TREASURER
J. L. BUSFIELD, Montreal, Que.

GENERAL SECRETARY
R. J. DURLEY, Montreal, Que.

OFFICERS OF BRANCHES

HALIFAX
Chairman, I. P. MacNAB
Sec.-Treas., R. R. MURRAY, c/o Wm. Stairs Son & Morrow Ltd., Halifax, N.S.
Executive, S. BALL, J. H. M. JONES, H. R. THEAKSTON, S. W. GRAY, G. T. MEDFORTH
(Ex-Officio) J. R. KAYE, H. S. JOHNSTON

CAPE BRETON
Chairman, I. W. BUCKLEY
Sec.-Treas., S. C. MIFFLEN, 60 Whitney Ave., Sydney, N.S.
Executive, C. M. ANSON, M. F. COSSITT, J. A. MacLEOD, S. G. NAISH
(Ex-Officio) Y. C. BARRINGTON, M. R. CHAPPELL

SAINT JOHN
Chairman, S. HOGG
Sec.-Treas., L. G. LILLEY, 57 Havelock St., W. St. John, N.B.
Executive, H. P. LINGLEY, T. S. MOFFAT, T. C. MACNABB
(Ex-Officio) J. R. FREEMAN, E. J. OWENS

MONCTON
Chairman, E. B. MARTIN
Vice-Chair., B. E. BAYNE
Sec.-Treas., V. C. BLACKETT, Engrg. Dept., C.N.R., Moncton, N.B.
Executive, F. O. CONDON, C. S. G. ROGERS, R. H. EMMERSON, G. E. SMITH, A. S. GUNN, F. L. WEST
(Ex-Officio) G. L. DICKSON, T. H. DICKSON, H. W. McKIEL

SAGUENAY
Chairman, F. L. LAWTON
Vice-Chair., M. G. SAUNDERS
Sec.-Treas., C. MILLER, Saguenay Power Co. Ltd., Arvida, Que.
Executive, G. F. LAYNE, A. B. SINCLAIR, G. E. LaMOTHE, R. RIMMER
(Ex-Officio) S. J. FISHER, A. C. JOHNSTON, G. H. KIRBY

QUEBEC
Hon. Chair., A. R. DECARY
Chairman, ALEX. LARIVIERE
Sec.-Treas., J. SAINT JACQUES, Quebec Power Co., P.O. Box 730, Quebec, Que.
Executive, C. H. BOISVERT, L. P. METHE, M. BOURGET, A. O. DUFRESNE, J. G. O'DONNELL, E. D. GRAY-DONALD
(Ex-Officio) A. B. NORMANDIN, HECTOR CIMON

ST. MAURICE VALLEY
Chairman, J. F. WICKENDEN
Vice-Chair., H. J. WARD
Sec.-Treas., C. H. CHAMPION, 783 Bonaventure St., Three Rivers, Que.
Executive, H. O. KEAY, K. S. LeBARON, F. W. BRADSHAW, J. H. FREGEAU
(Ex-Officio) B. GRANDMONT

MONTREAL
Chairman, B. R. PERRY
Vice-Chair., C. K. McLEOD
Sec.-Treas., E. R. SMALLHORN, 2033 Vendome Ave., Montreal, Que.
Executive, W. F. DRYSDALE, K. O. WHYTE, R. E. JAMIESON, R. E. HEARTZ, P. E. BOURBONNAIS, J. A. BEAUCHEMIN
(Ex-Officio) J. B. D'AETH, F. P. SHEARWOOD, F. S. B. HEWARD, A. DUPERRON, F. NEWELL, E. A. RYAN, A. FRIGON, J. A. McCRORY

OTTAWA
Chairman, J. G. MACPHAIL
Sec.-Treas., R. K. ODELL, Victoria Memorial Museum, Ottawa, Ont.
Executive, W. H. MUNRO, E. M. DENNIS, N. B. MacROSTIE, A. FERRIER, P. SHERRIN
(Ex-Officio) E. VIENS, A. K. HAY, G. J. DESBARATS

PETERBOROUGH
Chairman, V. R. CURRIE
Sec.-Treas., W. T. FANJOY, 627 Homewood Ave., Peterborough, Ont.
Executive, E. J. DAVIES, B. I. BURGESS, J. L. McKEEVER, A. L. KILLALY
(Ex-Officio) H. R. SILLS, A. B. GATES, R. L. DOBBIN

KINGSTON
Chairman, H. H. LAWSON
Vice-Chair., W. L. MALCOLM
Sec.-Treas., R. A. LOW, Carruthers Hall, Queen's University, Kingston, Ont.
Executive, J. B. WILKINSON, R. F. LEGGET
(Ex-Officio) L. F. GRANT, N. C. SHERMAN, J. E. GOODMAN

TORONTO
Chairman, A. U. SANDERSON
Vice-Chair., C. E. SISSON
Sec.-Treas., J. J. SPENCE, Engrg. Bldg., University of Toronto, Toronto, Ont.
Executive, N. MacNICOL, A. E. BERRY, H. E. BRANDON, D. D. WHITSON, W. E. P. DUNCAN, W. P. DOBSON

THE ENGINEERING JOURNAL

VOLUME XXI, No. 1 JANUARY, 1938

Canadian Air Transportation

G. A. Thompson,
General Manager, Canadian Airways Limited.

Paper presented before a meeting of the Montreal Branch of The Engineering Institute of Canada on November 4th, 1937.

SUMMARY.—After a brief history of the development of air transport in Canada, the author discusses the special geographical, climatic, and traffic conditions which apply, and the features of aircraft design which they call for, to ensure satisfactory performance and easy maintenance under northern conditions.

Since the earliest days of which there is any record, transportation has played a leading part in the development of empires and civilization. Genghis Khan, one of the greatest conquerors and Empire builders of all time, was able to overrun the greater part of Europe, overcoming numerically stronger and better equipped armies due to the mobility of his striking force, composed principally of cavalry mounted on Mongol ponies. This enabled the Tartar hordes to move incredible distances overnight to attack their enemies from an entirely unexpected quarter.

Centuries later Spain owed her greatness largely to her navy and merchant marine, which not only brought to her the wealth of the then known world, but enabled her to conquer and colonize distant lands. It was not until the defeat of the Spanish Armada, which was symbolic of Spain's greatness on the ocean and consequently in trade, that her wealth and power started to wane, and that of Britain to rise. From that day Britain's merchant marine steadily increased until it became supreme on the trade routes of the world, and with the growth of foreign trade carried on the ocean, the wealth and power of the British Empire has grown until it is the envy and admiration of all.

Similarly the internal development of nations can be traced to the expansion of transportation. It is not necessary to look further than Canada to see the growth of wealth and population which took place with the building of the Canadian Pacific Railway across the Prairies to Vancouver. Without a railroad across the Western Provinces this great territory could not have been developed except by railroads being extended north from the United States, in which case our neighbours to the south, and not Canada, would have benefited.

Until the present time the history of the world has been an incessant conflict amongst the nations for supremacy on the surface trade routes, but December 17th, 1903, the day on which Orville Wright made the first successful flight in a power driven aircraft, saw the birth of another race among nations for the trade routes of the air. The intensity of this race can be judged by the following subsidies paid by the various Governments to their nationals to encourage the development of commercial aviation:

Accurate figures for European air transport subsidies are difficult to obtain, but in a report issued by the League of Nations Air Transport Co-operation Committee in 1935, it shows that the total cost of air transport to the European tax payer for the period of 1930 to 1932 inclusive was two thousand million francs or approximately ninety million dollars at that time. It further shows that every ton kilometre by air cost the tax payer 44 francs 70 centimes or approximately two dollars per ton kilometre at that time.

In a book entitled "By Air" written by Sir Harry Brittain and published in 1935, he points out that the votes for civil aviation of the leading nations for 1931 were as follows:

U.S.A.	£2,480,814	exclusive of air mail payments.
U.S.A.	5,548,705	inclusive of air mail payments.
Germany	2,119,475	
France	2,037,883	
Italy	798,183	
Great Britain.	678,400	

The U.S. Department of Commerce Air Commerce Bulletin for May 15th, 1937, shows that on domestic and foreign routes, exclusive of Hawaiian operations, 18,324,012 lb. of mail were carried for which the operators received $19,724,488.53 or better than one dollar per pound.

The capital invested in the major airlines in the U.S.A. is in the neighbourhood of $125,000,000. The subscribed capital of Imperial Airways, excluding 25,000 deferred ordinary shares of £1 par value, all held by the British Air Ministry, and excluding an issue recently offered of one million ordinary shares of £1 par at 30s. each, is £1,624,080.

The significance of these figures lies in the fact that capital required for air transportation on a large scale is low when compared to large ground and water transportation systems, and a nation does not have to be immensely wealthy to take part in this race for world supremacy in the air, if it has sufficient vision and courage to play its part. Canada not only has great wealth in its natural resources waiting to be developed, but is geographically favoured by being in the middle of the shortest air routes connecting the centres of trade and commerce of Europe, America and Asia.

At the close of the war in 1918 many Canadian pilots who had received their training during the war were anxious to continue flying in commercial life, but the public were not ready for this new form of transportation, and consequently the money to develop it was not available. Apart from stunt flying and joyriding, the first serious attempt to use aircraft commercially was on forest surveys, forest fire patrol and photography. The first serious attempts, however, to provide commercial air transportation was not until 1924, when the Laurentide Air Service Limited established a route between Haileybury and Rouyn. This undertaking did not prosper and it was not until December 1926, when Mr. James A. Richardson formed Western Canada Airways, that air transportation in the North, as it is known today, came into being. Since 1926 many air transportation companies have been formed, and the following impressive figures show the volume of traffic transported by air in 1936, just ten years later:

Miles Flown	Hours Flown	Pay Pass.	Freight or Express	Mail
7,100,401	76,443	99,451	22,947,105 lb.	1,161,069 lb.

In this type of air transportation Canada leads the world, and the volume of freight handled exceeds the airborne freight and express, not only in the United States, but in all other countries except possibly Russia, for which country no figures are available. In reaching this imposing record new problems had to be overcome, most of which being of a pioneering nature added to the difficulties.

Up until 1918, aircraft designers had been concentrating on military aircraft, but from 1919 more attention was given to producing aircraft for the transportation of passengers and express between the centres of population both in Europe and America. These machines, however, had all been designed for local requirements, with little, if any, thought to their use as seaplanes. In Canada in 1926 when air transportation really started there was practically no manufacturing of aircraft, with the result the foreign market had to be analyzed for the most suitable machine.

Northern Canada is, fortunately, provided with an abundance of lakes and rivers which make satisfactory airports, both summer and winter, but this in itself provided the problem of choosing a machine which would operate as a seaplane in summer and a skiplane in winter.

The most suitable machine available in 1926 for Canadian use was the Fokker Standard Universal, made in New Jersey, the chief characteristics of which were as follows:

Tare Weight—lb. Landplane	Tare Weight—lb. Seaplane	Gross Weight
2,100	2,521	4,000

Disposable Load—lb. Landplane	Disposable Load—lb. Seaplane	Pass.	Crew	Cruising Speed—m.p.h.
1,900	1,479	4	1	80

This machine was a great improvement on any machines previously used, and fulfilled the requirements of being rugged; could be used as a seaplane or landplane; comfortable for passengers, and had a good cargo space owing to the size of its cabin.

Along about this time American aviation received a great stimulus through the public interest created by Lindbergh's Atlantic flight; the demand for commercial aircraft was considerably increased, and there began to appear on the market several medium sized, general purpose aircraft, such as the Bellancas and Fairchilds. As the demand for aircraft in Canada increased, subsidiaries of American firms were formed in this country for the manufacture or assembly and sale of American aircraft to Canadian operators. The De Havilland Aircraft Company of England also formed a subsidiary company in Toronto to cater to Canadian operators, as also did the Junkers Aircraft Company of Germany.

Fig. 1—Indian canoe train leaving Chibougowan Post for Oskelaneo to pick up freight.

By 1929 air transportation in the North had outgrown the usefulness of the Fokker Standard Universal, which was being replaced by more, efficient machines such as Fokker Super-Universals, Fairchild FC2W2's, Junkers W-33's and 34's, and Bellancas. In passing it is interesting to note that the prototype of the Junkers W-34 was designed and built in Germany in 1917, was one of the first successful all metal machines, and is today considered by many as the most efficient general purpose machine in operation in Canada. Being of all metal construction it is more costly than a machine of an equivalent size of composite construction using metal, wood and fabric, and is one reason why it has not been manufactured in this country. Canadian Airways' experience, however, shows that the extra cost is warranted by the extreme ruggedness of this machine and the lower maintenance costs.

The years 1928 and 1929 saw the promotion of many small air transportation companies which went bankrupt during the depression, and although this period was difficult for the aircraft operator, it had an even worse effect on the aircraft manufacturer, particularly in Canada. Operating companies going out of business all over the continent placed on the market innumerable second hand aircraft at sacrifice prices, making it impossible for the Canadian aircraft manufacturer to sell new equipment, or develop new types of aircraft especially designed for Canadian needs.

Coincident with the market break in 1929, a very definite phase in the development of northern air transportation ended. It should be remembered that in 1926, although there were available pilots and air engineers the equal of any in the world, there were no executives, traffic agents or cost accountants experienced in aviation to look after the business side of air transportation as distinct from the practical operation of the equipment. The operations were of necessity spread over a vast territory with practically no communication once the aircraft left its base on the railroad, and as the machine was away from its base sometimes for days or weeks at a time, the pilot, in addition to operating his machine, had to be the business representative, salesman and traffic agent for the company. To a lesser extent he still has to be today, although the situation is materially improved through the development of short wave radio and two-way communication between aircraft and the ground.

From the foregoing it can be readily seen that operations were not carried on as efficiently or economically as could be desired, but, fortunately, rates were at a high level and companies who operated on sound business lines were able to build up sufficient reserves to see them through the lean years ahead.

The years 1930 to 1932 inclusive was a period of retrenchment and consolidation. It was soon evident that the traffic could not stand the rates that had been charged during the boom period, and would have to be drastically reduced. It was also realized that before the rates could be reduced to a level which would draw the traffic, costs would have to be reduced by increased hours flown per month per machine and more efficient equipment. It also became very evident that whereas the number of passengers travelling in the North varied greatly with prosperity, there would always be a large quantity of freight moving to mines and trading posts, and although passenger traffic is the more lucrative, northern air transportation, like the railroads, would have to depend on freight for its steady volume of traffic.

A survey of the world markets in 1931 indicated that the most efficient machines available were the Junkers W-34, having a cruising speed of 90 m.p.h. and mean disposable loads on skiis and pontoons of 2,794 lb. and for heavy freighting the single engined Junkers JU-52 with a cruising speed of 90 m.p.h. and mean disposable load on skiis and pontoons of 7,286 lb. The arrival of the Junkers JU-52 in Canada saw the commencement of large tonnage shipments of freight by air. Since 1931 the freight moved by air has increased tenfold, and 1937 should see a good increase over 1936.

With the re-valuation of gold, prospecting and development of prospects received a tremendous impetus; the demand for air transportation increased very rapidly, and soon the capacity of all available aircraft was taxed to the limit. Until this time, passengers realizing northern air transportation was still in the pioneering and formative stage, had been content to travel along with the miscellaneous cargoes of mail and freight, sitting on packsacks and cased goods. During this period however air transportation in the United States had developed rapidly, schedules had been speeded up, and great attention was being given to passenger comfort, and it was not long before the effect of this development was felt in Canada. Mining engineers, salesmen and executives began to demand comfortable seats and better aircraft. The problem was temporarily solved by placing in operation small aircraft such as the Wacos and Stinsons, four-passenger machines cruising at approximately 110 m.p.h.

With this increased demand for aircraft the Canadian manufacturers at last gave thought to the design of machines to meet local conditions, and in 1934 the Canadian Fairchild Company developed the Fairchild Super 71. The chief characteristics of this machine, which is a high wing monoplane, was the all metal fuselage and the large door at the rear of the cabin for accommodating bulky pieces of freight. This machine, once the development troubles were overcome, has given excellent service and the manufacturer showed considerable courage and deserves credit for producing this machine at a time when the immediate future of air transportation was still uncertain. The Super 71 was followed by the Fairchild 82 in which the fuselage instead of being all metal is the standard steel tube fabric-covered type. This machine was the first to appear in this country with special "bush" type seats for the passengers arranged in the form of a bench running lengthwise on each side of the cabin. This arrangement allows greater seating capacity and when the machine is used for freighting, the seats fold down against the wall of the fuselage. Both the Super 71 and the Fairchild 82 are developments of the Fairchild 71C and use the same mainplanes.

The first modern machine to be designed entirely in Canada for Canadian conditions was the Noorduyn "Norseman" and its success is largely due to the manufacturer having consulted the operators and given a close study to operating conditions in the North before producing the machine. There has been in the past too great a tendency for the manufacturer to tell the operator what he requires, instead of asking what is required and then doing his best to produce it. The Norseman is a high wing monoplane having a tubular steel fuselage and empennage with wooden wings, all components being fabric-covered. The chief characteristics of the Norseman are its rugged construction, and improved cruising speed over equivalent machines in use at this time. By actual test on operations on a long haul route over a period of 244 hours flying, the cruising speed was 128 miles per hour on floats.

Table I is a tabulation of machines used by Canadian Airways on northern transportation from 1926 to date. The makers of the aircraft may take exception to the cruising speeds as being lower than that indicated when performance tests were made to obtain the type certificate. The operator, however, is more concerned with the actual speed made good on operations, rather than theoretical speeds, or speeds obtained under optimum conditions when type tests are carried out. The tabulated speeds are those actually obtained over a long period of operations and obtained by dividing the total miles covered by the flying time. This method of arriving at cruising speeds may be unjust to aircraft powered with supercharged engines whose optimum cruising altitude is over 5,000 ft., but except on long hauls, operations are rarely carried out at this height. On the other hand, on the majority of northern operations where it is unsafe to indulge in instrument or blind flying through lack of aids to navigation, it is often impossible to reach optimum cruising altitude due to clouds or poor visibility from other causes. The operator, however, is only interested in the performance he actually obtains as it is on this he has to base his costs.

A glance at this tabulation shows that the effective cruising speed in ten years has only increased on the latest Canadian machine in operation 40 m.p.h., and since 1928 only 25 m.p.h., and on the majority of machines in use since 1928 only 17 m.p.h. The increase in disposable loads, except for the Junkers JU-52, since 1928 has been negligible. The increased speed has been obtained principally by increased horsepower and not by improved aerodynamical

Table 1

Aircraft		Engine		Weight Empty			Weight Loaded		Weight Disposable		Passengers	Crew	Average Cruising Speed	Date
Make	Type	Make	Type	H.P.	L.P.	S.P.	L.P.	S.P.	L.P.	S.P.

efficiency of the machine. In comparison with the increase in performance and efficiency of commercial aircraft in foreign countries, this is most disappointing, but the reasons are obvious.

The United States and all of the major European nations realized many years ago the importance of aircraft, not only for national defence but also for trade and commerce, and have heavily subsidized not only the

Fig. 2—Fairchild Super 71 Skiplane at the Hudson Bay Post, Lake Manowan, P.Q.

operator but the manufacturer by competitions for high performance military aircraft, the winner being given substantial orders. The knowledge gained thereby has been applied to commercial aircraft suitable for the country in question and services required. In some cases subsidized operators have been able to build up sufficient reserves to place orders with manufacturers to design machines for their requirements. Imperial Airways and Pan American Airways are notable examples.

The production of a new type machine is not only slow but extremely costly and only justified where there is a demand for a considerable number of that particular type.

In Canada, where the demand is comparatively small and where several types are required, the situation is aggravated, and if the Canadian operator is to obtain efficient machines for northern transportation at a reasonable cost, some form of assistance is necessary. It is suggested that this might take the form of an annual subsidy of a moderate but adequate sum of money to be used for the design of aircraft suitable for northern operations.

The operation of northern air transportation can be compared to branch lines on railroads where it is customary to handle mixed loads of mail, freight, express and passengers, stopping at every intermediate point to discharge and embark traffic. Speed is, therefore, of secondary consideration to load carrying capacity and economical operation. Speed, nevertheless, remains a very desirable feature where it is obtained by improved aerodynamic qualities in the machine for a given power and payload. The faster machine is cheaper per mile and can accomplish more work in a given time. Speed gained by increased engine power alone is not economical.

In the design of a general purpose aircraft for "bush" lines, the following points require consideration:

The machine should be a monoplane designed primarily as a seaplane. Opinions differ as to whether it should be a high or low wing type; both have their advantages. For passenger carrying, photography, sketching and reconnaissance, the high wing monoplane has the obvious advantage of better visibility for the passengers, camera operator or observers. It also has the advantage of greater clearance for the wing when approaching high docks. When approaching floating or low docks the high wing is a disadvantage in that it is usually too high to be caught by the mooring party, should it be necessary to give assistance in high winds. The high wing also permits easier loading in that the trailing edge of the plane in no way obstructs the loading door.

The advantages of the high monoplane are the drawbacks of the low wing type. The mainplanes block the downward vision from the cabin, and unless the machine is of some size and has a considerable dihedral angle there is danger of fouling high docks or mooring posts on the docks. The trailing edge of the wing usually comes close enough to the back loading door into the cabin, to interfere with the loading of pieces of freight which are difficult to handle. The low wing type is easier to handle in high winds on the ground; the mainplanes are less liable to serious damage in event of an under-carriage failure, and some authorities claim are aerodynamically more efficient.

The cabin should be roomy so that the full payload can be carried when the freight to be transported is bulky. In present day machines there is seldom sufficient space to carry a maximum load by weight of bulky but light articles such as parcel post or furs. It should also have sufficient length to carry the ordinary run of drill rods, lumber et cetera. As this machine is to be used for mixed loads of passengers and freight the cabin should be divided by a removable partition; the forward part to accommodate four passengers in comfortable chairs; the rear part for baggage, mail, et cetera. This partition, however, must be easily removable, so that the full cabin space can be utilized for long pieces of freight when required. The floor must be reinforced to withstand the concentrated weight of heavy machinery and the walls protected from damage. There should be doors on each side of the cabin, fore and aft, to facilitate loading and unloading on either side of the machine. One of the doors at the rear into the freight compartment should be 4 by 5 ft. or as large as the construction of the machine will allow, to facilitate loading of bulky pieces of freight. A roof hatch should be incorporated in any aircraft to be used for freighting, as it permits the use of a derrick for loading and unloading difficult pieces. This hatch should be as large as possible, and as it is not continuously required it would be possible to design it as a stressed part of the airframe. The dimensions of the cabin should be approximately 15 ft. long, 6 ft. high and 4 ft. 6 in. wide. In addition there should be a separate compartment of at least 36 cu. ft. for the storage of emergency supplies, such as rations, sleeping bags, heaters, oil pails, etc. This compartment must have an entrance from the outside of the machine so that admission through the cabin is not necessary.

The cabin should be well ventilated to permit of its being kept cool in summer and conversely well insulated and heated to keep it warm in winter. Both the ventilating and heating systems should be capable of control by the passengers.

The pilot's cockpit should be designed with the maximum of comfort for the crew and have complete dual control incorporated. As the machine being considered is for general purposes and may, therefore, be used on photography where accuracy of flight lines are essential, particular attention should be paid to forward visibility and a window should be incorporated in the floor between the pilot's legs, to obtain a clear view of the ground directly beneath the machine. It is considered essential that the side windows, on both sides, be made to open for ventilation and to assist visibility in the event of the windows becoming frosted or oiled up. Some adequate system of defrosting should be provided but as defrosters are not infallible, windows to open must be provided as an additional safeguard. Adequate heating must be provided for winter flying.

In the past instrument flying has not been used to any extent on northern transportation, but undoubtedly it will be in the future, possibly sooner than is indicated today; therefore, more attention must be given to the layout of the instrument panel than has been in the past. The instrument panel can be likened to the nervous system in the human body and must function right, otherwise the consequences may be disastrous. Opinions differ as to the best grouping of instruments, consequently there is no standard lay-out. This is a feature to which designers might pay more attention, as it would materially assist pilots in taking over new types of aircraft, if they did not have to get accustomed to a new distribution of instruments. It is axiomatic, however, that the navigating instruments should be grouped so that they are readily seen by the pilot without his eyes having to wander all over the panel. Some prefer these instruments to be directly in front of the pilot on the left hand side of the cockpit, but for dual control machines where a co-pilot is carried, a better arrangement is in the centre of the panel on a level with the eye. In this position both pilots can readily see them. The tachometer should also be easily read from either seat; the position of the remainder of the engine instruments being of secondary consideration.

Generally speaking there is room for great improvement in the installation of instruments, particularly the compass, which in some cases appears to have been placed in the cockpit anywhere as an afterthought. Next to the airspeed indicator, bank and turn indicator and rate of climb indicator, there is no more important navigating instrument than the compass, for without it on many occasions the pilot is as helpless as a blind man. It is of prime importance that the aircraft manufacturer pay more attention to the location of compasses, so that the interference from electric wiring, generators, et cetera is not so great that corrections cannot be made.

With the exception of the all metal Junkers aircraft, the mainplanes of most aircraft in northern service have either box or solid wooden spars, and although very satisfactory, they have one serious drawback. Regardless of how efficient a pilot may be, at times he is forced to land on snow or ice conditions which cause an undercarriage failure. On these occasions, particularly in low temperatures, it is very common for the resultant shock on the wing tip to break the main spar. At any time the splicing or replacing of a main spar is a costly major repair, and when this has to be done in the open or under improvised shelter many miles from the railroad the difficulties and costs mount very considerably. Cases are known where the obstacles have been so great that it was cheaper to abandon the machine. Junkers aircraft have been subject to as many undercarriage failures as any other type of aircraft in the North, but no serious structural damage has ever been done to the wings due to their having metal tubular spars, which will bend without fracturing, and regain their normal position once the weight is taken off. In the course of time the operator would be saved thousands of dollars, if this safety factor were to be incorporated in fabric covered mainplanes, by using metal spars. The initial cost of a metal spar would be higher than a wooden spar for the same purpose; this extra cost, however, should be more than taken care of by decreased maintenance.

The tail plane should be of cantilever design, there being considerable risk in damaging bracing wires or struts on the externally braced type. Trimming tabs should be incorporated in preference to an adjustable tail, care being taken that the controls are not subject to freezing from spray.

The land undercarriage should be especially designed for winter conditions in Northern Canada. In the past most machines used in the North have been designed for operations as land machines flying from prepared aerodromes on wheels, and whereas for this purpose they may be quite suitable, generally speaking for northern operations on skiis, they have been lacking in shock absorbing qualities and consequently strength. Every winter there are undercarriage failures, through no fault of the pilot having to land on surfaces too rough for the undercarriage to withstand. It is costly enough to have to repair an undercarriage many miles from steel where all parts have to be specially taken in by air, and when one considers that a failure of this type usually causes serious damage to the frame of the machine, such as broken tubes or spars, the situation is aggravated. In a few cases undercarriage failures far from steel have done sufficient damage to cause the complete loss of the machine due to insurmountable difficulties in repairing the machine under existing conditions. It can be seen therefore that too much care cannot be given to the design of the undercarriage. It has been shown by experience that the most satisfactory shock absorbing device is an oleo strut which should have at least a ten inch travel.

In the design of oleo legs for use with skiis it should be borne in mind that these must withstand the downward shock load of the full weight of the ski on a bounce. Due to normal lag, when a machine leaves the ground suddenly by bouncing off drifted snow, the oleo leg does not fully extend until the ski is clear of the snow. The resulting impact load, when the oleo leg reaches its limit of extension, is very heavy and on occasion has been known to break a 1,200 lb. check cable.

Float undercarriages have fortunately given little trouble from breakages. They have, however, too little leeway for adjusting the rigging of the floats to take care of the idiosyncrasies of individual machines. Cases occur from time to time where a machine one year may perform satisfactorily on a given set of floats, and the following year on the same set of floats have a very poor performance. When this situation arises it is extremely difficult to correct through there being insufficient adjustments possible on the struts or fittings to alter the rigging on the floats. In some cases a different pair of floats will solve the difficulty, but it should not be necessary to do this, if when designing the floats and undercarriage attention were paid to this feature.

Fig. 3—Winter operating base at Oskelaneo, P.Q. Fairchild 71C and Junkers W34, also loading crane, winter engine covers, radio masts, etc.

In designing the undercarriage care must be taken to see that the tread of the floats is wide enough to permit the use of a 6 in. lens when the machine is used for photography. In the past this has not been the case, with the result that certain machines cannot be used for photography with cameras fitted with a wide angle lens.

The floats should be of all metal construction, internal wooden formers having been found unsatisfactory except when comparatively new. In time these wooden formers rot from moisture and the maintenance costs become excessive. Design should be such that running repairs to any part of the skin can be made by working through the regular inspection holes. These inspection holes must therefore be so spaced that any part of the float can be reached by the length of an average man's arm.

Adequate reserve buoyancy at the stern is desirable. It appears to aid stepping of the float, is important when loading the machine, and in the event of heavy snow accumulating on the rear of the fuselage and tail plane during the night may be instrumental in preventing the machine from sinking at the mooring.

The float rudders to be effective must be below the level of the float bottom. They must also be easily retracted from the pilot's cockpit, and so designed that jamming of the float rudders does not prevent the free movement of the air rudder. This is usually taken care of by spring loading the float rudder cables.

When one considers that during approximately five months of the northern operating season all operations are conducted on skiis, their importance can readily be appreciated. To date manufacturers and aeronautical engineers have not given sufficient thought to ski design, and the ski as used universally in the North is the result of trial and error coupled with the experience of the operating companies. The results have been surprisingly good, but aerodynamically great improvements can be made.

With one exception skiis as used by Canadian operators are constructed with wooden bases. The greater the ratio of length to breadth the lower is the running coefficient of resistance and sporting skiis have a ratio as high as 30 to 1. This ratio is reduced on aircraft for ease in turning and the ratio used is mostly between 4½ and 5 to 1, and loaded from 160 to 175 lb. per sq. ft. The conventional type of ski is laminated ash, copper riveted, having three or more brass covered runners on the bottom to protect the wood from damage on rough ice, stones and concrete aprons in front of hangars.

A large part of the total resistance of a moving ski is due to rubbing friction, therefore the choice of material for the runners is of prime importance. Dural, aluminum, stainless steel, brass and wooden runners have all been tried; none of them, however, are satisfactory under all conditions. The most satisfactory to date has been brass. One of the weaknesses of metal shod runners is the ease with which the metal becomes damaged running over broken ice, thinly covered rocks, et cetera, necessitating too frequent replacements of the covering, and often the replacement of the wooden runner beneath the metal covering. Scratches and gouges on the metal coverings also, greatly increase the resistance.

One ski manufacturer in Alberta endeavoured to solve this problem by using uncovered iron bark or iron wood runners, which worked most satisfactorily in the North West Territories. Not only was there less running friction, but the iron bark runners after two seasons hard usage showed no signs of wear. A set of these skiis was tried out at Sioux Lookout, Ontario, but due to the different quality of the snow, once the ski came to rest for only a comparatively few minutes, the effort required to again get the aircraft moving was so great that this type of runner was discarded. The difference in performance was due to the snow in the North West Territories being drier than in Ontario. Generally speaking, the drier the snow the less the rubbing friction of the ski, although in extreme cold when the snow is very crystalline this rubbing friction increases considerably. Due to the great variation of the snow in different localities it is doubtful whether a satisfactory runner to suit all conditions will ever be obtained.

One ski manufacturer in Vancouver has had considerable success in making sporting skiis of laminated bakelite and wood with bakelite bottoms. Reports indicate that in the soft, wet snow in both British Columbia and Quebec these skiis are a great improvement over the standard wooden skiis. Not only are they stronger, but have less tendency to stick than the waxed skiis, and have the added advantage that they do not have to be repeatedly treated with wax or any other preparation. They have not as yet been tried on aircraft or in extreme cold as encountered in the Far North. It is hoped to test a set of these skiis on aircraft this winter.

The greatest resistance is encountered with heavy wet snow, it being impossible at times even with a lightly loaded machine to get up sufficient speed to take-off. These conditions are of course a great hindrance to ordinary toboggans and sleighs as used with dogs and there are various methods of overcoming it. In Northern British Columbia some of the oldtimers used to take with them a mixture of tar and pitch, with which they used to treat the toboggans. The Eskimos use frozen mud runners which they ice periodically by spraying on water and obtaining a polished finish by stroking it with a piece of polar bear hide or any nonfrosting fur. The system of waxing sporting skiis is well known and effective, but none of these methods are practical with aircraft on northern operations, so it is suggested that research into the possibility of impregnating wooden runners with wax or some other preparation to prevent skiis sticking on snow is justified.

Trimming gear has to be used to keep the ski in proper attitude to the line of flight and for landing. The conventional type consists of flexible cable attached to the front and rear of the ski. In the forward cable is incorporated one or more strands of shock absorbing cord to hold the front of the ski, slightly above the horizontal, the rear cable being used as a check to prevent the nose of the ski being pulled too high by the shock cord. Although this trimming device serves its purpose it is crude and aerodynamically inefficient, creating so much resistance that the average machine is faster on floats than skiis. It has the added disadvantage of having to be detached every night to prevent the shock cord losing its elasticity.

Squadron Leader A. Ferrier, A.M.E.I.C., of the Department of Transport, has designed an internal trimming device for holding streamline skiis in the correct position relative to the line of flight under all conditions. This device works on a cam and roller principle operated automatically in such a manner that when the aircraft is in flight the skiis are positively locked in their proper position, but when the aircraft is on the ground and flexibility of ski position is required the cam and roller action has a slight movement allowing the ski to change its angle approximately 15 deg. on either side of the vertical. Such a device appears to be easy to manufacture, is light in weight, should be trouble-free, and due to its location have no drag which would retard the speed of the aircraft when fitted with skiis.

During the past few years the National Research Council in co-operation with the aircraft manufacturers and The Royal Canadian Air Force have been developing a self aligning streamline ski, based on the principle that a streamline form aerodynamically sound should maintain its correct attitude in relation to the line of flight. Good progress has been made and self aligning streamline skiis have been flown satisfactorily under aerodrome conditions, but it is felt in some quarters that this type of ski should be rigorously tested under northern conditions, to thoroughly try out the construction under commercial conditions. The ski bottoms are made of wood with plywood covering, and experience to date has shown that plywood covering on

Fig. 4—Air mail being loaded into Fokker Super Universal.

Fig. 5—Ore cars being loaded into a Junkers JU52.

skiis is too subject to damage, causing the interior to fill with snow and slush, making the skiis abnormally heavy. The flat wooden ski as used today is quite flexible and tends to conform to uneven snow conditions and has a certain amount of give when travelling over drifted snow. The streamline ski being rigid would not do this and it is felt by some that on account of this when made of wood rigid skiis would not stand up to the strenuous service demanded in the North.

Probably the most efficient ski that has yet been used commercially in Canada is the all metal streamlined ski with internal trimming device, manufactured by the Lockheed Aircraft Corporation, Burbank, California. This ski was designed for use on the Lockheed Electra 10A in Alaska. It is an outstanding example of what can be done when funds are available, and trained engineers collaborate with an operator. The skiis are aerodynamically so efficient that even on a high speed aircraft, with folding undercarriage, the machine with a fixed undercarriage was only reduced in cruising speed approximately five miles per hour. When installing the skiis the folding undercarriage is removed and the skiis attached to the machine by means of a specially designed and streamlined undercarriage having an oleo shock leg with 10 in. travel obviating the necessity of a shock absorbing pedestal. The outstanding feature of these skiis is that they are loaded approximately 450 lb. per sq. ft., or more than double the normal loading in use in Canada. These skiis were tried out between Winnipeg and Red Lake alongside standard skiis in general use, and in spite of the heavy loading, they performed more satisfactorily in very heavy slush than the lighter loaded standard skiis. This type of ski is giving equal satisfaction in Alaska under very different snow conditions, and leads one to believe that the standard loading of skiis in Canada could be materially raised, thereby reducing the weight of ski and correspondingly increasing the payload. The Lockheed skiis are very expensive in comparison to wooden streamlined skiis, but if produced in quantity, as would be required in Canada, the price should be materially reduced.

The dimensions of these skiis are:

Main Skiis:

Overall length. . . . . 15 ft. 10 in.
Greatest width . . . . . 1 ft. 7¼ in.
Bearing surface at rest 5 ft. 5⅜ in. x 1 ft. 7¼ in.

Tail Ski:

Overall length . . . . . . 4 ft. 4⅜ in.
Greatest width. . . . . . 9 in.
Bearing surface at rest 3 ft. 0 in.

On the conventional ski many types of pedestal are in use. Solid wood, built-up wood, built-up sheet steel, built-up aluminum alloy sheet, welded tubing and various types of shock absorbing pedestals such as welded tubing using rubber shock cord, aluminum alloy cast pedestal with oleo cylinder and piston of a similar type to those used as shock absorbing devices for undercarriages. One would have thought that by now, in a country where aircraft skiis are more extensively used than in any other country, with the possible exception of Russia, that our manufacturers and designers could have produced a satisfactory and more or less standard type of ski pedestal. It is another indication of what little thought has been given to the design of aircraft components for the Canadian operator. Most pedestals in use have their good points. Generally speaking the solid or non-shock absorbing pedestal has proved the most satisfactory, and of these except for their weight the wooden pedestal is better, being more easily streamlined, stronger, and cheaper. There should be, however, a great future for a streamlined, reinforced sheet steel or sheet aluminum alloy pedestal which will stand up to the severe strains to which it is subjected. The non-shock absorbing steel tube pedestal is satisfactory except for the difficulty in streamlining, and without streamlining the drag is not only serious, but snow and slush tends to lodge and build up at the base of the tubes.

The steel tube shock absorbing pedestal is of such a height that breakage of tubing occurs too frequently, and due to its flexibility when turning in soft snow the inside ski has a tendency to cut in, sometimes to an alarming extent. Failures are also quite frequent in the larger sizes of cast aluminum pedestals.

If the Canadian aircraft manufacturer would take the trouble to provide the operator with long travel oleo shock absorbing struts on the undercarriage, there would be no need for the added expense and troubles coincident with shock absorbing pedestals. A minimum travel of 10 in. is required, the extra cost of which in comparison to a 6 in. travel leg or a shock absorbing pedestal is slight. Some manufacturers advance the argument that a 10 in. travel would cause the machine to roll too much when on wheels; there is no reason, however, why the air pressure in the oleo could not be decreased to take care of this. Not long ago Canadian Airways took delivery of some English twin-engined De Havilland machines in which the undercarriage did not have sufficient shock absorbing qualities for use on skiis. The Canadian agent on request immediately obtained new shock absorbing struts with sufficient travel, which have been so effective that no repairs were required on the machines at the end of the season, whereas machines working alongside equipped with standard undercarriages required considerable repairs. If it can be done for one machine there is no reason why it cannot be done for another.

The location of the pedestal on the ski is of considerable importance. If the pedestal is located too far forward the ski has a tendency to push snow ahead of it on occasion, seriously increasing the resistance to the ski and consequently its efficiency for take-off. Generally speaking the farther back from the centre of the ski the pedestal is placed the less tendency is there to pack snow ahead of the ski. If, however, the pedestal is moved too far back the pitching moment of the ski presents a problem and a compromise has to be made. For average snow conditions a satisfactory location for the pedestal is over the centre of the ski, for this not only reduces the pitching moment to a minimum, but does not tend to unduly push snow ahead of the ski. For conditions of wet, heavy snow as encountered in some localities a satisfactory position has been found to be 55 per cent of the length of the ski measured from the front at the point where the ski begins to bear on the snow.

The National Research Council during the winter of 1935-36 carried out tests to investigate the snow characteristics of aircraft skiis, the results being published in a most interesting Interim Report by Mr. G. J. Klein, Division of Mechanical Engineering. The tests were carried on last winter but were handicapped by lack of snow. The Research Council is to be commended on their efforts, and it is hoped the tests will be completed and result in the production of more efficient skiis for northern operations.

For Canadian conditions the manufacturer does not appear to have given sufficient thought to engine cowlings. Modern low drag cowlings for radial motors are seldom designed with the requirements of seaplane and winter operation in mind. They permit engines to overheat dangerously during prolonged slow running on water and provide inadequate control of airflow for very cold weather. This problem is becoming increasingly serious for summer operations on floats with air-cooled motors which are being designed for high speed aircraft in which it is easier to obtain an adequate airflow, than it is with a slower machine. The ideal cowling should have sufficient control to not only cool the motor in summer, but also be sufficiently airtight in winter to render it unnecessary to cover the engine with a tarpaulin when stopped for a short while in order to prevent it from cooling too rapidly. This is probably one of the most difficult problems facing the designer of aircraft for Canadian use, but it should be possible to make improvements over existing cowlings if more thought and research were given the problem.

Apart from there being insufficient cooling control on most cowlings, the maintenance on them is excessive through cracks and breakages due to too light gauge material being used. Aircraft designers seem to feel that weight must be saved at all costs in all components not subjected to structural stress or strain. In principle this is undoubtedly correct and the operator will probably always expect more payload than the designer can give him, but there is no economy if the revenue derived from a few pounds extra payload is more than used up in added maintenance, and lost time taken for the repairs.

Bullets, grommets or other fastening devices usually give trouble due to their flimsiness, and to overcome this the latest types of cowling fasteners as used by American manufacturers should be used. These fasteners must positively lock the cowlings to the engine bearers or airframe and at the same time should be easily removable on winter operations with gloved hands. On some of the later types of aircraft cowling fasteners have so far given satisfactory service and can be easily removed with a screw driver. There are a good many cases, however, where the pilot may want to remove cowlings and where the tool kit cannot be easily reached. This is particularly important in case of fire. For this reason a fastener easily operated without the use of tools is advisable.

It is not proposed to deal at any length with various types of engines; there are, however, a few remarks which are applicable generally to engines for northern air transportation in Canada. The aircraft designer is demanding and consequently the engine designer is producing engines suited to high speed aircraft normally operating at considerable heights, and in the near future long range air transportation will be carried on at heights of 25,000 ft. and even higher as technical advancements are made. Engines for this type of work are supercharged and have high compression ratios. On northern air transportation where flights are comparatively short and operating altitudes low, these engines are not suitable. It would be equivalent to using a thoroughbred horse for farm work.

Engine manufacturers, unfortunately, do not seem to appreciate this, for they continue to extol the merits of their engines having 6.5 to 1 or even higher compression ratios, pointing out that these engines operate successfully on 80 octane fuel as generally used in Canada. These engines would and do operate satisfactorily on this fuel on wheels, where acceleration is quick and take-off time short. They will not, however, stand up when used on slow aircraft on skiis or floats where acceleration is much slower and take-off time very much longer, with consequently less efficient cooling of the motor. The use of high compression engines on bush operations has invariably been followed by excessive cylinder, piston and spark plug troubles. Theoretically, possibly, these troubles should not develop, the fact remains that they do, and experience has shown it is inadvisable to use air cooled motors with a compression ratio of higher than 6 to 1. This seems to be an ideal ratio for bush operations and the newest types of motors are now giving 600 hours between overhauls—a remarkable performance when one considers the rough usage they get and that only ten years ago radial air cooled motors required overhaul after 225 hours.

A moderately supercharged engine is desirable for it gives added horsepower for take-off, can be used to advantage at altitude on longer flights, and gives no trouble if carefully handled and the recommended manifold pressure not exceeded. Where more power, however, can be taken out of the motor than it can continuously stand, pilots are prone to take advantage of this fact, particularly under poor conditions for take-off, with resultant damage to the motor.

What promises to be a most useful development in engines is the radial air cooled sleeve valve motor developed by the Bristol Aeroplane Company in England. These use a single sleeve type valve and obviate the necessity of frequent servicing which is both expensive and inconvenient in bush operations. One of the greatest troubles with high performance engines has been caused by valve trouble through the use of heavily doped fuels and higher speeds of rotation. The sleeve valve offers a solution.

Fig. 6—Emergency case brought out in a Fairchild 71C.

It is unfortunate from the standpoint of northern operations that the development of medium sized liquid cooled motors has been neglected, and it is doubtful if there is available today a satisfactory water cooled motor of 450 to 550 horsepower. There are on the market very excellent high powered watercooled motors, which however, are too large for the average machine used in Northern

Canada. It is significant that the Russians on their Polar exploration flights, and through Siberia are using liquid cooled motors. The old disadvantage of leaks in the cooling systems of liquid cooled motors is a thing of the past. Canadian Airways have operated Junkers and Rolls-Royce liquid cooled motors and have found them much easier to handle on bush operations both in summer and winter. Their reliability is as good as the best air cooled motors and their maintenance costs are lower. The extra weight per horsepower is more than counteracted by simplicity of cowling and temperature control over a very wide range.

Diesel motors have given very interesting results, particularly in Germany. At present their chief value lies in long range operation where the extra weight of the motor is offset by the lower fuel weight. There is also the obvious advantage of lessened fire hazard, particularly in the event of a serious crash. Some authorities, however, feel that with the advent of high performance gasoline motors and fuel of very high octane rating, the advantage of the Diesel motor on long flights is considerably lessened.

Insufficient attention has been given in Canadian aircraft to care and speed in changing engines. At present it is a laborious process, taking the best part of a day and under difficult conditions in the North even longer. When this is compared to the ease and speed with which motors are changed on transports used in the States, it is not very flattering. Engine mounts should not be welded to the fuselage, but be quickly detachable by the removal of four bolts or taper pins, so that the engine and mount can be removed and a new mount and engine installed with a minimum loss of time. To facilitate this it should be possible to bring all engine connections such as oil, gas and water lines, electrical connections and controls to the fire wall and simply hooked up to the opposite numbers on the airframe.

Engine designers should do everything possible to make the oil screens more accessible. Today in most installations one of the most troublesome items of maintenance for the mechanics is to remove the oil screens for cleaning and inspection. This is particularly true on winter operations where oil screens often have to be removed in the open with bare hands in temperatures many degrees below zero. Under these conditions maintenance crews have a tendency to pass up examination of oil screens, increasing the danger of sudden bearing failures, which could have been caught in time to prevent any serious damage, had the oil screens been easily removable and examined regularly.

Probably the greatest inconvenience in northern air transportation in winter is the necessity of having to drain the oil each night and warm it and heat the motor in the morning before starting. Where electric power is available it is comparatively easy to keep the motors warm with ordinary strap heaters, but it is still common practice to drain the oil. Immersion heaters for oil are satisfactory in machines which have suitable tanks; the Lockheed Electra is an example.

Various experiments have been tried to obviate the necessity of heating the motors by using very light grade oils, but generally speaking these have not proved satisfactory in Canada. The Mechanical Engineering Staff of the United States Army Air Corps have for some time been investigating this problem and have devised a very ingenious method for starting motors without the application of heat, and have experienced no difficulties in starting cold motors in temperatures as low as −20 deg. F.

In sub-zero temperatures the viscosity of normal oils is so great that it is often impossible to even turn the engine over using man power on the tip of the propeller, which affords considerable leaverage. The system employed to overcome this by the U.S. Army method is to supply oil to the engine diluted with gasoline to the proper lubricating viscosity for sub-zero temperatures before the engine is stopped. When oil is diluted in this manner and poured through the engine before stopping, no heat is required for re-starting the motor even after long periods in sub-zero temperatures. A detailed description of this system and the necessary apparatus and accessories is

Fig. 7—Fairchild 71C with two canoes loaded ready for delivery.

given in a paper prepared by Weldon Worth, Assistant Mechanical Engineer, United States Army Corps, and published in the S.A.E. Journal for July 1937. It is hoped that this method can be used for Canadian operations.

Northern Canada is bountifully supplied with lakes and rivers which make natural landing grounds both summer and winter. For most localities a single engined machine is preferable. It is, generally speaking, more economical to operate and has the advantage of only one engine to maintain and service. This is a distinct advantage in winter when the time required to heat the motor and oil before starting is considerable, and naturally adds to the expense of operations. This advantage will, of course, disappear when a satisfactory method is devised of starting engines when cold. There are, however, a few routes which to comply with Air Board Regulations necessitate the use of twin-engined aircraft. There is also the psychological effect of added safety on passenger services. On account of this, and as the demand for twin-engined aircraft will increase, any machine for general purpose work in Northern Canada should be so designed that it will take either one engine in the nose or two smaller engines in the mainplanes.

As to the performance characteristics of a general purpose machine, if a questionnaire were issued to the various operators there would probably be a fair unanimity of opinion as to load characteristics but a wide divergence on speed. If speed can be obtained without unduly adding to the initial cost of the machine and is attained by aerodynamical efficiency rather than increased engine power, the importance of speed cannot be overstressed, for the operating cost per mile is in direct proportion to the miles covered in any given time. This does not only refer to so many miles per hour, but to so much work accomplished per day, for the operators' overhead costs are fixed regardless of the number of hours flown. It, therefore, follows that the more trips per day flown the more economical the operation, and the number of trips completed particularly on a freight operation is partly dependent on the ease of loading, unloading and running maintenance required on the machine. This in turn is dependent on the thought and care put into the design of the aircraft and is nearly as important as speed. As an example the Junkers JU-52 operated by Canadian Airways and carrying two and a half tons payload can be and is loaded in fifteen minutes, and unloaded in less, due to the large loading door and platform. The average machine with a payload of 1,500 to 2,000 lb. except when hauling easily handled freight such as small package goods, takes as long and sometimes longer to load and unload.

In northern transportation due to the competing forms of transportation being so slow in comparison, speed is not as important as on interurban runs competing with automobile and railroad transportation, and for this reason more attention should be paid to ton-mile or passenger-mile costs. Speed in miles per hour is not an economy when

Fig. 8—Fairchild 71C and two Junkers W34 at Goldpines loading fuel oil.

dependent on engine power, and due to Canada's proximity to the United States, where the operators are forced by competition to call for speed and more speed, there is danger of attaching too much significance to this item in aircraft performance.

Canadian operators would do well to study the development of Imperial Airways who have built up an enviable reputation for economy and reliability and did not unduly stress the requirement of speed until the first two requisites of successful air transportation were attained.

The operations of Imperial Airways are far more analogous to operations in Northern Canada than are the interurban operations in the States. It is true that Imperial Airways' operations are of a different character, requiring very different types of machines; it was however on their Empire routes essentially a pioneering effort, stretched over vast distances where unknown obstacles had to be faced and overcome, as in Northern Canada. Under these pioneering conditions, it was economy and reliability of aircraft that was required rather than speed. Having attained this objective Imperial Airways then demanded speed, and have now in operation aircraft, as witness the Empire boats, second to none.

It is suggested that for general air transportation in Northern Canada an economical cruising speed for the immediate future would be 125 to 130 m.p.h. at 65 per cent power at sea level. This speed should be attainable at reasonable cost. If, however, a cruising speed of 140 m.p.h. can be economically obtained without unduly raising the initial cost of the machine or by using excessive engine power and without sacrificing payload capacity, so much the better.

The payload requirements of a machine are dependent on volume of traffic and intensity of schedule, which varies considerably in different localities, and owing to the traffic being largely dependent on mining development, there is a considerable fluctuation in the same locality from year to year. A machine should be of a size that it can be operated as near to capacity load as possible. Competition in the past few years has created an unhealthy situation by increasing the number of schedules and number of machines in various districts far in excess of the traffic requirements. This has educated the public to look upon northern air transportation in much the same light as a taxi service in cities. A customer expects service when he wants it, and is not prepared to wait for an established schedule as he is with railroad or steamship travel, consequently as far as passengers are concerned, if he wishes to retain the business the operator must be prepared to give service at short notice even if a payload is not available.

Freight and express, except perishables, can be held within reason until payloads are available, which is fortunate as it assists in making up payloads when the passenger traffic is light, and warrants the use of a larger machine than is at first apparent. On certain favoured routes where passenger traffic is heavy there is undoubtedly room for a smaller machine to specialize on taxi service and small charter trips, but for most districts the most economical machine should be capable of handling fair sized loads of passengers, freight and mail. For these conditions a machine should have a disposable load on floats of 3,000 lb. This would enable the aircraft to comfortably handle in two compartments four passengers and baggage with 1,000 lb. of express, freight and mail, and on short routes under favourable conditions slightly more.

As already noted the ground conditions in winter are extremely rough, consequently a slow take-off and landing speed is of the greatest importance in winter time to prevent damage to skiis or undercarriage. During summer slow take-off speed is as important on floats to prevent overheating of the motor through an excessively long run on the water to attain flying speed. The machine should be able to take-off fully laden on floats in a flat calm in 25 seconds.

In northern transportation where one cannot safeguard airports from the close proximity of obstacles by zoning restrictions, and where the lakes are often comparatively small with high timber and hills around the shores, a quick rate of climb is very desirable. This should be at least 1,000 ft. in the first minute, and as the machine may be required on photographic operations it should have a service ceiling of at least 17,000 ft.

From the foregoing, the following required specifications are indicated for a general purpose aircraft for northern transportation:

Type: Monoplane convertible land and seaplane.
Power: Single-engined, moderately supercharged air or liquid cooled motor of 500 to 550 h.p. Compression ratio not to exceed 6 to 1.
Twin-engined, each engine sufficient power to take-off and climb to 4,000 ft. on one engine.
Crew: Two.
Disposable Load: 3,000 lb. as seaplane.
Passenger Accommodation: (a) As passenger aircraft—10.
(b) As passenger and freight—4.
Cabin Dimensions: Length 15 ft.
Height 6 ft.
Width 4 ft. 6 in.
Range: Six hours.
Cruising Speed: Sea Level—125-130 m.p.h., 65 per cent power.
Landing Speed: Not to exceed 60 m.p.h. fully loaded.
Initial Rate of Climb: 1,000 ft. per min.
Service Ceiling: 17,000 ft.

As already stated a large volume of traffic has been made available since 1932 by drastic lowering of rates to the customer. A point has been reached, however, where regardless of volume, rates cannot be further reduced with existing equipment. The quantity of airborne freight in the North although considerable, is small in comparison to the volume moved by ground transport. Given more efficient machines there is no reason why aircraft should not entirely supplant ground transportation in the North, except on favoured routes where steamboats can ply or where there are roads the year round. It is as much to the interest of the manufacturer to provide efficient equipment as it is to the operator to increase his business by providing cheaper air transportation, and it is to be hoped that every effort will be exerted to produce more economical machines which will make available to the operator greatly increased volume of traffic, on which both manufacturer and operator are dependent for their welfare.

Some New Developments in Refrigeration and Cold Storage

W. H. Cook, Ph.D.,

Division of Biology and Agriculture, National Research Council, Ottawa, Ontario.

Paper presented before the Ottawa Branch of The Engineering Institute of Canada, on February 11th, 1937.

SUMMARY.—Discusses the advantages of "quick freezing," the equipment needed, and the recent developments in gas storage and the control of humidity in storage rooms.

The application of artificial refrigeration to the transport and storage of perishable foodstuffs is of comparatively recent origin. The value of low temperature for preserving perishables has been known since antiquity from the simple fact that they could be kept longer in the winter than in the summer. Certain of the principles of artificial refrigeration, such as evaporative cooling, were probably known to the ancients but there is no evidence to indicate that these were applied to the preservation of foodstuffs.

In the modern sense, the first half of the 19th century saw refrigeration in its embryonic state. During that period the predecessor of our modern ice machine came into being, artificial ice was made in significant quantities for the first time, and artificial cooling had been crudely applied to the preservation of foodstuffs, as judged by modern practice. Many of these early applications of refrigeration were concerned with the transport of perishables, since the meat producing countries such as North and South America, and Australia, were anxious to export their products to Great Britain, where the growing scarcity of meat had become a serious problem. Most of the early attempts were unsuccessful owing to deterioration of the product as a result of inadequate cooling equipment and the comparatively long time necessary for transportation. One of the first reasonably successful shipments of meat was made on the S.S. *Frigorifique* from Buenos Aires to Rouen in 1877. This shipment was organized by Tellier who invented an ammonia-absorption machine in 1859 and a compression machine in 1867.

These events mark the portal to the large structure which now represents the modern science and application of refrigeration. In this paper it is proposed to pass through the completed part of this structure to the region that is still under construction, to examine a few of the additions that are sufficiently advanced to determine their form and significance. Before doing so, however, it is important to distinguish between transport and storage problems. In general, physical conditions that are satisfactory for storage are also suitable for transport, provided such facilities are available on the carrier. The distinction really arises from the kind of product. Briefly, problems of preservation arise with products that are produced seasonally such as fruits. On the other hand, commodities such as beef and bacon are ordinarily available throughout the entire year in a producing country but transport problems arise in connection with their export to foreign markets. Importing countries are primarily interested in transportation, and producing countries in preservation, and since the storage period is generally increased by lowering the temperatures, one finds that lower storage temperatures are commonly used in producing (e.g. America and Russia) than in consuming countries (e.g. Great Britain).

Temperature

Since temperature is one of the most important factors determining the safe storage life, its influence will be discussed first. The temperature range commonly employed for transport and storage varies from 55 to −20 deg. F. depending on the product and the period of transport or storage necessary for successful marketing. This temperature range may be subdivided into three distinct parts. The first may be termed chilled storage for natural products and includes the temperature range from 55 deg. F. to their freezing point, usually about 30 deg. F. Chilled storage is employed wherever the safe storage life of the commodity at these temperatures exceeds the period of preservation required, or where the product, e.g. shell eggs, beef carcasses and large fruits, cannot be frozen without suffering a loss of quality. In this temperature range the safe storage period is usually determined by certain biological changes such as the growth of micro-organisms and physiological changes in the product.

The temperature range from somewhat above 30 to 15 deg. F. is used chiefly for the storage of products to which salt has been added, or water extracted, during processing, e.g. bacon, pickled herring, and fatty substances such as butter. Such products have lower freezing points than natural products, and if necessary can be held at temperatures somewhat below 30 deg. F. without freezing.

For storage in the frozen condition the temperature ranges employed extend from 15 deg. F. to the lowest economically attainable; −20 deg. F. is about the lowest temperature in commercial use for storage purposes at the present time. The exact temperature recommended depends on the product and the period of preservation required. Temperatures above 15 deg. F. are not recommended, since the product is only partly frozen at temperatures above 25 deg. F., while microbiological activity continues slowly at temperatures down to at least 20 deg. F. Furthermore, all the disadvantages of freezing are involved without prolonging the safe storage period nearly as much as at still lower temperatures.

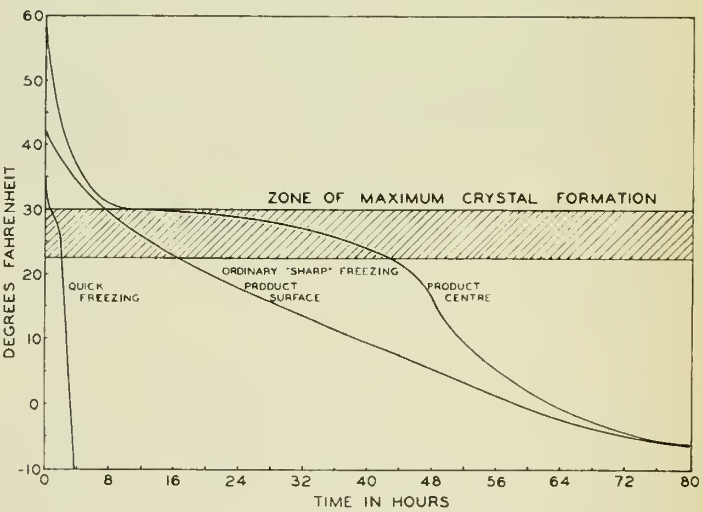

Fig. 1—Freezing rates by "quick" and "ordinary" methods.

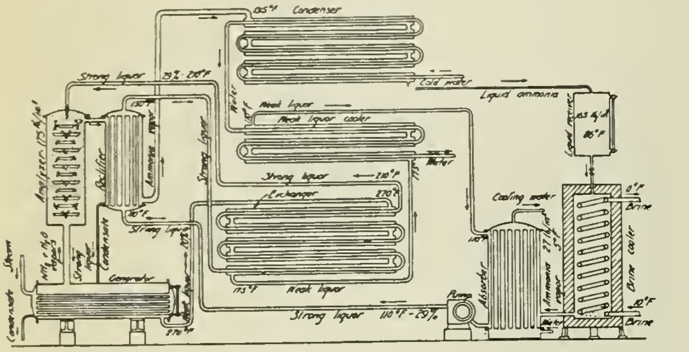
Quick Freezing

The need for extending the storage life of commodities held in chilled storage has recently resulted in several new developments. It has been found that certain commodities such as small fruits and vegetables, and cuts of beef, can be frozen without a loss in quality if they are frozen quickly. Quick-freezing implies passing through the zone of maximum crystallization in from thirty minutes to one hour, in contrast to ordinary freezing which requires from ten to seventy-two hours. Figure 1 shows a comparison of quick and ordinary freezing rates. Ordinary freezing is accomplished by placing the commodity in a room at freezing temperatures, the temperature being the same, or slightly lower than the subsequent storage temperature.



(*Courtesy of American Society of Refrigeration Engineers*)

Fig. 2—Single stage absorption machine.

Quick-freezing is accomplished by bringing small packages or pieces of the commodity into contact with plates or immersing them in brine at temperatures of −40 deg. F. or lower, and many modifications of these two general methods are in use.

The advantage of quick-freezing over ordinary freezing is due to the production by the former method of much smaller ice crystals, more uniformly distributed within and between the cells of the product. This results in less destruction of the tissues, with little loss of flavour or weight by drip when the product is subsequently thawed. It is essential that quick-frozen materials should be subsequently stored at relatively low (freezer) temperatures, (e.g. below 0 deg. F.) to prevent growth of the ice crystals during storage, otherwise the real advantage of quick-freezing might be lost. This illustrates one of the reasons for using low storage temperatures, that is, below 0 deg. F., for frozen products.

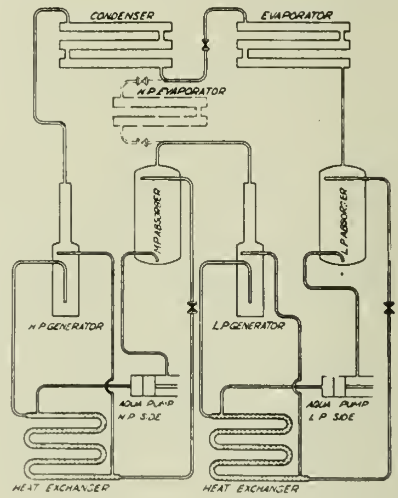
It is evident from these considerations that the food industry requires very low temperatures for freezing, and moderately low temperatures for subsequent preservation. At the present time the conditions are frequently attained with equipment designed to operate at higher temperatures. In some instances multi-stage compressors are employed, and in others rotary booster compressors have been installed ahead of the old single-stage machines. These devices are far from being the last word in low temperature refrigeration.

The Maintenance of Low Temperatures

It is interesting to digress at this point and see how the refrigeration engineer has contributed toward the economical production of these low temperatures. Judging from the papers presented in June 1936 at the 7th International Congress on Refrigeration, it appears that the engineers from nearly all countries are agreed that although low temperatures can be attained by compression methods, the absorption machine is a more practical solution. This conclusion is based on the fact that the relative capacity of an absorption machine does not fall off as rapidly at low temperatures, e.g. low suction pressures, as that of a compression machine. The ordinary compression cycle, in which ammonia and carbon dioxide are the most commonly used refrigerants for low temperature work, needs no description. The absorption cycle differs from this in that the low pressure is produced by the absorption of ammonia in water, while the high pressure is produced by heating the aqueous ammonia. Figure 2 shows a diagram of the absorption machine of about 1932. The first point to note is that it is a single stage machine, and although heat is used on one side to produce cold on the other, the heat exchangers provided are only capable of transferring sensible heat. In other words the heat of condensation and absorption are lost to the cooling water. Furthermore the percentage of water vapour in the gas leaving the rectifier and the percentage of ammonia in the weak liquor used for absorption are such that −35 deg. F. is about the lowest temperature attainable at ordinary steam pressures and condenser water temperatures.

Since 1933 considerable work has been done to increase the efficiency of the absorption machine under ordinary conditions and to modify it for the production of low temperatures of the order −60 to −100 deg. F. The efficiency has been increased by about 100 per cent by making use of part of the heat of condensation and absorption in accordance with the thermodynamic principles laid down by Altenkirch in 1913. A similar increase in efficiency was obtained by adding zinc chloride to the aqueous phase. In order to attain lower temperatures the water has been replaced with lithium nitrate which forms liquid compounds with ammonia; with this system it has been possible to attain temperatures of −85 deg. F. using the usual steam pressures and condenser water temperatures.

Another method of attaining low temperatures has been the design of a two-stage aqua-ammonia absorption machine as shown in Fig. 3. The design of a two-machine that would operate successfully by this method was an engineering achievement. In a two-stage compression machine if one stage exceeds the capacity of the other the interstage pressure rises or falls until a balance is obtained. The same is true in a two-stage absorption machine as far as the ammonia vapour is concerned, but it is not true for the aqueous vapour. If the vapours passing from one stage to another are not rectified sufficiently, a transfer of water between the two stages results, and as these must operate as closed circuits to attain low temperatures, the machines must be carefully designed to avoid this difficulty.



(*Courtesy of Refrigerating Engineering*)

Fig. 3—Two-stage absorption machine.

Machines of this type can attain temperatures of the order of −100 deg. F.

It might be interesting to touch on a new industrial application of low temperature refrigeration which is related to the food industry. As you are aware, dry ice, or solid carbon dioxide, is now used to a considerable extent for the preservation of foodstuffs during transport by truck or in small containers over short distances. Its use for food transport purposes would be increased considerably if its cost could be lowered. For instance, the cooling of railway refrigerator cars with dry ice would be possible if the cost of this material could be reduced to about one cent per pound. At the present time the cost is generally about twice this figure and is due principally to the cost of purifying the gas obtained from coke, or fermentation processes and to the cost of compression. The application of the absorption refrigerator at temperatures below about −70 deg. F. would make it possible to effect the transformation of liquid carbon dioxide to solid carbon dioxide at moderate pressures, thus reducing the cost of compression. This procedure would doubtless also reduce the purification costs. Low temperature absorption plants have already been installed in some of the chemical industries for similar purposes.

Gas Storage

Although proper methods of freezing will extend the safe storage period of certain products that would otherwise have to be kept in the chilled state, this method is not applicable to some commodities as they are handled and marketed today, such as apples, whole carcasses of beef, etc. Present methods of extending the safe storage period of such commodities involve some supplementary method of preservation in addition to reduced temperatures. Fruit and vegetable products are alive, and even at chilled temperatures, respire and produce carbon dioxide. If the storage period of apples, for instance, is to be extended the rate at which these life processes proceed must be reduced further than is possible by reducing the temperature to the freezing point. Investigations made by the Food Investigations Board of Great Britain over the last ten years have shown that this can be done by allowing the carbon dioxide produced to accumulate in the store. The ordinary refrigerated store must therefore be converted into a gas-tight space. Carbon dioxide concentrations in excess of about 10 per cent are, however, detrimental to the product and the carbon dioxide must be kept at about this level by either manually or automatically controlled ventilation. In certain cases the storage life can be extended still further by reducing the oxygen concentration, as well as increasing the percentage of carbon dioxide Since the product absorbs oxygen in the respiration process as well as producing carbon dioxide, it can again be made to produce the necessary conditions. When both oxygen and carbon dioxide are to be controlled the excess carbon dioxide is removed by absorption in a lime suspension, instead of by controlled ventilation which would admit oxygen. As oxygen is absorbed by the product for the production of carbon dioxide the oxygen content gradually falls until a concentration of about 5 per cent is reached, and it can be maintained at this value by controlled ventilation.

An atmosphere containing 10 per cent carbon dioxide will double the storage life of chilled beef. This product, however, is dead and does not produce carbon dioxide except when attacked by living micro-organisms which is the reaction that must be suppressed. Under these conditions the carbon dioxide must be added from tanks, and such a practice is only feasible commercially if the storage space is gas-tight; thus very little gas is required for replacement, after the original charge has been added. This has been accomplished even on ships, and within the last three years the shipment of chilled beef from Australia to England, an eight-week transport period, has become a commercial enterprise as the result of gas-storage.

Control of Conditions

Another factor that must be considered if the maximum storage life of a given product is to be obtained, is the relative humidity. Nearly all products tend to dry out at relative humidities below about 95 per cent. In chilled storage the direct loss of weight may be several percent

Fig. 4—Poultry stored for 6 months at 7.5 deg. F. and 100 per cent relative humidity.

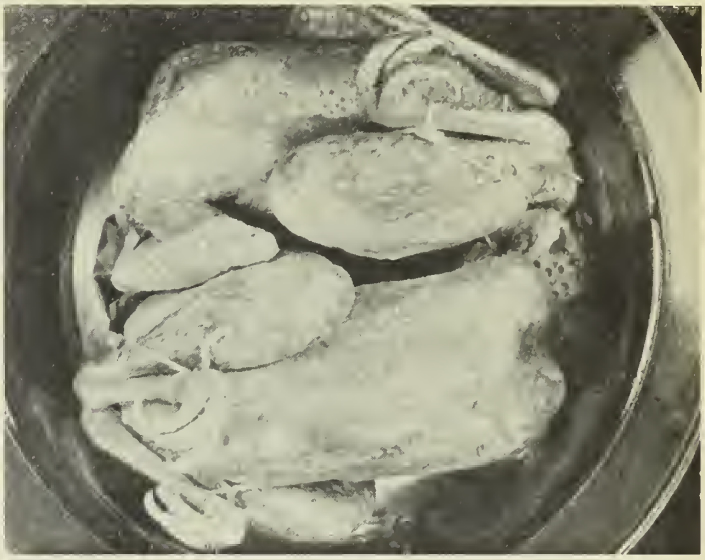


Fig. 5—Poultry stored for 6 months at 7.5 deg. F. and 50 per cent relative humidity.

and result in serious losses. In most instances, however, the greatest loss is caused by the depreciation in quality caused by shrinkage. Even in freezer rooms, at temperatures of 0 deg. F. the surface desiccation may result in a serious loss in saleability. This is illustrated in Figs. 4 and 5, which show the appearance of frozen poultry stored at 7.5 deg. F. for six months over snow, or a relative humidity of 100 per cent, and over a solution that maintains a relative humidity of about 50 per cent. The chickens stored at the high relative humidity are in excellent condition, but those stored at the lower humidity show the uneven surface drying, known as freezer-burns, store-burn or pock marking. At the present time losses from this cause are reduced by wrapping the product in special moisture proof papers, but the final solution of the problem probably lies in the development of a practical method of humidifying freezers. Investigations along this line are now under way at the National Research Laboratories.

In chilled storage rooms the control of relative humidity is intimately related with the control of temperature. Even in some of the better commercial chilled storage rooms, the temperature may differ by as much as 2 deg. F. in different parts of the room even after the product has cooled down. When the stored product produces heat within itself by respiration, even greater spatial variations are observed. Under these conditions it is impossible to maintain relative humidities higher than that about 85 per cent in the warmer regions without risk of condensation in the colder parts. Forced air circulation is commonly employed to reduce these spatial differences in temperature and in modern commercial installations no cooling grids are placed in the room, the air being cooled in an external cooling battery and forced into the room. Although forced air circulation is a step in the right direction it has not yet solved the problem entirely. In the first place it is extremely difficult to make the air traverse the stacked product uniformly at all points. In most of the present day stores the bulk of the air passes over the product and along corridors and does not pass through the product at all. Secondly, since this air must remove both the heat generated by the product and that entering through the walls, it must be warmer in the region of the exit duct than in the region of the supply duct. In some cases the temperature difference between these two regions, at air flows which are commercially feasible, is of the order of the space variations observed with the internal cooling grids. In order to solve this difficulty it is obvious that the air must traverse the minimum length of product, which is usually the vertical dimension, and if possible the two sources of heat, the product and the leakage through the walls, should be dealt with separately.

These considerations have led to the "jacket" system of air distribution, a system developed and tested in the artificial ship's hold at the Ditton Laboratory, one of the investigational units of the Food Investigation Board of Great Britain. In this system the cold air is delivered into the space above the stack of product by a duct which circles the room near the ceiling. This air then passes down through the product which is packed in tightly without spacing strips or dunnage. The air is drawn off through a slatted floor, up between duct-work forming a false wall or jacket, and is collected in a return duct which circles the space just beneath the delivery duct. It was found that a better air distribution was obtained when the product was stored without dunnage than with dunnage. This system provides the other conditions necessary for minimum temperature differences in the refrigerated space. The air traverses the minimum or vertical dimension and in passing through the product suffers a temperature change which corresponds only to the heat generated in the stack, the heat passing through the walls being removed subsequently in the jacket. Using this system it has been possible to reduce the spatial variations in temperature to a fraction of a degree in a space having the approximate dimensions of a ship's hold. Whether or not it can be modified for use in warehouse rooms remains the subject of future investigations.

Agriculture and Engineering

E. S. Hopkins, Ph.D.,
Dominion Field Husbandman, Central Experimental Farm, Ottawa.

Paper presented before a meeting of the Ottawa Branch of The Engineering Institute of Canada on March 11th, 1937.

SUMMARY.—Notes on some economic factors affecting present day farming, stressing the need for greater technical ability to take advantage of improved farm machinery and the information furnished by scientific agricultural research.

Among the fourteen or more different classes of engineers, there is included an agricultural engineer. At present the agricultural engineer in Canada occupies a very lowly rank almost like some rare species of plant. However, it is to be hoped that the position and importance of agricultural engineers may improve and that the other classes of engineers may also find it interesting and profitable to enter certain fields of agricultural work related to their special branches of engineering.

There are several branches of agriculture in which some phase of engineering has a direct relationship. It is only necessary to mention the following farm work to show this important relationship.

Relationship between Agriculture and Engineering

In the humid regions of Eastern Canada and British Columbia, drainage is an essential feature of farm improvement. The civil engineer is sometimes called upon to construct large outlet surface ditches in order to provide additional drainage for farm land. In many cases, such work should be greatly increased and certainly the additional drainage of private farm land either by surface drainage or by underdrainage is very desirable. In the dry regions of Western Canada and the inter-mountain valleys of British Columbia, irrigation is an important phase of agricultural work. It is very probable that in future years it will become much more important. Even today, hundreds of small private individual irrigation projects are being developed under the Prairie Farm Rehabilitation Act programme in Western Canada. Farm buildings offer a promising field for improvement and undoubtedly would undergo a very great change if more money were available on the farm.

Labour saving devices are nowhere more necessary than on the farm, to eliminate as much as possible the drudgery of farm work. Farm machinery production has for many years been a prominent phase of industrial work. Tractors have entered the field of agriculture in considerable numbers and promise to expand with improvement in design and ability to do more and cheaper work. Rural electrification makes possible many comforts and conveniences in agricultural work and in farm homes where electric power is available at reasonable rates.

Soil drifting, water erosion and flood control are all phases of agricultural work which have a direct bearing on certain fields of engineering and which have utilized the services of engineers, especially in the United States. In future years they promise even wider scope.

Early Agriculture

In primitive times agricultural work was largely done by slaves. As the work was entirely of a manual character, no special intelligence was required and the slaves were directed by the landed proprietors.

This condition existed in the Southern United States up to the time of the liberation of the slaves in 1864. A similar condition existed in Russia where the serfs, who were really slaves, were liberated in 1861. In many other countries slaves were forced to undertake all the arduous farm work.

Even today, in many countries, the class of labour undertaking farm work can scarcely be compared, from an educational and financial point of view, with people in urban centres. Only where agriculture has evolved to a position in which the operator can enjoy a reasonable standard of living, is this condition overcome.

A very surprising and disappointing aspect of continental European agriculture is to observe the large number of women forced to undertake the heaviest kinds of farm labour. Every effort should be made to prevent the adoption of this practice in Canada.

Farming as a Way of Living

During depressions, agriculture is confronted with the plans of zealous enthusiasts who suggest moving the inexperienced, unemployed from the city to abandoned farm property or to virgin land. It would seem from the suggestions of these enthusiasts that the unemployed would merely have to move to the farm, plant some vegetables and farm crops and live comfortably ever after. In boom times, industry draws labour from the farm but in depressions the farm is expected to re-absorb the unemployed. No thought seems to be given to the necessity of securing sufficient revenue to meet expenses which are absolutely necessary in this modern age. It is not sufficient to provide food and housing on a farm; it is necessary to conduct a business which will provide additional revenue for fuel, taxes, clothes, education and many other items.

Furthermore, no thought seems to be given to the effect of such extra production on decreasing the prices of products and making conditions which are already burdensome even more severe for the other farmers on the land. There is also the question of securing suitable virgin land which may be used for profitable farming. To engage in farming on a scale that offers any hope of a reasonable standard of living for the farm family, after the free land or homestead stage of agriculture, requires a considerable amount of capital.

Farming as a way of living is a very poor conception of agriculture. It is based on a primitive self-sufficient type of farming which derives no advantages from modern agriculture and engineering.

