp Sheet Piling (Neue Spundwandeisen Bauart Krupp), G. Rueth. Bauingenieur (Berlin), vol. 11, no. 32, Aug. 8, 1930, pp. 554-557, 11 figs. Description, reports on tests, construction experience with new type of interlocking steel sheet piling.

SOLAR ENERGY

Utilization of. Generation of Power by Direct Transformation of Solar Heat (Production de force motrice par transformation directe de la chaleur solaire), H. Delecourt. Revue Universelle des Mines (Liége), vol. 4, no. 4, Aug. 15, 1930, pp. 97-106; Sept. 1, pp. 137-147, 14 figs. Aug.: Historical review, importance of available energy; work of Claude and Boucherot; production of power by utilization of intermediate cycle; utilization of ethyl-chloride vapour cycle; choice of auxiliary fluid; experimental plant of Brabant at Oisquercq; theoretical study of cold vapour cycle. Sept.: Application of recuperation to steam turbine; comparison between exhaust-steam turbine and ethyl-chloride turbine; results of tests at Brabant central station at Oisquercq; details of solar engine; net cost of solar kilowatt-hour; utilization of energy produced and future possibilities.

SOUND

Measurement of. Full Automatic Reverberation Measuring Equipment (Ueber eine vollautomatische Nachhallmessvorrichtung), M. J. O. Strutt. Elektrische Nachrichten-Technik (Berlin), vol. 7, no. 7, June 1930, pp. 280-282, 2 figs. Improved equipment consisting of microphone and vacuum-tube amplifier containing Philips B 405 tube and by which reverberation time can be measured within 0.01 of second exact.

Investigation of Sound Damping Materials (Ueber die Untersuchung von schalldaempfenden Koerpern), H. Tischner. Elektrische Nachrichten-Technik (Berlin), vol. 7, no. 6, June 1930, pp. 236-247, 10 figs. In previous article in May 1930 issue of same journal propagation of sound in tubes was studied by means of compensating equipment and measuring telephone; with same equipment influence of various damping materials on sound propagation in tubes is investigated.

New Automatic Method for Measuring of Reverberation (Ein neues automatisches Verfahren der Nachhallmessung), E. Meyer. Zeit. fuer Technische Physik (Leipzig), vol. 11, no. 7, 1930, pp. 253-259, 9 figs. Graphical construction of reverberation process; control of stop watch; glow lamps, and tube relays; measuring method; examples showing exactitude; influence of air humidity of sound absorption decrement of tuning forks.

SPEED RECORDERS

New Types. New Instruments, D C. Gall. Jl. of Sci. Instruments (Lond.), vol. 7, no. 7, July 1930, pp. 230-231, 2 figs. Variable but constant-speed recording drum, 12 in. diam. by 12 in. long, arranged to be driven at any constant speed between 9 and 12 r.p.m.; high degree of constant speed obtained by phonic motor and electrically maintained tuning fork.

SPRINGS

Stresses in. Stress Strain Relationships in Spring Steels, G. A. Hankins. Engineer (Lond.), vol. 150, no. 3892, Aug. 15, 1930, pp. 178-179, 1 fig. Discussion of stress strain under conditions which are often assumed to be elastic; experimental results on changes in elastic moduli after excessive overstraining of material. Communication from Springs Committee of Department of Sci. and Indus. Research Bibliography.

STEAM ACCUMULATORS

Ruth. Economy of Ruths Accumulator (Wirtschaftlichkeit der Ruthsspeicher), C. Nunn. Maschinen-Konstrukteur (Berlin), vol. 63, no. 13, July 10, 1930, pp. 270-273, 5 figs. Discussion of effect of accumulator on production cost; practical examples from sugar-beet industry are followed through; data on amortization.

Investigation of 50,000-Kw. Ruths Accumulator (Untersuchungen an einer 50,000 Kw-Ruthsspeicheranlage), W. E. Wellmann. V.D.I. Zeit. (Berlin), vol. 74, no. 23, June 7, 1930, pp. 743-753, 18 figs. Description of boiler, turbine, and steam accumulator plant of Charlottenburg Power Plant of BEWAG; detailed discussion of test data and performance of accumulator in meeting peak load; full data on cost of construction and efficiency of plant are given.

Peak-Load Compensation by Means of Ruths Steam Accumulator (Spitzendeckung in Elektrizitaetswerken durch Dampfspeicher, inshesondere Ruthsspeicher), E. Praetorius. Brennstoff und Waermewirtschaft (Halle), vol. 12, nos. 13/14 and 15/16, July 1930, pp. 174-179, and Aug., pp. 194-197, 10 figs. Requirements of peak-load power plants and use of Ruths accumulators for peak-load equalization; examples of Ruths accumulator installations and operating experiences.

Significance of Ruths Accumulators in Electric Power Practice (Die Bedeutung des Ruthsspeichers fuer die Elektrizitaetswirtschaft), T. Stein. V.D.I. Zeit. (Berlin), vol. 74, no. 23, June 7, 1930, pp. 754-760, 38 figs. Discussion of special features of Ruths plant at Charlottenhurg and comparison with similar plants in other countries; possibilities of Ruths accumulators in making electricity supply more economical and preventing interruption are outlined; diagram illustrates efficiency of Ruths accumulators and turbines with regard to peak loads.

STEAM CONDENSERS

Latest Installations. Condensing Equipment. Nat. Elec. Light Assn.—Report, no. 069, July 1930, 37 pp., 46 figs. Tables showing characteristics of latest condenser installations indicate increased use of single pass-condensers for large capacity; condensers with tubes rolled at both ends are in satisfactory operation; satisfactory results for use of chlorine in circulating water; ⅞-in. tubes are being used more frequently.

Maintenance and Repair. Condenser Maintenance: Its Influence on Turbine Performance. Power, vol. 72, no. 9, Aug. 26, 1930, pp. 349-351, 5 figs. Aside from occasional tube renewals, cleaning, and stopping leakage of circulating water and air into steam space sums up maintenance work that generally has to be done on condensers; careful attention of engineer is demanded and neglect may result in loss of turbine economy and feedwater troubles; condenser operating data plotted to show effect of tube fouling and cleaning.

Surface. Dimensioning of Surface Condensers (Die Bemessung von Oberflaechenkondensatoren), P. Danninger. Archiv. fuer Waermewirtschaft (Berlin), vo. 11, no. 9, Sept. 1930, pp. 305-307, 2 figs. Values governing dimensioning of condensers are established, formulae are covered from them, and diagram is developed.

STEAM-ELECTRIC POWER PLANTS

Baton Rouge, La. By-Product Power From Louisiana Station—Electrical Features of Baton Rouge Plant of Louisiana Steam Products, Inc., M. J. Lowenberg. South. Power Jl., vol. 48, no. 9, Sept. 1930, pp. 54-57, 4 figs. High-pressure, non-condensing steam-electric plant designed primarily to furnish process steam to adjacent oil refinery, generates up to 45,000 kw. of electric power, in accordance with conditions of steam demand, which is poured into high-tension network serving central South; cross-section of plant is illustrated showing location of mechanical and electrical equipment.

California. Steam Power Development of the Pacific Gas & Electric Company, R. C. Powell. Am. Inst. Elec. Engrs.—Advance Paper, for mtg. no. 30-147, Sept. 2-5, 1930, 6 pp., 2 figs. After brief history of development of steam power on system of Pacific Gas & Electric Co., fundamental factors entering into problem of providing additional steam plant capacity for this company in accord with changed economic conditions are described; recent work completed and under construction are described; some of economic results obtained and expected are given.

Canada. Saskatoon's New 10,000 Kw. Steam Unit. Elec. News (Toronto), vol. 39, no. 14, July 15, 1930, pp. 45-47 and 61, 4 figs. Province of Saskatchewan installs high pressure steam-electric plant as part of big programme; initial installation of main generating equipment in this new plant consists of one 10,000 kw. turbine-driven generator with 60 kw., 250 volt direct-connected exciter; current is generated at 13,200 volts, three-phase, 60 cycle, and distributed through underground circuits from new station at generator voltage or to old station through two banks of transformers; notes on design features and station auxiliaries.

Another New Steam-Electric Plant. Elec. News (Toronto), vol. 39, no. 15, Aug. 1, pp. 33-34, 5 figs. Latest steam-electric plant to be put in operation in Canada is new Seaboard plant of Dominion Coal Co. located on salt water inlet about mile from seacoast, adjoining coal mine No. 24 of Dominion Coal Co. at Glace Bay, Nova Scotia; provision has been made in coal and ash handling equipment and in construction of condensing water tunnels for 30,000 hp. plant; first 10,000 hp. unit has been installed.

Operation. The Use in Power Stations of Steam Turbines Having, with Their Auxiliaries, Large Overload Capacities, C. A. Parsons, and R. Dowson. World Power (Lond.), vol. 14, no. 80, Aug. 1930, pp. 148-149 and 151-157, 6 figs. Direct comparison is made between cost of generating emergency peak load by (1) turbo-generators with 25 per cent overload capacity, peak load carried by additional plant lying idle during rest of day, and (2) turbo-generators with 75 per cent overload, no additional plant being used for peak. Abstract of paper presented before World Power Conference, June 1930.

STEAM PIPE LINES

High-Pressure. Study of High-Pressure Steam Pipe Lines (Essai de contribution à l'téude des tuyauteries de vapeur à haute pression), L. Perreau. Arts et Métiers (Paris), no. 117, June 1930, pp. 233-241, 14 figs. Notes on choice of metals to be employed; joints most suitable to give satisfactory operation; internal pressures; temperatures; abrasive action of fluid; initial deformations; effects of dilation fatigue, etc.

STEAM POWER PLANTS

Ash Handling. Various Types of Ash Conveyors Used in British Power Station Practice, E. W. Robey. Combustion, vol. 2, no. 2, Aug. 1930, pp. 38-42, 10 figs. Description of various types of water-sealed and sluice-type ash conveyors and discussion of typical applications; novel development of water-sealed type of conveyor is also described; in this conveyor series of buckets, mounted on rollers and joined by rubber connections, forms continuous moving trough in which water remains at fixed level; no particular advantage of relative movement between any part of conveyor and material being handled which results in notably low maintenance.

Coal Handling. Handling Coal in Modern Power Plants, L. O. Millard. Blast Furnace and Steel Plant, vol. 18, no. 8, Aug. 1930, pp. 1319-1324 and 1334, 12 figs. Discussion of equipment and procedure for preparing coal and conveying it from storage pile to boilers; data on unloading equipment, feed control, coal elevating units, coal distribution to bunkers, stokers, and pulverizers.

Maintaining Service in Coal and Ash Handling. Power, vol. 72, no. 9, Aug. 26, 1930, pp. 325-329, 6 figs. With high-sulphur coal, maintenance costs on various types of coal-handling systems range from 4 to 6 cents per ton; coal-handling maintenance approximates 6 per cent of total plant maintenance; table illustrating maintenance costs in large central station coal-handling systems; ash removal.

The 100 Atmos. Installation of the Super-Power Plant in Mannheim (Die 100 at-Anlage des Grosskraftwerkes Mannheim). Elektrotechnische Zeit. (Berlin), vol. 51, no. 31, July 31, 1930, pp. 1105-1108, 5 figs. Details of Hanomag and Humboldt boilers of 835 and 716 sq. m. heating surface, respectively, two 5,000-kw. turbines of Brown Boveri Co., Mannheim, and heat diagram of this extension to initial 57,500 kw. plant.

The Billingham Power Plant of Imperial Chemical Industries. Engineering (Lond.), vol. 130, nos. 3367 and 3369, July 25, 1930, pp. 119-121, and Aug. 8, pp. 183-184, 11 figs. July 25: Quantity of steam required for process purposes is double that necessary to generate requisite electrical energy, so that output of boiler plant is three times that of turbines; adequate stand-by plant had to be provided; high-pressure and high-temperature steam, after utilization in high-pressure turbines, can be passed on to process ranges at original temperature and pressure. Aug. 8: Sectional view is given of one of high-pressure turbines; machines are of single-cylinder type with 16 stages.

Industrial—Cost Accounting. Establishing a Maintenance Cost System, S. W. Allen. Power, vol. 72, no. 9, Aug. 26, 1930, pp. 318-321, 7 figs. While subject of power-plant maintenance is separate and distinct from operating, it is nevertheless, closely tied in with it in its practical application, and it is generally advisable to devise some system for collecting and tabulating all data applicable to both problems.

New York City. Boiler Capacity Doubled Without Increasing Space. Power, vol. 72, no. 10, Sept. 2, 1930, pp. 385-388, 5 figs. New 700,000-lb. unit of New York Steam Corp. installed in room originally alloted for boilers of 325,000-lb. capacity; furnace volume increased; wider economizers installed; auxiliary equipment.

STEAM TURBINES

Design. Recent and Possible Future Developments Affecting the Economics of Large Steam Turbine Practice in the United States, G. B. Warren. Gen. Elec. Rev., vol. 33, no. 8, Aug. 1930, pp. 434-443; Sept., pp. 522-527; 28 figs. Aug.: General trend of large steam-turbine development, as it bears on economics of power-plant operation, with particular reference to designs of General Electric Co. Paper presented at World Power Conference, Berlin, June 16-25, 1930. Sept.: Notes on probable immediate future trend; relative economics of present and possible future steam cycles; effect of new cycles upon possible capacity; effect of more efficient cycles upon turbine design; commercial value; turbine efficiency.

Inspection. Turbine Outage Reduced by Regular Inspection. Power, vol. 72, no. 9, Aug. 26, 1930, pp. 346-348, 3 figs. Power plants, both industrial and utility, are called upon to deliver service that must be continuous and uninterrupted; such service cannot be rendered if main and auxiliary turbines are neglected to such extent that forced shutdowns occur.

Ljungström. Radial Steam Turbines with Special Regard to Ljungström Turbine (Radialdampfturbinen mit besonderer Beruecksichtigung der Ljungström-Turbine), H. Kirst. Waerme (Berlin), vol. 53, nos. 30, 32, and 33, July 22, 1930, pp. 569-574, Aug. 9, pp. 606-609, and Aug. 16, pp. 623-626, 35 figs. Development of radial turbines; differences and advantages in comparison with axial turbines; defects of original design overcome in Ljungström type, which is latest development of radial turbine.

STEEL

Embrittlement. Brittleness-Embrittlement Phenomena in Steels (Sproedigkeitserscheinungen bei Stahl), O. Schwarz. Maschinenbau (Berlin), vol. 9, no. 14, July 17, 1930, pp. 471-472, 9 figs. Discussion of importance of and tests for ductility; behaviour of steel at various temperatures, brittleness as result of age, non-aging steel; notes on various other factors affecting ductility and brittleness.

Molybdenum. Molybdenum in High-Speed Steel, S. B. Ritchie. Army Ordnance, vol. 11, no. 61, July-Aug. 1930, pp. 12-19, 12 figs. Investigation as to practicability of eliminating tungsten wholly or in part from high speed steels undertaking at Watertown Arsenal; comparative test of molybdenum steel with tungsten steel; methods of heat treating molybdenum steel; it was determined that there are no differences of manufacture of molybdenum high-speed steel in desired quantities.

Sheet. Use of Sheet for Stressed Structural Parts (Die Verwendung von Blech fuer beanspruchte Konstruktionsteile), R. Kusserow. Metallboerse (Berlin), vol. 20, no. 62, Aug. 2, 1930, pp. 1713-1714. Author refers to frequent use of commercial fine sheet and warns against its indiscriminate use for highly stressed structural parts; remarks are prompted by tests which are being carried out for purpose of substituting fine sheet for hot-rolled strip steel.

STEEL CASTINGS

Heat Treatment. Effect of Cooling Rate on the Properties of Steel Castings, W. J. Crook, D. J. Martin, and J. W. Halleg. West Machy. World, vol. 21, no. 7, July 1930, pp. 311-314, 8 figs. Experiments and theories of dendritic structure; dendritic structure and its relation to cooling rate; data on physical properties and microphotographs illustrate results.

STOKERS

Traveling Grate. Relation Between Weight and Temperature of Travelling-Grates (Zusammenhang zwischen Gewicht und Temperatur des Wanderrostes), E. Molinder. Archiv fuer Waermewirtschaft (Berlin), vol. 11, no. 9, Sept. 1930, p. 308, 1 fig. Heat volume transmitted to grate surface through flame radiation is almost constant at a certain flame temperature and temperature increase of grate is inversely proportional to its weight.

STRUCTURAL STEEL

Temperature Effect. Results of Fatigue Tests with Different Structural Steels at High Temperatures (Ergebnisse von Dauerbelastungsversuchen mit verschiedenen Baustaehlen bei hoehn Temperaturen), E. Pohl, H. Scholz and H. Juretzek. Archiv fuer das Eisenhuettenwesen (Duesseldorf), vol. 4, no. 2, Aug. 1930, pp. 100-110, 21 figs. Description of improved testing equipment; evaluation of experimental results on carbon, nickel and molybdenum steel sheets; best behaviour of molybdenum steel in temperature range of 300 to 500 deg. cent.; comparison of process described and that of Pomp and Dahmen for determination of fatigue resistance.

SUPERHEATERS

Heat Transmission in. Heat Transfer in Superheaters (Die Waermeuebertragung in Ueberhitzern), W. Gumz and F. Michel. Feuerungstechnik (Leipzig), vol. 18, nos. 13/14 and 15/16, July 15, 1930, pp. 129-134, and Aug. 15, pp. 152-155, 15 figs. Contribution to calculation and numerical investigation of superheaters; behaviour of superheater in operation; influence of load and temperature regulation; operating troubles.

T

TESTING MACHINES

Fatigue. Design of Fatigue Testing Machines (Zur Konstruktion von Dauerpruefmaschinen), W. Spaeth. Zeit. fuer Technische Physik (Leipzig), vol. 11, no. 4, 1930, pp. 115-118, 5 figs. Theory and principles of construction of Spaeth-Losenhausen machine with details of vibrating motors and apparatus for torsional fatigue testing.

Tensile. New German Machines for Testing Tensile Strength (Neue deutsche Zerreissmaschinen), M. Moser. Stahl und Eisen (Duesseldorf), vol. 50, no. 31, July 31, 1930, pp. 1086-1088, 5 figs. Critical description of universal testing machine and two special tensile strength testing machines with special regard to basic improvements.

TIDAL POWER

France. Tidal Power (L'utilisation de l'énergie des marées). Génie Civil (Paris), vol. 96, no. 20, May 17, 1930, pp. 485-486; see also brief translated abstract in Power Engr. (Lond.), vol. 25, no. 293, Aug. 1930, p. 326. Summary of paper by A. Pawlowski together with one by A. Defour concerning latest improvements in cycle for utilization of tidal power; list is given of 80 places where tidal power could be developed on French coast; only one tidal power station is at present under construction, that at Aber Vrach, which should be ready for service in 1933 and is expected to yield 12,000,000 kw-hr. per year.

TUNNELS

Construction. High-Speed Tunneling, C. S. Hurter. Explosives Service Bul., July 1930, 4 pp., 5 figs. Fundamental principles of speed; advantages of Roger Pass system; economy of drilling time; ventilation; choice of explosives; co-ordinating drilling, blasting and removal of broken rock.