Urban and Rural Populations

A marked change is taking place in many countries throughout the world in the relative percentage of rural and urban populations. In primitive times it was necessary for a large percentage of the people to live on the farm. In no other way was it possible to produce sufficient food.

Fig. 1—The first successfully operated combine in Canada was used on the Dominion Experimental Station. Swift Current, Saskatchewan, in 1922.

Fortunately times have changed and where modern agriculture and engineering exist, it is possible to greatly reduce the number of people on the farm and at the same time produce sufficient food for the urban population.

The following table shows the number and per cent of the urban populations in Canada, England and Wales, and the United States.

Rural and Urban Population in Canada

	1901		1931	
	Number	Per cent	Number	Per cent
Rural	3,318,887	62.3	4,804,728	46.3
Urban	2,005,080	37.7	5,572,056	53.7

Rural and Urban Population in England and Wales

	1891		1931	
	Number	Per cent	Number	Per cent
Rural	7,257,240	25	8,000,459	20
Urban	21,745,280	75	31,951,541	80

Rural and Urban Population in the United States

	1880		1930	
	Number	Per cent	Number	Per cent
Rural	35,383,345	70.5	53,820,223	43.8
Urban	14,772,438	29.5	68,954,823	56.2

It will be seen from the above data that the percent of the people in Canada, England and Wales, and in the United States living in rural communities, has appreciably decreased. This is true particularly in Canada and the United States, although it occurs also in England and Wales.

It should be remembered in any consideration of these percentages of urban and rural population, that the rural population includes quite an appreciable number of people living in small villages. In the United States the rural population includes towns up to 2,500 people. In Canada the urban population includes all incorporated cities, towns and villages; the population required for incorporation varies in different provinces and in Ontario must exceed 750 inhabitants. While 46.3 per cent of the population in Canada is classified as rural, only 29 per cent of those gainfully employed are employed in agriculture.

It has been estimated that the percent of the population actually living on farms in the United States in 1800 was 97 per cent of the entire population. In 1850, it was 90 per cent, while in 1930, only 23 per cent were actually on farms. Some predictions have indicated that 15 per cent of the people actually living on farms would be sufficient to produce an adequate supply of food.

Investment on the Farms

There is a very wide variation in the value of farm property in different parts of the country. In some communities the total value of all farm property is extremely low, indicating that it is essentially a type of agriculture which might be classed under the heading of "a way of living." In other places, the value is much greater, indicating that considerable investment is involved and that the farm business is essentially a commercial enterprise.

It will be seen from the following table that the total value per farm varies from $2,216 in the State of Mississippi, to $17,654 in Illinois. It is obvious that as these are State averages, there are many farms with considerably smaller investments and others with investments much greater. As the investment becomes greater, the need of engineering and scientific agriculture becomes more urgent. The farm becomes a commercial enterprise in which business methods must be followed if interest is to be returned on the capital invested and a fair return made for the labour.

The table below shows this situation.

Average Value of Farm Property

Region	Value
Canada, 1931	$ 7,273
New Brunswick	3,043
Ontario	7,283
Saskatchewan	9,326
United States, 1930	9,103
Mississippi	2,216
New York	10,712
Illinois	17,654

Investment in Farm Machinery

The total investment in farm machinery in Canada, according to the 1931 census, was $650,664,000. This investment was 12.4 per cent of the value of all farm property. The average inventory value of farm machinery on Canadian farms is $894 per farm, which means that approximately double this sum was actually spent in the purchase price of the machinery.

Increase in Farm Tractors

According to the 1931 census, the number of tractors in Canada amounted to 105,360. Of this number 81,659 were reported from the three Prairie Provinces. As there are 728,623 farms in Canada, it would mean that throughout the entire country, there was about one tractor to every seven farms, while in the three Prairie Provinces, there would be one tractor to approximately every three farms.

In the United States, it is estimated that in 1936 there were 1,500,000 tractors on farms. As there are 6,288,648 farms in the United States, according to the 1930 census, it means that there is now approximately one tractor on every fourth farm. There has been a substantial increase in the number of tractors in use in Canada, United States, Russia, Great Britain and other countries.

On the other hand, the number of horses and mules has decreased. In Canada the maximum number of horses and mules occurred in 1922, with a total of 3,648,871. This number dropped in 1935 to 2,931,357. In the United States, the maximum number of horses and mules occurred in 1920 with 25,323,000. In 1934 there were only 16,873,000. It is difficult to realize the significance of these figures but in the United States the decrease in the number of horses would be equivalent to a single line of horses, each occupying 15 feet, around the entire world at the equator. In Canada it would be equivalent to a similar single row 2,152 miles in length. This large decrease in horse population has made a large acreage of farm land available for other crops.

Inventions in Farm Machinery

In the early days, ploughing was done with a metal faced wooden plough. A crude wooden contraption served as a harrow. The seed was sown by hand.

Harvesting was done with the scythe and later with the cradle. The grain was removed by threshing with a flail.

It is interesting to observe that many important agricultural inventions have been developed within the last 150 years. In 1797 James Newbold invented the cast-iron plough. Unfortunately, the farmers were opposed to this plough thinking that it would poison the soil. In 1831 the mower was invented by Manny. In the same year McCormick invented the reaper. In 1837 Deere developed the steel plough while in 1842 J. I. Case introduced the thresher. In 1870 the twine binder replaced the wire binder. In 1870 the portable steam engine was developed for belt work and in 1892 the first successful tractor was introduced. It is only within the last few years that Diesel engines and pneumatic tires have become available for farm tractors.

It is difficult to realize the improvements which have taken place in agricultural equipment. A mere recital of the dates of inventions is not sufficient to visualize the marked improvement which has occurred.

On the Central Experimental Farm at Ottawa a new agricultural museum is being established. Some equipment has already been secured and it is interesting to compare some of the earlier types of machinery with present day models. As the early models were obtained in Canada and were used by early settlers, it shows how great has been the advance even within the short history of Canada. An old wooden plough equipped with an iron point to protect the implement from excessive wear has been obtained; also, an old wooden binder which offers a marked contrast to the present steel frame power binder in use today. Scythes, sickles and cradles are also available as relics of the past.

A striking demonstration of the marked contrast between old farm equipment as compared with present models was demonstrated in the 1931 meeting of the American Society of Agricultural Engineers at Ames, Iowa. The delegates to this meeting witnessed a demonstration in which a large field of wheat was being harvested on the one hand by two men, one operating a tractor and the other a combine. In contrast to this modern method of harvesting, there was located in another portion of the same field the old primitive method but arranged with a sufficient number of men to harvest an area equal to that handled per day with the tractor and combine. In order to accomplish this task, twelve men were working side by side cutting the wheat with cradles. Following the cradlers were twelve men who raked and bound the wheat into sheaves. After the binders, came 48 men with flails on their shoulders who would be required to thresh the grain which the cradlers were cutting. It was necessary, therefore, to have 72 men with the old method of cradling and threshing the grain with the flail to equal the work of the two men operating the tractor and combine.

Agriculture is a Complicated Business

With the change in farming methods from the early primitive machinery to the modern labour saving machinery, more technical ability is necessary for the farmer. Furthermore, with improvements in varieties of various crops, impairments in soil fertility, use of commercial fertilizers, attacks of insects and fungus diseases, considerable scientific knowledge is necessary if farming is to be properly and economically conducted. It is not only necessary that the farmer should have considerable physical ability but he must have a technical knowledge of farm machinery and considerable scientific information on the proper methods of growing crops and handling livestock.

In industrial occupations, the workman or professional man is frequently confined to one very limited field. He does not need to know and is not expected to know other lines. The carpenter, bricklayer, motorman, dentist or doctor knows and practises only his special trade or profession. With the farmer, however, this condition is very different. It would be ruinous for the farmer to know only one particular line.

Radio broadcasts have recently been improved by a very interesting type of programme. The celebrated Professor Quiz has introduced a programme which is both amusing and instructive. The questions which he asks are comprehensive, covering a wide range of subjects and if answered correctly reveal a good general education. If questions of an agricultural nature were to be asked, the number of successful contestants would be very few. On one occasion a candidate was asked if he knew what a "whiffletree" was but the candidate had never heard of this kind of tree.

In order to indicate some few subjects in which the farmer must have information, the following questions might be presented:

1. Why is it that loose smut of wheat and barley must be treated differently from loose smut of oats or covered smut of wheat, oats and barley? What treatments would be suggested for these diseases?

Fig. 2—The combined corn harvester and silage cutter has been used successfully for many years on the Central Experimental Farm, Ottawa.

2. Certain dust treatments or sprays are effective in treating seed grain for certain smuts but are not effective against rust. What is the reason for this?
3. Western wheat stem sawfly attacks wheat in strips in the newly developed strip farming plan to combat soil drifting, more than it does wheat seeded in a solid block. Why is this the case and how might it be prevented?
4. Large areas in Eastern Canada suffer from what is known as "brown heart" of turnips. It has been learned recently that ten pounds per acre of a certain commercial fertilizer will correct this trouble. What is this material?
5. What is the difference between a 2-12-6 fertilizer and a 4-8-8 fertilizer?
6. What is meant by a "nutritive ratio of 5 to 1" in feeding stock?
7. At what stage in maturity should alfalfa be cut for hay and for silage?
8. What is the lowest permissible gradient for tile underdrainage? What home-made device might enable this grade to be maintained?
9. Give the names of three rust resistant varieties of wheat.
10. How is the labour income of the farm calculated?

An attempt to answer these questions will indicate the difficult problems with which the farmer is presented. This list does not commence to include a great number of other problems equally difficult to answer.

The Effect of Modern Machinery and Improved Organization on the Cost of Production

The introduction of improved machinery has made possible a very considerable reduction in the cost of producing various crops. In some studies conducted by the Dominion Experimental Farms and reported in bulletin No. 159, "Cost of Producing Farm Crops in the Prairie Provinces," it was found that the cost of producing wheat on summer-fallow from 1923 to 1930 on the Dominion Experimental Farms in the Prairie Provinces was 64 cents per bushel. The yield of wheat in this particular case was 27.4 bushels per acre. The cost of producing wheat after wheat was 75 cents per bushel with a yield of 19.8 bushels per acre.

In some calculations which were made on the cost of producing wheat on different sized farms, a very marked difference was found between small and large farms. With a one-quarter section farm, the cost of producing wheat was estimated at $1.02 per bushel. With a one-half section farm, the cost was estimated at 79.5 cents per bushel. On a one section farm, the cost was further reduced, varying with different methods of handling the farm. If the work were handled entirely with horses, the cost was estimated at 77.4 cents per bushel, while if it were handled entirely with tractor and combine, the cost was 63.6 cents per bushel. Further reductions in cost took place with larger farms until with a two or three section farm, the cost was reduced to from 55 to 51 cents per bushel. It is not possible for all farmers to acquire two or three sections of land, but even on smaller farms, mechanical equipment may be utilized to good advantage.

It is interesting to visit large mechanized farms. While it is true that some of these have not succeeded financially, it is also true that others have been quite successful. The farm of Mr. Florence at Humbolt, Minnesota, offers a striking example of a mechanized industrial farm. On this farm, twelve men seeded 14,000 acres of grain. The work was handled with five Diesel tractors working in day and night shifts. Purchases were made economically on a large scale and the business was arranged so as to get the greatest economy of labour without any sacrifice in quality.

While some people disapprove of large mechanical farming enterprises, claiming that in some vague manner they may impair the social conditions in the country, it would seem that such enterprises permit of a better utilization of machinery, engineering and scientific agricultural knowledge. The well-meaning but uninformed commentator who views agriculture from the window of a pullman car and who might be called a "trained" observer, is scarcely in a position to offer any really helpful suggestions. It is certain that persons engaged in engineering or scientific agriculture can assist much more effectively in developing improved types of agriculture.

The Future

While at first glance it might seem that farming is not a very competitive business, inasmuch as the production of neighbouring farmers has little immediate effect on a farmer's revenue, nevertheless, considered in its broad national and international character, farming is very competitive. Only the most efficient farmer can hope to produce sufficiently economically to enable a reasonable revenue to be derived from the farm. Unless such a revenue is obtained, the standard of living on the farm will fall much too low for Canadian aspirations. With a gradual increase in world population and with little additional virgin land available, it would seem that agriculture should offer in the future a very promising field.

In the Province of Ontario itself, there are fewer farms today than there were fifty years ago, although the urban population has greatly increased. When this limitation of land will begin to make itself felt no one can predict, but that it must ultimately arrive no one can question. Certainly, modern scientific agriculture and engineering should and will play a very important part in increasing the financial returns from the farm and in improving the position of the farmer.

The Geology of Northern Ontario

H. C. Rickaby,
Provincial Geologist, Department of Mines, Province of Ontario.

Paper presented before the Toronto Branch of The Institute, on October 15th, 1936.

SUMMARY.—A brief account of the pre-Cambrian formations which cover most of Northern Ontario, followed by notes on the later rocks of Southern Ontario whose history ended with the Ice-age of the Pleistocene.

Geology is the study of the structure of the earth's crust and the substances which compose it and is, therefore, concerned chiefly with rocks. The formation of rocks is going on to-day as it has been even since the first crust was formed. Rocks are classified on the basis of their origin as sedimentary, igneous, and metamorphic. Sedimentary rocks are largely the products of weathering and erosion and are usually thought of as having settled from running or standing water in beds. Igneous rocks are formed by the cooling of molten magmas and may be either volcanic or plutonic in origin. Metamorphic rocks are highly altered igneous or sedimentary rocks. Rocks are also classified for certain purposes on the basis of their age relationships, that is the period in the earth's history at which they were formed. Estimates of the age of the earth, or rather of the length of time from the formation of the first crust up to the present, vary from a few million years up to 2,000 million years. The most recent scientific investigations, based largely on measurements of the rate of disintegration of radioactive minerals, favour the larger figures.

The accompanying table (Fig. 1) shows the main divisions of geological time with an estimate of the probable lengths of time represented by each. Owing to the wide variation in the estimate of the age of the oldest rocks of the earth these figures must be taken with a grain of salt, but at any rate the proportions of the various divisions are approximately correct. There is one major line of separation or break between those rocks known as pre-Cambrian and those known as Paleozoic or later. The boundary between these two types may be seen just beyond Orillia. The pre-Cambrian rocks may be illustrated by the bed rock as seen in Muskoka while the later divisions are represented by the comparatively flat lying rocks such as occur in Southern Ontario.

The earliest work on the classification of the Paleozoic rocks was done in England, and hence the names used. The earliest attempt to subdivide the pre-Cambrian was done in Canada by Sir William Logan who was the first director of the Geological Survey of Canada. This work was commenced by him in 1843 on the north shore of the St. Lawrence and continued later on the north shore of Lake Huron. Much further work has been carried on since then in Ontario by such well known geologists as A. P. Coleman, A. C. Lawson, the late W. G. Miller, the late W. H. Collins, and others.

Since the geology of Northern Ontario is under discussion we are concerned mainly with that division known as the pre-Cambrian.

Pre-Cambrian

With regard to the geological time table given above it should be understood that the scheme of classification used here for the pre-Cambrian will not apply for the pre-Cambrian rocks of the world or of Canada, or even of all of Northern Ontario. Geological processes since the beginning of the formation of the earth's crust have gone on much as they are going on to-day: that is to say, certain areas were covered by the sea and sedimentary rocks were being deposited, while in other areas volcanic eruptions were taking place or land surfaces were being eroded away. The general order of events was much the same, however, and the classification used here is about as general as can be applied for this part of the pre-Cambrian (see Fig. 2).

Features of the pre-Cambrian

The area underlain by pre-Cambrian rocks in Ontario viewed from the ground appears very rugged and picturesque. Yet viewed from an aeroplane a few hundred feet in the air the skyline appears to be very even and much like a level plain with its surface dotted by innumerable lakes and streams. The elevation of Lake Superior which may be taken as base level is 600 feet above sea level. The highest known point of Northern Ontario, Tip Top mountain on the north shore of Lake Superior, is 2,122 feet. As a matter of fact there are comparatively few elevations in Northern Ontario higher than 1,400 feet above sea level. During pre-Cambrian times there were several periods of mountain building when great ranges of mountains were undoubtedly built, but throughout many millions of years the rocks were undergoing the slow processes of weathering and erosion as a result of which these mountains were worn away leaving only their roots, with elevations of only a few hundred feet.

Keewatin

Going back to the classification of rocks on the basis of age we start with the lowest division in the pre-Cambrian, the Keewatin series. Very little is known about the nature of the earth's crust prior to Keewatin time.

	Cenozoic Era	Quaternary	Pleistocene	One million years
		Tertiary		550 million years
	Mesozoic Era	Cretaceous		
		Jurassic		
		Triassic		
	Palaeozoic Era	Permian		
		Carboniferous		
		Devonian		
		Silurian		
		Ordovician		
		Cambrian		
Pre-Cambrian	Proterozoic Era	Late Proterozoic	Keweenawan	1450 million years
			Animikie	
			Huronian	
		Early Proterozoic	Algoman	
			Timiskamian	
	Archaeozoic Era		Laurentian	
			Keewatin	

Fig. 1—Geological Time Table.

The Keewatin period was a time of great volcanic activity, probably on a scale greater than has happened at any time since then. Keewatin rocks consisted of lavas of basic to acid composition in the form of flows and tuffs or explosive volcanic rocks. Many of these volcanic rocks were erupted under water and between periods of eruptions sediments were being deposited. These areas of Keewatin rocks are represented on our geological maps by areas in green colour and a glance at one of these maps will show how widely scattered they are. From an economic standpoint the chief ores that were deposited in Keewatin times were the richer sections of iron formation which were formed as a result of chemical precipitation. Under this head comes the Helen mine of the Michipicoten area as well as the Lake Superior iron ores.

Laurentian

Following the deposition of the Keewatin rocks comes a period of granite intrusions. Mountain building processes took place and the rocks of the Keewatin period underwent folding. The geological work so far has not separated these Laurentian granites from the later granites. The main evidence for granites of Laurentian age consists of the presence within the next great series of rocks of vast numbers of boulders of granite. These Laurentian rocks probably gave rise to ore deposits but if so they have been largely eroded away and we do not know definitely of any remaining deposits of Laurentian age.

Timiskaming Series

Following this came widespread encroachments of the sea and the deposition of extensive areas of sediments consisting of conglomerate with granite boulders, quartzite, slates, etc. Sediments of Timiskaming age are particularly noteworthy in our better known camps, such as Porcupine, Kirkland Lake and Sudbury, but similar types are found in many other areas of Northern Ontario. Iron ores similar to those of the Keewatin series were deposited in Timiskaming time.

Algoman

Then comes another great period of mountain building attended by intrusions of granite and other igneous rocks. As a result of this folding one finds that all the older rocks which were originally deposited in fairly flat beds are now standing on edge or dipping at very steep angles.

The Algoman period was a very important one from the standpoint of ore deposits in Northern Ontario and Quebec, for with it one associates most of our major gold deposits and other deposits of copper, lead, zinc, etc.

Huronian

Following this came another period of deposition of sedimentary rocks known as the Huronian, including the Cobalt series of Cobalt, and the Bruce series of the north shore of Lake Huron, and two somewhat later sedimentary series known as the Animikie of Sudbury and the Port Arthur region. It will be noted that these areas of sediments while large are more localized. Much of the crustal rocks had become more stabilized and many areas were not further covered by the sea. The rocks of this series differ from the older rocks in the fact that they are not so highly tilted except locally but lie fairly flat. Again iron ore deposits are the only deposits of economic value.

Keweenawan

Further intrusions of basic to acid igneous rock took place along with local mountain building processes. With the diabase of this period is associated the rich deposits of silver of the Cobalt area along with cobalt, nickel and arsenic.

The great norite-micropegmatic sheet of Sudbury with which are associated the great nickel-copper ores of that area belong here, as do also probably some of our minor deposits of gold.

This is the end of the pre-Cambrian rocks which probably underlie all the later rocks of the world and are exposed in the areas mentioned. From the standpoint of ore deposits the pre-Cambrian rocks are extremely important as a source of ore deposits of certain types. They are the oldest rocks of the earth's crust and consequently have been subjected to the most stresses and strains and have the most favourable structures for the deposit of ores. On the other hand, of course, they have been subjected to erosion over a much greater length of time than the later rocks and hence in many cases only the roots of ore bodies that formerly existed are left.

Fig. 2—Geological Sketch Map of Ontario.

Paleozoic and Later Rocks

Above the pre-Cambrian rocks are deposited the paleozoic rocks consisting in Ontario of flat lying sandstones, limestones, and shale, such as all are familiar with in southern Ontario. These rocks occur only in a strip along Hudson and James bay and in a small area near Haileybury. The country along the Hudson's bay is quite flat and poorly drained with only small vegetation, except along the river valleys. They contain some deposits of clay, lignite, and gypsum, but as yet have not been productive.

Pleistocene

The last great event or events which affected the surface of Canada was the coming of the great glaciers during Pleistocene times. A few hundred thousand years ago for some reason the climate of the northern hemisphere became colder and ice and snow began to accumulate at certain points. The accumulation continued for hundreds of years until the ice had a thickness of many thousands of feet. Under the influence of its own weight the glacier flowed outward from its centres. The work of the glaciers was two-fold. In its outward movement it removed much surface material. As it moved over the country it served to reduce the irregularities of the unevenly eroded surface. Rocks were stripped of soil and fresh unoxidized surfaces were exposed. In the lee of steep hills pockets of weathered material were left, but most of the material picked up was scattered far and wide. That is the reason why in Ontario there are no placer deposits. This country with its numerous lode deposits of gold and other mineral should probably otherwise have been an ideal placer country.

During the retreat of the ice sheet on the other hand till, sand, and gravel were deposited wherever the ice front remained stagnant for any length of time and esker ridges were found at the margins. The out-flowing water from the melting ice supplied efficient transportation for some of the finer material and spread it out into sand plains. Hollows were filled and river valleys drained so that former drainage systems were entirely disorganized. The myriads of lakes that dot the surface of Northern Ontario were due more than anything else to the effects of the glaciers.

Several very large lakes were formed by the damming action of the glaciers including Lakes Agassiz, Algonquin, Ojibwa, and Iroquois. The remains of the old beach levels of the lakes may be seen at various points in the north country. In the case of Lake Ojibwa fine clay from the glacial till was spread out on its floor as a result of which there are the flat clay belts of the section along the transcontinental railway.

The advances and retreats of the glaciers were the last great geological events affecting the surface of Northern Ontario. The length of time since the retreat of the last great ice sheet to the present is roughly estimated at 20,000 years, a very short time, geologically speaking. During this time only the slow processes of erosion have acted to affect the land surface. During the last fifty years these changes due to erosion have been supplemented by the coming of settlers. A few sections have been turned to agricultural uses, much of the valuable timber has been removed, while water levels of some of the lakes and rivers have been altered for water power purposes. A striking feature of the topography of Northern Ontario when viewed from an aeroplane is the number of mine shafts and dumps scattered over the country. Present developments in the mining industry indicate that these will become a still more striking feature of our northern Ontario topography.

DISCUSSION ON THE PAPERS[1] OF THE

Symposium on the Burning of Canadian Coals

Investigation of Canadian Coals Including Their Testing, Classification and Utilization[2]

A. C. Fieldner[3]

Messrs. Haanel and Gilmore are to be congratulated on the preparation of a most interesting and informative review of the highly important fuel investigations that have been conducted by the Mines Department of Canada during the past several years.

These investigations are of great value to producers and users of coal. The determination of the chemical and physical properties of coal is of fundamental importance in the improvement of coal preparation and coal utilization. The large-scale tests reported in this paper have given data for comparing the suitability of various domestic and foreign coals for use as fuel, for the production of coke and gas, and eventually for the manufacture of synthetic gasoline.

In the United States Bureau of Mines, a somewhat similar programme has been followed with respect to our own coals. The members of our staff have kept in close touch with the staff of the Bureau of Mines of Canada and have benefited greatly by this interchange of ideas. The respective Bureaus have worked together in developing methods for testing coal and both institutions have used these same methods of tests. The results, therefore, are directly comparable and useful to each other.

Members of the staff of the Mines Department in Canada have participated in the work of our committees, and the fundamental research on which some of the methods are based was done in the laboratories at Ottawa. Through this co-operation our continent has avoided the confusion that prevails on the European Continent due to having different methods of testing, different nomenclature, and different classification.

The paper calls attention to the importance of a correct understanding of the definition of the "as-received" basis of coal analysis. Ordinarily this term means what it says, and in the United States one thinks of the "as-received" analysis as a close measure of the condition of the coal at the mine, since the largest fraction of American coals now being mined is low in moisture content and is received in the laboratory substantially as mined. However, in the case of low-rank bituminous coal, sub-bituminous coal, and lignite the "as-received" condition may be considerably lower in moisture than the coal as mined, unless special precautions against moisture loss are observed in taking and in transmitting the sample to the laboratory. This point should be emphasized in reporting "as-received" analyses that may have lost some original mine moisture.

In regard to the discussion of "dust index" or "dustiness," it is believed that "dust index" should be qualified to include the method of determination. The "dust index" resulting from the tumbler test might be called the "tumbler dust index" to differentiate it from the settling-plate method now being considered by the American Society for Testing Materials.

The term "size stability" has definite merit from the point of view of the coal producer and it will be a more welcome term than "friability."

Table IV, which contains a comparison of the classification of Canadian coals according to rank by the A.S.T.M. method and according to the "specific volatile index," calls attention to a real problem of nomenclature in using these two classifications. Confusion is likely to result from the use of the same names for different kinds of coal in the two scales of classification. The commercial user of coal will be mystified by having the same coal called "sub-bituminous" in the S.V.I. classification and "high-volatile A or B" in the A.S.T.M. classification. It is to be hoped that some revision of nomenclature can be made.

The results of the large-scale storage tests conducted on Nova Scotia coal are of great practical value. The development of methods for storage of coal without danger of spontaneous heating is of significance in smoothing out the effect of seasonal variations in the demand for coal. Moreover, storage would safeguard consumers against interruptions in supply. Much more research is needed on the problem of coal storage.

It is gratifying to note that domestic fuel tests have been made wherein variable rates of combustion are incorporated with standby firing for the night. This method of test reproduces practical conditions and should furnish a better appreciation of the most suitable methods for utilizing domestic fuel.

The latter part of this paper, which deals with coal carbonization and hydrogenation investigations, is of interest to industry in the United States as well as in Canada. Several years ago, coal-carbonization tests were made on the same lot of Canadian and American coals by the Mines Department of Canada and the Bureau of Mines of the

[1] Papers published in the Engineering Journal, July 1937.

[2] By Messrs. B. Haanel, M.E.I.C., and R. E. Gilmore, M.E.I.C., Division of Fuels, Bureau of Mines, Ottawa.

[3] Chief, Technologic Branch, U.S. Bureau of Mines, Washington. Published by permission of Director, U.S. Bureau of Mines.

United States. The Canadian tests were made on a commercial coke oven and also on a semicommercial-size byproduct oven installed at the Mines Department laboratories. The Bureau of Mines tests were made in a special coal-carbonization unit, designed in co-operation with the American Gas Association and known as the BM-AGA apparatus. Valuable data on the correlation of these methods of test were obtained.

The results reported by the authors of this paper on the hydrogenation of coal are of special interest to the United States Bureau of Mines. Recently we completed a similar coal-hydrogenation plant and are beginning a study of the suitability of our coals for the production of synthetic oil. Preliminary tests on a Pittsburgh coal from the Bureau of Mines Experimental Mine show results comparable to those reported in the paper on Yorkshire coal: 79.6 per cent oil; 14.1 per cent gas; and 3.8 per cent of aqueous liquor; and the consumption of hydrogen was 8.2 per cent.

This paper records in few words a tremendous range of experimental work on coal. While much has been done, much more remains to be done. Enormous progress will be made in the next half century in the production of energy. Conservation of fuel resources will become increasingly important, and public sentiment will insist on economical mining and the most efficient possible utilization of the country's fuel reserves.

A. W. Gauger[4]

The review of the work of the Canadian Bureau of Mines, Division of Fuels, on coals of Canada, as presented by Messrs. Haanel and Gilmore, is an indication of the excellent programme of investigation being conducted by this Division. To comment on the many phases of coal technology outlined in this paper is hardly within the scope of a brief discussion. The writer will therefore confine himself to a few brief statemens in connection with the section on fusion point of ash.

While this determination gives a rough indication of the tendency of a fuel to form clinkers when burned, there is no simple relationship between the two. The experience of some engineers has been such as to indicate the need for high ash fusion coals in underfeed stokers operating at high ratings; the experience of other engineers dealing with different power plants, different personnel, and different coals, has indicated that low fusion coals (below 2,200 deg. F.) can be burned at ratings of over 50 lb. per sq. ft. of air-admitting surface per hour. Clinker is the resultant of many contributory causes of which the coal ash is only one. Among these causes may be listed: properties of coal; types of fuel burning equipment; firing practice; and human factors.

One may not say that ash fusion temperature specifications may be lowered in accordance with lowering of ash content below that considered normal or average in all cases. There are examples in practice in which a lower ash softening temperature coal may be burned at a higher rating if the ash content is increased. Such factors as the coking properties and air distribution are of great significance in this connection.

T. W. Harris[5]

This paper has been read with interest and the only comment is with regard to the "Use Classification" on page 512. The printing of a series of articles is being undertaken to further supplement and broaden the information as reported by Sub-committee VI on the Correlation of Scientific and Use Classification. This work is being done under the guidance of the Coal Committee of the National Association of Purchasing Agents of which the writer is chairman.

Acceptances have been received from a number of leading authorities on coal in the United States for the writing of these papers which are covering both the factors in the selection of coal and the various uses. A number of articles have already been written and are being published by the National Association of Purchasing Agents.

The work has been conducted under the auspices of the Coal Classification Committee and therefore necessarily must be confined as far as possible to a statement of facts rather than expression of opinions. The articles as printed will expand the usability of the "coal selection charts" prepared by the committee as the articles contemplate presenting not only the opinions of the contributors but also bringing in the economic factors as well.

Characteristics and Quality of Nova Scotia Coals[6]

Mark W. Booth, M.E.I.C.[7]

Dr. Sexton is to be congratulated in presenting a paper which bears no apologies, or any reservations, in describing the characteristics and quality of Nova Scotian coals.

He has shown by the chemical analysis that the coal is of a high grade, and in the particular field covered by his own experiments, that the fuel compares very favourably with the imported product.

As a large proportion of the solid fuels used in the Provinces of Quebec and Ontario, in which provinces Nova Scotian coal has to find its greatest market, is in the domestic heating field, and the author's paper shows that the fuel generally is of a high grade, and under proper conditions of burning, superior results can be obtained from it.

This refers particularly to the coke obtained from Nova Scotia (e.g. the gas coke and Dosco coke); and it is pleasing to note the reference to the character of the refuse obtained, which "is in the form of solid heavy clinker easily disposed of by the householder."

Published literature and generally former papers given before The Institute, have referred to the clinker obtained from Nova Scotia fuels as being of an objectionable nature because it had fused.

To one accustomed to both kinds, it can be said that this form of clinker is much to be preferred to that obtained from the non-fusing kind, for instance the American anthracites, which Dr. Sexton well describes as giving a large volume of dusty ash which is disagreeable to handle and contains a good deal of unburned carbon.

It can be truthfully said that the fused clinker is many times more desirable than this latter dusty kind.

Referring to the boiler trials described in the paper and giving results obtained from the standard Horizontal Tubular Boiler. There are a good many H.R.T. boilers in Central Canada, and the point made by the author that settings for this type of boiler can be too high is a good one.

Designers appear to forget the long flame travel available in the setting of an H.R.T. boiler before the chilling effect of the boiler tubes is reached, and have endeavoured to imitate the design required for a water tube boiler by giving a large volume of combustion space directly under the front of the boiler.

This is entirely against the principle of the H.R.T. boiler, and a lot of disappointment has been met with by this practice.

[4] Director, Mineral Industries Research, Pennsylvania State College.

[5] Chairman, Fuel Committee, National Association of Purchasing Agents.

[6] By F. H. Sexton, LL.D., President, Nova Scotia Technical College, Halifax, N.S.

[7] Steam Engineer, Dominion Steel and Coal Corporation, Sydney N.S.

The weathering tests described are important considering the amount of storing that Nova Scotian coals are liable to, due to geographical and winter transportation limitations, and these show that Nova Scotian coals do not deteriorate in storage as regards composition and evaporative value for steam raising purposes.

This paper has of course not dealt with the characteristics and quality of Nova Scotian coals from the general steam raising and other standpoints, but if the original high quality is there to begin with, and the coal can be delivered to the consumer's plant as such, general engineering progress in the art of the combustion of these coals will take care of the rest.

G. H. Jenkins[8]

The general quality of Nova Scotia coal is well known, and it is conceded that some of it is of high quality, both for steam and other purposes. However, it is not the intention to discuss the quality of Nova Scotia coal, but rather to make a few comments on its preparation, transportation, and banking, as they affect the Canadian National Railways in the hope that they may be of interest to other buyers of coal, and perhaps to the coal producers as well.

The Canadian National Railways have been, for many years, large buyers of this coal. The delivery is by rail and water. The latter is more important. The quantity is larger, and, besides there are handling and banking factors to be considered, which do not mean so much in the more direct rail-borne delivery.

The banking of coal in the high temperatures during the summer makes it necessary to take great precautions to avoid heating and firing. There is always a risk in this respect, but experience indicates that, with the exercise of proper care, it is not unsurmountable. If coals selected for banking are those that are known to be less susceptible to spontaneous combustion than others, the danger is greatly reduced.

In a broad way, and in the absence of any special conditions, it has not been found that there is much, if any, loss in heat value in the banking of Nova Scotia coal, even when piled for several years. On the surface of piles, there is a certain amount of weathering and dullness of appearance, but it is superficial. Actually, one feels that coal in banks, at times, goes through a certain mellowing or seasoning process, so that as far as chemical characteristics are concerned, it is just as acceptable as fresh mined coal. In fact, coal from stock piles is often preferred by locomotive foremen to fresh mined coal.

The size degradation of coal handled in and out of ships or stock piles, is a factor of importance, and one that can never be fully overcome. It is necessary that great care be taken to see that nothing is done during these operations that might increase unduly this degradation.

The mixture of snow and ice, taken with fine coal from piles during the winter months, is a serious problem. Even with the utmost care in the loading, it is always there. The finer the coal, the more serious the results, because fine coal, stuck together with ice, will cause trouble in stoker-fired engines.

The proper cleaning of coal at the mines and keeping it free from extraneous matter in transit, is a factor that cannot be over-emphasized.

These observations are based on the Nova Scotia coal ordinarily purchased by the Canadian National Railways, for water delivery.

An Economic Use for New Brunswick Coal[9]

J. D. Garey, A.M.E.I.C.[10]

The following tabulation* is somewhat similar to Table II appearing in Dr. Stephens' paper but is extended to a final cost per ton of coal in the plant of the N.B. Power Company at Saint John and an ultimate cost per million B.t.u. as fired. The samples for this tabulation were taken by the writer in November 1935 and all were from cars loading at the mine shafts. These samples were enclosed and sealed in glass containers, and an analysis of each sample was made as soon as possible after the sample was taken.

In Table III in Dr. Stephens' paper:

Operator	Tons	Average per cent combustible	Average per cent combustible for all operators	Deduction for quality under contract	Average cost per ton combustible including freight
A.	6,568	80.87	82.8	8.6c. per ton	$4.03
B.	3,050	84.4			or
C.	3,426	81.5			74,000
D.	522	85.5			B.t.u.
E.	1,217	83.1			for
F.	1,048	82.2			1 cent

An analysis of the above table gives the following results:

Average combustible received per ton of coal......	82.2% or 1,644 lb.
Average B.t.u. per lb. combustible................	15,000 B.t.u.
B.t.u. per ton of coal as received................	24,660,000 B.t.u.
Average price per ton of coal as received.........	$3.22
Cost per ton of combustible (corrected)...........	$4.03
Cost per million B.t.u. $\frac{4.03}{30,000,000}$	13.43c.

[8] General Fuel Agent, Canadian National Railways, Montreal.

[9] By John Stephens, D.Sc., M.E.I.C., Professor of Mechanical Engineering, University of New Brunswick, Fredericton, N.B.

[10] Chief Engineer, N.B. Power Co., Saint John, N.B.

*Typical Proximate Analysis and Costs

Origin	Per Cent					B.t.u. per lb.		Cost per ton—$				$
	Water	Volatile	Carbon	Ash	Sulphur	B.t.u. as received	B.t.u. dry	Cost at Mine	Freight Saint John	Cartage	Total Cost	Cost per Million B.t.u.
A	3.13	30.59	52.87	16.54	7,39	12,345	12,745	2.50	0.95	0.35	3.80	0.1539
B	4.93	29.53	50.99	19.48	8.22	11,545	12,145	2.70	0.95	0.35	4.00	0.1732
C	10.39	29.80	58.65	11.55	3.38	11,920	13,305	2.70	0.95	0.35	4.00	0.1677
D	3.91	30.61	52.12	17.27	7.69	12,000	12,500	2.70	0.95	0.35	4.00	0.1666
E	4.41	31.27	45.99	22.74	6.71	11,090	11,595	2.50	0.95	0.35	3.80	0.1713
F	5.17	27.70	47.11	25.19	6.01	10,765	11,350	2.70	0.95	0.35	4.00	0.1860
G	3.91	27.60	45.86	26.54	6.45	10,710	11,145	2.25	0.95	0.35	3.55	0.1657
Average	5.12	29.58	50.51	19.90	6.55	11,482	12,112	2.58	0.95	0.35	3.88	0.1692

In Dr. Stephens' Table IV:

Tons	Average per cent combustible for all operators	Deduction for quality under contract	Average cost per ton combustible including freight
24,310	79.4 Max. 92.4 per cent (51 tons) Min. 76.4 per cent (8,550 tons)	20.05c. per ton	$3.64 or 82,000 B.t.u. for 1 cent

An analysis of the above Table IV gives results as follows:

Average combustible received per ton of coal	79.4% or 1,588 lb.
Average B.t.u. per lb. of combustible	15,000 B.t.u.
B.t.u. per ton of coal as received	23,820,000 B.t.u.
Cost per ton of coal as received	$2.89
Cost per ton of combustible (corrected)	$3.64
Cost per million B.t.u. $\frac{3.64}{30,000,000}$	12.13c.

The results of the tabulation and the results of the analysis of Dr. Stephen's Tables III and IV, although obtained by entirely different methods, when compiled have very similar results.

R. E. MacAfee, M.E.I.C.[11]

Coal from the central New Brunswick field has always been considered difficult from a combustion point of view when burned in quantity in refractory furnaces. The most difficult feature of this coal is its high ash content and low ash fusion temperature. Dr. Stephens reports that the ash fusion temperature goes down as low as 1,700 deg. F. This is a very low ash fusion temperature and necessitates a furnace design that will permit the gases of combustion to be cooled to practically this temperature in order to eliminate the ash sticking on the first rows of boiler tubes and in addition, the ash that is deposited in the bottom of the furnace must be cooled to the point where it becomes dry and friable before it reaches the ash hopper so that it can be removed in the dry state by ordinary ash removal methods without trouble. On the other hand, in order to secure good combustion efficiencies, it is necessary to keep the furnaee temperature as high as possible. These two conditions seem to have been well taken care of in the furnace design illustrated. Dr. Stephens does not mention specifically ash adherence to boiler tubes, but it is assumed that this does not occur at ratings up to 325 per cent.

The writer's experience generally bears out that reported in this paper. To burn this coal successfully, it is necessary to have a fully water cooled furnace, liberal furnace volume and effective cooling in the bottom of the furnace to give good ash removal conditions. The design at this plant has a staggered water screen made up of tubes on 14 in. centres. The writer prefers either a hopper bottom made up of tubes on 6 in. centres with smooth cast iron blocks clamped to the tubes on the furnace side with a heat conducting bond between the tubes and blocks, the back of the tubes being covered with plastic insulation, block insulation and a steel casing, or a flat floor made up in the same manner. This construction gives a very cold surface which immediately chills the ash that falls on it.

The superheater performance given in the paper is extremely interesting. The writer's experienee when burning this coal is that the actual superheater performance agrees substantially with that estimated.

Preheated air temperature is influenced by two main factors: (1) general overall efficiency of the unit and (2) drying wet coal in the pulverizer. It may be judged from the paper that the second condition predominated in the 1935 addition to this plant. Pulverizer capacity, preheated air temperature and moisture are closely related in any pulverized coal plant. High moisture content in the coal can best be taken care of with a lower air temperature in a pulverizer that forces all the primary air entirely through the coal bed, thus giving a much more intimate coal and air mixture in the pulverizer resulting in much better drying.

The fineness of pulverization reported in the paper is excellent. Probably Dr. Stephens could give fineness figures after longer periods of operation. It would also be interesting to know the life of the hammers and the maintenance on the pulverizers per ton of coal pulverized.

This paper has served a useful purpose and the data presented will greatly assist those attempting to burn this coal.

J. Roberts[12]

The statement which Dr. Stephens made in his paper that "the fineness of pulverization was not of great concern" is of considerable interest. This might be true with certain types of coal, but in the experience of the writer when using slack coal from the Maritime provinces in pulverized fuel plant, an endeavour is made to pulverize to 82 per cent through a 200 mesh.

Also of interest are his remarks that the mills of the New Brunswick Electric Power Company were able to handle coal up to 9.6 per cent moisture. The writer's experience has been that it is practically impossible to handle coal in impact mills over 5 per cent moisture. On the Canadian National system, the mechanical department are not only responsible for handling coal in locomotives, but also have a very large number of stationary power plants, scattered over the entire system—some of these plants are old and more or less obsolete and others are modern plants. The power plant at the Point St. Charles locomotive shops is entirely modern, handling pulverized coal (Maritime Provinces slack coal) and one unique feature is that it is constructed to operate from 50 over 300 per cent of rating. This was made possible by a combination of water walls and air-cooled walls. The entire plant is an interesting installation, operating during the winter months at 300 lb. pressure at over 300 per cent of boiler rating.

The Author (Prof. John Stephens, M.E.I.C.)

Mr. Garey's statistics of the costs of Minto coal seem to be in substantial agreement with those of the New Brunswick Eleetrie Power Commission.

Variations, due to different prices and freight rates, are to be expected.

The energy contents given by Mr. Garey are rather higher than would have been expected from the experience at Grand Lake. B.t.u. contents to five significant figures are of interest as showing the possibility of this degree of precision. Reasonable doubt of the value of the third figure is often felt.

In answer to Mr. R. E. MacAfee, Grand Lake ash does not adhere to boiler tubes or water walls at 325 per cent rating and since writing the paper, ratings up to 400 per cent have been experienced with a like result. Slagging is not found on any tubes and the fly ash keeps the surfaces clean and bright.

No need has been found for supplementary cooling effect in addition to that provided by the water screen tubes at 14 in. centres. The sugestion of a water cooled hopper should help those who must use smaller furnace volumes.

The superheater condition has been since improved by the removal of a few baffle tiles, but the inherent

[11] Manager, Eastern Branch, Babcock-Wilcox and Goldie-McCulloch Ltd, Montreal.

[12] Chief of Motive Power and Car Equipment, Canadian National Railways, Montreal.

difficulty remains with the combination of a large water cooled furnace, a steep temperature gradient through the first bank of tubes and a convection superheater.

Mr. MacAfee's remarks on pulverizer performance are of great interest to those in charge of the Grand Lake plant. The information he asks for is not at present available, in view of the great secular variation in the coal. It may be taken, however, that the pulverizer maintenance costs are comparatively high. This is compensated for by the fact that even 10 per cent moisture coal will not plug the impact mills.

The fineness of pulverization described in the paper has been maintained.

In reply to Mr. J. Roberts, it should be stated that it was not intended in the paper to give the impression that fineness of pulverization was not of "great concern."

If good results are being obtained on a weight of combustible per kw.h. basis, however, fineness is of secondary importance. Mills should not be criticized adversely if they pass some ungrindable pyrites in comparatively large form.

At Grand Lake, the mills must and do grind coal of over 5 per cent moisture. The experience there with slack of 9.6 per cent moisture was accurately described in the paper.

It is noted that Mr. Roberts uses the term "Maritime Provinces slack coal." This does not appear to be justified as a generic name for a product of such wide variation in quality.

* * *

Some Observations on the Use of Bituminous Coal as Locomotive Fuel[13]

G. H. Jenkins[14]

The use of bituminous coal as a locomotive fuel as discussed in Mr. Roberts' paper leaves no doubt of the importance of this subject to the fuel department of a railway that provides the coal that is burned in the locomotives; and probably a few remarks concerning the purchase of coal are in order. More than half of the coal used by the Canadian National in Canada today is from Canadian mines. This is nearly twenty per cent of all the coal produced in Canada. Nova Scotia contributes the largest tonnage; Alberta a close second, New Brunswick third, and British Columbia last. We also buy some Saskatchewan coal, but not for locomotive fuel purposes.

In arranging for this coal supply many things must be considered, including some relating to policy. Any information that assists in making a wise selection of coal is utilized and the main concern is what the coal will do when used under actual service conditions. Considerable reliance is placed on the work of inspectors who are constantly in touch with sources of coal supply, our chemist is also a great help. Further valuable assistance is obtained from the Dominion Department of Mines, and other outside agencies.

It is known that the chemical, physical, and burning characteristics of coals are not all alike. On account of conditions it is not possible to obtain 100 per cent delivery of so-called No. 1 coals. This involves acceptance of certain quantities of coal of usable quality but less suitable for our purposes, and it is the endeavour to utilize the best coals for important or fast services, and the others to best advantage in other services. Efforts in this respect have not been unsuccessful.

Experience has shown no standard specification of coal can be applied everywhere. A general stipulation for hard structure, high fusing point, or high volatile, is not desirable, when some of the coals available will not measure up to the stipulations named due to their inherent nature. The one general condition is that coal shall be cleaned of extraneous impurities and loaded on to railway cars in the best possible condition and size as called for by the purchase agreement.

An endeavour is made to maintain as strict a coal inspection as any other railway on the North American continent, and quite apart from the fact that this is in the interest of the railway, such a policy is actually rendering an important service to the coal producers even if they do not all appreciate our attitude at the time.

It is conceded that while the coal producers have the sole responsibility for cleaning the coal there is also a responsibility resting with the railways. That is, if there is any deterioration in the quality or size condition of the coal through carelessness in handling where the railways are responsible, then it is in their power to correct this and they must do so.

The mechanical department frequently check up on coal performance, and in addition make frequent formal running tests in order to keep coal quality ratings up to date. This is done from time to time, due to changing conditions in the coal product, or the introduction of new sources of supply. In addition to testing one coal against another, there is the important question of testing the same coal in various sizes, such as mine-run or lump, egg, nut, etc. There is a large field for tests of this kind, which are proposed with the idea of developing the advantages of a particular size or sizes of coal including the size degradation caused by the movements of coal through locomotive stokers from tender to distributor plate.

Locomotive coal operating conditions in a country like Canada are more exacting in the winter than in the summer months, and if possible, a superior coal should be furnished in the winter.

A large proportion of the coal used is loaded in open cars, which means that for three to five months in the year it is subject to some quality deterioration due to ice, snow, etc. Coal is also moved in box cars, which means that it is protected and thus kept free from ice and snow, but against this there is the greater size degradation due to additional handling, as compared with coal furnished in open top cars.

Winter conditions prevent the water transportation of a large tonnage of locomotive coal and make it necessary to use coal from stock piles where it has been placed during the navigation season. In the handling of this coal and with the snow conditions as they are in Canada, it is, at times, difficult to keep the coal entirely free from snow and ice. These conditions reduce the useful heat delivery of the coal to some extent.

There is also the question of some loss in heat value in the banking operations. This is with reference to the heating and firing hazard, which is always present more or less, although by the exercise of great care, the Canadian National have been fortunate in being free from any serious occurrences. However, the final delivered condition of the coal is likely to be unfavourably affected at times, by heating and firing, while in stock piles.

The presence of tramp iron, etc., in coal has always been serious, but it is more so today, with the large number of stoker-fired engines. Pieces of scrap metal, etc., getting in the stoker mechanism are serious. One method of eliminating this material at the mine is by the installation of magnets at the ends of picking tables, and these are installed at quite a number of mines.

The mechanical cleaning of the coal is an important factor today, and quite a large percentage of the coal received is mechanically cleaned by one method or another.

[13] By John Roberts, Chief of Motive Power, Canadian National Railways, Montreal.

[14] General Fuel Agent, Canadian National Railways, Montreal.

F. Williams, A.M.E.I.C.[15]

Through close contact with the fuel problems of the Canadian National Railways for a good many years the writer is able to appreciate the amount of co-operative effort exerted by the mechanical and fuel departments, and the value of this co-operation. Some problems have been eliminated, some have been mitigated to a very appreciable extent, but unfortunately a great many of them still persist and will probably continue for many years to come. The only way to treat such problems is to look them squarely in the face and surmount them by the most practical means which can be devised.

To cite a typical example—Mr. Roberts mentioned the tendency of some fuels to plaster the back tube sheet with slag. This condition persisted on one division to such an extent that the back tube sheets had to have the slag removed at the end of every round trip and this operation entailed the removal of a section of the brick arch to obtain access to the tube sheet. The difficulty was eventually surmounted by omitting the deflector plate in the stoker, removing the second flight from the front end of the stoker conveyor screw and installing soot blowers at the back tube sheet. The engines on this division now run for the full thirty-day washout period with increased efficiency and availability; there has also been a great reduction in the consumption of arch brick.

The difficulties encountered are far too diversified to permit of anything like a comprehensive survey and as soon as one is solved another seems to take its place. However, life without its perplexities would soon become tame and it is only the constant battle with adverse circumstances which enables the railway management to separate the wheat from the chaff when selecting men for supervisory positions.

* * *

The Burning of Low Rank Alberta Coal[16]

A. G. Christie[17]

Professor Robb has ably presented the present state of the art of steam station development in western Canada. The details of equipment are fully considered. However, it is inadvisable to draw too definite conclusions on the basis of these data, as the art itself is changing rapidly and experience with western coals is steadily increasing. The possibilities of new methods and new equipment are well illustrated in Mr. Bull's accompanying paper.

Professor Robb mentions briefly the interconnection of water and steam power in his opening paragraphs. There is much misunderstanding on this important subject. The rivers of western Canada have their full flows during the summer months when electrical loads are lowest. The normal run-off is small in winter when the electrical loads are maximum. Hydro plants, to operate the year round, must store water in lakes during the summer to care for the winter deficiency in run-off. In some cases this storage can be effected at a reasonable cost, particularly when these storage lakes can be located in the mountains. An alternate method is to care for periods of low flow by the operation of auxiliary steam plants. This plan has particular merit when these plants can be located at load centres near the ends of the longer transmission lines, since outages would be less serious.

Engineers no longer consider hydro and steam power as competitors but rather as complementary sources of power. Each should be developed as component parts of a system to the extent that such additions would result in lower total system costs for a given output.

Alberta has many coal fields which can supply low cost fuel to steam plants. The situation in that province warrants an unbiased study of the correlation of these two sources of power so as to effect lower rates to customers. Too often when this subject is raised, local prejudices or political considerations dominate the discussion and a true understanding of the situation is not presented to the public.

Referring to the paper itself, the annual load factors as shown by the curves are low, indicating a small industrial power load in these western cities. The performances of the stations expressed in B.t.u. per kw.h. show excellent progress in station betterment. Auxiliary power requirements seem high, although this may be due to the relatively small size of the equipment and the continued use of many old steam-driven auxiliaries. The ratio of fixed charges to total cost shows a wide variation. Plant 1 in Fig. 8 has an unusually low ratio. Can Professor Robb explain why this plant is so much below the usual average ratio?

The heat values per pound and the cost per ton vary widely between different western coal fields. It would, therefore, seem better for Professor Robb to express fuel costs in terms of cents per million B.t.u. rather than in dollars per ton. In the case of the Saskatchewan cities freight forms probably the larger portion of the total coal costs.

Western Canada will experience rapid growth in the next twenty-five years. New plants must be built and new equipment added to present plants and this paper will serve as a base of reference to which the design and performance of the newer plants may be compared.

H. G. Thompson, A.M.E.I.C.[18]

In the section of Professor Robb's paper devoted to boiler feedwater some very interesting points were presented. One of these was the extent to which it has been found possible to reduce feedwater make-up. With this amounting to 4 per cent, or less, of the total boiler feed the problem of providing suitable make-up becomes a relatively simple one, whether evaporators, external softening or internal chemical treatment are used.

There appears to be a definite tendency on the part of larger industrial organizations to go to the higher pressures, and the amount of make-up being much greater in most cases than for the straight generating plants, the matter of proper boiler water conditioning will become increasingly important. Also, the problem is not entirely one of eliminating scale at the evaporating surfaces. With higher percentages of make-up there are more possibilities for scale in the feedlines, pumps, regulators, heaters, economizers, etc. and this part of the equipment must be kept clean as well as the boiler.

Reference was made in the paper to the descaling feature incorporated in modern evaporators and in this connection it is our understanding that the practice of using chemical treatment in evaporators is becoming more and more common because it permits of uninterrupted operation and better heat transfer.

In the matter of preventing corrosion by the use of sodium sulphite, mention might be made that considerable success has attended the use of certain organic materials for this purpose. These have the advantage of serving at the same time to prevent the deposition of feedline scale as well as helping to condition phosphate sludges and other benefits.

The Author (Prof. C. A. Robb, M.E.I.C.)

The author appreciates the scope of the discussion which has been presented.

[15] Mechanical Engineer, Canadian National Railways, Montreal.

[16] By C. A. Robb, M.E.I.C., Professor of Mechanical Engineering, University of Alberta, Edmonton, Alta.

[17] Professor of Mechanical Engineering, The Johns Hopkins University, Baltimore, Md.

[18] Aluminate Chemicals Ltd., Toronto, Ont.

Professor Christie has contributed an appreciation of the possibilities of steam power stations in western Canada which may well serve to stimulate those charged with their design and operation to make the fullest possible use of the experiences and developments in the larger stations on this continent.

The statement that "engineers no longer consider hydro and steam power as competitors but rather as complementary sources of power" cannot be stressed too strongly when the real objective is a reliable supply of power at minimum cost.

In regard to the wide variation in the ratio of fixed charges noted by Professor Christie, and the unusually low ratio shown in Fig. 8, the explanation tendered the author in regard to Plant No. 1 is that "a block of debentures were written off during the year 1936." It would appear that the usual provision has not been made in the case of this plant.

Mr. Thompson's understanding that the practice of providing chemical treatment for the raw water make-up served to the evaporators is becoming more common, is correct. Suitable control is required, even in these circumstances, to inhibit carry-over from the evaporator.

In regard to the higher percentage of make-up required in certain industrial plants, two have reported a make-up of about 33 per cent. In such cases chemical treatment of the feedwater requires special consideration.

The Saskatchewan Lignite Industry[19]

B. W. Parker[20]

Mr. Sutherland is an outstanding authority on the production and burning of lignite coal, and is largely responsible for the development in Winnipeg of the use of lignite coal for commercial purposes, by his advice to consumers' requirements.

The United States had been the chief source of coal for commercial purposes in Winnipeg until the year 1932, when the increased tariffs and conditions of production under the N.R.A. raised the price to a prohibitive figure and consumers had to find a new source of supply. No time was lost by those interested in the lignite industry to take advantage of the situation to introduce this fuel for commercial use, and with the assistance of the freight subvention allowed by the Federal Government, consumers soon discovered that lignite could be burned in a satisfactory manner and was as cheap, and in some cases cheaper, than the high grade American coal formerly used.

As pointed out in the paper, this industry, like the construction industry in Canada, suffers severely from seasonal conditions. This is not a fuel that can be mined and stored above ground like high grade bituminous coal, but must be produced as required. However, Mr. Sutherland's preference for a system of mining having a minimum of seasonal fluctuation in employment appears to be sound in principle.

When government enters the field of industry control consumers nearly always suffer, and in consequence the action of the Saskatchewan Government was viewed with alarm by large coal consumers. However the increase to date in the price of lignite has not been serious. Many large consumers have gone to considerable expense however in equipping their boilers for burning lignite, and the risk in doing so is becoming apparent owing to the action of the Saskatchewan Government and the recent reduction in freight subvention which at any time might be withdrawn altogether.

It is to be hoped that the Saskatchewan lignite operators will realize this situation and endeavour to take the necessary steps to establish and maintain a firm price so as not to discourage further use of lignite in Manitoba.

R. A. Strong, A.M.E.I.C.[21]

Mr. Sutherland in his paper gives a clear outline of the situation faced by the Saskatchewan lignite operators in producing a coal which has so many distinct disadvantages.

For several years the writer was associated with the author while working on an attempt to eliminate the unfortunate seasonal operations in the lignite mines of both North Dakota and Southern Saskatchewan. It was considered at that time that the upgrading of this fuel by carbonization and briquetting would allow for its increased sale in both the domestic and power fuel markets as well as an aid in its storage, thus making it possible to produce the fuel during the entire year at a steady rate rather than seasonally as has been indicated in the paper.

It is well known that the attempts to overcome this disadvantage by the means mentioned has not materialized and in view of developments in other fields it is unlikely that it will do so except in certain cases where conditions are definitely favourable.

The increase in tonnage from the Saskatchewan field during the past few years is one of the bright spots in the coal industry of Canada and this increase is in no small measure due to the efforts of Mr. Sutherland's company and his own personal contribution to the increased knowledge and use of a fuel which, as previously stated, has decided disadvantages in comparison to the fuels with which it competes. As an example of this it might be stated that from 1917 to 1921 the production of lignite from the Saskatchewan field was approximately 350,000 tons per annum. This was increased, due to scientific sales efforts and concentration on the methods outlined by the author for use of this fuel, to practically 1,000,000 tons in 1935 which represents an increase of 158 per cent over 1929, a peak year for the Canadian coal industry. This might be contrasted with a 24 per cent decrease in Alberta, a 17 per cent decrease in Nova Scotia, a 57 per cent increase in New Brunswick and a 47 per cent decrease in British Columbia during the same period.

With respect to the suggestions made regarding the elimination of uneconomic properties for the benefit of the miners employed in the industry, as well as the operators, this is a subject which must of necessity be handled by the authorities in control of the coal resources which, in this case, is the province of Saskatchewan. It is very difficult to arrive at a correct conclusion in regard to this proposal inasmuch as it would require somewhat dictatorial powers on the part of some authority to make a decision as to which properties should be operated. While such a situation has distinct merits and has been attempted through legislation in other countries it also has the disadvantage of being subject to very severe criticism on the part of those who have invested money in what might be termed uneconomic properties.

It would appear to me that the Saskatchewan field will, unfortunately, be compelled to develop along the same lines as other fields and that such suggestions as the author make, will take place only through the elimination of these properties on the basis of economics rather than legislation.

Experience in Burning Western Canadian Coals[22]

A. G. Christie[23]

This paper plainly demonstrates that Mr. Bull has availed himself of modern developments in power plants as rapidly as these have been evolved. His early uses of

[19] By R. L. Sutherland, Combustion Engineer, Truax-Traer Coal Company Limited, Winnipeg, Man.

[20] Vice-President, Northern Public Service Corporation, Winnipeg.

[21] Engineer, Department of Mines, Ottawa.

[22] By E. W. Bull, Supt. Light and Power Department, Regina, Sask.

[23] Professor of Mechanical Engineering, Johns Hopkins University.

underfeed stokers, preheated air, pulverized coal, radiant superheaters, extraction heating of feed water and water cooled furnaces are evidences of his recognition of progress in the art and of his courage in applying these new developments to the combustion of the little-known coals of western Canada. The additional knowledge presented in this paper on the characteristics of these abundant and potentially valuable fuels will be of great worth to others contemplating their use in boiler furnaces.

One is at once impressed by the frankness of the author in presenting the shortcomings of plant and fuels during the various stages of development and the remedies which he found effective. Doubtless some will wish to know why he chose certain types of pulverizing equipment in preference to other standard types. It would also be of interest to have Mr. Bull state his opinions on the suitability of the several mills for the preparation of the coals that he has tested.

Many western plants employ chain grate stokers to burn low volatile and non-coking coals. Some of the coals burned by the author had sufficiently high ash contents to appear suitable for chain grate stokers. What were the reasons for not trying the widely-used chain grate stoker on his western coals?

Mr. Bull mentions coal dust fires with lignite. Has he experienced fires with any of the other coals and if so from what causes? Have any coal dust puffs or explosions occurred and from what causes? If such occurred what remedies have been applied to avoid their future occurrences?

A statement of particular interest relates to the experience with lignite char and other pretreated material. It is apparent from this paper that the treated material has limitations as a transportable fuel that may offset its other advantages.

Apparently mill drying, using preheated air, was employed to remove moisture from the raw coal. If this is the case, what temperature of air is supplied to the mills? Recent practice seems to indicate that higher air temperatures are permissible than in earlier installations. Possibly higher drying air temperatures might aid in the better grindability and pulverization of the Saskatchewan lignite. Mr. Bull might also state how much drying was found necessary.

An objection to the use of pulverized coal has been the fly-ash discharge from the chimney. Has this given any difficulty at Regina and, if so, what means have been employed to decrease its amount? Are any future changes under consideration to deal with fly ash?

When the new plant at Edmonton was under consideration, the use of pulverized coal was discussed. The Edmonton coals appear to have higher grindability factors. Probably the factor that induced the late William Cunningham to decide on chain grate stokers in place of powdered coal was the possible nuisance from fly ash that would be discharged by the Edmonton plant. This station is located quite centrally in the city in the deep valley beside the Saskatchewan river. Stacks sufficiently high to carry this dust above the city's homes were out of the question.

The tests of March 1937 in Table III of the author's paper show efficiencies with several classes of coal that are practically equal to the best results obtained in other much larger central stations. A statement from Mr. Bull of his average production cost per kilowatt-hour for the past year would be of much interest, particularly if broken down into its elements of fuel, labour, repairs and maintenance and supplies.

The last line states that the plant cost $90.00 per kilowatt of capacity. This is a low figure for a plant of this size located at such a distance from the source of equipment. This price indicates an unusual combination of good engineering and careful purchases of equipment.

The writer hopes that this paper will lead to a wide discussion by western members of their own experiences in fuel burning so that certain conclusions may be formed regarding the best methods of burning the coals of western Canada.

Mr. Bull is to be congratulated on his excellent contribution to our knowledge of these fuels.

C. A. Robb, m.e.i.c.[24]

Mr. Bull is to be congratulated upon his paper which is timely and presents the results of an obviously extended investigation. The paper will have special interest for all those concerned with the quality of engineering represented in thermal power stations in the area served by the fuels of Alberta and Saskatchewan.

In reviewing the test data, certain questions arise, and the author might care to add details which would permit comprehensive study of the material. The addition, for example, of the CO and O content of the flue gas, and the analysis of the fuel, would make it possible to set up a boiler heat balance.

What gain in per cent was obtained from the novel application of the water-cooled ash pits of 1921?

The boiler trials of 1922 (Table I) can hardly be considered to give a fair comparison of what might be done with these coals on modern equipment. The limitations of the stoker in handling so great a variety of fuels is evident in the wide variation of the efficiencies, which range from 62.2 per cent for Saskatchewan lignite to 81.8 per cent for bituminous coal, and in the low CO_2 content of the flue gases from the Alberta lignites.

The Saskatchewan lignite test of 1933 shows an efficiency of 81.36 per cent. It would be interesting to know how this would compare with the average efficiency for the year.

The author's conclusion that "the fuel should be ground to extreme fineness" is not clear. Does he mean extreme fineness in passing all screens, or simply a high percentage passing the 40 mesh?

Would he give a brief summary showing the effect, in recent years, of the improved efficiency of the steam generating plant on the annual station performance?

No reference is made to scrubbing of the flue gases, or to the quantity of ash recovered, although the plant is shown in Zone Map No. 1 as Res. Dist. A and within city limits.

L. A. Thornton, m.e.i.c.[25]

Mr. Bull's contribution to steam power plant practice in the West has been outstanding, and the results he has attained are matters of respect on the one hand and envy on the other hand from those of us who are also engaged in the same problem. Mr. Bull is in a peculiar way thoroughly conversant with every detail of the subject with which he deals, and is in a position to substantiate by actual performance any of the experiences which he has related.

The coal from the Crow's Nest district is not dissimilar in general properties from the steam coals you are familiar with in the East, but the lignite fuels from the Drumheller and Saskatchewan fields present problems which are not as well understood, either by the operators in the East, or, indeed, by the designers, and the experiences of men like the author have been of great assistance in bringing about efficient methods of handling of this coal.

[24] Professor of Mechanical Engineering, University of Alberta, Edmonton.

[25] Commissioner, Saskatchewan Power Commission, Regina.

THE AUTHOR (E. W. Bull)

Replying to points raised in discussion by Mr. A. G. Christie. Due to the toughness of certain coals, especially lignite, it was considered that the type of pulverizer where the material to be pulverized is definitely acted upon by a rolling action between guided metal rings and rollers or balls, was a better principle than a hazardous condition of contact in impact mills at high speed.

The definite rolling action brought about a greater action of coal particles on other coal particles in their passage between rollers, or balls, and grinding rings.

The only dust fires encountered were with lignite in the burner plenum chamber, due to sifting, and this was only because lignite dust, when dry and undisturbed, ignites at a low temperature. The remedy was, as stated, to avoid an accumulation by keeping this dust moving towards the furnace and venting the pipes to the furnace.

No bituminous coal dust fires have been encountered with preheated air as high as 450 deg. F.

The air temperature to the mills has been up to 450 deg. F. and the coal and air temperature to the burners has been as high as 210 deg. F. with bituminous coal with only surface moisture, and 110 deg. F. when burning Saskatchewan lignite with 33 per cent inherent moisture.

It appears that the inherent moisture in the particles of Saskatchewan lignite, originally 33 per cent in the coal feed, is reduced to about 17 per cent, which gives a satisfactory condition for lighting up on entering furnace.

In an endeavour to further improve conditions for burning lignite, No. 10 boiler which started operation in September 1937, was designed to give 500 deg. F. preheated air, of course with the necessary tempering air connections for carrier air to the pulverizer in use, when burning bituminous coals.

Due to the plant location and the direction of the prevailing winds, there has been no difficulty with fly-ash of later years, or since a determined effort was made to grind the coal to a fineness of 85 per cent through 200 mesh screens.

Previous to this, coarse particles in the immediate vicinity of the plant had been a source of some trouble.

Replying to points raised in discussion by Mr. C. A. Robb. Heat balance computations have been made on certain tests run on lignite, but it was not considered advisable to add further to an already long paper on experience by including these lengthy records.

In recent years the plant has not operated continuously on high or low pressure, consequently, any statements of yearly efficiency should also carry explanatory notes. High pressure operation of boilers with bituminous coals show monthly averages of above 85 per cent efficiency.

The term grinding to extreme fineness means that over 85 per cent will pass a 200 mesh screen and the author's experience is that when this condition is met, only a very small percentage will not pass a 40 mesh screen.

Under the conditions as set out in reply to Mr. Christie's discussion, no necessity has arisen for scrubbing of flue gases.

British Columbia Coals in Metallurgy[26]

BERNARD DUNELL[27]

The Consolidated Mining and Smelting Company of Canada are unusually well placed for obtaining a wide range of information on the burning of coal, in that they not only burn an immense quantity in their varied metallurgical processes, but also burn a large amount on chain grate stokers as well as in pulverized form for steam raising purposes.

Mr. McNaughton makes mention of a coal containing 22.9 per cent moisture as having been burned in pulverized form at the Fuel Research Laboratories, Ottawa. It would be interesting to know how much the water content of this coal was reduced in pulverizing, or what the moisture content was at the point of entering the coal burner. It would also be interesting to know whether Mr. McNaughton has made any determinations as to the highest percentage of moisture allowable for burning coal satisfactorily in pulverized form, particularly with regard to the small burners which he describes as burning only one ton of coal per day. Presumably the percentage of volatiles in the coal would have a bearing on this.

As mentioned by Mr. McNaughton, the ash fusion temperature of a coal is often of vital importance, and it is frequently a surprise to find that coal companies are not always in a position to give this information readily. In the design of a boiler and boiler setting and the selection of the stoker, where even moderately high boiler ratings are contemplated, it is essential to know the fusion temperature of the ash if furnace troubles are to be avoided. Provided this information is available, it is not of so much consequence if the fusion temperature is low, as proper provision can be made by giving adequate grate area, if the coal is to be burned by means of stokers, and by designing the boiler with a suitable "fraction cold." If the coal is to be burned in pulverized form, sufficient furnace volume and proper "fraction cold" must be provided so that the particles of ash, which are molten during combustion of the coal surrounding them, have become solidified before they reach the boiler tubes or furnace floor, otherwise "birdsnesting" of the ash on the tubes will occur, or it will solidify in a mass on the furnace floor.

During the past thirteen or fourteen years the writer has been privileged in being able to discuss with the Consolidated Mining and Smelting Company their combustion problems, and would like to take this opportunity of acknowledging the valuable assistance and whole-hearted co-operation that he has universally received.

* * *

The Burning of Canadian Coals[28]

F. A. COMBE, M.E.I.C.[29]

The papers presented in this symposium form a valuable series and particularly so to the combustion engineer, and to those engaged in the actual design and operation of steam plants. In addition to reports of laboratory work on the classification and analysis of fuels, information is given regarding results obtained and difficulties experienced with the burning of various coals, both from the Western and Eastern Districts by different methods and on different types of equipment in a number of steam plants operating under actual commercial conditions.

Tests made on hand fired small steam boilers in government and university testing plants, of which reports are given, may serve a useful purpose in determining certain basic characteristics of the coals burned but can hardly be used for definite comparisions of values for practical purposes.

Today, mechanical methods of firing are quite generally adopted, even in the small plants, and equipment and special furnace settings have been designed to suit particular coals. For example, good results can be obtained with underfeed stokers in correctly designed furnaces burning Nova Scotia coals, but such stokers have apparently not proved to be altogether satisfactory for Alberta coals.

Obviously the resources at the disposal of the Department of Mines or the universities cannot provide for

[26] By R. R. McNaughton, Smelter Metallurgist, Consolidated Mining and Smelting Company of Canada Limited, Trail, B.C.

[27] C. C. Moore and Company, Engineers, Vancouver, B.C.

[28] General Discussion on the Symposium on the Burning of Canadian Coals.

[29] Consulting Combustion and Steam Engineer, Montreal.

installation in utility, industrial or other active plants. In this connection it would be well worth while for the government, through some committee or agency, to form contacts for co-operation with a selected number of active steam plants to investigate, analyze and assemble data which is available or possible to obtain for a comprehensive and continuing study of the subjects on which the papers presented have given a general review.

This does not apply, of course, to the tests with domestic heaters, which tests apparently must be carried out under artificial conditions. It is interesting to note the comparison of figures from tests on domestic heaters made by the Department of Mines in the 1925 and 1935 series; also the corresponding tests with different grades of Nova Scotia coals carried out at the Nova Scotia Technical College. Some years ago the Fuel Committee of the Montreal Branch of The Engineering Institute carried on an investigation on the burning of fuels available in the Montreal district and made records of actual consumptions in a number of houses over an entire heating season using different fuels under conditions which were considered to be average for the ordinary householder. These figures agreed in general as to comparative values with the Ottawa tests made at that time.

It would be of interest, and of value in developing improved designs of house heaters, if the heat balance of the tests made were published showing where losses occurred and giving flue gas temperatures, together with details of heaters used and observations as to smoke, soot, etc., particularly for Nova Scotia coals.

Mr. Munroe's paper deals very clearly with the production of coke in Canada for domestic use. It is gratifying to note the success of experiments by which certain Nova Scotia coals may be prepared to form a satisfactory fuel for domestic coke manufacture.

In the writer's opinion there are economic possibilities for a wider use of gas and domestic coke than at present.

Mr. Munroe points out the effect on Canadian producers of the importation of low priced coke from Europe. This is obviously a matter for government attention and control since with business and human nature as it is, it is useless to expect any one to pay even ten cents more per ton for equal quality on the theory of general benefit by keeping money in the country.

The papers by Messrs. Haanel and Gilmore and by Professor Stansfield contain much original and valuable matter on the classification and testing of coals and the extremely interesting and important suggested formulae for combustion results and the use of gross vs. nett efficiency, supplementing the extensive work which they have carried out in the past.

A phase of the subject which could profitably be studied further is the character of the low fusible ashes, which is referred to briefly in the paper by Messrs. Haanel and Gilmore. In general, analyses of coals give merely the percentage of ash and the fusion point, but do not include analysis of the ash or slag as to iron content and other constituents. Particularly with coals from Nova Scotia and New Brunswick, the difficulties of burning result largely from the iron content slag and its formation in either an oxidizing or a reducing atmosphere. With the coke, iron and fluxing materials under forced draft we have all the elements of a first class blast furnace. Ash from certain western coals, which have an equal or lower fusion point, do not behave in the same manner nor present difficulties of the same kind, due to their different composition and character. As illustrative of one minor difference in effect, Professor Robb and Mr. Bull refer to the successful use of carborundum or carbofrax bricks in side walls of stoker furnaces burning Alberta coals. This material in solid brick form is rapidly attacked by the molten ash from Nova Scotia or New Brunswick coals, although the action can be reduced to a considerable extent by effective air cooling with special thin wall blocks.

From practical experience gained in the past, much improvement has been made during recent years in furnace design and equipment to meet the difficulties formerly encountered, but further investigatory work and published information as to ash constituents, characteristics and action under conditions obtaining in boiler furnaces would be of value.

Mr. McNaughton points out a feature which is not often considered, that is, the choice of coal to give a particular colour of ash as sometimes called for in a metallurgical furnace.

Dr. Stephens remarks upon the significance of boiler efficiency. Although possibly not altogether relevant to the subject under discussion, the writer would like to add his plea for the discontinuance of the use of the term "percent rating" when speaking of the output of a boiler unit, based on the old standard of ten square feet of heating surface per boiler horsepower. With modern steam generators comprising water wall furnaces, segregation of evaporating and water heating surfaces, etc., ratings on such a basis are absurd and mean nothing. The writer has preached this for many years and hopes that a more rational basis of performance soon will be recognized and generally used.

G. H. Jenkins[30]

The fuel department of the Canadian National Railways are large users of Western Canadian coals, and Alberta furnishes the largest portion. More than half of all of the coal purchased from Canadian mines in the west is used as locomotive fuel and firing practices are based on using the coal that is available in the vicinity of the Canadian National lines. This coal is not all alike, either in respect to rank, physical, or chemical characteristics, and an attempt is made to distribute the coals to areas where they will be used to best economic advantage. Some of it is not of the hardest structure, and, in some cases, the final size condition is not improved by further size degradation, caused in box car handling.

Against the foregoing size deficiency, however, some of the chemical constituents of Alberta bituminous coals, like the high fixed carbon content, low sulphur and moisture, and high ash fusing point, are desirable, and help balance the various factors entering into the use of Alberta coal for locomotive fuel purposes.

In order to reduce the number of cars in company coal service during grain carrying months, when cars are wanted for the commercial business, it has been the practice to move coal to selected points in the off-season, and dump it on the ground, which means another handling and size degradation.

The loss of heat value through storing selected Alberta bituminous coals in banks has not been found to be great. Heating and firing is a risk but it is not insurmountable.

[30] General Fuel Agent, Canadian National Railways, Montreal.

THE ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE OF CANADA

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

VOLUME XXI JANUARY, 1938 No. 1

A New Year's Message

The President and Council take pleasure in conveying to all members of The Institute cordial greetings and hearty good wishes for 1938.

To these should be added a word of appreciation of the constructive interest in the affairs of The Institute shown by the membership during the past year. Thanks to their active co-operation the Semicentennial celebrations were successful beyond our expectations, improvement in general conditions has been reflected in the substantial progress of The Institute itself, and it seems likely that in the coming year definite steps will be taken towards the establishment of closer relations between The Institute and the Associations of Professional Engineers.

With these and other encouraging features in mind an optimistic view of The Institute's prospects for 1938 seems amply justified.

Negotiations with Provincial Associations

During the year just closed there has been considerable activity of the Council on the lines of laying foundations for co-operation with a number of the Provincial Professional Associations, a matter in which President Desbarats has played a very prominent part through the medium of personal conferences in various parts of the country.

In the Province of Nova Scotia the greatest advance has been made, and through conversations between the representatives of the Council of The Institute, of the Institute's Branches and the officers of the Association of Professional Engineers, the tentative basis of an agreement has been reached, which it is hoped will lead in due course to a close co-operation in that Province. Naturally certain formalities are still required for the final consummation, such as the approval of the necessary enabling by-laws of the Institute and the Association.

Conferences have also been held in New Brunswick to a similar end, which while not as far advanced as in the case of Nova Scotia, nevertheless lead Council to hope that a satisfactory arrangement will be reached in the near future.

At the time of going to press, discussions are also under way with the Association of Professional Engineers of Manitoba. It will be remembered that a fairly definite scheme was under discussion in that Province a year or so ago and no doubt this proposal will form the basis of future conferences.

Our Branches and the Young Engineer

It is encouraging to note the success of the measures which have been taken in several of The Institute Branches with the object of developing the interest of our Junior and Student members in the work of The Institute and in engineering problems and topics other than those at which they happen to be working individually.

With such an end in view, the 'Junior Section' of the Montreal Branch was formed some five years ago and has been functioning actively since that time. It has shown a steady increase in numbers and in the popularity of its meetings, of which twelve were held in 1936 with an average attendance of forty-nine. The papers, usually in English (but occasionally in French), are well presented and give rise to active discussion in which everyone is encouraged to take part. That this section is filling one of the young engineers' real needs, is indicated by its growth from an original membership of seventeen to over ninety at the present time. It is managed entirely by its own elected representatives, and provides two papers annually for presentation at a meeting of the Montreal Branch.

Another example of a successful organization of similar character exists in Peterborough, where the younger members have formed a 'Junior and Students' Discussion Club' under the auspices of the Branch. The Club's deliberations are largely informal. At some of the meetings written papers are presented by members and then discussed. For other meetings, two speakers are appointed well in advance of the date selected. They choose their own subjects, of which the remaining members are promptly notified; in this way everyone comes prepared to contribute to the discussion. The average attendance at such meetings has been thirty. The subjects—largely electrical—have included such topics as commutation, fluorescent lighting, high voltage direct current transmission, and lightning protection.

Branch organizations of this kind, formed at centres where there are enough Students and Juniors to club together, can render a very real service to The Institute and to our younger 'engineers-in-training.' They do this, first, by bringing to The Institute the right type of young and active member, who will later be available to take part in the regular activities of the Branch and of The Institute, and, secondly, by giving these young men opportunities to secure training in public speaking and the conduct of meetings, to increase their store of professional knowledge, and to meet each other and the senior members of the profession under congenial and informal conditions.

The Fifty-Second Annual General and General Professional Meeting

The Annual General Meeting for 1938 will be convened at Headquarters, 2050 Mansfield Street, Montreal, on Thursday, January 20th, 1938, at eight o'clock p.m.

After the transaction of formal business the meeting will be adjourned to reconvene at the Hotel London, London, Ont., at 2.30 p.m. on Monday, January 31st, 1938, continuing with the Professional Sessions on the following days.

Programme of Meeting in London

(Subject to minor changes)

Headquarters: The Hotel London

MONDAY, JANUARY 31st

10.00 a.m. REGISTRATION.

12.30 p.m. INTRODUCTORY LUNCHEON (Ball Room).

Members $1.00.

Chairman: A. O. WOLFF, M.E.I.C., Chairman of the London Branch.

Welcome by His Worship the Mayor of London.

Address by PROFESSOR J. A. SPENCELEY, University of Western Ontario. Subject: "Robinson Crusoe."

2.30 p.m. ANNUAL GENERAL MEETING OF THE INSTITUTE (Ball Room).

Reception and discussion of reports of Council, Committees and Branches.

Discussions on proposals for the amendment of the By-laws.

5.00 p.m. Scrutineers' Report and Election of Officers.

Address of the Retiring President.

Induction of new President.

8.30 p.m. ANNUAL GENERAL MEETING (continued if necessary).

TUESDAY, FEBRUARY 1st

9.30 a.m. PROFESSIONAL SESSION (Ball Room).

Chairman: J. A. VANCE, A.M.E.I.C.

The following papers will be presented and discussed:—

(1) **Engineering the Highways for Safety,** by A. A. Smith, M.E.I.C., Chief Engineer, and C. A. Robbins, District Engineer, Toronto, Department of Public Highways, Ontario, Toronto, Ont.

2.15 p.m. (2) **Engineering Efficiency into the Highways,** by Miller McClintock, Ph.D., Director, Harvard University Bureau for Street Traffic Research, Cambridge, Mass.

7.00 p.m. ANNUAL DINNER OF THE INSTITUTE (Ball Room).

THE PRESIDENT in the chair.

THE HON. MITCHELL F. HEPBURN, Prime Minister of Ontario, will address the members and ladies present.

The prizes and medals of The Institute will be presented.

The Dinner will be followed by an *entertainment* organized by the London Branch of The Institute.

Tickets for Dinner and Entertainment $2.50 per person.

WEDNESDAY, FEBRUARY 2nd

9.30 a.m. PROFESSIONAL SESSION (Ball Room).

Chairman: R. L. DOBBIN, M.E.I.C.

The following papers will be presented and discussed:—

(1) **Precipitation in Southwestern Ontario,** by John Patterson, Controller, Meteorological Service of Canada, Toronto, Ont.

(2) **Surface Run-off in the Thames and Grand River Basins in Ontario,** by Norman Marr, M.E.I.C., Chief Hydraulic Engineer, Dominion Water and Power Bureau, Ottawa, Ont.

(3) **Agricultural Drainage in Southwestern Ontario and its Effects on Stream Discharge,** by G. A. McCubbin, M.E.I.C., Surveyor and Civil Engineer, Chatham, Ont.

(4) **Flood Control and Water Conservation in Southwestern Ontario,** by F. P. Adams, A.M.E.I.C., City Engineer, Brantford, Ont.

12.30 p.m. OFFICIAL LUNCHEON (Ball Room).

Members $1.00.

THE ONTARIO VICE-PRESIDENT in the chair.

Address by MAJOR F. L. C. BOND, M.E.I.C., General Manager, Central Region, C.N.R., Toronto, Ont.

2.15 p.m. PROFESSIONAL SESSIONS (held simultaneously in the Ball Room and City Hall Auditorium).

(*A*) In the *Ball Room,* the discussion on **Flood Control** will be continued.

(*B*) In the *City Hall Auditorium: Chairman:* COL. IBBOTSON LEONARD, M.E.I.C., the following papers will be presented and discussed:—

(1) **Canadian Steam-Electric Power Plants,** by C. A. Robb, M.E.I.C., Professor of Mechanical Engineering, University of Alberta, Edmonton, Alta.

(2) **Design and Construction of the 18-foot Steel Pipe Line at Outardes Falls, Que.,** by A. W. F. McQueen, A.M.E.I.C., Hydraulic Engineer, H. G. Acres and Company, Ltd., Niagara Falls, Ont. and E. C. Molke, A.M.E.I.C., formerly Designing Engineer, H. G. Acres and Company Ltd., Niagara Falls, Ont.

Natural Science Building, College of Arts, University of Western Ontario.

Municipal Offices, London, Ontario.

LADIES' PROGRAMME

A special programme of entertainment for the ladies is being arranged by the Ladies' Committee.

Visiting ladies and ladies of the London Branch will be guests of the Branch at the following—Tea at Byron Sanatorium on Monday afternoon, following by a Theatre Party in the evening; also a Luncheon and Bridge on Tuesday at the London Hunt and Country Club.

Visiting ladies will also be guests of the Branch at the Luncheons on Monday and on Wednesday at the Hotel London.

INDUSTRIAL PLANTS AND PUBLIC INSTITUTIONS

The Committee will be happy to make arrangements for members who would like to visit any of the industrial plants or public service institutions in or near London; members will please notify the Registration desk as to their wishes regarding this.

Among such establishments may be mentioned the following:—

- The University of Western Ontario
- The Byron Sanatorium
- The City Waterworks and Sewage Disposal Plant
- The Industrial Plants of
  - E. Leonard and Sons Limited
  - Empire Brass Mfg. Co. Limited
  - General Steel Wares Limited
  - George White & Sons Co. Limited
  - John Labatt Limited
  - Kellogg Company of Canada Limited
  - London Concrete Machinery Co. Limited
  - London Structural Steel Co. Limited
  - McCormick's Limited
  - Murray Shoe Company Limited
  - Roberts-Wilcox Canadian Co. Limited
  - Service Lamp Co. Limited
  - Sparton of Canada Limited.

Dual Highway—Toronto to Hamilton.

Dual Highway—Toronto to Hamilton.

ANNOUNCEMENTS

Hotel Arrangements

In order to be certain of accommodation members are *urged to make definite arrangements for rooms at least a week in advance.* Reservations are to be made directly with the Hotel—acknowledgment will be made direct to member.

The Hotel London quotes the following rates:—

Single room with running water and toilet—
$2.50 per day.
Single room with bath—
$3.00 and $3.50 per day.
Double room with bath—
$4.00, $4.50 and $5.00 per day.

The Hotel London is the headquarters for the meeting—all attending are requested to register at the meeting headquarters immediately upon arrival.

Railway Rates

Both railways offer the following return rates for groups of ten or more:—

(*a*) Organized parties having a minimum of ten up to fourteen persons: Single fare and a half.

(*b*) Organized parties of fifteen to twenty-four persons: Single fare and a quarter.

(*c*) Organized parties of twenty-five or more: Single fare and one-tenth.

All these fares require the party to travel together on the same train and date on the going trip, with individual return on any train within the time limit of sixteen days. They apply either to coach rates or ordinary first-class rates. Members intending to proceed to London by train are requested to *notify their Branch Secretaries* without delay, so that parties may be made up locally.

Local Committee on Arrangements

Chairman.................... E. V. Buchanan, M.E.I.C.
Vice-Chairman................ J. A. Vance, A.M.E.I.C.
Secretary.................... D. S. Scrymgeour, A.M.E.I.C.

Members...	S. W. Archibald, M.E.I.C.	H. L. Hayman, A.M.E.I.C.
	F. C. Ball, A.M.E I.C.	W. C. Miller, M.E.I.C
	F. A. Bell, A.M.E I.C.	V. A. McKillop, A.M.E.I.C.
	H. F. Bennett, M.E.I.C.	H. A. McKay, A.M.E.I.C.

Ladies Committee

Chairman.................... Mrs. E. V. Buchanan

New Dominion Public Building, London, Ont.

The Work of the Hydro-Electric Power Commission of Ontario

An Address Delivered by T. H. Hogg, D.Eng., M.E.I.C.

At a dinner on December 8th, 1937, on the occasion of his appointment as Chairman of the Commission.

Mr. Chairman, Mr. Prime Minister, honoured guests, and members of the Engineering Fraternity of Canada: Tonight I address myself to the engineering fraternity of Canada, partly because the nine societies which have sponsored this gathering in my honour are thoroughly representative of the engineering fraternity of Canada, partly because individual references to each society might call for distinctions of some delicacy, and partly because, on this unique occasion, my heart goes out to the profession at large.

In an interview given last month, I made a statement to the effect that I was not interested particularly in my job as Chairman, but was intensely interested in what could be done with it. This was one way of intimating that there is attached to this post a responsibility so great, involving a burden so considerable as to more than offset any personal satisfaction or feeling of pride arising out of the distinction which it carries, leaving only one thing to rejoice over; fortunately that one thing is a very big thing in which I said I was intensely interested, "what can be done with the job?" I am inspired by the opportunity to do something much greater than I have ever done before for one of the greatest institutions in my native Province, in whose service I am proud to say I have spent the best part of my life; for that opportunity I wish to express my most sincere thanks to the Prime Minister of Ontario and his colleagues. To you who have so spontaneously expressed your approval of my appointment, I feel the deepest personal gratitude. At the same time I feel that the choice of an engineer as Chairman of the Commission is a tribute to the engineering profession to which I belong, rather than a mark of personal distinction.

How can any man fail to do his very best when he is supported by the knowledge that so many friends pin upon him their hopes for the accomplishment of fine things, confident that he will not be found wanting.

Opportunities have opened up to me through my activities as an engineer, and my reputation as an engineer is dear to my heart. The activities which are described as "executive," and which will henceforward claim an even greater portion of my time than formerly, are of a more recent order.

Years of experience in the engineering field inevitably establish as a matter of course, cautious approach, careful inquiry and measured appraisal, the attitude of mind which can rest only on a firm foundation of fact, and which frowns on irresponsible exaggeration and subterfuge; I think you will agree that this common heritage of the mature engineer is an asset in any responsible post.

However, for responsible executive positions, something more is required; there must be the capacity to effectively synchronize, each in its proper perspective, a variety of administrative functions and to so direct the co-ordinated organism that its purpose may be fully, effectively and economically achieved. I can only hope that the qualities and capacities demanded for the performance of the executive duties which now devolve upon me may prove to be present in sufficient measure to enable me to discharge the trust which has been placed in my hands in a manner which will reflect credit upon the Commission, so that it will continue to be a source of pride to its employees and the public at large.

The story of the origin and phenomenal development of that great institution founded by Sir Adam Beck which we in Ontario call "Hydro," must be familiar to most people in this Province and to many elsewhere, for it has been told over and over again. Yet I sometimes wonder how many grasp the significance of the story or have more than a meagre appreciation of the nature and function of this enterprise which is so vital to the well being of Ontario homes and industry; indeed, many of those who have been immersed in "Hydro" activities for upward of twenty-five years or more must pause and take stock to realize what it is today, so great has been its growth and extension, yet so unobtrusive.

Prior to the depression, the whole enterprise was characterized by an uninterrupted record of expansion, until it seemed as though there could be no end to it, not even a pause. This period was not without difficulties. Difficulties in obtaining power to meet the rapidly increasing demands. Difficulties due to selfish interests, and many other difficulties too numerous to mention.

This enterprise, with its $314,000,000 in physical assets, exclusive of any assets of the municipal electric utilities, its interest bill of $13,000,000 per year, its annual wage outlay between $8,000,000 and $9,000,000, its forty-one generating stations aggregating 1,425,000 horsepower in capacity, its peak-load demand, which last year was about 1,600,000 horsepower and this year will be materially greater, and its 18,000 circuit miles of transmission lines of all voltages, including rural, has tremendous potentialities for good. With proper handling, it is a servant of incalculable value, but lacking intelligent direction it may be transformed into an exacting taskmaster, perhaps even a gigantic octopus. If the interests of this institution should ever become secondary to other interests in the minds of the men who are at its head, then, surely, the transition from servant to octopus is inevitable.

Active in Three Fields

The object and justification for the existence of the Hydro-Electric Power Commission of Ontario is the distribution of power throughout the Province in the best interests of all the people. Naturally, the people's interests demand that power be supplied at the lowest possible cost consistent with security of service and proper guarantees of future supplies. The Commission has no assets in its own rights; it is simply a trustee administering the affairs entrusted to it. In the discharge of its responsibilities, the Commission is active in three principal fields:

1. The municipal field.
2. The fields of rural supply.
3. The Northern Ontario field.

Bear with me while I enlarge somewhat on this, even though much of the ground is familiar.

In the municipal field, the Commission is principally concerned with the wholesale delivery of power to cities, towns and villages, which, in turn, distribute it to individual customers, subject to certain Commission supervision. The municipalities associate themselves into co-operative groups, usually referred to as systems, which collectively are responsible for all provisions made on their behalf in the form of power developments, transmission facilities, power purchases or services.

Each system is a separate and distinct entity, and the municipalities of which it is composed are entitled to all benefits derivable therefrom and obligated for all its losses, quite independently of the success or failure of any other "system" or group of municipalities.

It is, of course, a cardinal principle that each municipality must pay its proper share of the cost of power and each municipality is obligated under the Power Commission Act and its contracts to ensure the Commission against default.

In the second field; namely, the field of rural supply, the Commission is both wholesaler and retailer. The settled parts of the Province are divided into rural districts. Each rural district derives its power supply from one of the municipal systems and pays for it on a cost basis as though it were a municipality of the group, and each is financially independent of all the others. Neglecting the fact that the Province bonuses rural areas to the extent of supplying half the capital cost of rural primary lines, rural power is sold to rural customers on a strictly cost basis at rates depending upon the district cost of power and the added cost of distribution; the act provides for the collection of over-due accounts by tax levies.

It will be noted that in both the municipal and rural fields, the Province assumes no risk unless through the insolvency of its municipalities, for the latter are obligated under the terms of their contracts and the Power Commission Act for all expenditures made on their behalf by their trustee, the Commission.

In these two fields of endeavour, viz., municipal and rural, the Commission's physical properties have rapidly spread all over Southern Ontario, where there are now scores of generating stations, hundreds of transformer stations, and a veritable network of transmission and distribution lines.

In Northern Ontario, the third field, the situation is quite different from either of the other two, and should be particularly interesting to mining men. In the main, even the settled part of the country is sparsely settled and a great deal of it is in the natural state. The distances are great and the principal demand for power comes from mines or industries associated with the mining industry. No group of municipalities exists in this territory which could possibly finance developments of the magnitude needed to supply the mines and allied industries. Consequently, the title to the power developments and transmission systems rests in the Province and the risk of loss, in case of customer default or from any other cause, rests upon the Province and not upon any group of municipalities as in Southern Ontario. The Commission operates the Northern Ontario properties, which consist of the Nipissing, Sudbury, Abitibi, Patricia, and St. Joseph districts, as trustee for the Government.

Throughout these districts there is great activity. Generating stations, transformer stations and transmission lines are making their appearance at an astonishing rate. The large Abitibi Canyon plant is rapidly being loaded with primary power, generating stations have been established and extended on the Albany and English rivers at Rat Rapids and Ear Falls, respectively, and the recently acquired Crystal Falls plant on the Sturgeon river has been connected to the Wahnapitae system to provide for the growing load.

Starting insignificantly in the 1890's, the metal mining industry of Ontario has now become one of the major industries of the Province, second only to agriculture. Its output in 1936 was valued at $165,000,000, and the estimate of the Ontario Department of Mines for 1937 approaches $205,000,000. During 1936 it employed 23,000 men and paid an annual wage bill of $35,300,000.

Moreover, despite the ups and downs of the stock market, present indications point to a large and prolonged increase in mining activity. Forecasts of the Ontario Department of Mines indicate that there will be a 15 per cent increase in mineral production in 1937 over 1936. Diamond-drilling, which is always considered an excellent yardstick in appraising the general trend in mining development, showed a 100 per cent increase in core footage in 1936 over 1935. Diamond-drilling companies alone spent last year $1,500,000 in wages and employed 1,473 men.

Mines must have power, and many mines must have cheap power otherwise they cannot operate. In many cases the Commission is in a position to supply the power at rates which permit the opening and operation of the mines, but the question of financial guarantees sometimes presents an obstacle. Will the mine prove itself, or will it be a failure? Caution urges against the investment of capital in transmission lines to supply a mine which may only operate a few years, and all manner of reasons are brought forward as to why the Commission, as trustee of the Government, should take no risk, but should invariably require the mines to deposit security which would guarantee the Commission against any possible loss.

Is this a short-sighted viewpoint? It is apparent that large capital expenditures should not be made on behalf of uncertain mining prospects; but may there not be circumstances under which the Province, through the agency of this Commission, might well co-operate with established mines in the construction of transmission lines which enable them to be supplied with electric power? Participation to this extent might be justified, and might actually be made attractive by charging such rates for power as, in the aggregate, would show a profit notwithstanding an appropriate allowance for short life and consequent losses. This is the practice of privately owned power companies, and the arguments in favour of its adoption by the Province are worthy of very careful consideration. For example, suppose a mine should close down after a few years of operation, leaving the Commission with a capital investment in a transmission line which has not been fully retired; is it not possible that the indirect benefit to the Province of that few years of mine operation might more than offset the loss of the unretired capital so that the Province would actually gain by a transaction which superficially might appear to be to its disadvantage?

A precedent already exists in rural operation for Provincial aid where the indirect return justifies it. In that case, the Government furnishes capital to the extent of one-half the cost of the primary lines without any expectation of its return, whereas in the mining field it would look for compensation for all losses from revenue received from the successful mines. As already stated, this is the policy of large private power companies operating in mining areas. These companies recognize that they, too, must have a stake in the mines if the mining country is to be developed, and they are content to take more or less selected risks.

In any large organization, the question of financial reserves is one of great importance and considerable complexity. From its inception, the Commission has set up three principal reserves:

1. A sinking fund, which is accumulated to retire all capital indebtedness.

2. A depreciation and obsolescence reserve, which accumulates at a rate sufficient to make available for replacement or reconstruction, at the end of their useful life, the full capital cost of all buildings and apparatus.

3. A contingency reserve, which is drawn upon to defray the cost of all manner of individually unpredictable events; for example, damage caused by lightning, winds and floods. This contingency reserve furnishes the broad stabilizing influence of insurance.

As the state of these reserve accounts is an indication of the soundness of the general financial position of Hydro, it has been the subject of considerable public discussion of late years. I do not intend to analyze these reserves or the security which they provide, but I am very pleased to say that they are in excellent condition and that Hydro's position is very strong indeed. The safeguarding of these funds and the continuance of a sound policy with respect to reserves is quite evidently one of the most important duties of the Commission, and I assure you that I shall let nothing interfere with their maintenance in the soundest possible condition, while at the same time making such proper use of them as they were and are intended to fulfil.

After the intense anxiety of depression and early recovery years, it is pleasant, and I think I may say, without being misconstrued, that it is gratifying, to contemplate the healthy, vigorous and substantial load growth which all systems of the Commission are showing. Leaving out of consideration all deliveries of secondary power, namely, surplus power which the Commission supplies at will or when available, the Niagara System has been running 10.5 per cent higher than last year, Eastern Ontario 11 per cent, Thunder Bay 18 per cent, and Georgian Bay, where the Ragged Rapids plant of 10,000 horsepower is under construction, none too soon to provide for next year's growth, 8 per cent above last year. In the Northern districts, Abitibi is up 41 per cent, Sudbury 8 per cent, Nipissing 10 per cent, Patricia 18 per cent and St. Joseph 77 per cent. Last December the annual growth in primary load of all systems was 9.6 per cent, and there is every indication that that figure will be exceeded this year.

Notwithstanding the importance of this question of load growth, a detailed analysis of the figures is altogether too intricate for presentation here; publication of further information relative to loads will be reserved for future statements.

Prior to the fall of 1925, there had been a great deal of discussion as to advisability of making extensive steam power developments, which was terminated by a pronouncement of the Commission in favour of hydraulic power. I wish to point out that there are still extensive undeveloped hydraulic power resources in Southern Ontario on interprovincial or international streams, where the development of power cannot be undertaken without interprovincial or international agreements. As agreements of this kind often take considerable time to consummate, the prospect of obtaining power from these sources, in the immediate future, is uncertain.

However, every possible effort should be made to develop and utilize these resources before resorting to steam, although, for certain special purposes, steam power may have its place in the composite framework of the Commission's resources and in the not too distant future.

As an engineer, I am acutely conscious of the fallibility of even the best apparatus, of the reality of the service threat to existing plants through the enormous forces of floods, winds and ice, and of the degree of probability that substantial losses in supply may occur for considerable periods of time and for a variety of reasons. This is not a question of timidity; it is simply a realization of the nature and ominous consequences of the possible occurrence of certain events, commonly classed as contingencies, which might disastrously affect the service being rendered by the Commission.

Shortage Would Be Grave

Can the industries of this Province complacently face the possibility of a shortage in power? You, as engineers, recognize the enormity of the consequences of a serious shortage for weeks or months; but do the people at large, who would be called upon to face that loss, realize what it would mean? I think not.

Considering the hazards and the weight of responsibility which rests on this Commission, and bearing in mind the lengths to which other large public utilities go to provide against contingencies, I ask you whether it is surprising that I stress the necessity of making provision for the two undernoted requirements:

1. Provision of a continuously available power reserve, in excess of primary requirements, to meet contingencies which may arise without warning.
2. Positive provision for future load growth so as to guarantee adequate supplies from economical sources.

This question of future supplies is one on which I wish to make my meaning very clear, so, at the risk of labouring the point, I shall cite an example:

Suppose a survey of resources indicates that from the long-range point of view it is economical and desirable to undertake a certain large hydraulic development, and suppose that three years must be allowed from the time this project is authorized until power can be obtained from it. It is obvious that such a development must be authorized at least three years in advance of the anticipated date on which power from it will be needed and that the estimated growth requirements of the intervening years must either be in hand or available on demand or otherwise obtainable and assured.

It is only the part of common prudence to avoid onerous commitments so long as the future is not being jeopardized by doing so, but it is also the part of wisdom to complete preliminary arrangements and always have work so well in hand as to be able to meet, by acceleration of existing programmes or otherwise, whatever growth in demand is reasonably probable. Failure to do this may have much more serious consequences than an error in the reverse direction, especially as the cost of reserve power is comparatively little owing to the ready market for it on an at-will basis.

There is a question that has recently excited a great deal of public interest and, in some quarters, considerable apprehension, about which a few words may be appropriate here; I refer to the nature of the relationship between employer and employee, often referred to as the relationship between capital and labour. The struggles which have taken place in the past between employees indicate very clearly that it is not wise to have employees who are dissatisfied, much less resentful and bitter. Such a state of affairs is demoralizing and adversely affects the efficiency of the service being performed. When no better alternative is in evidence a worker will usually accept with comparative cheerfulness a very low wage provided he is convinced the business in which he is employed cannot properly pay more; whereas he would keenly resent being held down to a low rate if he were convinced that a higher rate were in all fairness amply justified.

The full significance of this will be apparent when it is remembered that no system of supervision or coercion will wring from an unwilling disgruntled worker his best efforts, for his best is invariably the spontaneous product of his interest, his enthusiastic voluntary effort and his will to do, as well as his skill and intelligence. Compared with this "best" the grudging minimum of the dissatisfied worker is but a poor apology, expensive at almost any price.

I believe this to be a fundamental psychological fact and the prime reason why progressive management today recognizes the need for scrupulous fairness in dealing with employees and lays such stress upon the establishment of effective channels through which views and ideas may be interchanged, facts displayed, explanations made, agreements reached and mutual understanding attained, to say nothing of much incidental technical benefit. Without such a channel suspicion is apt to grow into misunderstanding, misunderstanding into resentment and resentment into cessation of work.

Workers usually respond to progressive managerial methods of this kind and quickly recognize the mutuality of their interest with that of management. Their attitude of mind toward management changes from one of suspicion and latent antagonism, with all its attendant dangers of possible injury to the business in which they are engaged, to one of sympathy and understanding, which, in turn, stimulates in them the otherwise dormant desire to increase their efforts in the interests of that business in the confident hope and expectation that their efforts will be fairly rewarded by management; in other words, the spirit of understanding and fairness displayed by management begets a like spirit among the workers.

In the Commission's case this contact channel has been established for the benefit of all employees, through a plan of representation, by which employees are provided with duly accredited representatives who act on district and general committees, and meet with management representatives. While the plan is young as yet, much has already been accomplished in the way of establishing improved standards of wages and working conditions, and it is my firm conviction that, properly administered in a spirit of frankness, fairness, mutual appreciation of difficulties and sympathetic readiness to make concessions, it will be of the greatest value, both to the staff and to the Commission.

I am sure you will agree that it is only proper, both from the point of view of economy and social justice, that a large publicly owned utility such as ours should give constructive leadership in the matter of fair treatment of its employees, especially when it is realized that, taken by and large, the individuals who comprise the Commission's staff are well trained and well qualified for their work. If the foregoing is accepted it must also be conceded that special care must be exercised in the selection of employees for the service according to qualifications, that systematic training methods are necessary, and that those who fail to measure up to the progress requirements must be weeded out at the earliest possible stage, in their own interest as well as that of Hydro.

In short, the performance of the Commission's staff is a matter of great importance, and nothing should be left undone to establish and maintain it upon the highest possible level.

The splendid reputation now enjoyed by all ranks of the Commission's staff has been earned by loyal and efficient service and is well deserved. I have for them only words of the highest praise and I am confident that the Commission can count on them all to maintain if not improve their present record in this respect.

Under the British system it is considered that every citizen of voting age has an inalienable right to have a voice in government and in public affairs relating thereto. The method of expression may vary widely but the right remains.

Without public confidence the administration of a publicly owned institution must become more or less weak and lacking in constructive contribution. Therefore, the Commission must maintain and, if possible, increase public confidence in its administration; failure to do so would be fatal. But how can public confidence be acquired and retained without keeping the public fully and effectively informed about all important Hydro matters and encouraging constructive criticism of Hydro affairs?

Let me voice a word of caution about public criticism. Criticism may be just or unjust, intelligent or ignorant, well-meaning or selfish, straightforward or misleading, constructive or destructive, but, if it is not actually vicious it all has its place; in the main, public criticism, like vigorous opposition in government, is healthy, particularly if it is honest. It promotes caution, a tendency to weigh and consider. It reveals new viewpoints and new vistas which might otherwise escape attention. In the case of this Commission even the somewhat irritating and troublesome investigations of the past have brought in their train indirect benefits.

Nevertheless, there is a time and a place for everything, and even though I am not altogether a newcomer to this work, a short period of adjustment will necessarily be required to enable me to properly and intelligently appraise my responsibilities; when the adjustment period is over I shall welcome constructive criticism.

My remarks tonight would not be complete if I did not refer to my fellow-Commissioners. From the very first, both Mr. Houck and Mr. Smith have given every indication of their firm intention to discharge their duties in formulating and directing Hydro policies in a way which will do credit to themselves, to the Commission, and to the municipalities.

I approach my new responsibilities as Chairman of the Hydro-Electric Power Commission with humbleness of mind. My duties as Chief Engineer will not take me away from familiar ground, but those of Chairman involve a greatly extended field of activities, and call for the exercise of very different qualities.

Before closing, there is one last word I would leave with you; it is not new, yet it can scarcely be driven home too often.

If we do not want excellence in the conduct of Hydro affairs to lapse and become one of the many sporadic things which momentarily appear upon the stage of life only to disappear and be forgotten, we must constantly be alive to the dangers which from time to time beset Hydro, and we must test all proposals with respect to it in the light of their effect upon the future.

If this viewpoint is to be carried forward as time goes on, the Commission must constantly seek to improve the already high standard of Hydro service, to maintain it at a level which will be unexcelled elsewhere and to expand the great advantages which Hydro affords the people of Ontario.

If we think of ourselves as trustees, who, though not exactly answerable to future generations for our acts, are, nevertheless, morally responsible for handing down this great public heritage unimpaired, we shall probably not go far astray.

Past-Presidents' Prize 1937-1938

The subject prescribed by Council for this competition for the prize year July 1st, 1937 to June 30th, 1938, is **"Stream Control in Relation to Droughts and Floods."**

The rules governing the award of the prize are as follows:

The prize shall consist of a cash donation of the amount of one hundred dollars, or the winner may select books or instruments of not more than that value when suitably bound and printed, or engraved as the case may be.

The prize shall be awarded for the best contribution submitted to the Council of The Institute by a member of The Institute of any grade on a subject to be selected and announced by Council at the beginning of the prize year, which shall be July 1st to June thirtieth.

The papers entered for the competition shall be judged by a committee of five, to be called the Past-Presidents' Prize Committee, which shall be appointed by the Council as soon after the Annual Meeting of The Institute as practicable. Members and Honorary Members only shall be eligible to act on this Committee.

It shall be within the discretion of the Committee to refuse an award if they consider no paper of sufficient merit.

All papers eligible for the competition must be the bona fide work of the contributors and must not have been made public before submission to The Institute.

All papers to be entered for the competition must be received **not later than June 30th, 1938,** by the General Secretary of The Institute, either direct from the author or through a local Branch.

OBITUARIES

Morris Stansfield Blaiklock, M.E.I.C.

Members of The Institute will learn with regret of the death of Morris Stansfield Blaiklock, M.E.I.C., on November 25th at his home in Montreal. He was 78 years of age at the time of his death, having then born in Quebec City on July 19th, 1859.

Mr. Blaiklock was educated in Montreal and in 1885 was indentured to W. T. Thomas, an architect, entering the engineering department of the Grand Trunk Railway in 1880. From 1890 to 1892 he acted as assistant engineer on the construction of the St. Clair tunnel, when he returned to Montreal as an inspector of operations for the railway. In 1897 he was appointed resident engineer of the eastern district and superintendent in 1902. He became engineer, maintenance of way, Grand Trunk Railway System, in 1907, holding this position until 1912 when he was appointed assistant chief engineer, operating department, of the Canadian National Railways. In 1930 he received the appointment as assistant chief engineer of the system, retiring in 1931 after more than 50 years of service.

Mr. Blaiklock was particularly active in connection with the co-operative management plan with maintenance of way employees on the Canadian National System and continued as chairman of the general co-operative committee of maintenance of way employees after his retirement.

He joined the Canadian Society of Civil Engineers in June 1909 and became a Life Member in October 1932.

Allison Robert Chambers, M.E.I.C.

It is with great regret that we announce the sudden death of Allison Robert Chambers, M.E.I.C., of New Glasgow, Nova Scotia, in Montreal on December 4th, at the age of 58 years. Mr. Chambers was born at Halifax, January 14th, 1879, receiving his technical education at McGill University from which he graduated with the degree of B.Sc. in 1904. From that date until 1908 he acted as mining engineer and resident manager for the Nova Scotia Steel Company at Wabana, Newfoundland. In 1909 he was appointed mining engineer and in 1911 assistant manager of the ore mines and quarries department of the same company at New Glasgow, Nova Scotia. He was later designated manager and served in that capacity until 1917 when he founded and became president of the Malagash Salt Company.

Mr. Chambers from that time devoted himself not only to the operation of the salt mine of this company at Malagash but also to expanding the use of the product.

He was one of the pioneers in investigating and advocating the use of common salt to stabilize the surface of highways and to him is due much credit for the progress already made in this practice in Canada and elsewhere.

Mr. Chambers became a Member of The Institute in January 1919.

Horace Bruce Kippen, A.M.E.I.C.

We regret to announce the death of Horace Bruce Kippen, A.M.E.I.C., who died on December 10th, 1937, at his home in Toronto. Mr. Kippen was born in Kent, England, on September 3rd, 1862. He came to Canada at an early age and his first engineering experience was with the Atlantic and North Western Railway, in Maine in 1887. In 1889 he was engaged on the Qu'Appelle, Long Lake and Saskatchewan Railway, then later on the Saskatoon and Battleford Railway, surveying a projected line from Saskatoon to Battleford, and with the Calgary and Edmonton Railway.

He was appointed assistant engineer with the Quebec Central Railway in 1894. Sir William Van Horne later employed him on the construction of a railway in Cuba. Between 1904 and 1910 he had charge of the building of the Canadian Pacific Railway lines and bridges on the Toronto Sudbury route.

Mr. Kippen later joined the Canadian National Railway and became assistant engineer on maintenance, retiring in 1932.

He joined the Canadian Society of Civil Engineers as a Student in November 1890, transferring to the class of Associate Member in 1894.

John Grant MacGregor, M.E.I.C.

The death of John Grant MacGregor, M.E.I.C., a Life Member of The Institute, occurred in Vancouver, B.C. on October 19th, 1937. Mr. MacGregor was born at Morryburgh, Scotland, on May 10th, 1862, and was educated at Gartshorrie Academy and School of Mines. From 1880 to 1885 he was an engineering pupil of James Fraser of Inverness, Scotland, and from 1886 to 1890 acted as assistant engineer on the Caledonia Railway. He came to Canada in 1890, receiving an appointment as assistant engineer of the Canadian Pacific Railway at Montreal on the survey and construction of branch lines. In 1899 he became principal assistant engineer with the Great Northern Railway, Quebec, and from 1900 to 1903 was principal assistant and bridge engineer with the Cincinnati, Hamilton and Dayton Railway. From that date until 1909 he held appointments with the Louisville and Nashville and with the Guelph and Goderich Railways, where with the latter he also acted as assistant to the late Mr. P. A. Peterson. In 1909 Mr. MacGregor was appointed chief engineer of the Alberta Central Railway.

He enlisted and went overseas with the Royal Canadian Engineers in 1916 and when demobilized held the rank of captain. On his return to Canada Mr. MacGregor had charge of highway work at Jasper Park, Alberta, and from 1925 to 1932 acted as resident engineer at Killarney, Manitoba.

For three or four years prior to his death Mr. MacGregor was virtually an invalid.

He joined the Canadian Society of Civil Engineers in April 1894 and transferred to the grade of Member in 1912.

Cyrus James Russell, A.M.E.I.C.

It is with deep regret that we record the passing of C. James Russell, A.M.E.I.C., in Sault Ste. Marie, Ont., on December 5th, 1937, after an illness of two and a half years. Mr. Russell was born in Renfrew, Ontario, in January 1885. He spent his early years in Renfrew and obtained his early education there. Following his graduation from the Renfrew Collegiate Institute. Mr. Russell taught school for three years. He then attended the School of Practical Science in Toronto for two years. A short period in electrical construction work in Northern Ontario, followed after which Mr. Russell joined the staff of the Tagona Water and Light Co. Limited, Sault Ste. Marie, Ont., in 1911, as line foreman. In 1914 he became associated with the City of Sault Ste. Marie, Ont. Water and Light Commission as line superintendent. This position he held until 1918 when he joined the staff of the Great Lakes Power Co., Limited, as line superintendent, which position he held until his death. Mr. Russell joined The Institute as an Associate Member in September 1925.

PERSONALS

H. D. Brydone-Jack, A.M.E.I.C., has been made assistant manager, department of personnel, Canadian Pacific Railway, Montreal. He graduated from McGill University with the degree of B.Sc. in 1911 and has since been employed with the Canadian Pacific Railway in various capacities, principally in Western Canada, until he came to Montreal in 1934.

Lt.-Col. G. R. Turner, M.C., D.C.M., R.C.E., A.M.E.I.C., has been detailed to attend a course at the Imperial Defence College, London, England. Lt.-Col. Turner graduated from the Staff College at Quetta, India, and on his return to Canada in 1927 was appointed assistant director of engineer services, Department of National Defence, Ottawa. For the last three years he has been on the general staff, Department of National Defence, Ottawa.

John G. Spotton, A.M.E.I.C., has resigned from the sales staff of Messrs Delany and Pettit to enter the business of manufacturers' representative in the field of electrical and mechanical engineering equipment. Mr. Spotton graduated in engineering, from the University of Toronto in 1922 and was connected with radio and electrical work in Guelph as the Spotton Engineering Company up to 1931, then with the above firm until his recent change. He is making his headquarters in Toronto and will represent a number of companies manufacturing engineering equipment.

Otto Holden, A.M.E.I.C., has been appointed chief hydraulic engineer of the Ontario Hydro-Electric Power Commission. He graduated from the University of Toronto in civil engineering with the degree of B.A.Sc. in 1913 and after a short period with the Public Utilities Commission, London, Ont., he joined the engineering staff of the Ontario Hydro-Electric Power Commission. In 1918 he was placed in charge of the design of hydraulic plants and since then has been engaged on developments at Cameron Falls, Ranney Falls, Queenston, Chats Falls and others. Mr. Holden has been assistant hydraulic engineer since 1923.

Promotions in the Royal Canadian Air Force

The following flying officers were recently promoted flight lieutenants: D. S. Blaine, S.E.I.C., R. C. Mair, S.E.I.C., and W. A. Orr, S.E.I.C. D. S. Blaine is a graduate of the Royal Military College and Queen's University in 1934. R. C. Mair received his engineering training at the University of Alberta from which he graduated in 1934. W. A. Orr also studied at the University of Alberta, graduating with the degree of B.Sc. in electrical engineering in 1932. All three have been with the Royal Canadian Air Force since prior to graduation.

Promotions in the Saguenay Power Company

F. L. Lawton, M.E.I.C., has recently been promoted chief engineer of the Saguenay Power Company. Prior to this he was electrical engineer with this company and with the Duke-Price Power Company, with whom he has been connected since 1927. Mr. Lawton graduated from the University of Toronto with the degree of B.A.Sc. in electrical engineering.

J. R. Hango, A.M.E.I.C., has become power engineer for the Saguenay Power Company. He is a graduate of the University of Alberta in 1927 in electrical engineering and after taking a course with the Canadian Westinghouse Company in Hamilton, Ontario, he joined the Duke-Price Power Company.

Charles Miller, A.M.E.I.C., has been promoted to the position of hydraulic engineer with the Saguenay Power Company Limited. Mr. Miller has been with the Duke-Price Power Company and the Saguenay Power Company since 1930. He is a graduate of Queen's University in civil engineering in 1930.

Amendments Proposed to the By-laws of The Institute

The following proposals to amend existing By-laws and to introduce a new By-law are hereby presented for the information of corporate members prior to the Annual General Meeting.

The proposals comprise (A) the addition of a new Section 76, and (B) amendments to Sections 44 and 51.

As printed below, matter not contained in existing By-laws is shown in **bold face** type.

(A) Proposed New Section

This would read as follows:

Section 76. **The council may co-operate with any association or corporation of professional engineers constituted by an Act of any Province of the Dominion of Canada (hereinafter referred to as "the Association") in furtherance of the mutual interests of the members of the Institute and of the Association. To this end, the council may, notwithstanding the foregoing By-laws, enter into an agreement with the Association regarding—**

(*a*) **The admission and classification as members of the Institute (in accordance with the foregoing By-laws insofar as the council in its discretion deems advisable) of applicants for membership in the Institute who are members of the Association;**

(*b*) **The amount, if any, and method of collection of entrance fees payable by applicants for membership in the Institute who are members of the Association;**

(*c*) **The amount and method of collection of annual fees payable by members of the Institute who are also members of the Association;**

(*d*) **Provision for the termination of the said agreement;**

(*e*) **Any other provisions necessary for the carrying out of the said agreement.**

To become effective, the said agreement, after publication in the Journal of the Institute, must be sanctioned by—

(1) **An affirmative vote of two-thirds of the letter ballots cast by the members of council; and**

(2) **An affirmative vote of a majority of all valid letter-ballots cast by the corporate members of the Institute resident within the Province of the Association.**

The above proposal for a new section is now presented by the council. It has also been accepted by the three accredited representatives of the thirty-one corporate members who put forward a series of proposals dated September 25th, 1937, in lieu of all but two of those original proposals. The council greatly appreciates the action of these representatives in making possible the submission to the membership of one brief general new by-law that will enable appropriate co-operation agreements to be worked out between The Institute and the provincial Associations of Professional Engineers.

(B) Sections 44 and 51

These sections in their amended form would read as follows:

Meetings of Council

Section 44.—The council shall meet at least once each month, from the beginning of October to the end of April, and at such other times as may be deemed necessary.

Eleven members shall constitute a quorum.

A meeting of council at which not less than five members are present, but not a quorum, shall constitute a "Committee of Council" to receive reports and make recommendations only, and all their resolutions must be approved by a majority of the council by letter-ballot or by a regular meeting of the council.

Management

Section 51.—Each branch shall be managed by an executive committee which shall include:—

(*a*) A chairman, secretary and treasurer, and not less than three other members, all to be known as elected members and to be balloted for by all members of the branch entitled to vote at branch elections. The secretary and treasurer may, as an alternative, be appointed by the executive committee, instead of being elected by the members of the branch.

(*b*) Those members of council resident within the jurisdiction of the branch, to be known as ex-officio members, **such ex-officio members not to exceed four in number and to be determined by the order of their official seniority,** and

(*c*) The immediate past-chairman and the immediate past-secretary of the branch, to be known as members emeriti, these latter to be members for only the year immediately following their term of office.

The above proposals for amendments to Sections 44 and 51 have been presented by thirty-one corporate members, whose representatives have requested the council to submit them to the members on a separate ballot from that for the new Section 76, and also in such form that a separate vote may be taken for each of the sections to be amended.

R. J. DURLEY,
Secretary.

Montreal,
December 27th, 1937.

ELECTIONS AND TRANSFERS

At the adjourned meeting of Council held on December 20th, 1937, the following elections and transfers were effected:

Members

BALLOU, Frederick H., Mech.Eng., (Stevens Inst. of Technology), chief engr., B.C. Sugar Refining Co. Ltd., Vancouver, and Canadian Sugar Factories Ltd., Raymond, Alta.

CAMERON, Alan Emerson, B.Sc., M.Sc., (McGill Univ.), D.Sc., (Mass. Inst. Tech.), Deputy Minister of Public Works and Mines, Province of Nova Scotia, Halifax, N.S.

JOHNSON, James Henry, M.E., (Syracuse Univ.), chief engr., The Borden Co. Limited of Canada, Tillsonburg, Ont.

PARTRIDGE, John Kenneth, (Univ. of Leeds), senior asst. engr., Dept. Public Works of Canada, Toronto, Ont.

Associate Members

BOISMENU, Romeo, (Ecole Polytechnique), supt., Town of Hawkesbury, Ont.

SMITH, John Leslie, B.Sc., (Univ. of Leeds), senior asst. engr., Aeronautical Engineering Division, Department of Transport, Ottawa, Ont.

STEVENTON, Harry Elgin, B.Sc., (Univ of Man.), service engrg. work, Otis-Fensom Elevator Co., Hamilton, Ont.

TEAGLE, Robert Wills, B.A.Sc., (Univ. of Toronto), asst. constrn. mgr., Seigniory Club, Montebello, Que.

VINET, Pierre Paul, B.A.Sc., C.E., (Ecole Polytechnique, Montreal), B.Sc. (Mech.), (Mass. Inst. Tech.), professor at the Ecole Polytechnique, Montreal, and consulting engineer.

WALKEY, Arthur Wallace, B.Sc., (Univ. of Man.), junior engr., Dept. Public Works of Canada, Winnipeg, Man.

WRIGHT, Errol Harcourt, B.Sc., (Queen's Univ.), asst. engr., Northwestern Utilities Limited, Edmonton, Alta.

Juniors

BRYCE, John Bemister, B.A.Sc., M.A.Sc., (Univ. of Toronto), junior engr., hydraulic dept., H E.P.C. of Ontario, Toronto, Ont.

CARTER, William Franklin Shaen, B.Eng., (McGill Univ.), Canadian Ingersoll Rand Co. Ltd., Montreal, Que.

DYKE, William Edgar, B.A.Sc., (Univ. of Toronto), estimator and designer, Dominion Bridge Co. Ltd., Lachine, Que.

HOLT, William George Herbert, B.A.Sc., (Univ. of Toronto), mechanical designer, Dominion Bridge Co. Ltd., Lachine, Que.

MORGAN, Ralph T., B.Eng., (McGill Univ.), mech. engr., Canadian International Paper Co. Ltd., Three Rivers, Que.

Affiliate

LOGGIE, Gerald Purves, Lt.-Col., R.C.O.C., Ordnance Representative, Dept. of National Defence, Lôndon, England.

Transferred from the class of Associate Member to that of Member

WIGGS, Gordon Lorne, B.Sc., (McGill Univ.), consulting engineer, 1702 University Tower, Montreal, Que.

Transferred from the class of Junior to that of Associate Member

AITKENS, John Currey, B.Sc., (Univ. of Man.), mine engr., Madsen Red Lake Gold Mines Ltd., Red Lake, Ont.

CLARK, James Ernest, B.Sc., (Queen's Univ.), field engr., transmission dept., Bell Telephone Company of Canada, Ottawa, Ont.

HOULDEN, James Walter, B.Sc., (Queen's Univ.), ballistic engr., Canadian Industries Ltd., Brownsburg, Que.

*KING, Eric Charles, relief first operator, Churchill River Power Company, Island Falls, Sask.

LUSBY, Gerald Winkworth, B.Sc., (N.S. Tech. Coll.), engr., Ford Motor Co. of Canada Ltd., Windsor, Ont.

MATHIESON, Thomas Stanley, B.Sc., (Queen's Univ.), designer, Falconbridge Nickel Mines Ltd., Falconbridge, Ont.

MORTON, Ralph MacKenzie, B.A.Sc., (Univ. of B.C.), asst. elect'l engr., Bepco Canada Ltd., Montreal, Que.

NORMAN, Douglas, B.Sc., (Univ. of Man.), distribution transformer engr., Canadian General Electric Co. Ltd., Toronto, Ont.

ROWE, Gordon William, B.Sc., (Univ. of Man.), field engr., C. D. Howe Co. Ltd., Port Arthur, Ont.

Transferred from the class of Student to that of Associate Member

ANTENBRING, Clarence V., B.Sc., (Univ. of Man.), designer, Cowin & Co. Ltd., Winnipeg, Man.

BAILEY, Loring Withall, B.Sc., (McGill Univ.), station supt., Gatineau Power Company, Grand Falls, N.B.

BARBOUR, Ronald Granville, B.Sc., M.Sc., (Univ. of N.B.), industrial engr., T. Pringle & Son, Ltd., Montreal, Que.

BARR, Frederick Gordon Fordyce, B.A.Sc., (Univ. of Toronto), asst. to equipment engr., gen. traffic dept. (western area), Bell Telephone Co. of Canada, Toronto, Ont.

BOUTILIER, Frederick Thomas, B.Sc., (N.S. Tech. Coll.), asst. to aluminum plant supt., Aluminum Co. of Canada, Ltd., Arvida, Que.

CARTER, John Russell, B.A.Sc., (Univ. of Toronto), designer, engrg. dept., Canadian Johns-Manville Co. Ltd., Asbestos, Que.

CLARKE, Owen Mawbey, B.Sc., (McGill Univ.), asst. mgr., Worthey Park Estate, Ewarton, Jamaica, B.W.I.

DALTON, Peter Dudley, B.Sc., (McGill Univ.), constrn. mgr., George A. Fuller Co. of Canada Ltd., Toronto, Ont.

DARLING, Thomas Creighton, B.Sc., (McGill Univ.), sales engr., Canadian General Electric Co. Ltd., Montreal, Que.

DEANS, Charles Warbrick, B.A.Sc., (Univ. of B.C.), M.Sc., (Iowa State Coll.), estimator, Western Bridge Co. Ltd., Vancouver, B.C.

GAGNON, Elmore Gerard, B.Sc., (McGill Univ.), equipment service supt., Northern Electric Co. Ltd., Montreal, Que.

HARTNEY, James Rowan, B.Sc., (McGill Univ.), inspr., Willis, Faber & Co. of Canada Ltd., Montreal, Que.

HAWLEY, Eric Farwell, B.Sc., (McGill Univ.), asst. foreman, test dept., English Electric Co. of Canada Ltd., St. Catharines, Ont.

HAYES, E.bert Harvey, B.Sc., (Univ. of N.B.) equipment engr., Northern Electric Co. Ltd., Montreal, Que.

HULME, Gordon D., B.Sc., (McGill Univ.), engr., dept. of development, Shawinigan Water & Power Co. Ltd., Montreal, Que.

INGHAM, Jason Harold, B.Eng., (McGill Univ.), mech. designer, Dominion Bridge Co. Ltd., Montreal, Que.

JONES, Allison Maurice Stevens, B.Sc. (Forestry), B.Sc. (Civil), (Univ. of N.B.), chief field engr., Anglo-Canadian Pulp & Paper Mills Ltd., Mauriceville, Que.

KIRK, William Douglas, B.Sc., (Queen's Univ.), M.Eng., (McGill Univ.), engr., E. G. M. Cape & Co. Ltd., Montreal, Que.

LEVIN, Max, B.Sc., (Univ. of Man.), Dept. of Highways Ontario, Bancroft, Ont.

LOCKE, Charles William Evans, B.A.Sc., (Univ. of B.C.), constrn. and mtce. engr., Pacific Mills Ltd., Ocean Falls, B.C.

MAHON, Albert Gordon, B.Sc., (N.S. Tech. Coll.), asst. engr., Nova Scotia Power Commission, Halifax, N.S.

MASON, Orley B., B.Eng., (McGill Univ.), development engr., Imperial Oil Limited, Sarnia, Ont.

MILLER, William F., B.Sc., (Queen's Univ.), inspr. of electricity and gas., Dept. of Trade and Commerce, Sudbury, Ont.

MORRISON, J. Alexander, B.A.Sc., (Univ. of Toronto), director, utilization laboratory, Consumers Gas Company, Toronto, Ont.

OUIMET, J. Alphonse, B.Eng., (McGill Univ.), operations engr., Canadian Broadcasting Corporation, Montreal, Que.

ROSS, George Victor, B.Sc., (N.S. Tech. Coll), asst. engr., Engineering Service Co. Ltd., Halifax, N.S.

SILVER, Ralph Charles, B.Sc., M.Sc., (McGill Univ.), protection engr., Gatineau Power Company, Ottawa, Ont.

STADLER, John Charles, B.Sc., (McGill Univ.), station mgr., CRCM-CBF, Canadian Broadcasting Corporation, Montreal, Que.

Transferred from the class of Student to that of Junior

BACKLER, Irving Saul, B.Eng., (McGill Univ.), consltg. engr., 1577 Van Horne Ave., Montreal, Que.

* Has passed Institute's examinations.

BILLETTE, Roger, B.Sc., (McGill Univ.), designer and tester, elect'l. repair dept., Shawinigan Water & Power Co., Three Rivers, Que.

BRADDELL, Eberhard Sylvester P., B.Sc., (Univ. of Man.), Northern Electric Co. Ltd., Winnipeg, Man.

BURRI, Henry William, B.Eng., (McGill Univ.), proposition engr., Mathews Conveyor Co. Ltd., Port Hope, Ont.

CAPELLE, William Abram, B.Sc., (Univ. of Man.), purchasing agent, engr.'s dept., T. Eaton Co. Ltd., Winnipeg, Man.

CARSON, Mervyn Shannon, B.Sc., (Univ. of Sask.), production engr., Link-Belt Ltd., Toronto, Ont.

CRAIG, Carleton, B.Eng., M.Eng., (McGill Univ.), lecturer, dept. of civil engrg. and applied mechanics, and dept. of maths., McGill University, Montreal, Que.

DENTON, Allan Leslie, B.Sc., (Univ. of N.B.), office engr., Lamaque Mining Co. Ltd., Bourlamaque, Que.

DUNLOP, J. Russell, B.Eng., (McGill Univ.), dftsman., Canadian International Company, Gatineau, Que.

DYER, John Henry, B.Sc., (N.S. Tech. Coll.), electr'l. switchgear dftsman., English Electric Company of Canada, St. Catharines, Ont.

ECKENFELDER, George Victor, B.Sc., (Univ. of Alta.), ap'tice. engr., Calgary Power Company, Seebe, Alta.

FLEURY, Maurice, B.A.Sc., C.E., (Ecole Polytechnique, Montreal), asst. engr., Sun Trust Ltd., Montreal, Que.

FRASER, Allan Donald William, B.Eng., (McGill Univ.), in operating dept., Beattie Gold Mines, Duparquet, Que.

FRISKEN, Orval James, B.Sc., (Queen's Univ.), asst. engr., The DeLaval Co. Ltd., Peterborough, Ont.

GOODMAN, Hyman Bernard, (McGill Univ.), 5653 Hutchison St., Montreal, Que.

GROLEAU, Arnold John, B.Sc., (McGill Univ.), traffic dept., Bell Telephone Company of Canada, Montreal, Que.

HAMILTON, Parker C., B.Sc. (Civil & Elec.), (N.S. Tech. Coll.), district engr., Gunite & Waterproofing Ltd., and Construction Equipment Co., Ltd., Halifax, N.S.

HOUGHTON, Thomas Walter, B.Eng., (McGill Univ.), dftsman., Canada Paper Company, Windsor Mills, Que.

INGLES, Charles Leycester, Lieut., R.C.E., (Grad., R.M.C.), B.Sc., (Queen's Univ.), c/o Canada House, Trafalgar Square, London, England.

JACKSON, Kenneth Arthur, B.Sc., M.Sc., (Univ. of Alta.), radio service and sales, Taylor & Pearson Ltd., Edmonton, Alta.

KAUTH, Carl Gladstone, B.Sc., (Queen's Univ.), operator, Dominion Oxygen Co. Ltd., Toronto, Ont.

KENT, William Leslie, B.Sc., (Univ. of Alta.), junior asst. engr., Stuart Cameron & Co. Ltd., Vancouver, B.C.

LAZORKA, Dick, B.Sc., (Univ. of Sask.), timekpr., Dept. of Mines and Resources, Prince Albert, Sask.

NIX, Charles Edward, B.Sc., (Univ. of Alta.), asst. to cost acct., Shawinigan Water & Power Company, Montreal, Que.

PARSONS, Ezra Churchill, B.Sc. (Civil & Elec.), N.S. Tech. Coll., supt. for Ralph & Arthur Parsons, contractors, Walton, N.S.

PERLSON, Ellsworth Hartland, L/Corp., R.C.M.P., (Grad., R.M.C.), B.Sc., (McGill Univ.), Edmonton, Alta.

POOLER, Gilbert Douglas, B.Sc., (Queen's Univ.), Woodroffe, Ont.

POPE, Joseph Morley, B.Sc., (McGill Univ.), asst. to elec. engr., Belgo Divn., Consolidated Paper Corpn. Ltd., Shawinigan Falls, Que.

REINHARDT, Gerard Victor, B.Sc., (N.S. Tech. Coll), mech. design dept., Dominion Bridge Co. Ltd., Montreal, Que.

SHANKS, Victor, B.A.Sc., (Univ. of Toronto), elect'l. lab. asst., Sangamo Electric Co., Toronto, Ont.

SOMERS, Claude Judson, B.Sc., (Univ. of N.B.), field engr., Howard Smith Paper Mills, Cornwall, Ont.

STANFIELD, John Yorston, (Grad., R.M.C.), B.Sc., (Civil & Mech.), (N.S. Tech. Coll.), Candn representative, Anti-Hydro Waterproofing Co., Newark, N.J.

WALKEM, Richard, (Grad., R.M.C.), Vancouver Iron Works, Vancouver, B.C.

Students Admitted

ATHEY, Frank A. P., (Univ. of Man.), 138 Roslyn Road, Winnipeg, Man.

DUSSAULT, Jean, (Ecole Polytechnique, Montreal), 74 Laurendeau Ave., Montreal East, Que.

WILSON, John Pye, (Queen's Univ.), senior dftsman., civil aviation divn., Dept. of Transport, Ottawa, Ont.

BOOK REVIEW

Geodetic Position Evaluation

By W. M. Tobey, revised and enlarged by J. E. R. Ross, Canada Department of Mines and Resources, Geodetic Service Publication No. 7, 1937. 63 pp. 6½ by 9¾ inches, paper, $1.50.

Reviewed by JAMES WEIR, A.M.E.I.C.*

This brochure gives concise explanation of the theory and examples of calculation of latitude and longitude through length and azimuth, and also the inverse problem of deriving the length and azimuth of the geodetic line between two fixed points on the spheroid. Clarke's 1866 spheroid is used, this being the adopted spheroid for the North American Datum. The tables are based on its dimensions.

The revision has clarified the explanation, and the tables now extend for the range 42 to 70 degrees latitude. Geographic positions here envisaged are not to be confused with observed latitude and longitude, subject to considerable errors. When the directions of a large triangulation network have been given their most probable values by a least squares adjustment, and the sides have been calculated, the next step is the evaluation of the geographic positions. The triangulation is projected on the adopted reference spheroid.

The method here followed is distinctly Canadian, but has recently been adopted by the Section of Geodesy, Military Section of China. It is believed to be accurate, even in high latitudes, for lines up to 100 miles in length, and could easily be extended to embrace longer lines through the addition of discarded terms of the series expansions. In modern practice such lengths are rare.

In addition to the enlarged tables essential to the method, many tables in common use in geodetic practice are included in the enlargement.

An appendix of the common spheroids, Clarke of 1866, Bessel of 1841, and Hayford of 1909, with their dimensions and constants is given, and a summary also of salient facts of Physical Geodesy appears.

An unusually complete and well-selected conspectus of the formulae for series and expansions, and of the trigonometric formulae, is given in this appendix. For a ready-reference of the mathematical side of geodesy conveniently assembled, these tables are a real contribution.

*Associate Professor of Geodesy, McGill University.

BULLETINS

Conveyors.—The Mathews Conveyer Company, Ltd., Port Hope, Ontario, have prepared a 55-page bulletin containing illustrations of representative installations of conveying equipment developed by them during the past twenty-five years.

Automatic Controls.—The Alco Valve Company, Inc., St. Louis, Mo., have issued several bulletins dealing with automatic control devices for refrigeration and air conditioning and containing illustrations and price lists.

Cutters.—A 4-page leaflet has been received from the Brown & Sharpe Manufacturing Co., Providence, R.I., describing their special purpose cutters.

Lathes.—The South Bend Lathe Works, South Bend, Indiana, have issued a new catalogue for January 1938, demonstrating the new 1938 9-inch precision lathes, as well as precision lathes of all types.

Glass.—A 29-page booklet has been received from the Duplate Safety Glass Company of Canada, Oshawa, Ont. Good illustrations are accompanied by short descriptions and cover the various uses of glass in the home.

Navigational Instruments.—A 48-page catalogue has been received from Henry Hughes and Son, Limited, London, illustrating and describing their 1938 navigational instruments.

Welded Design.—A 34-page bulletin received from the Lincoln Electric Company, Cleveland, Ohio, was published with the aim of providing information relative to electric welding as applied to the design of machines and machinery structures.

Pressure Pipes.—Canadian Johns-Manville Company Limited, Toronto, Ont., have issued a 32-page bulletin describing the manufacture and use of their transite pressure (asbestoes-cement) pipe for water transportations.

Exhaust Fans.—The Northern Blower Company, Cleveland, Ohio, describe their new high speed "Norblo" exhaust fans in a 4-page bulletin.

Excavation and Grading.—The Cleveland Tractor Company, Cleveland, Ohio, have issued an 80-page booklet describing, with numerous illustrations, the most modern methods of moving earth.

Auto Patrols.—A 40-page booklet has been issued by the Caterpillar Tractor Company, Peoria, illustrating the various types and uses of auto patrols.

Diesel Tractors.—The Caterpillar Tractor Company, Peoria, Ohio, give particulars of their Diesel tractor in a 32-page booklet recently received.

Registration in the Faculties of Applied Science or Engineering in Canadian Universities, Session 1937-1938

By direction of Council enquiries have been addressed to the engineering schools in Canada asking for particulars of their undergraduate registration for the current year in the various branches of engineering.

The following table has been compiled from the information furnished in reply. In some respects it is necessarily incomplete; for example, some universities have courses in forestry, or forest engineering and have included them, while others have not done so.

University	Year	General Course	Agriculture	Architecture	Ceramic	Chemical Engrg. & Chemistry	Civil	Electrical	Forestry	Geology & Mineralogy	Mechanical	Metallurgy	Mining	Physics, Engrg.	Total

BRANCH NEWS

Border Cities Branch

J. F. Bridge, A.M.E.I.C., Secretary-Treasurer.
F J. Ryder, Jr.E.I.C., Branch News Editor.

On Tuesday, November 16th, 1937, the members and ladies of the Border Cities Branch held a joint meeting and inspection tour with the Detroit Section of the American Society of Mechanical Engineers.

The Ford Company of Canada Limited invited the members and friends to visit their power house and new body plant.

Among the features of the tour were the 100 lb. bent-tube boilers for pulverized coal firing, and the pass-out turbines. The three boilers have a normal rating of 165,000 lb. of steam per hour and a peak rating of 200,000 lb. or better. One new 5,000 kw. turbine generator takes steam at 800 lb. 800 deg. F. and exhausts at 175 lb. 500 deg. F. into a 10,000 kw. low pressure turbine. Another new turbine has 20,000 kw. capacity and is a condensing double-bleeding unit.

The new body plant is the most up-to-date plant of its kind in Canada using the most modern types of material handling equipment, conveyors, etc.

After this very interesting trip, the parties returned to the Prince Edward hotel for dinner, which was attended by 192.

Remarks of welcome were made by our President, C. F. Davison, A.M.E.I.C., and were responded to by Mr. C. F. Freund, President of the Detroit Section of the American Society of Mechanical Engineers.

On behalf of the Ford Motor Company, Mr. J. E. Porter welcomed all present and gave a short synopsis of the workings and operation of the new plants.

The ladies present adjourned to another room where they made up fourteen tables of bridge.

The speaker for the evening, Mr. Henry Kreisinger, engineer, the Combustion Engineering Company, Inc., presented a paper on "Combustion of Pulverized Coal."

At the close of Mr. Kreisinger's excellent paper, it was found that there was a long list of names presented for discussion of the paper. However, owing to the lateness of the hour, it was only possible to hear one or two short synopses.

After the adjournment of the meeting, the ladies rejoined the men and refreshments were served. This international joint meeting was considered a most successful affair.

Edmonton Branch

M. L. Gale, A.M.E.I.C., Secretary-Treasurer.
F. A. Brownie, Jr.E.I.C., Branch News Editor.

Branch Chairman J. D. Baker, M.E.I.C., delivered the address of the evening at the Edmonton Branch's first dinner meeting of the season. The meeting was held at the Macdonald hotel on November 19th, 1937. The speaker's topic was "Some Phases of Telephone Engineering."

Mr. Baker has been for a number of years Deputy Minister of Telephones in Alberta, having joined the Calgary Telephone System as a young man thirty-four years ago. At that time the Calgary system boasted some 200 phones and an exchange over a bookstore. As part of the Alberta Government Telephone System, it now has one of the most modern plants on the continent.

The speaker dealt with the general features of the method of planning and developing a modern telephone system so that the system itself will keep pace with the changes in a rapidly developing community, in an orderly and economical fashion.

From the technical features of his paper the speaker went on to some more general aspects of the telephone business in Alberta. Slides were used to illustrate what care has been used and what success achieved in making exchange buildings conform with surrounding buildings when engineering factors demanded sites in fine residential districts and suburban business sections. Of great interest too were slides showing the havoc wrought on rural lines by severe storms of recent years, and emergency measures used to restore service.

The interest of the audience in the paper was attested to by the discussion which followed. Deputy Chairman W. E. Cornish, A.M.E.I.C., presided.

Hamilton Branch

A. R. Hannaford, A.M.E.I.C., Secretary-Treasurer.
W. W. Preston, S.E.I.C., Branch News Editor.

The Problems of Braking High Speed Trains

The largest audience of the year, numbering 250 persons, attended the joint meeting of the Hamilton Branch E.I.C., and the Hamilton Group A.I.E.E., when they met on November 9th, 1937, in the Westinghouse Auditorium. The speaker of the evening was Mr. W. E. Sprague, Secretary of the Canadian Westinghouse Company, Limited, and Manager of the Air Brake Department, Mr. Sprague spoke on the subject, "The Problem of Braking High Speed Trains," and illustrated his remarks with lantern views.

The speaker explained how the difficulties of braking fast trains have become greater with improvements in the rolling stock of railways. A decrease in the weight of equipment and an increase in speed have opposed ease of braking because adhesion between rail and wheel is less for reduced weight and journal speed is least when speed greatest. Furthermore, the braking equipment for any particular train has to be suitable for its predecessors.

Mr. Sprague outlined the history of the air brake and showed pictures of a progression of improvements from the simple, straight air brake of 1896 to the universal type used on present-day passenger trains. A recent advance has been the use of an electrically operated governor to prevent damage from sliding of wheels on the rails during braking. Standard practice now requires a brake shoe on each side of the wheel, for the two-fold purpose of obtaining additional friction and of neutralizing the stresses to which the car journal is otherwise subject.

The speaker also described the results of field tests in braking high speed trains. A passenger train with an initial speed of 40 miles per hour would be found to come to a drift stop, on the level, in a distance of 19,000 ft. A train travelling at 100 miles per hour had been stopped in 3,000 ft. but this had been known to weld the brake shoe to the wheel and set the right of way on fire.

The meeting was opened by D. W. Callander, A.M.E.I.C., Chairman of the Hamilton Group A.I.E.E., who handed the remainder of the meeting over to Col. E. G. McKay, A.M.E.I.C., Chairman of the Hamilton Branch E.I.C., Mr. Sprague was introduced by Mr. C. A. Price, Chief Engineer, Canadian Westinghouse, and H. B. Stuart, M.E.I.C., proposed a hearty vote of thanks to the speaker.

Representatives from the London Branch E.I.C. were present to invite the local members to attend the Fifty-second Annual General and General Professional Meeting, to be held in London, January 31st to February 2nd, 1938. Of these gentlemen, the following spoke briefly: E. V. Buchanan, M.E.I.C., Chairman of the Annual Meeting, H. A. Bennet, A.M.E.I.C., Chairman of Papers Committee, and J. A. Vance, A.M.E.I.C., London District Councillor.

Lethbridge Branch

E A. Lawrence, S.E.I.C., Secretary-Treasurer.
R. F. P. Bowman, A.M.E.I.C., Branch News Editor.

The Lethbridge Branch held a dinner meeting in the Marquis hotel on Saturday evening, November 20th, 1937. During and after the dinner, orchestral and vocal selections were rendered by George Brown's instrumental quartette and Mr. R. H. Standen.

The Bus vs. Street Railways

The speaker of the evening was Alderman J. A. Jardine, who spoke on "Bus versus Street Railways," a question of increasing concern in the city of Lethbridge. Mr. Jardine illustrated the great increase of bus service in urban transportation, both as an auxiliary to, or substitute for street car systems. The inducements for this change he cited as being: reduced operating costs and greater flexibility of service, together with the possibility of providing service in districts where light population density or short distances rendered the installation of street cars inadvisable. However, each city has its own particular set of conditions which make the problem complicated and render it difficult to set forth hard and fast rules as to the desirability of either type of service.

Dealing with the situation in Lethbridge, the speaker pointed out that the present street car system has an operating cost of 17.46 cents per car mile, whereas bus manufacturers claim that their products are capable of operating at 11 cents per car mile, including fixed charges and depreciation. He then gave particulars of the annual deficits which the present system is piling up, and described some of the heavy maintenance which will be necessary shortly, if the street cars are kept in operation.

He then pointed out that although it was desired to call for tenders for a bus franchise, it was found that the city charter did not permit the city to give such a franchise as long as the street railway was in operation and that attempts to have the Provincial Legislature amend the charter to overcome this obstacle had so far met with no success.

A very interesting discussion followed Mr. Jardine's address, many aspects of the history and operation of the street car system being brought out.

Mr. P. M. Sauder also gave an interesting report on the Semicentennial celebrations held in Montreal in June.

Ladies Night

The Lethbridge Branch, Engineering Institute of Canada, held a Ladies Night at the Marquis hotel, on Saturday, December 6th, 1937. During dinner, George Brown's instrumental quartette rendered a number of selections, followed by vocal solos by Mrs. A. Wright and Mr. R. H. Standen.

The speaker was W. L. McKenzie, A.M.E.I.C., whose subject was "10,000 Miles Along the Coast of Asia." He described part of a round the world tour he had taken last winter and in a humorous and delightful manner brought to his audience a picture of the coast of Asia from Japan to the Suez Canal. After the address the members and their wives enjoyed bridge on the mezzanine floor of the hotel.

London Branch

D. S. Scrymgeour, A.M.E.I.C., Secretary-Treasurer.
Jno. R. Rostron, A.M.E.I.C., Branch News Editor.

The regular monthly meeting of the Branch was held on the 15th November, 1937, in the Auditorium of the City Hall. The speaker of the evening was W. J. Bright of the Johns-Manville Company, and his subject "Heat and Its Control."

A. O. Wolff, M.E.I.C., chairman of the Branch, presided and introduced the speaker.

HEAT AND ITS CONTROL

Mr. Bright gave a short address regarding the making of the talking picture on the above subject, which had been produced by the Johns-Manville Company. It is the first sound movie ever to be made on this subject and depicts the story of heat from the time man worshipped the sun to present day methods of development and manufacture of heat conservation materials.

Special sets, accurate in detail, were used to show James Watt's invention of the steam engine, and other historical milestones in the story of man's attainment of mastery over heat.

Actual laboratory demonstrations, animated drawings and shadowgraphs were used to visualize the nature of heat and other technical phases of the story.

The picture likewise showed man's first efforts toward the scientific conservation of heat, the activity in a modern heat research laboratory, and how modern materials for conserving heat are developed, manufactured and utilized.

After the showing of the picture a number of various insulating materials were handed round for inspection and in which great interest was taken by the 70 members and guests who were present. Many questions were asked and fully answered by Mr. Bright.

A hearty vote of thanks was proposed by W. C. Miller, M.E.I.C., seconded by V. A. McKillop, A.M.E.I.C., and carried unanimously.

Montreal Branch

E. R. Smallhorn, M.E.I.C., Secretary-Treasurer.

JOINT MEETING WITH ILLUMINATING ENGINEERING SOCIETY

"A New Approach to the Industrial Lighting Problem, and Current Trends of School Lighting" was the subject of an address by H. B. Dates, head of the Electrical Engineering Department of the Cleveland Case School of Applied Science, which was given in the Institute headquarters on November 15th. This proved to be an exceptionally interesting address and was heard by a large number of members of both societies. The address was well illustrated.

Joint chairmen: Huet Massue, A.M.E.I.C., and D. M. Jones.

TRENDS IN ELECTRICAL COMMUNICATION

On November 18th J. L. Clarke, M.E.I.C., transmission and foreign wire relations engineer with the Bell Telephone Company of Canada, was the speaker. He discussed the aims of electrical communication, progress made in the past and the status at present. Particular attention was given to the telephone but other methods of electrical communication were discussed. The lecture was illustrated by slides and a number of demonstrations were given.

H. J. Vennes, A.M.E.I.C., acted as chairman.

JUNIOR SECTION

On November 24th, 1937, two interesting papers were presented before the section: "Some Aspects of an Electric Mine Hoist," by D. E. Evans, S.E.I.C., of the Dominion Engineering Works Limited, and "Mesures de Sécurité Influant la Construction d'une Route Rurale," by Lucien Perrault of Les Laboratories Industriels et Commerciaux.

J. S. Lochhead, S.E.I.C., acted as chairman.

SEWAGE TREATMENT

W. S. Lea, M.E.I.C., consulting engineer, Montreal, on November 25th gave a talk on various treatment processes for purification. Particular attention was given to new developments in equipment which have rendered treatment more economical and efficient and a number of the more modern treatment plants were described. The paper was illustrated by slides.

The chairman was A. Cousineau, A.M.E.I.C.

THE GEOLOGICAL SURVEY OF CANADA

The purpose and scope of the geological survey of Canada was the subject of a paper by Dr. F. J. Alcock, given on December 2nd. Dr. Alcock's investigations have extended from Nova Scotia to British Columbia and he has been in this field since 1911.

This address began with the work accomplished by Sir William Logan and included the work undertaken up to the present day, through the publication of geological reports and maps and by other services to aid in the development of Canada's mineral industry.

Prior to the meeting an informal dinner was held at the Windsor hotel.

C. R. Lindsey, A.M.E.I.C., was chairman.

JUNIOR SECTION

The closing meeting of the fall session was held on December 8th, taking the form of a "student night." Papers were presented by Graham Treggett, fourth year Civil Engineering student at McGill University, on the "Construction of Log Flumes," and by Lucien Buteau, S.E.I.C., a recent graduate of the Ecole Polytechnique, on "Etude comparative de deux sources d'approvisionnement en eau potable pour la ville de Sherbrooke."

Jean Flahault, S.E.I.C., was chairman.

MATERIAL HANDLING BY EQUIPMENT OF THE CONVEYOR TYPE

W. J. Ramsay, of the Mathews Conveyor Company, Elwood City, Penn., gave an address on December 9th. This covered a brief history of the development of conveyor equipment and the suitability of the various types for particular conditions. A number of interesting views were shown.

An informal dinner was held at the Windsor hotel prior to the meeting.

Chairman: Prof. C. M. McKergow, M.E.I.C.

TRENDS AND MODERN METHODS OF CITIES' ASSESSMENT AND TAXATION

The Assistant Director, Citizens' Research Institute of Canada and Bureau of Municipal Research of Toronto, Joseph E. Howes, presented a most interesting paper on the above subject on December 16th. This covered the trend of taxation in the principal Canadian cities since 1922 and the effect of this on tax collection. Canadian assessment methods were compared with the English system and possible improvements in Canadian assessment methods were also discussed. Considerable interest was taken in this meeting and discussion followed.

An informal dinner was held at the Windsor hotel before the meeting.

J. G. Chenevert, M.E.I.C., acted as chairman.

Ottawa Branch

R. K. Odell, A.M.E.I.C., Secretary-Treasurer.

BUREAU OF STATISTICS TABULATING MACHINES

The tabulating machines in operation at the Bureau of Statistics were the subject of an address at the noon luncheon at the Chateau Laurier on November 18th, given by A. Ernest Thornton, superintendent of Mechanical Tabulation at the Bureau. Mr. Thornton, in collaboration with Fernand Belisle of the same organization, had invented and built the mechanical tabulating machines in operation there.

In compiling census of agriculture information, for instance, individual data relating to each farm is first of all recorded by means of small round punch-holes on small cards, the location of each hole upon each separate card reoresenting a certain definite item of information. In summing up this information for all the farms of any municipality, the cards recording the data for the municipality in question are run through a mechanical tabulator which automatically records the counting of all items under similar headings after which a permanent record on a large sheet of paper of the various totals is obtained by photography. The process of summing up the information further for provinces or other large divisions follows in a similar manner.