TURBO-GENERATORS

Germany. 62,500-Kva. Turbo-Generators at the Goldenberg Power Station, Germany. Engineer (Lond.), vol. 150, no. 3891, Aug. 8, 1930, pp. 144-145, 9 figs. partly on p. 148. This is largest steam plant in Germany; details of turbo-generators supplied by A.E.G. latest of which have speed of 1,500 r.p.m.

Rotors. Turbo-Generator Rotor Shafts, W. Sharp. Engineering (Lond.), vol. 130, no. 3368, Aug. 1, 1930, pp. 127-129, 27 figs. For machines of this description, there are two classes of steel employed, carbon and 3 per cent nickel; in first method ingot, after being cast, is allowed to cool until centre is solid when it is removed from mould and charged into furnace; in second method, ingot after casting is allowed to cool as before, and is reheated for blooming purposes; carbon steel provides adequate margin of safety for present-day design and it is not advisable to use more expensive steel which is possibly less reliable.

V

VIBRATIONS

Measurement. Practical and Theoretical Study of Instruments for Recording and Determination of Traffic Vibrations (Praktische und Theoretische Untersuchung von Schwingungsmessern zur Aufnahme und Beurteilung von Verkehrserschuetterungen), W. Zeller. Zeit. fuer Bauwesen (Berlin), vol. 80, no. 7, July 1930, pp. 171-184, 18 figs. Classification of vibration recording instruments, their theory and details of construction, including seismographs, cibrographs, piezoelectric apparatus, etc.; precision of instruments; calibration; development of absolute intensity scale for rating of earthquakes and vibrations.

VOLTAGE REGULATION

Revenue. Revenue and Voltage, M. De Merit. Clec. World, vol. 96, no. 10, Sept. 6, 1930, pp. 436-437. Good service as characterized by voltage regulation depends upon conditions under which service is given; improved regulation increases revenues only when accompanied by sales of additional appliances; practical considerations modify theoretical gains.

W

WATER FILTRATION PLANTS

Experimental—Ottawa. The Trial Filtration Plant, Ottawa, Canada, G. G. Nasmith. Am. Water Works Assn.—Jl., vol. 22, no. 8, Aug. 1930, pp. 1017-1046. Process of floc formation; experiments with preformed floc; use of alum as coagulant; sodium aluminate and coagol; use of ferric chloride as coagulant; corrosive action of Ottawa River water; treatment with lime to avoid corrosion; description of original and of redesigned mixing chambers; collection of sludge; floc in redesigned plant; consolidation of settled sludge; character of sludge; effect of sunshine, depth of filter sand, etc.

WATER TANKS

Elevated. New Elevated Tank Built Around Old Standpipe. Eng. News Rec., vol. 105, no. 11, Sept. 11, 1930, p. 415, 1 fig. Description of ellipsoidal-bottom elevated tank of 600,000-imp. gal. capacity inclosing old standpipe at Toronto, Canada.

WATER WORKS

Operation—Ontario. Water Works and Sewerage in Ontario, A. E. Berry. Can. Engr. (Toronto), vol. 59, no. 10, Sept. 2, 1930, pp. 291-294. Review of activities of sanitary engineering division of Ontario Department of Health covering water purification plants, sewerage systems and sewage disposal plants.

WELDING

Spot, Machine for. Electric Spot Welding Machine (Soudeuse électrique par points), L. Lenouvel. Science et Industrie (Paris), vol. 14, no. 199, Aug. 1930, pp. 595-597, 4 figs. Recently developed welding machine of Sciaky type PP. 320 for automatic regulation is described; notes on principal characteristics, power consumption, power factor, strength of welds, water cooling of electrodes, water consumption, etc.

Engineering Index

This Index is prepared by the American Society of Mechanical Engineers.

In this department will be published from month io month the titles of current engineering papers with the authors and source and a brief extract of the more important. It is designed to give the members of The Institute a survey of all important articles relating to every branch of the engineering profession.

PHOTOSTATIC PRINTS

Photostat copies (white printing on a black background) of the articles lsited in this section or others on engineering subjects can be obtained from the Engineering Societies Library at a cost of 25c. per page.

When ordering identify the article by giving: the author; the title of the article; the name of the periodical in which it appeared; and the volume and page numbers. A remittance of 25c. a page should accompany the order.

The print's size is limited to 11 by 14 inches, but where possible, two pages up to 7 by 9 inches in size wiii be photographed on one print, larger magazines require a print per page.

The Library is also prepared to translate articles, to compiie lists of references on engineering subjects and render assistance ln similar ways. Charges are made sufficient to cover the cost of this work. Correspondence ls invited. Information concerning the charge for any specific service wiil be given those interested. In asking for lnformation please be definite, so that the investigator may understand cieariy what is desired.

The Engineering Societies Library is under the management of the United Engineering Society, which administers it as a pubiic reference library of engineering. It is maintained jointiy by the American Society of Civil Engineers; the American Institute of Mining and Metallurgical Engineers; the American Society of Mechanical Engineers and the American Institute of Electrical Engineers. It contains 150,000 volumes on engineering and allied subjects, and receives currently most of the important periodicals in its field.

Orders and correspondence should be addressed to

Harrison W. Craver, Director,
Engineering Societies Library,
New York, N.Y.

29 West Thirty-ninth Street.

A

AERODYNAMICS

Modern German Research. Modern Aerodynamical Research in Germany, J. W. Maccoll. Roy. Aeronautical Soc.—Jl. (Lond.), vol. 34, no. 236, Aug. 1930, pp. 649-679 and (discussion) 679-689, 18 figs. Important results of modern German research upon motion of incompressible fluids; theory of boundary layer and its application for laminar and turbulent conditions; experimental and theoretical investigation of development of turbulence; characteristics of fully developed turbulence; spreading of jets; flow in pipes and channels; convergent and divergent channels; flow between rotating cylinders.

AIRPLANE ENGINES

Air Cooled. Some Recent Progress in Air-Cooled Aero-Engine Development, C. F. Abell. Engineering (Lond.), vol. 130, no. 3373, Sept. 5, 1930, pp. 308-311, 7 figs. To summarize progress made in 10 years, weight per horsepower has been reduced by 25 per cent, power output increased by 50 per cent, and period between overhauls increased by 700 per cent, with corresponding increase in reliability of engine and life of main components; recent changes in design which have led to higher speeds of revolution, higher brake mean-effective pressure, and higher overall efficiency in Jupiter radial engine. Paper read before Section G. of Brit. Assn. Sept. 4, 1930.

Diesel. Air-Cooled Heavy Oil Engines, A. H. R. Fedden. Aircraft Eng. (Lond.), vol. 2, no. 20, Oct. 1930, pp. 261-262, 3 figs. Experiments on single-cylinder 4-cycle airless-injection engine of 8½ liter capacity and 7⅜ by 12 in. bore stroke; for maximum fuel injection of 0.54 cc. engine developed, 77 b.hp. at 1,100 r.p.m.; fuel consumption of 0.446 lb. per b.hp.-hr. at 108 b.m.e.p.; graph shows comparative weight curves for compression-ignition and gasoline engine installations. Paper read before Fifth Int. Air Congress, Hague.

The Packard Diesel Aircraft Engine, L. M. Woolson. Soc. Automotive Engrs.—Jl., vol. 27, no. 3, Sept. 1930, pp. 279-281 and 319. Discussion of paper previously indexed from Apr. 1930, issue of same Journal; elimination of fire hazard; ability to use crankcase oil as emergency fuel; advantages of two-stroke Junkers engine as compared with four-stroke Packard.

Liquid-Cooled. Possibilities of the Liquid-Cooled Aircraft Engine, R. B. Beisel. Soc. Automotive Engrs.—Jl., vol. 27, no. 4, Oct. 1930, pp. 403-407. Advantages of liquid cooling as compared to air cooling; reduced resistance ethylene glycol cooling; reduction in cooling-surface area; adaptability to gearing and high engine speed; characteristics of future engine visualized.

Radial vs. In-Line. In-Line versus Radial Aircraft Engines, W. F. Davis. Soc. Automotive Engrs.—Jl., vol. 27, no. 4, Oct. 1930, pp. 451-453, and (discussion) 454-458. Comparison of advantages with regard to reliability, simplicity of design, weight, visibility, head resistance, installation and service costs; discussion relates experiences with ethylene-glycol cooling; carbureter location.

Supercharging. Geared Centrifugal Superchargers for Airplane Engines, S. A. Moss. Soc. Automotive Engrs.—Jl., vol. 27, no. 2, Aug. 1930, pp. 148-153 and 160, 13 figs. and (discussion), no. 3, Sept. 1930, pp. 340-343. Discussion of design and functioning of General Electric supercharger used in Pratt and Whitney, Curtiss, and Wright engines; notes on development and advantages; supercharging at sea-level and at altitude; maintenance of carburetor efficiency.

AIRPLANES

Dope. Airplane Dopes and Lacquers and Their Application, W. W. McCutcheon. Soc. Automotive Engrs.—Jl., vol. 27, no. 3, Sept. 1930, pp. 263-266 and (discussion) 266-267, 1 fig. General outline of composition, process of manufacture, and application of dopes, lacquers and pigmented dopes, and trouble experienced with available materials; simple and cheap methods of testing dope to ascertain its qualities are explained; primary requisites of good dope and cause and remedy for blushing.

Fuels. Fuel Problems in Aviation Engines, G. W. Vaughan. Oil and Gas Jl., vol. 29, no. 19, Sept. 25, 1930, pp. 38 and 76. President of Wright Aeronautical Corporation deplores fact that knock rating, characteristic that most interests aircraft engine builders, is not definitely and accurately covered by existing specification; thing that must control design of standard engine that goes into general service is anti-knock value of poorest fuel that operator may buy under indefinite and misleading name of domestic aviation gasoline; unsatisfactory situation is holding back commercial development of new industry. Read before Nat. Petroleum Assn.

The Effect of Airplane Fuel-Line Design on Vapour Lock, O. C. Bridgeman and H. S. White. Soc. Automotive Engrs.—Jl., vol. 27, no. 4, Oct. 1930, pp. 444-450 and 458, 9 figs. Measurement of flow through systems of various designs; increases in cross-sectional area along direction of flow are particularly liable to cause vapour lock; weathering of gasoline in carburetor float bowl reduces vapour-locking tendency; fuel-pump experiments.

The Vapour-Locking Tendency of Aviation Gasolines, O. C. Bridgeman and H. S. White. Soc. Automotive Engrs.—Jl., vol. 27, no. 2, Aug. 1930, pp. 218-230 and (discussion) 230-233, 20 figs. Study of properties of gasolines which determine their vapour-locking tendency; conditions under which vapour lock occurs in typical fuel feed of vapour lock; measurement of temperatures existing in fuel-feed systems of representative aircraft during flight.

Landing Speeds. An Investigation of Airplane Landing Speeds, K. F. Ridley. Nat. Advisory Committee for Aeronautics—Tech. Notes no. 349, Sept. 1930, 39 pp. 21 figs. Performance characteristics; experimental work in measuring landing speed of several monoplanes by new photographic method; tests supplemented by available information regarding biplanes were compared with predictions made in accordance with basic aerodynamic theory; fundamental relation between wing loading, lift coefficient and speed of level flight, and effects of aspect ratio and proximity to ground on lift curve slope.

Light Alloys for. The Use of Non-Ferrous Metals in the Aeronautical Industry, D. Hanson. Engineer (Lond.), vol. 150, no. 3896, Sept. 12, 1930, pp. 291-293. Discussion of aluminum and magnesium and their alloys for air-craft construction; wrought alloys; "Y" alloys; cast aluminum alloys; approximate compositions and properties of typical aluminum casting alloys and of magnesium alloys for castings. Ninth autumn lecture to Institute of Metals, Sept. 9, 1930.

Propellers. Theory of Self Rotating Screw. Investigation of Conditions Necessary for Obtaining Maximum Braking (Teoria dell'elica in autorotazione. Ricerca delle condizioni necessarie per ottenere il massimo effeto frenante), G. Serragli. Notiziario Tenico di Aeronautica (Rome), vol. 6, no. 7, July 1930, pp. 40-53, 4 figs. Discussion of propeller action in vertical descent and at great angle of incidence.

Wind-Tunnel Testing. Wind Tunnel Experiments on the Burnelli All-Wing Principle, A. Klemin. Aviation Eng., vol. 3, no. 9, Sept. 1930, pp. 22-24, 4 figs. Summary of test results on large twin-engined transport plane; curves for various coefficients of aerodynamic efficiency are given and body and wing arrangement illustrated.

AIRSHIPS

Rigid. The Development of Rigid-Airship Construction, V. C. Richmond. Engineering (Lond.), vol. 130, nos. 3374 and 3376, Sept. 12, 1930, pp. 341-344 and Sept. 26, pp. 412-414, 2 figs. Idea of what future airships may look like may be gained from trend of development described; increase to twice capacity of existing vessels, and more, in lifetime of present generation can be foreseen without insuperable engineering difficulty; such ships, 1,000 ft. long and of 200 ft. girth, will constitute largest moving structure in world; with present speed of 70 to 80 m.p.h., saving in time constitutes great advantage over other forms of transport. Paper read before Section G, Brit. Assn.

ALLOY STEEL

Castings, Heat Treatment of. Trends in Heat Treatment of Alloy Steel Castings, A. W. Lorenz. Iron Age, vol. 126, no. 11, Sept. 11, 1930, pp. 693-695 and 705-756, 3 figs. Brief review of manufacturing methods and equipment; properties and application of principal alloy castings.

ALUMINUM ALLOYS

Aluminum-Iron-Silicon. Constituents of Aluminum-Iron-Silicon, W. L. Fink and K. R. Van Horn. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 351, for mtg. Sept. 1930, 11 pp., 6 figs. Result of uncompleted study of constituents of aluminum-iron-silicon system; methods employed; preparation of specimens; X-ray methods; silicon; aluminum-iron compound found in aluminum-iron alloys up to 40 per cent iron; alpha and beta iron-silicon compounds; table of interplanar spacings. Bibliography.

Aluminum-Silicon-Magnesium. Aluminum-Silicon-Magnesium Casting Alloys, R. S. Archer and L. W. Kempf. A.I.M.E.—Tech. Pub., no. 352, Sept. 1930, 34 pp., 19 figs. Object of work described was development of alloys and heat treatment for production of sand castings and permanent-mould castings having advantages of binary aluminum-silicon alloys; constitution of alloys; theory of heat treatment; previous work on castings; experimental methods and materials used; effect of pouring temperature; corrosion resistance; machinability; some properties of castings. Bibliography.

Die-Cast Castings. Pressure Die-Cast Aluminum Alloy Test-Pieces, J. D. Grogan. Inst. of Metals—Advance Paper (Lond.), no. 530, for mtg. Sept. 9-12, 1930, 18 pp., 14 figs.; see also Engineering (Lond.), vol. 130, no. 3374, Sept. 12, 1930, pp. 345-347, and (discussion) pp. 334-335, 11 figs. Investigation of mechanical strength of aluminum alloys when pressure cast in form of small tensile test pieces; behaviour of selected alloys when subjected to attack of molten aluminum alloy and method of entry of metal under pressure into simple cylindrical mould; results indicate that, if certain technical difficulties can be overcome, process will yield products of excellent mechanical properties.

Properties. Modulus of Elasticity of Aluminum Alloys, R. I. Templin and D. A. Paul. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 366, Sept. 1930, 9 pp., 5 figs. Modulus of elasticity as affected by alloying elements commonly used; results of tensile tests made on aluminum-magnesium series of alloys, both heat-treated and not heat-treated, on number of alloys of aluminum-magnesium type containing different percentages of various alloying elements, and on number of aluminum alloys containing appreciable amounts of alloying elements; apparatus used; method of determining E from tensile stress-strain data.

ALUMINUM-SILICON ALLOYS

Heat Treatment. Influence of Heat Treatment on Resistance of Aluminum-Silicon Alloys Containing up to 2.5 Per Cent Silicon (Influence du traitement thermique sur la résistivité et la résistance mécanique des alliages aluminium silicium contenant jusqu'à 2.5 % de silicium), L. Guillet and M. Ballay. Revue de Métallurgie (Paris), vol. 27, no. 8, Aug. 1930, pp. 398-403, 9 figs. Results of tests on 21 alloys, compositions of which are given.

AMMETERS

High Frequency. New Current Meter for High Frequency (Ein neuer Strommesser fuer Hochfrequenz), K. Schlesinger. Zeit. fuer Hochfrequenztechnik (Frankfort), vol. 36, no. 2, Aug. 1930, pp. 62-65, 7 figs. New hot-wire ammeter by which stretch is not measured directly but by change in natural frequency of wire when heated.

AUTOGIROS

THEORY OF. The Autogiro Analyzed, W. L. Le Page. Soc. Automotive Engrs.—Jl., vol. 27, no. 3, Sept. 1930, pp. 257-262, 9 figs. Brief history of its development and elementary theory of flight; mast upon which hub is mounted generally is set sligbtly to one side to correct for lack of symmetry; climbing speed is not as good as tbat for equivalent airplanc, but angle of climb is greatly superior.

AUTOMOTIVE FUELS

PROPERTIES. Suitability of Fuels for Modern Internal-Combustion Engine (Les carburants appropriés aux moteurs à explosion modernes), A. Grebel. Chimie et Industrie (Paris), vol. 23, nos. 4, 5 and 6, Apr. 1930, pp. 825-833, May, pp. 1082, 1091, and June, pp. 1353-1358, 15 figs. Survey of properties, cbemical composition and combustion characteristics of gasoline and oil fuels for all kinds of internal-combustion engines; control of detonation by compounding and addition of various substances.

TESTING. Latent Heat of Vaporization of Fuels and Measuring Method (Die Verdampfungswaerme der Kraftstoffe und eine Metbode zu ihrer Bestimmung), Wawrziniok. Automobiltecbnische Zeit. (Berlin), vol. 33, nos. 25 and 26, Sept. 10, 1930, pp. 618-620 and Sept. 20, pp. 644-646, 3 figs. Effect of heat of vaporization on engine performance. New principle and apparatus for determining its value for non-homogeneous liquids give accurate cbecks; tables give data on alcohol-benzol mixtures.

VOLATILE. Volatile Liquid Fuels, H. C. Dickinson. Petroleum World (Lond.), vol. 26, nos. 358 and 359, July 1930, pp. 248-254 and Aug., pp. 273-274. July: Fuel volatility and economy; dilution of crankcase oil; engine starting; engine acceleration; vapour lock; knock cbaracteristics of fuels; gasoline specifications. Aug.: Potential sources of motor fuel. Paper read at World Power Conference, Berlin.

(*See also Airplanes, Fuels.*)

B

BEAMS

BENDING. Correcting an Error in Application of Flexure Formula, F. B. Seely. Macbine Design, vol. 2, no. 9, Sept. 1930, pp. 32-34, 8 figs. Determination of distance of shear-centre from web-centre line by experiment and calculation.