The tabulating machines are electrically operated. The various mechanical arrangements whereby the operations are carried out were briefly touched upon by the speaker, since owing to their intricacy they could hardly be covered in detail in the short space of time at the speaker's disposal. In a general way, however, as each card is passed into the machine, pins drop through the various punch holes into cups of mercury below, thereby closing separate electrical circuits and actuating the counting device corresponding to each pin. The speed at which the counting takes place may be realized from the fact that for 1,240 farms the machine required less than 6 minutes of operation for the collection and totalizing of 520 facts for each.

Mr. Thornton stated that in the summation of the information there is no possibility of figures being left out as there are always certain ways in which the totals must balance. Cards which may inadvertently have information which is quite evidently incorrect recorded upon them—such as, for instance, a two-year old child being recorded as attending school—are automatically rejected by a "verifying machine" which calls attention to the material which requires checking over.

The machines at the Bureau are capable of handling 520 items of information at the same time. The nearest approach to these machines in any other country, stated the speaker, are those of the United States government at Washington which are able to handle 60 items at the one time.

The Canadian machines do not cause unemployment, Mr. Thornton pointed out. They are doing work which would be utterly impossible to perform by hand and at the same time have the results available "before they are old enough to be put into the Archives." The results are on record quickly for purposes of study at any time and for all this work a large staff is required.

Mr. Thornton extended an invitation to the members of Ottawa Branch to pay a visit to the Bureau of Statistics and see the tabulating machines in operation.

Saguenay Branch

C. Miller, A.M.E.I.C., Secretary-Treasurer.
J. W. Ward, A.M.E.I.C., Branch News Editor.

At a meeting of the Saguenay Branch on October 15th, 1937, Mr. McNeely DuBose, General Superintendent of the Saguenay Power Company, presented a paper entitled "The Cost of Power" to some thirty-five members and guests in the main office of the Aluminum Company of Canada.

Cost of Power

There are three fundamental factors which govern the cost of electricity. These are:

(1) The average value of the investment in generating station and distribution lines. This proportion of cost is more or less fixed.

(2) The cost of operation which includes labour and materials, fuel and taxes. This proportion of the cost varies with the cost and amount of fuel, and with the amount of taxes which the company must pay.

(3) Load factor—the most important of the three fundamentals. It is the ratio of the average power demand to the maximum power demand over a certain period of time.

As to the first fundamental, it is to be noted that the cost is that of the average of all plants and not the individual cost of each plant. The average value per horse power of Canadian generating plants taken from the 1935 Census of Industry published by the Dominion Bureau of Statistics is $205. The figure includes the cost of the generating station, the transmission and distribution systems, and all other property. The average cost of the generating stations above is $126 per horse power. On this figure of $126 per horse power we must set aside 5 per cent for interest on the investment and 2 per cent to retire the capital in 50 years and take care of major replacements during that time. On that basis, 7 per cent of $126 is $8.80 per horse power year on the installed plant capacity.

Coming now to the second fundamental. The average of the Ontario Hydro-Electric Commission system's costs for operation and maintenance amount to 2.2 per cent of the invested capital. For all of Canada, when taxes are taken into consideraion, the average cost of operation is 2.5 per cent of the total value of the plant. Applying this percentage to the average figure of $126 per horse power one finds that the cost of operation which includes maintenance and administration is $3.20 per horse power year. Adding this to the previous figure of $8.80 a total of $12.00 is obtained.

The third fundamental factor in establishing the cost of electricity now enters the picture. It is the rate of demand, more commonly called the load factor. The load factor, or the ratio of average demand to maximum demand, for all hydro-plants in the United States is a little below 50 per cent while the load factor for all hydro-plants in Canada is a little above 50 per cent. Consideration must then be given to the fact that the cost of $12 per horse power year worked out above is the cost which would be arrived at if all the power plants ran at full capacity twenty-four hours a day seven days a week. In order to ascertain the actual cost per horse power sold, it is necessary to divide the $12 price by the load factor. On this basis the average cost per year of hydro-electric power at the bus-bars of the generating station, using a 60 per cent load factor as being the average for Canada, would be $12 divided by 0.60 which is $20.

Saskatchewan Branch

J. J. White, M.E.I.C., Secretary-Treasurer.

The proposed October meeting of the Saskatchewan Branch was cancelled in order to co-operate with the Association of Professional Engineers, which organization held its semi-annual meeting for all engineers in Saskatchewan. A very good representation from the Saskatchewan Branch was present at the meeting, which was preceded by attendance at a Western Canada Rugby Conference game and later a dinner.

The November meeting was held on the 19th in the Science Lecture Room of Regina College. This was a joint meeting of The Engineering Institute of Canada, the Association of Professional Engineers and the American Institute of Electrical Engineers, and was the first of a series to be conducted during the winter months. The proposal is to have joint meetings throughout the winter season with the presiding officer of each organization alternating to have charge of the meeting. The meeting for November 19th saw The Engineering Institute of Canada in charge with Stewart Young, M.E.I.C., as chairman, and the guest speaker was Professor A. R. Greig, M.E.I.C., University of Saskatchewan, Saskatoon, Sask. His subject, which was thoroughly enjoyed by all the forty-five persons present, was "Coal and its Combustion." The Saskatoon Section of the Branch was represented at the meeting by Dean C. J. Mackenzie, M.E.I.C., and Professor I. M. Fraser, A.M.E.I.C., both of the University of Saskatchewan.

Sault Ste. Marie Branch

N. C. Cowie, Jr.E.I.C., Secretary-Treasurer.

The Sault Ste. Marie Branch of The Engineering Institute of Canada held a dinner meeting in the grill room, Windsor hotel, Sault Ste. Marie, on Friday, October 29th, 1937.

A short business meeting, at which the chairman, C. W. Holman, A.M.E.I.C, presided, was held immediately following the dinner.

The guest speaker of the evening was Dr. H. W. Johnston, M.D., Algoma Steel Corporation physician, who spoke on the subject "Health Service in Industry." Dr. Johnston traced the growth of health service in industry, the methods being used to select men for certain types of work and the measures taken to eliminate hazards to the workman. With regard to the hazards encountered, Dr. Johnston mentioned some of the most common and most dangerous that are met with and the ways taken to eliminate them or to guard against them.

The discussion that followed the address showed the keen interest the members had in the subject under discussion.

Centrifugal Pump Practice

A general meeting of the Sault Ste. Marie Branch of The Engineering Institute of Canada was held in the grill room, Windsor hotel, Sault Ste. Marie, on November 30th, 1937.

A dinner, served by the hotel staff, was enjoyed by the members and guests attending. A short business meeting followed the dinner. C. W. Holman, A.M.E.I.C., chairman of the Branch, presided at the meeting.

Following an introduction by the chairman, the speaker of the evening, Mr. G. H. Heyn, engineer, Northern Foundry & Machine Co., Limited, presented a very interesting paper entitled "Centrifugal Pump Practice." In his paper, which was well illustrated with pictures showing pump design and construction, and curves showing the characteristics of centrifugal pumps, Mr. Heyn discussed the characteristics of this type of pump, the specifications required to design and build the machine. He then illustrated how the designer and the manufacturer determines the type and style of centrifugal pump to fit a given set of specifications with the best efficiency. By means of the above mentioned illustrations and mathematical formulae he pointed out the relation between the various factors involved and the resultant operation of the machine.

At the conclusion of Mr. Heyn's paper the meeting was held open for an informal discussion of the subject.

Following the discussion, the members thanked Mr. Heyn for his well prepared, well presented and interesting paper on this subject.

Toronto Branch

A. U. Sanderson, A.M.E.I.C., Chairman.
A. E. Berry, M.E.I.C., Branch News Editor.

The second meeting of the Toronto Branch held in the Mining Building at the University of Toronto on November 4th, 1937, brought out a very excellent attendance. In addition to the members of The Institute, representatives were present from the American Society for Metals, American Society of Mechanical Engineers, and the American Institute of Electrical Engineers.

The Metallurgy of Metallic Arc Welding and Its Applications

The speaker, C. R. Whittemore, metallurgist, Dominion Bridge Co. Ltd., stressed the progress made in recent years in welding. Development work is intensive, and increased activity is recorded in every sphere of the industry, new applications of existing methods, as well as new processes being added to those already proved in practice. Many manufacturers have partially or wholly adopted welding.

In a very true sense the art of welding is largely metallurgical, particularly that of metallic arc welding which involves the proper choice of materials and their correct use. The problem, of course, is that of satisfactorily joining various pieces.

The main advantages of the process of welding applied to the fabrication of component parts are the economy, rigidity, simplicity, and beauty of the resulting product.

The most outstanding metallurgical contribution has been the replacement of the "bare" wire electrode with electrodes covered with mineral coatings, having slag forming characteristics. Metal deposited by this latter class of electrodes is characterized by high ductility, tensile strength, impact, fatigue and corrosive resistance as compared to low ductility, low impact, low fatigue and poor corrosive resistance for bare wire welds. The maximum values can only be obtained by observing the factors which affect the melting and solidification of the metal. These factors are the choice of the proper current, arc voltage, length of arc, and rate of travel, etc.

The microstructure of the joint varies with the method of welding and necessitates a complete understanding for the attainment of the best physical properties. The solidification of weld metal as deposited in a single layer results in the formation of a "columnar" structure, characteristic of cast metals. In multiple layer welding, each layer modifies the structure of the preceding one by annealing it.

To determine if the welded joint fulfils all requirements, various methods of testing have been adopted. These divide themselves into two main methods: (1) by physical testing of different types of welded specimens—destructive tests; (2) by examination of the finished weld—non-destructive tests.

The only positive method of ascertaining the degree of homogeneity of deposited weld metal and the completeness of fusion throughout the weld section is by means of radiographic inspection, using either x-rays or Gamma rays. X-ray inspection has proved the more satisfactory and in the welding industry it is chiefly confined to the examination of pressure vessels.

Of particular interest to Toronto engineers is, the fabrication by Dominion Bridge Company, Sorauren Ave., plant, by welding of the 48 in. diameter water supply pipe now being installed by the city. The pipe is made in twelve, eighteen and thirty foot lengths of $\frac{1}{2}$ and $\frac{9}{16}$ in. steel plate, rolled and automatically welded by the Unionmelt process, the latest contribution to the methods of producing a quality product. By this method, which is automatic, satisfactory welds can be made in plate up to one inch thick with only one pass. The welded steel shell is hydraulically tested, wire mesh reinforcing tacked inside the shell and the pipe centrifugally lined with $1\frac{1}{2}$ in. of concrete.

Vancouver Branch

T. V. Berry, A.M.E.I.C., Secretary-Treasurer.
J. B. Barclay, A.M.E.I.C., Branch News Editor.

Report of the annual meeting and dinner of the Vancouver Branch held in the Aztec room of the Georgia Hotel, on Tuesday November 16th, 1937.

Fifty-nine members and friends of the Branch sat down to dinner at 6:30 p.m. At the head table were seated Mr. H. N. Macpherson, chairman; J. N. Finlayson, M.E.I.C., Past-Presidents G. A. Walkem, M.E.I.C., and E. A. Cleveland, M.E.I.C.; Col. J. P. Mackenzie, M.E.I.C.; Major W. G. Swan, M.E.I.C.; James Robertson, M.E.I.C.; P. H. Buchan, M.E.I.C., Councillor, and E. A. Wheatley, M.E.I.C., Registrar, of the Association of Professional Engineers of B.C.

Following dinner the annual business of the Branch was transacted. Financial statements were read by the secretary-treasurer and showed the Branch to be in a healthy financial condition. The chairman, Mr. H. N. Macpherson, reported on the year's activities. The election of officers resulted in the election by acclamation of Col. J. P. Mackenzie, M.E.I.C., as chairman, and C. E. Webb, M.E.I.C., as vice-chairman, for the year 1938.

Trends in Engineering Education

The guest speaker of the evening was J. N. Finlayson, M.E.I.C., Dean of the Faculty of Applied Science of the University of British Columbia and head of the Department of Civil Engineering. Dean Finlayson addressed the meeting on "Trends in Engineering Education." The speaker traced the development in the education and training of the engineer from the early part of the eighteenth century down to the present time.

Illustrating by intimate details of the early life and training of such engineering geniuses as William Brindley, John Smeaton, John Rennie, Whitworth, Telford, George and Robert Stevenson, he demonstrated that their early training was the result of an apprenticeship system. The engineering attainments of these men were remarkable because their education was received entirely through their own ambition and perseverance and against overwhelming odds and difficulties.

As time went on, the apprenticeship system was found inadequate and in Great Britain engineering schools were developed to train the artisan, the technician and the designer. During the second half of the last century, due largely to the very severe competition of the technical schools and universities of the continent, the British Institutions were forced to pay greater attention to the scientific and theoretical training of the engineer.

In Canada the training of the artisan has been neglected and the speaker urged the support of all engineers for the renewal of the apprenticeship system and for the development of vocational and technical schools to educate and train the artisans of the future sufficient for the ever-growing needs of a complex society.

A vote of thanks to Dean Finlayson for his interesting and instructive address was moved by Major Walkem and heartily applauded.

Through the efforts of Major W. G. Swan, consulting engineer for the Provincial Government on the Pattulo Bridge, New Westminster, B.C., two reels of films were shown, describing the various phases of the construction of that bridge. Major Swan made running explanations during the exhibition of the films. A vote of thanks to Major Swan was proposed by Col. F. J. Simpson.

The Thames River in Flood

London, Ont.—April 1937

Fig. 1—West London Breakwater.*

Fig. 2—Coves Area, London, from the C.N.R. Embankment.*

Fig. 3—Wellington Street Bridge, London.*

At the Annual Meeting in London, Ontario, the professional session, held on Wednesday, February 2nd, will be devoted to a discussion on flood control, water conservation, agricultural drainage, precipitation, stream discharge and run-off in Southwestern Ontario. Papers on the above subjects will be presented by prominent Canadian engineers.

Preliminary Notice

of Applications for Admission and for Transfer

December 27th, 1937

The By-laws provide that the Council of The Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in February, 1938

R. J. Durley, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the Council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science of engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of Student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

CHESTNUT—KENNETH RANDOLPH, of Saint John, N.B., Born at Fredericton, N.B., Oct. 8th, 1882; Educ., B.Eng., 1904, M.Sc., 1907, Univ. of N.B. R.P.E. of N.S.; 1904, instr'man. and dftsman., City of Fredericton; 1905, instr'man. and dftsman., City of Saint John; 1906, testing dept., General Electric Co., Lynn, Mass., and Windsor, Conn.; 1907, asst. prof. of civil engrg., Univ. of N.B. Topographer and dftsman on survey of Atlantic and Lake Superior Rly., Quebec; 1908-10, dftsman., instr'mn. and res. engr. on constrn., Nat. Transcontinental Rly.; 1910-14, Railways and Canals Dept. as inspecting engr. on G.T.P. Rly.; 1915-16, with Baird & Howie, contractors, on bridge foundation work in Maine and New Brunswick; 1917-18, asst. engr., C.N.R. Ocean Terminal, Halifax; 1919-20, asst. chief engr. i/c field work, on constrn. of Halifax Shipyards; 1920-21, with Bedford Constrn. Co., contractors, on highway constrn., and Nova Scotia Constrn. Co. on bridge foundations, and Canadian Bridge Co. on steel work in N.B.; 1922-23, land surveys in N.B., and acct. for R. Chestnut & Sons; 1924-25, field engr., Butler, Barnett & Taylor, West Palm Beach, Florida; 1925-26, office engr., Southeastern Engineering Corpn., Delray, Florida, on land subdivision, drainage and improvement work; 1927-28, chief inspr., Atmospheric Nitrogen Corpn. of Hopewell, Va., on constrn. of chemical works; 1929-32, district engr., Stone & Webster Engrg. Corpn., on constrn. of hydro-electric development in Missouri; 1932-33, asst. engr. on appraisal and valuation of public utilities for State of Missouri Public Service Commission; 1935, engr. for Town of Devon, i/c street paving; 1935 to date, asst. engr., National Harbours Board, Saint John, N.B.

FOR TRANSFER FROM THE CLASS OF ASSOCIATE MEMBER TO THAT OF MEMBER

JOST—LESLIE GORDON, of 8342 Kirkwood Drive, Los Angeles, California., Born at Guysboro, N.S., March 9th, 1887; Educ., B.Sc., McGill Univ., 1910; 1906-10 (summers), rly. location and struct'l. drawing; 1910-11, detailing, Canada Foundry Co., Toronto; 1911-12, checking and designing. Cleveland Bridge Co., Montreal; 1912-18, res. engr., Quebec Bridge, St. Lawrence Bridge Co. Ltd.; 1918-19, non-technical work, Great Lakes Engrg. Works, Detroit; 1919-28, Llewellyn Iron Works, Los Angeles; 1929 to date, with the Consolidated Steel Corpn. Ltd., Los Angeles. In charge of structural design all this time. In charge of detailing also for about a year. Chief engr. for one year until Oct. 15th, position abolished, depts. consolidated due to slackness, transferred from production to sales. At present, chief struct'l. engr. Regd. Civil and Struct'l. Engr., California. Member, Struct'l. Engrs. Assn. of So. California. Member, Am.Soc.C.E., 1937. (*St. 1909, A.M. 1913*)
References: W. P. Copp, R. B. Stewart, W. C. Thompson, F. P. Shearwood, P. L. Pratley, C. N. Monsarrat.

MASSUE—HUET, of 3815 St. Hubert St., Montreal, Que., Born at Montreal, May 24th, 1891; Educ., B.A.Sc., Ecole Polytechnique, Montreal, 1913; 1913-26, with the Quebec Streams Commission, i/c inventory of water powers and other investigations concerning the hydro-electric industry; 1926 to date, with the Shawinigan Water and Power Company, on further investigations of problems connected with the hydro-electric industry; since 1932 on statistical investigations and research work connected with rates and other commercial problems relating to the hydro-electric industry. (*St. 1912, A.M. 1918*)
References: J. C. Smith, A. Surveyer, O. O. Lefebvre, J. B. Challies, P. S. Gregory.

FOR TRANSFER FROM THE CLASS OF JUNIOR

BUTLER—ERNEST W. R., of Winnipeg, Man., Born at Ashton, Ont., March 16th, 1903; Educ., B.Sc. (Mech.), McGill Univ., 1924; 1924-29, sales service engr., and from 1929 to date, manager, Western Canada Branch, Bailey Meter Co. Ltd., Winnipeg, Man. I/c sales and service, including supervision, installn. and adjustment of steam boiler combustion control and metering equipment. (*St. 1924, Jr. 1930*)
References: E. V. Caton, T. C. Main, H. G. Thompson, N. M. Hall, F. S. B. Heward.

DONNELLY—WILLIAM DAVID, of 558 Partington Ave., Windsor, Ont., Born at Deseronto, Ont., Sept. 15th, 1904; Educ., B.Sc. (Mech.), Queen's Univ., 1925; 1925-26, stock layout man and stock gang foreman, Hudson Motor Car Co., Detroit, Mich.; 1926-30, dftsman. on stock handling equipment, conveyors, ventilating systems, plant layout, surveyor of yards and bldgs., for some company; 1930-32, dftsman. and estimator in schedule dept., Canadian Locomotive Co. Ltd., Kingston, Ont.; 1934-35, foreman in brake lining dept., Canadian Johns-Manville Co. Ltd., Asbestos, Que.; 1935 to date, mech. dftsman. on conveyors, heating and ventilating systems, piping layouts, Ford Motor Co. of Canada, Windsor, Ont. (*St. 1924, Jr. 1936*)
References: J. E. Porter, J. E. Daubney, V. W. MacIsaac, C. G. Walton, B. Candlish, C. F. Davison.

GRINDLEY—FRANK LLEWELLYN, of Medicine Hat, Alta., Born at Douglas, Isle of Man, England, March 21st, 1904; Educ., B.Sc. (Civil), Univ. of Alta., 1926; 1925, rodman, L. and N.W. Rly. (now C.P.R.); 1926-27, instr'man., C.N.R.; 1927, instr'man.. Aluminum Co. of Canada; 1928-30, res. engr., C.N.R.; 1931-33, misc. engrg.; 1934-35, foreman and asst. engr., Dept. of National Defence Relief Camps; 1935 to date, junior engr., Dept. of Agriculture, Dom. Govt., Regina, Sask. (*St. 1926, Jr. 1928*)

FOR TRANSFER FROM THE CLASS OF STUDENT

BAKER—JOHN ARTHUR, of London, Ont., Born at Hill End, Alta, April 15th. 1907; Educ., B.A.Sc., Univ. of B.C., 1930; 1930-33, commercial engrg., Northern Electric Co. Ltd., Montreal; 1933-36, radio sales and service; 1937 to date, sales engr., estimating and sales work, Taylor Electric Mfg. Co., London, Ont. (*St. 1930*)
References: D. S. Scrymgeour, A. B. Hunt, A. O. Wolff, D. M. Bright, J. F. Plow.

BARNSLEY—FRANK RICHARD, of Montreal, Que., Born at Victoria, B.C., Aug. 20th, 1901; Educ., B.A.Sc., Univ. of B.C., 1927. R.P.E. of Que.; 1918-19, ap'tice test dept., Can. Gen. Elec. Co Ltd., Peterborough, Ont.; 1919-27 (summers), operating small power and distrib. plant, Bowen Island, summer resort; With the Can. Gen. Elec. Co. Ltd., as follows: 1927-28, student test dept., Peterborough; 1928-30, industrial heating specialist, Toronto; 1930-33, industrial heating specialist, Montreal; 1933-35, distribution specialist, Montreal; 1935 to date, manager, air conditioning division, Montreal. (*St. 1924*)
References: W. T. Fanjoy, W. E. Ross, W. M. Cruthers, E. C. Kirkpatrick, R. H. Findlay, K. O. Whyte.

BENJAFIELD—PHILIP GRANT, of 146 Larch St., Sudbury ,Ont., Born at London, Ont., July 15th, 1907; Educ., B.Sc., Queen's Univ., 1932; 1929 (summer), rodman, Mich. Central Rly.; 1930 (summer), dftsman., Ont. Dept. of Highways; 1931 (summer), transitman, Lake Shore traverse on Lake St. Clair; 1934 to date, instr'man., field engrg. dept., International Nickel Company, Copper Cliff Ont. (bldg. constrn. in company towns and plants). (*St. 1928*)
References: C. O. Maddock, F. A. Orange, J. F. Robertson, W. C. Miller, W. P. Wilgar.

BENNETT—ROBERT DOUGLAS, of Montreal, Que., Born at Montreal, Dec. 5th, 1909; Educ., B.Eng., 1932, M.Sc., 1933, Ph.D., 1935, McGill Univ.; 1930 (summer), lacquer dept., Sherwin Williams Co. of Canada Ltd.; 1931 (summer), technical service, organic dept., Milton Hersey Co. Ltd.; 1933-34, graduate asst., 1934-35, head demonstrator, Dept. of Chemical Engrg., McGill University; 1935-36, chief chemist, Canadian Industrial Alcohol Co. Ltd.; 1937 to date, head of organic dept., J. T. Donald and Co. Ltd. (consultation, research and contract work). (*St. 1930*)
References: J. B. Phillips, J. R. Donald, J. F. Plow, C. M. McKergow, R. DeL. French.

BIESENTHAL—CLARENCE G., of Kapuskasing, Ont., Born at Pembroke, Ont., June 5th, 1909; Educ., B.Sc., Queen's Univ., 1936; 1935 (summer), dfting, and May 1936 to date, dfting., machine design, mechanical problems in paper mill, Spruce Falls Power and Paper Co. Ltd., Kapuskasing, Ont. (*St. 1935*)
References: C. W. Boast, R. S. Walker, D. N. McCormack, G. R. Connor, L. M. Arkley, L. T. Rutledge.

BLACHFORD—HENRY EDMUND, of 133 Hillcrest Ave., Montreal West, Que., Born at Montreal, Feb. 22nd, 1908; Educ., B.Sc., McGill Univ., 1931; 1929-31, design of induction motors, Montreal Armature Works Ltd., Montreal; 1932-33, supervn. of elect'l. installn., Can. National Steamships, Halifax, N.S.; 1935-37, estimating cost of telephone and special products equipment, Northern Electric Co. Ltd., Montreal, Que. (*St. 1930*)
References: H. J. Vennes, E. S. Kelsey, C. A. Peachey, T. Eardley-Wilmot, B. H. Steeves, G. B. Mitchell.

COLLISON—LLOYD SETH, of 140 Prospect St. N., Hamilton, Ont., Born at Leamington, Ont., July 12th, 1902; Educ., B.A.Sc., Univ. of Toronto, 1924; 1923, land surveying, Windsor, Ont.; With the City of Hamilton as follows: 1924-27, instr'man., 1927-29, asst. on waterworks constrn., 1929, asst. on sewer constrn., 1929-31, asst. on sewer design, 1931-33, asst. on roadway constrn; 1933 to date, on filtration plant operation, Hamilton, Ont. (*St. 1921*)
References: W. L. McFaul, J. Stodart, W. H. Collins, H. S. Philips, A. R. Hannaford.

CRAIG—WILLIAM ROYCE, of Picture Butte, Alta., Born at Chicago, Ill., July 4th, 1909; Educ., B.Sc. (E.E.), Univ. of Alta., 1933; Summers—1930-31, rodman and asst., 1932-34, instr'man and dftsman., Lethbridge Northern Irrigation District; 1934 (Fall), gravel checker, 1935 (Spring), instr'man., Alberta Road Dept.; 1935-36, surveyor and dftsman., Dominion Construction Co.; 1936-37, electrn., and at present, asst. master mechanic and office engr., Canadian Sugar Factories, Picture Butte, Alta. (*St. 1933*)

EMPLOYMENT SERVICE BUREAU

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party.

All correspondence should be addressed to

The Employment Service Bureau, The Engineering Institute of Canada
2050 Mansfield Street, Montreal

Situations Vacant

MECHANICAL ENGINEER, with good general draughting experience, also some shop experience, between the ages of thirty and forty, for a large industrial company in Ontario. Apply giving full details of experience to Box No. 1699-V.

SALES ENGINEER. A company marketing a standard alloy cutting tool and hard-facing rod, desires the services of a sales engineer. The duties will be to demonstrate cutting tools and hard-facing applications and to conduct sales correspondence and sales development work. Applicants will kindly mail replies, giving experience, age and training to Box No. 1700-V.

ELECTRICAL ENGINEER. Young electrical engineer with some experience in radio if possible, eventually to go into sales organization selling radio equipment. Apply to Box No. 1702-V.

ELECTRICAL ENGINEER, experience in radio work and broadcasting. Young graduate preferred. Apply to Box No. 1703-V.

RECENT GRADUATE in chemical engineering for a large industrial company situated near Montreal. Apply to Box No. 1704-V.

MECHANICAL ENGINEER. A large industrial company has an opening for a graduate mechanical engineer not over thirty-five years of age, who has had some experience in efficiency engineering and preferably in the design and maintenance of small automatic machines. The position offers opportunity for advancement commensurate with ability. Only applicants giving information including age, religion, education, and experience will be considered. Apply to Box No. 1706-V.

ELECTRICAL ENGINEER. Recent graduate with some little experience in draughting, for a large manufacturing company. Apply to Box No. 1708-V.

MINING AND METALLURGICAL ENGINEER, experienced in manganese mining and manufacture of ferro-manganese. Must be familiar with markets, operation and development of a property in Eastern Canada. Available on short notice. Give technical education and brief summary of practical experience, and if possible Toronto references. Apply to Box No. 1710-V.

YOUNG ENGINEER. Graduate in mechanical, electrical, civil or chemical engineering, preferably with some experience in design or maintenance, for a large industrial company in Toronto. Apply giving full details of experience to Box No. 1711-V.

ELECTRICAL ENGINEER, with power plant construction or operating experience, about thirty to thirty-five years of age, speaking French, if possible. Apply to Box No. 1712-V.

Situations Wanted

INDUSTRIAL ENGINEERING EXECUTIVE, with wide experience including fourteen years in design, construction, maintenance and operation of pulp and paper mills and power developments. Now employed, desires change of location. Apply to Box No 320-W.

STEAM POWER PLANT DESIGNER, with wide experience on high pressure steam-electric plant. Available at once. Apply to Box No. 525-W.

MECHANICAL ENGINEER, JR.E.I.C., university training, age 28, Married. Four years experience in administration and operation of business. Two years experience construction as instrumentman and field control, and inspection of concrete. Experience assembly line supervision one year. Read, write and speak French. Will go anywhere. Available immediately. Apply to Box No. 551-W.

DOMINION LAND SURVEYOR, and graduate engineer with extensive experience on legal, topographic and plane-table surveys and field and office use of aerophotographs, desires employment either in Canada or abroad. Available at once. Apply to Box No. 589-W.

ELECTRICAL ENGINEER, B.SC., E.E., age 38. Married. Ten years electrical experience; including, one year operation, one year maintenance, and four years on construction of hydro-electric plants and sub-stations Four years electric maintenance and construction in pulp and paper mill Also experience on highway construction and Geological Survey Available at once Apply to Box No. 636-W.

ELECTRICAL ENGINEER, B.SC. E.E. '28. Two years with large electrical manufacturing company including test course, about two years in supervisory operating office of a large electrical power utility, and considerable experience in electrical and mechanical draughting. Location In Ontario preferable. Apply to Box No. 660-W.

Situations Wanted

ELECTRICAL AND CIVIL ENGINEER, B.SC. Elec. '29, B.SC. Civil '33. JR.E.I.C. Age 31. Experience includes four months with Can. Gen. Elec. Co., approximately three years in engineering office of large electrical manufacturing company in Montreal, the last six months of which was spent as commercial engineer. For the last year and a half employed in electrical repair shop. Best of references. Apply to Box No. 693-W.

YOUNG CIVIL ENGINEER, B.SC. (Univ. of N.B. '31), with experience as rodman and checker on railroad construction, is open for a position. Apply to Box No. 728-W.

CIVIL ENGINEER, B.SC., M.SC., R.P.E.; Sixteen years municipal, highway and construction, 5 years overseas. Married. Read, write and talk French. Will go anywhere. Apply to Box No. 737-W.

ELECTRICAL ENGINEER, B.SC. '31, JR.E.I.C. Single. One and a half years with contracting firm installing power and lighting equipment. Four years supervision over service and sales staff of electrical and radio company. Draughting and designing experience in power and compressed air layouts. Estimating and designing for electrical and mechanical layouts desired. Available on short notice. Apply to Box No. 740-W.

CIVIL ENGINEER, S.E.I.C., B.SC. in C.E. (Sask. '32). Single. Age 27. Three years experience includes—instrumentman, compiling reports and draughting with a National Park; in charge of construction of water supply and sanitary sewer systems; assistant on city surveys. Excellent draughtsman. Available at once. Location immaterial. References. Apply to Box No. 818-W.

MECHANICAL ENGINEER, JR.E.I.C., technical graduate, bilingual, age 35, married, experience includes five years with firm of consulting engineers, design of steam boiler plants, mechanical equipment of buildings, heating, ventilating, air conditioning, plumbing, writing specifications, etc. Five years with large company on sales and design of power plant, steam specialties and heating equipment. Available on short notice. Apply to Box No. 850-W.

ELECTRICAL ENGINEER, B.SC. (McGill '28), age 34. Experience includes transmission line and rural distribution construction and design. Some installation of motors and equipment, also house wiring. Available immediately. Apply to Box No. 940-W.

ENGINEER SUPERINTENDENT, age 44. Engineering and business training, executive ability, tactful, energetic. Had charge of several large projects. Intimate knowledge of costs and prices, reports and estimates. Available immediately. Any location. Apply to Box No. 1021-W.

ELECTRICAL ENGINEER AND GEOPHYSICIST. B.SC. (Man. '23), A.M.E.I.C. Married. Ten years specialized experience in the practical use of magnetic, electrical and mechanical instruments for the prospecting, surveying and mapping of mineral, oil and gas lands. Five years experience with telegraph, telephone and radio equipment. Capable of giving instruction in theory and practice in these lines and in college physics Available on short notice. Apply to Box No. 1063-W

CIVIL ENGINEER, A.M.E.I.C., with over twenty years experience in field and office on construction, maintenance, surveying, location, etc., desires position preferably of a permanent nature. At present near Montreal, but willing to locate anywhere Apply to Box No. 1168-W.

ELECTRICAL ENGINEER, B.SC. '34 (Univ. of N.B.), S.E.I.C. Age 24, single. Desires any kind of electrical work. Will consider any location. Apply to Box No. 1262-W

ELECTRICAL AND RADIO ENGINEER, S.E.I.C., B.SC. (Elec.) '32, M.SC. '34. Experience includes four years part time operator for radio broadcast station, repairs to radio receivers and test equipment, design and construction of amplifiers and inter-office communication systems. Available on short notice. Apply to Box No. 1283-W.

CIVIL ENGINEER, M.E.I.C., R.P.E., married, age 40. Twenty-two years experience in detail, design, estimating and cost accounting of buildings, bridges, tanks and all types of structures,; organization and management. Apply to Box No. 1367-W.

Situations Wanted

CIVIL ENGINEER, B.SC. 1910, A.M.E.I.C. Married. Twenty-six years experience on heavy construction work, both field and office; rails, roads, power house, hotels, bridges, etc. Location immaterial. Available at once. Apply to Box No. 1470-W.

CONSTRUCTION SUPERINTENDENT, M.E.I.C. Age 49. Married. Twenty-two years experience as engineer, superintendent and manager in charge of hydro-electric, mechanical production, structural steel erection, also considerable experience in steam plants, combustion, transmission lines, millwright work, complete mine installations, rock work, rock crushers and conveyors. Executive ability. Speaking French fluently. Location immaterial. Apply to Box No. 1482-W.

ELECTRICAL ENGINEER, B.Eng. (McGill '33). One and a half years experience in plant and production routine, and with considerable training in sales work. Bilingual, single, and available at once for any location. Apply to Box No. 1509-W.

ELECTRICAL ENGINEER, B.SC. '31 (Univ. of Alta.), JR.E.I.C. Age 28. Married. One year students' test course with C.G.E.Co. including testing and operation of transformers, meters, industrial control and switchgear apparatus. Two years as instrumentman on highway construction. Desires electrical utility, commercial lighting or air conditioning work, location immaterial and available at once. Apply to Box No. 1522-W.

CIVIL ENGINEER, B.SC. '32, S.E.I.C., P.E.N.B., NY.L.S.N.B., age 32. Experience in mining, both coal and metals, private and legal surveys, railroad construction, geology and building construction. At present in private practice in coal mining district. Desirous of changing location for position either in mining field or construction in Canada. or abroad. Apply to Box No. 1562-W.

RESIDENT ENGINEER, familiar with all types of surveys and construction work including, railway, roads, irrigation, drainage, buildings and air ports. Executive ability. Had charge of several large projects. Intimate knowledge of reports and estimates. Available immediately. Any location. Apply to Box No. 1567-W.

CIVIL ENGINEER, B.SC. '17, O.P.E. Married. Executive and administrative experience. Extensive office and field experience in harbour works, dredging; both steam and electric railways in location, construction and maintenance; telephone works in design, construction and maintenance of pole lines, wire, cable and conduit; highways in location, construction and paving; municipal works in roads, sidewalks, sewers and water mains. Intimate knowledge of estimating, unit costs, cost accounting and analysis. Some knowledge of air conditioning. Willing to locate anywhere. Available at once. Apply to Box No. 1587-W.

ELECTRICAL ENGINEER, B.SC. '27 (McGill), A.M.E.I.C. Age 36. Married. Bilingual. Three years experience in telephone work (installation of manual and automatic exchanges). One year electrical prospecting. Nine years experience with electrical power company. Apply to Box No. 1601-W.

CHEMICAL ENGINEER, graduate McGill '36. Eight months experience in commercial laboratory of large industrial plant. Knowledge of coal chemistry and boiler water treatment. Also some experience in pulp and paper control work. Location immaterial. Apply to Box No. 1617-W.

CIVIL ENGINEER, B.SC. in C.E., A.M.E.I.C. Age 32. Married. Three years of pulp and paper mill experience, draughting, instrumentman and maintenance. One year as instrumentman on highway construction. Five years checking and designing reinforced concrete and steel. Apply to Box No. 1658-W.

ELECTRICAL ENGINEER, B.A.SC., U. of T. '24, A.M.E.I.C., single, age 44. Ten years in supervisory operating office and two years in construction division (office and field) of large city electrical utility commission. One year factory supervision and tool design in manufacture of small electrical equipment. Wide experience with internal combustion engines. Experience handling heavy machinery. Private pilot's license for light aircraft. Full details on request. Available on short notice. Apply to Box No. 1693-V.

MECHANICAL AND ELECTRICAL ENGINEER, age 47, graduate University of Toronto, 1911. Machinist's trade. Two years tool design and quantity production in the U.S.A. Twelve years Canadian shop experience design and producing heavy equipment. Twelve years as chief sales engineer and field man for one of the largest Canadian national concerns. Experience in manufacturing and sales of pumps, engines, paper mill equipment, power plant equipment and specialties, electrical machinery etc. Clean record, excellent connection. Apply to Box No. 1699-V.

ELECTRICAL ENGINEER, B.SC., E.E. (Univ. of Man. '37). Experience in highway construction as inspector. Available at once. Apply to Box No. 1703-W.

ELECTRICAL ENGINEER, B.SC., A.M.E.I.C., age 44, married. Experience includes draughting, construction and maintenance. The last eight years holding the position of electrical superintendent, of a fair sized industrial plant. Apply to Box No. 1718-W.

THE ENGINEERING JOURNAL

VOLUME XXI, No. 2 FEBRUARY, 1938

The Precipitation of the Grand and Thames River Basins

John Patterson, M.A., F.R.S.C.,

Controller of the Meteorological Service, Air Services Division, Department of Transport

Paper presented at the Annual Meeting of The Institute in London, Ont., February 2nd, 1938.

The subject proposed for discussion by The Engineering Institute is limited to the relation between precipitation in Southern Ontario and floods in the region drained by the Grand and Thames rivers. While complete data regarding floods are not available, Mr. Maclennan of the Hydro-Electric Power Commission of Ontario has kindly supplied stream flow measurements since 1914 in the Grand river area. These are published in a report issued by the Province of Ontario in 1932 on "Grand River Drainage." There are there some references to spring floods of great magnitude in earlier years. Some recent events of like nature have also been known through notices in the daily press.

For the present discussion years of evidently unusual floods were singled out to be examined as to the sequence of meteorological events during the previous winter and the contemporaneous spring. The apparent departure of these events from the average or normal course of weather sequences will be indicated for consideration.

The accompanying maps and diagrams deal first with average conditions. Figure 1 shows the average annual precipitation over Southern Ontario. This has been prepared from all observations taken since 1845. The earliest date is confined to Toronto, but some points contributed figures for the period between 1870 and 1880. Most of the data do not date back of 1885 and not all the early observations have been continuous. In the region of the most elevated sources of the Grand river the data are particularly deficient, that is, in the district including Dundalk and the townships of East and West Luther. In spite of the irregularities and deficiencies of the data, it is believed that the map gives a very fair presentation of the average annual precipitation.

The monthly amounts of precipitation when averaged over a long period for Southern Ontario show that there is little difference in the amounts to be expected from month to month. That is, there is no wet winter and dry summer as on the Pacific coast nor a dry winter and wet summer as on the prairies. For this reason the map of average annual precipitation serves well to show the local variations of susceptibility to precipitation.

The average amount for southern Ontario is about 32 or 33 inches. Most of the course of the Grand river is through a territory receiving nearly this amount. At the apex of watersheds of the rivers in Southwestern Ontario there is a small area in Dufferin county and the northern portion of Wellington county which receives about 38 in. as nearly as can be judged from the broken and scanty observations in that region. Run-off from this region at the apex of the watersheds should appear first at Belwood, below the Luther, Amaranth and Garafraxa swamps. It is, therefore, interesting to note that the published figures of run-off in the report already mentioned between 1914 and 1923 indicate that the flood run-off at Belwood when expressed as inches on the drainage area above that point, show generally a maximum or are exceeded only by the flood run-off at Galt.

In the case of the Thames, it appears that the precipitation averages about 3 in. more than over the drainage of the Grand, from the headwaters in the lower half of Perth county to the upper part of Elgin county. From an altitude of about 700 ft. above sea to the river mouth,

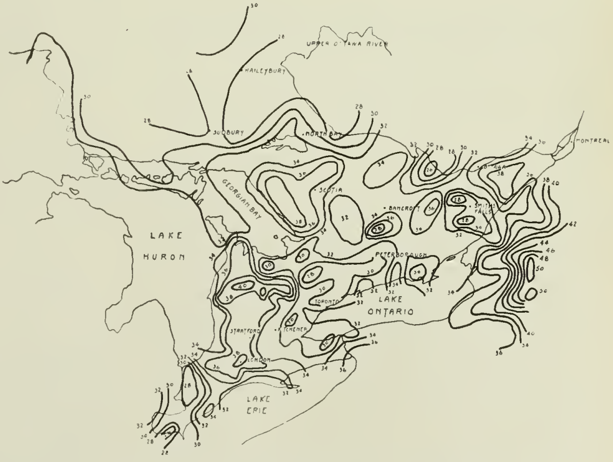

Fig. 1—Average Annual Precipitation over Southern Ontario.

that is, from near Wardsville to Lake St. Clair at 576 ft. above sea, the precipitation falls off sharply. At Chatham it averages about 30 in. or about 3 in. less than the average of the greater part of the Grand valley, while near the mouth of the Thames it is about 28 or 29 in. The few figures of run-off which it has been possible to check (from the stream-flow reports of the Dominion Water Power and Hydrometric Bureau, principally for the north branch of the Thames at Fanshawe, the south branch at Ealing and the mainstream at Byron, as well as the flow of the Grand at Galt) appear to agree rather well with the precipitation maps.

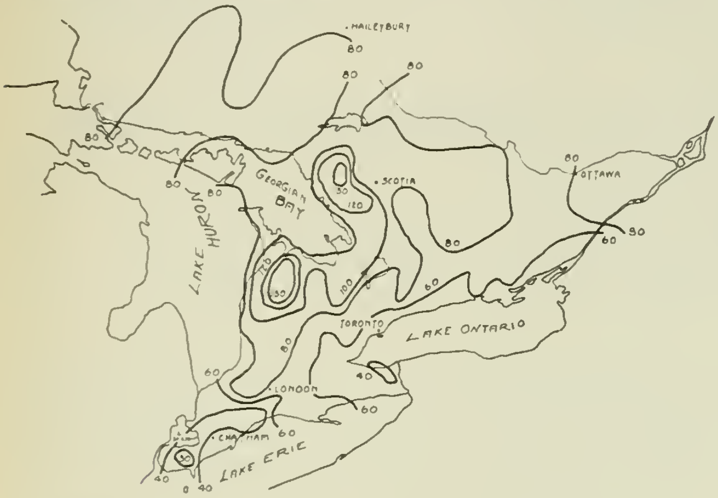

Fig. 2—Average Annual Snowfall Southern Ontario.

So far no distinction has been made between the rainfall and the water-content of snowfall. The map of average total snowfall shows about 60 in. annually from Guelph and Kitchener along the Grand to Port Maitland. To the west along the divide between the Thames and Grand drainages in Perth and Oxford counties the annual average rises to 80 in. Below London on the Thames the amount falls away from 60 in. to 40 or less at the mouth, but the north branch drains a territory with 80 to 90 in. of snow.

On the other hand, to the east of the Grand river snowfall is less but cannot be given with certainty. There have been in the past very few observations in Lincoln and Wentworth counties except along the Lake Ontario shore. It may be 50 in. or less.

North of Grand Valley village at the upper sources of the Grand river a small area averages probably 80 to 100 in.

Summarizing, it appears that the Thames above London so far as the north branch is concerned drains from a territory with precipitation of about 36 or 37 in. annually of which 23 per cent is snow, while the Grand drains from about 33 in. of which perhaps 18 per cent is snow. The south branch of the Thames approximates quite closely to the precipitation of the Grand below Brantford.

The meteorological observers do not systematically and regularly measure the depth of accumulated snow and the thickness of ice on the ground under the snow. Provision has been made for this on the forms supplied to them, but most of the observers make all observations voluntarily and little remuneration is allowed in any case. It has, therefore, been impossible to insist on these extra measurements with the result that estimates of the stored precipitation at various times in the winter do not stand on a very satisfactory basis. No attempt has been made to prepare maps of average storage.

The average temperature of the winter months, particularly of the mean daily minimum temperature, undoubtedly gives some idea of probable storage. Figure 3 indicates that the temperature is depressed along the ridges between Lakes Ontario and Erie on the one hand and Lake Huron on the other. This is, of course, to be expected, since the broken surface of the interior highlands radiates away to the sky on a clear night in dry polar air (particularly when snow-covered) at a faster rate than the lake surfaces. Towards such sinks as the marshes of the Grand, the increased density of the cooling air immediately above the ground will set the cold air draining down where it will continue to cool until fog has formed over the marshes. It is, therefore, not at all likely that the meteorological stations have been at points where the lowest temperatures have occurred. The map, however, may be taken to indicate the average minimum temperature of all the territory except natural sinks. It would appear from the temperature and snowfall maps so far considered that the greatest storage of winter precipitation should be in the region from Dundalk at the head of the Grand to the junction of the Conestogo and the Grand and thence southwestward along the creeks of the north branch of the Thames to the vicinity of St. Mary's and London. It will be seen that this region has a central area about the highest elevations where the mean daily minimum in February is as low as 5 deg. F., while the greater part experiences 10 deg. F. or less.

From the situation so far depicted it may be assumed that (*a*) fairly heavy snows accumulate on the higher levels near the sources of these two river systems, (*b*) in the spring the lower reaches clear first because of the higher temperature, (*c*) that the stored snow in the interior later dissolves and comes down to the lower valley. It should be fairly easy on these grounds to show statistically that a serious flood could result only after a winter of great snowfall, and that very seldom could this happen on the Grand river and should be of very rare occurrence on the Thames. The frequency of serious floods on the Grand river is greater than this simple view of the data supposes. The sequence of events in several years of exceptionally large floods on the Grand river were, therefore, examined in detail from November of the preceding year to the time of the flood peak in March or April. From this detailed examination it appears that the absolute magnitude of the snowfall is not so important as the actual sequence of events involving rainfall, snowfall, and thawing.

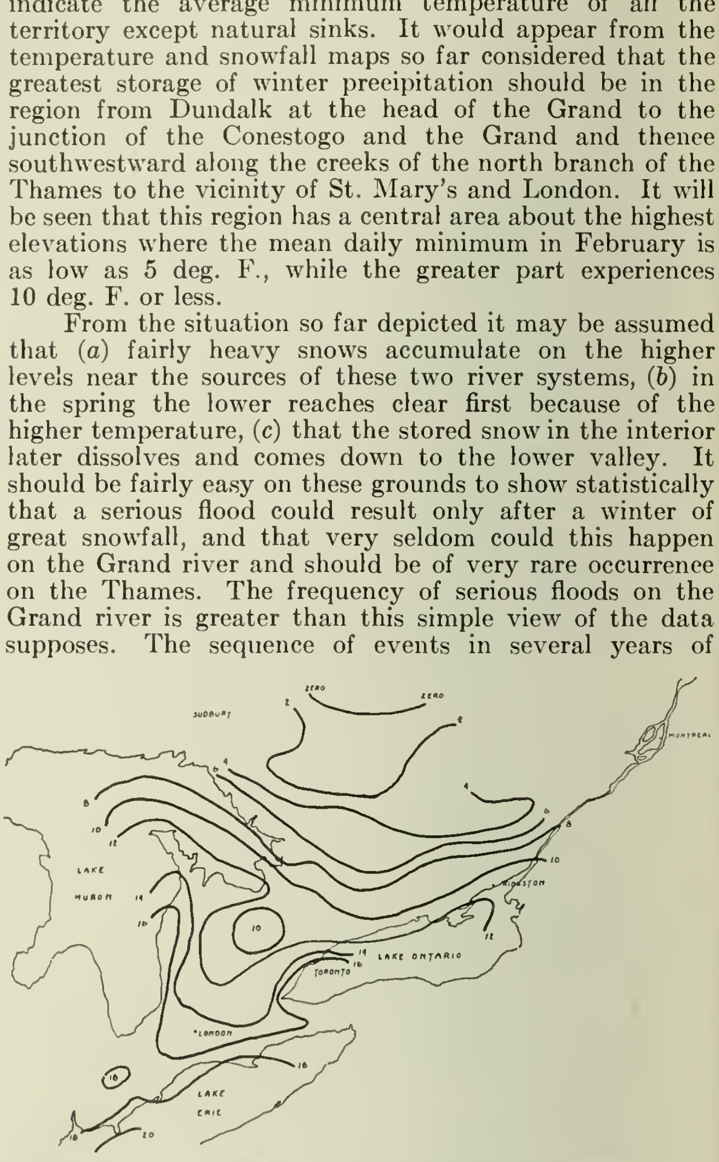

Fig. 3—Normal Mean Daily Minimum Temperature Dec. 1 to March 1.

It will not be possible to show here the details for each of these bad years. But in summarizing it may be

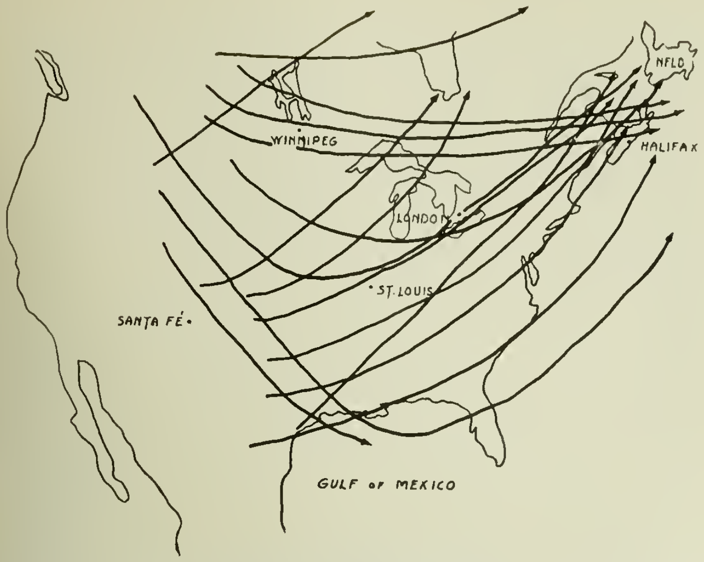

Fig. 4—Average Tracks of Pressure Minima Nov. 1 to Feb. 1 Preceding Bad Floods.

said that there was evident a general similarity in the type of weather experienced. Stated broadly, the course of events began with numerous movements of low pressure waves from the far southwestern portion of the continent to the Great Lakes or the St. Lawrence region in the early winter. There was then a period of sharp cold in February which was followed by a return to low pressure movements from the southwest bringing heavy or wet snowfalls or alternate snow and rain at the close of the winter. The continuance of the frequently recurring movement of comparatively mild and moist airmasses converging on eastern Canada brought heavy early rains. These heavy rains started the wet snow moving off the highlands while the lower valley was already too wet to absorb these rains.

The run-off in the lower valley of heavy spring rains on wet soil should naturally be heavy and tend to rapidly fill the lower courses of the river. In addition, evidence is found which suggests a coating of ice or frozen wet snow laid down on the upper portions of the watershed during the cold spell in February which followed the period of wet snow (or mixed snows and rains) of the preceding fall. Upon this nearly impervious surface the wet snows of late winter when attacked by heavy rains probably move downhill with great rapidity and with no opportunity for absorption of the freed water by any surfaces except possibly the marshes.

On the other hand, there were winters with fairly heavy snowfall throughout which appear not to have been distinguished by unusual floods in spring, even when March was above normal in temperature. Winters of frequently alternating thaws and freezes also seem devoid of serious consequences unless unusually heavy late snow is closely followed by at least moderately heavy rains.

Of the ideally worst conditions in spring (that of sudden release of stored moisture from the upper reaches under heavy rains when no part of the watershed or of the lower valley can absorb the rains, with run-off approaching totality), there are doubtless degrees of varying severity. There has been insufficient time to spare for meticulous examination of the observations in all years. A composite picture, constructed from the general features of a few bad flood-years, will serve to illustrate the meteorology of the floods of spring. In the preparation of these composite maps, it has been necessary to assume some familiarity with the general conception of precipitation as closely related to the movement of low pressure areas. In high pressure areas there is generally a mass of air which is nearly homogeneous over a wide extent at any given level above the ground. The air may be warm or cold, moist or dry, but little or no change is occurring between levels so that fair or fine, stable weather is experienced.

Along the boundary between such masses conditions are generally unsettled, with the moister, warmer and, therefore, lighter air ascending above the margin of the denser mass. Dynamic cooling of the load of water-vapour carried aloft by ascending currents is the preliminary to the fall of rain or snow. These unsettled conditions are generally at a maximum in the low pressure wave which runs along the boundary between distinct masses. The general paths of these low pressure systems during winters followed by bad floods are indicated on Fig. 4.

The most northerly paths are between masses of intensely cold and dry air moving along the surface of the continent from polar or arctic regions and air originally polar which has been somewhat modified in mid-continent. Such low pressure systems bring only light or very moderate snowfalls in winter and light rains only to the most southerly regions of Ontario. A winter with a great preponderance of such movements would be very cold over most of Ontario with precipitation much below normal.

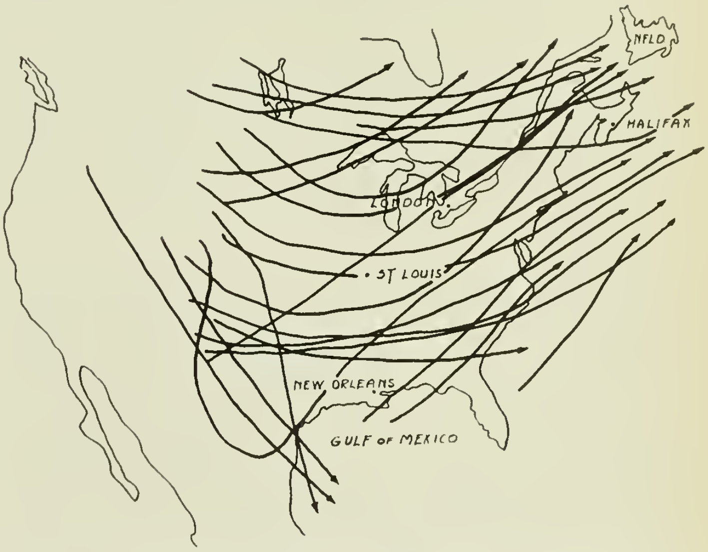

Fig. 5—Average Tracks of Pressure Minima During Midwinter Freeze-period of Bad Flood Years.

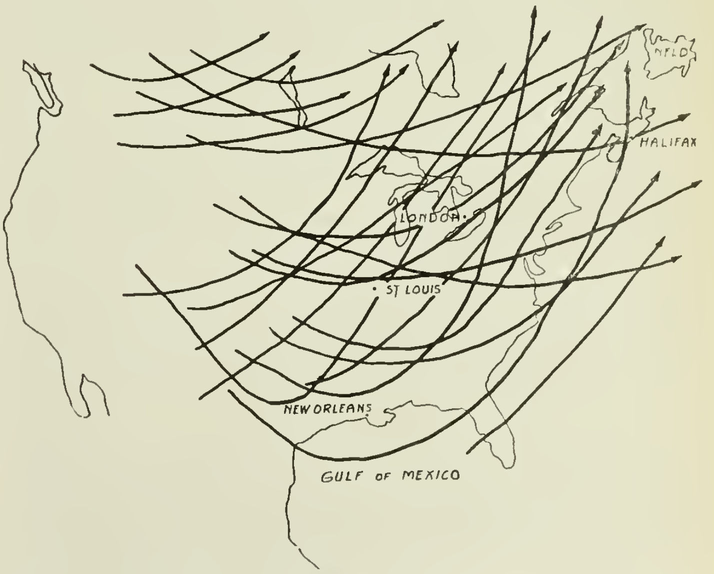

Fig. 6—Average Tracks of Pressure Minima in March and April of Bad Flood Years.

More southerly courses indicate low pressure waves moving along divisions between Pacific airmasses, considerably modified in character on the southwestern portion of the continent and masses of new polar or arctic air. Precipitation is heavier, much of it is snow in Southern Ontario and the cold weather following the cessation of the precipitation favours storage of the snow. The temperature fluctuations accompanying passage of the division between such masses are larger than in the first case mentioned. A preponderance of such movements, therefore, indicates a winter not only averaging nearly normal in all respects but seldom departing far from normal conditions.

The paths of low pressure movements which are seen beginning in the far southwest, or in the region of the Gulf of Mexico or in the Caribbean Sea, are worthy of special note. On the eastern side of the path the airmass has moved from over the warm waters of the south and will carry a load of water-vapour in the lowest layers. On the western side there is a denser and relatively much colder and drier airmass of either polar Pacific or polar basin air. In either case the precipitation will be of the heaviest character experienced in winter in Southern Ontario, but in the case of superposition of Atlantic air directly above air newly arrived from the polar basin, supercooled rain or ice particles will be added to the wet snow.

It will be seen from the composite maps (Figs. 5 and 6) that there is an unusually large number of movements involving southern airmasses in the early winter and again at the close of winter and the beginning of spring. These maps have shown the relation of flood periods in southern Ontario to the type of atmospheric circulation in the northern hemisphere which leads up to the floods. Figures 7 and 8, which show the temperature sequences in Southwestern Ontario in such winters, show the successive monthly variations from normal temperature at stations from north to south, Georgetown, Guelph, Kitchener, Stratford, Paris, Brantford. The winters of 1916, 1917, 1918, 1920, 1921, and 1929, chosen because of the magnitudes of the floods in the Grand river system, may be seen to follow much the same temperature pattern. That of 1929 is rather pronounced; early winter well above normal, midwinter below normal, and a very warm spring. The course of this winter is shown in detail at Brantford in Fig. 9. This diagram shows at the top the actual and normal rate of totalization of the falling precipitation from November 1st, 1928. As the collected amount increases, the scale swings downward to the right. At the bottom the individual falls of rain and snow are shown, rain by clear rectangles, snow by shaded rectangles. It will be noted that there were some very large falls of rain and comparatively little snow. What snow fell in November and December was well mingled with rain, while in January extraordinary rains alternated with snowfalls.

The daily march of temperature is shown along the middle of the diagram with a dotted line depicting the normal course of temperature. It is interesting to note the waves of warmth coming at very irregular intervals of about a fortnight and accompanied in each case by rain with a little snow as the following cold margin of the wave sweeps over the highlands. These following cold waves were severe after the middle of January was reached, with the temperature averaging below zero on February 27th. The heavy rains and the saturated top-soil must

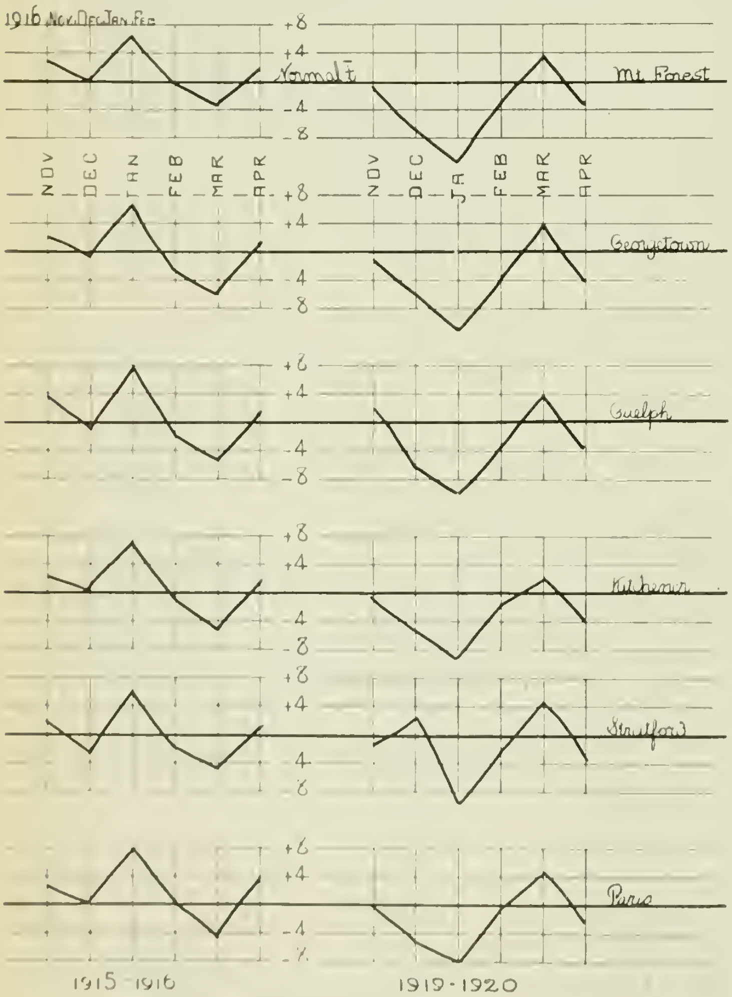

Fig. 7—Difference from Normal Temperature.

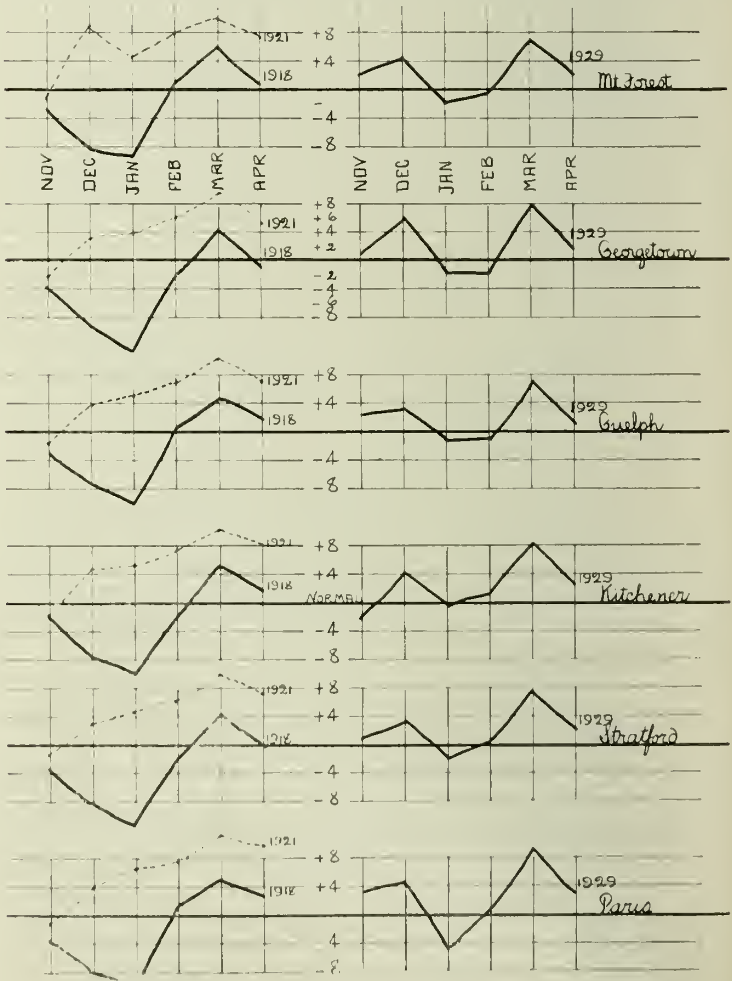

Fig. 8—Difference from Normal Temperature.

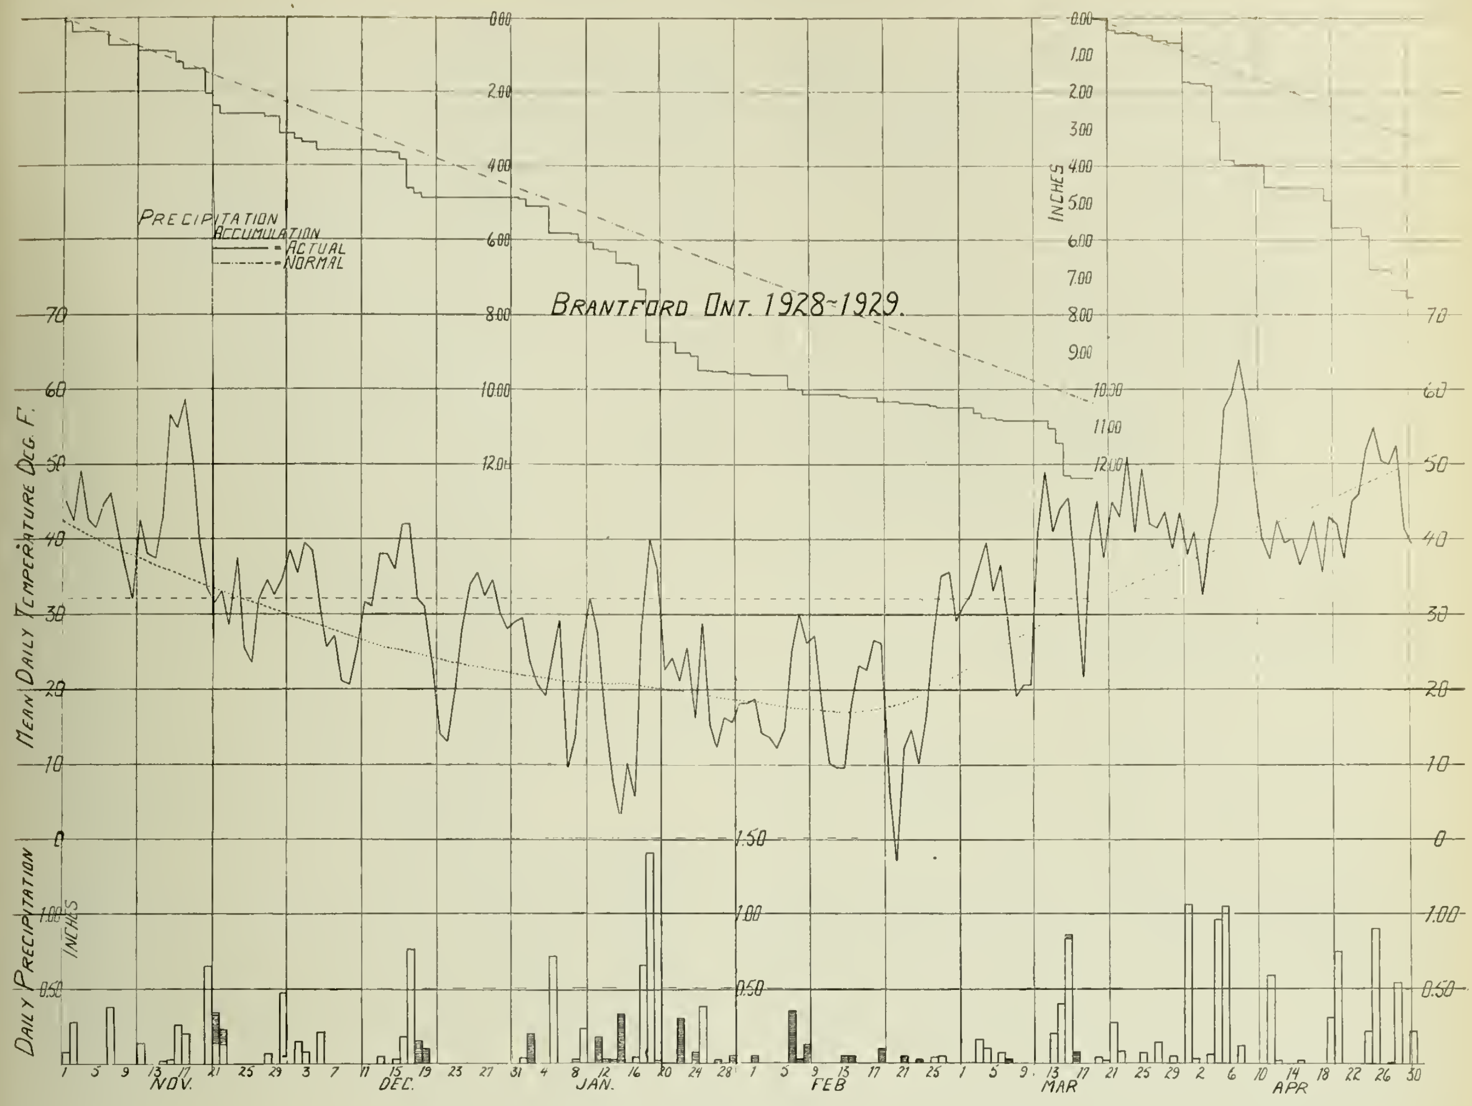

Fig. 9—Precipitation, Brantford, Ont., Winter 1928-29.

by these periods of sharp cold in January and February have created a glazed or icy foundation for the moderate but frequent snowfalls of late January and most of February.

From the figure it will be seen that by February 20th the total precipitation already fallen (top graph) was far above the normal amount. How much had already run off is not known. But records indicate that upstream there were similar conditions, except a larger proportion of wet snow. After that date the slope of the actual accumulation curve is less steep than the normal till March 2nd when the early rains began with swiftly rising temperature. The heavy rains of the 13th to 17th then set in.

In the top right-hand corner of the diagram there begins a new accumulation slope on March 15th. The extraordinary departure of this rainfall from the normal and the unusual warmth coincides with the worst period of spates and freshets. The highest peak was apparently that of the 11th to the 19th of March at Galt. It is perhaps correct to suppose that the rains of the 13th to 17th together with the stored amounts loosened by the warm waves of February 25th to March 3rd ran off completely from the icy substructure of the rains frozen prior to January 24th.

The heavy and frequent rains of March and April were probably more than sufficient to tax the capacity of the lower portions of the channel without the load of water shed from the saturated upper portions of the basin.

The history of the winter of 1936-1937 is interesting on account of the severe flood on the south branch of the Thames. It is desirable to review the course of events preceding this flood. The flood of 1937 in the Thames valley will be the only other specific instance which can be dealt with in detail. The only major item of the events preceding this flood which differs noticeably from the sequence associated with many similar occurrences in Southern Ontario was the lag on account of rather steady cold weather during March and the first three weeks of April. November in the Thames region was 4 or 5 deg. below normal with normal precipitation or more.

December was mild, 4 deg. above normal, with rains above normal. January was extraordinarily mild, 8 deg. or more above normal in the upper portion of the basin, with precipitation of 6 to 8 in., mostly rain, over most of the area draining to Lakes Erie and St. Clair. February was also very mild, about 6 deg. above normal, with heavy rains about the 1st, 8th and 14th. There were sharply cold periods of short duration followed or preceded by light snow. March was backward and so was April till about the 20th. On April 21st, after a sharp rise in temperature from about 35 deg. F. to 65 or 70 deg. F., more than an inch of rain fell in about 26 hours. This was followed by northwest and then by northeast winds with near frost for several mornings. On the 24th temperature again rose sharply to about 60 deg. F. or higher and very heavy rain fell.

From November 1st to April 1st about 17 in. had fallen on the Thames basin above London. Most of this had been rain during an abnormally mild December, January, and February. During the long freeze-period of March and part of April it would seem that the soil, saturated to an abnormal depth, had a large content of

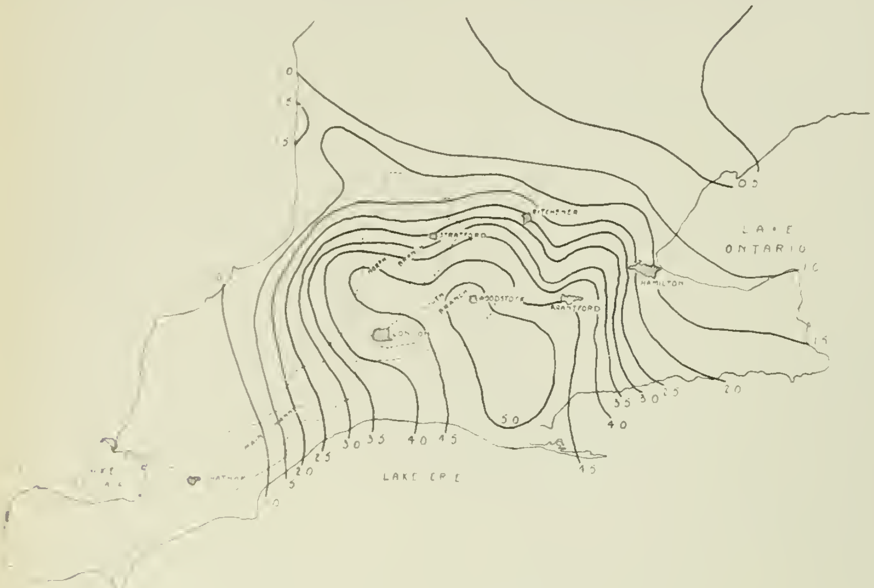

Fig. 10—Rainfall in inches Apr. 24-26th, 1937.

frozen water in the top-layer. After the inch of rain on the 21st, thaw-water added to the rain must have left the soil saturated to the point where the heavy downpour of the 25th and 26th was practically total run-off. Assuming that an inch of rain on the 21st falling on already saturated soil would have totally run off, then a sustained flow of 3,145 cu. ft. per sec. for five days would have been needed to carry all this water past the gauging station near Fanshawe on the north branch of the Thames, and about 2,700 cu. ft. per sec. past the gauge at Ealing on the south branch sustained for the same five days. On the night of the 24th began a rain which exceeded 5 in. over a portion of the south branch and more than 4 in. over the southern half of the north branch. The map in Fig. 10 indicates the distribution of this rain of about 48 hours. On top of the conditions created by the rain of the 21st following upon the abnormal rainfall of the winter, this last rain may without doubt be considered total run-off. To carry this additional rainfall away in five days would have required a sustained flow of 10,950 sec.-ft. at Fanshawe and 13,050 sec.-ft. at Ealing. Since the five-day period postulated for the run-off of the rain of the 21st was not complete when the great rains of the 25th and 26th were falling, our supposition is equivalent to a flow of over 14,000 sec.-ft. at Fanshawe and 15,750 sec.-ft. at Ealing on the 26th. The previous maxima recorded for one day were on March 25th, 1928, at Fanshawe of 12,510 sec.-ft. and on March 23rd, 1926, at Ealing of 9,230 sec.-ft.

A five-day run-off period has been taken for water totally shed from the surface of the basin without any knowledge of the actual gauge-readings of this period. For the most tortuous paths by tributary creeks to the mainstream at Ealing this assumes a mean speed of less than one mile per hour; and for the most direct route from, say, Innerkip to Ealing, about a quarter of a mile per hour. Hydraulic engineers will be familiar with stream-flow in this territory and will be able to amend these suppositions from actual measurements. All that the above considerations indicate is that very heavy rainfall upon already saturated top-soil must result in flood-stages.

1916 shows three peaks of warmth separated by two cold periods. 1917 shows an average early winter, diving steeply in February, then rising rapidly in March and falling again in April. 1918 shows a cool fall going down to a very severe January, then climbing to a warm March. 1920 is of the same character, except the early winter was normal or above normal. 1921 is in a class by itself. As far as departure from normal was concerned, the winter increased in mildness throughout to peak in spring. By comparison there is the winter of 1923. From a warm fall the weather went below normal to a moderate extent and stayed there till April. There was apparently one flood period during the first ten days of April which was about two thirds of the average of the preceding ten years at Belwood, 30 per cent below average at Conestogo, more than 50 per cent below normal on the Conestogo river, and more than 50 per cent below the seventeen-year average at Galt. For most of this year the precipitation was below normal.

The years 1914 and 1915, also devoid of interest, had late floods which were about the smallest on record. Elora had 52 in. of snow the winter of 1913 and 1914 and 4.94 in. of rain from November to March, but the greater part of the rain fell in November. February was very cold and

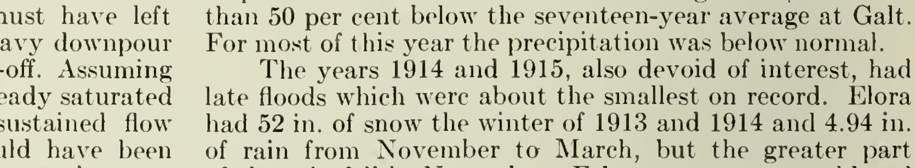

Fig. 11—Precipitation Nov. to Apr. 1936-37.

March about normal. In the winter of 1914-1915, 70 in. of snow fell at Elora and 4 in. of rain. December was cold, February warm, while January and March were about average. April was rather dry with several very cold days.

Summarizing again from the meteorological point of view, it may be said that the occurrence of damaging floods from spring rains appears to be largely dependent not only upon the magnitude of the rainfall but also upon the proportion of the run-off. The run-off ratio is in turn dependent upon the absorptive efficiency of the surface. This efficiency can be reduced to the vanishing point by (*a*) a glazed surface, (*b*) a surface already saturated. Both of these conditions are evidently dependent upon the preceding weather sequences in Southwestern Ontario. These sequences are incidents in large-scale change in the atmospheric circulation of the northern hemisphere.

There are two subsidiary points which have been brought out by the analysis of the figures which are worth mentioning. The first is that although the temperature begins to fall sharply on the highlands of the interior at an earlier date in the autumn than on the lowlands and the lower reaches of the valleys, yet in spring the rise of temperature on the highlands is faster than along the lower reaches of the rivers. The map (Fig. 12) shows the difference in degrees between the drop from autumn to midwinter and the rise from midwinter to spring. The quicker recovery of the highlands is noticeable in respect to both daily maximum and daily minimum temperatures. This will suggest that the disintegration of the top layers of snow during periods of fair weather may be proceeding at a much faster rate than is generally realized. Conversely during such fair weather the lower reaches of the valleys may not be clearing out as fast as is ordinarily taken for granted. A warm spring rain may then act as the trigger to release potentialities whose magnitude is out of proportion to the magnitude of the rainfall.

It will be seen from Fig. 12 that there is an area with a net gain of 10 deg. F. in the average daily maximum between the drop from November 15th to February 15th and the rise from February 15th to April 15th. A slightly greater proportion of this area covers the sources of the north Thames than the sources of the Grand. There is also a greater lagging of the temperature towards the mouth of the Grand than towards the mouth of the Thames.

The net gain of the average daily minimum is much less than that of the maximum but the areal differentiation is similar. It follows that sunny quiet days after the middle of February when the temperature on the highlands rises steeply after 10 a.m. probably have a greater effect on disintegrating the top layers of snow there than down

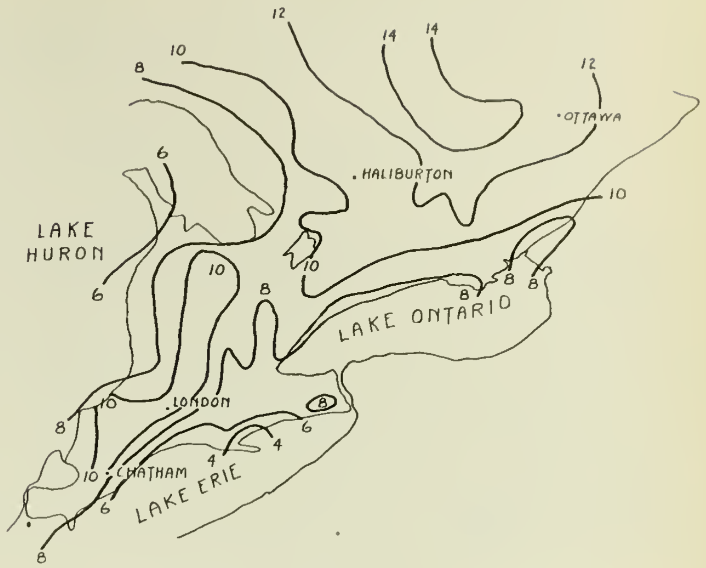

Fig. 12—Net gain Maximum Temperature (Rise in Daily Max. Feb 15th to Apr. 15th Less Fall of Same Nov. 15th to Feb 15th).

valley towards the lake. This point was not stressed when dealing with large floods, since it becomes a minor factor in contrast with the unusual warm waves preceding great floods. In more normal years its relative importance is increased.

The second subsidiary point worthy of mention arises from parallel comparisons of precipitation records in Southwestern Ontario with those of a century at Toronto. There are periods of very heavy precipitation in the Toronto record which have not recurred in the last half-century. These periods are, moreover, seen in the long record at Boston while fragmentary records from the vicinity of the Conestogo river also check very well. Considering the size of the airmasses involved in very wet periods, it is justifiable to suppose that there were much wetter periods in Southwestern Ontario than are shown in the records since 1885. No valid reason can be adduced against their recurrence at some future time.

Surface Run-Off in the Thames and Grand River Basins in Ontario

Norman Marr, M.E.I.C.,
Chief Hydraulic Engineer, Dominion Water and Power Bureau, Surveys and Engineering Branch, Department of Mines and Resources.

Paper presented at the Annual Meeting of The Institute in London, Ont., February 2nd, 1938.

SUMMARY.—The author presents for reference the available records of run-off in the basins of two rivers in Southwestern Ontario, which are liable to extreme variations of flow, and have total drainage areas of 2,250 and 2,610 sq. mi. respectively.

The extremes of high and low flow experienced in the streams of the southwestern peninsula of Ontario in recent years have directed attention to the possibility of alleviating these conditions, particularly in the basins of the Thames and Grand rivers which occupy a large part of this peninsula. In any study of proposed remedial measures a knowledge of the surface run-off is essential. Therefore, it is the purpose in this paper to present for convenient reference a compilation of all run-off records secured in the Thames and Grand river basins.

Thames and Grand River Basins

Thames River Basin

The Thames river with a total drainage basin of approximately 2,250 sq. mi. has its source in the vicinity of Stratford in the county of Perth. Three main branches constitute the upper part of the river. The middle branch joins the south branch a short distance from Ingersoll and the north and south branches unite at the city of London to form the main stream. The river follows generally a southwesterly course and about seventeen miles below the city of Chatham empties into Lake St. Clair. The basin has a total length of about 120 miles and the river a total descent from source to mouth of 625 ft., of which about 200 ft. occurs in the main stream from London to the mouth. The basin has been largely cleared of forest for many years and contains throughout its area some of the most fertile agricultural lands in the province. It is quite thickly populated and the cities of Stratford, Woodstock, London and Chatham and towns of Ingersoll, St. Mary's and Ridgetown are located in the area.

Grand River Basin

The Grand river with a total drainage basin of approximately 2,610 sq. mi. has its source in the northwest part of the county of Dufferin and flows in a general southerly direction to the city of Brantford where it turns to the southeast and enters Lake Erie at Port Maitland. The principal tributaries are the Conestogo, Speed and Nith rivers. The basin has an over-all length of about 110 miles and the river from source to mouth a total descent of about 1,100 ft. Following the course of the river from Belwood bridge, about 142 miles from the mouth, there is a descent of about 469 ft. in the 52 miles from Belwood to the confluence of the Speed river and the Grand near Galt, and about 308 ft. in the remaining distance of 90 miles to the mouth. The Grand basin too has been largely cleared of forest for many years and the lands given over to agriculture. It is one of the most thickly populated areas of Ontario containing such industrial cities as Guelph, Kitchener, Galt, and Brantford, and the towns of Elora, Fergus, Preston, Hespeler, Waterloo, Paris, Caledonia, and Dunnville.

Run-Off Records

The Hydro-Electric Power Commission of Ontario began the systematic collection of run-off records of the Grand river in 1913 and of the Thames river in 1914 and continued until October 1st, 1919, when responsibility for this and other hydrometric work in Ontario was assumed by the Dominion Water Power Branch of the Department of the Interior in accordance with the terms of a co-operative agreement between the Commission and that Department. The work has been continued under this co-operative arrangement, the Dominion Government organization now being known as the Dominion Water and Power Bureau of the Surveys and Engineering Branch, Department of Mines and Resources.

In the Thames river basin daily records of gauge height and discharge commenced on March 13th, 1914, at Kilworth bridge about two miles downstream from the village of Byron. The station was maintained at Kilworth bridge until September 30th, 1922, when it was replaced by a new station about two miles upstream at Byron. Records were secured at Byron until March 1932 when the station was discontinued. The drainage area tributary to the river at Kilworth bridge is estimated at 1,270 sq. mi. and that at Byron at 1,230 sq. mi. In Table I the maximum, minimum, and mean monthly flows and the mean yearly

Table I—Thames River (Main Stream) at Kilworth May 1914-September 1922 and at Byron October 1922-September 1931.

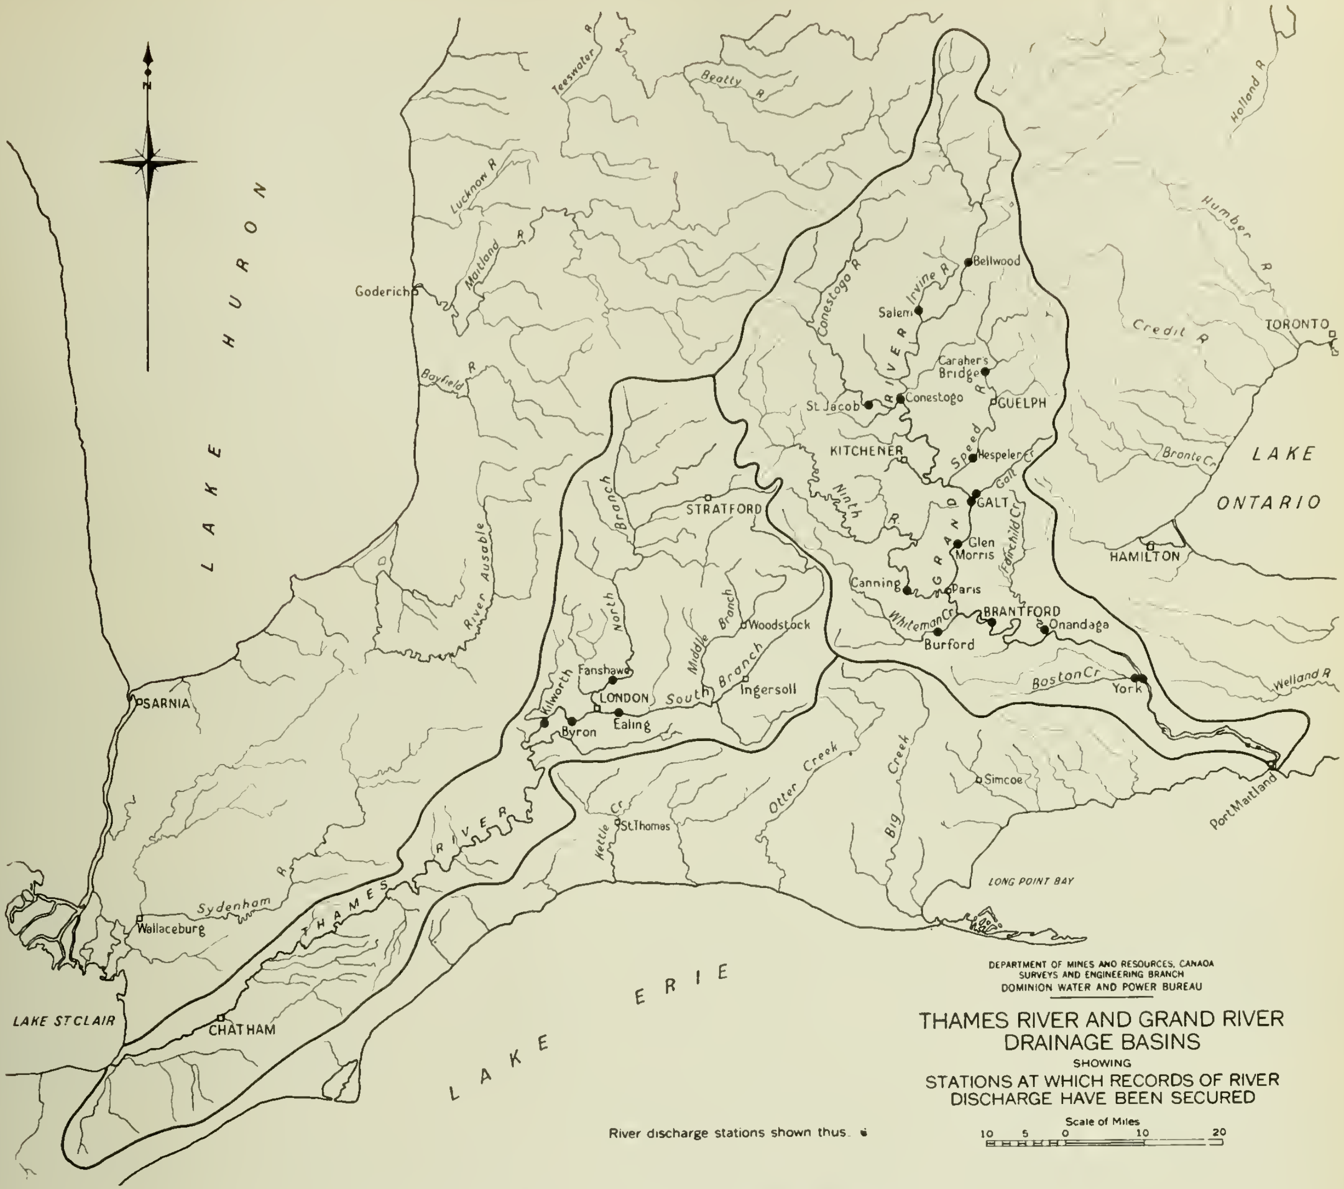

Fig. 1—Thames River and Grand River Drainage Basins.

flows are tabulated for the period of record at Kilworth bridge and Byron.

On the south branch of the Thames, daily records of gauge height and discharge were commenced on May 11th, 1915, at the Vauxhall traffic bridge about three miles above the junction of the south branch with the main stream. These daily records have been continued to the present time. The drainage area tributary to the south branch at Vauxhall bridge is estimated to be 515 sq. mi. Table II lists the maximum, minimum, and mean monthly flows and the mean yearly flows for the period of record.

On the north branch of the Thames daily records of gauge height and discharge were commenced on May 12th, 1915, at the highway bridge near Fanshawe Post Office about six miles above the junction of the north branch with the main stream. With the exception of a break which occurred for the year October 1934 to September 1935, these daily records have been continued to the present time. The drainage area tributary to the north branch at Fanshawe is estimated to be 585 sq. mi. Table III lists the maximum, minimum, and mean monthly flows and the mean yearly flows for the period of record.

In the Grand river basin stations were established in June and July 1913 at six locations on the Grand river and at nine locations on its tributaries. Descriptions of these stations and tabulations of the records secured are given hereunder.

The uppermost station on the Grand river was established at the bridge in the village of Belwood. Daily records of gauge height and discharge commenced on August 1st, 1913, and were continued to September 30th, 1923. The drainage area tributary to the river at Belwood is estimated to be 280 sq. mi. Table IV lists the mean monthly flows and the mean yearly flows at this station for the period of record.

The second station on the Grand was established at the bridge one-quarter mile below the village of Conestogo. Daily records of gauge height and discharge commenced on July 16th, 1913, and were continued to September 30th, 1923. The drainage area tributary to the river at Conestogo is estimated to be 550 sq. mi. Table V lists the mean monthly flows and the mean yearly flows at this station for the period of record.

The third station on the Grand was established at the Concession Street bridge in the city of Galt. Daily records of gauge height and discharge commenced on July 21st, 1913, and have been continued to the present time. The drainage area tributary to the river at Galt is estimated to be 1,360 sq. mi. As this is the key station in the Grand river watershed and has the longest term of record, the maximum, minimum, and mean monthly flows and the mean yearly flows are listed in Table VI for the period of record.

The fourth station on the Grand was established at the bridge in the village of Glenmorris. Daily records of gauge height and discharge commenced on July 22nd, 1913, and were continued to September 30th, 1920. The drainage area tributary to the river at Glenmorris is estimated to be 1,390 sq. mi. Table VII lists the mean monthly and the mean yearly flows at this station for the period of record.

At the fifth station on the Grand located at the Toronto, Hamilton and Buffalo Railway bridge in the city of Brantford, daily records of gauge height and discharge commenced on July 8th, 1913. These records were continued to September 30th, 1922. The drainage area tributary to the river at Brantford is estimated to be 2,000 sq. mi. Table VIII lists the mean monthly and mean yearly flows at this station for the period of record.

At the sixth station on the Grand located at the highway bridge in the village of York, daily records of gauge height and discharge commenced on July 1st, 1913, and continued to September 30th, 1923. The drainage area tributary to the river at York is estimated to be 2,280 sq. mi. Table IX lists the mean monthly and mean yearly flows at this station for the period of record.

Records have been secured of the flow of eight tributaries of the Grand river. These are submitted hereunder in the order in which these tributaries enter the main river from source to mouth.

On the Irvine river which enters the Grand at Elora records of daily gauge height and discharge were secured at the highway bridge known as Watt's bridge for the period July 30th, 1913, to August 31st, 1916. The drainage area tributary to Irvine river at this station is estimated to be 67 sq. mi. Table X lists the mean monthly and mean yearly flows for the period of record.

The Conestogo river enters the Grand river at the village of Conestogo. A station was established at the bridge in the village of St. Jacob's and records of daily gauge height and discharge were secured for the period July 16th, 1913, to August 31st, 1916. The drainage area tributary to Conestogo river at this station is estimated to be 305 sq. mi. Table XI lists the mean monthly and mean yearly flows for the period of record.

The Speed river enters the Grand a short distance above the city of Galt. Records were secured at two stations on this river. The upper station was located at Caraher's bridge above the junction of the Speed and Eramosa rivers about four miles from the city of Guelph. Records of daily gauge height and discharge were secured for the period November 1st, 1913, to September 30th, 1917. The drainage area tributary to the Speed at this station is estimated to be 77 sq. mi. Table XII lists the mean monthly and mean yearly flows for the period of record.

The lower station on the Speed was located at a point 100 ft. below the gaol in the town of Hespeler. Records of daily gauge height and discharge were secured for the period November 1st, 1913, to September 30th, 1922, and during the spring freshet period in the years 1923 to 1928 inclusive. The drainage area tributary to the Speed at Hespeler is estimated to be 250 sq. mi. Table XIII lists the mean monthly and mean yearly flows for the period of record.

Galt creek enters the Grand river in the city of Galt. A station was established at Kerr Street bridge in Galt and records of daily gauge height and discharge were secured for the period July 21st, 1913, to August 31st, 1916. The drainage area tributary to Galt creek at this station is estimated to be 45 sq. mi. Table XIV lists the mean monthly and mean yearly flows for the period of record.

The Nith river enters the Grand at the town of Paris. A station was established at the bridge 200 ft. upstream

from the Canadian National Railways bridge, one mile from the village of Canning. Records of daily gauge height and discharge were secured for the periods July 5th, 1913, to September 30th, 1917; March 1st, 1920, to September 30th, 1923; March 23rd to May 31st, 1924; March 9th to May 31st, 1925; and April 1st to July 13th, 1926. The drainage area tributary to the Nith at this station is estimated to be 430 sq. mi. Table XV lists the mean monthly and mean yearly flows for the period of record.

Whiteman's creek enters the Grand river between Paris and Brantford. A station was established at the first concrete bridge above its confluence with the Grand and continuous records of daily gauge height and discharge were secured for the period October 15th, 1913, to September 16th, 1916. The drainage area tributary to Whiteman's creek at this station is estimated to be 154 sq. mi. Table XVI lists the mean monthly and mean yearly flows for the period of record.

Fairchild's creek enters the Grand river at the village of Onondaga below Brantford. A station was established at Howell's bridge near Onondaga and daily records of gauge height and discharge were secured for the period July 1st, 1913, to August 31st, 1916. The drainage area tributary to Fairchild's creek at this station is estimated to be 115 sq. mi. Table XVII lists the mean monthly and mean yearly flows for the period of record.

Boston creek enters the Grand river at the village of York. A station was established at the first highway bridge above its confluence with the Grand and was later moved to the second highway bridge known as Anderson's bridge. Records of daily gauge height and discharge were secured for the period July 1st, 1913, to August 31st, 1916. The drainage area tributary to Boston creek at this station is estimated to be 125 sq. mi. Table XVIII lists the mean monthly and mean yearly flows for the period of record.

FLOOD FLOWS

Thames River

An examination of the discharge records secured in the Thames river basin during the past twenty-three years indicates that on the main stream below the junction of the north and south branches, maximum daily flows of less than 10,000 c.f.s. occurred in three of the years; flows of 10,000 to 15,000 c.f.s. in six of the years; flows of 15,000 to 20,000 c.f.s. in nine of the years; flows of 20,000 to 25,000 c.f.s. in three of the years; and flows in excess of 25,000 c.f.s. in two of the years.

The greatest flood in the period of record was experienced in the month of April 1937 when heavy local precipitation occurred on lands previously saturated from the rains and melted snows of a very open winter. The sum of the estimated daily flows of the north and south branches reached a maximum on April 27th with a figure of 38,380 c.f.s. The peaks on the two branches did not synchronize. On the north branch the maximum flow occurred on April 26th with an estimated mean daily discharge of 20,570 c.f.s. and an instantaneous peak of probably 32,000 c.f.s. The south branch reached a maximum on April 27th with an estimated mean daily discharge of 22,160 c.f.s. and an instantaneous peak of probably 25,000 c.f.s. The maximum daily discharge of the north branch indicated a run-off from the tributary drainage of 35 c.f.s. per sq. mi. while on the south branch the corresponding figure was 43 c.f.s. per sq. mi.

Floods on the Thames are of the flashy type, high rates of flow being sustained for relatively brief periods. For example, in the flood of April 1937, the daily flows of the north branch from the 25th to the 30th were as follows: 25th—1,010 c.f.s.; 26th—20,570 c.f.s.; 27th—16,220 c.f.s.; 28th—5,430 c.f.s.; 29th—4,570 c.f.s.; 30th—2,270 c.f.s. Similarly on the south branch the daily flows were: 25th—

2,030 c.f.s.; 26th—11,000 c.f.s.; 27th—22,160 c.f.s.; 28th—8,260 c.f.s.; 29th—5,510 c.f.s.; 30th—3,050 c.f.s.

The maximum flow of the year is usually experienced in the months of March or April, but the records indicate that in addition to these months high flows may be looked for in the months of January, February, May, November and December.

Grand River

During the twenty-four years in which discharge records have been secured of the Grand river at Galt, maximum daily flows of less than 10,000 c.f.s. occurred in two of the years; flows of 10,000-15,000 c.f.s. in five of the years; flows of 15,000-20,000 c.f.s. in eight of the years; flows of 20,000-25,000 c.f.s. in five of the years; flows of 25,000-30,000 c.f.s. in three of the years; and flows in excess of 30,000 c.f.s. for one of the years.

The greatest flood in the period of record was experienced on March 18th, 1919, when a daily flow of 30,090 c.f.s. was recorded, indicating a run-off from the tributary drainage of 22 c.f.s. per sq. mi. A flood of almost as great a magnitude occurred on April 6th, 1929, when a daily flow of 29,720 c.f.s. was recorded.

As in the Thames river basin the floods on the Grand are of the flashy type. For example, in the flood of 1919 the daily flows for the period March 16th-20th were as follows: 16th—3,440 c.f.s.; 17th—13,560 c.f.s.; 18th—30,090 c.f.s.; 19th—10,370 c.f.s.; 20th—8,840 c.f.s.

The maximum flow of the year is usually experienced in the months of March or April. In the period of record it has occurred in March for twelve of the years, in April for eleven of the years, and in February in one year. In addition to the months of March and April when flood flows are normally experienced the records indicate that high flows may be looked for in the months of January, February, May, November and December.

Low Flows

Thames River

The records which have been secured of the north and south branches of the Thames and also of the main stream indicate that this river ordinarily reaches its lowest flow in the late summer or early autumn. On the north branch September is normally the lowest month, the next in order being August, October, July and June. On the south branch August shows the lowest mean flow, the next in order being September, October, July and June.

The most pronounced period of low flow was recorded in 1936, July to October inclusive. The month of August showed a combined mean flow in the north and south branches of 36 c.f.s. indicating a run-off from the tributary drainage of 0.033 c.f.s. per sq. mi. During the three months July, August and September the mean flow was 42 c.f.s. while for the four months July to October it was 54 c.f.s. Other years of low flow in the summer and autumn period were 1918, 1919, 1925, 1929, 1930, 1933, 1934 and 1935.

The lowest yearly mean flow was recorded in the climatic year October 1st, 1930-September 30th, 1931, with a figure of 510 c.f.s. as the combined flow of the north and south branches and 605 c.f.s. on the main stream at Byron. Other low years were 1919-20 with 610 c.f.s. on the two branches; 1924-25 with 634 c.f.s.; 1917-18 with 727 c.f.s.; 1935-36 with 769 c.f.s.; 1933-34 with 846 c.f.s.; 1922-23 with 874 c.f.s.; and 1934-35 in which 340 c.f.s. was recorded on the south branch, records of the north branch being missing in this year.

Grand River

The records which have been secured of the Grand river indicate that it ordinarily reaches its lowest flow in the late summer or early autumn. August is normally the lowest month, the next in order being September, October, July and June.

The most pronounced periods of low flow were recorded in the consecutive years 1933, 1934, 1935, and 1936. August of 1936 produced the lowest mean monthly flow of 47 c.f.s. indicating a run-off from the tributary drainage of 0.035 c.f.s. per sq. mi., and the lowest daily flow of 26 c.f.s. In the three months of July, August and September of 1936 the mean flow was only 64 c.f.s. During August, September and October of 1935 the mean flow was 73 c.f.s. During July, August and September 1934 the mean flow was 80 c.f.s. and during July, August and September of 1933 the mean flow was 86 c.f.s.

The lowest yearly mean flow was recorded in the climatic year October 1st, 1930-September 30th, 1931, with a figure of 483 c.f.s. Other low years were 1913-14 with 645 c.f.s.; 1934-35 with 685 c.f.s.; 1935-36 with 740 c.f.s.; 1924-25 with 750 c.f.s.; 1919-20 with 875 c.f.s.; 1914-15 with 890 c.f.s.; and 1933-34 with 950 c.f.s.

Agricultural Drainage in Southwestern Ontario

Its Effect on Stream Discharge

Geo. A. McCubbin, M.E.I.C.,
Consulting Engineer, Chatham, Ontario.

Paper presented at the Annual Meeting of The Institute in London, Ont., February 2nd, 1938.

SUMMARY.—After describing briefly the larger drainage schemes in Southwestern Ontario and outlining the legal questions connected with such undertakings, the author concludes that there is little or no indication of increasing flood discharge, subsequent to the active period of drainage construction in the area discussed.

When a flood of unusual magnitude and destructiveness occurs, such as that of the Thames in late April 1937, interest is aroused not only as to what measures can be taken to prevent recurrence of flood damages, but also as to whether the flood is wholly due to the forces of nature or, in part, to the works of men and corporations, for which they may be held responsible. Our present discussion is confined to the nature and extent of agricultural drainage in Southwestern Ontario and its effects, if any, on stream discharge.

Drainage does not include the cutting down of forests, clearing the land, cultivating the soil, removing obstructions to the flow of surface water, or any of the other operations that may properly be done in the course of good husbandry. All these may be done without incurring any liability for increased flow of water and resulting damage to lower lands. It does consist in the construction of artificial channels, whether covered or open, other than mere plough furrows, and it also comprises operations of embanking and pumping. The purpose of drainage is not so much to expedite the flow of surplus water as to lower its surface and carry it off below ground level. Where flat lands have no swales or natural depressions, the effect of ditches is to collect surface water and confine the flow in definite channels, instead of allowing it to pass over the surface of the ground. Where valleys are subject to flooding between the high banks, the construction of ditches or the improvement of the natural watercourses lowers the level of the flood waters and increases the velocity of flow, but diminishes the sectional area.

The smallest drains, and the most numerous, are private ditches or tile drains constructed by individual owners on their own lands. Two Ontario statutes facilitate the construction of drains affecting the lands of more than a single owner. The Ditches and Watercourses Act enables an individual requiring drainage for his land, but affecting the lands of others, to initiate and carry out proceedings for drainage work, with certain limitations. The work may not pass through or into more than seven original township lots; the cost may not exceed $2,500; owners of lands more than one hundred and fifty rods from the drain may not be made liable for its construction; land owners are individually liable for the construction and maintenance of specified portions of the work, and the work as a whole must be continued to a sufficient outlet.

The Municipal Drainage Act aims at drainage for a community rather than for the individual. The basis of all proceedings is the petition of a majority of owners whose lands are to be benefited. The work is undertaken and carried out under by-law, and no limits are fixed as to the area assessable or the magnitude or cost of the work, save only that the benefits to be derived must be commensurate with the cost. When once a drain has been constructed under this Act, it may subsequently be improved and extended without a further petition. This provision is intended to enable a municipality to remedy any defect or insufficiency in the original work and to extend it to a sufficient outlet, instead of being continually liable for damages to low-lying lands along or below the termination of the work. The Municipal Drainage Act is greatly preferred in Southwestern Ontario to the Ditches and Watercourses Act because of its greater flexibility and freedom from limitations. In Central and Eastern Ontario, where municipal councils are not so familiar with drainage procedure, more use is made of the Ditches and Watercourses Act.

Large Drainage Schemes

Municipal drains, as they are called, may be very small drains serving areas of only a few acres, or they may be trunk channels providing outlets for areas extending into the hundreds of square miles. Where a trunk channel costs over $10,000, aid to the extent of twenty per centum of the cost of the work may be granted by the Province.

A trunk outlet drain for one of these large areas may be fed either by a complete system of tributary drains, or almost wholly by natural watercourses. The Raleigh Plains drain in the county of Kent, for instance, receives scores, or possibly hundreds, of smaller drains from the surrounding higher lands. Of the total area of a hundred and fifty square miles it is safe to say that almost every acre is artificially drained. The main channel is constructed through the level plains that comprise about a fourth of the area, and the outlet is into the River Thames not far from its mouth. If it be taken for granted that the surplus water from the whole area reaches the river more rapidly through this system of drains than it otherwise would, the effect on the river floods is beneficial rather than detrimental, as the waters from this area have reached Lake St. Clair well in advance of the flood waters from the upper part of the river.

The so-called Canada Company drain in the county of Lambton differs from the Raleigh Plains drain in that it

Fig. 1—Raleigh Plains Drain at No. 2 Highway (Dec. 1937).

was constructed for the local purpose of reclaiming, or relieving the flooding of, some 17,000 acres known as the drowned lands, rather than to provide an outlet for tributary drains. The drain is in reality a shortening of the course of the River Aux Sables, the new channel four miles in length cutting off a twenty mile loop by way of Grand Bend. The area draining to the cut, or canal as it is sometimes called, is 500 sq. mi., and the discharge capacity is one-third of an inch of run-off in twenty-four hours. The outlet is into the original course of the river not far from Lake Huron. There are no agricultural lands to be damaged between the outlet end of the cut and the lake, but some complaint has been made of erosion and change of the river banks at the summer resort and fishing village of Port Franks. It has not been definitely determined or admitted that damage is directly due to the drainage work.

Fig. 2—Canada Company Drain at Blue Water Highway (1924).

The effect of channel shortening by cutting off a long loop is to lower the water surface throughout the length of the new cut, and for some distance above, without detriment to the stream or the lands further down, provided the supply of water from upstream is a steady flow, but if the flow from above is increasing in volume, the cut-off causes greater flooding than before on the downstream section.

While 500 sq. mi. is about the limit of area for which a trunk drainage channel has been provided, either by original construction or by improvement of a natural watercourse, schemes of greater magnitude have been mooted. The county council of Simcoe and the Provincial Government of Ontario investigated the possibility of improving the Nottawasaga river near its mouth to reclaim 16,000 acres of swamp lands in the townships of Vespra and Sunnidale. The tributary area is 1,000 sq. mi., and the cost of providing a trunk channel twenty miles in length, with capacity of one-fifth of an inch run-off in twenty-four hours, was estimated at $860,000, more than fifty dollars for each acre of swamp land to be benefited. The cost was not considered warranted by any possible results.

The records of the smaller streams, having drainage areas of 100 sq. mi. or less, indicate generally a run-off in the annual floods of a half-inch in twenty-four hours. An occasional record, and some actual gaugings by the author, have shown as high as one inch. Drainage designed for areas of only a few thousand acres usually provides for from one inch to two inches, according to circumstances and the damage that might arise from incomplete drainage.

Legal Responsibility

Any persons or corporations collecting water and causing it by artificial means to flow upon lower lands are liable in common law for resulting damages. The only exception is in favour of riparian owners, who have the right to make reasonable use of natural watercourses through or adjoining their own lands. This use, which may be made without incurring liability to owners downstream, includes the construction of drains and the straightening or otherwise improving of the watercourse. "And what one riparian proprietor may do, several in combination may do with or without an award."

Under the drainage laws of Ontario, proceedings may be taken to construct proper and sufficient outlets for all drains, and land owners may be assessed for the value of outlets so provided for their drains, or, in the alternative, may be assessed for relief from injuring liability. A sufficient outlet is defined as the safe discharge of water where it will do no injury to lands or roads, and a great deal of litigation has arisen in the past over the interpretation of this definition. In one case an engineer's award providing for the drainage of a small area was set aside by the court on the rather technical ground that the river into which the outlet would be made was already subject to overflow, and that the outlet was therefore not sufficient. A more liberal finding in another case and in another court was that a strict interpretation of the drainage laws would put a stop to all drainage work in the Province, and that in theory there was no such thing as a sufficient outlet short of Niagara Falls or the Gulf of St. Lawrence. The courts generally are inclined to be more practical than theoretical in determining the sufficiency of an outlet, and to hold that a drainage work intended to serve only a small area, and not materially increasing flooding upon lower lands, should not be prohibited on technical or theoretical grounds.

The largest complete drainage systems in the Province have grown from the branches rather than from the trunk. The construction of many small drains leads to a demand for an outlet common to, and sufficient for, all the tributaries. The growth of these drainage systems has in general been the result of damage claims, or actions at law, brought by the owners of low-lying lands to compel municipalities and owners of higher lands to continue the drainage works to or towards a sufficient outlet. The complaint of the lower land owner has always been that

Fig. 3 Excavating the Canada Company Drain through the Sand Hills (1924).

the construction of drains upstream has brought water to his land in greater volume and with greater speed than it came naturally. This kind of claim has not been seriously or successfully challenged. Any required number of cases might be cited, but we shall mention only one by way of illustration. A section of the Nottawasaga river in the township of Tecumseh had been artificially improved under the Municipal Drainage Act on petition of owners of lands along the river and on tributary drains. Shortly after completion of the river improvements, a mill dam a mile downstream from the termination of the work was partly washed out by a flood, and the owner recovered damages from the township responsible for the drainage work. The drainage area was 300 sq. mi., and the flood run-off was slightly over an inch in twenty-four hours. This case is typical in one respect of all the suits for damages arising from the construction of drains, in that the damages were sustained within a relatively short distance from the drainage work.

The impossibility of complying strictly with the requirements of the drainage laws as to sufficiency of outlet brought about amendments to the Municipal Drainage Act by which compensation may be determined and paid to owners of low-lying lands instead of continuing drainage works to sufficient outlets. A more recent amendment provides that any drainage scheme may be appealed against on the ground that the benefits to be derived are not commensurate with the estimated cost. As a result of these amendments it is no longer necessary, as it was in the past, to construct outlets costing several times as much as the amount of the damages to be prevented.

Very recently the compensation provision of the Act was applied on a rather extensive scale. The flats of the Maitland river in the county of Huron expand in one place to a swamp of 1,900 acres, and two attempts to drain this swamp by improvement of the river had proved both expensive and unsuccessful. A land owner brought, and succeeded in, an action against the municipality for loss of a crop by flooding. The only way of avoiding a recurrence of such claims was by a further and adequate improvement of the channel, or by compensation under the Municipal Drainage Act, and of these alternatives the latter, virtually an easement in perpetuity, was found the less expensive and the more satisfactory.

Drainage Through Natural Watercourses

Where rivers like the Thames and Grand traverse rolling country it is unusual for drains to be carried to a final outlet into the river. The drains usually have their outlets into natural watercourses flowing in narrow valleys, which, in turn, discharge into the river. The length of natural watercourses varies with the topography. In the comparatively flat lands around the head waters of the River Thames, and also near its mouth, the length of artificial drains is greater than elsewhere. Throughout the greater part of the course of both rivers the lengths of tributary natural watercourses exceed the lengths of the artificial drains that enter them; under these circumstances the effect of the drains upon the river flooding at any time may well be questioned.

The extent to which river floods may be affected by a tributary, whether a natural watercourse or a large drain, will be greater or less according as the tributary enters the main stream nearer its source or its mouth. It is a matter of common observation that any local freshets in the creeks tributary to the lower reaches of the Thames subside before the crest of the flood comes down from the head waters. Floods on the Thames at Chatham are usually two days later than those at London. It would seem then that drainage schemes having outlets into the lower reaches of the rivers have a tendency to diminish rather than to increase the river floods. This cannot be said, however, of the embankments which form a substantial part of drainage schemes in the low lands for several miles along the lower reaches of the Thames. These embankments prevent the river from spreading over the adjoining plains as it would otherwise do, and in this way they increase the height, though not the volume, of the river floods.

Records of Stream Flow

The most direct method of determining the effect of land drainage upon river floods would be by observation of a particular watershed over a period of years, both prior to and subsequent to the construction of drainage systems. The observations would include rainfall as well as run-off. An alternative direct method would be by observation of two watersheds similar in location, topography and rainfall, one of them undrained and the other provided with a fairly complete system of drainage. The records available in this Province are those of the Hydro-Electric Power Commission from 1915 to 1919, inclusive, and of the Dominion Water and Power Bureau from 1919 to the present time. From all records published up to and including the climatic year 1930-31, and those for subsequent years kindly furnished by the Bureau, an analysis has been made of the rate of discharge or run-off at the time of maximum annual floods for all the rivers in Ontario on which records have been kept. A few graphs are presented herewith, and a complete set may be had on application to the Secretary of The Institute. The graphs show the discharge in cubic feet per second per square mile. For comparison with rainfall records, and with the rate of run-off in inches per twenty-four hours used in the design of agricultural drains, it may be stated that one inch of run-off in twenty-four hours is equivalent to 26.89 cu. ft. per sec. per sq. mi.

While the records cover a period of twenty-two years from 1915 to 1937, the most active period known in the construction of drains in the Province was in the prosperous years following the Great War, say from 1920 to 1929. If the construction or improvement of drains during this period had any marked effect on the maximum annual floods one might expect to find some trace of it in the records, particularly in those of the Grand and Thames rivers, both of which traverse rich agricultural land in which there are extensive drainage works.

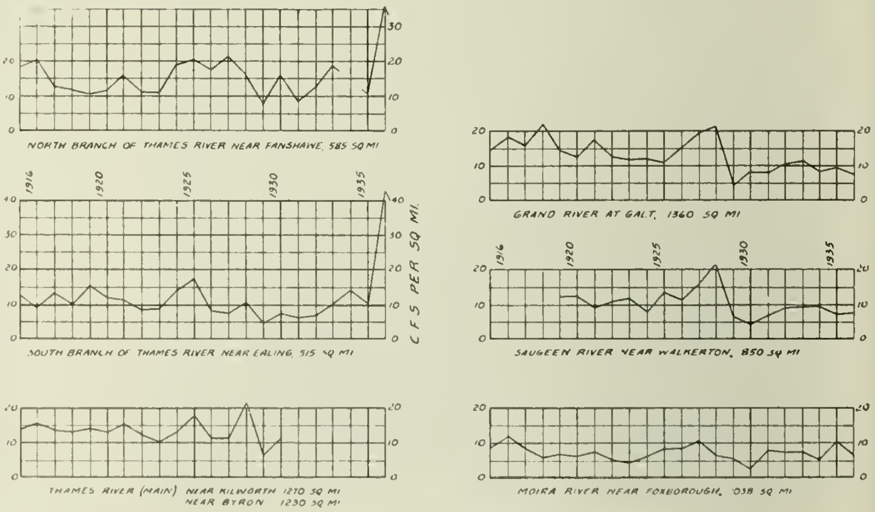

Fig. 4—Maximum Annual Floods (26.89 c.f.s. per sq. mi. equals 1 in. run-off in 24 hrs.).

The South Branch of the River Thames at Ealing, with a drainage area of 515 sq. mi., shows throughout the period a maximum annual flood discharge of about 12 cu. ft. per sec. per sq. mi. prior to 1929, and about 10 cu. ft. per sec. per sq. mi. since then, exclusive of the abnormal flood in the spring of 1937 which reached a peak of 43 cu. ft. per sec. per sq. mi.

The North Branch of the River Thames at Fanshawe, with a drainage area of 585 sq. mi., shows throughout the whole period of record a higher maximum annual flood than the South Branch, but like it, gives no indication of increasing flood discharge subsequent to the active period of drainage construction. The record flood in the spring

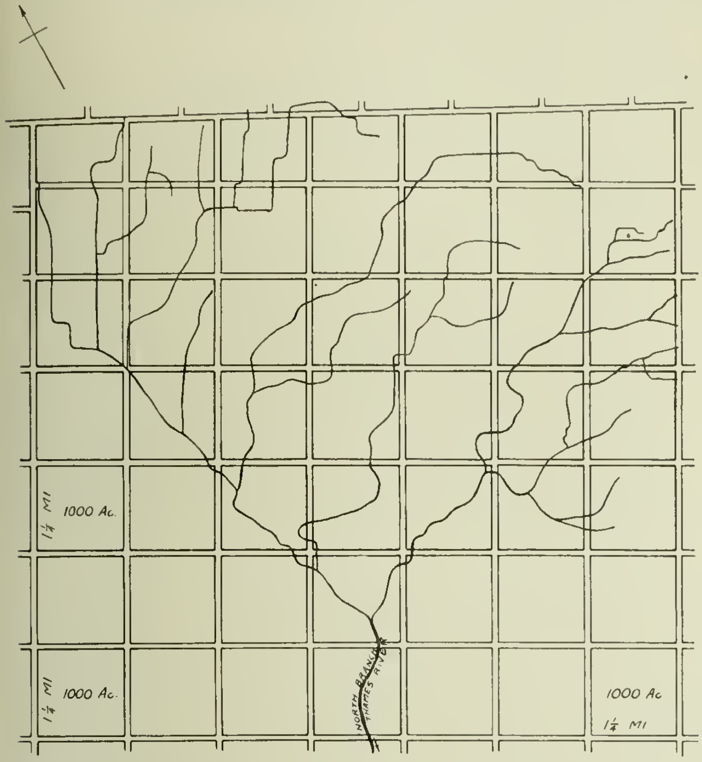

Fig. 5—Agricultural Drains Combining to Form Head Waters of North Branch of Thames River.

of 1937 reached a maximum discharge of 35 cu. ft. per sec. per sq. mi., more than twice the average for a number of years.

The records of the main Thames river near Kilworth, with a drainage area of 1,270 sq. mi., or at Byron, with an area of 1,230 sq. mi., terminating with the year 1930-31, show a fairly regular maximum annual flood discharge of about 13 cu. ft. per sec. per sq. mi. If flooding of either branch or of the main stream has been increased by land drainage, there appears to be no definite indication of it in these records.

The question may arise as to why the North Branch should, over a long period of years, have a relatively greater flood discharge than the South Branch. A more complete study than has been found possible for the present discussion might indicate one or more of the following causes: (1) greater snowfall with more rapid melting on the southward slope, (2) more numerous tributary watercourses, (3) steeper natural slopes, (4) more extensive drainage systems around the head waters. This difference between the two branches of the Thames is very similar to that between the branches of the Maganatawan and between the branches of the Muskoka, the north branch in each case having the greater flood discharge.

The flood discharge reached by the Thames at the end of April 1937 was greater than of any other flood on record of this or any other river in Ontario.

Turning to the Grand river, the record shows no increase in the flood discharge following the active drainage years. On the contrary, there is a marked decline since 1929, due in all probability to lesser precipitation. The maximum annual floods on the Grand river at Galt, with a drainage area of 1,360 sq. mi., are almost identical with those of the Thames river at Byron, with an area of 1,230 sq. mi.

The Thames and Grand rivers both have within their drainage areas, and particularly near their head waters, extensive systems of agricultural drainage, and it is interesting to compare the flood flows of these two rivers with those in other parts of the province where there is a minimum of drainage. The Saugeen river at Traverston, with a drainage area of 850 sq. mi., has an annual flood discharge similar to that of the South Branch of the Thames, but less than that of the North Branch. All other rivers in Northern and Eastern Ontario, whose records are given, have lower flood discharges than the Thames or the Grand in Southern Ontario. All rivers, including those two, seem to have had higher floods than the average in either 1928 or 1929, the years of highest levels of the Great Lakes.

Authorities Cited

From what has been previously said it may be inferred that there always has been, and probably always will be, controversy and litigation between downstream and upstream landowners. The findings and opinions of outstanding authorities as to the effects of agricultural drainage on flood conditions are therefore quoted at some length.

George W. Pickels, Professor of Drainage Engineering, University of Illinois, in his book on Drainage and Flood Control Engineering, 1925, says:

> "There are no valid reasons for believing that recent floods are of greater magnitude than those which have occurred in the past, opinions to the contrary notwithstanding, or that the frequency of great floods is increasing." . . . "Although the flood discharges are not becoming greater, the flood heights are; and the more the river channels and flood plains are restricted, the greater will be the heights to which the flood waters will rise, and the greater the damage caused by flooding." . . . "When shallow ponds and swamps are drained by the construction of drainage ditches, the restricted outlets mentioned above as existing in a state of nature are opened up so that the possible rate of outflow from these areas is as large as the rate of inflow, thus increasing the flood flow and decreasing the low-water flow. The maximum run-off will occur early in the spring when the ground is frozen or saturated, or during extended periods of precipitation in the summer when the ground is again saturated. The purpose of drainage is, however, to lower the water table, thus removing the gravitational water in the soil, and, since swamp soils are usually

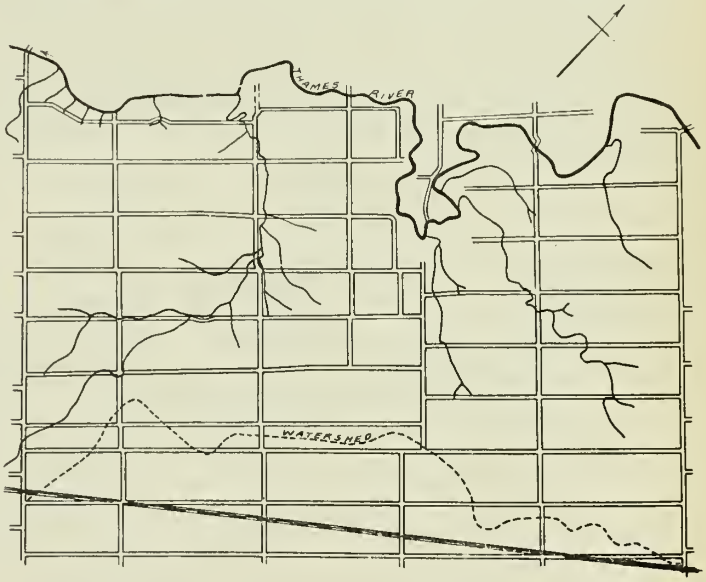

Fig. 6—Artificial Drainage is Confined to the Narrow Area Between the Watershed and the Head of the Natural Watercourses.

loose and porous, providing a large storage reservoir in the soil itself, so that even an intense rainfall of short duration will result in a low surface run-off. While the frequency of floods is thus decreased, the flood run-off from storms of long duration is increased by drainage.

Drainage of the upland level areas has, in general, the same effect. Here the soil is not so open, although cultivation and drainage tend to make it more so, and the surface run-off will be greater than in the case of the more open swamp land soil. Also when the small laterals of the drainage system are open ditches, the flood run-off will be greater than where large tiles are used for the laterals.

In general it may be stated that up to the point of soil saturation the effect of artificial drainage is to decrease flood flows, while beyond this point it is to increase it."

In a University Bulletin of 1931 dealing with run-off investigations in Central Illinois for areas from five to sixty square miles, the same writer says:

"Completeness of drainage is an important characteristic. The more adequate the drainage facilities, the greater the rate of flood discharge during excessive storm periods, especially those occurring during the winter and spring."

Professor S. M. Woodward and the late Professor F. A. Nagler of the State University of Iowa made an exhaustive and scientific study of the effect of agricultural drainage on the flood run-off of the Iowa and Des Moines rivers, and the results are given in the proceedings of the American Society of Civil Engineers for 1929. The study included an analysis of conditions for a four-year period from 1903 to 1906, inclusive, before any drainage work had been done, and for a six-year period from 1918 to 1923, inclusive, after the completion of drainage works aggregating thousands of miles in length and draining millions of acres. The study embraced both precipitation and run-off, the drainage area of the Iowa river at the gauging station being 3,140 sq. mi. and of the Des Moines at three stations being 4,170, 6,180 and 13,900 sq. mi. respectively. The results are summarized as follows:

"A survey of completed drainage enterprises in the Upper Mississippi Valley indicated that a comparison of stream-flow conditions prior and subsequent to extensive drainage could best be made upon the Des Moines and Iowa rivers, a large portion of the water-sheds of which have been covered with artificial drains subsequent to the establishment of stream-gauging stations.

A critical examination of the records of these two streams shows that during flood periods there has been no significant change in their behaviour which may be attributed to drainage. The total run-off from storms of like precipitation, the maximum rates of discharge, and the rain-water storage conditions within the basins seem to have been unaltered by the extensive drainage operations. It is believed that if any of these factors had been changed by a measurable amount, such fact could easily have been detected by the analysis made in this paper.

The drainage operations on the water-sheds of these two rivers involved the construction of tile drains, open ditches, and some straightening of stream channels, typical operations in drainage projects in the Upper Mississippi Valley." . . . "If the carrying out of agricultural drainage affects the flow of streams in any measurable way, such effects must be most conspicuous near the drained areas."

The late Allen Hazen, in his book on Flood Flows, published shortly before his death in 1930, says:

"Apparently other conditions introduced by drainage offset the increased rate of flow directly due to drainage so that the total result of agricultural drainage is not important in maximum flood quantities.

One of the effects of drainage is to create ground storage where none existed before. Wet and marshy soil in swamp areas has no ground storage. There will be temporary storage over the surface of such wet areas in times of heavy rainfall, but where the ground itself is normally water-logged it is without value as a reservoir for holding back flood flows.

The most effective and instantaneous of all reservoirs, so far as flood control is concerned, is the surface soil; and this is available only to the extent that at the beginning of a flood period it is drained and its pores are filled with air which may be replaced with water. Drainage takes the water out of swamp soil and creates a storage space where none had existed. The effect of soil storage is greatest in taking care of run-off from summer or early autumn storms after the soil has been thoroughly dried out, but it may be much less with respect to late winter and early spring flood flows."

Conclusion

The opinions of the authorities above quoted sum up the relations between drainage and floods so well that any addition would seem superfluous. In a rather long experience, the author has found that no two drainage problems are exactly alike, and it is submitted that this statement might apply to flood problems as well. Each should be considered with regard to time, duration, place, distance, area, topography and all other conditions. The solution of a single problem, with all the factors taken into account, will give more satisfaction than attempting to apply a formula or a hard and fast rule to all cases.

Flood Control and Water Conservation in Southwestern Ontario

Frank P. Adams, A.M.E.I.C.,
Secretary, Grand River Conservation Commission, Brantford, Ont.

Paper presented at the Annual Meeting of The Institute in London, Ont., February 2nd, 1938.

SUMMARY.—After sketching the geology and physiography of the Thames and Grand river watersheds the paper outlines the history of flood control and conservation works in the district and the proposals for further construction, with a brief general discussion of river control methods.

The peninsula of Southwestern Ontario was opened for settlement early in the nineteenth century.

The early settlers found the country covered with hardwood and coniferous forest. Numerous streams taking their rise in the highlands of the interior flowed in all directions to the Great Lakes which form three sides of its boundary.

The larger of the rivers provided ready access to the interior and full advantage was taken of their facilities of transport.

Southwestern Ontario

From the shores of Lake Erie on the south and the shore line of Lake St. Clair and the River St. Clair on the west a gently rolling plain extends northerly and easterly with gradually increasing grades to the height of land in the vicinity of Dundalk.

From this height of land the Grand river flowing in a southerly direction empties into Lake Erie; the Maitland, Ausable and Saugeen rivers flow in a westerly direction to Lake Huron and the Nottawasaga and Beaver rivers flow north into Georgian Bay. The Thames and the Sydenham drain the southwestern extension of the peninsula flowing in a southwesterly direction into Lake St. Clair and River St. Clair respectively.

Rock Structure

The Niagara escarpment forms the easterly boundary of the peninsula. It is a well defined step upward from the lowlying plains to the east and north. Commencing at Niagara Falls on the Niagara river it follows the southerly shore of Lake Ontario to the city of Hamilton, thence in a direction slightly west of north to the town of Collingwood on Georgian Bay. It is the only important rock outcrop in the area under consideration and forms the easterly edge of the Silurian system of sedimentary rock formations which underlie the easterly part of the area. Further to the west, and extending in a line roughly from Southampton on Lake Huron to the city of Woodstock and thence in an easterly direction to Fort Erie on the Niagara river, the later Devonian system of sedimentary rock formation begins and underlies the westerly part of the area. No violent deformations have taken place in the rock structure of the area but gentle structural undulations are in evidence and the general slope of the underlying rock surface is from the northeast to the southwest.

No metallic minerals are obtained from the Silurian rocks but they furnish an ample supply of building stone and road metal, quicklime, gypsum, gas and some oil.

Influence of Glacial Period

The factor which finally determined the course of the rivers, gave to the land its fertility, and provided ground storage for its surplus rainfall, was the great icecap of the glacial period. Two lobes of the glacial ice sheet moved down through the troughs of Lake Erie and Lake Huron, their edges meeting at a line extending in a southwesterly direction through the central portion of the peninsula. As the ice melted the first land to appear was a large area extending along the junction of the two lobes northeast from London, which has been named "Ontario Island." The waters from the melting ice found an outlet along the crease at the junction of the two ice streams and thus the course of the Thames river was determined. Terminal moraines of sand and gravel mixed in some cases with clay were deposited at the edges of the glacier as the ice fields retreated and the location of these moraines shaped the present courses of the rivers and streams.

A map showing the location of the terminal moraines in Southwestern Ontario, prepared by Mr. Frank B. Taylor, is shown in Fig. 1. The heavily drawn moraines are those deposited on land and the lighter hatched portions are those deposited under water, the water-laid moraines being generally smoother and weaker than the land-laid moraines. The redistribution of the land surfaces during the ice age has not only marked out the courses of our rivers but it has affected our public and private water supplies as well.

Municipal Water Supplies

The city of London obtains its supply from the open gravel beds at the junction of the Milverton and Ingersoll moraines. The city of Kitchener obtains its supply from the gravels of the great Paris moraine and from deeper rock wells. The city of Brantford obtains its supply from the Grand river but uses the filtering action of the gravel in the Galt moraine for preliminary treatment of the highly polluted river waters. The open texture of these immense gravel deposits has exercised a controlling influence in conserving the water supplies of Southwestern Ontario.

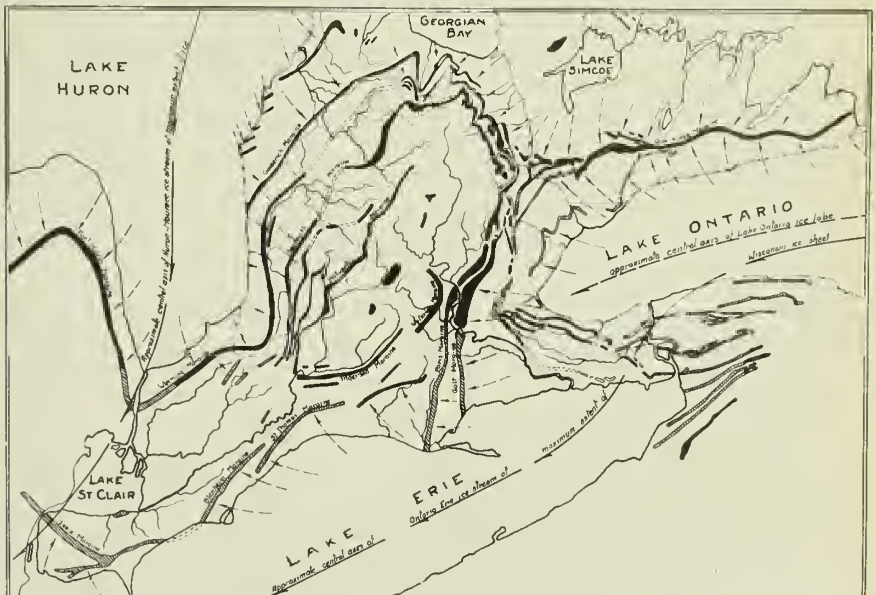

Fig. 1—Map of Glacial Moraines in Southwestern Ontario.

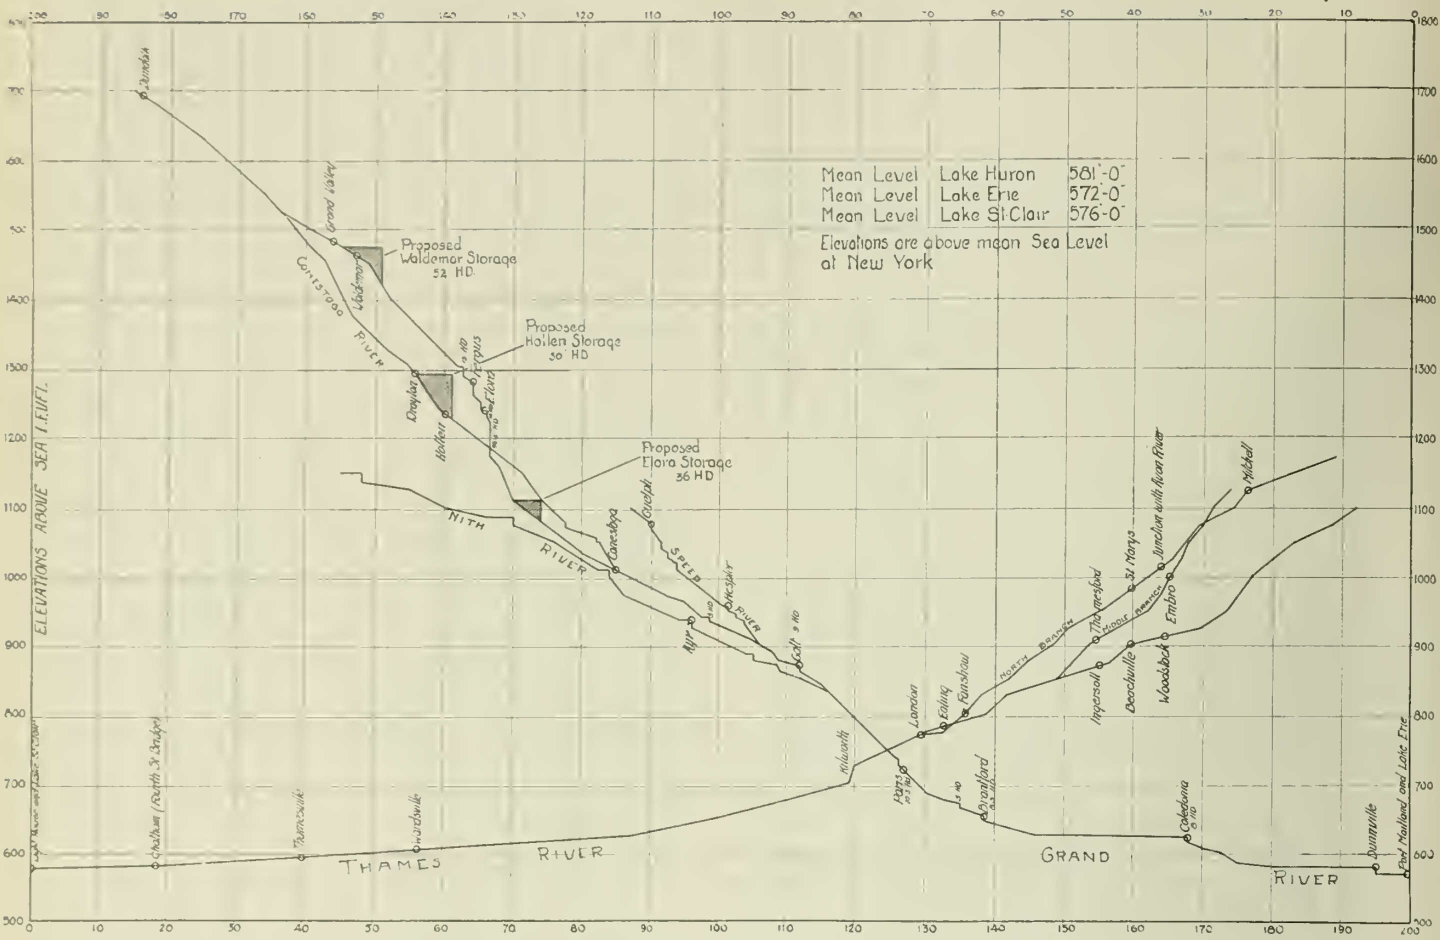

Fig. 2—Profile of Thames River and Grand River with their Tributaries.

Watersheds of the Grand River and Thames River

In discussing water conservation and flood control measures in this area it is proposed to consider the watersheds of its two river systems, considered most important from the size of their drainage areas, the density of population served by them, and the variety and importance of their industries, viz., the Grand and the Thames.

Headwaters of the Grand River

The Grand and its tributary, the Conestogo, take their rise upon the high plateau in the vicinity of Dundalk. Large areas on this plateau are covered by peat bogs which overlie dense impervious clay. Much of the bog has been drained by the construction of deep surface ditches and the land reclaimed for agricultural purposes.

Grades of the Grand River and its Tributaries

The accompanying river profiles show that the upper reaches of the Grand and the full length of the Conestogo have heavy grades averaging about 12 feet to the mile. The stream bed in this part of the main channel of the Grand river is largely composed of rock and in the Conestogo, of clay. The combination of these conditions tends to give a quick run-off and cresting of floods in times of heavy precipitation, the effects of which have a marked influence on the behaviour of the main stream. From the junction of the Grand and the Conestogo to the city of Brantford the grade of the river is about six feet to the mile and in this section it is joined by the Speed and the Nith. The Nith drains a gently rolling watershed with an average grade to the stream of about four feet to the mile. It exercises a moderating influence on the cresting of floods in the main stream and usually provides a steady though diminishing water supply through the dry summer months. Whiteman's creek enters the main stream between Paris and Brantford. It is a stream flowing through a wooded valley and is fed during the summer months from the springs emerging from the gravels of the Paris and Waterloo moraines. It furnishes usually about one-third of the stream flow in the Grand river through Brantford during the dry summer months. From Brantford to its outlet into Lake Erie the Grand river has an average fall of less than one foot to the mile. The watershed narrows rapidly and only two streams of importance, Fairchild's creek and Boston creek, enter the main stream in this portion of its course.

A profile of the Grand and its tributaries and of the Thames and its branches is shown herewith, in Fig. 2.

History of Grand River Improvement Plans

In the year 1912, due to increasing damage from floods, the municipalities of Brantford, Paris, Galt and Preston made representations to the government of the Province of Ontario for relief and asked that a survey of the river be made. Shortly after that date gauging stations were established on the river and its principal tributaries by the Hydro-Electric Power Commission of Ontario, and a preliminary report submitted. No action was taken at this time and the matter rested until the year 1930. At that time the Government asked the Commission and the Department of Lands and Forests to report on suitable works for the control of floods and the increase of summer flows in the river. This report was completed in 1931 under the direction of Dr. T. H. Hogg and Mr. L. V. Rorke and the control works contained therein are those discussed in this paper.

H.E.P.C. Report of 1931

Under this report it is proposed to construct four dams, two on the upper reaches of the Grand river and two on its tributary, the Conestogo. In addition it is also proposed to dam back the outlet draining the unreclaimed portion of the Luther marsh situated near the headwaters of the river. This will affect an area of about 3,000 acres and will furnish about 10,000 acre ft. of storage.

A study of the floods for which records are available shows that quick run-off conditions and consequent cresting occur during the spring breakup of the river while the ground is still frozen and where the melting of the snow is hastened by warm rains accompanied by above-freezing night temperatures. The crests of such floods sweep down the high gradients of the headwaters and carry destruction to the more densely populated cities and towns along its lower reaches. For this reason it is proposed to construct the two first dams well up-stream. An outline drawing showing the type and general dimensions of the dam to be constructed above Belwood is reproduced. This dam is typical of the design adopted for all.

The central section is mass concrete of the gravity type, the crest of the spillway being 44 ft. above the bed of the stream. Stoplogs are provided over the spillway which will enable the reservoir to be raised 9 ft. above the crest of the dam. Three circular conduits fitted with electrically operated control valves are located in the lower section of the dam through which the controlled discharge of the reservoir takes place.

The apron of the spillway extends for about 100 ft.

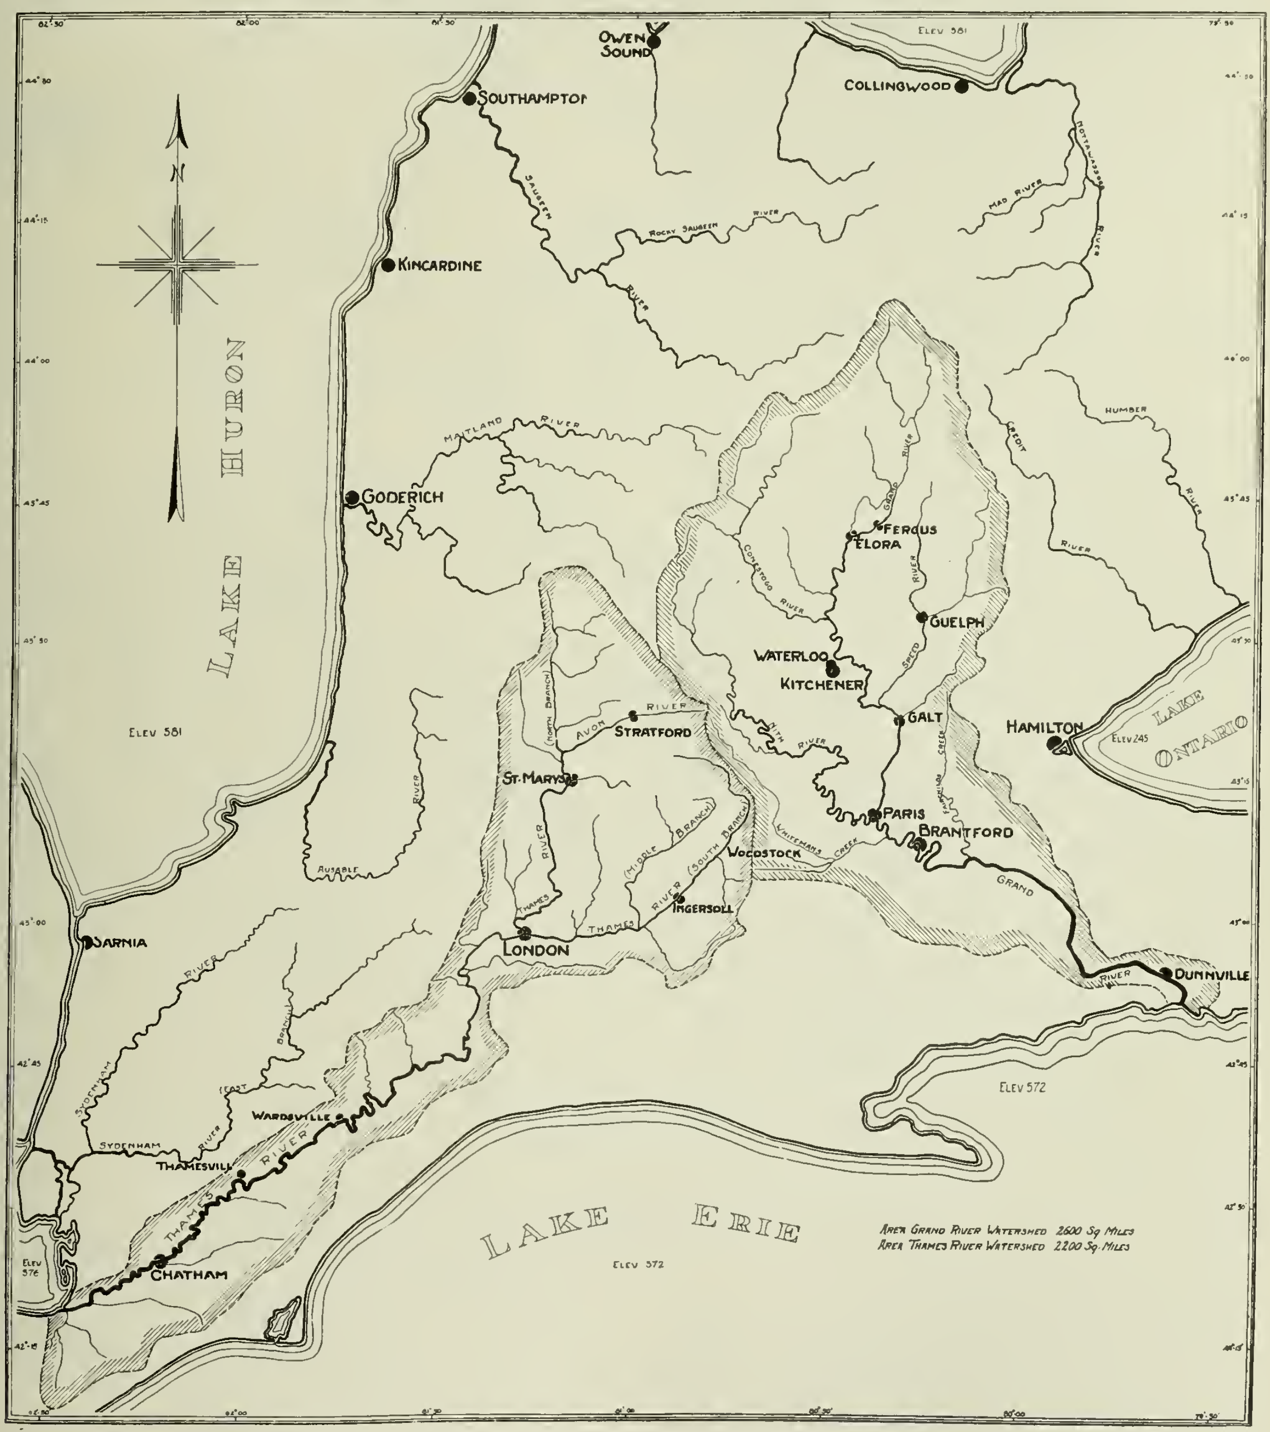

Fig. 3—Watershed of Thames River and Grand River in Southwestern Ontario.

down stream. The toe of the apron is raised three feet above the level to break up the high velocity of discharge.

Each reservoir is designed to provide about 10,000 acre ft. of storage. It is proposed to operate these impounding reservoirs in such a manner that the existing channel of the river will take care of floods but that sufficient water will be stored in them during the wet months of the year to provide a flow during dry periods which will supply the necessities of the several municipalities. It is expected also that the reservoirs will have a beneficial effect on the storage of ground waters in the area through seepage from the reservoirs and increased flow in the streams.

Local Flood Control Works

A number of cities and towns along the course of the Grand river have suffered from periodic floods. Galt, Paris and Brantford have had their streets flooded, their industries crippled and their inhabitants menaced by these visitations. They have endeavoured more or less successfully by the construction of dykes and river walls to confine the river to its natural channel. They have also in some instances endeavoured to improve the river channel, going beyond their corporation limits to accomplish this.

The history of flood prevention work undertaken by the city of Brantford dates from the year 1887, when the late Samuel Keefer, C.E., M.Can.Soc.C.E., was called in to investigate and report on measures which should be adopted to minimize the effects of the floods. He said in opening his report to the city authorities: "I have now procured all the information necessary to enable me to form an opinion on the semi-annual floods from which West Brantford, for years past, has suffered and to suggest the proper means for the protection of that portion of the city from inundation."

This would suggest that even at that early date floods in the Grand river were of common occurrence and had been for many previous years. He recommended that a system of earthen dykes be constructed along the southerly bank of the river and marked out the location and form of these works. The earthen dykes were to be raised to a level 3 ft. above high water, were to be 6 ft. wide on top with both slopes at 1½ to 1. The area enclosed, he said, might need to be provided with a pump to pump out accumulated surface water. This latter recommendation was never carried out, nor was it found to be necessary, as floods were of such short duration that surface water did not prove to be of consequence.

These dykes, however, were breached by a flood which occurred in 1894, and under the direction of the City Engineer, the late Mr. T. Harry Jones, were then raised and strengthened by timber cribs extending a short distance into the stream; also at that time a system of similar dykes was constructed along the north bank of the river to protect Eagle Place, another lowlying section of the city which had suffered from floods. Later on the river channel was widened at Lorne bridge by adding to the existing structure an additional span 100 ft. in length.

One of the measures recommended and carried out at about this time was the digging of an artificial channel for the river below the city limits in an endeavour to improve a sharp bend in its course. This work did not prove effective, the channel silted up and the river resumed its original course. In later years the dyking system has been extended, raised and strengthened; railway and highway bridges have been lengthened. No subsequent floods have broken through these defences.

The present dykes have a minimum width of 8 ft. on top with slopes of 2 to 1 on the river side and 1½ to 1 on the land side. The river faces where necessary are paved with reinforced concrete 6 in. in thickness, resting on low concrete walls or footings. The concrete facings extend to normal high water levels and are provided with expansion joints and are constructed in the same way as

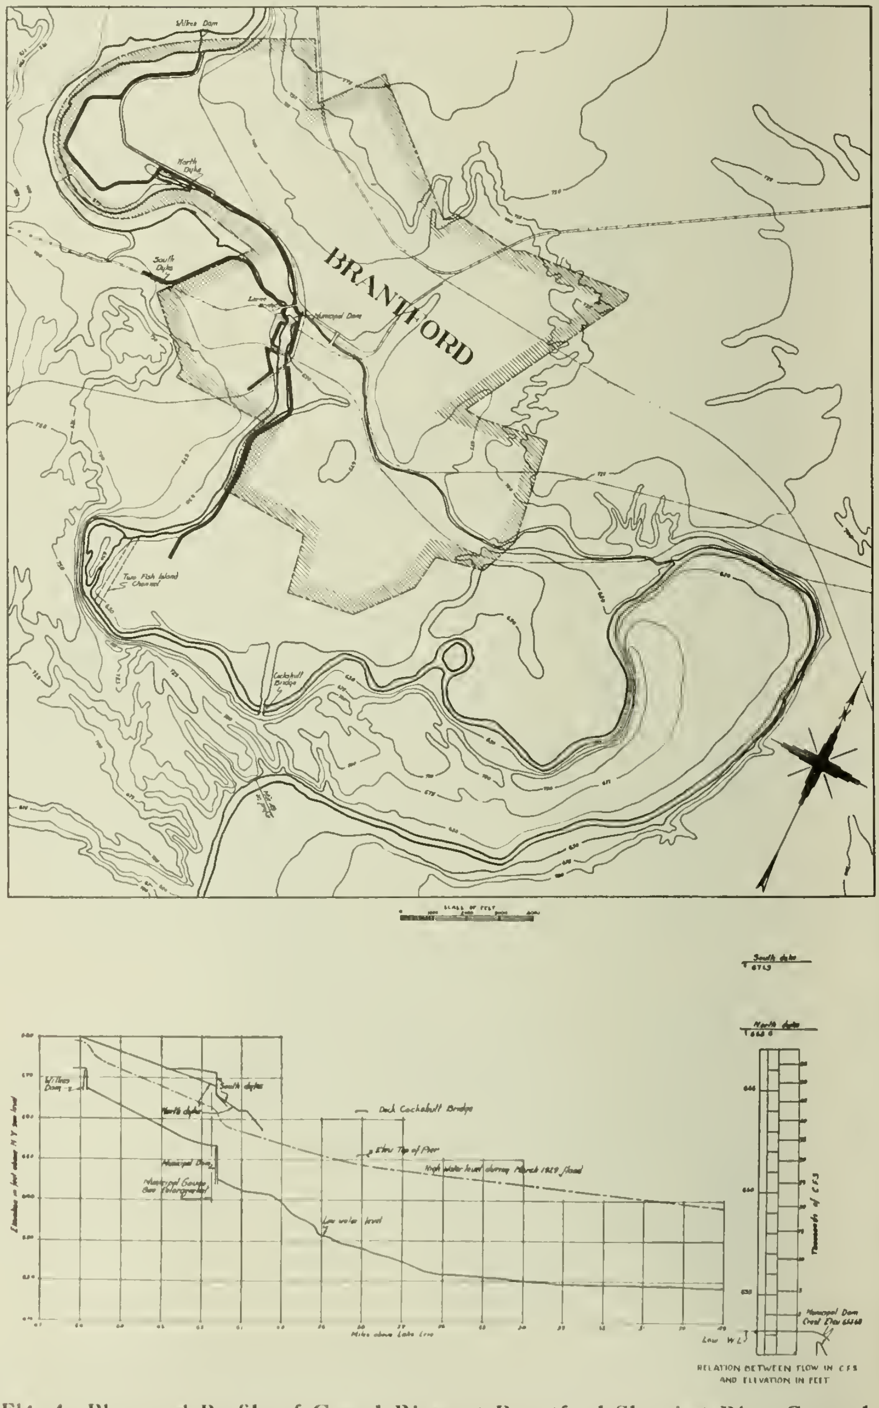

Fig. 4—Plan and Profile of Grand River at Brantford Showing River Control Works and Flood Flow in River During 1929 Flood.

pavements of this type are built. Stone blocks were at first used for this purpose but it was found that the action of ice and river currents displaced them, necessitating frequent repairs.