CONCRETE. Steel Requirements of Reinforced-Concrete Beams (Der Eisenbedarf der Eisenbeton-Balken), K. Bernhard. Zement (Charlottenburg), vol. 19, nos. 25, 27, 28 and 29, June 19, 1930, pp. 591-595, July 3, pp. 637-640, July 10, pp. 663-666 and July 17, pp. 688-690, 1 fig. Notes on iron coefficient; comparison witb slabs; increasing, sbear and bending reinforcement; special examples; main and auxiliary reinforcement; total steel requirement of beam field; pressure reinforcement.

BEARING METALS

BRONZE. Bearing Bronzes witb Additions of Zinc, Pbosphorus, Nickel, and Antimony. U.S. Bur. of Standards—Jl. of Research, vol. 5, no. 2, Aug. 1930, pp. 349-364, 16 figs. Study was made of copper-tin-lead-bearing bronzes with and without additions of zinc, pbospborus, nickel, and antimony; test made included wear resistance, resistance to impact, Brinell bardness, and resistance to repeated pounding at several temperatures.

BOILERS

DESIGN. Developments in Boiler Design. World Power (Lond.), vol. 14, no. 81, Sept. 1930, pp. 257-259, 1 fig. Design of steam-raising boilers has undergone various developments and modifications during recent years in order to meet improvements in methods of combustion, introduction of new systems of combustion, and notably higher steam pressures whicb have become common; illustrated description of design features incorporated in Cbalk boiler.

FURNACES. Modern Grate Furnaces (Neuere Rostfeuerungen—Fortschritte und Versuchsergebnisse), R. Schulze. Waerme (Berlin), vol. 53, no. 36, Sept. 6, 1930, pp. 665-669, 6 figs. Notes on progress and experimental results; by comparison of some entirely new boiler installations with otbers 4 to 6 years old, extent of improvement in past few years is shown.

Relations between Furnace, Furnace Temperature, Combustion Process and Efficiency (Feuerraum, Feuerraumtemperatur, Verbrennungsvorgang, Wirkungsgrad), Marcard. Waerme (Berlin), vol. 53, no. 39, Sept. 27, 1930, pp. 714-726, 26 figs. Critical study of mean furnace temperature and its influence on furnace design and combustion process; metbods of determining heat volume transmitted in furnace through radiation; discussion of efficiency based on different losses; examples of practical applications.

HEADS. Calculation of Boiler Heads Exposed to Internal Pressure (Calcul des fonds soumis à une pression intérieure), E. Hoebn. Cbaleur et Industrie (Paris), vol. 11, no. 123, July 1930, pp. 314-319, 15 figs. Discussion of test results and methods for calculating stresses in disbed boiler heads.

HIGH PRESSURE. Super-Pressure Boiler at Bradford Power Station. Engineer (Lond.), vol. 150, nos. 3895-3896, Sept. 5 and 12, 1930, pp. 244-246 and 279-280, 20 figs. Sept. 5: Duty of boiler is to generate normally 75,000 lbs. of steam per hr. at pressure of 1,100 lbs. per sq. in. and temperature of 800 deg. fabr. though output of 94,000 lbs. of steam per hr. can be continuously maintained; boiler is cross-drum marine type; furnace is entirely water cooled, tubes connected witb boiler system abstracting beat from side walls, back and arch witb its front wall. Sept. 12: Stoker is of Babcock and Wilcox's latest compartment type; it has working lengtb of 18 ft. and is 21 ft. 5 in. wide, thus having total working surface of practically 386 sq. ft.; it is largest single stoker in service in Great Britain; feature of grate is absence of any stress in links tbemselves; stoker is equally suitable for balanced or simple induced draft, change from one to other being effected in few moments.

RIVETING. A New System of Riveting. Engineer (Lond.), vol. 150, no. 3896, Sept. 12, 1930, pp. 276-277, 7 figs. Attempt to avoid difficulties of scale, and insufficient upsetting of shank at bead end, resulted in introduction of Schucb system of riveting; heat of rivet is conical before closing to allow scale to escape readily, and to promote swelling of upper end of shank; Skoda Works, Czechoslovakia, have eliminated all previous manufacture of rivets and use plain lengths of rivet iron cropped from bar; process facilitates workmansbip of highest class, while minimizing production cost; Skoda works employ pin riveting for all locomotive boilers.

VIBRATIONS. Observations on Pulsating Boilers (Beobachtungen an brummenden Dampfkesseln), F. Kaiser. Zeit. des Bayerischen Revisions-Vereins (Munich), vol. 34, nos. 16 and 17, Aug. 31, 1930, pp. 223-225 and Sept. 15, pp. 234-236, 2 figs. Number of examples are cited to show to what extent pulsation can be attributed to certain factors, such as nature of combustion, design of flues, and cleanliness of boilers.

WOOD-WASTE-FIRED. Design of Furnaces and Fuel Feeders for Burning Refuse, M. A. Hofft. Am. Soc. Mecb. Engrs.—Advance Paper, for mtg. Oct. 16-17, 1930, 9 pp., 10 figs. Recent development in design of furnace for burning dry wood refuse in suspension; factors influencing design of wood-burning furnaces in industrial plants; development of inclined-grate furnaces for burning refuse fuels; development of automatically controlled dry wood-refuse feeders and storage bins.

BRAZING

ELECTRIC-RESISTANCE METHOD. Brazing by Resistance Method, W. C. Reed, M. Unger and G. E. Gifford. Gen. Elec. Rev., vol. 33, no. 10, Oct. 1930, pp. 568-570, 7 figs. Many metals such as copper, nickel, silver, steel, and their alloys can be brazed electrically; tbis type of brazing has been perfected in Pittsfield Works Laboratory of General Electric Co. and used extensively in production work for two years; equipment required; bandling capacity; preparation of joints; tecbnique of brazing operation.

Electric Resistance Brazing Affords Durable Joints, G. E. Gifford. Steel, vol. 87, no. 11, Sept. 11, 1930, pp. 59-60, 3 figs. Description of methods and equipment developed by General Electric Co., Scbenectady, N.Y.; difference between pressure brazing and resistance brazing is explained and data are given on fluxes and silver alloys.

BRICKMAKING MACHINERY

VIMAX. The Vimax Brick-Making Macbine. Engineering (Lond.), vol. 130, no. 3374, Sept. 12, 1930, pp. 337-338, 6 figs. partly on p. 330. Vimax bricks manufactured by Vimax Macbinery Co. are prepared from good-quality cement, combined with sand obtained from Folkestone beds; correct proportions of sand and cement in dry state are put into ordinary mixer of pan type, and after thorough mixing, sufficient water is added to cause material to just bind when squeezed by hand; machine is driven from line sbafting by belt; it has normal output of some 2,400 bricks per hr.

BRICKMAKING PLANTS

POWER CONSUMPTION. Power and Fuel Consumption in Sand-Lime Brick Factories, W. Leder. Tonindustrie-Zeitung (Berlin), vol. 54, nos. 59 and 60, July 24, 1930, pp. 975-978, and July 28, pp. 993-995, 1 fig. Power can be supplied by steam engine, oil engine or electric motor; tables are given showing power and fuel consumption in factories with different technical equipment and manufacturing processes.

BRIDGE DESIGN

CONTINUOUS GIRDER. Continuous Girder of Multi-Span Bridges with Supports Fixed at Their Base (Travi continue da ponte solidali con piedritti incastrati alla base), C. Guidi. Annali dei Lavori Pubblici (Rome), vol. 68, no. 6, June 1930, pp. 477-495, 4 figs. Theoretical mathematical analysis of concrete structures of this type, showing that author's formula gives results of satisfactory precision, better than formulae usually employed; application of methods of influence lines for determination of bending moments and shears.

STRESSES. The Proportioning of Bridgework, J. S. Wilson. Engineering (Lond.), vol. 130, no. 3376, Sept. 26, 1930, pp. 399-400. Editorial review of paper read before Britisb Association comparing past and present specifications for bridge work; it would be well if, when new bridge specifications were being prepared, "why" of each clause should be considered before its final adoption.

BRIDGE PIERS

FOUNDATIONS. Experimental Ramming and Loading for New Limfjord Bridge (Beretning om proveramning og provebelastning for den nye Limfjordsbro), O. Kielrulff. Ingenioren (Copenhagen), vol. 39, no. 35, Aug. 30, 1930, pp. 417-425, 9 figs. Report on driving of bollow reinforced-concrete test piles, 50 cm. external diam., 23 to 35 m. long; data analyzed in ligbt of Eytelwein formula.

BRIDGES, CONCRETE

DESIGN. Some Points in Reinforced Concrete Bridge Design, C. S. Chettoe. Soc. of Engrs.—Trans. (Lond.), 1929, pp. 193-209 and (discussion) 209-219, 17 figs. Problems in design of reinforced-concrete slabs, beams, rigid frame, abutments, wings, walls, and arches.

BRIDGES, CONCRETE ARCH

BELLEVILLE, ONT. Handsome Concrete Bridge Completed at Belleville, C. A. Mott. Contract Rec. (Toronto), vol. 44, no. 39, Sept. 24, 1930, pp. 1133-1134, 5 figs. Description of two-span bow-string structure, 220 ft. long overall, completed in less tban four months; splash panel is novel feature of design.

BRIDGES, STEEL TRUSS

VANCOUVER. Large Bridge, 2,817 ft. Long, to be Built in Vancouver. Contract Rec. (Toronto), vol. 44, no. 37, Sept. 10, 1930, p. 1085. Features of projected steel-truss highway bridge with individual spans up to 295 ft. 5 ins. in length.

BRIDGES, SUSPENSION

DETROIT RIVER. Tbe Ambassador Bridge, J. Jones. Military Engr., vol. 22, no. 125, Sept.-Oct. 1930, pp. 401-404, 5 figs. General description of suspension bridge baving main span of 1,850 ft.; roadway 47 ft. wide; heat-treated vs. cold-drawn wire; replacement of cables; characteristics of anchorages; terminals.

BUILDINGS

FOUNDATION REPLACEMENT. Foundation of Fourteen Storey Building Replaced under Basement Floor. Eng. News-Rec., vol. 105, no. 13, Sept. 25, 1930, pp. 496-499, 5 figs. Report on how 14-storey building in San Francisco was transferred from foundation of 1,100 wooden piles to 210 concrete piers, without disturbing tenants of building or causing any appreciable settlement; hydraulic jacks place load on needle beams; foundation plan, showing footings, caissons and connecting beams; transferring column loads to caissons.

BUILDINGS, CONCRETE

FRAMEWORKS. Reinforced-Concrete Frameworks (Skelettbauten aus Eisenbeton), G. Rueth. Zement (Berlin), vol. 19, nos. 31 and 32, July 31, 1930, pp. 728-733 and Aug. 7, pp. 755-758, 18 figs. Advantages of use of high-grade cement in framework of buildings and examples of sucb constructions.

WINTER CONSTRUCTION. Winter Concreting Methods Applied on Contract of Moderate Size, R. C. Johnson. Concrete, vol. 37, no. 4, Oct. 1930, pp. 13-16, 5 figs. Report on winter construction of four-storey Y.M.C.A. building in Kenosha, Wisconsin, 120 ft. by 100 ft.; wall-bearing construction prolonged concreting period; frequent tests made; winter concrete plant equipment; coal and coke consumption of boiler and salamanders; cost of winter concreting.

BUILDINGS, STEEL FRAME

WIND BRACING. Notes on the Bracing of Steel Framed Building, W. Smith. Structural Eng. (Lond.), vol. 8, no. 9, Sept. 1930, pp. 330-339, 15 figs. Discussion of metbods of bracing of various types of structures; rafter girder; horizontal girder at tie level; continuous tie angles at tie level; crane girders; tie joists; vertical bracings.

C

CABLEWAYS

ELECTRIC MOTORS. Special Motors Increase Tramway Speed. Elec. World, vol. 96, no. 14, Oct. 4, 1930, pp. 650-651, 5 figs. Electrification of 2,500-ft. tramway for transporting lumber in carloads across American River Canyon in California; employs two 225-hp., wound-rotor, intermittent-duty, boist motors operating electrically and mecbanically in parallel meets maximum power requirements; new tram is designed to carry narrow-gauge railroad car loaded with lumber and to make 70 trips in 8-hr. sbift.

CAMS

MILLING. Milling Cams Correctly, A. L. DeLeeuw. Am. Mach., vol. 73, no. 13, Sept. 25, 1930, pp. 503-505, 5 figs. Rapid wear in barrel cams is avoided by special machine wbich produces tbeoretically correct grooves, built by American Machine & Foundry Co.; master cam engages fixed roller to actuate cam blank during cut; data on feeds, speeds and output.

CANALS

WELLAND. The Welland Ship Canal. Engineering (Lond.), vol. 130, no. 3373, Sept. 5, 1930, pp. 285-288, 40 figs. partly on supp. plates. Details of Chippawa Creek siphon; structure consists of six low-level tubes 22 ft. in internal diameter with, at eacb end, vertical tubes of same size rising to surface; upper ends of each set of tubes terminate in concrete structure divided by walls into three sections, each containing two tubes. (Continuation of serial.)

CARBON DIOXIDE RECORDERS

Duscom Type. A New Combustion Recorder. Eng. and Boiler House Rev. (Lond.), vol. 44, no. 3, Sept. 1930, pp. 182 and 184, 2 figs. Illustrated description of operation of Duscom carbon dioxide and carbon monoxide recorder; record chart showing carbon dioxide and carbon monoxide readings.

CASE HARDENING

Carburizing. Normal and Abnormal Steel (Normaler und anormaler Stahl), E. Houdremont and H. Mueller. Stahl und Eisen (Duesseldorf), vol. 50, no. 38, Sept. 18, 1930, pp. 1321-1327, 13 figs. Report of Subcommittee on Case Carburizing Testing of Materials Committee of Verein deutscher Eisenhuettenleute; metallographic characteristics of normal and abnormal steels; physio-chemical methods of analysis; influence of treatment on behaviour of steel; metallurgical processes and their relations to observed phenomena. Bibliography.

Cyanide Bath. Structure of Steel Immersed in Cyanide Bath (Gefuege un Zyanidsalzbad eingesetzten Stahles), W. Henninger and H. Jurich. Stahl und Eisen (Duesseldorf), vol. 50, no. 38, Sept. 18, 1930, pp. 1334-1335, 4 figs. By etching with hot concentrated sodium-picrate solution, it is possible to detect eutectoid and needles in structure of low-carbon case-hardened steel after 5-hr. treatment in cyanide hardening flux and subsequent slow quenching; carbon and nitrogen absorption in cyanide flux is shown in curve.

CAST IRON

Electric-Furnace Melting. The Manufacture of Cast Iron in the Electric Furnace, W. Lister. Foundry Trade Jl. (London), vol. 43, no. 733, Sept. 4, 1930, pp. 165 and 167. Outline of advantages over cupola such as reduction of sulphur content, complete solution of carbon, and uniform structure; neutral higher temperature; data on melting procedure and duplexing method are given; table shows analysis of cupola-melted irons before and after treatment in electric furnace.

High-Test. Progress in Gray Iron Castings, H. Bornstein. Metal Progress, vol. 18, no. 4, Oct. 1930, pp. 43-46, 6 figs. Physical properties and composition of high-strength cast iron, alloy cast, iron, and heat treatment of gray-iron castings; microphotographs illustrate various structures; heating temperature and machinability.

CASTINGS

Centrifugal. Large Centrifugal Castings Made at Navy Yard, J. F. Crowell. Iron Age, vol. 126, no. 15, Oct. 9, 1930, pp. 994-996, and 1037, 3 figs. Methods and equipment for making centrifugal castings, including pipe for water, gas and oil mains; cylinder liners for engines and pumps; babbitt bearing surfaces of large bearing brasses, and sleeves for tail shaftings: sketch shows plan of elevation of centrifugal machine for castings 14 ft. long and 28 in. diam.

Cleaning. Cleaning of Castings by Means of Water Jet (Kritische Betrachtungen ueber das Putzen von Gusstuecken mittels Wasserstrahl), A. Rodehueser. Giesserei (Duesseldorf), vol. 17, nos. 36, 37 and 38, Sept. 5, 1930, pp. 882-884 and Sept. 12, pp. 896-903, and Sept. 19, pp. 926-930, 14 figs. Action of water jet; design of wet cleaning plant and experimental arrangement; volume of water required per second; influence of pipe friction; maximum kinetic energy with given nozzle diameter; influence of length of pipe line; back pressure; distribution of wages and water costs in relation to nozzle diameter; relations between physical and economic optimum nozzle.

CEMENT ANALYSIS

X-Ray. The X-Ray Method Applied to a Study of the Constitution of Portland Cement, L. T. Brownmiller and R. H. Bogue. Am. Jl. of Science, vol. 20, no. 118, Oct. 1930, pp. 241-264, 3 figs. Report from U.S. Bureau of Standards outlining X-ray method of analysis and its application to cement chemistry; examination of commercial cement clinkers; results obtained by X-ray methods are in agreement with those obtained by phase equilibria, chemical and microscopical methods. Bibliography.

CHIMNEYS

Concrete. Monolithic Reinforced-Concrete Chimneys (Monolithische Eisenbeton-Schornsteine), O. Hoffmann. Zement (Berlin), vol. 19, no. 35, Aug. 28, 1930, pp. 828-834, 13 figs. Examples of German designs by Wayss and Freytag.

CHROMIUM-VANADIUM STEEL

Properties and Uses. Vanadium Additions Improve Steel, N. Petinot. Steel, vol. 87, nos. 8, 9, 10, Aug. 21, 1930, pp. 43-45 and 48, Aug. 28, 1930, pp. 47-49 and Sept. 4, pp. 56-57, 60, 7 figs. Development of vanadium-containing steels in United States, properties and present application in major industries; effects of vanadium upon steels; properties of vanadium steels and discussion of commercial applications; use of vanadium as process element. Paper read before sixth International Congress of Min., Met. and Applied Geology in Liége, Belgium, June 22-28, 1930.

CITY PLANNING

Land Subdivision. Land Subdivision: The Effect of Density on Acreage Values and on Lot Values, R. Whitten. City Planning, vol. 6, no. 4, Oct. 1930, pp. 259-263. General discussion of subdivision practice; correlation of subdivision and building; housing density, and land and lot values.

CLUTCHES

Jaw. Design and Production of Jaw Clutches with Sloping Teeth (Nochmals einfache Konstruktion und Herstellung von Klauen-Kupplungen mit schraegen Zaehnen), R. Matthes. Werkstattstechnik (Berlin), vol. 24, no. 17, Sept. 1, 1930, pp. 472-473, 6 figs. Outline of calculating method for jaw clutch with arbitrary number of teeth which can be cut in one milling operation; practical examples are given.

COAL MINES AND MINING

Electric Substations. Changing Manually-Operated Substation to Automatic, R. W. Monroe and H. S. Littlewood. Elec. Jl., vol. 27, no. 9, Sept. 1930, pp. 515-519, 5 figs. Consolidation Coal Co., Somerset, Pa., was confronted with problem of moving existing manually operated converter substation to new location two miles away and making it automatically operated; operations at their Bell Mine, at which manually operated station had been located, were to be discontinued; how operations were carried out and details of equipment.