Maximum floods of about 42,000 c.f.s. have occurred since these dykes were completed and they have provided a freeboard of about 3 ft. under these conditions.

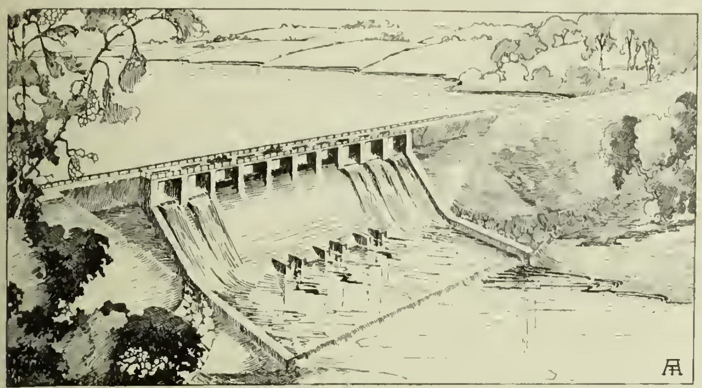

Fig. 5—Grand River Conservation Project. Perspective of Proposed Waldemar Dam.

Storm sewers entering the river in low-lying areas are provided with gate valves which are closed during the peak of the flood.

Flood prevention works in other municipalities on the Grand river are not as extensive as at Brantford but are constructed on the same general lines as those described above.

It is probable that greater floods will occur in the future and it is expected that the construction of the proposed reservoirs in the upper reaches will provide sufficient control of the cresting of these floods to keep them within the present improved channel of the river.

Flood of 1937

On April 26th and 27th of this year, one of the greatest floods on record occurred on the Thames watershed. The run-off on the drainage area of the south branch of the Thames river reached a maximum of 43.03 c.f.s. per sq. mi. of watershed. Had this same run-off occurred on the Grand river watershed above Galt, the flow in the river at Galt would have reached a maximum of 58,500 c.f.s. and at Brantford 73,000 c.f.s., allowing for an increase of 24 per cent in the flow between these two points, which is the usual flood increase. It is estimated that the operation of the proposed control works on the Grand river will make a reduction of 18,500 c.f.s. in the cresting of floods, thus reducing a 73,000 c.f.s. flood to 54,500 c.f.s. The present dykes at Brantford will pass a 55,000 c.f.s. flood but would not take care of a 73,000 c.f.s. flood.

A study of the probable dimensions of future floods is contained in the report and it is assumed that the proposed works when completed will enable the present river channel at Brantford, Paris and Galt to pass them with some margin of safety.

Low Summer Flows

The mean flow of the Grand river at Galt from 1916 to 1937 is 1,134 c.f.s., the yearly mean varying from a minimum of 438 c.f.s. in 1931 to a maximum of 1,790 c.f.s. in 1929. The daily flows, however, are reduced during the summer months in most years to figures well below 100 c.f.s., reaching in 1926 an all time low of 26 c.f.s.

This quantity of water is not sufficient to supply the needs of the population depending upon it for their requirements.

The municipalities of Kitchener, Preston and Galt discharge the effluent from their sewage disposal works into about ten miles of the length of the river above Galt. They have a combined population of 53,000 and empty sewage effluent into the river at the rate of 13 c.f.s. The mean monthly flows at Galt for July, August and September in 1936 and 1937, were as follows:

	1936	1937
	Drainage area 1,360 sq. mi.	
July	55 c.f.s.	152 c.f.s.
August	47 c.f.s.	162 c.f.s.
September	91 c.f.s.	146 c.f.s.

In 1936 the conditions in the river, to say the least, were offensive. In 1937 the increased flow in the river improved the situation to the extent that no complaints were registered with the authorities.

It is not anticipated by the municipalities that the proposed works will relieve them of the responsibility of so treating the effluent from their disposal works that it will not become a nuisance, but the increased summer flow of the river will reduce the amount of treatment to a point that is within reasonable limits and will provide for the requirements of a moderate increase in population.

The regulated low flow of the river at Galt after the proposed works have been constructed is estimated at 350 c.f.s. and at Brantford 500 c.f.s.

The Thames River

The Thames river watershed adjoins that of the Grand river along its southwesterly boundary, the length of the two rivers and the area of their watersheds being about the same.

	Area of watershed	Length
Grand river	2,610 sq. mi.	184 miles
Thames river	2,250 sq. mi.	192 miles

The grades of the Thames, however, are very much less than those of the Grand, it having a total fall from headwaters to outlet into Lake St. Clair of 625 ft. against a fall in the Grand river from headwaters to outlet into Lake Erie of 1,128 ft.

Profiles of the two rivers and their tributaries are shown drawn to the same scales. (See Fig. 2.)

The Thames river watershed comprises a low-lying level plain for the first 90 miles of its course, the river having a fall of only 0.6 ft. per mile in this portion. From this point to the city of London, a distance of 40 miles, the grade increases to 3.5 ft. per mile. From Lake St. Clair to London the watershed has a fairly uniform width of about 12 miles and the river parallels the north shore of Lake Erie at a distance from the lake of about ten miles.

Above London the river branches and the upper portion of the watershed assumes the character of a gently rolling plateau similar to that of the Nith river which it adjoins on the west.

The average grade of the North Branch above London is 6.3 ft. per mile and of the South Branch 5.0 ft. per mile.

The mean rainfall on the watershed of the Thames is somewhat higher than on the Grand, resulting in a higher run-off, these figures being as follows:

	Mean run-off per sq. mi. of watershed
Grand river at Galt	0.84 c.f.s.
Thames river, North Branch	0.87 c.f.s.
Thames river, South Branch	0.93 c.f.s.

Flood Flows of the Thames River

The lower grades of the Thames river have a tendency to reduce somewhat the quick cresting of floods, but they also slow up their velocity and raise their levels. A flood on the Grand discharging 40,000 c.f.s. at Brantford will raise the river level about 12 ft., while a similar flood on the Thames at Chatham, will raise the river level about 18 ft. above normal.

Below the city of Chatham the river overflows its banks during flood periods and inundates large areas of its watershed. Certain lands have been dyked in this area and provided with pumping equipment as a protection against these periodic floods.

It is understood that the Hydro-Electric Power Commission are now making a preliminary survey and investigation of the Thames River Watershed and have been asked to report on suitable measures for controlling floods. It is expected that their report will be available in the near future.

Possible Control Measures

An examination of the contours of the watershed in the upper reaches of the river would indicate that suitable locations for control reservoirs might be available along the North Branch, but along the South Branch would be few and not very suitably placed, on account of road and railway location along the river valley. One measure of relief which will no doubt receive consideration is the cutting of an overflow or relief channel from the main stream below London into Lake Erie. Such a channel would have the effect of increasing the hydraulic grade line of the flood waters, thus increasing the velocity of the stream and lowering the flood levels.

Low Summer Flows in Thames River

The low flow conditions in the Thames river are very similar to those in the Grand. The following table gives a comparison of the mean monthly low flows during 1936 and 1937:—

	North Branch 585 sq. mi. c.f.s.	South Branch 515 sq. mi. c.f.s.	Combined 1,100 sq. mi. c.f.s.
		1936	
July	16	22	38
August	10	26	36
September	21	32	53
		1937	
July	56	86	142
August	49	124	173
September	57	102	159

The extremely low summer flow of the combined streams in 1936 would indicate that trouble from sewage disposal works would develop at London, the total quantity of water passing that city being far short of the quantity required to furnish even a moderate amount of dilution to the effluent from its disposal works.

River Control Methods

In a discussion of river control measures it is well to consider the probable cause of floods and succeeding low flows. It is generally assumed that the transformation of the land from its natural state to that of intensive cultivation has had the effect of increasing the cresting of floods and diminishing the summer flow of the streams.

The cutting down of forest growth has destroyed the highly absorbent forest floor and has removed the protecting shade of the trees from the accumulated winter snows.

The construction of farm and municipal drains has given quick access of rainfall and the water from melting snows to the streams.

There is no reason to doubt that these changes have contributed to low summer flows, but it is open to question whether they have materially increased the cresting of the occasional extremely high flood.

The Thames river flood of this year occurred on April 26th-27th. The ground was well saturated with water from an open winter and wet spring, but all snow had disappeared and the frost was out of the ground.

Had the watershed been covered with a dense forest growth with snow still lying in the forest and frost in the ground, which might well have been the case at this date, then the heavy rainfall of about 4 in. in three days over the watershed would have been augmented by the waters from melting snows and a flood of even greater dimensions would have taken place.

There are no records of the floods which occurred before the land was settled in this part of Ontario, and their height and volume is purely a matter of conjecture.

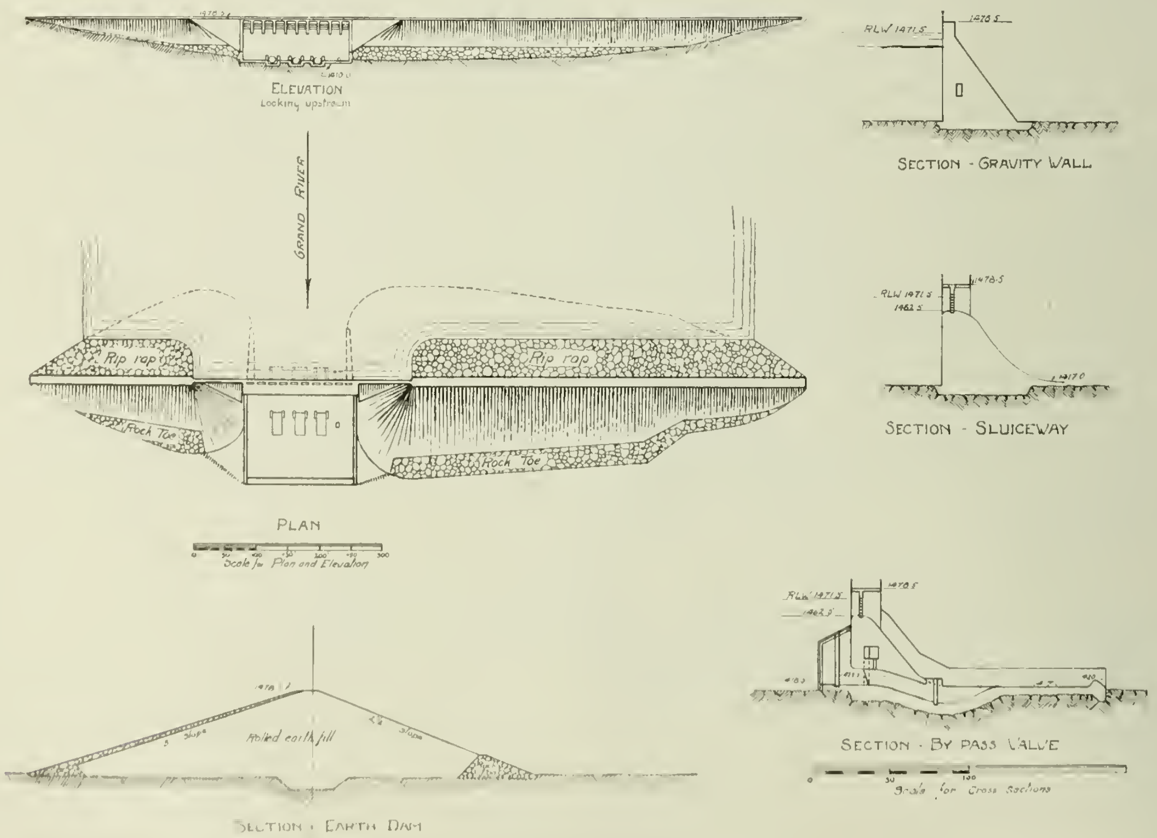

Fig. 6 Grand River Conservation Project. Preliminary Plan of Proposed Waldemar Dam.

It has been suggested that reforestation would regulate stream flows, and no doubt it would to some extent if such a course were practical, but it must be remembered that only about five per cent of the area under consideration is now under forest and to turn back highly productive agricultural lands to the growing of trees would not be economically feasible.

There are, however, considerable areas of swamp lands at the headwaters of our streams that are not suitable for agricultural purposes. Some have been drained, but the top soil is thin and the subsoil cold and wet. These areas might well be returned to their natural state and they would furnish their water quota to the streams during the dry summer months. They should never have been opened for settlement.

There are no lakes of any size upon the watersheds of the rivers in Southwestern Ontario which might serve as reservoirs and give some degree of regulation to the flow of streams. The summer flow is obtained from the few remaining swamp areas and the stored ground waters in the large gravel deposits of glacial moraines. Direct run-off from summer rainfall is almost negligible in many seasons.

It thus becomes necessary to consider artificial storage for the excess run-off during the wet months of the year.

Stream Flow Regulation by Artificial Storage

There are two methods of regulating the flow of streams by means of artificial storage.

First—Storage reservoirs retained by dams provided with openings without control valves designed to release definite calculated quantities of water while discharging under maximum heads.

Second—Storage reservoirs retained by dams provided with control valves or other regulating devices.

Works of the former character have been used successfully to control floods. The discharge openings or conduits through the reservoir retaining dam are of such form and dimensions that while discharging under maximum heads, i.e., while the reservoir is full, they will deliver to the stream a quantity of water that will fill its channel but will not overflow its natural or artificial banks down stream. These openings are not provided with control valves. The reservoir formed by the dam is of sufficient capacity to store the maximum estimated run-off from the watershed, less the quantity of water that is discharging through the openings in the dam from the commencement of the flood until its end. A factor of safety is provided by making the capacity of the reservoir somewhat greater than the estimated requirements. A concrete spillway of sufficient size is provided for the safety of the dam, otherwise the dam would probably collapse through overtopping. If, however, water flowed over the spillway it would add its volume to the discharge through the openings, and if of sufficient volume would destroy the regulating effect of the reservoir on the stream below.

Control works of this character make no effort to retain flood waters for use during dry periods. They level off the flood crests and a short time after the flood has passed, the control reservoir is empty. The ordinary flow of the stream passes through the openings in the dam without restraint and the flooded lands behind the dam drain off their surplus water and are returned to agricultural uses. This procedure is quite possible in Southwestern Ontario as floods usually occur in late winter or early spring when farming operations are at a standstill. The payment of compensation for damage to crops from the occasional summer flood would be necessary, or a release from flood damages would have to be given by the purchaser of such lands.

Works of the above description have been constructed to control floods on the Miami river in Southwestern Ohio. In all, five earth dams were built across the valley of that river and its tributaries to form retarding basins, and the improvement of several miles of river channel within the half dozen largest cities of the valley was undertaken. The work was commenced after the flood of March 1913, which took a toll of 360 lives and destroyed millions of dollars worth of property. Since its completion disastrous floods have swept down the Ohio river, of which the Miami is a tributary, but the Miami valley has been secure from such visitations.

The second method of regulating the flow of streams by means of artificial storage is similar to the method described above, except that the conduits through the reservoir retaining dam are provided with control valves, and are intended not only to control floods but to furnish additional waters to the stream during low summer flows. This method of control depends for its successful operation upon the skill and experience of the operator in charge. In order to obtain the maximum control of floods the reservoir should be empty when the flood period begins, discharging only the volume of water which the stream channel will take during its continuance. To provide water for periods of low flow in the river, the reservoir should be full or nearly so at the end of the flood period.

Probably this method of control could not be operated at more than 80 per cent efficiency.

This method of stream control was adopted for the Grand river project, as the problem in this case was not only to control the destructive spring floods, but to provide a moderate stream flow during the dry months of the summer.

Land for the flooded areas of the storage reservoirs will have to be purchased, and not worked under an agreement as described in the first named method of stream control, since such land will remain flooded during the greater portion of the year.

It is expected that the construction of four such storage and regulating reservoirs and the damming back the drainage from about 3,000 acres of the Luther swamp near the headwaters of the river, will provide sufficient regulation of the stream to guard against destructive flooding in the towns and cities situated upon its banks and give a supply of water sufficient for the needs of the inhabitants upon its watershed.

Note:—The author desires to express his indebtedness to Mr. F. P. Adams, Jr. for the preparation of the drawings illustrating this paper.

Report of Council for the Year 1937

Your Council has pleasure in reporting upon a year during which the activities of The Institute have continued under generally favourable conditions. The membership has shown a steady though not phenomenal increase, and the financial situation has shown improvement. The year was notable as that of The Institute's Fiftieth Anniversary, which was celebrated in a manner befitting the importance of the occasion.

The outstanding features of the Semicentennial Meetings, which took place from June 14th to 19th in Montreal and Ottawa, were the presentation of greetings and the reception of official representatives from some thirty of the leading engineering societies and organizations in Great Britain, the Dominions, the United States, and the continent of Europe; the conferring of honorary memberships in The Institute upon eight distinguished Canadian, British, American and French engineers; an "Overseas Session" at which three prominent British engineers presented papers; a noteworthy series of nine monographs on The Utilization of Canadian Coals, followed by ten others dealing with characteristic problems in Canadian engineering practice, and the addresses of the Governor-General and other eminent guests at the banquet.

A special June number of The Engineering Journal contained a brief history of The Institute; a record of the many notable figures connected with its foundation and growth, and seventeen historical papers by members of The Institute, each dealing with the work accomplished in some branch of engineering or industrial activity in Canada during the past fifty years.

The whole of the proceedings formed a memorable experience for the members and guests, numbering nearly a thousand, who had the privilege of attending.

As regards The Institute's relations with the Professional Associations, it is gratifying to note that definite progress has now been made towards an acceptable entente. The proposals of the Committee on Consolidation which were discussed at length at the Annual General Meeting of 1937, failed to obtain the approval of the membership on ballot. On consideration of the situation arising from this failure, it appeared to your Council that a less ambitious programme of by-law amendments should be put forward, containing only those provisions necessary to empower the Council to enter into agreements with the Professional Associations, looking towards the attainment of common membership, simplification of admission, and a mutual arrangement as regards fees.

Such provisions, together with a number of other proposals of less importance, were included in a series of amendments put forward by a group of thirty-one corporate members on October 1st. Your Council felt, however, that the situation would be better met by a simple by-law giving Council the power to enter into agreements with the Associations, and accordingly prepared such a by-law. This was accepted by the representatives of the group of corporate members in lieu of their proposals, and your Council desires to express appreciation of this action on their part. It is now possible to submit one brief general new by-law, which it is hoped will enable co-operative agreements to be worked out between The Institute and the Associations. This proposed by-law will be submitted to the Annual General Meeting for discussion and subsequent ballot. It has the support of both Council and the group referred to, and your Council would therefore urge all corporate members to vote in its favour, so as to enable The Institute to bring to a satisfactory close the discussions which have been carried on during the past year with several of the Provincial Associations.

These discussions began in April, as soon as the result of the ballot was known. The President visited Manitoba, and the Treasurer journeyed to the Maritime provinces, to discuss the situation in those localities, in both of which movements looking to closer co-operation between The Institute and the Association were already in existence. At the request of the Nova Scotia committee, representatives of your Council were appointed to confer with the officers of the Association and of the two Institute branches. Later, Council, by letter ballot of its members, expressed its willingness to enter into an agreement with the Nova Scotia Association, this decision applying also to the question of similar agreements with other Professional Associations. The discussions with Nova Scotia have now advanced so far that a preliminary draft of an agreement has been prepared and has been forwarded to Nova Scotia for consideration. Discussions in Manitoba, Saskatchewan and New Brunswick have not yet reached this point.

The Council is greatly indebted to its representatives who took part in the local discussions which have led to such a promising result, and particularly to Vice-President McKiel for his services in connection with the negotiations in Nova Scotia and New Brunswick.

A Plenary Meeting of Council was held on June 14th, 1937, at which the relations of The Institute with the Professional Associations formed one of the main subjects of discussion, a resolution being unanimously passed expressing Council's desire to co-operate with them. On the same date, a Round Table Conference of Branch Representatives was held, at which delegates from all the branches of The Institute discussed matters connected with branch organization, operation and management. Their report, which contained many valuable suggestions regarding the policies and operation of The Institute, was later presented to Council for review and consideration.

In view of the many interesting questions raised both at the Plenary Meeting and at the Round Table Conference, and after presentation of a report from a committee of Council which had been appointed to suggest the best method of dealing with problems relating to professional interests and the management of The Institute, Council decided to appoint a Committee on Professional Interests, and also a Committee on Membership and Management of The Institute. The former Committee, under the chairmanship of Past-President F. A. Gaby, M.E.I.C., will deal, amongst other matters, with those involving negotiations with the Professional Associations. The latter, under the chairmanship of Professor R. A. Spencer, A.M.E.I.C., will investigate problems connected with the internal organization and functioning of The Institute. Following another of the representations of the Round Table Conference, Council has appointed a committee, under the chairmanship of Mr. J. L. Busfield, M.E.I.C., to investigate and report upon the publications of The Institute. All of these committees are at the present time actively at work.

An examination of the technical papers and the records of branch activities published in the past year's issues of The Engineering Journal, will show that the principal object of The Institute, the interchange of professional knowledge, has been energetically promoted, both at The Institute meetings and at those of the several branches. The past year has, in fact, been notable for the quality of the papers contributed by our members and the activities of the papers and meetings committees of the branches.

During the year the cordial relations existing between the great American engineering societies and The Engineering Institute have been evidenced on several occasions.

In May our members, particularly those in Ontario, took advantage of the kind invitation of the American Society of Mechanical Engineers to attend the Semi-Annual Meeting of that body in Detroit, at which a varied programme of papers was presented dealing with many aspects of modern mechanical engineering. In October a most successful joint meeting of The Institute with the American Society of Civil Engineers took place in Boston, and was attended by a large Canadian representation. One of the sessions, at which a number of Canadian papers were presented and discussed, was a joint session conducted by The Institute. Many of the American papers presented at other sessions were outstanding and of great interest as dealing with engineering economic problems of international importance.

The Fifty-first Annual General Meeting convened at Headquarters on January 21st, 1937, and was adjourned to the Windsor Hotel, Montreal, on Friday, January 29th. In view of the many technical papers to be presented at the Semicentennial Meetings in June it was not followed by the usual general professional meeting. After the transaction of the regular business of The Institute, the principal feature of the General Meeting was the reception and discussion of the report of the Committee on Consolidation, the debate on which was of a very detailed nature, and resulted in the adoption of the Committee's report.

Roll of The Institute

During the year 1937, three hundred and twenty candidates were elected to various grades in The Institute. These were classified as follows:—One Honorary Member, nineteen Members, forty-five Associate Members, fifty-two Juniors, two hundred Students, and three Affiliates. The elections during the year 1936 totalled two hundred and fifty-eight.

Transfers from one grade to another were as follows:—Member to Honorary Member, seven; Associate Member to Member, seventeen; Junior to Associate Member, thirty-one; Student to Associate Member, fifty-two; Student to Junior, fifty-two; a total of one hundred and fifty-nine.

The names of those elected or transferred are published in The Journal each month immediately following the election.

Removals from the Roll

There have been removed from the roll during the year 1937, for non-payment of dues and by resignation, seven Members, twenty-one Associate Members, ten Juniors, sixty-seven Students, and one Affiliate, a total of one hundred and six.

One hundred and seventy-three reinstatements were effected, and eleven Life Memberships were granted.

Deceased Members

During the year 1937 the deaths of sixty-three members of The Institute have been reported as follows:—

Honorary Member

Eddy, Harrison Preseott

Members

Anthony, Frank D.
Armstrong, Henry William Dudley

Treasurer's Report

The President and Council:—

Notwithstanding the past year being one of unusual activity, it is very gratifying to note that the Annual Financial Statement, as prepared by The Institute's Auditors, indicates only a small loss in operating expenses. Nevertheless, in view of the fact that for one cause or another, deficits, sometimes small, sometimes large, have been the rule for the last ten years, the situation cannot be looked at with entire equanimity.

As a result of the continuous annual deficits, not only has the liquid reserve been used up, but it has been necessary for some years to hypothecate for several months some of the securities belonging to the special funds in order to make available enough cash to meet ordinary expenditures until fees are paid. This very undesirable position may be justified in an emergency, but should not be tolerated as an habitual occurrence.

Furthermore, it has been impossible to take care of many items which, under ordinary business procedure, would be desirable, for example, the building has depreciated owing to lack of maintenance, The Institute is handicapped in carrying out many possible, and desirable, activities through lack of funds.

What is to be done about it? Although with improved conditions, and renewed activity in The Institute, the revenue from annual fees has increased, nevertheless, the possibility of a substantial increase in revenue from this source is not great. Other sources of revenue should be explored to the fullest possible extent. Similarly, the possibilities of reduction in cost of operation should be carefully studied. It would appear to be very desirable that the budget prepared by the beginning of the year should definitely provide for—(*a*) a reserve for unknown contingencies, and (*b*) a substantial amount for replacement of the working capital. The former being especially desirable, as experience shows that it is not always possible to foresee the necessity and desirability of holding a plenary meeting of Council, or some other special function.

Respectfully submitted,

J. L. Busfield, M.E.I.C., *Treasurer.*

Finance Committee

The President and Council:—

In presenting the Auditor's Statements for the year 1937, your Finance Committee wishes to commend the General Secretary and the Headquarters' Staff for their assistance in operating within a restricted budget in a year whose activities called for a great deal of additional effort on their part. The fact that The Institute is able to show such a good statement is due in no small part to their co-operation.

The Comparative Statement of Revenue and Expenditure we believe clearly sets forth the financial results of the year's operations but we would like to call your attention to one or two points that appear to us to be significant or that may need amplification.

It is cause for gratification that the receipts from fees show an increase over the previous year of almost $3,000. This reflects in part the increase in numbers and in part the improved economic status of our membership. As this is the most important source of our revenue, from more than a financial standpoint, we would like to stress the necessity of rendering all possible assistance to the Membership Committee in their efforts to increase our membership. The Institute has been carrying on under a restricted budget for a number of years and has had to forgo many of its former activities. We believe that a strenuous effort should be made this year to substantially increase our corporate membership.

In comparing Journal advertising and Journal expenses it will be noted that in both cases the items are considerably larger for 1937 than they were in 1936. These increases are largely due to the publication of the Semicentennial number of The Journal. The appearance of this number of The Journal reflects great credit on all those who were concerned in its preparation and deserves the high praise it has received.

The statement shows a profit of $1,331.69 on the 1937 Catalogue. Although this exceeded the budgeted net income from this source by some $500 the results were disappointing to us and to the Catalogue staff in that we had hoped that the year's efforts would result in a considerably greater profit. In this connection we want to

express our high regard for the loyalty and unflagging zeal shown by Mr. Sheppard and his staff in connection with the Catalogue and The Journal advertising.

In conclusion we wish to express our thanks to Mr. Durley for his assistance in our work during the past year.

Respectfully submitted,

J. A. McCrory, m.e.i.c., *Chairman.*

Committee on Western Water Problems

The President and Council:—

During the past year your Committee has followed with appreciative interest the work accomplished in the West under the Dominion government in carrying out the provisions of the Prairie Farm Rehabilitation Act. The construction of stock-watering dams and dug-outs on individual farms has been encouraged and a start has been made on a number of minor irrigation projects. In contrast with this sound policy, certain grandiose irrigation schemes have been advocated, that are unlikely to produce benefits commensurate with their cost. Such projects should only be undertaken after thorough study has demonstrated their economic feasibility.

Recurring droughts of greater or less severity are a characteristic of the very lands that produce the best wheat. A large part of the area affected by the present crop failure will, over a period of years, yield the farmer a higher return than most of the agricultural land throughout Canada. Furthermore, the present distress is not all due to drought, but arises in part from the past low price of grain and crop damage from rust infestation. Even if irrigation were available, the application of the water to the land is laborious and the farmer will only undertake it in sections so dry that there would otherwise be little chance of raising a crop. It is idle to irrigate lands other than these.

With lands where there is a reasonable expectation of obtaining a crop the risk of crop failure can be greatly reduced by proper agricultural methods. Therefore, the problem with these is primarily one for the agriculturist, but the engineer can be of service in alleviating conditions in time of drought by providing a water supply for domestic and stock-watering purposes.

The prosperity of many of the irrigated districts in Alberta affords convincing proof of what can be accomplished where the soil is fertile and suitable settlers are available. Furthermore, the stabilizing influence of such districts lessens the burden of drought on the community as a whole. The economic benefits, though they fully

Audit Certificate

We have audited the books and vouchers of The Engineering Institute of Canada for the year ending 31st December, 1937 and have received all the information we required. In our opinion, the above Statement of Assets and Liabilities and attached Statement of Revenue and Expenditure are properly drawn up so as to exhibit a true and correct view of The Institute's affairs as at 31st December, 1937, and of its operations for the year ending that date, according to the best of our information and the explanations given to us and as shown by the books.

Ritchie, Brown & Co.,
Chartered Accountants.

Montreal, 17th January, 1938.

justify irrigation where conditions are favourable, are far too widespread to be readily assessable, and on this account the work can only be undertaken by the Government.

The past year has seen a rapid expansion in the use of electric pumps in the Eastern Irrigation District of Alberta. There are now ten such installations either pumping water to lands above ditch level or reclaiming drainage from land already irrigated. The extension of existing projects by such means and by the creation of storage can be accomplished at much less cost per acre than for most of the proposed new projects.

The day will come when all the available supply is being utilized and water is at a premium. It would, therefore, seem advisable to proceed with the requisite works to conserve and utilize Canada's share of the boundary waters, such as the St. Mary's and Milk rivers, as also the planning of a comprehensive water conservation programme.

Respectfully submitted,

G. A. Gaherty, M.E.I.C., *Chairman.*

Past-Presidents' Prize Committee

The President and Council:—

Your Committee has carefully considered the eight papers submitted for the prize year 1936-1937, the subject being "The Need of the Engineer's Participation in Public Affairs." Some members of your Committee feel some doubt as to the eligibility of any of the papers, on the ground that the authors misunderstood the real significance of the title; if, however, Council decides that an award should be made, the Committee is unanimously of the opinion that the paper submitted by W. H. Powell, M.E.I.C., is first in order of merit and that submitted by E. R. Jacobsen, A.M.E.I.C., is second.

Respectfully submitted,

P. H. Buchan, M.E.I.C., *Chairman.*

Note:—In view of this report, the Council, at its meeting on December 20th, awarded the Past-Presidents' Prize to Mr. Powell, and honourable mention to Mr. Jacobsen.

Duggan Medal and Prize Committee

The President and Council:—

Your committee for the year 1936-1937, having read the papers published in The Journal, and those specially submitted, dealing with the subjects for which the prize might be awarded, is of the unanimous opinion that none of these papers is of sufficient merit to justify the award of a prize of this importance. The award of this prize carries with it a distinction to which, in your committee's opinion, none of the authors of the papers submitted is entitled.

Respectfully submitted,

A. H. Harkness, M.E.I.C., *Chairman.*

Gzowski Medal Committee

The President and Council:—

Your Committee on the Gzowski Medal Award, consisting of E. P. Fetherstonhaugh, R. S. L. Wilson, J. M. Robertson, J. N. Finlayson, and the writer, wish to report as follows:—

First—"North Atlantic Air Service, London to Montreal" by J. H. Parkin, M.E.I.C.

Second—"The Adaptation of Rigid Frames to Modern Construction" by E. R. Jacobsen, A.M.E.I.C.

Respectfully submitted,

E. V. Caton, M.E.I.C., *Chairman.*

Note:—In view of the above report, the Council, at its meeting on January 21st, awarded the Gzowski Medal to Mr. Parkin.

Plummer Medal Committee

The President and Council:—

The Plummer Medal Committee recommends that the Plummer Medal for the year 1937 be awarded to J. R. Donald, M.E.I.C., for his papers "Fire and Explosion Hazards from Industrial Products," July, 1936, and "Chemical Engineering," June, 1937. As second choice, the Committee names Professor Edgar Stansfield, M.Sc., M.E.I.C., for his paper "The Burning of Low Rank Alberta Coals, Combustion and Control," July, 1937. The Committee recommends that a silver medal be awarded to Professor Edgar Stansfield.

Respectfully submitted,

Alfred Stansfield, M.E.I.C., *Chairman.*

Leonard Medal Committee

The President and Council:—

The Committee unanimously recommend that the Medal be awarded to T. L. McCall, M.E.I.C., for his paper "Some Coal Mining Practices of the Dominion Steel and Coal Corporation Limited," which was published in the C.I.M. & M. Bulletin, July, 1936.

Respectfully submitted,

J. B. de Hart, M.E.I.C., *Chairman.*

Students' and Juniors' Prizes

The reports of the examiners appointed in the various zones to judge the papers submitted for the prizes for Students and Juniors of The Institute were submitted to Council at its meeting on January 21st, 1938, and the following awards were made:—

H. N. Ruttan Prize (Western Provinces) No papers received.

John Galbraith Prize (Province of Ontario)—To D. C. McCrady, S.E.I.C., for his paper "Sanitary Analysis of Drinking Water."

Phelps Johnson Prize (Province of Quebec, English)—To G. Martin, Jr.E.I.C., for his paper "The Elements of Modern Combustion Engineering."

Ernest Marceau Prize (Province of Quebec, French)—No papers received.

Martin Murphy Prize (Maritime Provinces)—No papers received.

Papers Committee

The President and Council:—

Following the procedure of the previous year the Papers Committee of The Institute was composed of the Chairmen of all the Branches. Efforts have been made to establish some method of helping the smaller and more isolated Branches to secure suitable papers but, unfortunately, without much tangible results.

Branches in the larger cities and those near these cities have no trouble in getting papers but the others are greatly handicapped in this respect. The Institute's Papers Committee should, therefore, largely concern itself with the latter. The difficulties are many and they will not be recounted here. The officers of these Branches know them all.

It would seem that it is largely a local problem and if a Branch has an energetic and resourceful Chairman many suitable papers could be secured. The larger manufacturing companies of the Dominion are generally willing to co-operate in sending members of their staff to our Branches and in the past have been very generous in this respect.

However the Chairman of your committee believes that a great deal more should be done by Headquarters, and serious consideration should be given by the Council to the possible setting up of a Department to assist in the supply of papers to those Branches that require them. The strength of The Institute lies in its Branches and anything that can be done to keep them active and enthusiastic will be amply repaid.

In last year's report it was suggested that Headquarters might prepare a list of available 16mm. motion pictures on engineering subjects, but on account of the large amount of detail in connection with the Semicentennial Meeting, this was not done. It should be followed up in 1938 and this very valuable addition to Branch programmes made available.

The Papers Committee regrets that it has not been able to do more for the Branches requiring help, but the handicaps of distance and the financial situation seem to be insurmountable.

Respectfully submitted,

R. L. Dobbin, M.E.I.C., *Chairman.*

Committee on Professional Interests

The President and Council:—

At the Plenary Meeting of Council held in Montreal in June last, approval was given to the recommendations of a special committee appointed by Council on May 28th, 1937, and consisting of J. L. Busfield, M.E.I.C., F. S. B. Heward, A.M.E.I.C., and R. A. Spencer, A.M.E.I.C.

This Committee recommended:—

(*a*) "That a Main Committee on Professional Interests (C.P.I.) be appointed by Council and consist of a Chairman, who shall be a member of Council, and two other members.

"This Committee is to co-ordinate and supervise the activities of the Provincial Committees of The Institute on Professional Interests. More particularly it shall collect, codify and deal with the various matters submitted to it by the Provincial Professional Committee and, following approval by Council, shall issue instructions as to appropriate actions to be taken.

(*b*) "In each province, Council shall nominate a Councillor to act as Chairman of the Provincial Committee of The Institute on Professional Interests, with powers to appoint additional members on sub-committee, subject to the approval of Council.

"The duties of the above mentioned Provincial Committees are to investigate and report on matters relating to:—

1—Salaries and Remuneration
2—Professional Practice
3—Junior Engineers
4—Public Education."

At the Plenary Meeting, the Committee on Professional Interests was appointed as follows:—

F. A. Gaby, M.E.I.C., Chairman,
F. Newell, M.E.I.C., Member,
O. O. Lefebvre, M.E.I.C., Member.

Council at the same time appointed the Chairmen of the Provincial Sub-Committees, as follows:—

P. H. Buchan, M.E.I.C., British Columbia
R. M. Dingwall, M.E.I.C., Alberta
R. A. Spencer, A.M.E.I.C., Saskatchewan
T. C. Main, A.M.E.I.C., Manitoba
J. A. Vance, A.M.E.I.C., Ontario
J. A. McCrory, M.E.I.C., Quebec
E. J. Owens, A.M.E.I.C., New Brunswick
H. S. Johnston, M.E.I.C., Nova Scotia.

The Chairman of each Provincial Committee was asked to organize his own Committee.

All Provincial Committees have not yet been completed. The following is the standing to date in the various provinces:—

British Columbia

P. H. Buchan, Chairman, has selected to act with him:—

H. Nolan Macpherson, M.E.I.C., Vancouver
J. P. Mackenzie, M.E.I.C., Vancouver.

Mr. Buchan has reported that the President of the Association of Professional Engineers of British Columbia, Mr. Vilstrup, has expressed himself as being satisfied that the Provincial Sub-Committee might be in a position to assist his Council in matters of common interest and be of real service to the Association of Professional Engineers of British Columbia.

Alberta

R. M. Dingwall, Chairman of the Sub-Committee, has selected two members of the Lethbridge Branch:—

J. T. Watson, A.M.E.I.C.,
R. F. P. Bowman, A.M.E.I.C.

Two members of the Calgary Branch are yet to be selected.

Saskatchewan

Professor R. A. Spencer, Chairman of the Sub-Committee, has selected the following members:—

From Saskatoon: W. E. Lovell, M.E.I.C.,
A. M. Macgillivray, A.M.E.I.C.,
E. K. Phillips, A.M.E.I.C.

Professor Spencer has not been able to appoint any member from Regina.

Professor Spencer, who is also Chairman of The Institute's Committee on Membership and Management, submitted, in October, a memorandum on Membership Classification and Fees, together with a suggested plan for Provincial Consolidation. A great deal of this material refers to the work of the Committee on Professional Interests, and the Main Committee will investigate the suggestions that Professor Spencer has submitted.

Manitoba

The Manitoba Sub-committee has the following membership:—

A. J. Taunton, M.E.I.C., Chairman
A. E. Macdonald, M.E.I.C.
H. L. Briggs, A.M.E.I.C.

Ontario

James A. Vance, Chairman of the Sub-Committee, has announced the following appointments:—

H. J. A. Chambers, A.M.E.I.C., Border Cities
H. F. Bennett, M.E.I.C., London
R. W. Boyle, M.E.I.C., Ottawa
W. E. Bonn, M.E.I.C., Toronto

This Sub-Committee has been very active, having held many meetings at different points in the province, namely London on September 8th, Peterborough on September 10th, etc.

Quebec

J. A. McCrory, Chairman of the Sub-Committee, has selected as members:—

Arthur Duperron, M.E.I.C.
E. A. Ryan, M.E.I.C.

There was some misunderstanding concerning the respective duties of the Main Committee and of the Sub-Committee. Now that the relations between the two Committees have been clearly set out, it is expected that progress will be made.

New Brunswick

E. J. Owens, Chairman of the Sub-Committee, has appointed the following members to act with him:—

T. H. Dickson, A.M.E.I.C., Moncton
G. A. Vandervoort, A.M.E.I.C., Saint John.

A scheme of co-operation between The Institute and the Provincial Association is now under consideration by the Council of the New Brunswick Association of Professional Engineers.

Nova Scotia

Harold S. Johnston, M.E.I.C., Chairman of the Sub-Committee, has appointed the following members to act with him:—

W. A. Winfield, M.E.I.C., Halifax
S. C. Mifflen, M.E.I.C., Sydney, Cape Breton.

It is to be noted that Council of The Institute, prior to the appointment of the Committee on Professional Interests and the Sub-Committees, had appointed H. W. McKiel, M.E.I.C., and C. A. D. Fowler, M.E.I.C., to act on a Joint Co-ordination Committee made up of representatives from the Halifax and Cape Breton branches of The Institute and the Nova Scotia Association of Professional Engineers, this Joint Committee to investigate the possibility of co-operation between The Institute and the Association of Professional Engineers in Nova Scotia. Proposals of this Joint Committee were submitted to the Council on October 22nd, and it was then resolved that The Institute would be prepared to enter into the proposed agreement, if the proposals were accepted by the membership through letter ballot. Actually a draft of a proposed agreement has been sent to Nova Scotia for consideration.

Your Committee hopes that in considering this report, members of Council and members of The Institute will appreciate that the important work entrusted to the Committee cannot be initiated rapidly and that the organization of the Provincial Sub-Committees is sometimes more involved than would appear to be the case.

The Committee hopes that following the organization of the Provincial Sub-Committees, progress will be made.

Respectfully submitted,
F. A. Gaby, M.E.I.C., *Chairman.*

Board of Examiners and Education

The President and Council:—

Your Board of Examiners beg to report as follows regarding the results of The Institute examinations held in May and November:—

Examined under	*Number of Candidates* May	Nov.	*Number passed* May	Nov.	*Passed in all subjects Completely*
Schedule B (Junior)					
I Elementary Physics and Mechanics	1	3	1	2	..
II Strength and Elasticity of Materials	2	3	2	2	4
Schedule C (Associate Member)					
III A General Electrical Engineering	1	..	1	..	..
III B2 Electric Power Transmission and Distribution	1	..	1	..	1

Respectfully submitted,
R. S. L. Wilson, M.E.I.C., *Chairman.*

Committee on Membership and Management

The President and Council:—

This committee was appointed at the Plenary Meeting of Council in June of this year to examine and report on the following:—

1. Is more local autonomy in the Provinces advisable?
2. Would the setting up of Provincial Divisions be advisable?
3. Can the present organization of Council be improved and is the conduct of Institute affairs efficient and economical?
4. What are the standards of admission and fees in other engineering organizations?
5. Are the present qualifications for admission to The Institute best suited to existing conditions?
6. Are the present classifications of membership in the E.I.C. best suited to existing conditions?
7. Can ways and means be provided under which better knowledge of Institute affairs will be disseminated throughout the membership and particularly with regard to conditions pertaining in the respective Provinces?

Up to the present time considerable information bearing on the above has been collected. Some of this material has been mimeographed and sent to individual members of Council.

Matters of organization of Council, standards of admission, classification of membership and fees, are all to some extent tied up with the proposed changes in by-laws now being discussed. They are also involved in the activities of the Committee on Professional Interests. Our Committee must, therefore, move slowly until the situation in regard to these matters has become clarified.

Respectfully submitted,
R. A. Spencer, A.M.E.I.C., *Chairman.*

Library and House Committee

The President and Council:—

During the year your committee has continued the policy of keeping down expenditures on maintenance and repairs and has been successful in showing a slight reduction over previous years.

Library and Information Service

There has been a falling off in the demands made upon this Department and Service during the past year as will be noted from an examination of the figures tabulated hereinafter for the years 1936 and 1937. To some degree this may be explained in that less publicity was given the facilities afforded, owing to the demands made upon the staff at Headquarters by reason of the holding of the Semicentennial celebrations last June. It may be also an indication of better times in the profession and fewer of our members with time on their hands for reading, etc. In previous years many of those who were out of employment used the service extensively.

Practically no additions were made to the Library other than those volumes presented us by the publishers and it is to be observed that a smaller number was obtained from this source than in previous years. As soon as funds permit, we should again adopt the policy of adding to the Library, at our own expense, such books on engineering subjects as may be considered useful and which are published from time to time. Unless this be done we shall soon reach a point where the information and data available will be obsolete in certain fields.

We desire to refer to the Committee's report for the year 1936 in which certain suggestions were made for improving the facilities afforded the members through the Library and Information Service, to which it has not been found possible to give effect up to the present.

Summaries of the activities of this department for the years 1936-1937 are given herewith for purposes of comparison.

	1937	*1936*
Requests for information	516	861
Requests for textbooks, periodicals, etc.	360	577
Technical books borrowed by members	130	153
Bibliographies compiled for members	27	40
Accessions to library (largely reports, etc.)	554	665
Requests for photoprints	11	22
Total pages of photoprints furnished to members	158	119
Books presented for review by publishers	19	32

Building Repairs and Maintenance

Rather extensive repairs had to be undertaken on the property this year in regard to fences, fire-escape, etc., but notwithstanding same the total cost on this account was less than in the previous year. The comparative figures follow:—

	1936	*1937*
Building maintenance	$526.34	$474.47

On behalf of my Committee I wish to express to the General Secretary and his staff our appreciation of their collaboration and assistance. To their unstinted efforts are due the excellent service afforded and the success attained in keeping operating costs within budgeted figures.

Respectfully submitted,
E. A. Ryan, M.E.I.C., *Chairman.*

Employment Service Bureau

The President and Council:—

The Employment Service Bureau of The Institute is able to report a distinct improvement in employment conditions during the past year, the sixth consecutive year to show such a betterment.

The following figures show the placements effected during the past six years:—

Year	*1932*	*1933*	*1934*	*1935*	*1936*	*1937*
Placements	58	50	70	77	110	181

The extent of the Bureau's work for 1937, as compared with 1936 is shown as follows:—

Number of registrations during the year:	*1937*	*1936*
Members	132	103
Non-members	74	45
Number of members advertising for positions	68	77
Replies received from employers	40	42
Vacant positions registered	275	195
Vacancies advertised in The Journal	69	25
Replies received to advertised positions	380	259
Men's records forwarded to prospective employers	701	746
Men notified of vacancies	355	259
Placements definitely known	181	110

Our active list of men seeking positions now contains 298 names, only some ten per cent of whom are actually unemployed.

Five lists of vacancies were issued during 1937.

A large number of interviews were given in connection with employment, both with employers and those seeking employment.

During a considerable part of the year the demand for engineers exceeded the supply available. This occurred principally in the following classifications:—

Recent graduates in mechanical and civil engineering.
Young mechanical and civil engineers with two or three years experience.
Experienced mechanical and structural designers.
Mechanical and electrical draughtsmen.

During the last two months of the year there was a considerable reduction in the number of positions listed with the Bureau. However, the number of men who during that time advised us that their work had terminated showed a large reduction from previous years.

It should be noted that the known placements for the year are 181, this is only the number who have notified us that they have received positions through the Employment Service Bureau. In many cases where contacts are made through the Service, no definite action may be taken for some months or even longer; or an employer may report that he has engaged a man to fill the position and may later decide that he requires an additional man or two, and he then engages these men from the records we have sent to him in the first instance, and as a rule we are not advised in such cases.

Respectfully submitted,

R. J. Durley, M.E.I.C., *General Secretary.*

Branch Reports

Border Cities Branch

The President and Council:—

On behalf of the Executive committee, we have the honour to submit the annual report for the calendar year 1937.

The Executive committee met seven times during the year for the transaction of Branch business.

Seven regular meetings were held during the year and one meeting on December 10th for the election of officers for the year 1938.

Information on the regular monthly meetings is as follows:—

1937

Jan. 22.—**Some New Things under the Sun**, by S. E. McGorman, M.E.I.C., the Chairman of Windsor Board of Commerce and an engineer of Canadian Bridge Co. Ltd. Attendance 21.

Feb. 12.—**Archery**, by Prof. Geo. J. Higgins, Associate Professor of Aeronautical Engineering, University of Detroit. Attendance 35.

Mar. 19.—**The Future of Aviation**, by Dr. H. F. Gerhardt, Professor of Aero Engineering, Wayne University, Detroit. Attendance 21.

Apr. 19.—**The Human Map Speaks for Itself**, by Prof. J. H. Levy of Toronto.

May 28.—**Air Compressors**, by E. T. Harbert, A.M.E.I.C., Canadian Ingersoll-Rand Co., Sherbrooke. Attendance 14.

Oct. 15.—**Heat Insulation** was a talking film presented by J. Bright of the London office of Johns-Manville Co. Attendance 33.

Nov. 16.—**The Burning of Powdered Fuel**, by Henry Kreisinger of Combustion Engineering Incorporated, New York City. This was a joint meeting with the Detroit Section of A.S.M.E. and the dinner was preceded by an inspection trip through the Ford Motor Company power house and new body plant at Windsor. Attendance 191.
The Border Cities Branch acted as host.

Dec. 10.—**Reminiscences of an Engineer**, by C. M. Goodrich, M.E.I.C., chief engineer of Canadian Bridge Co. The election of officers took place. Attendance 17.

MEMBERSHIP

The membership of the Branch is made up as follows:—

	1936 Resident	*1936* Non-Resident	*1936* Total	*1937* Resident	*1937* Non-Resident	*1937* Total
Members	11	4	15	11	4	15

		$810.00

OBITUARY

The Border Cities Branch lost a valuable member in the person of J. W. Seens, the President of the Canadian Steel Corporation and Canadian Bridge Company, Walkerville. His influence in this Branch is greatly missed.

Respectfully submitted,
C. F. DAVISON, A.M.E.I.C., *Chairman.*
J. F. BRIDGE, A.M.E.I.C., *Secretary-Treasurer.*

Calgary Branch

The President and Council:—

On behalf of the Executive committee of the Calgary Branch we have the honour to submit the following report covering the activities of this Branch for the year 1937:—

MEMBERSHIP

	Branch Resident *1936*	*1937*	*Branch District* *1936*	*1937*	*Total* *1936*	*1937*
Members	17	19	5	5	22	24
Associate Members	48	49	10	10	58	59
Juniors	6	14	1	3	7	17
Students	13	12	4	2	17	14
Branch Affiliates	6	10	..	..	6	10
Total	90	104	20	20	110	124

MEETINGS

Ten general and special meetings of the Branch were held during the year. The following summary shows the dates, speakers, subjects and attendance at these meetings:—

1937

Jan. 14.—W. J. Gold, Jr.E.I.C., on **Overhead Conductor Vibration.** Attendance 20.

Jan. 23.—Annual joint dinner with Association of Professional Engineers of Alberta and Rocky Mountains Branch Canadian Institute of Mining and Metallurgy. A. E. Ottewell, Registrar, University of Alberta, on **Nothing Remains To Be Done**. Attendance about 100 (aggregate).

Feb. 11.—A. T. McCormick, A.M.E.I.C., on **Sound, Natural and Unnatural.** Attendance 34.

Mar. 4.—F. H. Ballou, M.E.I.C., chief engineer, B.C. Sugar Refining Co., Ltd., and Canadian Sugar Factories Ltd., on **Beet Sugar Refining and Construction of the Picture Butte Sugar Factory**. Attendance 31. This meeting was held in conjunction with the regular weekly luncheon of the Junior Section, Calgary Board of Trade.

Mar. 13.—Annual meeting. Attendance 20.

Sept. 11.—Annual Golf Tournament. Attendance 20.

Sept. 24.—Dr. G. S. Hume, Geological Survey of Canada, on **The World Situation in Petroleum.** Attendance 150 (aggregate). Members of The Oil and Gas Association were invited to this meeting.

Oct. 20.—Informal dinner and entertainment provided by The Canadian Western Natural Gas, Light, Heat and Power Company, Ltd. E. W. Bowness, M.E.I.C., spoke on **A Trip to the Coronation** (illustrated by films) **and Conditions in Europe.** Attendance 60.

Nov. 16.—J. W. Young, A.M.E.I.C., on **The Chemistry of Crime.** Attendance 60.

Dec. 2.—J. S. Neil, A.M.E.I.C., on **Natural Gas Burners**, and J. V. Eckenfelder, S.E.I.C., on **A Hydrographic Survey of Tuktoyaktuk Harbor, MacKenzie River Delta.** Attendance 40.

We are pleased to be able to report that of the seven papers given at Branch general meetings five were given by the younger members of the Calgary Branch.

During the year the Branch Executive committee met seven times for the purpose of conducting the business of the Branch and the other committees held meetings as required for their work. One problem which has been given a lot of consideration during the year is that of attendance at Branch meetings. While some improvement has been achieved the problem is not yet solved.

Finances

Statement of Revenue and Expenditure for year ending December 31st, 1937

Revenue		
Rebates	$201.00	
Branch Affiliates dues	27.00	
Interest	33.36

H. W. Tooker, A.M.E.I.C., *Chairman.*
James McMillan, A.M.E.I.C., *Secretary-Treasurer.*

Cape Breton Branch

The President and Council:—

The annual report for the Cape Breton Branch is as under:—

Financial Statement

Receipts		
Balance brought forward	$206.26	
Rebates	119.10	
Receipts, meeting	27.50	
		$352.86
Expenditures		
Meetings	$ 78.53	
Printing	5.03	
Assessment Headquarters re meeting Branch representatives	8.88	
Expenses delegates to Halifax meetings re co-operation with Professional Association	36.80	
Telegrams	1.82	
Postage and secretarial	13.40	
Balance on hand	208.40	
		$352.86

During the year the Branch held but three general meetings at one of which Vice-President McKiel spoke on the success of the Semi-centennial meeting and on the subject of co-operation with the Professional Associations.

The second was the annual meeting which took the form of an afternoon sail on Sydney harbour followed by a picnic lunch and dance at Crawley's Creek.

The third was a reception to meet President Desbarats and was addressed by the President on Institute affairs, following which a very general discussion ensued and there was passed unanimously a resolution of appreciation of the co-operation received from Headquarters and particularly from the General Secretary.

Respectfully submitted,
Sidney C. Mifflen, M.E.I.C., *Secretary-Treasurer.*

Edmonton Branch

The President and Council:—

On behalf of the Executive committee of the Edmonton Branch we wish to submit the following report for the year 1937:—

Membership

Our present membership is as follows:—

	Resident	*Non-Resident*	*Total*
Members	19	2	21
Associate Members	25	7	32
Juniors	5	1	6
Students	28	..	28
	77	10	87

This shows the same total membership for the Branch as in 1936.

Meetings

The Executive committee held four meetings during the year to transact the business of the Branch, and one special meeting at which they entertained one of the visiting Eastern members.

The Branch held five general meetings throughout the year. The following is a summary:—

1937

Feb. 16.—The annual mixed meeting of the Branch, when the members entertained their wives and friends at the Corona hotel. Captain E. R. Gibson, member of the Alpine Club of Canada, gave an address on **Climbing the Great Divide.**

Apr. 9.—Dinner and meeting at Macdonald hotel, addressed by P. L. Pratley, M.E.I.C., who spoke on **The Island of Orleans Bridge.**

Apr. 28.—Dinner and meeting at the Macdonald hotel. Election of officers for 1937-38 session and an address on **Recent Ideas in Earthwork Engineering**, by Professor I. F. Morrison.

Aug. 28.—Luncheon meeting at Macdonald hotel. G. J. Desbarats, C.M.G., Hon.M.E.I.C., President of The Institute, gave a talk on **Institute Matters.**

Nov. 19.—Dinner and meeting at the Macdonald hotel, addressed by J. D. Baker, M.E.I.C., on **Some Phases of Telephone Engineering.**

Halifax Branch

The President and Council:—

The year 1937 was marked with great activity on the part of the Executive of the Halifax Branch with respect to co-operation and amalgamation with the N.S. Society of Professional Engineers, and several joint meetings were held throughout the year by the executives of both Societies and the members of the Professional Society were invited to all the general meetings of The Institute.

The usual meetings were held during the year as follows:—

1937

Jan.— Annual Banquet in co-operation with the Nova Scotia Society of Professional Engineers was held at the Nova Scotian hotel.

Feb.— J. S. Roper, on **The Relations Between the Engineering and Legal Professions.**

Mar.—A general meeting on subject of **Housing and Housing Conditions.** The following subjects were covered:
Dominion Housing Act—C. A. Fowler, M.E.I.C.
Slum Clearance—Colonel S. C. Oland.
Home Improvement Plan—A. J. Haliburton.

April—I. P. McNab, on the subject of **Depreciation.** This lecture was well attended, especially by several out-of-town members who are interested in public utilities.

Oct.— A Students' Meeting was held at the N.S. Technical College. Chairman, J. B. Hayes, A.M.E.I.C. Speakers, Mr. Hayes, and members of the engineering staff of the N.S. Light and Power Company, Limited.

Nov.—Dr. Allan Cameron, M.E.I.C., Deputy Minister of Mines, Province of Nova Scotia, presented a travelogue on the **McKenzie River Basin.**

Dec.— Annual Meeting of the Branch, addressed by President G. J. Desbarats on the activities of The Institute, and of the Council with respect to amalgamation in Nova Scotia. He advised the Halifax Branch that the Council were definitely going to take steps in accordance with the proposed agreement, presented to Council by the Committee appointed by the Council, The Institute Branches in Nova Scotia and the N.S. Professional Engineers, and that the matter would come before the next Annual Meeting. Officers were elected for the year, 1938.

Executive

The Executive held several meetings during the past year, many of which were held in the evenings. The principal subject under discussion was Amalgamation and Co-operation, and it is hoped that definite action will be taken during 1938.

The financial statement is as follows:—

Income		
Rebates	$207.30	
Bank interest	1.61

Meetings and Papers

1937

Jan. 6.—Annual business meeting and dinner held at the Wentworth Arms hotel. Mr. Patton, entertainer, lectured on **The Tropical Valley of Alaska.** Attendance 75.

Jan. 14.—**Acoustics and Sound Control,** by W. J. Hodge, acoustical engineer, Johns-Manville Co., New York. Attendance 122.

Jan. 20.—Joint meeting with the Hamilton Chemical Association. **The Engineer and Chemist in the Oil Industry,** by Dr. F. A. Gaby, M.E.I.C., Executive Vice-President of the British American Oil Company. Attendance 81.

Feb. 19.—**Vancouver Jubilee Fountain,** by G. F. Mudgett, Manager, Illuminating Division, Canadian Westinghouse Company, and J. T. Thwaites, Jr.E.I.C. Attendance 95.

Mar. 10.—**The Manufacture of Cold Drawn Wire and Some Factors Affecting its Physical Properties,** by A. B. Dove, A.M.E.I.C. Attendance 55.

Apr. 7.—Annual joint meeting with the Toronto Section of American Institute of Electrical Engineers. Held in the Westinghouse Auditorium. **Industrial Progress Through Science and Research,** by Dr. L. W. Chubb, Director of Research, Westinghouse Electric and Manufacturing Company, Pittsburgh. Attendance 193.

May 4.—**Motor Car Engines and Their Fuels,** by P. B. MacEwen, combustion engineer, Ethyl Gasolene Company. Attendance 120.

May 14.—Joint meeting with the Ontario Section of the American Society of Mechanical Engineers, the Grand Valley Group of the Registered Professional Engineers of Ontario and the Niagara Chemical and Industrial Association. Meeting held at Brantford, Ontario, during the afternoon and evening. Visits to plants and local industries, civic welcome by His Worship the Mayor of Brantford, followed by a banquet which was enjoyed by 165 guests.

Oct. 5.—**The Work of the National Research Council,** by Major General A. G. L. McNaughton, C.B., C.M.G., D.S.O., M.Sc., LL.D., M.E.I.C., President of the National Research Council. Attendance 86.

Oct. 21.—**Recent Achievements in Colour Photography,** by Mr. Jackson, Eastman Kodak Company, New York. This meeting was ladies night and was well attended by the wives and friends of the members who were guests of the Branch during refreshments after the meeting. Attendance 180.

Nov. 9.—**The Problem of Braking High Speed Trains,** by W. E. Sprague, Secretary, Canadian Westinghouse Company Limited. Held in the Westinghouse Auditorium. Attendance 220.

Dec. 14.—**Advance Practice in the Use of Automatic Oxy-Acetylene Cutting,** by W. A. Duncan, of the Dominion Oxygen Company. Attendance 78.

W. J. W. Reid, M.E.I.C., chairman of the Meetings and Papers committee, has added another year of valuable service to the Branch by his selection of speakers. Although the lectures have been made as attractive as possible the technical side of the subjects has not been sacrificed in order to attract large numbers to our meetings. Most, perhaps all, of the speakers have given valuable information, such that the average listener would have to spend long and concentrated effort to obtain by ordinary method of study.

Branch lectures are not a study class but rather a period where an engineer may increase his sphere of usefulness by listening to and questioning about the deeper things of another engineer's diverse knowledge.

Except where specially noted these meetings have been held in the Science Lecture Hall, McMaster University, and the Executive wishes to once more record their appreciation of the many favours and conveniences placed at the disposal of the Branch by the Management of the University.

Publicity

The Executive committee wishes to record sincere appreciation for the courtesies extended by the press, especially the "Hamilton Spectator" and the "Daily Commercial News."

Obituary

We record, with deep regret, the passing of W. F. McLaren, M.E.I.C., on August 19th, at his home "Balquhidder," Ancaster, Ontario. Mr. McLaren was secretary-treasurer for six years and later chairman and during those years he gave generously of his time for the upbuilding of the Branch.

General

The Executive wishes to record a sincere appreciation, to members of all grades of the Branch, for the generous support given throughout the year in all the affairs and matters that have been undertaken, also to all other local engineering associations for their co-operation.

By arrangement with the Management of McMaster University, after all meetings, coffee, sandwiches and cake are served and a half hour of pleasantry is enjoyed by all present.

Kingston Branch

The President and Council:—

During the year 1936-1937 the Branch met five times as follows:—

1936

Nov. 4.—Annual meeting for reports and election of officers, discussion of Branch affairs for the coming year, etc.

Dec. 11.—Dinner and paper by Lt.-Col. N. C. Sherman, R.C.O.C., M.E.I.C., chairman of the Branch, on **Industrial Preparedness.**

1937

Jan. 26.—Meeting at Queen's University. Paper by O. Holden, A.M.E.I.C., chief hydraulic engineer, H.E.P.C., on **Power Development in Northern Ontario.** This meeting was especially for students and cadets and there was an attendance of 175.

Mar. 1.—Professor S. N. Graham, Queen's University, on **The Development of Gold Mining in Canada.** This meeting, which was held in the Sir Arthur Currie Hall, Royal Military College, was also primarily for students and cadets, and there was an attendance of about 235.

Apr. 1.—Dinner and address by Dr. W. A. Jones entitled **Some Remarks on Radiology.** This meeting, which was held at the Badminton Club, was the final one of the season.

Employment

One member of the Branch (non-active list) has been assisted in finding suitable employment.

Chamber of Commerce

No meetings of the Chamber of Commerce have dealt with questions in which the Branch, as such, was interested.

Semicentennial Meeting

Five members of the Branch attended the semicentennial meeting in Montreal. R. F. Legget, A.M.E.I.C., represented the Branch in the Round Table Conference on Branch Affairs.

Membership

The membership for the past five years is given below, and last year shows an encouraging increase:—

	Honorary Members	Members	Assoc. Members	Juniors	Students
1932-33	1	13	16	6	16
1933-34	1	11	19	7	14
1934-35	1	11	18	3	13
1935-36	1	12	18	4	11
1936-37	1	11	25	4	18

Financial Statement

In view of the fact that the Branch repaid $25 of the loan owing to Headquarters, the financial statement is reasonably satisfactory. It is recommended that consideration be given to paying the remaining $25 this year, and thus discharging the debt in full.

Lakehead Branch

The President and Council:—

On behalf of the Executive committee we submit the following report of the Lakehead Branch for the year 1937:—

The following meetings were held:—

1937

Jan. 20.—Dinner meeting at the Provincial Mill, Port Arthur.

Feb. 12.—Dinner meeting at the Royal Edward hotel, Fort William. Guest speaker, J. L. Busfield, M.E.I.C., speaking on **Consolidation and Diesel Engines with Reference to Automatic Applications.**

Feb. 28.—Ladies' Night at Shuniah Club, Port Arthur.

Mar. 17.—Dinner meeting at the Prince Arthur hotel, Port Arthur. Paper by P. E. Doncaster, M.E.I.C., on **Cellular Fills for Retaining Structures.**

Apr. 28.—Annual meeting with election of officers held at the Royal Edward hotel, Fort William.

May 19.—Dinner meeting held at the Prince Arthur hotel, Port Arthur, to welcome the President of The Institute, G. J. Desbarats, Hon.M.E.I.C., and Mrs. Desbarats.

Aug. 20.—Dinner meeting at the Royal Edward hotel, Fort William, in honour of the departing Secretary of the Branch, G. R. McLennan, A.M.E.I.C.

Nov. 17.—Dinner meeting at the Prince Arthur hotel, Port Arthur, four local speakers on Institute affairs.

Nov. 22.—Excursion to Red Rock, Ontario, to inspect the construction of the new mill for the Lake Sulphite Pulp Company.

Lethbridge Branch

The President and Council:—

The following is a report of the operations of the Lethbridge Branch, of The Engineering Institute of Canada, for the year 1937.

Since January 1st, 1937, 8 regular meetings with an average attendance of 31; 1 corporate members meeting with an attendance of 8; and 4 executive meetings with an average attendance of 8, were held.

All regular meetings have been held in the Marquis hotel preceded by a dinner during which numbers were rendered by George Brown's Instrumental Quartette, followed by vocal or instrumental numbers, interspersed with community singing.

The list of speakers and subjects chosen follows:—

1937

Jan. 16.—R. Randle, Calgary Power Co. Ltd., Calgary, on **Electric Power Engineering Achievements and Operating Facts.** Two reels of motion picture film were also shown through courtesy of the International Harvester Co. Ltd. Attendance 17.

Jan. 30.—Biographies of Eminent Engineers. Prize Competition. R. B. McKenzie, S.E.I.C., Lethbridge, spoke on **Dr. Charles Frederick Burgess**, eminent chemical engineer; R. F. P. Bowman, A.M.E.I.C., Lethbridge, on **Dr. John Alexander Low Waddell**, eminent structural engineer; also E. A. Lawrence, S.E.I.C., Lethbridge, on **Sir William Willcocks**, eminent irrigation engineer. Attendance 16.

Mar. 13.—Annual meeting and election of officers; also joint meeting with the Association of Professional Engineers of Alberta, and the Rocky Mountain Branch of the Canadian Institute of Mining and Metallurgy. A. W. Haddow, A.M.E.I.C., President of the Association of Professional Engineers of Alberta, spoke on **Some Early Examples of Engineering**, illustrated with lantern slides. Attendance 40.

Aug. 14.—G. J. Desbarats, Hon.M.E.I.C., President of The Engineering Institute of Canada, on **Institute Affairs.** During his short stay in Lethbridge, Mr. Desbarats was taken to various points of interest in the district. Attendance 20.

Oct. 9.—J. T. Watson, A.M.E.I.C., Lethbridge City Manager, on **A Brief History of the City of Lethbridge Electric Power Plant**, illustrated with lantern slides. Attendance 24.

Nov. 6.—Jack deHart gave a talk on **A Trip to the Coronation.** Ladies' Night. Attendance 60.

Nov. 20.—J. A. Jardine, Alderman, City of Lethbridge, on **Bus vs. Street Railway.** Attendance 30.

Dec. 4.—Ladies' Night. W. L. McKenzie, A.M.E.I.C., on **10,000 Miles Along the Coast of Asia.** Attendance 40.

At December 31st the membership of the Branch stood as follows:—

	Resident	*Non-Resident*	*Total*

London Branch

The President and Council:—

During the year 1937 the following meetings were held:—

1937

Jan. 20.—Annual meeting and election of officers was held at the Richmond Street Armouries as guests of the Military Engineers Association. The guest speakers were P. L. Pratley, M.E.I.C., Montreal, and R. L. Dobbin, M.E.I.C., Peterborough. Attendance 64.

Feb. 25.—Regular meeting was held in the Public Utilities Commission board room. G. Harold Reaveley, M.A., D.I.C. (London), Assistant Professor of Geology at University of Western Ontario, spoke on **Some Geological Principles Affecting the Engineer.** Attendance 14.

Mar. 18.—Regular meeting held in the Public Utilities Commission board room. C. A. Cline, B.Sc., of Hamilton, spoke on **A Niagara Free Port.** Attendance 19.

Apr. 22.—Regular meeting held in the Public Utilities Commission board room. R. S. Charles, B.Sc., London, gave a travelogue of his experiences encountered while searching for public water supplies in France, Indo-China and Algeria. Attendance 22.

May 20.—Regular meeting held in the council chamber, County Building, London. S. W. Archibald, M.E.I.C., London, gave an illustrated lecture on **Flood Control on Western Ontario Streams.** Attendance 45.

Oct. 20.—Dinner meeting for discussion of 1938 Annual Meeting arrangements. R. J. Durley, M.E.I.C., was the speaker. Attendance 21.

Nov. 15.—Regular meeting held in the Auditorium, City Hall, London, when a talking motion picture was presented through the courtesy of Johns-Manville Company, the machine being operated by Mr. Boyce of Toronto. W. J. Bright, B.Sc., London, was the speaker. Attendance 70.

Average attendance of all meetings 36.

In addition to above eight Executive meetings were held with an average attendance of 7.

Moncton Branch

The President and Council:—

On behalf of the Executive committee we beg to submit the eighteenth annual report of Moncton Branch.

The Executive committee held five meetings. Four meetings of the Branch were held, at which addresses were given and business transacted as follows:—

1937

Jan. 19.—A meeting was held in the City Hall. Through the courtesy of Noranda Mines Ltd., the motion picture **The Noranda Project** was shown.

Apr. 14.—A meeting was held in the City Hall. Through the courtesy of Cunard White Star, the motion picture **On Wings to Capetown** was shown. At this meeting, Branch officers for 1937-38 were nominated.

May 31.—The annual meeting of the Branch was held on this date.

Dec. 6.—A supper meeting was held in the Y.M.C.A. An address on **Institute Affairs** was given by G. J. Desbarats, Hon.M.E.I.C., President of The Engineering Institute of Canada.

Membership

Our membership at present consists of fifty-eight members, as follows:—

Montreal Branch

The President and Council: –

On behalf of the Executive committee, we have the honour to submit the twentieth annual report of the Branch.

For the year 1937, the Executive committee consisted of the following members:—

Chairman	Huet Massue, a.m.e.i.c.
Vice-Chairman	Brian R. Perry, m.e.i.c.
Secretary-Treasurer	E. R. Smallhorn, a.m.e.i.c.
Past Chairman	J. B. D'Aeth, m.e.i.c.

Elected Members of Committee

W. F. Drysdale, m.e.i.c.	C. C. Lindsay, a.m.e.i.c.
R. E. Jamieson, m.e.i.c.	T. C. Thompson, a.m.e.i.c.
P. E. Bourbonnais, a.m.e.i.c.	J. A. E. Gohier, m.e.i.c.

Ex-Officio Members of Committee

A. Frigon, m.e.i.c.	A. Duperron, m.e.i.c.
E. A. Ryan, m.e.i.c.	J. A. McCrory, m.e.i.c.
F. Newell, m.e.i.c.	F. P. Shearwood, m.e.i.c.
F. S. B. Heward, a.m.e.i.c.	C. K. McLeod, a.m.e.i.c.

At the meeting held on January 22nd, 1937, the following members were duly appointed chairmen, and vice-chairmen, of the various committees and sections:—

Committees	*Chairmen*	*Vice-Chairmen*
Papers and Meetings	K. O. Whyte	R. E. Jamieson
Membership	T. C. Thompson	
Admission	J. A. E. Gohier	W. F. Drysdale
Reception	C. C. Lindsay	
Nominating	P. E. Bourbonnais	
Town Planning	Leonard Schlemm	
Finance	Huet Massue	C. K. McLeod
Sections		
Civil	R. E. Heartz	L. H. Burpee
Electrical	I. S. Patterson	S. H. Cunha
Mechanical	T. M. Moran	P. E. Poitras
Municipal	J. G. Chenevert	J. G. Comeau
Radio and Communications	D. J. McDonald	S. Sillitoe
Transportation	G. G. Ommanney	H. B. Bowen
Junior	C. E. Frost	P. E. Savage

The outstanding event of the year was the Semicentennial Celebration of The Institute, which brought to Montreal hundreds of engineers from all parts of Canada and other countries. Many members of the Montreal Branch were called upon to help the Chairman, J. L. Busfield, m.e.i.c., to organize and conduct the various activities.

At the beginning of the year, the Branch had the misfortune to lose its Secretary, C. K. McLeod, a.m.e.i.c., who for 12 years had most efficiently conducted its affairs. At the Executive Meeting of January 22nd, E. R. Smallhorn, a.m.e.i.c., was duly appointed as the new Secretary, Mr. McLeod agreeing to attend the Executive Meetings for the current year.

During the year the Executive committee held 10 meetings with an average attendance of 12 members. There were also held two special general meetings of the Branch: on April 1st, for the discussion of consolidation; on October 21st, to appoint three members of the Branch Nominating Committee.

To establish a closer co-operation with the Junior Section, the Chairman of that Section was invited to attend Executive Meetings.

Membership Committee

The membership committee decided that the best way to obtain immediate results from a membership viewpoint would be the thorough consideration of the non-active list. A letter with a form-reply was sent to each person on this list. The results have been such that on December 31st, the non-active list will be discontinued.

The Committee feels that the only way to obtain further constructive results, would be to form a Membership Committee, under the chairmanship of some very active member, consisting of one or two members from each section, in a way similar to the present organization of the Papers and Meetings Committee.

The changes in membership during the year are shown in the following table:—

Montreal Branch Active List:

Membership	*1936*	*1937*	*Change*
Honorary Members	1	2	1
Members	216	212	– 4
Associate Members	498	528	30
Juniors	66	84	18
Students	258	321	63
Affiliates	15	16	1
Totals	1,054	,163	109

Montreal Branch District Active List:			
Members	4	4	..
Associate Members	34	33	− 1
Juniors	7	3	− 4
Students	8	20	12
Totals	53	60	7
Non-Active List:			
Members	3	4	1
Associate Members	48	25	−23
Juniors	14	12	− 2
Students	8	..	− 8
Affiliates	1	..	− 1
Totals	74	41	−33
Summary:			
Total Active Members	1,107	1,223	116
Total Non-Active Members	74	41	−33
Total Membership	1,181	1,264	83

Members Deceased

The Committee deeply regrets the loss by death of the following members:—

Members:

Blaiklock, Morris S.; Fortin, Sifroy Joseph; Humphreys, James John; Lafleche, Alphonse; Morkhill, John Thomas; Rolph, Harold.

Associate Members:

Angus, John Vickers; Fusey, L. Ernest F.; Heckman, Joseph William; Lucas, Leslie; Warnock, Charles.

Students:

Lemieux, Denis; Milne, Geoffrey Robertson; Roy, Louis Philippe.

Admission Committee

During the year, the Committee considered a total of 111 applications for admission or transfer as follows:—

Applications for Admission:		*Applications for Transfer:*	
Members	4	To Member	2
Associate Members	20	To Associate Member	42
Juniors	19	To Junior	21
Branch Affiliates	3		
Institute Affiliates	..	Total	65
Total	46		

In addition, 93 Students were admitted to The Institute at this Branch.

Reception Committee

This Committee sponsored all entertainments undertaken by the Branch.

On January 29th, 1937, a very successful smoker was held under the direction of R. H. Findlay, M.E.I.C., Chairman of the Reception Committee for year 1936. This smoker was attended by some 400 members, the total receipts being $381.00, and the expenditures $282.69, the profit amounting to $98.31.

Owing to the celebrations connected with the Semicentennial of The Institute, no special efforts were made to provide additional entertainment during the spring session. For the fall session, the Committee investigated the possibility of a cruise on the St. Lawrence river. Since this would have necessitated giving a guarantee of $300 to the steamship company, and because the season was rather far advanced, the proposition was abandoned. It is felt that such an outing is well worth considering by the incoming committee.

The Committee wishes to make the following recommendations:—

(1) That the period of tenure of office of the Reception Committee should synchronize with that of the Papers and Meetings Committee.

(2) That the incoming committee consider ways and means to improve the attendance at the courtesy dinners to out of town speakers.

(3) That the length of papers be limited. Without encroaching upon the domain of the Papers and Meetings Committee we venture the suggestion that the papers should not be too long. No paper should last longer than one hour and a quarter, at most an hour and a half. Members lose interest and some always start to go out around ten o'clock. The average engineer is a hard-working man, and he wants to leave The Institute not later than 10.15 in order to get home for 11.00 p.m.

The Reception Committee is now organizing a smoker which will be held on February 17th, 1938.

Branch Nominating Committee

At the Special General Meeting of the Branch held on October 21st, R. E. Jamieson, J. B. D'Aeth and P. E. Bourbonnais were elected members of this Committee. At a meeting held on November 11th, these members, together with H. Massue and E. R. Smallhorn, both appointed by the Executive, nominated the candidates for offices for the following year.