Mechanization. Modern Methods of Machine Mining, N. E. Nicholson and W. Widdas. Colliery Guardian (Lond.), vol. 141, no. 3635, Aug. 29, 1930, pp. 754-757, 6 figs. Machines are described, and layout of districts and application of machines are discussed; conveyor-loader, designed for semi-long-wall system in United States, installed at Mainsforth coal mine; belt conveyor; chain coal cutters; main-and-tail haulage system; electric power; scraper loader.

COBALT DEPOSITS

Ontario. A Qualitative and Quantitative Determination of the Ores of Cobalt, Ont., L. Thomson. Economic Geology, vol. 25, nos. 5 and 6, Aug. 1930, pp. 470-505, and Sept.-Oct., pp. 627-652, 32 figs. Aug.: Eight new microchemical reagents have been developed for differentiation of arsenic minerals; crystal habits, modes of occurrence, and interrelationships of nine of these minerals; relative abundance of common minerals. Sept.: Relations of metallic minerals to diabase sill; minerals favourable and unfavourable to deposition of native silver; rarer minerals; details of ore genesis. Bibliography.

COLD STORAGE PLANTS

Air Conditioning. Cooling and Ventilating Cold Storage Rooms, C. L. Hubbard. South. Power Jl., vol. 48, no. 9, Sept. 1930, pp. 77-81, 10 figs. Cooling by direct expansion is simple, definite; cooling by brine systems, more flexible and readily controlled; both have their proper applications; arrangement of cooling surface; fan systems; insulation.

COMPRESS AIR RECEIVERS

Explosions, Prevention of. The Prevention of Air-Receiver Explosions, E. Ingham. Mech. World (Lond.), vol. 88, no. 2278, Aug. 29, 1930, pp. 203-204, 1 fig. Air receiver's strength to resist any required pressure is easily determined, and there is little reason why possibility of explosion should not be almost entirely eliminated; safe type of air receiver is cylindrical mild-steel vessel with butt-riveted joints for longitudinal seams, lap-riveted joints for circumferential seams and with outwardly cambered endplates.

COMPRESSED AIR LINES

South Africa. Compressed Air System on the Rand, B. Price. S. African Eng. (Lond.), vol. 41, no. 9, Sept. 1930, pp. 229-230, 1 map. Pipe system of Victoria Falls and Transvaal Power Co., Ltd., supplies compressed air for power purposes to mines on Central Rand; consumers are fed by short single branch pipes from network of mains, which affords duplicate supply to all branches excepting those situated east of Rosherville; anchoring of bends; joints; joint packing; drainage of condensed moisture and collection of grit; internal and external corrosion; value of aluminum powder paint.

CONCRETE

Vibrated. Vibrated and Pervibrated Concrete (Le béton vibré et pervibré), Trêves. Société des Ingénieurs Civils de France—Mémoires et Compte Rendu des Travaux—Bul. (Paris), vol. 83, no. 5-6, May-June, 1930, pp. 450-474, special plate of drawings. Historical review of development of methods in France; advantages of vibration methods; features of electric and compressed-air apparatus used; details of modern methods; future of vibrated concrete construction.

Waterproofing. Watertight Concrete (Zur Frage der Wasserundurchlaessigkeit von Beton), Vogeler. Bautechnik (Berlin), vol. 8, no. 23, May 30, 1930, pp. 342-343, 1 fig.; see also Bldg. Science Abstracts, vol. 3, no. 8/9, Aug./Sept. 1930, p. 291. Evidence and argument in defense of method of designing mixes for watertight concrete, introduced by Ostendorf and incorporated in instructions on mortar and concrete issued by German Railway, as against criticism by Marx, who maintained that method of proportioning fine to coarse aggregate necessitates their separation, thus precluding direct use of natural mixtures. See also supplementary remarks by Ostendorf on p. 34.

CONCRETE CONSTRUCTION

Stresses. Shear Cracks in Reinforced-Concrete Cantilever (Schubrisse in einem Kragtraeger), Marcus. Bauingenieur (Berlin), vol. 11, no. 17, Apr. 25, 1930, p. 302, 3 figs.; see also brief translated abstract in Bldg. Science Abstracts, vol. 3, no. 8/9, Aug./Sept. 1930, p. 322. Cantilever in which reinforcement was placed in accordance with usual practice, developed few days after stripping, nearly horizontal cracks, towards but not reaching outer end; phenomenon is explained by comparison with behaviour of wooden cantilevers, and it is recommended that inclined bars be spaced approximately uniformly rather than in accordance with shear diagram.

CONCRETE DESIGN

Slabs. More Economic Design by Utilization of Slabs in Reinforced-Concrete Walls and Floors (Wirtschaftlicherer Entwurf durch Ausnutzung der Scheibenwirkung von Eisenbetonwaenden und Decken), H. Craemer. Zement (Berlin), vol. 19, no. 30, July 24, 1930, pp. 703-708, 12 figs. Reciprocal influence of neighbouring construction elements due to monolithic construction of reinforced concrete-resulting stress equalization and its economic importance; effect of self-supporting slabs in silos; wall obviates use of beams; practical examples; in one case waste of over 300 cu. m. of reinforced concrete is shown in medium-sized building.

CONVEYORS

Cement Plants. Mechanical Conveying in Cement Manufacture. Mech. Handling (Lond.), vol. 17, no. 10, Oct. 1930, pp. 335-338, 3 figs. Various mechanical-handling processes involved in manufacture of cement, and conveying appliances employed.

Redler Type. A New Conveyor Principle, G. F. Zimmer. Mech. Handling (Lond.), vol. 17, no. 10, Oct. 1930, pp. 317-319, 5 figs. Redler system of conveying based on principle of conveyor which carried continuous mass upon series of narrow strips of chain links in bottom of trough.

COPPER ALLOYS

Heat Conductivity. Thermal Conductivity of Copper Alloys—Copper-tin Alloys—Copper-phosphorus Alloys, C. S. Smith. Am. Inst. Min. and Met. Engrs.—Tech. Pub., no. 360, Sept. 1930, p. 11, 4 figs. Continuation of Tech. Pub. no. 291, previously indexed; thermal conductivity of copper is rapidly reduced by addition of tin until with 10.41 per cent it is only 0.121 cal./sq.cm./sec./deg. cent. at 20 deg. cent.; phosphorus is 10 times as powerful as tin; electrical conductivity decreases more rapidly on alloying than does thermal conductivity, and Wiedemann-Franz-Lorenz ratio increases rapidly at first, but beyond 2.0 per cent tin or 0.15 per cent phosphorus remains almost constant.

Heat Treatment. Shaping and Annealing Treatment of Copper and Copper-Zinc Alloys, Mendl. Metal Industry (Lond.), vol. 37, no. 10, Sept. 5, 1930, pp. 217-220, 1 fig. Hot and cold deformation, annealing and impurities of copper; equilibrium diagram and stretching stresses of copper alloys. Translated from Metallwirtschaft, Mar. 21, 1930.

Copper-Silicon-Zinc. A New Silicon-Zinc-Copper Alloy, E. Vaders. Foundry Trade Jl. (Lond.), vol. 43, no. 735, Sept. 18, 1930, pp. 202-204, 5 figs. Composition and physical properties of various silicon-zinc-copper alloys; diagram gives ternary system silicon-zinc-copper, showing solubility curve of silicon; cooling curves of silicon-zinc-copper alloys; curves showing dependence of tensile strength elongation and hardness of silicon content; notes on foundry practice. Abstract of paper read before Inst. Metals, previously indexed from Advance Paper, no. 544.

COPPER REFINING

Electrolytic. El Paso Refinery of the Nichols Copper Company, F. R. Corwin and C. S. Harloff. Min. and Met., vol. 11, no. 286, Oct. 1930, pp. 459-465, 6 figs. Yearly capacity of 100,000 tons of anodes; detail of layout, equipment, slime treatment, wire-bar furnace construction, sampling, electrolysis, etc.

COPPER-ZINC ALLOYS

Constitution of. Constitution of Alloys of Copper and Zinc (Sur la structure des alliages cuivre-zinc), W. Broniewski and J. Strasburger. Académie des Sciences—Comptes Rendus (Paris), vol. 190, no. 24, June 16, 1930, pp. 1412-1415, 2 figs. Variations with composition of 8 physical properties of copper-zinc alloys, namely conditions at 0 deg., coefficient of electric resistance between 0 and 100 deg., thermoelectric potential at 0 deg. referred to lead, change of thermoelectric potential between minus 78 and plus 100 deg., maxima of e.m.f. coefficient of dilation at 0 deg., change of this coefficient between minus 183 and plus 218 deg. and Brinell hardness; data are represented by means of curves.

COPPER-ZINC MINES AND MINING

Manitoba. Proposed Mining and Milling Practice at Sherritt Gordon Mine. Can. Min. and Met. Bul. (Montreal), no. 220, Aug. 1930, pp. 1012-1038, 13 figs.

partly on supp. plates. Mine in development stage, located 90 mi. north of The Pas; history; geology; ore characteristics; exploration and development; ore testing data and pilot mill results; development and production plans; proposed stoping method; concentrator equipment and flow sheet; flotation reagents, etc.

COPPER-ZINC ORE TREATMENT

MANITOBA. Concentration and Cyanidation at Flin Flon Pilot Mill, S. P. Lowe. Can. Min. and Met. Bul. (Montreal), no. 221, Sept. 1930, pp. 1183-1205, 7 figs. Assays of heavy sulphide ore and disseminated ore; laboratory tests; experimental 2-ton plant; 25-ton flotation plant and 10-ton cyanide plant; 3,000-ton mill is described; flow sheets.

COUPLINGS

FLEXIBLE. Selecting and Installing Flexible Couplings, F. A. Annett. Power, vol. 72, no. 14, Sept. 30, 1930, pp. 534-537, 8 figs. Most of troubles experienced with flexible couplings can be eliminated by selecting right size and type for job, and by giving them reasonable amount of care after they have been properly installed; service factors for flexible couplings.

CUTTING METALS

ECONOMICAL METHODS. Need for Economical Cutting Methods (Ueber die Notwendigkeit wirtschaftlicher Zerspanungsarbeit), F. Theimer. Maschinenbau (Berlin), vol. 9, no. 18, Sept. 18, 1930, pp. 598-600, 5 figs. Mathematical investigation of losses and loads under various operating conditions of machine tools; diagrams illustrate speed, feed, and forces with different metals; effect of load on efficiency.

CUTTING TOOLS

TUNGSTEN CARBIDE. Cutting Tests with Cemented Tungsten Carbide Lathe Tools, T. G. Digges. U.S. Bur. of Standards—Jl. of Research, vol. 5, no. 2, Aug. 1930, pp. 365-383, 12 figs. Investigation was made for purpose of developing method of testing cemented tungsten-carbide lathe tools under heavy duty and to extend to new cutting material some of laws originally developed by Taylor and his associates for cutting with carbon and high-speed steel tools; relations were determined between speed, feed, depth of cut, and tool life for selected form and size of tool; results are presented in both graphic and tabular forms.

D

DAMS

BOULDER DAM PROJECT. Controlling the Colorado, R. F. Walter. Eng. News-Rec., vol. 104, no. 6, Feb. 6, 1930, pp. 247-253, 9 figs. Chief engineer of U.S. Bureau of Reclamation discusses Boulder Canyon project; discharge of Colorado River; flood control; irrigation and power storage; silt storage; dimensions of dam; plans for building involve earth-fill cofferdams and four diversion tunnels; outlet works; railroad from Las Vegas, Nev., will be first item of construction; total expenditure of $165,000,000 is provided for in Boulder Canyon Act.

CONSTRUCTION. Hydro Construction Costs Reduced. Elec. World, vol. 96, no. 13, Sept. 27, 1930, pp. 590-591, 6 figs. Construction plant minimized in erecting Waterville dam; diversion sluices useful on Osage project for Union Electric Light & Power Co.; generator repair pedestal saves in hydro construction; precast dam closes narrow channel.

Suspended Pumps Dewater Dam. Constructor, vol. 12, no. 9, Sept. 1930, p. 39, 2 figs. Two electrically operated Byron Jackson pumps suspended from cables stretched across canyon were used to remove water from site of dam being constructed at Owyhee, Ore.; pumps handled almost 5,000 gals. of water per min.

DAMS, ARCH

DESIGN. Design Features of High Arch Dams, F. Vogt. Can. Engr. (Toronto), vol. 59, no. 11, Sept. 9, 1930, pp. 303-306. Fundamental views in analysis of arch dams; elastic properties of concrete; elastic deformation in foundation; direct water load on canyon; stresses in cross-section; external loads on dams; transfer of heat in concrete; periodical changes in temperature. From paper presented at Second World Power Conference, Berlin. (To be continued.)

DAMS, CONCRETE

CONSTRUCTION. Derricks Place 1,850 Yds. Per Day in Concreting Connecticut River Dam. Construction Methods, vol. 12, no. 10, Oct. 1930, pp. 36-40, 14 figs. Report on Construction of Fifteen Mile Falls Lower Development involving concrete dam, up to 180 ft. in height; plant consisting of four 1 yd. mixers and battery of derricks made consistently high placing record of more than 1,850 yds. per day; five cofferdams contained 37,378 cu. yds. of rock-filled cribs; 275,000 yds. of earth fill was placed.

DAMS, CONCRETE ARCH

CONSTRUCTION. Material Handling and Methods Used on the Ariel Hydro-Electric Project on the Lewis River, Wash., W. A. Scott. Contractors and Engrs. Monthly, vol. 21, no. 3, Sept. 1930, pp. 71-76, 6 figs. Report on construction of hydro-electric plant costing $8,500,000, including concrete arch dam about 300 ft. maximum height, 760 ft. long at crest, also concrete lines diversion tunnel 1,467 ft. long, etc.; unwatering dam site; digging below river bed; operation of slackline cableways; proportioning and mixing plant.

DESIGN. Circular Concrete Arch Dam Designed by Simple Method, R. P. V. Marquardsen. Concrete, vol. 37, no. 4, Oct. 1930, pp. 27-29, 5 figs. Simple method for obtaining stresses in concrete dam of circular-arch type having constant cross-section in any one horizontal plane; working formulae and diagrams required by designer are given. (To be continued.)

DIES

FORGING. Use of Special Steels for Forging Dies (Die Verwendung von Sonderstaehlen fuer die Anfertigung von Pressgesenken), V. Fabian. Maschinenbau (Berlin), vol. 9, no. 17, Sept. 4, 1930, pp. 582-583, 6 figs. Discussion of experience with special steel of uniform hardness which increases life of dies from 5 to 40 times; data on composition and heat treatment are given.

FORMING AND BENDING. Dies for Bulldozing and Upsetting, G. A. Smart. Heat Treating and Forging, vol. 16, no. 9, Sept. 1930, pp. 1147-1151, 15 figs. Description and sketches of various types of bulldozer and upsetter dies; die holders; adjustable back stop; adjustable bending dies; angle iron bending dies; channel iron bending dies; progressive bending dies (inserts, etc.); combination bending dies; piercing dies; dies used in conjunction with drop hammer operations; selection of steel; one, two, and three pass dies, showing all essential points; piercing dies for gears, bushings, etc.

DIESEL-ELECTRIC POWER PLANTS

COSTS. Low Diesel Operating Costs, H. J. Achee. Power Plant Eng., vol. 34, no. 19, Oct. 1, 1930, pp. 1100-1101, 3 figs. Seven years operation with Diesel power at Woodward, Oklahoma, demonstrates economy of investment; operating costs with old steam plant; cost summary; chart showing varying cost and operating data for 7-yr. period.

DIESEL ENGINES

FLYWHEEL DESIGN. Simplified Calculation of Diesel Alternator Flywheels for Parallel Operation, T. Schou. Diesel Power, vol. 8, no. 9, Sept. 1930, pp. 474-479, 17 figs. Calculation of flywheels for Diesel-engine-driven alternators, when correctly carried out on basis of fundamental differential equation given by Doherty and Franklin, is laborious and difficult; results worked out for 16 of commonest engine arrangements; with aid of various factors inertia of flywheel for any other type of engine belonging to group of 16 may be easily arrived at by use of simple multiplication formula; specific examples are illustrated.

DRAINAGE PUMPING PLANTS

DESCRIPTION OF. Modern Drainage Pumping Stations (Neuzeitliche Schoepfwerkanlagen), E. Schulz. V.D.I. Zeit. (Berlin), vol. 74, no. 36, Sept. 6, 1930, pp. 1225-1233, 21 figs. Description of several high-capacity low-head pumping plants located in Germany, Egypt, etc., having individual pump capacities up to 8 cu. m. per sec.; features of Wasserhorst propeller pump, having diameter of 1,800 mm., capacity 7.5 cu. m. per sec., working against head of 1.75 m.; comparison of characteristics of Francis and propeller pumps.

DREDGES

DIESEL-ELECTRIC. Diesel-Electric Hoppers for French Account. Shipbldg. and Shipg. Rec. (Lond.), vol. 36, no. 10, Sept. 4, 1930, pp. 271-272, 8 figs. Deutsche Werft-built vessels for Dieppe, Dunkerque and Le Havre; built to class with Bureau Veritas; length o.a. 182 ft.; deadweight capacity 800 tons; one main Diesel generating set supplies current to two propulsion motors, twin-screw arrangement having been adopted.

E

ELECTRIC CIRCUIT BREAKERS

QUENCHED ARC. The Braking Performance of High-Power Switchgear of a New Form of Quenched-Arc Switch, L. C. Grant. Instn. Elec. Engrs.—Jl. (Lond.), vol. 68, no. 405, Sept. 1930, pp. 1089-1110 and (discussion) 1111-1117, 44 figs. Circuit breaker embodying entirely new principles has been evolved and tested under short-circuit conditions; its performance is superior to that of usual oil switch, and unit of given size and weight is capable of breaking many times power broken by oil switch of similar dimensions, while its performance appears to be wholly consistent.

ELECTRIC EQUIPMENT

SELF-SYNCHRONIZING. Principles of Selsyn Equipments and Their Operation, L. F. Holder. Gen. Elec. Rev., vol. 33. no. 9, Sept. 1930, pp. 500-504, 9 figs. System includes small self-synchronous instruments used as electrical means of transmitting accurate angular motion between two or more remote devices which cannot conveniently be mechanically interconnected; principles involved; selective and multiple operation; differential system; mechanical construction and applications.

ELECTRIC FURNACES

HIGH-FREQUENCY. High Frequency Steel Furnaces, D. F. Campbell. Engineering (Lond.), vol. 130, no. 3376, Sept. 26, 1930, pp. 409-411, 5 figs. Survey of present status of ironless induction furnace shows that its field of utility is much wider than is generally supposed; ironless induction furnaces of Ajax-Northrup type of hourly output of 20 to 25 cwt. have been operated since July 1929; at present largest units are furnaces of 20 to 25 cwt. capacity per heat, giving output of 20 tons per day, but design of furnaces of 3 to 5 tons presents no technical difficulties; steel making operations to which these furnaces have been applied. Paper read before Iron and Steel Inst. at Prague, Sept. 16, 1930.

ELECTRIC GENERATORS

DESIGN. Theory of Self-Excited Welding Dynamo of the G. E. Co. and Fundamentals of its Calculation (Theorie der eigenerregten Schweissdynamo nach dem System der General Electric Co. and die Grundlagen fuer ihre Berechnung), W. T. Kassjanoff. Elektrotechnik und Maschinenbau (Wien), vol. 48, no. 35, Aug. 31, 1930, pp. 797-803, 9 figs. Construction and operation of equipment consisting of double-pole armature, three commutator brushes and four-pole magnetic system; quantitative and graphical construction of characteristics as basis for design and calculation.