1937 Papers and Meetings

Jan. 7.—Annual Meeting.
Jan. 14.—**Petroleum Products and the Automobile**, by R. S. Weir, A.M.E.I.C., and Gordon M. Connor.
Jan. 21.—**Modern Trends in Illumination**, by A. L. Powell.
Jan. 29, Jan. 30—Annual General Meeting.
Feb. 4.—**Recent Developments in Steam Heating**, by H. F. Marshal.
Feb. 11.—**Transmission over Electric Wave Guides**, by Dr. G. C. Southworth.
Feb. 18.—**Modern Highway Construction**, by Hon. F. J. Leduc.
Feb. 25.—**Non-Ferrous Alloys**, by H. F. Roast, M.E.I.C.
Mar. 4.—**Schorer Method of Analysis Applied to Pipe Line Design**, by A. W. F. McQueen, A.M.E.I.C., and E. M. C. Molke, A.M.E.I.C.
Mar. 11.—**Telemetering**, by Perry Borden.
Mar. 18.—**Application of Negative Regeneration in Communication**, by C. B. Fisher, A.M.E.I.C.
Mar. 25.—**Construction of the Bridge at St. Anne de la Perade**, by P. G. A. Brault, A.M.E.I.C.
Apr. 1.—Meeting of Montreal Branch of The Institute to discuss the question of Consolidation.
Apr. 8.—**Production of Radio Active Substances**, by Dr. J. S. Foster.
Apr. 15.—**The Problem of Economic Stability as Seen by an Engineer**, by P. Ackerman, A.M.E.I.C.
Apr. 22.—**Indeterminate Roof Trusses**, by E. R. Jacobsen, S.E.I.C.
Apr. 29.—**Business Management from a Scientific Point of View**, by Harry A. Hopf.
Oct. 7.—**The Part Played by the Forest Industries in the Economic Life of the Province of Quebec**, by Lt.-Col. L. J. D. Marquis.
Oct. 14.—**Engineering Achievements**, by Dr. Chubb.
Oct. 21.—**Pre-stressing and Erection of Isle of Orleans Bridge**, by D. B. Armstrong, A.M.E.I.C.
Oct. 28.—**Technical Men in Industry**, by Dr. Littler and C. A. Peachey.
Nov. 4.—**Canadian Air Transportation**, by G. A. Thomson.
Nov. 11.—**Operating Problems (Electrical)**, by R. N. Cooke, A.M.E.I.C., J. M. Crawford, A.M.E.I.C., A. Benjamin, A.M.E.I.C., and G. C. Read.
Nov. 15.—**A New Approach to the Industrial Lighting Problem, and Current Trends of School Lighting** (Joint meeting with the I.E.S.), by H. B. Dates.
Nov. 18.—**Trends in Telephone Equipment**, by J. L. Clarke, M.E.I.C.
Nov. 25.—**Sewage Disposal**, by W. S. Lea, M.E.I.C.
Dec. 2.—**Geological Survey of Canada**, by Dr. F. J. Alcock.
Dec. 9.—**Material Handling by Mechanical Equipment of the Conveyor Type**, by W. J. Ramsey.
Dec. 16.—**Trends and Modern Methods of Cities' Assessment and Taxation**, by J. E. Howes.

Your Committee has attempted to inaugurate a type of paper which could be expanded in a series, such as the "Technical Men in Industry" series, and the "Operating Problems" series. The thought behind this attempt being that many subjects cannot be adequately presented in one paper, and could with advantage be expanded into two or more papers. A continuation of this practice is recommended by the Committee. An attempt has also been made to pre-arrange the discussion of papers by members familiar with the subject.

The question of the reporting of meetings has been considered by your Committee. The following procedure is suggested:—

A member should be appointed to make a report of each meeting, his duties to be as follows:—

1. See that an attendance sheet is filled in by all members and guests present.
2. Make a summary of the main paper, and of the ensuing discussion.
3. See that the newspaper reporter gets a copy of the paper or a sufficiently clear summary so that adequate and accurate newspaper accounts are obtained.
4. Send a copy of the report to the General Secretary so that he may have all information about the paper and the discussion, should he wish to publish the proceedings of the meeting. A copy should also be sent to the Branch Secretary, for filing.

The attendance sheet would give the Executive committee the names of members who are taking an active part in the affairs of the Montreal Branch, and who might therefore be suitable members of the various committees.

The average attendance at meetings during the Fall Session was only 107. For a Branch with well over a thousand members on its rolls, this is very disappointing. If the papers presented by the Committee are not the type desired by our members, we would be very glad to have their constructive criticism.

As constituted at present, the Papers committee are trying to obtain papers which will interest six distinct types of engineers, "Civil, Electrical, Mechanical, Municipal, Radio, and Transport." This means that each section can have only two papers per session which are of direct interest to it. Although this method of presenting papers has been followed for a good many years, your Committee feels that the time has come when it should be reconsidered.

Junior Section

Fifteen regular meetings, including five plant visits, were held during the past year as compared with twelve in 1936.

The total attendance at Junior Section meetings was 730, as compared with 588 in 1936, an increase of 24 per cent, reflecting greater activity in arranging meetings. The Junior Section Executive held eight meetings at which the general affairs of the Section were discussed and the programme of meetings arranged.

The following is a list of meetings and plant visits:—

1937

Jan. 18.—Annual Meeting. Address by H. Massue, A.M.E.I.C., Chairman, Montreal Branch, The Engineering Institute of Canada, on **Economic Trends and their Effect on the Employment of Engineers.** Attendance 50.

Jan. 30.—Visit to the Consumers Glass Company Ltd., Ville St. Pierre, Que. Attendance 70.

Feb. 15.—**Some Interesting Features of Inspection and Testing Work,** by J. M. Fairbairn, A.M.E.I.C.
Photo-Elastic Method of Stress Analysis, by Carleton Craig, S.E.I.C. Attendance 46.

Mar. 1.—**L'Application des Relais pour la Protection des Lignes des Transmissions,** by Yvon Deguise, S.E.I.C.
Further Research of the Residual Stresses Set up by Welding, by M. J. Lupton, S.E.I.C. Attendance 31.

Mar. 15.—**The Handling of Concrete in the Field,** by W. E. Griffiths, Jr.E.I.C.
The Theory and Application of Sliding Forms in Concrete Structures Having Thin Walls, by J. M. Cape, Jr.E.I.C. Attendance 39.

Mar. 29.—Visit to the Toll Building of the Bell Telephone Co. of Canada. Attendance 65.

Apr. 5.—**An Actual Case of Research Work on Reduced Models of Spillways,** by Louis Trudel, S.E.I.C.
Gears, by Jacques Hurtubise, S.E.I.C. Attendance 35.

Apr. 19.—**Highway Development in Alberta,** by J. L. Pidoux, Jr.E.I.C.
Elements of Modern Combustion Design, by G. Martin. Attendance 24.

Oct. 2.—Visit to Noorduyn Aircraft Limited, St. Laurent, Que. Attendance 125.

Oct. 13.—**The Engineer as the Citizen,** by David Boyd, A.M.E.I.C. Attendance 49.

Oct. 27.—**Sound Reproduction,** by S. T. Fisher, Jr.E.I.C. Attendance 43.

Nov. 8.—Visit to Ecole Polytechnique, Hydraulic Laboratories. Attendance 20.

Nov. 13.—Visit to the Montreal Locomotive Works, Montreal East. Attendance 80.

Nov. 24.—**Some Aspects of an Electric Mine Hoist,** by D. E. Evans, S.E.I.C.
Mesures de Sécurité Influant la Construction d'une Rurale, by Lucien Perrault. Attendance 25.

Dec. 8.—**The Construction of Log Flumes,** by Graham Treggett.
Etude Comparative de Deux Sources d'Approvisionnement en Eau Potable pour la Ville de Sherbrooke, by Lucien Buteau, S.E.I.C. Attendance 30.

In 1936, the Junior Section Executive requested one of its members to peruse the minutes of all previous Junior Section Executive meetings with a view to consolidating the suggestions and practices which had been found practicable and desirable into a "Code of Procedure," and also to formulate a Statement of Purpose for the Section. At the present time the "Code" is considered as complete, and it is proposed to submit it to the Montreal Branch for approval.

A short talk was given to the Junior and Senior years of McGill University by the Junior Section Chairman, to induce them to attend meetings and join The Institute as student members. No address was delivered to the students of Ecole Polytechnique but Messrs. Decarie and Flahault, the Section's student representatives, approached the members of their respective years personally; also one of the regular meetings of the Section was held at Ecole Polytechnique.

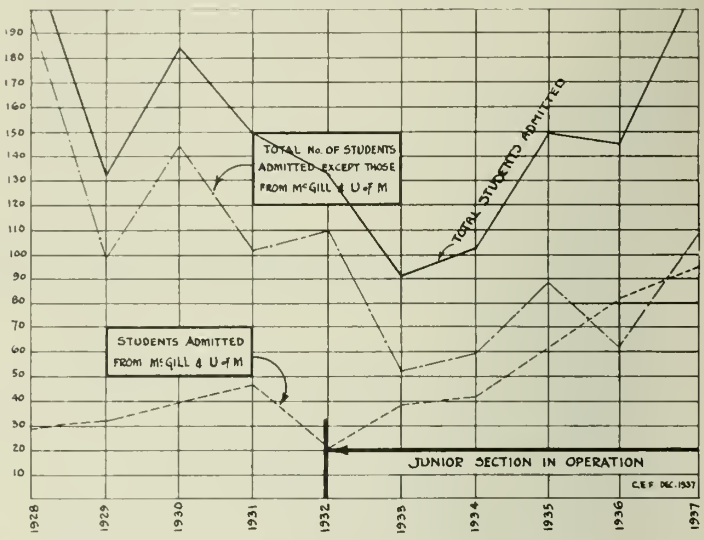
Due to the resignation of V. Upton, S.E.I.C., a vacancy on the Executive occurred early in the year. A by-election was held and R. N. Warnock, Jr.E.I.C., was elected.

Following is a list of University Students admitted to The Institute:—

	1934	*1935*	*1936*	*1937*
Ecole Polytechnique	11	10	43	25
McGill University	28	41	42	68
	39	51	85	93

Figure 1 is a graph showing the number of students admitted to The Institute from the Montreal Branch Area and the number admitted from other Branches since 1928.

Student admissions from the Montreal Branch area have increased every year since the Junior Section came into existence in 1932. During 1933, Student admissions showed a gain of nearly 100 per cent over their 1932 figure, and this, during a year in which student admissions from all other branches dropped to approximately 48 per cent of their 1932 figure. In 1936 approximately 30 per cent more students were admitted from the Montreal Branch area than from all other branches combined. In 1937 there were 93 students admitted from the Montreal Branch area, while there were 108 student admissions from all other branches. That is, the Montreal Branch area contributed 47 per cent of the total number of students admitted to The Institute during this year.



The above figures for student admissions indicate that the Junior Section is an asset to The Institute.

The Executive of the Junior Section wishes to express its appreciation and thanks to the Montreal Branch for its generous support and assistance during the past year.

Financial Statement
for the year ending December 31st, 1937

Revenue

	1936	*1937*
Rebates from Headquarters	$1,499.00	$1,611.30
Rebates due from Headquarters (estimated)	120.90	130.00
Affiliate dues paid	56.03	53.00
Affiliate dues unpaid	.....	10.00
Bank interest	9.16	2.96
Smokers	324.87	381.00
Dinners to speakers	164.00	119.00
Rebate from speakers travelling expenses	.....	10.00
Total revenue	$2,173.96	$2,317.26

Expenditures

Surplus from previous year	1,140.11	1,349.21
Surplus at end of year	$1,349.21	$1,451.30

This surplus of $1,451.30 existed in the following form at December 31st, 1937:—

Cash in bank	$1,311.30
Rebates due from Headquarters (estimated)	130.00
Affiliate dues unpaid	10.00
	$1,451.30

(There are no Accounts Payable.)

an Your Secretary-Treasurer wishes to suggest the appointment of auditing committee of one or two members, whose duty it shall be to audit the Branch accounts.

GENERAL

The Executive committee appointed F. S. B. Heward, A.M.E.I.C., and Brian Perry, M.E.I.C., a committee of two to investigate and report on what might be done to improve the activities and organization of the Branch. The report was submitted at the last meeting of the Executive on December 17th, 1937. Owing to pressure of other business, time was available for only a casual discussion. It was decided that it would be desirable to canvass the opinion of all members, and to have the suggestions submitted discussed at the Annual Meeting of the Branch, for the guidance of the incoming executive. A summary of these suggestions will be found on the notice card for this meeting.

At the request of a group of members interested in industrial management and operation, the formation of an industrial or management section was considered and approved. The activities of this section will start in 1938.

The Junior Section, formed some five years ago, has rapidly developed into a very important group. All those who are contributing to the success of this Section are performing a very valuable service to The Institute. To particularly acknowledge the splendid work done by John Plow for the Junior Section—apart from his duties at Headquarters—the Executive committee, at the suggestion of C. E. Frost, A.M.E.I.C., Chairman of the Section for 1937, is pleased to announce that it has unanimously voted to present Mr. Plow with a gift in appreciation of his efforts.

In concluding, the Executive committee desires to thank all those who, either through the presentation of papers, attendance at the meetings, or otherwise, have made possible the successful operation of the Branch in 1937.

Respectfully submitted,

HUET MASSUE, A.M.E.I.C., *Chairman.*
E. R. SMALLHORN, A.M.E.I.C., *Secretary-Treasurer.*

Niagara Peninsula Branch

The President and Council:—

On behalf of the Executive committee of the Niagara Peninsula Branch, we beg to submit this, our annual report for the year 1937.

The Executive held 7 business meetings and one electoral meeting to manage the activities of the Branch.

During the year the following Branch meetings were conducted:—

1937

Jan. 14.—Dinner meeting, Leonard hotel, St. Catharines. Joint meeting with the Niagara District, Chemical and Industrial Association. D. G. Geiger, A.M.E.I.C., transmission engineer with the Bell Telephone Company, on **The Transmission of Speech and Music.** Illustrated.

Feb. 18.—Dinner meeting at Foxhead Inn, Niagara Falls, Ontario. E. T. Harbert, A.M.E.I.C., of the Canadian Ingersoll-Rand Company, spoke on **The Selection and Design of Air Compressors.** Illustrated.

Mar. 18.—Joint meeting with the Niagara District Chemical and Industrial Association at the Leonard hotel, St. Catharines. Mr. McIntyre, chief chemist for Imperial Oils, Sarnia, spoke on **Gasoline Refining.** Illustrated.

Apr. 15.—Afternoon inspection trip through the International Nickel Company plant at Port Colborne and dinner meeting followed by F. L. LaQue of New York on **The Properties and Applications of Nickel and Non-ferrous Alloys.** Illustrated.

May 18.—Annual meeting at Leonard hotel, St. Catharines. Dr. R. W. Boyle, M.E.I.C., Director of Physics and Electrical Engineering Division of the National Research Council, Ottawa, on **Technology and Peace and War.**

Sept. 21.—Dinner meeting at Leonard hotel, St. Catharines. M. P. B. MacEwen, combustion engineer of the Ethyl Gasoline Corporation, on **Internal Combustion Motors and their Fuels.**

Oct. 28.—Joint meeting with the Engineering Society of Buffalo. Inspection trips through the Bethlehem Steel Company new strip mill and the new sewage disposal system under construction in Buffalo followed by a dinner meeting in Statler hotel and illustrated talk on **The Golden Gate Bridge.**

Nov. 9.—Dinner meeting at Foxhead Inn, Niagara Falls, Ontario. R. B. Morley, Manager of the Industrial Accident Prevention Associations, on **Accidents in Industry.**

Dec. 16.—Dinner and joint meeting with the Niagara District Chemical and Industrial Association in the Leonard hotel, St. Catharines. J. H. Cox, of the Westinghouse Electric and Manufacturing Co., East Pittsburgh, spoke on **Rectifiers and Ignitions.** Illustrated.

GEORGE E. GRIFFITHS, A.M.E.I.C., *Secretary-Treasurer.*

Ottawa Branch

The President and Council:—

On behalf of the Managing committee of the Ottawa Branch we beg to submit the following report for the calendar year 1937.

During the year the Managing committee held eight meetings for the transaction of general business. The Proceedings committee arranged ten meetings and there were in addition the annual meeting and an evening meeting in conjunction with the Aeronautical Section when the subject was "Aerodynamic Laboratories of England, Italy and France" with accompanying motion pictures. There was an attendance of approximately 400 at this evening meeting. These meetings were well attended and excellent addresses were enjoyed at the Branch meetings.

It is with deep regret that we report the deaths of eight members: T. L. Simmons, M.E.I.C., R. A. Davy, M.E.I.C., C. B. Daubney, A.M.E.I.C., Colonel J. Houliston, A.M.E.I.C., A. D. Stalker, A.M.E.I.C., C. A. Morrison, S.E.I.C., A. A. Imlach, Branch Affiliate, W. J. Lynch, Branch Affiliate.

As in previous years the Branch donated two sets of draughting instruments to the Ottawa Technical School for presentation as prizes for proficiency in draughting. A copy of "Standard Handbook for Electrical Engineers" was presented to the Hull Technical School to be awarded to one of its students.

SEMICENTENNIAL

The outstanding event of the year in Ottawa Branch was the celebration of The Institute's Semicentennial. The celebrations of this event were held June 15th, 16th, 17th in Montreal and the programme was continued in Ottawa on June 18th and 19th.

Delegates and visitors arriving in Ottawa at noon on the 18th were entertained at a luncheon, J. G. Macphail, the chairman of the Branch, presiding. The speaker was H. Gerrish Smith, Vice-President of the American Society of Marine Architects and Naval Engineers. His subject was "The Engineer in a Century of Marine Progress."

Following the luncheon visitors were given the option of taking four conducted tours by motor-bus:—

(1) Chelsea and Farmers Power Plants of the Gatineau Power Company.
(2) Gatineau Mills, Canadian International Paper Company.
(3) National Research Council Laboratories.
(4) Circle tour, including Central Experimental Farm, Parliament Buildings, Memorial Chamber and Peace Tower, and the Driveway.

In the evening there was held a very successful dinner dance. The chairman for the dinner and reception was our President, G. J.

Desbarats, and the speaker was the Hon. C. D. Howe, Minister of Transport, who spoke on "Recent Developments in Transportation." The dance which followed was thoroughly enjoyed both by out of town visitors and by our own members. On Saturday morning, June 19th, arrangements were made whereby visiting engineers were enabled to meet responsible officials in a number of the Departments of the Government who are carrying on work along lines in which they were interested.

PROCEEDINGS AND PUBLICITY

During the year ten luncheon meetings were held. The dates of the meetings and speakers are as follows:—

1937

Jan. 21.—W. L. Waters, C.E., **Recent Progress of Organized Labour in England.** Attendance 85.

Feb. 11.—Dr. W. H. Cook, **Some New Developments in Refrigeration and Cold Storage.** Attendance 72.

Feb. 25.—G. J. Desbarats, Hon.M.E.I.C., **Institute Affairs.** Attendance 84.

Mar. 11.—Dr. E. S. Hopkins, **Engineering in Agriculture.** Attendance 63.

Mar. 25.—V. L. Eardley-Wilmot, **A Day in the Life of a Miner.** Attendance 84.

Apr. 22.—R. H. Field, A.M.E.I.C., **The Use of Light Waves for Precision Gauge Standardization.** Attendance 57.

June 18.—Semicentennial luncheon and visits to Gatineau Power Co., Experimental Farm, International Paper Company Mills, and National Research Council. Attendance 300 (approx.).

Oct. 14.—M. S. Kuhring, **Some Recent Developments in Aircraft Fuels.** Attendance 55.

Oct. 28.—H. D. Parizeau, **Canadian Hydrographic Service on the Pacific Coast of Canada.** Attendance 107.

Nov. 18.—A. Ernest Thornton, **Bureau of Statistics Tabulating Machines.** Attendance 75.

MEMBERSHIP

With several adjustments during the year the membership roll now shows an increase of 16 during the year, the total now being 332 resident and 86 non-resident members.

The following table shows in detail the comparative figures for the years 1936 and 1937:—

	1936	*1937*
Honorary Members	2	3
Members	82	84
Associate Members	170	180
Affiliates of Institute	3	4
Juniors	17	18
Students	30	21
Branch Affiliates	28	22
Resident Members	332	332
District Members	70	86
	402	418

FINANCES

The attached financial statements show that the Branch closed the year with a balance of $676.73 in the bank, $4.60 cash on hand, and $1,000 in Government bonds. In addition the Branch had assets of $49.50 in rebates due from the main Institute on account of membership fees, and equipment and library with a nominal value of $21.00, an increase of $12.01 over that of 1936.

AERONAUTICAL SECTION

Nine evening meetings were held, when technical papers dealing with aeronautical or related subjects were read and discussions held. With the exception of the first meeting in April when there were over 400 in attendance, the average was 27.

OFFICERS FOR 1938

The annual meeting of the Branch will be held on the 13th of January when the officers and members of the Managing committee for 1938 will be elected.

Peterborough Branch

The President and Council:—

I am pleased to submit herewith on behalf of the Executive committee, the following report covering the activities of the Branch during the year 1937:—

MEETINGS

1937

Jan. 14.—Supper and social gathering with particular emphasis on Juniors and Students. Attendance 51.

Jan. 28.—H. Thomasson, Canadian Westinghouse Company, on **Electric Welding.** Attendance 40.

Feb. 16 } Feb. 17 } General Electric **House of Magic.** Special open meetings. Attendance approximately 2,200.

Mar. 11.—J. Patterson, Meteorological Service of Canada, on **Weather Forecasting.** Attendance 21.

Mar. 31.—Pros and Cons of Consolidation. Attendance 20.

Apr. 8.—Annual Student and Junior Night. E. L. Toy, **Features of the Sardine Industry**; W. Bergman, Peterborough, **Features of the Petroleum Industry**; C. E. Lewis, Peterborough, **Cylinder Wear in Gasoline Engines.** Attendance 33.

Apr. 22.—W. E. Ross, M.E.I.C., Canadian General Electric Co., Toronto, **Abitibi Canyon—H.E.P. Development.** Attendance 59.

May 13.—Annual meeting. Reports and election of officers. Attendance 34.

Sept. 25.—Annual outing to Kawartha Boys' Camp, Clear Lake. Attendance 26.

Oct. 28.—J. Grieve, M.E.I.C., Imperial Varnish and Color Company, Toronto, **Paints and Varnishes.** Attendance 46.

Nov. 23.—Annual dinner. R. O. Sweezey, M.E.I.C., consulting engineer, **The Drought Situation in Western Canada.** Attendance 75.

Dec. 16.—W. A. Scott, special representative, Canadian Airways, Toronto, **Canadian Aviation.** Attendance 40.

Executive committee meetings held during the year—seven.

Special sub-committees were as follows:

Meetings and Papers Committee	S. O. Shields, A.M.E.I.C.
	B. I. Burgess, A.M.E.I.C.
Branch News Editor	J. L. McKeever, Jr.E.I.C.

Students	15	2	17
Affiliates	1	..	1
Total	108	18	126

It is with deep regret that we report the death of Robert Wood, A.M.E.I.C., T. J. F. King, M.E.I.C., and S. S. Oliver, A.M.E.I.C., all of whom passed away during the course of the year.

Meetings

Four meetings of the Branch Executive committee were held during the year and seven Branch meetings, as follows:—

1937

Jan. 25.—Evening meeting at Chateau Frontenac. René Cyr, C.E., assistant engineer, Provincial Board of Health, on **Les raccordements dans les systèmes d'aqueduc sont-ils un danger?**

Feb. 62.—Luncheon meeting at Chateau Frontenac. J. B. Challies, M.E.I.C., Manager, Water Resources Department, Shawinigan Water and Power Co., spoke on **Canadian Participation in the World Power Conference.**

Mar. 8.—Evening meeting at Chateau Frontenac. Papers by 3 Juniors. Pierre Warren, S.E.I.C., on **Construction de maisons pour une ville moderne;** Maurice Archer, S.E.I.C., **The Construction of a Flume;** Henri Girard, C.E., **L'Exploitation de la tourbe dans la province de Québec.**

Apr. 14.—Luncheon meeting at Chateau Frontenac. Hon. F. J. Leduc, D.Sc., Minister of Roads, Province of Quebec, on **The Engineer's Share in the Road Building Programme of the Province.**

Apr. 27.—Afternoon reception by the council. Guest of Honour: Louis Beaudry, A.M.E.I.C., newly appointed manager of the Harbour of Quebec.

May 3.—Annual meeting and election of officers at Montcalm Hall.

Dec. 13.—Luncheon meeting at Chateau Frontenac. G. J. Desbarats, Hon.M.E.I.C., President of The Institute, gave an address on **Institute Affairs and particularly Consolidation.**

Committees

The Branch committees are the following:—

Nominating	L. P. Méthé, A.M.E.I.C.

Saguenay Branch

The President and Council:—

The Executive committee of the Saguenay Branch wish to submit the following report for the calendar year 1937.

Meetings

During the year meetings were held as follows:—

1937

June 10.—At Arvida. A paper on **Present-day Theories Regarding the Properties of our Industrial Metals** was presented by Dr. André Hone, member of the technical staff of the Aluminum Company of Canada.

July 30.—At Dolbeau. The annual general meeting and dinner. The members then inspected the Lake St. John Power and Paper Company's plant and the Trappist Monastery at Mistassini.

Oct. 15.—At Arvida. A paper on **The Cost of Power** was presented by Mr. McNeely DuBose, General Superintendent of the Saguenay Power Company.

	50	57	107

MEETINGS

Nine meetings of the Branch Executive were held during the year, and seven Branch meetings, as follows:—

1937

Jan. 8.—Evening meeting at Admiral Beatty hotel. The meeting assembled to discuss the proposals of The Institute Committee on Consolidation.

Jan. 27.—Annual joint dinner meeting with the Association of Professional Engineers of the Province of New Brunswick, held in the Admiral Beatty hotel. A. M. Narraway, Department of Mines and Resources, spoke on **The Application of the Aeroplane and Aerial Surveys to the Development of Canada's Resources, particularly Mining.**

Mar. 18.—Evening meeting in the Admiral Beatty hotel. J. R. Stephenson, Excise Tax Auditor, Department of National Revenue, spoke on **Experiences as a Bush Trader in Tropical Africa.** Mr. Stephenson spent four and one-half years in the Congo and Cameroons.

May 10.—Annual dinner and meeting of the Branch at the Riverside Golf and Country Club. Dr. E. C. Menzies, Superintendent of the Provincial Hospital for the Insane, gave an address on **The Mind.**

Oct. 22. Evening meeting in the Admiral Beatty hotel. Col. W. R. McCaffrey, Secretary of the Canadian Engineering Standards Association, and W. P. Dobson, M.E.I.C., Chief Testing Engineer for the Hydro-Electric Power Commission of Ontario, spoke respectively on **The Work of the Association and Laboratory Approval and Research Work.**

Nov. 18.—Evening meeting in the Admiral Beatty hotel. Professor H. W. McKiel, M.E.I.C., Vice-President of The Institute, and Dean of the Faculty of Engineering at Mount Allison University, spoke on **Mineral Resources and World Politics.** Professor McKiel also put forth a scheme for union between the Saint John Branch and the Association of Professional Engineers of New Brunswick, similar to that proposed in Nova Scotia.

Dec. 17.—Dinner meeting in the Admiral Beatty hotel in honour of President G. J. Desbarats, HON.M.E.I.C., who addressed the meeting on Institute affairs. Another guest at the dinner was Brigadier L. F. Page, Officer Commanding, Military District No. 7.

EMPLOYMENT

Employment for engineers of the Saint John Branch is almost 100 per cent, due to the programme of road construction being carried on by the Provincial Government.

FINANCIAL STATEMENT

The financial standing of the Branch is as follows:—

Receipts

Balance at December 31st, 1937	$292 69

SIDNEY HOGG, A.M.E.I.C., *Chairman.*
L. G. LILLEY, JR.E.I.C., *Secretary-Treasurer.*

St. Maurice Valley Branch

The President and Council:—

On behalf of the Executive committee, we submit the annual report of the St. Maurice Valley Branch for 1937.

Four general meetings were held during the year, two at Three Rivers, one at Shawinigan Falls, and one at Grand'mere, all of which were dinner meetings, the attendance averaging 43.

Papers presented were as follows:—

1937

Apr. 14.—**The Freeman Flash Roaster at St. Lawrence Paper Mill,** by Horace Freeman, in charge of Research Department, Consolidated Paper Corporation, Ltd. Attendance 32.

Apr. 22.—**Gasoline for To-day's Automobile,** by G. M. Connor, field representative, Ethyl Gas Corporation. Attendance 47.

May 20.—**The World Power Conference,** by J. B. Challies, M.E.I.C., assistant general manager, Shawinigan Water and Power Co. Attendance 45.

Nov. 5.—**Recent Developments in Concrete Construction,** by D. O. Robinson, A.M.E.I.C., and R. A. Crysler, A.M.E.I.C., Technical Department, Canada Cement Co. Ltd. Attendance 48.

In addition to the regular meetings, one social function was held in the form of a farewell dinner for Bruno Grandmont, A.M.E.I.C., Past Chairman of this Branch and Councillor of The Institute, who has transferred his headquarters to Rimouski, as District Engineer of the Department of Public Works.

MEMBERSHIP

The membership of the Branch as of December 31st, 1937, is as follows:—

Members	3
Associate members	20

Saskatchewan Branch

The President and Council:—

On behalf of the Executive we submit the following report of the activities of the Saskatchewan Branch for the year 1937.

MEMBERSHIP

The membership of the branch shows an increase of two over last year, being as follows:—

	Resident	*Non-Resident*	*Total*
Members	20	8	28
Associate Members	26	25	51
Juniors	9	6	15
Students	1	6	7
Branch Affiliates	2	1	3
	58	46	104

COMMITTEES

The Executive committee was elected on April 2nd, 1937, and a number of meetings were held—six (including trip to Fort Peck and a Kipling Camp meeting).

The standing committees are:—

Papers and Library .... P. G. McAra, A.M.E.I.C., Convenor.
Nominating .... D. A. R. McCannel, M.E.I.C., Convenor.
Membership .... J. J. White, M.E.I.C., Convenor.

MEETINGS

There were four regular meetings of the Branch, each being preceded by a dinner at which the average attendance and general interest was good. In addition a general meeting was held during the months of February and October under the auspices of the Association of Professional Engineers.

The trip to **Fort Peck Dam** proved to be of great educational and instructive value.

A new system has been inaugurated with regard to the monthly meetings which are now being held jointly by The Engineering Institute of Canada, the Association of Professional Engineers of Saskatchewan and the American Institute of Electrical Engineers. A common committee has been established being known as a Papers and Meetings committee. The Chairman of each Association will alternate monthly in charge of the meeting and all expenses will be pooled. The identity of each organization will be retained with elections and annual meetings being conducted as in the past.

The programme for the year was as follows:—

1937

Jan. 22.—Meeting of Kipling Camp.

Feb. 19.—Meeting under the auspices of the Association of Professional Engineers of Saskatchewan.

Apr. 2.—Address by Dr. J. W. Healey on **Heredity and Environment.**

Aug. 11.—Visit and address by the President of The Institute, G. J. Desbarats, C.M.G., Hon.M.E.I.C.

Sept. 6.—Members of the Branch visited **Fort Peck Dam,** Montana, U.S.A.

Oct. 23.—Meeting under the auspices of the Engineering Profession of Saskatchewan.

Nov. 19.—Address by Professor A. R. Greig, M.E.I.C., on **Coal and its Combustion.**

Dec. 17.—Address by Dr. J. R. Robertson on **Scheduled Air Line Flying and Bush Flying.**

FINANCES

The financial standing of the Branch is as follows:—

Receipts

Bank balance, December 31st, 1936	$ 90.32	
Rebate from Headquarters	193.65	
		$283.97

Expenditures

Postage	$ 4.75	
Meetings (notices, printing, etc.)	48.47	
Secretarial	75.00	
Miscellaneous	66.58	
Bank balance, December 31st, 1937	89.17	
		$283.97

All of which is respectfully submitted,
Stewart Young, M.E.I.C., *Chairman.*
J. J. White, M.E.I.C., *Secretary-Treasurer.*

Sault Ste. Marie Branch

The President and Council:—

On behalf of the Executive committee we submit the following report of the Sault Ste. Marie Branch for the calendar year 1937:—

The Executive committee met on January 27th and appointed standing committees. The committees and chairmen were as follows:—

Papers and Publicity .... W. A. Dawson, A.M.E.I.C.
Legislation and Remuneration .... F. Smallwood, M.E.I.C.
Entertainment .... John L. Lang, M.E.I.C.
Membership .... A. H. Russell, A.M.E.I.C.

The Executive committee met eleven times during the year to discuss and promote the business of the Branch and The Institute.

Eight dinner meetings were held during the year. No regular meeting date was adhered to rigidly as the executive found that it was necessary to fit the date of the meeting to suit the convenience of the speakers. The average attendance at the dinners was 16 members and guests.

Programmes of the meetings were as follows:—

1937

Jan. 4.—Annual general meeting for 1936. This meeting was followed by a social evening.

Feb. 19.—**The Kanuchan Power Development,** by W. M. Reynolds, A.M.E.I.C.

Mar. 19.—**Teaching Machine Shop Practice,** by H. R. Hipwell, of the Sault Technical and Commercial High School.

Apr. 26.—**The Maintenance of Worn Parts by the Oxy-acetylene Process,** by R. J. Anderson, of The Dominion Oxygen Company, Limited, Montreal, P.Q.

June 16.—This meeting was held at a time which coincided with the main banquet of The Engineering Institute of Canada Semicentennial Celebration. Through arrangements with Headquarters and the Sault Radio Station, C.J.I.C., the members were able to listen to the broadcast of the speech delivered at this banquet by His Excellency Lord Tweedsmuir, the Governor-General of Canada.

Following this speech, a discussion of the work of the Committee of Consolidation of The Engineering Institute of Canada was led by C. W. Holman, A.M.E.I.C., Chairman of the Sault Branch.

Aug. 6.—This was a special meeting which was held to enable our members to meet and hear the President of The Engineering Institute of Canada, C. J. Desbarats, Hon.M.E.I.C. Mr. Desbarats discussed the affairs and problems of The Institute with the members.

Oct. 29.—**Health Service in Industry,** by Dr. H. W. Johnston, M.D., physician at the Algoma Steel Corporation, Sault Ste. Marie, Ont.

Nov. 30.—**Centrifugal Pump Practice,** by G. H. Heyn, engineer, Northern Foundry and Machine Co. Limited, Sault Ste. Marie, Ont.

The membership record of the Branch at the close of 1937 is as follows:—

	Resident		*Non-Resident*		*Total*	
	1936	*1937*	*1936*	*1937*	*1936*	*1937*
Members	9	9	8	8	17	17

Toronto Branch

The President and Council:—

We beg to submit the following report of the activities of the Toronto Branch during the year 1937.

The annual meeting of the Branch was held at the Canadian Military Institute on Thursday, April 1st, 1937, and the officers for 1937-38 were elected. The meeting was preceded by a dinner, at which R. L. Dobbin, m.e.i.c., Vice-President of The Institute, E. P. Muntz, m.e.i.c., Councillor of the Hamilton Branch, Colonel E. G. MacKay, a.m.e.i.c., Chairman of the Hamilton Branch, W. T. Fanjoy, a.m.e.i.c., Secretary of the Peterborough Branch, Past-Presidents Brig.-General C. H. Mitchell, m.e.i.c., and Dr. F. A. Gaby, m.e.i.c., were present.

Following the dinner, the meeting was called to order by the chairman of the Branch, O. Holden, a.m.e.i.c., and the undermentioned were named chairmen of the standing committees:—

Papers	A. U. Sanderson, a.m.e.i.c.
Finance	C. E. Sisson, m.e.i.c.
Press Relations	D. D. Whitson, a.m.e.i.c.
Meetings	W. P. Dobson, m.e.i.c.
Membership	W. E. P. Duncan, a.m.e.i.c.
Student Relations	W. S. Wilson, m.e.i.c.
Branch Editor	A. E. Berry, m.e.i.c.
Social	Nicol MacNicol, m.e.i.c.

During the year the Executive committee has held twelve meetings for the transaction of Branch business, with an average attendance of about nine at each meeting.

The following regular meetings were held during 1937:—

1937

Jan. 10.—**Land and Water Transportation**, by D. Forgan, a.m.e.i.c.; **Air Transportation**, by W. A. Scott. Attendance 60.

Jan. 21.—**Power Development in Northern Ontario**, by Dr. T. H. Hogg, m.e.i.c. Attendance 75.

Feb. 4.—**Arc Welding—Its Testing and Inspection**, by W. D. Walcott, a.m.e.i.c. Attendance 50.

Feb. 18.—**Generating Equipment of the Abitibi Canyon Development**, by W. E. Ross, a.m.e.i.c. Attendance 40.

Mar. 4.—**Some Vital Economic Developments in Relation to Engineering**, by McKenzie Williams, b.a.sc. Attendance 40.

Apr. 1.—Annual Branch meeting. Attendance 50.

Oct. 21.—**Recent Advances in Civil Engineering at the University**, by Professor C. R. Young, m.e.i.c. Attendance 70.

Nov. 4.—**The Metallurgy of Metallic Arc Welding and its Applications**, by C. R. Whittemore, a.m.e.i.c. Attendance 180.

Nov. 18.—**The Engineer's Training for and Opportunity in Industry**, by Professor R. W. Angus, Hon.m.e.i.c.

G. J. Desbarats, Hon.m.e.i.c., President of The Institute, also spoke on **Institute Affairs.** Attendance 45.

Dec. 2.—**The Present Status of Air Conditioning**, by M. Barry Watson, a.m.e.i.c.

E. V. Buchanan, m.e.i.c., of the London Branch, also spoke and outlined the programme of the General Annual Meeting to be held in London on January 31st, February 1st and 2nd, 1938. Attendance 65.

Previous to each regular meeting, dinners were held and while the numbers attending have been most encouraging, it is regretted that more members do not avail themselves of these pleasant gatherings.

The Branch contemplate holding a social evening early in the new year at the Engineers Club, to which members will bring their wives.

The Toronto Branch Loan Fund, established five years ago, for the assistance of members, is in a satisfactory condition and during the past three years no application for help has been received. At present there is a balance of $299.48 in the Fund.

The membership of the Branch as at December 31, 1937, is as follows:—

	Resident	*Non-Resident*	*Total*
Members	127	5	132
Associate Members	206	8	214
Juniors	42	1	43
Students	57	9	66
Affiliates	4	1	5
	436	24	460

It is with very deep regret that we record the death of the following members of the Branch during the year: H. W. D. Armstrong, m.e.i.c., W. G. Chace, m.e.i.c., S. E. M. Henderson, m.e.i.c., H. G. Rogers, a.m.e.i.c., A. L. Mudge, m.e.i.c. Our sympathy is extended to their families in their loss.

A. U. Sanderson, a.m.e.i.c., *Chairman.*

J. J. Spence, a.m.e.i.c., *Secretary-Treasurer.*

Vancouver Branch

The President and Council:—

On behalf of the Executive committee of the Vancouver Branch, we beg to submit the following report of the activities of the Branch for the year 1937.

Meetings

Eleven meetings of the Branch and one inspection trip were held during the year and are herewith enumerated.

1937

Jan. 26.—Joint meeting with the A.I.E.E. (Vancouver section). J. F. Lincoln, President of the Lincoln Electric Co., Cleveland, on **Modern Developments in Electric Arc Welding.**

Feb. 11.—Dinner meeting. Inspector Harold Mortimer, of the Traffic Department of the Vancouver City Police, on **Vancouver's Traffic Problems.**

Feb. 25.—Evening meeting. R. Weir, Local Manager of the Pressure Pipe Co. of Canada, on **Capilano Water Lines Replacement.**

Mar. 9.—Evening meeting. A. G. Zima, development and research metallurgist of the International Nickel Co., on **The Role of Nickel in the Development of Modern Cast Iron.**

Mar. 22.—Dinner meeting. F. Vernon Jones, B.C. Board of Fire Underwriters, on **How Construction Affects Insurance Rates.**

Apr. 5.—Evening meeting. C. E. Webb, M.E.I.C., District Chief Engineer, Dominion Water Power Bureau, on **The Grande Coulee Dam.**

May 4.—Dinner meeting. W. J. Johnston, Surveyor, B.C. Board of Fire Underwriters, on **Automatic Sprinkler Equipment.**

Aug. 25.—Luncheon meeting in honour of the President, G. J. Desbarats, C.M.G., Hon.M.E.I.C.

Oct. 19.—Dinner meeting. J. W. Roland, M.E.I.C., resident engineer for Montserrat and Pratley, on **The Foundations of the First Narrows Bridge.**

Nov. 16.—Annual dinner and meeting. J. N. Finlayson, M.E.I.C., Dean of the Faculty of Applied Science and head of the Department of Civil Engineering, University of British Columbia, on **Engineering Education.**

Dec. 6.—Joint meeting with the A.I.E.E. (Vancouver section). Major J. C. MacDonald, M.E.I.C., Comptroller of Water Rights, Province of British Columbia, on **The Significance of the Tennessee Valley Authority.**

Oct. 30.—Inspection trip. An inspection trip to the foundation work of the First Narrows Bridge project was arranged by courtesy of the contractors of the foundation work, Messrs. Stuart and Cameron Co. Sixty-five members and friends sat down to luncheon in the mess room located near the bridge site and after luncheon inspection of the foundation work of the bridge in its various stages was made.

Executive

The Executive committee held thirteen meetings during the year. The Executive were pleased to have as ex-officio members Dr. E. A. Cleveland, M.E.I.C., and P. H. Buchan, M.E.I.C., immediate Past-President and Councillor respectively. As in previous years, the Registrar of the Association of Professional Engineers of British Columbia, E. A. Wheatley, M.E.I.C., was also elected an honorary member of the Executive. The presence of these three gentlemen at the deliberations of the Executive on numerous occasions was very much appreciated.

Membership

The resident membership of the Branch District shows a net increase of five during the year 1937 and the non-resident membership an increase of fourteen. The membership of the Branch now stands as follows:

	Resident		Non-Resident	
	December, 1937	December, 1936	December, 1937	December, 1936
Members	69	64	22	16
Associates	49	44	35	31
Juniors	1	2	7	6
Students	8	12	12	9
Affiliates	1	1	..	..
	128	123	76	62
Non-Resident	76	62		
Total	204	185		

Obituary

We regretfully record the passing of two members of the Vancouver Branch during the year 1937:—

Samuel Fraser Workman, M.C., A.M.E.I.C., on March 19th, and John Grant MacGregor, M.E.I.C. (Life member), on October 10th.

Walter Moberly Book Award

The Walter Moberly Book prize award (value $30) for the year 1937 was divided equally between Kenneth DePencier Watson and Phillip C. B. Emery, engineering students in the graduating year of the University of British Columbia.

Visit of the President

The Branch was very pleased to be honoured with a visit from the President, G. J. Desbarats, C.M.G., Hon.M.E.I.C., and Mrs. Desbarats on their western tour during August. The Branch's official function took the form of a luncheon on August 25th at which about fifty members welcomed the President who spoke to the gathering on "Institute Affairs."

Semicentennial Celebration and Round Table Conference on Institute Affairs

The Vancouver Branch was well represented at the Semi-centennial Celebration held in Montreal in June. As official delegate to the Round Table Conference the Branch was represented by its Chairman, H. N. MacPherson, M.E.I.C. The Branch was also represented by Past Presidents Walkem and Cleveland, Councillors P. H. Buchan, J. N. Finlayson, and Col. H. F. Letson. Reports made by some of these representatives later to the Executive and the Branch membership indicate the Semicentennial Celebration to have been a milestone in Institute progress. The deliberations and subsequent report of the Round Table Conference on Institute Affairs indicates the gathering to have been very worth while and one from which have already emanated many ideas for the improvement of branch activities and branch to branch relations.

Financial Statements

Audited financial statements covering the Branch activities for the period November 20th, 1936, to October 31st, 1937, are appended hereto.

General Account

Cash in bank and on hand—November 20th, 1936:			
Canadian Bank of Commerce	$122.07		
Secretary's fund	2.88		
		$124.95	
Surplus for period November 20th, 1936, to October 31st, 1937, in accordance with Statement of Revenue and Expenditures		74.50	
			$199.45
Cash in bank and on hand—October 31st, 1937:			
Canadian Bank of Commerce		$195.29	
Secretary's fund		4.16	
			$199.45

Revenue

Rebates from Headquarters, Montreal, May, 1936, to April, 1937			$309.23

Expenditures

Expenses incurred in connection with meetings and trips:			
Printing and mailing notices and addressograph plates	$ 64.66		
Rental of Auditorium for meetings	26.25		
Hire of projecting lantern	6.00		
Miscellaneous expenses incurred in respect of meetings	15.80		
		$112.71	
General Expenses:			
Stenographic services	20.00		
Secretary's honorarium (1936)	50.00		
Telegrams	4.97		
Stamps	7.95		
Miscellaneous	6.35		
		89.27	
Expenses re Semicentennial Celebration:			
Vancouver Branch share of cost of Round Table Conference held in Montreal during June		32.75	
			234.73
Surplus for period November 20th, 1936, to October 31st, 1937			$ 74.50

Walter Moberly Memorial Fund

Bank balance, November 20th, 1936			$111.70

Revenue

Interest received on:—			
$500 City of Vancouver 5% Bond, due 1964		$ 25.00	
$100 Dominion of Canada 5% Bond, due 1943		5.00	
Bank interest on balances		1.76	
			31.76
			$143.46

Expenditures

Charge by bank safekeeping of securities		$ 1.00	
Walter Moberly Book Prize award for year 1937		30.00	
			31.00
Balance in Canadian Bank of Commerce, October 31st, 1937			$112.46

Audited and found correct and the above securities verified by letter from Canadian Bank of Commerce:

H. P. Archibald, A.M.E.I.C., Auditor.

Respectfully submitted,

H. N. Macpherson, M.E.I.C., *Chairman.*

T. V. Berry, A.M.E.I.C., *Secretary-Treasurer.*

Victoria Branch

The President and Council:—

On behalf of the Executive committee we have the honour to submit the following report on the activities of the Victoria Branch for the year 1937.

Meetings

Three general meetings of the Branch were held during the year, one of which was a dinner meeting and one a luncheon meeting with an average attendance of 23. On August 20th the Branch tendered a reception for President Desbarats and Mrs. Desbarats at the home of Mr. and Mrs. F. C. Green when 25 members, their wives and friends attended. An enjoyable social evening resulted during which President Desbarats spoke for an hour reviewing Institute activities.

Seven meetings of the Executive committee were held with an average attendance of 70%, which is considered to be good.

MEMBERSHIP

The total membership of the Branch stands at sixty-four, which is the same figure as for the preceding year. One new Member was received and one Member resigned. One Associate Member was transferred to Halifax and one Associate Member transferred to Victoria from Port Arthur. Two Students were transferred to Victoria from other parts of Canada. The Branch had the misfortune to lose by death during the year two valuable and respected members: L. W. Toms, A.M.E.I.C., Life Member of The Institute, and F. W. Knewstubb, A.M.E.I.C. Two resignations are at present pending.

The Branch membership is made up as follows:—

	Resident	Non-Resident	Total
Members	23	1	24
Associate Members	21	5	26
Juniors	3	3	6
Students	7	..	7
Affiliates	1	..	1
Total	55	9	64

FINANCIAL STATEMENT

Receipts

Balance in hand, December 10th, 1936		$ 51.61
Rebates from Headquarters	$108.75	
Branch Affiliate's dues	3.00	
Total receipts		111.75
		$163.36

Disbursements

Lantern slides	$ 5.25	
Mimeographing and letter service	20.28	
Stamps and stationery	8.65	
Stenographic service	4.72	
Telegrams	2.70	
Entertainment of guests	12.90	
Flowers	2.50	
Branch's share of representation at the Semicentennial Round Table Conference	9.70	
1936 honorarium to Secretary	25.00	
Total disbursements		$ 91.70
Balance in hand, December 16th, 1937		71.66
		$163.36

Audited and found correct,
F. W. KNEWSTUBB, A.M.E.I.C., Auditor.

ANNUAL MEETING

The annual meeting of the Branch was held on December 16th. and was preceded by a dinner and followed by a general technical meeting. The total attendance was 31. The election of officers for 1938 followed.

Following the business the Branch enjoyed a technical meeting when A. L. Carruthers, M.E.I.C., bridge engineer for the Provincial Government, gave a talk on the construction of the new Pattulo bridge at New Westminster, which was well illustrated by several reels of motion pictures. Also there were on exhibit nineteen illuminated addresses presented to The Institute on the occasion of its Semicentennial Anniversary last June by the engineering societies of Great Britain, Europe, and the United States.

In conclusion this Executive committee wishes to sincerely thank the General Secretary and the Assistant Secretary at Headquarters for their generous assistance and unfailing courtesy throughout the year.

Respectfully submitted,
J. C. MACDONALD, M.E.I.C., *Chairman.*
KENNETH REID, Jr.E.I.C., *Secretary-Treasurer.*

Winnipeg Branch

The President and Council:

The following report of the Winnipeg Branch for the year ending December 31st, 1937, is respectfully submitted.

MEMBERSHIP

The membership of the Branch stands as follows:—

	Resident	Non-Resident	Total	Change from 1936
Members	36	3	39	..
Associate Members	76	12	88	..
Juniors	22	6	28	+11
Students	38	7	45	+ 2
Affiliates	2	..	2	..
Branch Affiliates	3	..	3	+ 1
	177	28	205	+14

MEETINGS

There were nineteen general meetings of the Branch throughout the year, the attendance at the regular evening meetings averaging 75.

1937

Jan. 7.—James Gilchrist, **Shelling of Tires.** Attendance 52.
Feb. 4.—Annual meeting. Dean E. P. Fetherstonhaugh, M.E.I.C., **The Cathode Ray Oscillograph.** Attendance 53.
Feb. 11.—Luncheon. J. L. Busfield, M.E.I.C. Attendance 22.
Feb. 18.—Dr. Alexander Gibson, **Color Photography.** Attendance 175.
Mar. 4.—Student's Prize papers. S. V. Antenbring, **Locating the Control for a Detailed Geological Survey;** J. J. Miller, **Air Conditioning in Railway Cars.** Attendance 75.
Mar. 25.—Dr. F. D. White, **The British Programme of Protection Against Aerial Gas Attack.** Attendance 150.
Apr. 1.—Flt.-Lt. D. Edwards, **The Technique of Modern Flying.** Attendance 60.
Apr. 15.—C. S. Landon, **History of the Association of Professional Engineers of Manitoba.** Attendance 36.
May 20.—President G. J. Desbarats, **Consolidation.** Attendance 35.
June 8.—Luncheon. Mr. Johnstone Wright, **The Central Electricity Board.** Attendance 41.
July 12.—Luncheon. Brigadier-General Magnus Mowat. Attendance 9.
Aug. 30.—Dinner. President G. J. Desbarats. Attendance 40.
Aug. 31.—President G. J. Desbarats, **Institute Affairs.** Attendance 22.
Oct. 15.—Visit to plant of the Greater Winnipeg Sanitary District. Attendance 125.
Oct. 21.—Dr. W. J. Hodge, **Acoustics.** Attendance 140.
Nov. 4.—G. E. Cole, A.M.E.I.C., **The Cyanide Process.** Attendance 93.
Nov. 17.—T. Sellar Cook, **The Edinburgh War Memorial.** Attendance 29.
Nov. 26.—Luncheon, Alan Ferrier, A.M.E.I.C. Attendance 40.
Dec. 2.—Film night. **Nickel Tales, Rhapsody in Steel.** Attendance 54.

Throughout the year the Executive committee held twelve meetings.

THE ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE OF CANADA

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

VOLUME XXI FEBRUARY, 1938 No. 2

Additional Authority Essential

The open discussions at the recent Annual General Meeting on January 31st, and the deliberations of an unusually well attended meeting of Council the same evening, indicated not only unanimity, but enthusiasm for positive and prompt action on the part of Council whenever and wherever an opportunity is offered for collaboration with a Provincial Association. At the same time, it was realized that as a definite programme for this desired co-operation could not be launched by Council under the existing by-laws of The Institute, additional authority in the form of a new by-law must be obtained for this purpose.

A new enabling By-Law, No. 76, is being submitted at once to the corporate membership. The importance of this new By-Law cannot be emphasized too strongly, as without the authority it conveys Council will continue to be impotent to meet the general demand of the corporate membership throughout the Dominion for a close constructive co-operation between The Institute and the Provincial Professional Associations. For instance, the strongly expressed desire of the engineers in Nova Scotia for an agreement between The Institute and the Professional Association that will unify the Profession in that province cannot be definitely satisfied without just such additional authority as the new By-Law will confer upon Council. Furthermore, active negotiations between the Council and the governing bodies of associations in other provinces that promise much for the Profession cannot be proceeded with effectively until this new enabling By-Law has been approved. In brief, as was stated at London by both the outgoing and the incoming presidents, this new enabling By-Law will open an era of greater usefulness for The Institute, and therefore deserves to be endorsed by the heaviest plurality vote of any By-Law change in the history of The Institute." To ensure this desirable result, all corporate members are urged to vote in favour of this new section and to do so promptly on receipt of the ballot.

The E.I.C. Engineering Catalogue

Acting on the recommendation of the Committee on Publications, Council has concluded arrangements for the transfer of the rights to the E.I.C. Engineering Catalogue to N. E. D. Sheppard, A.M.E.I.C., who will continue the publication under the name "The Engineering Catalogue." In taking this step Council has been guided by the desire to have the Catalogue continued under such auspices as will ensure the same high standard as has characterized this publication in the past.

Concurrently, an agreement has also been entered into whereby Mr. Sheppard will act as sole agent for the sale of advertising space in The Journal, and will supervise the production of the advertising section. Mr. Sheppard will have associated with him the same organization as has been responsible in the past for The Institute Catalogue and Journal advertising.

Entrance Fees Revised

The Annual General Meeting has approved a recent decision of Council that for the current year the entrance fees will be as follows:—

For admission as Student.................no entrance fee
For admission as Junior..................Five dollars
For admission as {Affiliate / Associate Member / or Member}......Ten dollars

The By-laws provide that the transfer fee shall be the difference between the entrance fees of the two classes of membership.

R. J. DURLEY,
General Secretary.

February, 1938.

From Square Timber to Pulpwood

During the economic development of Canada, the country's prosperity has largely depended on the export of a series of commodities, each characteristic of some phase of industrial growth. For example, the products of our forests have formed the background of Canadian industrial activity for a long period. Their export began before Confederation, and even now they constitute a large proportion of our exports, approaching our agricultural produce in value. Indeed, as Professor Lower has remarked, "it would be difficult to overestimate the influence of the forest upon the settlement and development of the North American Continent . . . Utilization of the forest for human need—in other words the lumber industry—naturally began with the building of the first log cabin." Thus the history of that industry begins with the very early settlers, who with the lumber jacks, succeeded the voyageurs and trappers.

The lumber industry started in the eighteenth century in the lower St. Lawrence valley and in the Maritime Provinces. As settlement extended, forest operations spread, first to the Ottawa valley and later further to the north and west. Lake Timiskaming was reached about 1835. As the timber cutters sought new areas the settlers followed close behind them. In many cases the settlers themselves combined lumbering with farming.

It is not generally realized that the first active development of the Canadian timber trade was due to Napoleon Bonaparte. The "Continental System," by which he attempted to destroy England's trade with all European countries, was so far successful that it practically stopped all importation of timber from the Baltic, the source from which Britain had been obtaining her naval supplies. But oak, pine and spruce had to be obtained for the hulls, masts and yards of the warships which formed Britain's great weapon against the Napoleonic Empire. In this emergency, the forests of Canada were made available. High duties were placed on the import of foreign woods to Great Britain. British timber firms began to operate in Canada, and by 1812 the trade was so extensive that five hundred timber ships loaded at Quebec for the voyage to England. Mast pine as much as 120 feet long and four feet in diameter at the butt, and sticks of square timber up to 70 feet long and 24 inches square, hewn with the broad axe, were to be found in their cargoes, together with a proportion of "deals" and other sawn lumber.

The rafting of square timber (largely white or "Quebec" pine) to Quebec for export, began with the nineteenth century. The first raft floated down the Ottawa and St. Lawrence in 1807, making its journey in thirty-seven days. The square timber industry reached its peak about fifty years later, gradually diminishing from that time until the last rafts passed down the St. Lawrence in the nineties, and the river lost one of its most picturesque forms of traffic.

As the settlements spread, big timber became more difficult of access. The farmer-lumberman became the farmer, the returns from the square timber industry dwindled, and activity in sawn lumber increased. As the export of sawn lumber developed, Quebec gave place to Montreal as the centre of its export activities. The square timber trade had however done much to provide the capital needed for the development of the young country and for the construction of its roads, railways, canals and public works.

During the first seventy-five years of the nineteenth century shipbuilding took an important place as an industry in Nova Scotia, New Brunswick and Quebec. Its most active period began about 1820; the industry was at its height in the sixties. In 1865, 294 vessels, aggregating over 56,000 tons, worth nearly $2,500,000, were built in Nova Scotia. In the same year in New Brunswick, 148 new vessels were launched, with a tonnage of more than 65,000. By that time Canadian-built wooden vessels were to be found in all parts of the world. At first they had been largely built for the builder-owners' use, and were often employed in the fish and lumber trade between the Maritimes and the West Indies. Later their moderate cost secured for them, in Great Britain, a ready sale for use in the timber trade, on other trade routes, and for the run to Australia. During the seventies the iron steamer began to supplant the sailing ship, and the industry did not outlast the century.

The sawn lumber trade received a great impetus during the early part of the period of railway development in Canada which began in the fifties, the railways themselves using large quantities for ties and bridge timbers. The completion of the Canadian Pacific Railway opened the way for the utilization of the vast timber resources of the Pacific coast, much of the cut of British Columbia lumber being required for the needs of the rapidly increasing population of the Prairie Provinces. During the past twenty years the immense stands of Douglas fir in the west have increasingly supplied the large sizes of saw-timber which the depleted forests of the east can no longer furnish. After the War, taking advantage of the Panama Canal, the Atlantic coast became an important market for British Columbia lumber.

Thus the eventful story of the Canadian lumbering industry pictures several periods, during each of which our forest resources have been utilized along some characteristic line. These periods naturally overlap, and it may be noted that the latest phase, the development of the pulp and paper industry, had its beginnings as long ago as 1866, when both ground wood and chemical pulp were first manufactured on a small scale in the Province of Quebec. The early growth of the industry was very slow and it was not until about 1900 that it became firmly established. From that time an era of active hydro-electric power development (from an installed capacity of 173,000 hp. in 1900 to 8,100,000 hp. in 1938) provided the large supply of power needed for its growth, while the forests of the east, though much of the large timber had been cut, continued to furnish ample supplies of the smaller sizes of spruce and balsam, the species most suitable for pulp making.

Compared with other forest products industries, it seems that pulp and paper manufacture has elements of permanence which were lacking in some of its predecessors. It is less seasonal, and wood pulp can be transformed into a variety of materials which are now indispensable for other branches of industry and trade. For example, ground wood pulp is the basis of newsprint and the other cheaper grades of paper and is used in large quantities for box boards and wall boards. Sulphite pulp is also used in newsprint, and for the finer grades of white paper and boards. It plays an important part in industry by furnishing the raw material for rayon, cellophane, certain of the plastic resins, duco and for many explosives. Soda pulp is used for book, magazine and writing paper; sulphate or kraft pulp, with its long fibre, is the basis of strong wrapping paper.

With such products, whose annual value is over 160 million dollars, the pulp and paper industry is of primary industrial importance to Canada. Pulpwood, pulp and newsprint form one of our principal items of export, amounting annually to some 600,000 tons of pulp, 2,000,000 tons of pulpwood and 2,500,000 tons of newsprint.

This great industry has had its ups and downs, upon which it is not necessary to enlarge here. It will be sufficient to note in passing, that Canadian pulp and newsprint has to be sold outside of Canada and in a highly competitive market. Quite apart from its value as one of the leading contributors to the commercial prosperity of Canada, however, the industry has had a profound influence upon the general development of the country and its manufacturing facilities. It has given rise to notable advances in the theory and technique of many chemical engineering processes, and provides the raw material for a host of subsidiary industries which could not exist without cellulose. Its technology has been built up by extensive research, in which the government has co-operated with the industrialists. The technical men in the industry may be regarded as practising a special division of engineering, drawing upon civil, mechanical, electrical, metallurgical, and chemical engineering for their technical contributions to a common end.

OBITUARIES

Arthur Frederick Dyer, A.M.E.I.C.

The death of Arthur Frederick Dyer, A.M.E.I.C., occurred in Halifax on December 19th, 1937, after an illness of several months. Mr. Dyer was born at Giridih, Behar, India, on December 7th, 1875. He received his early education and technical experience in England. In 1909 he came to Canada, joining the Dominion Bridge Company as a draftsman, later becoming manager in Montreal for the Clinton Fireproofing Company. Mr. Dyer acted as resident engineer for Sir John Kennedy on the construction of the new Pier No. 2, Halifax, N.S. He was later in charge of new construction for Messrs. Furness, Withy and Company, Halifax, and for a time was in general consulting work in Halifax. At the time of his death he was chief engineer of the McDonald Construction Company. He joined The Institute as an Associate Member in 1918.

Frederick William Knewstubb, A.M.E.I.C.

It is with deep regret that we record the passing of Frederick William Knewstubb, A.M.E.I.C., in Victoria, B.C., on December 16th, 1937. Mr. Knewstubb was born at Carlisle, England, on December 12th, 1874, receiving his technical education at Glasgow Technical College. He received his early engineering experience in England, coming to Canada in 1908, his first position in this country being that of inspector for the city of Port Arthur. He was later employed by the Grand Trunk Pacific and Canadian Northern Pacific Railways and in 1911 was appointed engineer and later chief field engineer, Water Rights Branch, Province of British Columbia. Mr. Knewstubb served overseas in the Great War. He joined the Canadian Society of Civil Engineers as an Associate Member in 1915.

Lt.-Col. Cecil George Porter, D.S.O., A.M.E.I.C.

Members of The Institute will learn with regret of the death of Lt.-Col. Cecil George Porter, D.S.O., A.M.E.I.C., on January 12th, at his home in Montreal. Col. Porter was born at Saint John, New Brunswick, on October 9th, 1887, and attended McGill University where he received the degree of B.Sc. in 1911 and M.Sc. in 1913, and a research fellowship in metallurgy. Mr. Porter's early experienced was obtained with the Nova Scotia Steel and Coal Company and other steel companies in the United States and Canada. He went overseas in 1914 with the Canadian Expeditionary Force, later commanding a battalion of infantry. He was wounded several times and was discharged with the rank of Lieutenant-Colonel at the end of the War. He was awarded the D.S.O. and mentioned four times in despatches. On his return to Canada in 1919 Colonel Porter was appointed manager of Douglas, Milligan Company Ltd. He later established the firm of C. G. Porter and Company, building contractors, of which he was head at the time of his death. Colonel Porter joined The Institute as a Student in 1907 becoming an Associate Member in 1921.

Victor Topping, A.M.E.I.C.

We regret to announce the death of Victor Topping, A.M.E.I.C., who died December 27th, 1937, at his home in Toronto. Mr. Topping was born in Hartlepool, England, on February 21st, 1896, and came to this country in 1912. He received his technical education at the University of Toronto from which he grdauated in 1917 with honours and the degree of B.A.Sc. He went overseas with the Royal Flying Corps in 1917 and in the following year was severely injured when his machine took fire and crashed. This resulted in his being confined to the hospital for some four years. In 1922 he was appointed engineer of traffic analysis with the Toronto Transportation Commission. Mr. Topping secured the degree of M.A. from Toronto in 1923 and in 1924 was awarded the degree of C.E. He was awarded the first Strathcona Memorial Fellowship for research work in transportation at Yale University. Mr. Topping later took up consulting work in Toronto and also studied law, graduating as a barrister in 1934 at Osgoode Hall.

Edward Augustus Wheatley, M.E.I.C.

As we go to press, word has been received of the death in Vancouver on February 2nd of Edward Augustus Wheatley, M.E.I.C., Registrar of the Association of Professional Engineers of the Province of British Columbia. An obituary notice will appear in our next issue. A consistent advocate of professional registration, he was able also to render valuable services to The Institute in British Columbia.

PERSONALS

F. O. Condon, M.E.I.C., has been appointed chief engineer of the Atlantic Region, Canadian National Railways. Mr. Condon was born in Moncton in 1878 and was educated in the public and high schools of that city. In 1893 he entered the service of the Intercolonial Railway as a messenger in the engineering department. He became a draftsman in 1899, and in 1912 was appointed division engineer. In 1923 he was made engineer, maintenance of way, Canadian National Railways; principal assistant engineer in 1927, and office engineer in 1932. As a member of The Engineering Institute of Canada, Mr. Condon has rendered faithful and devoted service. He has filled the office of vice-president of The Institute representing the Maritime Provinces in 1928 and 1929 and has also acted in the capacity of councillor for and chairman of the Moncton Branch.

F. O. Condon, M.E.I.C.

Dr. Augustin Frigon, M.E.I.C., has recently left for Europe where he will represent the Canadian Broadcasting Corporation in particular, and Canada in general, at the World Radio Conference, in Cairo, Egypt, commencing on February 1st, 1938. He was one of the official delegates from Canada attending the American Regional Conference in Havana in preparation for the World Radio Conference. Dr. Frigon, who is assistant general manager of the Canadian Broadcasting Corporation, is a past chairman of the Montreal Branch of The Institute.

George P. Hawley, M.E.I.C., has retired as resident engineer of the Rivière-des-Prairies power house of the Montreal Light, Heat and Power Consolidated. He joined this company in 1912 as resident engineer at the Cedars power house and in 1927 was appointed to the position from which he has just retired.

Philip Reynolds, M.E.I.C., has retired from the position of chief engineer of the Shell Company of Canada Limited of Toronto, Ont., and is now residing in Wiltshire, England. Mr. Reynolds was chief engineer of the Shell Oil Company in Canada from 1923 until 1937. He received his early technical experience with the Great Western Railway in England, the Canadian Pacific Railway in Vancouver and in the mechanical department of the same company in Montreal.

Gilles E. Sarault, S.E.I.C., is now chief engineer of the Canadian Broadcasting Corporation Station, C.B.F., Montreal. Mr. Sarault graduated from McGill University in 1924 and was for a time engineer in the special products department of the Northern Electric Company, Montreal.

John Stadler, M.E.I.C., has been appointed president of the Lake Sulphite Pulp Company. Mr. Sadler is a well known consulting engineer in Montreal who specializes in pulp and paper mill work. He was at one time general manager of the Lake St. John Power and Paper Company, Limited.

Thomas Henry White, who joined the Canadian Society of Civil Engineers as a Member at the original organization meeting held on January 20th, 1887, had his ninetieth birthday on January 27th, 1938.

He celebrated it in his retirement in Vancouver, receiving a host of messages of congratulation from his many old friends, who recall his long and distinguished career as an engineer, and his achievements as one of Canada's pioneer railway builders.

It gave the Council of The Institute great pleasure to send to Mr. White—who must be one of the oldest, if not the oldest, of our members—a sincere expression of their best wishes for his continued health and happiness.

N. E. D. Sheppard, A.M.E.I.C., manager of The Institute Publications Department, is severing his immediate connection with The Institute in order to continue the publication of The Engineering Catalogue.

Mr. Sheppard graduated from the University of Toronto in 1914 with the degree of B.A.Sc., and received an appointment to the staff of the Dominion Water Power Branch of the Federal Government, in Ottawa, as assistant to the chief hydraulic engineer on water power investigation. In 1916 he was transferred to Nova Scotia, and later returned to Ottawa where he was engaged on the preparation of the first edition of the Directory of the Central Electric Stations in Canada and on a detailed analysis of this industry in Canada. In 1920 Mr. Sheppard accepted the position of secretary to the vice-president and technical director of the Riordon Company Limited at Hawkesbury, following which he was appointed in 1922 assistant to the secretary on the Headquarters staff of The Institute. In that position, and as assistant secretary, he was responsible for the efficient handling of the affairs of The Institute. In 1930 Mr. Sheppard left to accept a position in Toronto and in 1932 returned as manager of The Institute Publications Department.

N. E. D. Sheppard, A.M.E.I.C.

In addition to producing The Engineering Catalogue, Mr. Sheppard will be in charge of the production of the advertising section of The Engineering Journal.

ELECTIONS AND TRANSFERS

At the meeting of Council held on January 21st, 1938, the following elections and transfers were effected:

Members

LeCOINTE, Pierre Leon Paul, C.E. (Ecole Nationale des Ponts et Chaussées, Paris), consltg. engr., F. J. Leduc & Associates, 354 St. Catherine Street East, Montreal, Que.

LEDUC, Hon. Francois J., B.A.Sc., D.A.Sc. (H.C.), (Ecole Polytechnique, Montreal), Minister of Highways, Province of Quebec, Montreal, Que.

Associate Members

CARLEY, Forest Cecil, B.A.Sc., (Univ. of Toronto), Montreal manager, Affiliated Engineering Corpns. Ltd., Montreal, Que.

HARTMANN, Nicholas Leopold, Dipl. Ing. (Technical College, Stuttgart, Germany), dftsman., Steel Company of Canada, Hamilton, Ont.

PERRAULT, Lucien, B.A.Sc., C.E., (Ecole Polytechnique, Montreal), chief engr. and manager, Industrial and Commercial Laboratories Ltd., Montreal, Que.

Juniors

BURLTON, George Arnold, B.Eng., (N.S. Tech. Coll.), 5245 Cote St. Luc, Montreal, Que.

CHAPLIN, Herbert Elliott, B.Eng., (McGill Univ.), asst. factory engr., Imperial Tobacco Co. Ltd., Montreal, Que.

GODFREY, William Robert, B.Sc. (E.E.), (Univ. of N.B.), asst. highway engr., Dept. of Public Works N.B., Chatham, N.B.

HAINES, Neil St. Clair, B.A.Sc., (Univ. of Toronto), 1311 Pape Ave., Toronto, Ont.

MILLER, Charles Arthur, B.A.Sc., (Univ. of Toronto), engrg. dept., Canadian Industries Limited, Montreal, Que.

PREVEY, Warren Harry Preston, B.Sc. (E.E.), (Univ. of N.B.), student engr., Can. Gen. Elec. Co. Ltd., Peterborough, Ont.

TRUDEL, Alphonse, B.Eng. (M.E.), (McGill Univ.), engr. dftsman., Canadian International Paper Co., Three Rivers, Que.

Affiliate

DYSON, Vincent Seddon, supt., heavy forging plant, Canada Foundries and Forgings Ltd., Welland, Ont.

Transferred from the class of Associate Member to that of Member

WEBB, Harry Randall, B.Sc., M.Sc., (Univ. of Alta.), associate professor of civil engrg., University of Alberta, Edmonton, Alta.

Transferred from the class of Junior to that of Associate Member

DesBRISAY, Aretas William Young, Capt., R.C.S., B.Sc., (McGill Univ.), Ph.D. (Univ. of London), chief technical instructor, Canadian Signal Training Centre, Barriefield, Ont.

FARRELL, Alfred James, B.Sc., (McGill Univ.), inspr., Real Estate Dept., The Royal Trust Company, Montreal, Que.

GRANT, Alexander George, B.A.Sc., (Univ. of Toronto), field engr., mill constrn., Lake Sulphite Pulp Co. Ltd., Red Rock, Ont.

PIDOUX, John Leslie, B.Sc., (Univ. of Alta.), M.Eng., (McGill Univ.), struct'l. designer, Dominion Bridge Co. Ltd., Montreal, Que.

RACEY, Herbert John, B.Sc., (Queen's Univ.), asst. mgr., Canadian Potteries Ltd., St. Johns, Que.

Transferred from the class of Student to that of Associate Member

BRITTAIN, Norman Westaway, B.Sc. (C.E.), (Univ. of N.B.), private practice as civil engr., Minto, N.B.

COOPER, Lawrence O'Toole, B.Sc., M.Sc., (McGill Univ.), asst. to master mechanic of mines, International Nickel Company, Sudbury, Ont.

EVANS, Delano Ernest, B.Sc., M.Eng., (McGill Univ.), designer. Dominion Engineering Works, Lachine, Que.

HEENEY, Carden Thomas, B.Sc., (McGill Univ.), res. engr., Ottawa Water Purification Plant, Ottawa, Ont.

LUNN, Frederick Richard, B.Sc. (Mech.), (McGill Univ.), manager, G. J. Lunn & Co., Montreal, Que.

MACPHERSON, Donald Cecil, B.Sc., (Queen's Univ.), factory supt., Canadian Marconi Company, Montreal, Que.

MANNING, Walter John, B.A.Sc., C.E., (Ecole Polytechnique, Montreal), res. engr., Dept. of Public Works, Rimouski, Que.

MURRAY, William MacGregor, B.Eng., (McGill Univ.), M.Sc., D.Sc., (Mass. Inst. Tech.), instructor, dept. of mech. engrg., Massachusetts Institute of Technology, Cambridge, Mass.

McQUEEN, Duncan Roderick, B.A.Sc., (Univ. of Toronto), quarry foreman, Canadian Gypsum Co. Ltd., Guelph, Ont.

PIMENOFF, Clement John, B.Sc., M.Eng., (McGill Univ.), struct'l. designer, Dominion Bridge Company, Ltd., Montreal, Que.

ROTHWELL, James Moscrip, B.Sc. (Civil), (Univ. of B.C.), senior instr'man., city engr.'s office, Vancouver, B.C.

SMITH, Adam W. Simpson, B.Sc., (McGill Univ.), asst. engr., H.E.P.C. of Ontario, Toronto, Ont.

WALLACE, Keith B., B.Sc., (McGill Univ.), chief engr., Barry & Staines Linoleum (Canada) Ltd., Farnham, Que.

WINTER, Francis Edward, B.Sc., (McGill Univ.), technical asst., Canadian Electrical Association, Montreal, Que.

Transferred from the class of Student to that of Junior

ALLAIRE, Lucien, B.A.Sc., C.E., (Ecole Polytechnique, Montreal), surveyor, Dept. of Agriculture, Prov. of Quebec, Montreal, Que.

BENOIT, Jacques, B.A.Sc., C.E., (Ecole Polytechnique, Montreal), district sales mgr., Wallace & Tiernan Ltd., Montreal, Que.

BUCHANAN, Edward Trevor, B.Sc., (McGill Univ.), asst. master mechanic, Consolidated Paper Corpn., Shawinigan Falls, Que.

GORDON, Hugh John, B.Eng., (McGill Univ.), dftsman., C.P.R., Montreal, Que.

JOLLEY, Malcolm Porter, Lieut., R.C.O.C., B.Eng., (McGill Univ.), Assistant to Director of Artillery and Mechanization, National Defence Headquarters, Ottawa, Ont.

LEMIEUX, Gilbert, B.A.Sc., C.E., (Ecole Polytechnique, Montreal), engr., Dept. of Highways, Prov. of Quebec, Quebec, Que.

LIND, Walter John, B.A.Sc., M.A.Sc., (Univ. of B.C.), test course student, Can. Gen. Elec. Co. Ltd., Peterborough, Ont.

ORR, Walter Alyn, Flying Officer, R.C.A.F., B.Sc. (E.E.), (Univ. of Alta.), Adjutant, Wireless School, R.C. A.F., Trenton, Ont.

PAQUET, Jean M., B.A.Sc., C.E., (Ecole Polytechnique, Montreal), engr., J. A. Y. Bouchard Ltee., Quebec, Que.

PEREGO, Henry Anthony, B.Eng., (McGill Univ.), struct'l. designer, Dominion Bridge Co. Ltd., Montreal, Que.

PHILLIPS, Robert Weston, B.Eng., (McGill Univ.), sales-service and combustion engr., Bailey Meter Co. Ltd., Chambly Canton, Que.

ROSE, Alexander, B.Eng., (McGill Univ.), junior research asst., National Research Council, Ottawa, Ont.

ROSS, Donald, B.Sc. (Civil), (Univ. of N.B.), asst. engr., Price Bros. & Co. Ltd., Riverbend, Que.

THOMAN, Russell Kenneth, B.Sc., (Queen's Univ.), production mgr., Remington Rand Ltd., Hamilton, Ont.

TUCK, Joseph Howard, B.Sc., (Queen's Univ.), Whitehead Metal Products of Canada, Port Colborne, Ont.

Students Admitted

CONNELL, Edwin Allison, (Univ. of N.B.), Fredericton, N.B.

DAVIS, Edgar Hawkins, (Univ. of Alta), Edmonton, Alta.

DUNPHY, Kenneth Rae, (Univ. of N.B.), 230 Regent St., Fredericton, N.B.

LOGIE, William Alexander, (Univ. of N.B.), 809 George St., Fredericton, N.B.

MORAZAIN, Jules Fernand, (Queen's Univ.), 185 Brock St., Kingston, Ont.

McBRIDE, James Wallace, (Univ. of Man.), 402 The Ambassador, Winnipeg, Man.

McGINNIS, Arthur David, (Queen's Univ.), King Street W., Kingston, Ont.

REYNOLDS, George Gilbert, (Grad. R.M.C.), (Queen's Univ.), 430½ Alfred St., Kingston, Ont.

BULLETINS*

Corrugated Pipes.—A 12-page bulletin has been received from the Canada Ingot Iron Co. Ltd., Guelph, Ont., describing their new asbestos bonded corrugated pipe.