PROTECTION. Field-Weakening Gear. AEG Progress (Berlin), vol. 6, no. 10, Oct. 1930, p. 318, 4 figs. Modern generator design, particularly of large units, demands large-scale development of field-weakening equipment; for special cases; A.E.G. therefore, supplies specially designed quick de-exciting devices.

SYNCHRONOUS. Increased Voltages for Synchronous Machines, C. M. Laffoon. Power, vol. 72, no. 11, Sept. 9, 1930, pp. 416-417, 2 figs. At present time there are number of turbine generators either in service or under construction by different American manufacturing companies with 22,000-volt armature windings; design of armature windings.

WELDED. Third Steigitz Electric Generator; Welding in Manufacture of Electric Machinery (Der dritte Teigitsch-Stromerzeuger), E. Rosenberg, V.D.I. Zeit. (Berlin), vol. 74, no. 34, Aug. 23, 1930, pp. 1165-1170, 26 figs. Development of Styrian Water Power and Electric Co. since 1925 and installation of third generator of 13,000-kva. generator, of which base, casing and other parts are welded; detail drawings of equipment are given.

ELECTRIC HOISTS

DESIGN. Requirements and Progress in Design of Electric Hoisting Machinery (Anforderungen und Fortschritte beim Bau elektrischer Foerdermaschinen), W. Philippi. Elektrotechnische Zeit. (Berlin), vol. 51, nos. 36 and 37, Sept. 4, 1930, pp. 1253-1257, and Sept. 11, pp. 1293-1298, 20 figs. Best conception of status in design of electric hoisting machinery and their importance in mining practice is obtained by consideration of main problems to be solved, i.e., to develop equipment of high dependability and installations of high efficiency and economy; comparison of German and other equipment on basis of installations in operation; comparison between three-phase a.c. and d.c. (Concluded.)

ELECTRIC LINES

CONSTRUCTION COSTS. Building Rural Lines for $1,300 per Mile, S. C. Murray. Elec. World, vol. 96, no. 13, Sept. 27, 1930, p. 614, 2 figs. It was impossible to construct lines for $1,440 per mile under old standards using weatherproof wire with 30 or more poles per mile, log anchors, etc.; in order to reduce cost fewer poles per mile had to be used, and after considerable experiment No. 2 A.C.S.R., with average span of 400 ft. using 40-ft. poles, was decided upon.

GROUNDS. Double Ground in Single Line Supplied at Either End in Light of Computation with Symmetric Components (Der Doppelerdschluss in einer zweifach gespeisten Einfachleitung, etc.), Oberdorfer. Wissenschaftliche Veroeffentlichungen aus dem Siemens-Konzern (Berlin), vol. 9, no. 2, June 12, 1930, pp. 77-87, 10 figs. Attempt to discover mechanism of double ground by means of example and calculus as outlined; problem can be represented in substitute circuit which separates three component systems and shows their interrelation; suggestions for further development. Bibliography.

ELECTRIC LINES, HIGH TENSION

COMPENSATION. Automatic Reactive Current Compensation on Long Transmission Lines (Selbsttaetige Blindstromkompensation auf langen Hochspannungsleitungen), E. Friedlaender. Siemens Zeit. (Berlin), vol. 10, no. 9, Sept. 1930, pp. 522-529, 26 figs. Details of system, i.e., delayed time and selective protection and relays; complete wiring diagram with interlocking and protection connections; regulating process with control wiring diagrams; extension to involved control processes; installed equipment.

CONSTRUCTION. Speeding Construction of 220-Kv. Aluminum Line, H. J. Kingsley. Elec. World, vol. 96, no. 14, Oct. 4, 1930, pp. 647-648, 3 figs. Two tractors and two trailers replaced eight teams and saved about $30 per day in material haulage in systematic procedure maintained in construction of New England

Power Association's 220-volt, 126-mile line; it was completed 16 months after excavation was started for tower footings; each of two initial circuits of 795,000 circ. mils aluminum conductor is carried by semi-flexible steel tower lines spaced 183 ft. apart on 350-ft. right-of-way.

CORONA LOSSES. Corona Loss Measurements on a 220-Kv. 60 Cycle Three-Phase Experimental Line, J. S. Carroll, L. H. Brown and D. P. Dinapoli. Am. Inst. Elec. Engrs.—Advance Paper, no. 152, for mtg. Sept. 2-5, 1930, 8 pp., 10 figs. Corona loss measurements were made on seven different conductor specimens; losses were measured directly, on three-phase line 700 ft. long by means of three single-phase high-voltage wattmeters; object of test was to obtain data for choice of conductor to be used on 220-kv. 60-cycle line. Results show effect of weathering of conductors, comparison of conductors of different diameters, stranding and surface conditions.

DESIGN. Mechanical Means in Planning High-Tension Power Lines (Essai de production mécanique des projets de lignes aériennes de transport d'énergie électrique), A. C. Raes. Revue Universelle des Mines (Liège), vol. 4, nos. 5 and 6, Sept. 1, 1930, pp. 129-137, and Sept. 10, pp. 164-166, 5 figs. Sept. 1: Curves, graphs, etc., to shorten calculation of lines with respect to electrical mechanical characteristics; diagram and alignment charts for lines of negligible capacity. Sept. 10: Lines with capacity to be considered; method of calculation and example of application; design of conductors from mechanical viewpoint; design curves and charts.

GROUND WIRE. Critique of Ground Wire Theory, L. V. Bewley. Am. Inst. Elec. Engrs.—Advance Paper, no. 145, for mtg. Sept. 2-5, 1930, 18 pp., 15 figs. Work of previous investigators is briefly reviewed, limitations of premises pointed out; generalized theory of ideal ground wires taking into account law of cloud discharge, distribution of bound charge, and formation of travelling waves; probability of line's being hit; effect of ground wires on attenuation, telephone interference, zero phase sequence reactance, corona, and reduction in surge impedance due to introduction of extra ground wires.

LIGHTNING PROTECTION. Applying Lightning Arresters to Transmission Lines, C. L. Fortescue. Elec. Jl., vol. 27, no. 6, June 1930, pp. 330-334, 8 figs. Arrester selection must be balance between degree of protection desired and allowable risk of arrester failure; arrester can be considered as insurance against failure of valuable apparatus; its cost being analagous to premium required; typical time-lag curves for insulators with and without arcing rings and for suspension insulators with conductor positive.

ELECTRIC MACHINERY

DIRECT CURRENT. Direct-Current Machine Free of Harmonics; Ground Wave and its Suppression (Beitrage zur oherwellenfreien Gleichstrommaschine die Grundwelle und ihre Unterdrueckung), K. Euler. Archiv fuer Elektrotechnik (Berlin), vol. 24, no. 2, Aug. 23, 1930, pp. 230-256, 22 figs. Theoretical mathematical analysis with reference to conception of ground wave; fundamentals of e.m.f. generated at brushes by rotation and transformation; sources of generation of ground waves; means of suppression; experimental verification of study. Communication from Institute of Technology, Breslau.

ELECTRIC NETWORKS

THREE-PHASE. Determination of Asymmetry of Three-Phase, A. C. Networks (Bestimmung der Unsymmetrie von Dreshstromnetzen), M. Zorn. Elektrotechnische Zeit. (Berlin), vol. 51, no. 35, Aug. 28, 1930, pp. 1233-1238, 14 figs. Summary and completion of literature on subject since 1920; analytical and vectorial methods; connections for measurement for determination of symmetrical components of asymmetric three-phase system.

ELECTRIC POWER FACTOR IMPROVEMENT

CONDENSERS. Use of Condensers for Improvement of Power Factor With Special Reference to Practical Experience (Die Verwendung von Kondensatoren zur Verbesserung des Leistungsfaktors unter besonderer Beruecksichtigung praktischer Erfahrungen), M. Tama. Elektrotechnische Zeit. (Berlin), vol. 51, no. 35, Aug. 28, 1930, pp. 1227-1231, 13 figs. Application of electrostatic condensers to power-factor conditions in Hirsch's brass and copper plant; factory at present has peak load of 7,500 kw. at power factor of 0.99 which has been obtained exclusively with condensers; equipment is described in detail.

ELECTRIC POWER FACTOR MEASUREMENTS

STUDY OF METHODS. Low Power-Factor Measurements at High Voltages, E. H. Rayner, W. G. Standring, R. Davis and G. W. Bowdler. Instn. Elec. Engrs.—Jl. (Lond.), vol. 68, no. 405, Sept. 1930, pp. 1132-1142 and (discussion) 1142-1148, 14 figs. Study of methods of measuring dielectric losses carried out with object of determining nature and magnitude of various errors to which different methods are liable; method is developed of shielding simple resistor of flowing water so that current is in phase with voltage within about 0.0001 radian; resistor has been developed on these lines for 150 Kv.

ELECTRIC RECTIFIERS

MULTIPLE-PHASE. Rectifier with Three Four-Phase Transformer (Ein Gleichrichter mit Drei-Vierphasentransformator), J. G. W. Mulder and D. H. Duinker. Elektrotechnik und Maschinenbau (Vienna), vol. 48, no. 36, Sept. 7, 1930, pp. 826-827, 6 figs. Author applied Scott's connection in combination with three core transformer of which centre core has 1.414 times larger cross-sectional area than outside cores; equipment finds application in small equipment like projector arc lamps, small regulating motors, electro-magnets, etc., up to 1.6 kw. capacity and is manufactured by Philips Works in Eindhoven-Holland.

ELECTRIC SUBSTATIONS

RECTIFIER. The Mercury-Arc Rectifier Installations of the Consolidated Mining & Smelting Company of Canada, Ltd., Trail, B.C., H. C. Beck. Brown Boveri Rev. (Baden), vol. 17, no. 10, Oct. 1930, pp. 311-314, 5 figs. Details of equipment and layout of station.

ELECTRIC SWITCHGEAR

METAL-CLAD. Progress in Metal-Clad Switchgear. Elec. World, vol. 96, no. 13, Sept. 27, 1930, pp. 562-563, 4 figs. Refinements of design that have resulted in greater compactness, better utilization of inclosed space, better arrangement and use of materials, improved factory production methods, easier installation, and more satisfactory performance are marks of definite progress and have their effects on attitude of engineers toward new development.

ELECTRIC TRANSFORMERS

NON-RESONATING. The Non-resonating Transformer, W. A. McMorris and J. H. Hagenguth. Gen. Elec. Rev., vol. 33, no. 10, Oct. 1930, pp. 558-565, 16 figs. Behaviour of transformer windings under lightning voltage excitation is analyzed; in new type of transformer, in which internal voltage oscillations are eliminated by proper use of electrostatic shields, all desirable characteristics of older type have been retained, and ability to withstand transient voltages has been increased; comparison with core-type, shell-type and non-resonating transformers. Bibliography.

PROTECTION. The Protection of Transformers, W. Wilson. World Power (Lond.), vol. 14, no. 81, Sept. 1930, pp. 204-207, 4 figs. Discussion of methods of securing appropriate sensitivity combined with stability and simplicity design of protective gear is complicated by separate windings on incoming and outgoing sides and by flow of magnetizing and transient switching currents.

ELECTRIC WELDING, ARC

SHRINKAGE STRESSES. Shrinkage Stresses in Arc Welding (Schrumpfspannungen und deren Beachtung beim Lichtbogenschweissen), Lottmann. V.D.I. Zeit. (Berlin), vol. 74, no. 38, Sept. 20, 1930, pp. 1340-1345, 19 figs. Causes and conditions leading to shrinkage; practical shrinking coefficients; shrinkage stresses in case of complete and incomplete fixedness of welds; effect of peening; rules for minimizing shrinkage stresses.

TESTING. Develops New Technique in Electric Arc Welding, J. D. Knox. Steel, voi. 87, no. 15, Oct. 9, 1930, pp. 62 and 65, 3 figs. Results of tests made with new electrode developed by Babcock & Wilcox Co.; data on composition of electrode material and physical properties of arc weld; maximum of 74,500 lbs. per sq. in. ultimate tensile strength.

ELECTRIC WELDING MACHINES

VOLTAGE RECOVERY. Developments in Voltage Recovery in Arc Welding Machines, A. F. Davis. Elec. Mfg., vol. 5, no. 3, Mar. 1930, p. 64, 2 figs. Explanation of recent discoveries in better performance of direct current welding machines to increase speed of operation; oscillograms showing length of time consumed in recovery of voltage from zero or short circuit to 95 per cent of final voltage in standard welding machines; use of small circuit breakers are advocated.

F

FLOTATION

XANTHATES. Flotation with Xanthates (Grundlagen der Flotation mit Xanthogenaten), K. Kellermann and E. Bender. Kolloid Zeit. (Leipzig), vol. 52, no. 2, Aug. 1930, pp. 240-243, 4 figs.; see also Chem. and Indus. (Lond.), vol. 49, no. 38, Sept. 19, 1930, p. 867. Flotation effect of xanthates is not property of xanthate radical, but is due to simultaneous effect of two products of hydrolysis; when carbon disulphide and alcohol were led simultaneously by means of stream of air bubbles into suspension of finely divided galena in water, normal flotation occurred; best conditions were realized with butyl alcohol.

FLOW OF FLUIDS

PIPES. Modern Measurements of Pressure Loss in Pipes and Law of Surface Friction with Large Reynolds Coefficients (Die neueren Messungen des Druckverlustes in Rohren und das Gesetz der Oberflaechenreibung bei grossen Reynoldsschen Zahlen), H. Lerbs. Werft Reederei Hafen (Berlin), vol. 11, no. 17, Sept. 7, 1930, pp. 365-367, 6 figs. Nikuradse's new measurements of pressure loss in pipe are used to develop law of surface friction based on generalization of Karman's calculation of law of Blasius; brief contribution by F. Eisner is appended.

FORGINGS, STEEL

HEAT TREATMENT. Forging and Heat Treating Departments of the Pennsylvania Railroad, C. I. Snowberger and E. Hoenstine. Heat Treating and Forging, vol. 16, no. 9, Sept. 1930, pp. 1140-1144 and 1155, 8 figs. Description of Forging and Heat Treating Department of Pennsylvania Railroad at Altoona, Pa.; sketches show arrangement of furnaces and location of hammers, presses and other equipment.

FOUNDRY EQUIPMENT

SAND BLASTS. Sand Blasts According to Gravity-Pressure System (Sandstrahlgehlaese nach dem Schwerkraft-Drucksystem), W. Kaempfer. Giesserei (Dusseldorf), vol. 17, no. 38, Sept. 19, 1930, pp. 931-933, 4 figs. Advantages and disadvantages of gravity and pressure systems; description of new design which combines both systems avoiding their dsadvantages; application to cleaning of iron and steel castings.

FURNACES

HEAT-TREATING, GASES. Influence of Furnace Atmospheres on Correct Heat Treatment, E. W. Esslinger. Metal Progress, vol. 18, no. 4, Oct. 1930, pp. 60-67, 5 figs. Effect of carbon dioxide, carbon monoxide, free oxygen, water vapour and nitrogen, upon surface of steel: ideal atmosphere for annealing, drawing, box carburization, and preheating is neutral atmosphere, or one which contains trace of free oxygen; scaling effects of gases.

HEAT-TREATING, ROTARY. Rotary Hearth Furnace for Heat Treating, R. E. Barker. Heat Treating and Forging, vol. 16, no. 9, Sept. 1930, pp. 1189-1190, 1 fig. Furnace for annealing, case hardening, etc. for coal firing; performance data and sketches are given.

LABORATORY, HIGH-TEMPERATURE. New High-Temperature Based on Principle of Surface Combustion (Ein neuer Verbrennungsofen fuer hohe Temperaturen nach dem Prinzip der Oberflaechenverbrennung), E. Ryschkewitsch. Feuerungstechnik (Leipzig), vol. 18, no. 17/18, Sept. 15, 1930, pp. 173-176, 2 figs. Nature of surface combustion; technical disadvantages of former furnace designs; description of new system, so-called Roessler furnace, of employing surface combustion; eliminating technical shortcomings; attempt is made to explain catalytic surface action on combustion process; in furnace described temperature of 2,100 deg. cent. can be obtained with coal gas of only 4,200 calories per cu. m.

G

GAUGES

REED INDICATOR. Reed Gauges Guarantee Close Tolerances Under Shop Conditions, C. F. Dreyer. Factory and Indus. Mgmt., vol. 80, no. 4, Oct. 1930, pp. 722-724, 10 figs. Improvement in indicator gauge which will permit its use in control of product tolerances defined in ten-thousandths of inch; limitations of fixed gauges and of usual forms of indicators; construction of fixed gauges and of improved indicator gauge; advantages shown in number of successful applications.

GAS ENGINES

COMBUSTION IN. Influence of Nitrogen in Air Supply on Combustion in Gas Engines, R. Matthews. Power, vol. 72, no. 14, Sept. 30, 1930, pp. 548-549, 1 fig. Recent experiments with gases in bombs show conclusively that nitrogen under some conditions is not neutral constituent during combustion; effects of nitrogen, oxygen and excess carbon monoxide upon engine combustion, with variation in pressure rise with time; rapidity of combustion.

GAS PRODUCERS

TYPES. Producer Gas Practice from the Point of View of the Carbonizing Industries, N. E. Rambush and F. S. Townend. Gas. Jl. (Lond.), vol. 191, no. 3508, Aug. 13, 1930, pp. 369-370. Two types of producers described are brick-built static type and mechanical-grate central producer; brief description of several installations; trend of development in mechanical producers. From paper read before World Power Conference, Berlin.

The Gas Producer—Continuous Producer, J. W. Romig. Am. Gas Jl., vol. 133, nos. 2 and 3, Aug. 1930, pp. 47-48 and Sept., pp. 44-45, 3 figs. Little information available as to actual temperatures in various zones of industrial gas producers; knowledge of reactions existing in distillation zone rather vague; heats of reactions in gas producer; producer gas constituents and percentages for bituminous coal gas; products of combustion of combustible in producer gas.

GASES

SPECIFIC HEATS AT HIGH PRESSURES. Specific Heats of Gases at High Pressures, B. H. Mackey and N. W. Krase. Indus. and Eng. Chem., vol. 22, no. 10, Oct. 1930, pp. 1060-1062, 2 figs. Methods of measurement and calculation of specific heats of gases as function of temperature and pressure have been developed, and results for nitrogen up to 150 deg. cent. and 700 atmos. are presented.

GASOLINE ENGINES

COMPRESSION RATIO. In Influence of Turbulence Upon Highest Useful Compression Ratio in Petrol Engines, T. F. Hurley and R. Cook. Engineering (Lond.), vol. 130, no. 3373, Sept. 5, 1930, pp. 290-293, 10 figs. Account of work being carried out at Fuel Research Station; engine used is E.5 Ricardo variable-compression engine, of 2⅞ in. bore by 3¼ in. stroke; it was found that optimum spark advance at given compression ratio with indiscriminate turbulence was, generally speaking, larger than that necessary with rotational turbulence; theory is advanced which affords explanation of most of observed phenomena, including that in connection with spark advance. Paper read before Brit. Assn. Sept. 4, 1930.

GRINDING MACHINES

SURFACE. Heavy Vertical-spindle Surface Grinder with Reciprocating Table, S. Weil. Eng. Progress (Berlin), vol. 11, no. 10, Oct. 1930, pp. 267-269, 3 figs. Grinder spindle of machine is driven by two 30-hp. motors running at 1,400 r.p.m. and capable of transient overload of 50 per cent; motors are arranged to either side of spindle, which they drive over elastic couplings and geared reductions; segmental abrasive wheel of 4.6 ft. diameter is used; spindle head is pivotally supended at top from two heavy pins, and held at bottom by two special screws.

GYPSUM INDUSTRY

CANADA. The Story of Gypsum in Canada, L. H. Cole. Can. Min. and Met. Bul. (Montreal), No. 221, Sept. 1930, pp. 1206-1224 and (discussion) 1224-1225, 8 figs. on pp. 126-1229. Historical note; gypsum and its varieties; anhydrite; Nova Scotia deposits and industry; New Brunswick; Quebec; Ontario; Manitoba; Saskatchewan, Alberta, and Northwest Territories; British Columbia; marketing; crude gypsum; calcined gypsum; possibilities of industry in Canada; illustrations show results of fire test on building where dry gypsum materials are combined with ordinary framework.

H

HANGARS, CONCRETE

GREAT BRITAIN. A Large Reinforced Concrete Aeroplane Hangar, C. E. Holloway. Structural Engr. (Lond.), vol. 8, no. 9, Sept. 1930, pp. 317-328, 7 figs. Details of design and construction of airplane hangars at Heston Air Park, Middlesex; suitability of reinforced concrete; main ground floor area is 100 ft. wide clear between columns and 80 ft. deep; tied-arch roof principals are 100 ft. clear span, 16 ft. centres, and 20 ft. rise; provision for wind pressure.

HARDNESS TESTING

BRINELL. Offers Some New Hardness Tables, T. N. Holden, Jr. Iron Age, vol. 126, no. 14, Oct. 2, 1930, p. 932. Tables give Brinell hardness number for 5-mm. ball with 750 and 250 kg. load; 10-mm. ball with 3,000, 1,000, and 500-kg. load; data on preparation of surfaces for Brinelling.

HYDRAULIC ACCUMULATORS

USES. Hydraulic Accumulators Charged with Compressed Air (Hydraulische Akkumulatoren mit Druckluftbelastung), R. Sackheim. V.D.I. Zeit. (Berlin), vol. 74, no. 36, Sept. 6, 1930, pp. 1234-1236, 4 figs. Applications and advantages of hydraulic accumulators; types of construction and regulation of high-head and low-head hydraulic accumulator plants.

HYDRAULIC ENGINEERING

EUROPEAN PROGRESS. Hydraulic Engineering Progress in Europe. Engineer (Lond.), vol. 150, no. 3897, Sept. 19, 1930, pp. 313-314. There is quite enough at present time to occupy hydraulic engineer in construction of dams, canals and inland waterways all over Europe; progress of hydraulic engineering is particularly marked in those countries possessing abundance of water power and little solid fuel; hydro-electric enterprise was to have reduced considerably importation of coal but while this has affected foreign coal trade, imports have been growing for some time past; coal has become serious competitor of hydro-electric energy, even in its own domain.

HYDRAULIC LABORATORIES

UNITED STATES. Alden Hydraulic Laboratory—Workshop of Modern Research, F. A. Annett. Power, vol. 72, no. 11, Sept. 9, 1930, pp. 418-422, 7 figs. Adequate hydraulic laboratory facilities in United States have been generally lacking; however, much valuable hydraulic research work has been done in laboratories of manufacturers, power companies, and universities; in his work Alden Hydraulic Laboratory of Worcester Polytechnic Institute has taken pre-eminent part; diagram of laboratory's property is illustrated.

HYDRAULIC TURBINES

DESIGN. Important Points in the Design and Operation of High Speed Hydraulic Turbines (Ueber einige wichtige Punkte beim Bau und beim Betrieb schnellaufender Wasserturbinen), R. Thomann. Elektrotechnik und Maschinenbau (Vienna), vol. 48, no. 39, Sept. 28, 1930, pp. 889-897, 23 figs. Design principles applying to turbines of which specific rotary speed exceeds 70, i.e., pressure turbines, propeller and Kaplan turbines.

SAND PROTECTION. Keeping Sand Out of Turbines and Forebays, R. P. Waite. Elec. World, vol. 96, no. 12, Sept. 20, 1930, pp. 535-536. Discussion on sand problem in Nebraska hydro-electric plant practice mainly theoretical, because careful engineering study has revealed fact that on account of erratic flow conditions kilowatt-hours produced by Nebraska streams hardly justify extensive improvements involving considerable expenditures; notes on experience. Based on paper presented before Nat. Elec. Light. Assn.

HYDRO-ELECTRIC POWER PLANTS

AUTOMATIC CONTROL. Automatic and Partial Automatic Hydro-Electric Plants. Nat. Elec. Light Assn.—Pub., no. 083, Aug. 1930, 19 pp., 5 figs. Salient features of automatic and partial automatic hydro-electric plants are briefly discussed; tabulations of principal characteristics of 104 such plants are included.

NEWFOUNDLAND. Hydro-Electric Plant at Lawn, Newfoundland, R. J. Murphy. Can. Engr. (Toronto), vol. 59, no. 11, Sept. 9, 1930, pp. 301-302, 4 figs. Report on small initial development by United Towns Electric Co., St. John's, Newfoundland, to supply power to Burin Peninsula; installation of 250-hp. Voith turbine and Westinghouse generator.

ONTARIO. Work Rapidly Proceeding on $23,000,000 Abitibi Job. Contract Rec. (Toronto), vol. 44, no. 37, Sept. 10, 1930, pp. 1083-1085, 3 figs. Features of hydro-electric power project including concrete dam 240 ft. high to develop 330,000 hp.

QUEBEC. Shawinigan Water Power, J. C. Wigham. Elec. Times (Lond.), vol. 78, no. 2029, Sept. 11, 1930, pp. 419-420, 3 figs. Development of Shawinigan Water and Power Co., and projected new developments; Company supplies current to both Montreal and Quebec and many intervening and surrounding places, containing population of over two millions; company has available 803,650 hp. and has control of water powers which can be developed up to two million.

I

ICE

SPECIFIC HEAT. Specific Heats and Latent Heat of Fusion of Ice, W. H. Barnes and O. Maass. Can. Jl. Research (Ottawa), vol. 3, no. 3, Sept. 1930, pp. 205-213, 1 fig. Values for heat capacities of ice and resulting water from initial temperatures of between 0 and 78.5 deg. cent. to final temperature of plus 25.00 deg. are measured to plus 0.05 per cent or better with improved adiabatic calorimeter; specific heats of ice over temperature range; to −80 deg. are found and latent heat of fusion of ice at 0 deg. is obtained from these heat-capacity determinations. Bibliography.

INTERNAL-COMBUSTION ENGINES

AIR FILTERS. The Efficiency of Air Filters for Internal Combustion Engines, W. Alexander. Engineering (Lond.), vol. 130, no. 3373, Sept. 5, 1930, pp. 295-296, 2 figs. Letter to editor referring to article by W. E. Gibbs, A. Brandt and M. L. Nathan, previously indexed from Aug. 22 issue of this journal; only centrifugal separator of which test results are given is old-fashioned cyclone; there are now applied to carburetor inlets vortical separators of through-flow type, which give movement to air much nearer to streamline motion of free or Rankine vortex than is given by cyclone; example of more modern type, called Supreme vortex separator, is illustrated.

AUSTRIA. Internal-Combustion Engines in Power Practice (Die Verbrennungsmotoren in der Energiewirtschaft), L. Richter. Elektrotechnik und Maschinenbau (Vienna), vol. 48, no. 38, Sept. 21, 1930, pp. 874-881, 4 figs. Classification of various types of engines and principal characteristics; fuel, prices and location of operation; comparison of operating costs of electric motors, Diesel engines and gas engines for long distance; paper is entirely based on Austrian conditions. Bibliography.

COMBUSTION. Combustion-Chamber Progress Correlated, A Taub. Soc. Automotive Engrs.—Jl., vol. 27, no. 4, Oct. 1930, pp. 413-443, 42 figs. Analysis of combustion-chamber design based on research of Ricardo, Janeway and whatmough; common principles are cooling last gas to burn by means of shallow clearance space; locating spark plug near exhaust valve; non-compact combustion chambers; volume control for smoothness; controlling acceleration of rise in pressure, to prevent roughness.

INDICATORS. Alterations and Tests of the "Farnboro" Engine Indicator, J. H. Collins, Jr. Nat. Advisory Committee for Aeronautics—Tech. Note No. 348, Sept. 1930, 14 pp., 5 figs. "Farnboro" electro-pneumatic indicator was tested as received from manufacturers and modifications made to improve its operation; modified indicator gives complete record of average cyclic variation in pressure per crank degree for any set of engine operating conditions which can be held constant for period of time required to build up composite card.

VALVE-CLEARANCE MEASUREMENT. A Valve-Clearance Indicator, F. Jehle. Soc. Automotive Engrs.—Jl., vol. 27, no. 4, Oct. 1930, pp. 473-474, 4 figs. Optical arrangement for measuring valve clearance during operation of engine is illustrated by sketch; graphs show changes and clearances of inlet and exhaust valve at three engine speed.

(See also Airplane Engines; Automobile Engines; Diesel Engines; Gas Engines; Gasoline Engines; Oil Engines.)

L

LIQUID OXYGEN CONTAINERS

GERMAN PROCESS. Shipment of Liquid Oxygen and Its Conversion to High-Pressure Gas Without Compressor (Der Versand von verfluessigtem Sauerstoff und seine umwandlung in Druckgas ohne Kompressor), A. Sander. Zeit. fuer kromprimierte und fluessige Gase (Berlin), vol. 28, no. 7, 1929-1930, pp. 65-69, 7 figs. New German process is described for transporting liquid oxygen in heat-insulated copper containers; at receiving point liquid oxygen is pumped into steel cylinder with thin-walled container not in heat contact with steel walls; this has small heat capacity and avoids evaporation losses in transferring oxygen.

LOCOMOTIVES

OIL-ELECTRIC. The Oil-Electric Locomotive, Its Limitations and Value, S. T. Dodd. Motive Power, vol. 1, no. 8, Sept. 1930, pp. 22-23 and 48, 4 figs. Consideration of design and operating characteristics; advantages of oil-electric type over steam locomotives; conclusion may be drawn that oil-electric locomotive presents advantage of highly efficient drive; disadvantage of power output strictly limited to capacity of its engine.

VALVE GEAR, POPPET. Holmes Poppet Valve Gear for Locomotives. Ry. Gaz. (Lond.), vol. 53, no. 12, Sept. 19, 1930, pp. 364-365, 3 figs. Perfect timing of valve events up to 84 per cent cut-off and interchangeability of left- and right-hand cam boxes and cylinders are among advantages claimed for this gear; illustrated diagrams showing general arrangement of valve gear.

LUBRICANTS

GRAPHITE. Lubrication with Graphite. Coloidal Graphite (La lubrification au graphite—le graphite colloiedal), R. Cordebas. Chimie et Industrie (Paris), vol. 23, no. 5, May 1930, pp. 1092-1098, 2 figs. Use and property of graphite for lubrication of various types of machines in dry, semi-fluid and liquid state; oiliness and capillary characteristics; graphite in lubricating oils.

M

MANGANESE STEEL

HEAT TREATMENT. Heat Treatment Determines Manganese Steel Properties, H. P. Evans. Steel, vol. 87, no. 11, Sept. 11, 1930, pp. 66-68. Brief outline of heat-treating method for manganese steel and discussion of reasons for structural changes; data on composition and hardness.

METALS

COLD WORKING. Variations in Hardness of Metals, and Alloys Resulting from Cold Working (Sur les variations de dureté de certains métaux et alliages en fonction de l'écrouissage), Guichard, Clausmann and Billon. Académie des Sciences—Comptes Rendus (Paris), vol. 190, no. 2, Jan. 13, 1930, pp. 112-114, 1 fig. Increase in hardness caused by cold working of 10 metals and alloys used for coinage was investigated by cold rolling sheets of completely annealed metals and determining relation between deformation and Brinell hardness; results expressed by curves.

ELASTIC HYSTERESIS. Elastic Hysteresis of Materials under Alternating Normal and Shearing Stresses (Die Daempfung der Werkstoffe bei wechselnden Normalspannungen und bei wechselnden Schubspannungen), O. Foeppl. V.D.I. Zeit. (Berlin), vol. 74, no. 40, Oct. 4, 1930, pp. 1391-1394, 8 figs. Classification of elastic hysteresis phenomena; practical value of elastic hysteresis; comparative study of hysteresis curves for normal and shearing stresses.

HEAT CONDUCTIVITY. Determination of Heat Conductivity of Metals, Especially at High Temperatures (Eine Methode zur Bestimmung der Waermeleitfaehigkeit von Metallen, besonders bei hohen Temperaturen), R. Holm. Wissenschaftliche Veroeffentlichungen aus dem Siemens-Konzern (Berlin), vol. 9, no. 2, June 12, 1930, pp. 300-311, 5 figs. Variation of methods of Rohltausch, Diesselhorst and Meissner which is especially suitable for metals of high temperature.

MINERAL RESOURCES

ONTARIO. Minerals of Hastings County, Ontario. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 35, Aug. 29, 1930, pp. 845-846. Notes on actinolite, arsenopynite, barite, clay, copper, corundum, dolomite, feldspar, fluorspar, galena, gold, granite, pyrites, limestone, lithographic stone, marble, mica, molybdenum, peat, silica, sodalite, talc, trap, rock, and iron ore.

MINES AND MINING

CABLEWAYS. Aerial Tramways Construction and Operation, D. L. Pitt. Can. Min. and Met. Bul. (Montreal), no. 221, Sept. 1930, pp. 1132-1174, 20 figs. partly on supp. plates. Notes on construction of Premier and Porter-Idaho tramways of Premier Gold Mining Co. in northern British Columbia; topography; climate; engineering and field work; design; construction; operation; maintenance and repair; performance data.

MINING GEOLOGY

MANITOBA. Leached Outcrops of Northern Manitoba, O. B. Gwilliam. Can. Min. and Met. Bul. (Montreal), no. 220, Aug. 1930, pp. 1039-1049, 3 figs. Comparison between leached outcrops of southwestern United States and those of northern Manitoba; outline of criteria used in southwest; gossans at Flin Flon agree with Locke's description of fine limonite boxworks, correlated with chalcopyrite accompanied by minor pyrite; iron-stained material at surface of Mandy correspond with description of flooded matrix correlated with abundant pyrite; portions of Smith-Pride gossan, and Sherritt-Gordon gossan boxworks, correlated with chalcopyrite and minor pyrite.

MINING LAWS AND LEGISLATION

MANITOBA. Some Notes on the Mining Law of Manitoba, and on the Mines Act of 1930, H. F. Maulson. Can. Min. and Met. Bul. (Montreal), no. 220, Aug. 1930, pp. 996-1011. Historical review of antecedents of Canadian mining laws; Orders-in-Council passed by Dominion, governing natural resources; discussion of Mines Act of 1930.

MOULDING MACHINES

FOUNDRY. Mechanical Handling Methods in Stove Manufacture, H. Magdelenat. Mech. Handling (Lond.), vol. 18, no. 9, Sept. 1930, pp. 297-298, 1 fig. Continuous handling operations embodied in Rosieres-Bachon moulding machine for repetitive production of castings in stove manufacture; a plan and elevation views of continuous moulding machine layout are illustrated. Paper read before Inst. Brit. Foundrymen, previously indexed from Foundry Trade Jl., July 10, 1930.

N

NATURAL GAS STORAGE, UNDERGROUND

ALBERTA. Recharging Old Canadian Gas Field, L. G. E. Bignell. Oil and Gas Jl., vol. 29, no. 19, Sept. 25, 1930, pp. 41 and 151-152, 4 figs. Data covering ground previously indexed from note in Petroleum World, Sept. 1930; maps and tabular records of gas production in wells of Bow Island field and of absorption by wells of waste gas surplus from Turner Valley field; typical well bookup.

NICKEL DEPOSITS

QUEBEC. Nickel-Cobalt Minerals on Calumet Island, Quebec, H. V. Ellsworth. Can. Min. Jl. (Gardenvale, Que.), vol. 51, no. 37, Sept. 12, 1930, pp. 886-888, 1 fig. Deposit of nickeliferous pyrrhotite on lot 11, range IX, in Pontiac County; chief ore mineral is disseminated nickeliferous pyrrhotite; considerable nickeliferous pyrite in some places; chalcopyrite, cobaltiferous gersdorffite and niccolite also occur in small amount; analyses of specimens; concentration, as by oil flotation, of all sulphides and arsenides together would probably yield nickel-cobalt-bearing concentrate of commercial value.

NITRIDATION

CONTINUOUS. Continuous Nitriding a New Development, R. J. Cowan. Metal Progress, vol. 18, no. 4, Oct. 1930, pp. 93-98, 5 figs. Nitridation process for high and low-temperature treatment and furnace equipment developed by Surface Combustion Co., Toledo, O.; sketch shows gas-fired muffle furnace with airlocks and seals at entrance and exit; graph illustrates relations between depth of nitrided case hardness and degree of dissociation and time.

METHODS. Nitriding or Casehardening with Ammonia, V. O. Homerberg and J. P. Walsted. Machy. (N.Y.), vol. 37, no. 2, Oct. 1930, pp. 106-108. Discussion of nitriding methods to produce parts that have tough inner core and surfaces with outstanding wear-resisting qualities; kinds of steel that can be nitrided; temperature required and time of exposure; experiments at temperatures ranging from 900 to 1,300 deg. fahr., inclusive, show that depth of case increases, but hardness decreases with increase in temperature. Abstract of paper read before A.S.M.E., Sept. 22-24, 1930.

RECENT DEVELOPMENTS IN. Recent Developments in Nitriding, R. Sergeson. Iron Age, vol. 126, no. 11, Sept. 11, 1930, pp. 680-682, 6 figs. Outline of types of nitriding analysis now found on commercial market as to many applications in industry; new free machining high-sulphur nitriding steel is reviewed as to its machinability and nitriding qualities; method of protection against nitriding with sodium silicate, chrome ore mixture.

O

OIL ENGINES

COMBUSTION. Ante-chambers and the High-Speed Oil Engine Combustion Problem, R. Matthews. Motive Power, vol. 1, no. 8, Sept. 1930, pp. 19-21 and 46, 5 figs. Questions pertaining to relative merits of ante-chambers and single combustion chamber design; specific reference to above factors are considered.

STARTING. Rapid Starter for Internal-Combustion Engines (Schnellanlasser fuer Verbrennungsmotoren), H. Lang. V.D.I. Zeit. (Berlin), vol. 74, no. 38, Sept. 20, 1930, pp. 1325-1328, 12 figs. Starting methods for low-compression oil engines are illustrated by sketches; rapid burners, electrical, mox, pyrochemical and glow-tube designs.

OPEN-HEARTH FURNACE

PRACTICE. Open-Hearth Furnace Steelworks, H. C. Wood. Iron and Steel of Canada (Gardenvale, Que.), vol. 13, no. 9, Sept. 1930, pp. 194-197, 213 and 215, 4 figs. Comparison of practice followed and results obtained in Great Britain and Germany and other leading Continental steel-producing countries; tables and graphs illustrate production of open-hearth steel according to process and country; typical operation data.

OXYGEN

ELECTROLYTIC MEASUREMENT. Electrolytic Production of Hydrogen and Oxygen, E. F. Evenden. Elec. Times (Lond.), vol. 78, no. 2028, Sept. 4, 1930, pp. 389-392, 6 figs. Advantages and disadvantages of filter press and bell-type electrolytic cells are discussed; Knowles plant at Bussi, Italy, is described in detail.

P

PHOTO-ELECTRIC CELLS

INDUSTRIAL APPLICATIONS. Applications of Photo-Electric Cells, E. H. Vedder. Elec. Jl., vol. 27, no. 6, June 1930, pp. 335-339, 9 figs. Uses for cell have been found in many different industries, and many more suggested applications are awaiting development; cell can be applied to three different types of work; indicating and recording, automatic control and relaying, and sorting, grading and matching; various applications are discussed.

PILE DRIVERS

HEAVY FLOATING. Heavy Floating Pile Driver (Schwimmramme schwerster Bauart), H. Nauhardt. Bauingenieur (Berlin), vol. 11, no. 18, May 2, 1930, pp. 318-319, 2 figs. Pile driver, having monkey weight of 6 tons, and designed to drive reinforced-concrete piles 14 m. long and weighing 10 tons, built by Maschinen-und Kranbay A.G. for Belgian Congo.

PIPE

HEAT TRANSMISSION. Relation of Mean Heat Transfer Coefficient of Length of Pipe (Die Abhaengigkeit der Mittleren Waermeuehergangszahl von der Rohrlaenge), W. Stender. Wissenschaftluchungen aus dem Siemens-Konzern (Berlin), vol. 9, no. 2, June 12, 1930, pp. 88-98, 5 figs. New equation is developed for temperature relations and heat transfer in heated pipes; new equation is applied to experiments by Nusselt, Rietschel, Stanton and Stander for verification of their constants derived for gases and water.

PROTECTIVE COATINGS. Simple Method for Quantitative Analysis of Atmospheric Corrosion of Protected Metal Pipe (Ein einfaches Verfahren zur quantitativen Verfolgung der atmosphaerischen Korrosion geschuetzter Metallrohre), W. Beck. Korrosion und Metallschutz (Berlin), vol. 6, no. 9, Sept. 1930, pp. 201-204, 4 figs. Results of study carried out at Kaiser Wilhelm Institut fuer Physikalische Chemie und Elektrochemie; tests were made with aid of gas-volumetric method; results of observations of Schade tube protective bandage show that this bandage possesses excellent anti-corrosive properties.

PIPE LINES

DESIGN. Calculation of Pipe Lines for Viscous Fluids (Berechnung von Rohrleitungen fuer Zaehe Fluessigkeiten), W. Guntermann and H. Kroessin. Waerme (Berlin), vol. 53, no. 38, Sept. 20, 1930, pp. 704-706, 6 figs. Simple values are given for relation between friction coefficient and Reynolds coefficient in dependence upon nature of flow; influence of temperature on viscosity and, therefore, on Reynolds coefficient and flow conditions; by applying this calculation to flow of tar, limit values are obtained for temperature, diameter and speed as basis for economic design of pipe lines.

POLES

CONCRETE. Study of Cross-Sectional Shapes to be Adopted for Concrete Poles (Etude des formes à adopter pour les sections des pylones en béton), H. Claude. Revue Générale de l'Electricité (Paris), vol. 28, no. 9, Aug. 30, 1930, pp. 326-330, 2 figs. Author points out that disregarding of forces acting on intermediate poles parallel to direction of line is erroneous as stresses in that direction can be quite appreciable; adoption of T-shape on this basis in England is discussed, and correctness of this practice is proven by mathematical analysis.

POWER PLANTS

TIDAL. The Shishkoff Hydro-Thermal Tidal Power System. Engineer (Lond.), vol. 150, no. 3898, Sept. 26, 1930, pp. 330-33, 10 figs. Experimental plant erected at Old Lock, Avonmouth Docks; Shishkoff system makes use of thermal storage; vertical shaft of water turbine is coupled directly to Heenan and Froude brake and to vertical alternator; energy delivered by water turbine is in part directly converted into electricity for immediate consumption and in part converted into heat; water which receives heat generated inside brake is circulated by pump in closed circuit between brake and Ruths steam accumulator.

STANDBY. Hydro-Electric and Thermal Plants. Can. Engr. (Toronto), vol. 59, no. 14, Sept. 30, 1930, pp. 511-512. Abstracts of papers from general report presented in symposium on electrical energy produced thermally, and its joint use with hydro-electric power, at World Power Conference, Tokyo; economy of thermal station serving as standby for hydro-electric plant.

PRESSES

HYDRAULIC. Piping Engineers Need Information on Hydraulic Equipment, F. G. Schranz and W. L. DeLaney. Heat., Piping and Air Conditioning, vol. 2, no. 9, Sept. 1930, pp. 776-788, 2 figs. Design and operation of hydraulic press; table giving capacities of hydraulic rams in tons for various diameters and pressures; list of industries that are used in hydraulic press equipment are given.

PRESSURE GAUGES

MERCURY. The Measurement of Pressures in Mercury, P. A. Redford. Mech. World (Lond.), vol. 88, no. 2279, Sept. 5, 1930, pp. 226-227, 3 figs. In contrast to column of water, level of which rises in consequence of capillary attraction in narrow pipes, column of mercury is reduced in height due to surface tension of mercury; depressions, which depend on pipe diameter and height of mercury column, must be taken into consideration in determining pressure to be measured; table giving depression in millimeters of mercury, and water column, for different internal diameters of glass tubes.

PRESSURE VESSELS

DESIGN. Correlating Theory and Practice in Pressure-Vessel Design, N. W. Krase. Chem. and Met. Eng., vol. 37, no. 9, Sept. 1930, pp. 540-543, 11 figs. Review of fundamentals of design of pressure vessels; difficulties encountered when very high pressures and temperatures are involved.

WELDING. The Strength and Design of Fusion Welds for Unfired Pressure Vessels, L. W. Schuster. Instn. Mech. Engrs.—Proc. (Lond.), no. 2, Mar. 1930, pp. 319-377 and (discussion) 378-422, 26 figs. Object, scope and need of investigation; conclusions reached on mechanical construction of welded vessels; various tables and figures are given illustrating extent of investigation; appendix of provisional rules for fusion-welded non-fired pressure vessels. Paper previously indexed from various sources.

PUMPS, CENTRIFUGAL

SELF-PRIMING. Self-Priming Centrifugal Pump of Unusual Pumping Lift (Ungewoehnliche Foerderhoehe einer selbstansaugenden Kreiselpumpe), C. Ritter. V.D.I. Zeit. (Berlin), vol. 74, no. 37, Sept. 13, 1930, pp. 1257-1258, 5 figs. Abstract of report on construction and tests of so-called Sihi pump manufactured by Siemen & Hinch m.b.H.; by means of special channels, nearly concentric with casing, pump is enabled to acquire multi-stage effect equivalent to 5 times lift expected of ordinary pump rotor of equal speed.

TURBINE. Experimental Researches on Turbine Pumps, M. Yendo. Yokohama Technological College—Reports (Yokohama), no. 1, June 1930, 96 pp., 293 figs. partly on plates. Experiments to determine mainly pressure, velocity, and direction of flow of water just after leaving impeller and entering diffusor ring; also diffusor efficiency and entrance conditions by aid of subsidiary measurements. (In English.)

R

RAIL MOTOR CARS

FUTURE. The Probable Rail-Motor Equipment of the Future, E. Wanamaker. Can. Ry. and Mar. World (Toronto), vol. 390, Sept. 1930, pp. 575-576. Discussion treating of study of commodities and passengers moved today, routes over which they are moved, form of transportation, and other features; part played by rail motor car in branch line transportation; discussion of transportation situation during next decade; historical review of rail motor car development. Paper read before Am. Ry. Assn., Motor Transport Division.

GASOLINE-ELECTRIC. Gas-Electric Motor Rail Cars, Canadian Pacific Railway. Can Ry. and Mar. World (Toronto), no. 390, Aug. 1930, p. 495, 1 fig. Design and constructional features of two gas-electric rail motor cars recently received for passenger service on branch line; list of principal dimensions is given; power plant consists of 400-hp. engine, 8-cylinder, 8-in. bore, 10-in. stroke, model 148, Winton Engine Co.

RAILROAD OPERATION STATISTICS

CANADA. A Decade's Progress in the Canadian Railway Industry, E. Winfield. Can. Ry. and Mar. World (Toronto), no. 390, Sept. 1930, pp. 549-552, 5 figs. Statistical review of financial results, all Canadian Railways, 1920-1929; discussion of operating progress illustrated with tables and curves.

RAILROAD TERMINALS

MONTREAL. Operation of Montreal Terminals, Canadian Pacific Railway, T. Collins. Can. Ry. and Mar. World (Toronto), no. 390, Aug. 1930, pp. 493-495. Discussion of operations of five distinct departments; handling of passenger and freight trains. Paper read before Eng. Inst. of Canada.

RESERVOIRS, STORAGE

CANADA. Water Storage Reservoirs in Canada, O. Lefebvre. Can. Engr. (Toronto), vol. 59, no. 12, Sept. 16, 1930, pp. 321-327, 6 figs. Water available for power generation; location and capacity of principal storage reservoirs in Canada; storage reservoirs built by Quebec Streams Commission. Paper presented at Second World Power Conference, Berlin.

ROAD CONSTRUCTION

ONTARIO. Highway Construction in Ontario, R. M. Smith. Can. Engr. (Toronto), vol. 59, no. 13, Sept. 23, 1930, pp. 143-145 and (discussion) 127 and 132, 4 figs.: see also Contract Rec. (Toronto), vol. 44. no. 39, Sept. 24, 1930, pp. 1162-1166, 2 figs. Highway widths, strengths, grades, curves and alignment; construction on highways; culverts and drainage; low-cost road surfaces; concrete roads.

ROAD MATERIALS

BITUMINOUS. Construction and Maintenance of Modern Roads, etc. (La construction et l'entretien des routes modernes—Le rôle du goudron), G. Coret. Jl. des Usines à Gaz (Paris), vol. 54, nos. 10, 11 and 12, May 20, 1930, pp. 219-229, June 5, pp. 246-258 and June 20, pp. 269-275, 6 figs. See also Génie Civil (Paris), vol. 97, no. 8, Aug. 23, 1930, pp. 187-188. General discussion of highway design and financing; types of roads; manufacture and use of tar products for road construction with special reference to coal-tar products derived from gas plants; cost data on bituminous surface treatment; treatment of roads.

ROADS, ASPHALT

CONSTRUCTION. Trend of Practice in Asphalt Paving, E. H. Scott. Can. Engr. (Toronto), vol. 59, no. 13, Sept. 23, 1930, pp. 257-258D and 258J, 6 figs. Construction and maintenance of sheet asphalt, mixed macadam, penetration and retread pavements; temperature stresses; resurfacing old roads; maintenance of secondary roads; types compared; asphaltic mixed macadam; reasons for methods used; rolling hot mixture; surface treated mixed macadam; asphalt plant inspectors and road inspector's duties; sheet asphalt and asphaltic concrete; correcting hair checking.

ROCK DRILLS

HOLLOW STEEL. Machine Simplifies Cleaning of Clogged Drills. Eng. and Min. Jl., vol. 130, no. 5, Sept. 8, 1930, p. 220, 1 fig. Brief note on machine constructed and installed at central drill-sharpening shop of Copper Queen Branch of Phelps Dodge Corporation, at Bisbee, Ariz.; driven by 5 hp. electric motor; average of 80 drills cleaned per hour.

ROLLING MILLS

DESIGN. Energy Required and Forces Developed in Rolling Mills, A. W. Knight. Mech. World (Lond.), vol. 88, nos. 2280, 2281, Sept. 12, 1930, pp. 248-251, Sept. 19, pp. 263-265, 10 figs., Sept. 26, pp. 290-294, 2 figs. Phenomena in rolling of hot and plastic steel; formulae for forces exerted on housings or rolls, torque on rolls, energy required for pass, horsepower necessary, and total amount of deforming energy required to roll from ingot or billet to finished section; frictional losses in roll journals; differences in efficiency of these journals explain why mills having small-diameter rolls absorb less energy to produce certain deformations than mills having large rolls. Values of plastic stress "f" and experimental verification of formulae on six different rolling-mills, all electrically driven; effect of rate of deformation on value of "f"; total amount of energy required to roll from ingot or billet to finished section.

ROLLER BEARING. Power Consumption Tests on the Timken Steel and Tube Company Blooming and Bar Mills, F. Waldorf. Iron and Steel Engr., vol. 7, no. 9, Sept. 1930, pp. 442-460 and 466-468, 23 figs. Discussion of test results with particular regard to effects of roller bearings; graphs illustrate data on rolling pressures, temperatures, reductions and elongations.

Results Obtained with Roller Bearings in Rolling Mills, G. E. Palmgren. Iron Age, vol. 126, no. 12 and 13, Sept. 18, 1930, pp. 778-781 and Sept. 25, pp. 855-859, 18 figs. Sept. 18: Discussion of design and application of roller bearings particularly to rolling mills, based on experience of SKF industries; two-bearing design for ordinary hot rolling mills; sketches show distribution of pressure and methods of absorbing actual trust. Sept. 25: Tables give data on power economy measurements in wire rolling mill and rolling of steel strips in medium mill.

ROLLS

FAILURES. Sheet and Tinplate Rolls, J. S. Caswell. Iron and Coal Trades Rev. (Lond.), vol. 121, no. 3259, Aug. 15, 1930, pp. 217-218. Roll-breakage records; loads set up by deformation of iron; roll temperature; thermal variations with falling face temperature; discussion. Extracts from paper read before South Wales Inst. of Engrs.

S

SCREW THREADS

DARDELET SELF-LOCKING. The Dardelet Self-Locking Screw Thread. Engineering (Lond.), vol. 130, no. 3372, Aug. 29, 1930, p. 282, 3 figs. In this device forms of threads for nut and bolt are somewhat different; portion of bolt between threads is made slightly tapered, with parts of smaller diameter nearer head, i.e., toward left in figures, while crests of threads in nut are tapered to same angle in both directions.

SEWAGE DISPOSAL

ACTIVATED SLUDGE. Guiding Principles of the Activated Sludge Process, T. C. Hatton. Civil Eng., vol. 1, no. 1, Oct. 1930, pp. 31-36 and (discussion) p. 45, 4 figs. History of activated sludge process with special reference to work done in United States; outline of experimental work done at Milwaukee and other laboratories; air requirement; depth of aerating tanks; precipitation of activated sludge; grit removal and screening; screen tests; dewatering of sludge; filters and sludge driers; plant and operation costs; sale of sludge. Paper presented before Summer School for Engineering Teachers at Yale University.

SEWER TUNNELS

CONSTRUCTION. Shield Tunnelling Under Stony Creek, Melbourne, J. C. Coldham. Commonwealth Engr. (Melbourne), vol. 17, no. 12, July 1930, pp. 433-438, 4 figs. Report on driving of concrete sewer tunnels, 8 ft. 6 in. interior diam., 1,892 ft. long, mostly through soft silt; shield consists of mild steel cylinder 11 ft. 9⅝ in. in diam. and 8 ft. 8 in. long, constructed of ⅞-in. plate with electrically-welded joints; tunnel lining is constructed of fabricated timber rings.

SHEET-METAL TESTING

METHODS AND APPARATUS. Method and Apparatus Giving Extension Coefficient and Breaking Load of Metallurgical Products in Thin Sheets (Méthode et appareil d'essai donnant le coefficient d'extension et la charge de rupture des produits métallurgiques en feuilles), C. Jovignot. Académie des Sciences—Comptes Rendus (Paris), vol. 190, no. 22, June 2, 1930, pp. 1299-1302, 2 figs.; see also brief translated abstract in Chem. and Industry (Lond.), vol. 49, no. 34, Aug. 22, 1930, p. 772. Test piece is pressed tightly between two circular jaws, and measured hydraulic pressure is applied through reservoir below it till rupture of leather sphere occurs; nature of break furnishes indication of homogeneity of test piece.

Testing Method and Apparatus Giving Coefficient of Expansion and Breaking Load of Metallurgical Sheet Products (Méthode et appareil d'essai donnant le coefficient d'extension et la charge de rupture des produits métallurgiques en feuilles), C. Jovignot. Revue de Métallurgie (Paris), vol. 27, no. 8, Aug. 1930, pp. 443-448, 10 figs. Method described consists of submitting specimen sheet clamped between circular jaws to direct action of liquid; advantages of method are set forth.

Testing of Thin Sheets with Deep Drawing Hole-Widening Test (Die Pruefung von Feinblechen durch den Tiefzieh-Weitungsversuch), E. Siebel and A. Pomp. Mitteilungen aus dem Kaiser-Whilhelm-Institut fuer Eisenforschung zu Duesseldorf (Duesseldorf), vol. 12, no. 9, 1930, pp. 115-125, 15 figs. partly on supp. plate. Authors' previously indexed paper in vol. 11, no. 8, 1929 issue, described cupping test using disc test piece in which central hole was cut: stretch of material during cupping occurs by radial flow outward from central circular hole, which gradually widens; tests on sheet and strip steel and non-ferrous metals and on coarse-grained recrystallized metal.

The Testing of Sheet Metal. Metallurgist (Supp. to Engineer, Lond.), Sept. 1930, pp. 139-141. Attempts have been made both in England and France to overcome defects of existing types of cupping tests and to develop it into reliable quantitative method of measuring certain important properties of sheet metal; idea underlying these attempts, is to replace plunger which produces cup by pressure of liquid, thus eliminating friction between plunger and sample; machine of this kind is described by C. Jovignot in August number of Revue de Métallurgie, previously indexed.

SHEET-METAL WORKING

STAMPING. Effects Economies in Small Stampings Production, A. H. Allen. Steel, vol. 87, no. 14, Oct. 2, 1930, pp. 60, 62, and 64, 6 figs. Production methods and equipment at plant of Detroit Stamping Co., making washers, small drawn shells, flanges, and shims; seamless sleeves.

SMELTING PLANTS

NATURAL GAS FUEL. Natural Gas Firing at El Paso Smelting Works, E. R. Marble. Min. and Met., vol. 11, no. 286, Oct. 1930, pp. 466-467, 1 fig. Successful smelting with new fuel; temperature, high rate of heat transfer and length of flame.

SMOKE ABATEMENT

PROGRESS IN. Smoke Abatement Progress, V. J. Azbe. Power Plant Eng., vol. 34, no. 19, Oct. 1, 1930, pp. 1102-1104, 5 figs. Improved methods for domestic and industrial firing; fundamentals for smoke elimination; performance curves for steam heating boiler with and without down-draft baffle; arrangement of down draft baffle in firebox of heating boiler. Paper presented before World Power Conference, Berlin, June 1930.

SOUND INSULATION

MEASUREMENT OF. Measurement and Calculation of Sound-Insulation, V. O. Kundsen. Acoustical Soc. of America—Jl., vol. 2, no. 1, July 1930, pp. 129-140, 3 figs. Author has made some insulation measurements by three different typical methods now in use at different laboratories, and obtains good agreement for coefficients of transmission by all three methods; by assigning reasonable properties to test rooms at Riverbank Laboratories it is shown that Sabine's results on insulation of rigid partitions are in essential agreement with Chrisler's results; simple formula is suggested for calculating insulation properties of rooms.

SPILLWAYS

GATES. Large Spillway Gates at Hume Dam. Commonwealth Engr. (Melbourne), vol. 17, no. 12, July 1930, pp. 439-442, 4 figs. Description of series of 29 gates of overshot type, 15 ft. 8 in. deep and 22 ft. wide, built of heavy rolled steel joists with mild steel plates riveted on downstream side and vertical tie plates attached on reverse side; continuous caterpillar roller trains running in grooved facings at each side of gate; staunching device for preventing leakage at each side of gate consists of length of 2-in. brass tubing floating in machined groove casting attached to gate and bearing against machined facing on groove casting attached to pier.

STEAM

DISTRIBUTION IN INDUSTRIAL PLANTS. Economical Production and Distribution of Steam in Large Factories, F. Carnegie. Instn. Mech. Engrs.—Proc. (Lond.), no. 2, Mar. 1930, pp. 473-526 and (discussion), 527-552, 22 figs. Factors involved in steam generation in English industrial power plants; survey of existing conditions; economical distribution or conveyance of steam from generating centre to user centre; system of accounting which would accurately reflect unit cost of steam at each generating and user centre; checking consumption and accounting for steam used; results of steam investigation at Woolwich Arsenal. Paper previously indexed from various sources.

HIGH-PRESSURE. High-Pressure Steam—A Money Saver in Process Plants, P. W. Swain. Chem. and Met. Eng., vol. 37, no. 9, Sept. 1930, pp. 568-569, 1 fig. Examples of wide application of high-pressure steam both in United States and abroad.

STEAM CONDENSERS

MAINTENANCE AND REPAIR. Improving Plant Operation by Condenser Maintenance. Power Plant Eng., vol. 36, no. 18, Sept. 15, 1930, pp. 1035-1038, 11 figs. Clean tubes, air and water leakage form important factors in successful condenser performance; typical condenser layout of modern power plant is illustrated.

SURFACE. Principles of Surface Condenser Design. Mech. World (Lond.), vol. 88, no. 2281, Sept. 19, 1930, pp. 274-278, 7 figs. Outline of fundamental thermodynamic relations and formulae; critical investigation of influence of various factors upon which performance of condenser depends; effect of limited conductivity; influence of pressure drop over tube nest.

STEAM-ELECTRIC POWER PLANTS

DESIGN AND OPERATION. Design and Operation of Super Power Plants (Bau und Betrieb von Energie-Grossanlagen), H. Gleichmann. Archiv fuer Waermewirtschaft (Berlin), vol. 11, no. 9, Sept. 1930, pp. 299-300. Interchange of energy between states; planning of large electric works; most economic steam pressure; intermediate superheating; peak-load power plants; momentary reserve. Paper read before World Power Conference, Berlin.

SWITCHGEAR. Switchgear at the 250,000-kw. Steam Generating Plant at Stalingrad, U.S.S.R., A. J. Cowan. Gen. Elec. Rev., vol. 33, no. 10, Oct. 1930, pp. 577-580, 9 figs. Power station, now in course of construction, will have steam-turbine-generator capacity of 50,000 kva. with provision for increase in near future to 170,000 kva. and ultimately to 250,000 kva.; power will be generated at 11,000 volts, 50 cycles by two generators and stepped up by their individual transformers to 115,000 volts for transmission some 130 miles to factories and municipalities; plant switching equipment is illustrated and described.

TESTING. Power-Plant Testing, P. H. Hardie. Engineering (Lond.), vol. 130, no. 3374, Sept. 12, 1930, p. 324. Letter to editor referring to article by Guy and Lamb, on Operating Results with Recent Extensions of Barton Power Station, previously indexed from May 9 and 16 issues of this journal; under classification Steam-Electric Power Plant—Great Britain, present writer, who is test engineer of Brooklyn Edison Co., criticizes fact that test heat consumption was reported only to number of significant figures; he believes that accuracy of plus or minus 0.5 per cent is best than can be obtained consistently on turbo-generator units tested in operation in power station.

STEAM PIPE LINES

RISERS. Capacity of Return Risers for Steam and Vapour Heating Systems, F. C. Houghten. Heat., Piping and Air Conditioning, vol. 2, no. 10, Oct. 1930, pp. 859-865, 9 figs. Paper marks completion of general investigation of capacity of pipe for carrying steam, condensate, and air in various parts of steam heating systems, as outlined by Technical Advisory Committee on pipe sizes for heating systems, and as carried on by Research Laboratory in co-operation with Carnegie Institute of Technology; test set-up and operation of experiments to determine capacity of return rises; graphic analysis of experimental results.

STEAM POWER PLANTS

EQUIPMENT. Boilers, Superheaters, and Economizers. Nat. Elec. Light Assn.—Pub., no. 0-1, Aug. 1930, 34 pp., 61 figs. In 1929 boiler which produced 1,250,000 lbs. of steam per hr. was used; steam pressure and temperature have increased; there are more than 15 boilers operating at 1,400 lbs. or more and steam temperature in large number of stations is 750 deg. fahr. knowledge of control of caustic embrittlement has been greatly extended; use of water-cooled furnace walls, particularly on large units, is almost standard practice; methods of welding have progressed.

Steam and Gas Turbines and Reciprocating Engines (Dampf und Gasturbinen und Kolbenmaschinen), A. E. Kraft. Archiv. fuer Waermewirtschaft (Berlin), vol. 11, no. 10, Oct. 1930, pp. 325-328. Generation of power steam; intermediate superheating; back-pressure and bleeder turbines; operating costs and statistics; high-pressure reciprocating engines; economic limits between reciprocating steam engines and turbines; gas engines and gas turbines; binary-vapour processes; it is believed that no other prime mover will replace steam turbine in some time to come, and that steam power plants will remain in ascendency. Paper read before World Power Conference. Berlin.

HIGH PRESSURE. High-Pressure Steam and Economic Steam Pressure (Hochdruckdampf und wirtschaftlichter Dampfdruck), G. Frantz. Warme (Berlin), vol. 53, no. 39, Sept. 27, 1930, pp. 740-745, 1 fig. Properties of high-pressure steam and its most important feature as compared with low-pressure steam; based on examples it is shown that most economic pressure can be determined only individually, and after careful calculation taking all special conditions into consideration.

STEAM TURBINES

EFFICIENCY CHARTS. A Steam Turbine Efficiency Chart, F. C. Martin. Australasian Elec. Times (Melbourne), vol. 9, no. 8, Aug. 27, 1930, pp. 499-500, 1 fig. Chart incorporates all steam properties and data required by turbo-electric plant engineer to check up on efficiency of his plant, and thus detect deterioration therein, mismanagement, mud in condenser tubes, air leakage to condenser, etc. Presented at World Power Conference, Tokyo, 1929.

OVERLOADING. Steam Turbine Overloads, C. A. Parsons and R. Dowson. Elec. Rev. (Lond.), vol. 107, no. 2755, pp. 435-437, 3 figs. Case for use in power stations of steam turbines having larger emergency ratings than are at present usually specified; steam-turbine design for wide ranges of load; alternators with artificially increased ratings; comparative costs. Abstract of paper presented before World Power Conference.

STEEL

COLD WORKING. Cold Rolling Raises Fatigue or Endurance Limit, G. S. von Heydekampf. Iron Age, vol. 126, no. 12, Sept. 18, 1930, pp. 775-777 and 829, 4 figs. Investigation of endurance limits and elastic behaviour with special attention to mechanical hysteresis effect for ranges of stress within elastic and fatigue limits; influence of surface and surface damage on fatigue strength; by cold rolling surface of machine parts fatigue or endurance limit can be raised about 15 per cent.

HARDNESS TESTING. Hardness Tests of Steel Strip, G. A. Hankins. Engineering (Lond.), vol. 130, no. 3374, Sept. 12, 1930, p. 324. Letter to editor containing remarks and results of tests carried out at National Physical Laboratory; typical series of tests in Vickers machine are given in table, material being steel strip 0.0152 in. in thickness.

HEAT TREATMENT. Steel and Its Heat Treatment for Parts That Must Resist Wear, H. W. McQuaid. Heat Treating and Forging, vol. 16, no. 9, Sept. 1930, pp. 1159-1162 and 1164, 5 figs. Relative status and economy of different steels and treatments which can be used where hard surface is required; curves showing depth hardness relation of various steels and treatments; notes on nitriding; use of low carbon steel and low carbon alloy steel.

STEEL CASTINGS

SPECIFICATIONS. Revised Edition of DIN 1681 (Cast Steel) [Die Neuauflage des Normblattes DIN 1681 (Stahlguss)], L. Schmid. Maschinenbau (Berlin), vol. 9, no. 17, Sept. 4, 1930, pp. 565-571, 6 figs. German cast-steel specification revised from standpoint of manufacturer and consumer of cast steel; production methods, physical properties, composition and heat treatment.

STEEL FOUNDRY PRACTICE

SAND MOULDS. Notes on Behaviour of Sand Moulds in Steel Foundries, P. L. Goodale. Am. Foundry Men's Assn.—Trans., vol. 1, no. 9, Sept. 1930, pp. 471-477 and (discussion) 477-480, 4 figs. Characteristics and properties of core surfaces when casting steel against them; surface of casting burns in contact with air, forming oxide slag which forms some iron silicate by action with sand; ideas to overcome this objectionable feature of slag formation.

STREET RAILROADS

SUBSTATIONS. Montreal's Third Automatic Mercury Arc Railway Sub-Station, M. L. de Angelis. Elec. News (Toronto), vol. 39, no. 18, Sept. 15, 1930, pp. 53-56, 5 figs. Montreal Tramways Co. started operation of their third automatic mercury-arc rectifier station; electric equipment supplied by Canadian General Electric Co., comprises two 1,500-kw., 600-volt, 12-phase mercury-arc rectifiers capable of 50 per cent overload for two hours; two 13,000/935-volt, 60-cycle, three-phase delta/12-phase quadruple zig-zag transformers; 5,000-amp. reactor, bake-out transformer, water-cooling and circulating system, etc.

STRUCTURAL STEEL

OXYACETYLENE WELDING. Application of Gas Welding to Steel Construction (Anwendung der Gasschmelzschweissung fuer Stahlbauten), R. Cajar. Stahlbau (Supp. to Bautechnik) (Berlin), vol. 3, no. 7, Apr. 4, 1930, pp. 80-81, 14 figs.; see also translated abstract in Bldg. Science Abstracts (Lond.), vol. 3, no. 8/9, Aug./Sept. 1930, pp. 329-330. Possibility of using acetylene welding in construction of steel buildings and engineering structures is demonstrated, but its ability to compete with arc welding is questioned.

WELDING. Welding Steel Structures. Eng. News-Rec., vol. 105, no. 12, Sept. 18, 1930, pp. 442-449, 5 figs. Symposium of six articles: Highest All-Welded Office Building Erected in Dallas; Inspecting Field-Welding of Structural Steel, W. F. Carson; Rational Method of Welded Connection Design, A. Vogel; Large Area of Welded Steel Floor in Pittsfield, Mass., Garage, E. N. Adams; Welding Field Joints on 14-Storey Office Building, J. T. Whitney; Arc-Welding Facts That Should be Common Knowledge.

T

TEMPERATURE SCALE

INTERNATIONAL. Experimental Bases of International Temperature Scale in Low-Temperature Range (Die experimentellen Grundlagen der internationalen Temperaturskala, etc.), F. Henning. Zeit. fuer die Gesamte Kaelte-Industrie (Berlin), vol. 37, no. 9, Sept. 1930, pp. 169-174. Following points have been established: within measuring accuracy of plus or minus 0.03 deg., internationally accepted relation between resistance of platinum wire and gas-thermometrically determined temperature holds true within range of minus 190 to 0 deg.; platinum resistance thermometers of varying platinum purity calibrated according to international regulations give temperature values agreeing within plus or minus 0.01 deg.

TUNGSTEN CARBIDE

ALLOYS. Hard Metal Carbides and Cemented Tungsten Carbide, S. L. Hoyt. Am. Inst. of Min. and Met. Engrs.—Trans., Inst. of Metals Div., 1930, pp. 9-57, 22 figs. Broad review and correlation of literature on hard metal carbides and cemented tungsten carbide; metallography; preparation; physical properties; cutting efficiency; hot press process of preparing cemented tungsten carbide, yielding harder product. Bibliography.

TUNNELS

CONSTRUCTION. How to Secure Speed in Rock Tunneling, C. S. Hurter. Contractors and Engrs. Monthly, vol. 21, no. 3, Sept. 1930, pp. 98-100, 3 figs. Advantages of Rogers pass system; economy of drilling time; ventilating; suction vs. blowing on single headings; choice of explosives; co-ordinating drilling, blasting and removal of broken rock.

ELECTRIC CABLE. Concrete Cable Tunnels Show Economy, R. A. Cole. Elec. World, vol. 96, no. 13, Sept. 27, 1930, pp. 586-588, 6 figs. Monolithic tunnel structures with ducts in side walls used by Detroit Edison Co. to provide path for cables where streets of Detroit are so congested with various underground structures as to make usual conduit outlets impossible or impracticable can be built at distinct savings over usual bricked construction; main tunnel is nearly 1,100 ft. long, with about 400 ft. of smaller tunnel, at average depth of 67 ft.

VEHICULAR—VENTILATION. Development of the Ventilation System of the Holland Tunnel, A. C. Davis. Heat. Piping and Air Conditioning, vol. 2, no. 10, Oct. 1930, pp. 866-874, 14 figs. Ventilation problems confronting design engineers; exhaust gases from automobile engines; summary of important results; effect of automobile exhaust gases on animal life; power required to ventilate tunnel; characteristics of ventilation system.

TURBINES

SPIRAL CASINGS. Theory and Design of Spiral Casings (Theorie und Konstruktion von Spiralgehaeusen), B. Eck. Werft-Reederei-Hafen (Berlin), vol. 11, no. 14, July 22, 1930, pp. 309-318, 17 figs. Hydrodynamic principles of design of spirals for turbo-machinery are developed; for spirals with parallel and conical lateral walls with circular and rectangular cross-sections, exact formulae are derived, which permit recording of spirals; influence of wall friction on spiral itself and on rotor; theoretical treatment and practical experiments show that practice of disregarding friction in spiral, in case of single-stage turbo-machinery, often leads to faulty design.

W

WATER PIPE LINES

RIVETED STEEL. Building a Steel Water Supply Conduit under Usual Conditions, S. M. Van Loan. Water Works Eng., vol. 83, no. 19, Sept. 10, 1930, pp. 1356 and 1403-1404, 5 figs. Report on construction of 20,000 ft. of 93-in. x 9/16 in. riveted-steel pipe, from Torresdale filter plant to pumping units of Torresdale Station, Philadelphia Water Supply; types of construction; specification for pipe; construction of piers in marshland.

WATER TOWERS

CONCRETE-STEEL. Harpenden Water Tower—An Improved Method of Construction. Water and Water Eng. (Lond.), vol. 32, no. 381, Sept. 20, 1930, pp. 419-421, 4 figs. Report on construction of concrete-steel water tower, 83 ft. high, having capacity of 350,000 gals.

WELDING

IRON AND STEEL PLANTS. Welding in Steel Plants (Schweissen in Huettenwerken), Adran. V.D.I. Zeit. (Berlin), vol. 74, no. 19, May 10, 1930, pp. 610-611. Abstract of following papers, presented at meeting of Welding Committee of Society of German Engineers: Acetylene or Arc Welding in Steel Works, Drescher; Water-gas Welding for Manufacture of Containers, Boilers and Pipes, Pohl; Progress in Development of Weld Metals, Hoffmann; Transfer of Metal in Arc Weldings, Hilpert.

STRESSES IN. Distribution of Stress in Parallel Welding Fillets, H. M. MacKay and A. M. Bain. Can. Jl. Research (Ottawa), vol. 3, no. 3, Sept. 1930, pp. 260-271, 11 figs. Mathematical theory is developed for distribution of stress in welded joints with parallel fillets, in case where each of members connected by weld is of uniform cross-section; theory is verified by strain measurements on two specimens of type of joint considered.

TESTING. Classification and Physical Tests for Various Types of Welded Plate Joints, G. R. Exley. Gen. Elec. Rev., vol. 33, no. 10, Oct. 1930, pp. 581-591, 8 figs. Variables affecting classification; comparison of rolled steel and deposited steel; effects of ductile extensibility; test specimens; test results; comparison of characteristics.

Fatigue and Impact Tests for Welds, C. H. Jennings. Am. Welding Soc.—Jl., vol. 9, no. 9, Sept. 1930, pp. 90-104, 13 figs. Need of fatigue tests and problems encountered in making them; information obtained by author on impact strength of arc welds.

Magnetic Testing of Butt Welds, T. R. Watts. Am. Welding Soc.—Jl., vol. 9, no. 9, Sept. 1930, pp. 49-68, 17 figs. Magnetographic method has been employed experimentally by Research Laboratories, Westinghouse Electric and Manufacturing Co., for nearly two years; several minor variations and improvements developed during this time are described.

WIND TUNNELS

DESIGN OF CORNERS. The Design of Corners in Fluid Channels, G. J. Klein, K. F. Tupper and J. J. Green. Can. Jl. Research (Ottawa), vol. 3, no. 3, Sept. 1930, pp. 272-285, 25 figs. Results of detailed investigation of characteristics of variety of modified corners in wind tunnel; report includes data on vane shape, spacing and incidence, on variation of accompanying air flow, and on resulting influence on corner resistance; variety of methods have been employed to analyse conditions existing in air stream at vanes and, from information so obtained, it is possible to select vane section and method of use which will lead to most desirable features in flow at corner.

WIRE GALVANIZING

PROCESS OF. The Process of Zinc Coating Steel Wires, A. D. Turnbull. Eng. Jl. (Montreal), vol. 13, no. 9, Sept. 1930, pp. 553-558, 2 figs. Factors which influence rate of corrosion of wire; uses of galvanized steel wire; process of galvanizing; advantages of wire drawing power block; tests of quality of galvanized wire.

WIRE ROPE

MINE HOISTS. Wire-Rope Failures (Bemerkenswerte Brueche von Foerderseilen), H. Herbst. Glueckauf (Essen), vol. 66, no. 33, Aug. 16, 1930, pp. 1091-1096, 9 figs. Account of two rather unusual failures of hoist cables, showing effect of dynamic stresses of end section of rope; suggestions for timely detection of internal damages and for their prevention.