Rock Drill Steel.—Canadian Ingersoll-Rand Co. Ltd., Montreal, Que., have issued a 44-page booklet describing a new line of IR-SKF drill steel. Some of the important sections included are those on dimensions; sections and weights of drill steel; forging and heat treating instructions; applications and tests; avoidance of steel failures; suggestions for prolonging the life of steel; effect on steel of damaged rock drill pistons, chuck bushings, etc.

School Lighting.—Trends in school lighting is the subject of a 16-page pamphlet received from the Edison Electric Institute, 420 Lexington Ave., New York. The material combines information obtained from a report of the Lighting Sales Committee of the Institute covering replies to a questionnaire received from 98 companies.

Insulation.—A 32-page booklet has been received from the Canadian Johns-Manville Co. Ltd., Toronto, Ont., containing specific information on sheet, block and pipe insulation developed by the company for service on various types of heated and refrigerated equipment in industry. A section is included on insulating brick.

Electrical Conductors.—Phillips Electrical Works Ltd. have just issued a 150-page catalogue containing detailed particulars of the various products of the company. This contains sections on Bare and Tinned Copper Wires, Magnet Wires and Radio Wires; Flexible Cords; Telephone Wires and Cables; Telephone and Switchboard Cords; Rockbestos Wires and Cables; Power Cables.

*Copies of these bulletins may be obtained by writing to the companies mentioned.

RECENT ADDITIONS TO THE LIBRARY

Proceedings, Transactions, etc.

American Institute of Electrical Engineers: Transactions, Vol. 56, 1937.

American Society of Civil Engineers: Proceedings, Vol. 63, No. 8, pt. 2, Oct. 1937 (Transactions Number 102, 1937).

Canadian Institute of Mining and Metallurgy: General Index of the Journal 1908-11 and Transactions 1912-20 of the Canadian Mining Institute and the Transactions of the Canadian Institute of Mining and Metallurgy and of the Mining Society of Nova Scotia, 1921-35.

Motorways, Flyovers and Mountain Roads

By F. G. Royal-Dawson, E. & F. N. Spon, London, 1938. 176 pp., 7½ by 4¾ inches, cloth, 8/6.

This book is a sequel to "Curve Design" and "Road Curves." It deals with the technique of motorways as compared with ordinary arterial roads, the essential characteristics of both types being clearly differentiated. The use of flyovers, or grade separations, as adjuncts to motorways, or as alternatives to roundabouts, is fully explained, and many foreign examples given. Detailed calculations are supplied for the design and setting-out of flyovers, horse-shoe curves, and mountain bends in all situations, on transitional principles.

A special feature is a simplified resumé of the author's basic method of laying out any curve, for ready reference and guidance, in a self-contained chapter.

This book contains many worked-out examples, with illustrations, tables, and an index. A number of the chapter headings which may be mentioned are: Evolution of the Motor Road, Camber versus Side-slant, Terminal Junction, Mountain Roads, etc. The series of which it forms the concluding volume comprises a complete textual exposition of the new science of road curvature in all its aspects, and is adapted for college, office, and field use.

Segmental Functions Text and Tables

By C. K. Smoley, 1st edition, C. K. Smoley and Sons, Scranton, 1937. 184 pp., 7 by 4½ inches, leather.

This handy book offers simple methods of solving a circular segment and computing its area when the segment is given with any two of its five parts, viz., the arc, chord, radius, central angle and height, with numerous examples illustrating the application of these methods.

An introduction of some 40 pages gives numerous examples and a description of the use of the tables. The book is divided into two parts.

Part 1 covers logarithms of function $a = \frac{A}{R}$ by intervals of 10 seconds from 0 to 10 deg. with proportional parts for additional seconds; table of logarithms of segmental function; lengths of arcs by steps of 1 minute with P.P. for seconds; logarithms of areas, etc. Part 2 covers logarithms of numbers from 1 to 1000; logarithms of feet, inches and fractions for 0 to 200 ft., etc.

A Statical Determination of the Reactions at the Points of Contra-flexure in the Columns of a Steel Mill Building Bent Due to an External Wind Load

The columns are fixed at their base and fastened to the truss with knee braces.

NOTATION

Bent as shown in Fig. 1 with span = S.

R and L are the points of contra-flexure in the columns taken as at one-third the distance from base to knee brace connection.

P_1, P_2, P_3, and P_4 the external loads on the bent.

R_2 = the resultant load of P_1, P_2, P_3, and P_4 as determined in Fig. 2 in direction, magnitude and sense.

O the point (Fig. 1) through which R_2 acts.

H = the horizontal component of R_2.

R_R and R_L = the right and left reactions at points R and L.

V_R and V_L = vertical components of R_2 and R_L.

H_R and H_L = horizontal components of R_R and R_L.

Assume H_L = 0.6 of H

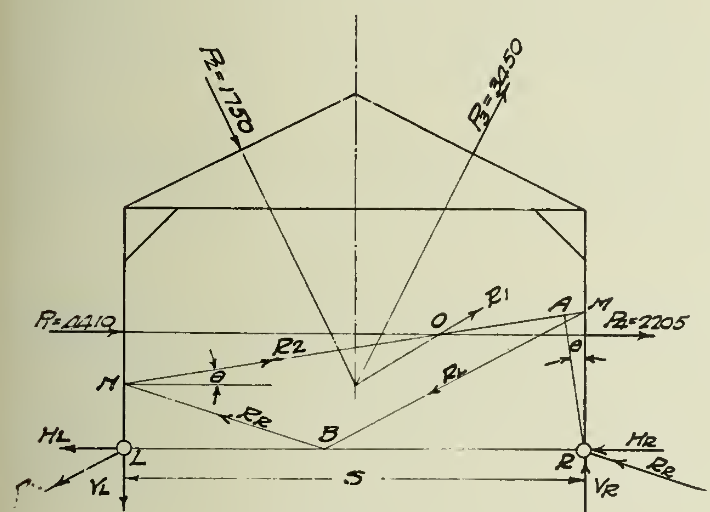

Fig. 1

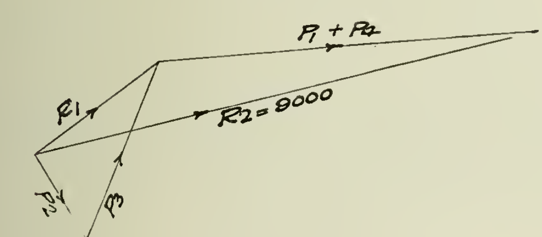

Fig. 2

CONSTRUCTION

Through O draw NOM parallel to R_2 intersecting the columns at N and M.

Let $NM = R_2$.

Then the scale for all vectors will be R_2 divided by the length NM.

Then $LN = V_R$ and $MR = V_L$.

Join L to R then $RL = H_L + H_R = H$.

Make RB = 0.6 of RL.

Join N and M to B.

Then $MB = R_L$ and $BN = R_R$ in direction, magnitude and sense.

PROOF

From R draw RA perpendicular to NM.

Then angle $ARM = \theta$ and θ is angle of inclination of NM to the horizontal.

$\therefore NM = R_2 = S \times \sec\theta$.

And $RA = MR \times \cos\theta$.

Take moments about R.

$V_L \times S = R_2 \times RA = S \times \sec\theta \times MR \times \cos\theta$

$\therefore V_L \times S = S \times MR$

$\therefore V_L = MR$

The direction of V_L and V_R may be found by going around the closed vector diagram N to M, M to R down, R to L, and L to N up.

NOTE

The above has been submitted by W. J. Smither, Assistant Professor of Structural Engineering, University of Toronto, who states that:

"This solution is entirely original on my part and under search of text books and inquiry of those who should know, I have been unable to find its previous use. It is more simple to construct and prove than the method most generally used. Also I find in teaching the subject the results as obtained by this method are more easily understood by the student. I will be indebted to any reader who can advise me of previous use of this method."

A Model Building Code for Canada

A conference called by the National Research Council was held in Ottawa on December 10th, 1937, which had as its object the formation of an organization to prepare a model building code for Canada. Associated with the National Research Council in the effort were the Dominion Housing Administration and the Dominion Fire Commissioner.

The key-note address was given by the Honourable C. A. Dunning, Minister of Finance, who was introduced by General A. G. L. McNaughton, President of the National Research Council. The conference was called in recognition of representations that had been made by many national organizations in Canada over a period of years that the condition of municipal building codes throughout the country was in general chaotic and that there was urgent need for leadership by a central authority in providing municipalities with authoritative information that they could use in revising or reconstructing existing codes.

Following the address by Mr. Dunning, statements were made by representatives of a number of national organizations and the meeting proceeded with the consideration of ways and means of bringing about its object. Committees were named to study various phases of the project and to prepare recommendations for submission to the National Research Council for approval at its meeting next week.

Organizations represented at this meeting included the following:

The Royal Architectural Institute of Canada
Canadian Construction Association
Canadian Engineering Standards Association
Association of Canadian Fire Marshals
Canadian Manufacturers' Association
Department of Mines and Resources of Canada
Department of Pensions and National Health of Canada
Canadian Housing and Planning Association
Engineering Institute of Canada
Dominion Board of Insurance Underwriters.

The organization contemplated for actually carrying out the work of preparing the model building code will embrace representatives of a large number of associations, government bodies, and municipal authorities in Canada.

Standards on Electrical Insulating Materials

In addition to the current report of Committee D-9 on Electrical Insulating Materials, this 1937 compilation includes all of the thirty-seven A.S.T.M. specifications and test methods covering the various types of insulating materials. These standards, given in their latest approved form, are grouped in the following manner: insulating varnishes, paints, lacquers, etc.; moulded insulating materials; plates, tubes, and rods; mineral oils; ceramic products (porcelain, glass); solid filling and treating compounds; electrical tests; papers and fabrics; mica products; rubber products and textile materials.

In addition, there are two proposed standards covering tests for neutralization number of petroleum products and specifications for rubber insulating blankets.

Also, three discussions on significance of tests involving dielectric strength tests, resistivity tests, and impact tests.

Copies of this 373 page publication can be obtained from the American Society of Testing Materials, 260 S. Broad St., Philadelphia, at two dollars per copy.

BRANCH NEWS

Hamilton Branch

A. R. Hannaford, A.M.E.I.C., Secretary-Treasurer.
W. W. Preston, S.E.I.C., Branch News Editor.

The Hamilton Branch, holding its monthly meeting on December 14th, 1937, in McMaster University, heard an illustrated lecture on the oxy-acetylene process of cutting steel and its latest applications in industry. The speaker was Mr. W. A. Duncan of the Dominion Oxygen Company. He was introduced to the 67 present by A. B. Dove, A.M.E.I.C.

Oxy-acetylene Cutting of Steel

Mr. Duncan explained that the flame method of cutting steel is primarily a chemical process. He showed the chemical reactions that take place as the gases burn, and described what happens. The first function of the flame is to preheat the metal to its kindling temperature. At or near this temperature oxygen has great affinity for ferrous metal, and as a result the metal is burned away. There is also a mechanical or eroding action due to the bombardment of the oxygen molecules. The flaming acetylene preheats the metal and the oxygen burns it away.

Use of the term "Burning" for "Flame Cutting" may lead one to assume that a flame-cut edge is damaged. In fact, it is not injured if done by a skilled workman, and with low carbon steel the edge is actually toughened.

The speaker displayed samples and lantern views of various kinds of cut edges. The smooth machined edge was the basis of comparison. A sheared edge was rough and curved. A friction-saw cut was ribbed and had a burr. A flame cut edge made by manual control was slightly rough, but one made by machine controlled equipment approached the smooth machined edge both in smoothness and squareness. Even in uniformity of hardness across the cut edge, the machine flame cut approximated the machined edge. Other samples showed the effect of faulty operation of cutting equipment on the appearance of the edge. When the preheat is excessive the top part of the cut is pitted; with deficient preheat the cut is irregular. When the torch moves too fast the edge has a flowing appearance and may not be cut through; insufficient speed results in a fluted edge. Examples of cuts made with the flame too close, too far away and with a dirty nozzle were also shown. To obtain good results, an operator should follow the specifications given with each torch. For each thickness of plate to be cut there is a specific nozzle size, speed of cutting, volume of oxygen and of acetylene required.

The concluding portion of the paper emphasized types of flame cutting machines, and their performances. Three reels of motion pictures showed, among others, the following operations—cutting circular plates, cutting by template, multiple use of torches, stack cutting (piled plates cut in one operation), cutting slabs to be used as frames for heavy machinery, and cutting of irregular shapes with varying thicknesses.

Following the final reel the chairman, Col. E. G. McKay, A.M.E.I.C., introduced a thought provoking discussion. Mr. H. Thomasson proposed the vote of thanks and the members retired to an adjoining room for the usual refreshments.

Lakehead Branch

H. Os, A.M.E.I.C., Secretary-Treasurer.

A dinner meeting was held at the Prince Arthur hotel on November 17th, 1937. Twenty-five members and guests were present.

G. R. Duncan, A.M.E.I.C., the chairman, called the meeting to order. Four short talks on Institute affairs were given.

The first speaker, P. E. Doncaster, M.E.I.C., District Engineer, Dept. of Public Works of Canada, prefaced his remarks by a short summary of his activities in connection with organized engineering. Mr. Doncaster's speech is given below in full:

"The following views may be faulty and the conclusions unsound. I sincerely hope some of them will prove to be so. If not, I am afraid you as engineers, and especially you younger engineers, will have a far way to travel before you catch up with much good work which has now been left behind.

"The result of the recent ballot to amend The Institute by-laws to facilitate consolidation of the profession in Canada was a setback to the advancement of the profession and to every one of the younger engineers now in it, or yet to enter it, from which it may take years to recover. The action was definitely a retrograde step, not having even the saving element of a 'stand pat' or 'as you were' result. That action (for which I regret to say the older and well situated engineers within The Institute were responsible) not only closed the door to a much needed consolidation of all the different branches of engineer interests in Canada but drove wedges in the gaps between them which had been for some years gradually closing in. Practising engineers in the electrical, mining, civil, chemical and other fields were never further removed from a point of common contact and interest than they are today. Like the spokes of a wheel that radiate from a common centre or hub, all these special branches of engineering have a common source in which the fundamentals and ground work of all engineering science lies. At this point there is common meeting ground and a community of interest for all engineers which, in their own interest and that of the profession, should never be allowed to disappear. Now, the spokes can only function effectively as parts of the wheel of this profession when they each and all find again a common, circumscribing and controlling bond in the rim and tire which binds them together and to which each contributes its measure of support. Such a bond was rejected by the recent ballot.

"My constructive suggestion to the younger members of this Branch is to start again and at once to build up a weight of opinion and action which will regain the lost position and see consolidation is successfully effected.

"There is no occasion for giving up the efforts to improve conditions within the profession. There remains much good already accomplished within The Institute and other organized professional bodies. The challenge to you as individual engineers and as members of this branch is clearly defined. Interest yourself in its problems, study them and, having come to a conclusion or conclusions, right or wrong, give voice to them in the local branch meetings and see to it that the best of these, by resolution, are sent on to Headquarters for its consideration. If they do nothing else they will keep Headquarters stirred, uneasy and fully alive to the fact that there are many thousands of engineers across the length and breadth of Canada who have opinions of their own and who are fully alive to the problems confronting the profession as a whole and them as individuals within the profession. Contrary to the admonition directed to speakers in other walks of life, it is well known that engineers generally need to give more frequent and forceful verbal expression of their views."

The second speaker on the programme was J. M. Fleming, A.M.E.I.C., manager of the C. D. Howe and Company. Mr. Fleming offered some criticism of the magazine in its present form and would like to see shorter news items and articles. He contended that many things that happened in this district, would, presented in short form, be of interest to the membership at large. He supported Mr. Doncaster's view that the membership should hammer on consolidation until some acceptable formula could be found for bringing it about. With regard to branch meetings, Mr. Fleming urged that they should be made as interesting as possible and also suggested that, although a Ladies' Night held last year was not a financial success, a social affair should be staged after the New Year.

Mr. Bird, manager of the Kam Power Company, expressed his pleasure at being present. In a short address Mr. Bird dealt with the various problems confronting engineers in their organization. He complimented Mr. Hurter on the progress made on the construction of the Red Rock plant and thought that the members of the branch would find it interesting to visit and look over this extensive building project.

The last speaker on the programme, F. C. Graham, A.M.E.I.C., Assistant City Engineer, Port Arthur, in a short address dealt with the small remuneration received by engineers in some responsible engineering endeavours.

Montreal Branch

Annual Meeting

The annual general meeting of the branch was held January 6th, 1938, at which was discussed the general business of the branch, the report of the retiring executive, financial statement, installation of new officers. Bryan Perry, M.E.I.C., was elected chairman for the ensuing year and C. K. McLeod, A.M.E.I.C., vice-chairman. Vacancies on the committee were filled by K. O. Whyte, A.M.E.I.C., R. E. Heartz, M.E.I.C., and Jules A. Beauchemin, A.M.E.I.C. F. S. N. Heward, A.M.E.I.C., chairman of the committee formed to discuss the activities and organization of the branch, advocated the encouragement of sections as a means of increasing an interest in membership. Considerable discussion ensued regarding this report.

Through the kindness of the Crane Company, an excellent motion picture film was shown at the end of the meeting, after which refreshments were served.

Alternating Current Network Analyzers

On January 13th, Mr. R. G. Lorraine, engineer of the General Electric Company, Schenectady, presented a paper which discussed briefly the history and development of network analyzers, giving a discussion of recent installations and their applications. Prior to the meeting a courtesy dinner was held at the Windsor hotel.

Chairman: Prof. C. V. Christie, M.E.I.C.

Junior Section

The annual meeting of the Junior section of the Montreal Branch took place on January 17th. A report of the retiring executive was followed by the election of officers: L. Jehu, A.M.E.I.C., chairman; L. Trudel, S.E.I.C., vice-chairman; P. E. Savage, A.M.E.I.C., secretary. Vacancies on the exectuive were filled by G. N. Martin, Jr.E.I.C., C. Craig, Jr.E.I.C., and R. Boucher, Jr.E.I.C., the latter two representing the universities.

Following this meeting Mr. M. C. R. Armstrong, M.A., safety supervisor for the Bell Telephone Company of Canada, spoke on applying for an engineering job. The attendance was 65 and refreshments were served following the meeting.

Technical Men in Industry

The second of a series of talks on technical men in industry took place on January 20th. The speakers were: Mr. L. St. J. Haskell, Assistant to Vice-President, Bell Telephone Company of Canada, on "Recruiting Technical Men for Industry"; H. R. Wake, Secretary, Aluminum Company of Canada, Ltd., A. J. Hill, Director of Personnel, Canadian National Railways, E. R. Complin, Industrial Relations Manager, Canadian Industries, Ltd., spoke briefly on the past, present and future of technical men in their respective organizations.

Dean Ernest Brown, M.E.I.C. was chairman.

Ottawa Branch

R. K. Odell, A.M.E.I.C., Secretary-Treasurer.

Annual Branch Meeting

The twenty-eight annual meeting of the Ottawa Branch of The Engineering Institute of Canada was held at the Auditorium of the National Research Laboratories, Sussex Street, on the evening of January 13th, 1938.

In his address, J. G. Macphail, the retiring chairman of the Branch, outlined the events of the past year, mentioning particularly the work in connection with the Semicentennial celebrations of The Institute last June, and the activities of the aeronautical section, which had had a year of progress under the chairmanship of Dr. J. J. Green.

G. J. Desbarats, President of The Institute, spoke briefly congratulating the Ottawa Branch on its fine showing in 1937 and also reviewed the efforts made to bring The Institute into closer relationship with the professional engineering associations in the various provinces.

J. L. Busfield of Montreal, who was present at the meeting, expressed the appreciation of the Council for the work of Mr. Desbarats as national president especially in connection with the Semicentennial of The Institute and over which he presided. He screened pictures of the celebrations, showing various groups of international visitors.

The report of R. K. Odell, Branch secretary-treasurer, showed that the Branch was in sound financial condition, and that membership had increased by 16 to a total of 418. Of this number 332 are resident, and 86 non-resident.

In accordance with a motion passed at the last annual meeting, the Branch donated two sets of draughting instruments to the Ottawa Technical School for presentation as prizes for proficiency in draughting. F. H. Peters, on behalf of the Branch, personally presented the prizes to the successful students. A copy of "Standard Handbook for Electrical Engineers" was sent to the Hull Technical School to be awarded to one of its students. It was decided to continue this procedure for next year.

Other reports presented were: Proceedings, Squadron Leader Alan Ferrier; Membership, P. Sherrin; Semicentennial Committee, Alan K. Hay; Aeronautical Section, Dr. J. J. Green. A vote of thanks was extended to the auditor B. H. Segre; also to the press. The vote of thanks to Mr. Macphail and the executive was moved by C. McL. Pitts.

Officers for the ensuring year follow: chairman, W. F. M. Bryce; secretary-treasurer, R. K. Odell; managing committee, R. A. Strong, Dr. R. Meldrum Stewart, W. H. Munro, Squadron Leader Alan Ferrier and P. Sherrin. The three last-mentioned members of the managing committee were elected at the 1937 annual meeting and have still one year each to serve. The other two have two years each to serve.

Following the meeting the Museums of Aeronautics and Surveys were visited and there was an exhibition of illuminated addresses which had been presented to The Engineering Institute at the Semicentennial. Refreshments were also served.

Peterborough Branch

W. T. Fanjoy, A.M.E.I.C., Secretary-Treasurer.
J. L. McKeever, Jr.E.I.C., Branch News Editor.

The outstanding function of the Peterborough Branch, the annual dinner, was held on Tuesday, November 23rd, 1937, at the Empress hotel. We were fortunate in having with us on this occasion our President, G. J. Desbarats, Hon.M.E.I.C., as well as the representatives of a number of other Ontario branches, while the main speaker of the evening was R. O. Sweezey, M.E.I.C., who chose as the subject of his address "The Drought Situation in Western Canada."

The toast to The Institute and its Branches, very ably proposed by H. R. Sills, A.M.E.I.C., was replied to by the President, Mr. Desbarats, and in the course of his address on the present state of The Institute, he made appropriate reference to the illuminated addresses received by The Institute from other engineering societies in connection with the recent Semicentennial Celebration. These addresses were on display in the main hall of the hotel, and were the occasion of considerable interest and comment.

Following Mr. Desbarats' address, a humorous skit was put on by the Junior and Student Section, the title of which might have been "She Done Him Wrong" or perhaps "And Still the Villain Pursued Her."

The Drought Situation in Western Canada

Mr. Sweezey advocated a project for control of moisture in the West, where he claimed drought areas of 40 million acres cost Canadians 300 millions of dollars this year. Total drought loss in the past nine years he estimated at close to one and a half billions of dollars.

The speaker's projected plan included control of the South Saskatchewan river by dam and ditch, of that portion above Medicine Hat, including main tributaries; control of the South Saskatchewan by a large dam near Elbow with canals and ditches; control of the North Saskatchewan and Red Deer rivers by dams and ditches; and control of small streams and lakes throughout an area under drought conditions.

He urged that those in authority forget political pettiness and appoint a competent group of men to study the question, not men of mere political and legal sagacity, but men of technical and commercial skill.

The subject was one which should be of great interest and concern to all Canadians, and the Branch greatly enjoyed the sincere and forceful way in which he delivered his case for irrigation.

After hearing a few words from each of the representatives of the other Branches, the meeting closed with the singing of "Auld Lang Syne." Attendance—75.

A meeting of the Peterborough Branch was held on Thursday, December 16th, at which the speaker was W. A. Scott, special representative of Canadian Airways, Montreal, and the subject of his paper "Canadian Aviation."

Canadian Aviation

Mr. Scott, who was well versed in his subject, gave an extremely interesting account of the development of civil aviation in Canada from its beginning shortly after the war up to the present time. He quoted figures showing the leading position Canada holds with regard to freight transportation, and mentioned the numerous obstacles which had been met with and surmounted in the development of this form of transportation.

The speaker mentioned, as he went along, the various types of planes which had been tried out, and he stressed the difficulty Canadian companies had in securing planes properly designed for the service. Flying in the "North Country" demands planes of special design, but the market for such planes in Canada is too small to interest the manufacturers in undertaking the study and special development.

The latter part of Mr. Scott's paper was taken up with a very complete specification of the type of plane most suitable to Canadian conditions, in the course of which the speaker made particular reference to the various types of skis which have been tried.

Mr. Scott's wide knowledge of his subject and the thoroughness with which he covered it, gave the members of the Branch a most interesting and instructive evening. Attendance 40.

Students' Junior Section

Since the inaugural meeting reported some time ago, three more meetings of the Discussion Club have been held, and it is hoped to continue with an active programme of probably two meetings per month, in the New Year.

The speakers at the last three meetings were as follows:—

November 8th:
E. W. Henselwood—"Live Line Testing of Transmission Insulation."
J. L. McKeever—"Commutation in Large D.C. Generators."

November 22nd:
A. J. Girdwood—"Small Sine-Wave Generators."
B. K. Scarlett—"Fluorescent Lighting."

December 13th:
B. Blanchard—"High Voltage D.C. Commutation."
R. E. Edson—"High Voltage D.C. Transmission."

Saskatchewan Branch

J. J. White, M.E.I.C., Secretary-Treasurer.

The meeting held in the Kitchener hotel on December 17th, 1937, was the second of a series of meetings under the joint auspices of the Saskatchewan Branch of The Engineering Institute of Canada, the Association of Professional Engineers of Saskatchewan and the Saskatchewan Section of the American Institute of Electrical Engineers.

The Chairman of the meeting was J. W. D. Farrell, M.E.I.C., Vice-President of the Association of Professional Engineers of Saskatchewan.

The meeting proper was preceded by a dinner at 6.30 p.m., at which there were present sixty-eight engineers. The attendance at both this meeting and the November meeting indicates a stimulating increased interest in the joint efforts of the Saskatchewan Engineering Associations.

After dinner the meeting was addressed by J. R. Robertson, Superintendent of Western Trans-Canada Airways, and his subject was "Scheduled Air Line Flying and Bush Flying." Mr. Robertson is an experienced pilot and his treatment of the subject was very interesting and instructive. In addition to dealing with air line and bush flying he also dealt at length with the proposed set up of the Trans-Canada Airways.

Following the address a general discussion took place with a number of members eager to get further information, all of which provided continued interest for a lengthy period.

M. J. Spratt, M.E.I.C., and D. W. Houston, M.E.I.C., moved a hearty vote of thanks to Mr. Robertson for his enlightening address.

Vancouver Branch

T. V. Berry, A.M.E.I.C., Secretary-Treasurer.

Luncheon in Honour of Percy Sandwell, M.E.I.C.

The Vancouver Branch said farewell to one of its members when about thirty-three members and friends met at an informal luncheon on Wednesday, January 5th, 1938, in the Hudson's Bay dining room in honour of Percy Sandwell, M.E.I.C., who is leaving Vancouver to take up an appointment as chief engineer of the Derwent Valley Newsprint project in Tasmania.

The luncheon was presided over by Vice-Chairman C. E. Webb, M.E.I.C., who expressed regret at losing Mr. Sandwell from the province and from the activities of the Vancouver Branch and wished him every success and good luck in his new field of endeavour. Mr. Sandwell replied in a short address of thanks and outlined briefly the details of the plant to be constructed under his supervision for the manufacture of newsprint from a species of eucalyptus in the Derwent Valley, Tasmania.

Short expressions of goodwill and farewell were also contributed by R. Bell-Irving, M.E.I.C., Powell River Power Co., L. Killam, Managing Director of the B.C. Pulp and Paper Co., and Dr. E. A. Cleveland, M.E.I.C.

Winnipeg Branch

H. L. Briggs, A.M.E.I.C., Secretary-Treasurer.

Air Conditioning

On January 6th, 1938, D. C. Brooking, air conditioning engineer, Canadian General Electric Company, Winnipeg, spoke with reference to "comfort" air conditioning which has to do with the health, comfort and welfare of human beings, as contrasted with industrial air conditioning which has to do with industrial processing.

Comfort air conditioning suitable for year round operation has to do with the heating, humidifying, cleaning, circulating, ventilating, cooling and dehumidifying of air. Winter air conditioning was concerned with the first five of these, summer air conditioning with the last five items.

Mr. Brooking proceeded to show by slides and by displays of apparatus, the types of equipment that are used and how various schemes of achieving these several requirements have been developed for home, store and office installation.

Among those taking part in the ensuing discussion period were A. E. Macdonald, M.E.I.C., W. D. Hurst, A.M.E.I.C., J. T. Rose, A.M.E.I.C., G. H. Herriot, M.E.I.C., C. V. Antenbring, A.M.E.I.C., T. C. Main, A.M.E.I.C., G. P. Morse, A.M.E.I.C., D. A. Ross, M.E.I.C., and E. P. Fetherstonhaugh, M.E.I.C.

The report of the nominating committee for branch officers for 1938 was presented by G. E. Cole, A.M.E.I.C.

EMPLOYMENT SERVICE BUREAU

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party.

All correspondence should be addressed to

The Employment Service Bureau, The Engineering Institute of Canada
2050 Mansfield Street, Montreal

Situations Vacant

MECHANICAL ENGINEER, for assistant in sales, design, and production supervision, with an Ontario manufacturer of wood and stainless steel tanks and industrial equipment. Must possess tact and initiative, knowledge of latest shop practices and ability to organize and direct. Applicants should state age, experience, salary expected, etc., in detail. Apply to Box No. 1715-V.

DRAUGHTSMAN, experienced in plant layout and design. Building construction would be an asset. Work will last about six months, but probability of permanency. Location northern Ontario. Apply to Box No. 1716-V.

MECHANICAL ENGINEER, with pulp and paper mill experience in actual operations, as well as some construction and rigging experience. Capable of handling men particularly labourers, and able to organize and install systems which would be of benefit in routine operations. Apply giving full particulars of experience to Box No. 1721-V.

Situations Wanted

INDUSTRIAL ENGINEER AND SUPT. Age 32, A.M.E.I.C., with combined electrical, mechanical and steel industry experience in several plants. Experience includes design and testing of various types of industrial electrical equipment, supervision of production and cost reduction, heat treating of steel, time study application in several plants, in United States and Canada. At present supt. of modern factory. Apply to Box No. 132-W.

SALES ENGINEER seeks position with a future. A mechanical engineer, JR.E.I.C., with thorough training in England and wide experience for past 8½ years in Canada is seeking a permanent position as sales engineer for manufacturer of industrial equipment, etc Has had varied experience in sales work, mechanical engineering, heating, ventilating and power plant equipment. Of good appearance, ambitious, intelligent. Excellent references. Apply to Box No. 270-W.

INDUSTRIAL ENGINEERING EXECUTIVE, with wide experience including fourteen years in design, construction, maintenance and operation of pulp and paper mills and power developments. Now employed, desires change of location. Apply to Box No. 320-W.

STEAM POWER PLANT DESIGNER, with wide experience on high pressure steam-electric plant. Available at once. Apply to Box No. 525-W.

MECHANICAL ENGINEER, JR.E.I.C., university training, age 28, Married. Four years experience in administration and operation of business. Two years experience construction as instrumentman and field control, and inspection of concrete. Experience assembly line supervision one year. Read, write and speak French. Will go anywhere. Available immediately. Apply to Box No. 551-W.

Situations Wanted

ELECTRICAL ENGINEER, B.SC., E.E., age 38. Married. Ten years electrical experience; including, one year operation, one year maintenance, and four years on construction of hydro-electric plants and sub-stations. Four years electric maintenance and construction in pulp and paper mill. Also experience on highway construction and Geological Survey Available at once. Apply to Box No. 636-W.

MECHANICAL ENGINEER, JR.E.I.C., technical graduate, bilingual, age 35, married, experience includes five years with firm of consulting engineers, design of steam boiler plants, mechanical equipment of buildings, heating, ventilating, air conditioning, plumbing, writing specifications, etc. Five years with large company on sales and design of power plant, steam specialties and heating equipment. Available on short notice. Apply to Box No. 850-W.

NOTICE

In future, notices appearing in the Situations Wanted column will be discontinued after three insertions. If a request is received for an advertisement to be re-inserted this will be complied with after the advertisement has been omitted for one month.

* *

Members desiring a new connection, unemployed members, and employers, are reminded that advertisements are inserted free of charge, and that the names of those advertising may be kept confidential, if desired.

ELECTRICAL ENGINEER, B.SC. (McGill '28), age 34. Experience includes transmission line and rural distribution construction and design. Some installation of motors and equipment, also house wiring. Available immediately. Apply to Box No. 940-W.

ELECTRICAL AND RADIO ENGINEER, S.E.I.C., B.SC. (Elec.) '32, M.SC. '34. Experience includes four years part time operator for radio broadcast station, repairs to radio receivers and test equipment, design and construction of amplifiers and inter-office communication systems. Available on short notice. Apply to Box No. 1283-W.

Situations Wanted

CONSTRUCTION SUPERINTENDENT, M.E.I.C. Age 49. Married. Twenty-two years experience as engineer, superintendent and manager in charge of hydro-electric, mechanical production, structural steel erection, also considerable experience in steam plants, combustion, transmission lines, millwright work, complete mine installations, rock work, rock crushers and conveyors. Executive ability. Speaking French fluently. Location immaterial. Apply to Box No. 1482-W.

RESIDENT ENGINEER, familiar with all types of surveys and construction work including, railway, roads, irrigation, drainage, buildings and air ports. Executive ability. Had charge of several large projects. Intimate knowledge of reports and estimates. Available immediately. Any location. Apply to Box No. 1567-W.

ELECTRICAL ENGINEER, B.SC. '27 (McGill), A.M.E.I.C. Age 36. Married. Bilingual. Three years experience in telephone work (installation of manual and automatic exchanges). One year electrical prospecting. Nine years experience with electrical power company. Apply to Box No. 1601-W.

CHEMICAL ENGINEER, graduate McGill '36. Eight months experience in commercial laboratory of large industrial plant. Knowledge of coal chemistry and boiler water treatment. Also some experience in pulp and paper control work. Location immaterial. Apply to Box No. 1617-W.

CIVIL ENGINEER, B.SC. in C.E., A.M.E.I.C. Age 32. Married. Three years of pulp and paper mill experience, draughting, instrumentman and maintenance. One year as instrumentman on highway construction. Five years checking and designing reinforced concrete and steel. Apply to Box No. 1658-W.

ELECTRICAL ENGINEER, B.A.SC., U. of T. '24, A.M.E.I.C., single, age 44. Ten years in supervisory operating office and two years in construction division (office and field) of large city electrical utility commission. One year factory supervision and tool design in manufacture of small electrical equipment. Wide experience with internal combustion engines. Experience handling heavy machinery. Private pilot's license for light aircraft. Full details on request. Available on short notice. Apply to Box No. 1693-V.

MECHANICAL ENGINEER, young graduate with six years diversified experience in the pulp and paper industry. JR.E.I.C. Desires position as master mechanic, or, as assistant in large mill. Apply to Box. No. 1694-W.

MECHANICAL AND ELECTRICAL ENGINEER, age 47, graduate University of Toronto, 1911. Machinist's trade. Two years tool design and quantity production in the U.S.A. Twelve years Canadian shop experience design and producing heavy equipment. Twelve years as chief sales engineer and field man for one of the largest Canadian national concerns. Experience in manufacturing and sales of pumps, engines, paper mill equipment, power plant equipment and specialties, electrical machinery etc. Clean record, excellent connection. Apply to Box No. 1699-V.

ELECTRICAL ENGINEER, B.SC., E.E. (Univ. of Man. '37). Experience in highway construction as inspector. Available at once. Apply to Box No. 1703-W.

ELECTRICAL ENGINEER, B.SC., A.M.E.I.C., age 44, married. Experience includes draughting, construction and maintenance. The last eight years holding the position of electrical superintendent, of a fair sized industrial plant. Apply to Box No. 1718-W.

Preliminary Notice

of Applications for Admission and for Transfer

January 29th, 1938.

The By-laws provide that the Council of The Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in March 1938.

R. J. Durley, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the Council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science of engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of Student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

ALLWRIGHT—ERNEST GILBERT, of 2217 Hingston Ave., Montreal, Que., Born at Deptford, Kent, England, Oct. 15th, 1886; Educ., 1931-32, Montreal Technical Institute. I.C.S. Engrg. Course; 1909-10, rodman, chainman, G.T.P. Ry.; 1926-27, rodman, instr'man., Candn. International Paper Co. Ltd., also Jan.-Oct. 1928; 1927 (Apr.-Dec.), topogr., prelim. and location surveys, C.P.R.; 1929-31, instr'man., gas distribution dept., Montreal Light, Heat and Power Cons.; 1931-32, engr., subways and bridges dept., City of Montreal; March 1937 to date, engr., Aluminum Co. of Canada Ltd., Arvida, Que.

References: E. V. Gage, D. Hillman, D. O. Wing, W. J. Yorgan, J. L. Leroux, M. G. Saunders.

BLONDEAU—JEAN LOUIS, of 2 Tessier St., Chicoutimi, Que., Born at Black Lake, Que., May 9th, 1897; Educ., Electr'l. Meter Engrg., Fort Wayne Corres. School, Indiana; 1917-18, night foreman, Levis Tramways Co.; 1918-21, Shawinigan Water and Power Co.; 1921-27, inspr., electricity and gas, Dept. of Trade and Commerce, Dom. of Canada; 1927 to date, supt., Saguenay Electric Company. Work includes responsiblity for two hydraulic power plants, 90 miles of transmission line, 150 miles of distribution lines, 17 substations, and distribution of power for 32 towns and villages.

References: F. L. Lawton, J. R. Hango, C. Miller, G. E. LaMothe, R. Belanger.

CAMPBELL—WILLIAM FISHER, of Cayuga, Ont., Born at St. John's, Nfld., Oct. 12th, 1900; Educ., 1916-18, St. Andrews College, Toronto. Private study of engrg. subjects; R.P.E. of Ontario; 1919-21, chainman, levelman, Reid Newfoundland Co., St. John's, Nfld.; 1922-23, timekpr., levelman, transitman, Sir W. G. Armstrong Whitworth & Co.; 1923-26, level, transit, party chief, Reid Nfld. Co.; 1926, appointed Deputy Crown Lands Surveyor for Nfld.; 1926 (3 mos.), general exploration of the Lapoile River area of Nfld. for A. H. Means of the American Smelting and Refining Co., reporting on timber, geology, waterpower, road and rld. possibilities; 1927-30, cruising timber, running contour lines, supervising cutting of channels in areas to be flooded for the Forest Engrg. Dept., Canadian International Paper Co.; 1930-33, general practice with Lee and Nash, Brantford, Ont.; 1934 to date, field and office work of a technical nature for A. L. S. Nash, county engr., Cayuga (Haldimand Co.). Work includes design and preparation of plans for two 3 span rigid frame bridges, also smaller structures.

References: G. R. Marsten, F. P. Adams, A. Vatcher, H. G. Acres, J. W. Morris, F. H. Midgley.

CARTER—THOMAS ALLEN, of 906 Moissan St., Arvida, Que., Born in Haldimand Co., Ont., Feb. 20th, 1908; Educ., B.Sc. (E.E.), Queen's Univ., 1931; 1928, lineman, 1929, asst. to suprvr., Welland Hydro Electric Commn.; 1930, junior engr., Duke Price Power Co. Ltd.; 1931-33, res. engr. at Isle Maligne, 1933-37, asst. to the elect'l. engr., and 1937-38, electr'l. engr., Saguenay Power Co. Ltd., Arvida, Que.

References: F. L. Lawton, M. G. Saunders, D. M. Jemmett, N. D. Payne, C. Miller.

COMMINS—JOHN THOMAS, of 1309 St. Joseph Blvd. East, Montreal, Que., Born at Bath, N.B., Dec. 17th, 1901; Educ., 1925-28, completed electrical course, Lowell Institute School, under the auspices of the Mass. Inst. Tech.; 1920-25, paper millhand, electric lineman, etc., Canada and U.S.; 1925-30, electrician, elect'l. foreman, General Electric Company, Lynn, Mass.; 1930-32, proprietor, Commins Electrical Engineering and Contracting Co., Presque Isle, Maine; 1932-35, mgr., Consolidated Telephone Co., Bath, N.B.; 1935, levelman, N.B. Highway Dept.; 1936, inspn. engr. on asphalt paving in N.B. for Milton-Hersey Company, and 1937, inspr. in charge, for same company; 1932-38, consltg. engr. for Bath, Bristol and Florenceville hydro district, Bath, N.B.; at present, lubricating engr., Imperial Oil Ltd., Montreal, Que.

References: C. G. Grant, G. M. MacPhail, S. R. Weston, M. F. Macnaughton, J. R. Scanlan.

GRANT—WILLIAM ROY, of Port Arthur, Ont., Born at New Glasgow, N.S., Oct. 23rd, 1891; Educ., B.Sc. (Civil), McGill Univ., 1915; 1911-12, rodman, Read Nfld. R.R.; 1917-18, R.A.F.; With Barnett-McQueen Co. Ltd., engineering contractors, Fort William, Ont., as follows: 1912-13, timekpr., 1914-15, instr'man., 1916-17, gen. foreman constrn., 1919-21, asst. supt., constrn., 1922-23, supt., constrn.; 1924-25, gen. supt., constrn., 1925-26, asst. mgr. and chief engr., 1927-29, director, president.

FOR TRANSFER FROM THE CLASS OF ASSOCIATE MEMBER TO THAT OF MEMBER

FARROW—RICHARD CHARLES, of Victoria, B.C., Born at Hornsey, Middlesex, England, Aug. 11th, 1892; Educ., Articled to Humphreys & Tupper, Vancouver, B.C. Studied under a coach until 1913. R.P.E. of B.C.; 1913-15, private practice as B.C.L.S., misc. surveys and engrg. work, highway, standard and incline logging rlys.; 1919-23, partnership in Tupper & Farrow, Vancouver, land surveys and misc. engrg. practice; 1923-24, South California Edison Co., Los Angeles, civil engrg. divn., 1924-27, i/c checking dept., and 1927-28, i/c civil divn. office, as engineer-supervisor; 1928-33, and 1934-1937, hydraulic engr., power investigation divn., Water Rights Branch, Province of British Columbia. Dec. 1937 put in charge of power investigation divn., also i/c B.C. Snow Surveys; at present, district engr., Water Rights Branch, Province of British Columbia. (*A.M. 1933.*)
Reference: J. C. Macdonald, E. Davis, H. L. Swan, F. C. Green, N. A. Yarrow, E. A. Wheatley.

FLEMING—JOHN MURRAY, of Port Arthur, Ont., Born at Winnipeg, Man., July 16th, 1899; Educ., B.Sc. (Civil), Univ. of Man., 1921. Post Graduate in struct'l. engrg. and demonstrator, Univ. of Man., 1922; 1922-23, designer and dftsman., Manitoba Power Co.; 1923 (Feb.-Sept.), res. engr., temp. rly. constrn., Tulsa Aqueduct, Walbridge Aldinger Co., Tulsa, Okla.; 1923 (Oct.-Dec.), inspr. on constrn., coke plant, Winnipeg Electric Railway; 1924-32, struct'l. designer, on grain elevators, docks and heavy structures, and 1933-35, chief engr., C. D. Howe & Company; Jan. 1936 to date, president and general manager, C. D. Howe & Co. Ltd., carrying on business of former company. (*St. 1919, A.M. 1928.*)
References: C. D. Howe, R. B. Chandler, P. E. Doncaster, H. G. O'Leary, J. N. Finlayson.

KETTERSON—ANDREW ROBERT, of 3652 Northcliffe Ave., Montreal, Que., Born at Greenock, Scotland, June 24th, 1881; Educ., Associate, Royal Technical College, Glasgow, 1902. R.P.E. of Quebec; 1902-04, designing, estimating shops, A. Findlay & Co. Ltd., Bridge Builders, Motherwell, Scotland; 1904-07, designing structures and setting out in field, Babtie & Brown, consltg. engrs., Glasgow; 1916-19, overseas, Major, D.S.O.; With the C.P.R. as follows: 1907-10, bridge inspr., 1910-13, dftsman. and asst. engr., 1913-16, asst. engr., Winnipeg; 1919-28, asst. engr., supervn. of bridge design, etc.; 1928-37, asst. engr. of bridges, and 1937 to date, engr. of bridges, Montreal. (*A.M. 1908.*)
References: J. M. R. Fairbairn, P. B. Motley, J. E. Armstrong, F. W. Alexander, D. Hillman.

FOR TRANSFER FROM THE CLASS OF JUNIOR

McDONALD—DONALD JOHN, of Montreal, Que., Born at Glen Nevis, Ont., Dec., 7th, 1903; Educ., B.Sc., Queen's Univ., 1926; 1926-27, test course, General Electric Co., Schenectady, N.Y.; With the Bell Telephone Company of Canada, Montreal, as follows: 1927-30, on staff of foreign wire relations engr., and from 1930 to date, foreign wire relations engr. for eastern area. (*Jr. 1930.*)
Feferences: J. L. Clarke, C. L. Dewar, T. C. Thompson, A. S. Runciman, L. E. Ennis, K. O. Whyte.

PATTERSON—IAN STEWART, of Montreal, Que., Born at Thomson, N.S., Sept. 21st, 1907; Educ., B.Sc. (E.E.), N.S. Tech. Coll., 1928; With the Canadian General Electric Co. Ltd., as follows: 1927 (summer), factory work, Peterborough; 1928-29, test course, Peterborough; 1929-30, training in industrial control engrg., at Peterborough, Toronto and Schenectady; 1930 to date, sales engr., specializing in industrial control engrg., Montreal. (*St. 1928, Jr. 1931.*)
References: R. H. Findlay, R. E. Heartz, B. R. Perry, J. L. Busfield, C. K. McLeod.

RICHARDSON—WILLIAM GORDON, of 256 Wilbrod Street, Ottawa, Ont., Born at Watford, Ont., Dec. 5th, 1903; Educ., B.Sc. (E.E.), Queen's Univ., 1926; 1926-27, with the General Railway Signal Co., Rochester, N.Y., elect'l. and mech'l. tests of transformers, relays, A.C. and D.C. motors, etc.; 1927-28, research work, Carborundum Co., Niagara Falls, N.Y.; 1928-29, demonstrator, elect'l. lab., Queen's University; 1929-33, development branch, Northern Electric Co. Ltd., elect'l. and mech'l. methods used in manufacture of relay coils, repeating coils, transformers, retardation coils, carrier telephone and telegraph equipment, development of new methods and equipment; 1935 to date, engr., transmission and development branch, Canadian Broadcasting Corporation, Ottawa, Ont. (formerly the Canadian Radio Broadcasting Commission). (*Jr. 1930.*)

LAWSON—GEORGE WHYTALL, of 37 Fleming Crescent, Leaside, Ont., Born at Bradford, Ont., July 28th, 1910; Educ., B.A.Sc., Univ. of Toronto, 1933; 1935, laborer, International Nickel Co.; March 1937 to date, designer and dftsman, Dufferin Paving and Crushed Stone Ltd. (*St. 1935.*)
References: A. B. Crealock, C. R. Young.

LYON—GRANT MacKENZIE, of Red Lake, Ont., Born at Winnipeg, Man., Aug. 10th, 1910; Educ., B.Sc. (C.E.), Univ. of Man., 1931; 1927-28 (summers), chainman, rodman, C.N.R.; 1936 (8 mos.), office asst. on constrn., C.N.R.; 1928 (5 mos.), bridge inspr. on constrn., C.N.R.; 1930 (5 mos.), res. engr. on reinforced concrete bridge constrn., and 1931 (6 mos.), contractor on highway constrn., Dept. of Highways, Prov. of Sask.; 1933-34, inspection engr., Dominion Water Power Branch; 1935-36, junior engr., conducting hydrometric surveys in Man. and Sask., Dom. Water Power Branch, Winnipeg; 1937 (June-Sept.), asst. on land subdivision survey, municipal district of Flin Flon; Sept. 1937 to date, engr. i/e surveying, mapping and other engrg. work, Red Lake Gold Shore Mines, Ltd. (*St. 1929.*)
References: W. Walkden, J. N. Finlayson, G. H. Herriot, A. P. Linton, J. T. Rose, A. E. Macdonald, A. Taylor.

MACDONALD—JOHN ERNEST, of South Slocan, B.C., Born at Vancouver, B.C., Sept. 30th, 1906; Educ., B.A.Sc., Univ. of B.C., 1931; 1927-28, constrn. and elect'l. inspn., Conowingo, Md., for Stone & Webster, Mass.; 1929 (summer), rly. location, surveying and bridge constrn., C.P.R., Vancouver; 1930 (summer), elect'l. design, Ruskin hydro-electric development, B.C. Electric Rly. Co.; 1931-34, hydro-electric constrn., operation and mtce., West Kootenay Power and Light Co., and Sept. 1935 to date, in charge Okanagan Division of same company, transmission line constrn. and substation constrn. (*St. 1929.*)
References: P. H. Buchan, L. A. Campbell, A. E. Wright, E. E. Carpenter, W. H. Powell.

SCHNYDER—MAX, of 1865 St. Catherine St. West, Montreal, Born at Biel, Switzerland, Aug. 5th, 1908; Educ., B.Eng. (Mech.), McGill Univ., 1935; 1935-36, dfting. and shop experience, Linde Canadian Refrigeration Co. Ltd., Montreal; 1936-37, mech'l. development engr., Jos. Stokes Rubber Co. Ltd., Welland, Ont.; at present, layout and design of mech'l. equipment for John Stadler, M.E.I.C., Montreal, Que. (*St. 1934.*)
References: C. M. McKergow, O. Biedermann, J. H. Ingham, J. F. Plow.

SHARP—WILLIAM GRAY, of Calgary, Alta., Born at Indian Head, Sask., Mar. 12th, 1910; Educ., B.Sc. (E.E.), Univ. of Alta., 1933; 1929-33, general theatrical management and mtce. of equipment; 1933 to date, servicing and mtce., and full charge of installns. of complete equipment, including arc lamps, rectifiers, projectors, and complete sound equipment for theatres supplied by Sharp's Theatre Supplies in Alberta, Eastern B.C. and Western Saskatchewan. (*St. 1933.*)
References: H. J. McLean, J. McMillan, J. Dow, P. F. Peele, R. S. Trowsdale.

SMITH—OWEN LEONARD, of Baie Comeau, Que., Born at Twillingate, Notre Dame Bay, Nfld., Aug. 25th, 1910; Educ., Lacking one subject for B.Eng., N.S. Tech. Coll., 1937; Summers 1929 and 1931, chainman, Anglo-Newfoundland Development Co., Grand Falls, Nfld.; 1929-30, electrn., International Power & Paper Co., Deer Lake, Nfld.; 1936, relieving engr., Anglo-Newfoundland Development Co., Grand Falls, Nfld.; at present, improver, elec. dept., Canadian Comstock Co., in the erection of paper mill at Baie Comeau. (*St. 1935.*)
References: H. S. Windeler, S. Ball, D. Anderson, A. D. Ross.

STIERNOTTE—ALFRED, of Turner Valley, Alta., Born at Couillet, Belgium, June 29th, 1908; Educ., B.Sc. (Chem.), Univ. of Alta., 1935; 1935 to date, lab. asst., Royalite Oil Company, Turner Valley, Alta. (*St. 1936.*)
References: W. H. Broughton, S. G. Coulter, J. H. Parks, F. K. Beach, R. S. L. Wilson, W. E. Cornish.

TAYLOR—FREDERICK WILLIAM, of 1198 Woodbine Ave., Toronto, Ont., Born at Toronto, Aug. 23rd, 1913; Educ., B.A.Sc., Univ. of Toronto, 1936; 1934 (summer), asst. on camp engrg. staff, Dept. of Northern Development road work; 1936 to date, dfting., designing and inspecting struct'l. work, for E. A. Cross, M.E.I.C., consltg. engr., Toronto, Ont. (*St. 1936.*)
References: C. R. Young, W. J. Smither, W. B. Dunbar, E. A. Cross, T. R. Loudon.

THOMAS—JAMES MACLEOD, of 236 Waterloo Row, Fredericton, N.B., Born at Fredericton, N.B., January 8th, 1910; Educ., B.Sc. (E.E.), 1932, B.Sc. (C.E.), 1933, Univ. of N.B.; Four summers course with R.C.C.S., Camp Borden; 1934, chainman and rodman, 1935, instr'man., 1936, senior instr'man., and at present, res. engr., highways divn., Dept. of Public Works of N.B. (*St. 1935.*)

THE ENGINEERING JOURNAL

VOLUME XXI, No. 3 MARCH, 1938

Engineering Efficiency into the Highways

Miller McClintock, Ph.D.,

Director, Bureau for Street Traffic Research, Harvard University, Cambridge, Mass.

Address delivered at the Annual Meeting of The Institute in London, Ont., February 1st, 1938

SUMMARY.—The principles of 'limited way' construction are discussed, based on the idea that "The solution for the problem of traffic congestion and a large part of the problem of traffic safety lies in a revision of the structural rather than the operating elements of the automotive transportation system." Actual examples of 'limited way' design in Chicago and San Francisco are described.

The street and highway traffic problem in the United States and Canada today is a universal problem. Every man, woman and child has a definite stake in the solution of the problem, both for reasons of personal protection as well as from motives of economic self-interest.

Because of the universal demand for solution and because of the gigantic size of the joint problem of traffic accidents and traffic congestion, it is necessary that the engineering profession assume its full responsibility to bring to bear upon the problem every scientific technique available. You have heard from your colleague, Mr. C. A. Robbins, the principles which are being followed by highway engineers in an attempt to build more inherent safety into the automotive roadbed. In a very real sense these remarks must serve as a confirmation of those principles which he has set forth. While these remarks are to be addressed primarily to the problem of engineering efficiency into the highway structure, it should be noted that this term "efficiency" incorporates, not only the concept of free and orderly movement, but, likewise, the concept of safe movement, for without reasonable safety there can be no reasonable efficiency.

Many of the proposals which have been made by Mr. Robbins would have been considered by earlier engineers and, indeed, by contemporary laity as radical in character, but constructive engineers have never been noted for following the crowd. It is the very essence of their profession that they should be leaders in thought. What the speaker has to say will parallel Mr. Robbins' remarks in the sense that they, too, will propose basic changes which in all probability would have been considered as radical proposals even a few years ago. Of necessity, attention will be directed principally to urban problems, for it is under conditions of urban congestion that one finds the most important illustrations of lack of efficiency today. It is under urban conditions that there is the greatest opportunity for the improvement of roadway efficiency.

Whenever proposals are made for basic changes in the methods for the handling of any broad human problem, these proposals are always subjected to acute criticism. This is as it should be. It is only through a vigorous exchange of facts and conclusions that the advantages or disadvantages of the proposed changes may be evaluated. Enthusiasts for change are notably over-optimistic with respect to the advantages of their plans and, equally, those who oppose change for various reasons are unwilling to admit that the old methods should not be perpetuated. These two schools of thought appear before the moderate jury of public opinion to submit their cases.

This is precisely what has happened and is now happening with respect to the basic issue as to the future character of our street and highway facilities. You will observe from the content of this address that its author is a proponent of change, that he is dissatisfied with conditions as they are, and that he believes that the whole future of automotive transportation is predicated, to a considerable degree, upon our ability to recognize and adopt certain physical changes, basically necessary for a better adjustment of the various factors which compose our automotive system.

In the consideration of proposed changes in policy and plan, one issue should be avoided and yet it is, unhappily, an issue which all too frequently distorts judicial consideration. A proposal to move to new and perhaps advanced ground does not, of necessity, imply a criticism of the past or those individuals who have achieved notable leadership in the development of past policies. Leadership can be lost only when it becomes so inflexible that it cannot adjust itself to new requirements. This is particularly true in a problem which has grown and changed as rapidly as has the traffic problem in the United States and Canada. If to have advocated different policies and plans in the past than those which ought to be followed in the future were a cause for criticism, the speaker, himself, would be most blameworthy. With his associates, he has been directly or indirectly responsible for the expenditure of many scores of millions of dollars for public works, the character of which he could not approve today.

The question of what has been should, therefore, with all of its surrounding inertia and personalities, be laid aside and attention should be given solely to what ought to be.

Some years ago a simple formula for the construction of street and highway facilities was proposed. Most of you are so familiar with the elements of this formula that no detailed description is necessary. Under the descriptive title of "limited way construction" it recommended that major traffic facilities should have in the future four physical elements:

(1) A complete and continuous physical separation of opposed streams of traffic;

(2) No direct access to abutting property and with all entries and exits to and from the structure by especially designed connections;

(3) A continuous separation of all intersections with no cross movement of any kind across the operating lanes of the Limited Way;

(4) A cross-section design to permit an adequate segregation of relatively fast and relatively slow vehicles and with retarding lanes at exits and accelerating lanes at entries.

The proponents of this proposal deserve no credit for originality. There is not a single one of the four elements of design that has not been known and used by the highway

Fig. 1—Henry Hudson Parkway in Borough of Bronx, New York City. Looking from Riverdale Avenue, showing four lane divided roadway in centre with service roads on each side.

engineering profession for many years. Such originality as may be involved lies exclusively in the combination of the four factors, each of which is individually essential, to formulate the concept of a structure functionally designed to carry modern automotive traffic with maximum safety and maximum efficiency.

No tedious arguments need be advanced at this stage of development to support the correctness of the formula, itself. The adherence of eminent public and private agencies and leaders and the practical demonstration of the validity of the formula in traffic facilities now in use, and some of which were indeed in use before the formula was proposed, give adequate support. This is by no means all of the story of progress. Many thousands of people recognized the basic necessity for good roads in the beginning of this century long before any adequate action was taken. The principle had to be sold to the public and, indeed, to many who were in presumed positions of leadership.

America will not have a safe and adequate system of major traffic facilities merely because you and I believe that there should be basic improvements. There are powerful influences which must be changed and imponderable barriers of inertia which must be moved. To merely say and, perhaps, even to prove that our problem of traffic congestion and traffic accidents create today an almost insufferable social and economic burden is not enough to achieve action. A score of different types of resistance must be overcome. The one which has been met most frequently in this particular movement is that of cost. Many are willing to agree with the almost axiomatic conclusion that the proper application of limited way principles of construction will, in fact, largely solve the problems of accidents and congestion insofar as the traffic thus carried is concerned. The retort is made, however, that such types of facilities cannot be afforded. There are others who agree that no matter how sound the principles may be it would be foolhardy to attempt any major application in view of the fact that the character of our traffic problem may alter in the future and, therefore, render the expenditure wasteful. How frequently were both of these arguments supported in the early days of the "good road movement." They are supported with equal vigour today and if they are true they should prevail, but if they are not true they should not be permitted to stand in the way of progress.

This address is directed, primarily, to an introductory analysis of the economic factors controlling the urban planning of major traffic facilities. The subject is limited to the urban problem because it is there that the most critical aspects of the congestion and accident problem is found and it is there that one may expect the largest share of relief through proper building for the future.

Before this urban problem can be considered intelligently, from an economic viewpoint, it is necessary to have a competent understanding of the facts and character of urban growth. The entire trend in the United States has been toward a greater and greater urbanization of our population so that at the present time substantially more than half of our people are city dwellers. It would be difficult for one to point to any basic changes in our social economy which would be likely to stop or reverse this cityward trend. It may be that our people would have been a happier and more prosperous people if the great majority of them had continued to live on the farm. This question, however, is an academic one for we are confronted with realities.

In their growth, all American cities have followed a typical pattern. There is, at that most accessible centre of city life, a highly concentrated business district, usually called the central business district. This area incorporates the principal executive, clerical, retail trade and related activities. Manufacturing and heavy industrial activities are located in the community largely in accordance with the availability of adequate transportation facilities. The population of the city forms a residential pattern largely controlled by the location of the central business district and the principal areas of industrial employment. No person can live farther away from his work than a distance which can be travelled twice each day with reasonable ease and economy. Since the central business district and the industrial areas are the principal sources of livelihood for the population of the community, they naturally control, together with available traffic and transportation facilities, the pattern and distribution of residential population.

There are some persons who are offended not only by the urbanization of our population but, likewise, by the typical pattern of the American city. They are particularly offended by high concentration of business activity in central business districts and, especially, by tall buildings. Seeing the greatest concentration of business activity and the greatest congestion of traffic, they assume that the cure for the problem of congestion lies in a decentralization of business activity. They believe that our cities should be forced to spread out and, again, there may be some idealistic merit in their proposals, but there is not a great deal of practical aid in the suggestions. American cities have not taken their present form because of any idle whim on the part of tradespeople, building owners and managers, or land speculators. There are, today, highly concentrated business districts because such concentration has, in itself, great economic advantages in the efficient conduct of business. To spread all of the existing business activity in Manhattan thinly and equally over the entire area from 125th Street southward to the Battery and for the full width of the island, would not add to the efficiency of business activity in New York City, nor would it, by any means, solve the street traffic problem. Rather, it would aggravate it many fold by multiplying the mileage of street travel required for the exchange of essential services and commodities. To tear all of New York City apart and spread it equally along a hundred mile stretch of the Atlantic seaboard, would not increase the efficiency of the people in their economic activities, nor would it do other than multiply the breadth and character of the problem of traffic movement. But such magic, even though it were useful, is not likely to be applied. Those who believe that America is shortly to return to a pastoral existence and that therein we will find a solution for our urban traffic problem are doomed to disappointment. Even those who believe that by fiat it would be possible to level the concentrations of business activities, even though this change should bring great traffic relief, are likewise to be disappointed. Those who believe in the efficacy of building height restrictions as a panacea for the traffic problem, are largely deluding themselves. One need only look at traffic conditions in Boston, Los Angeles or Washington, D.C., to know that low buildings, long required by law in these communities, bring no solution for the problems of traffic congestion.

If these conclusions be true, one is confronted with a realistic situation of fact rather than an academic one of ideals.

There is one form of urban decentralization that everyone would believe both desirable and possible. City dwellers should be permitted to live under conditions that are healthful and these can be achieved only where a reasonable wide and low intensity of population concentration is possible. If traffic and transportation facilities are so poor that people must live in close proximity to their work, there will continue to be congested residential and tenement areas. The degree to which a reasonable decentralization of residential population can be obtained, and the attendant staple and sustenance trade activities, is dependent almost exclusively upon the efficiency of urban mobility.

Here it may be wise to note another basic trend which is taking place in all urban areas. You are, of course, familiar with the degree to which the automobile has been adopted by urban as well as rural dwellers throughout our nation. The automobile is increasingly used by all classes of our population for personal workaday transportation. One need only look at the parking lots in any central business district and the parking areas surrounding our great factories, or even in the accumulation of cars near relief projects, to have adequate proof of this conclusion. What is not so clearly seen is that mass transportation, too, is trending definitely toward free wheel transportation units. In other words, it, too, is becoming automotive in character. Cities such as Los Angeles, Detroit, Cleveland and Chicago that once, at their current stage of development, would have been looking inevitably toward expensive systems of subway or elevated railway construction have now suddenly realized that their population is no longer street car population. Thus, the solution of the traffic problem involving the private passenger car and the commercial vehicle now has added to it the very great and real problem of an adequate provision of rapid transit facilities for automotive mass carriers.

In no place in the United States is this as clearly and conclusively shown as in the Chicago metropolitan area. The public officials have recognized that a city-wide rapid transit rail system proposed and, indeed, approved prior to the depression at a total cost of more than $300,000,000 would today be unsuited to the travel needs of the Chicago people. Except for a limited development of rapid transit facilities in the central area, Chicago has turned away from rapid transit and has developed consolidated plans for the joint carriage of major traffic streams and rapid transit automotive public carriers upon a comprehensive system of limited way construction.

A basic economic issue which confronts every great American city today, and, indeed, many of the smaller ones, is this: shall we subsidize, at great and continuing expense to the public treasury, rapid transit rail facilities affording comparatively low-grade and unprofitable mass transportation, or shall we, out of public funds made available by the generous contributions of street users themselves, provide adequate, safe, efficient and modern traffic facilities so that automobile owners will provide their own transportation of a high character at their own operating costs and so that such part of our people as may desire or find it necessary to use the facilities of mass transportation may have the type of transportation which they obviously desire and deserve and at a fraction of the cost which would otherwise be required? This is no hypothetical question. It is as real a problem and as critical a problem as has ever faced American cities. Upon its solution will depend the future and efficiency of the city itself, and the degree to which urban civilization may profit and not continue to suffer from the effects of the automotive revolution.

Assuming that city dwellers are not going to abandon urban areas and return to a rural existence in the near future, and assuming that those normal factors which have built our cities and have determined their character and pattern are still to remain effective in the future, it is apparent, to even the casual observer, that something must be done and done quickly. Relief actions of the so-called operating type are not without their value. Here,

Fig. 2—Newark Junction, Essex County, N.J. State Routes No. 21, 25 and 29. Showing rotary traffic circle in connection with two grade separations.

of course, reference is to a better education and direction of automobile drivers and other street users and a better regulation and control of traffic movement. Both education and enforcement have proved their ability to bring some substantial relief to the problem of traffic accidents. In the Harvard Bureau for Street Traffic Research we have studied and used these techniques for almost fifteen years and shall probably always study and use them as an

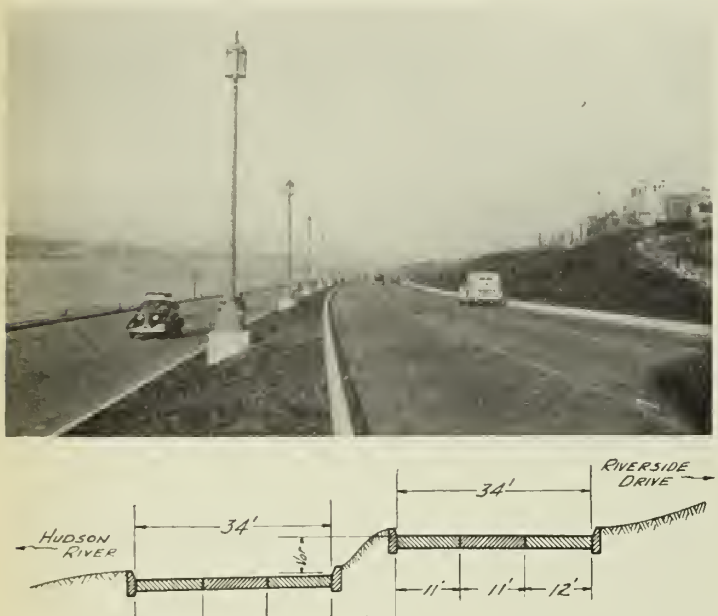

Fig. 3—West Side Express Highway, New York City, N.Y.

This project is an extension of the West Side Express Highway located in Riverside and Ft. Washington Parks and extends from 72nd Street to Dyckman Street, a total distance of 6.7 miles. The pavement consists of two 34 ft. roadways with variable width dividing strip in the centre. For that part of the pavement immediately adjacent to the Hudson River, the elevation of the northbound roadway is 4 to 6 ft. higher than the adjacent roadway, thereby affording an unobstructed view of the river for all motorists. Total cost of this improvement was approximately $24,000,000. The new highway was opened to traffic on Columbus Day, October 12th, 1937.

essential part of safe and efficient traffic operations. This reference is made to indicate that we believe in education and enforcement and also to indicate that we are, perhaps, in some position to appraise the limitations of this approach, so far as the major aspects of the safety problem are concerned, and almost all aspects of the problem of congestion. There is no magic by which two entirely safe drivers can put their automobiles on a crowded street in the same place at the same time, nor is there any magic by which any number of police officers, no matter how highly trained, can force traffic volume over a street system incapable of carrying the load, nor any formula by which the traffic engineer can change the basic elements of time and distance.

The solution for the problem of traffic congestion and a large part of the problem of traffic safety lies in a revision of the structural rather than the operating elements of the automotive transportation system.

At the present time there is not a single current automobile in production that cannot achieve speeds of sixty miles per hour safely under safe operating conditions. It is not, however, excessive crest speeds in which one should be interested in discussing the problems of automotive economics. The great achievement of the automotive engineer has been to build into his vehicle higher and higher optimum speeds. This means, of course, the speed at which the vehicle operates most economically and most effectively. There is no way of determining current optimum speeds, but the best advice available is that in the past fifteen years they have risen from somewhere around twenty miles per hour to substantially more than forty miles per hour. Notwithstanding what other assets the automobile may have, the primary investment of the American public in automotive equipment lies in these optimum speeds. One cannot look at any American or Canadian city today without realizing that a large part of the tremendous investment in the rolling stock of street and highway transportation is being wasted. Average over-all speeds of traffic in typical American cities are approximately seventeen miles per hour and in those areas where traffic has the greatest economic significance, average over-all speeds frequently fall as low as five or six miles per hour. But bear in mind that these ridiculously low speeds are achieved only under conditions of the greatest hazard and there is created, in turn, an economic load which is a severe burden to the entire public. It is not uncommon in studies of commercial traffic operation to find that more than fifty per cent of the operating truck day is spent standing entirely still in traffic jams. This is a sad commentary upon our vaunted efficiency. Let no one believe for a moment that, leaving out of consideration entirely the social and humanitarian aspects of traffic accidents, there is not here an economic waste that justifies the most serious consideration.

The classical approach to the problem of traffic congestion, and the speaker is willing to bear his full part in having formulated and promulgated it, was to widen streets. It followed logically out of early street and highway planning and design. The first objective was to make the roadway hard enough to hold vehicles up and the second objective was to make the roadway wide enough to accommodate them. Thus, during the decade of the twenties when the first full repercussions of traffic volume were felt, our cities were busy with vast programmes for major street improvements. No planner or engineer should be ashamed of his activities, for he was being guided by the best lights available. It was hoped that by widening streets, making them straight and providing them with adequate traffic rules and control devices the problem of congestion and accidents would disappear. All know now that that was a false hope, and that the orthodox street, no matter how wide, how straight or how well controlled, cannot be other than highly hazardous and highly inefficient. It was only natural, therefore, that engineers, seeking a satisfactory, functional solution of the problem, should have turned their attention to the design of traffic facilities mechanically and physically competent to absorb safely a reasonable part of the efficiency built into the rolling stock itself.

Again arises the question of cost. Even those who were most enthusiastic for the great expenditures necessary to bring about the good roads movement or who were the most enthusiastic leaders in major street planning of the last decade are often prone to look with resistance and scepticism upon these new types of development. Even the most sceptical, however, would not be willing to support a programme of inactivity. In this they would be wise, for unless the handwriting already on the wall is entirely misleading all American cities are confronted in the immediate future with an exceedingly critical problem of internal congestion and even stagnation. This, when it comes, and it has already made itself apparent in many of our metropolitan centres, will seriously distort the normal and healthy development of all phases of community activity, will place increasingly heavy burdens upon the machinery of distribution, will destabilize established business and residential property values and will thwart the natural development of automotive traffic and transportation.

So far as it is possible to know, there are only two ways of providing new traffic capacity to give any relief to the problems of increasing volume. One is through the widening of existing streets and the other is through the construction of special types of major traffic facilities. To get down to a "dollar and sense" basis, one can take an illustration from the city of Chicago. In that community three major traffic routes were widened. They were Ashland Avenue, Western Avenue and La Salle Street. They were the outstanding examples in the twenties of traffic benefits to be derived by the widening process. Actually, it should be noted in passing that Ashland Avenue and Western Avenue, as widened, now produce 16 per cent of all of the traffic fatalities in the entire city of Chicago. These consolidated widenings cost $384,000 per average mile for each additional ten-foot lane gained by the improvements. The estimated cost of a four-lane limited way structure was $431,000 per mile. This figure includes $100,000 per mile for ramps, street adjustments and accessories. With four new lanes in the structure, this estimate results in a cost of $107,750 per mile lane of limited way. Leaving entirely out of consideration relative safety factors and relative speed of traffic, each of these lanes has an 80 per cent greater traffic capacity per hour than that of a comparable surface route. Thus, in order to acquire an equal traffic capacity by surface route construction, it would be necessary to build 80 per cent more surface route lanes, which would bring the cost of street widened lanes, equal to the capacity of one limited way lane, to a total of $691,200 per mile. Or to obtain, by street widening improvements, the discharge capacity provided by one mile of limited way lane costing $107,750 it would be necessary to build $691,200 worth of widened street improvements. Lest there be any misapprehension as to these cost ratios, it is emphasized that the cost estimates and comparisons indicate that a given number of units of traffic capacity can be acquired by limited way construction at a cost of 15.5 per cent of the cost of equal traffic capacity in street widening as illustrated by the additional traffic lanes which were obtained in the Western Avenue, Ashland Avenue and La Salle Street projects.

Now turn briefly to a consideration of the economic value of the greater speed of travel afforded by limited way construction in comparison with that available upon the best of widened routes. A mile of surface route operating at an average over-all speed of twenty miles per hour, or at a rate of three minutes per mile, and carrying a daily traffic of 50,000 vehicles requires an expenditure of 150,000 vehicle minutes per twenty-four hour day. A mile of limited way operating at an average over-all speed of forty miles per hour, or at a rate of 1.5 minutes per mile, and carrying a daily traffic of 50,000 vehicles requires the expenditure of 75,000 vehicle minutes per twenty-four hour day. The daily time saving of the limited way as compared with the surface is 75,000 minutes, or a money saving to operators of $937.50 per day, computed at the rate of 1.25 cents per minute. On the basis of 365 days, the annual saving is $342,187.50 which may be capitalized at five per cent giving a total of $6,843,750 or the capital expenditure justified per mile for limited way construction over and above that required for surface route construction. This is without any consideration of the economic gain achieved through the fact that limited way construction renders physically impossible approximately 98 per cent of typical surface street accidents. Lest anyone believe that the use of the factor of 1.25 cents is hypothetical, it should be stated that it was derived from the actual experience of the Holland tunnel where more than ten million motorists each year go down in their pockets to pay in cash an even greater price per minute saved in the Holland tunnel in comparison with the service rendered by slower ferry facilities.

Where traffic facilities have been urgently needed to reduce congestion and increase convenience, they have been notably successful from the economic standpoint. This applies to facilities of the most costly character and even where the relative convenience afforded is limited in extent. The Holland tunnel, to which reference has just been made, is an excellent example. Though it cost more than $50,000,000 to construct it, the investment is being liquidated at a far faster rate than had been anticipated. So successful, indeed, has this structure proved from the financial standpoint, that the Port of New York Authority was encouraged to build the George Washington bridge, and now has under construction the Mid-Town Vehicular tunnel.

It may be said, of course, that the New York metropolitan area is an unusual one and, therefore, that structures which might be economically sound in New York could not be contemplated elsewhere. To disprove this position, one could turn to many scores of smaller communities throughout the United States. Perhaps the best and most recent example is to be found in San Francisco, which is more or less typical of the average American city except for its peculiar topographical location. In San Francisco, two great bridges have been opened within the past year—the Oakland-San Francisco Bay bridge and the Golden Gate bridge. The former cost approximately $77,000,000 and the latter approximately $60,000,000. They give San Francisco a direct vehicular connection with the populous areas of the East Bay district and with the sparsely populated territory to the north in Marin and adjacent counties. Certainly the expenditure of $140,000,000 for two bridge structures for the handling of the comparatively light traffic loadings to be anticipated in a metropolitan area such as San Francisco is a tremendous expenditure and one which might readily be questioned. Indeed it was seriously questioned, but the results have given a conclusive answer.

Fig. 4—Route 23, Morris County, New Jersey. Divided Lane.

At nominal tolls of 50 cents per trip, these structures are adequately taking care of their carrying charges and the total income promises a reasonably speedy liquidation of the investment.

As consultant to the city and county of San Francisco, it was the speaker's good fortune to have an opportunity to prepare comprehensive plans for the internal handling and distribution within San Francisco of the traffic volumes generated by these two bridge structures and to, concurrently, prepare for the other basic traffic problems of the community itself. To this end there was prepared for San Francisco a limited way plan, partially through elevated construction and partially through special treatment of grade routes and through depressed limited way design. This plan was formulated in such a manner as to provide a system of major traffic facilities for all functional parts of the city with almost complete safety protection and with relatively high safety speed potentials.

Since this limited way plan for San Francisco is the most recent application of these principles to urban planning and since it was possible to incorporate in the plans and designs all of the currently available techniques and materials, the economic factors are worthy of consideration.

The San Francisco limited way plan could be constructed for a total cost of approximately $26,000,000. The system would be 64.5 miles in total length. Parenthetically, it may be interesting to note that San Francisco has just defeated by a two to one vote a $50,000,000 bond issue for the construction of five miles of two-track subway.

Were it not for the fact that San Francisco is already provided with many of the elements of a basically sound street pattern the construction estimates as given above would be much higher. It has been possible, therefore, to provide a limited way system with a total mileage of more than sixty-four miles, almost all of which may be constructed in existing right of way. This is due to the fact that many of the logical routes for limited way construction are of such width that this construction can be undertaken without the acquisition of private property. Furthermore, most of the mileage proposed lies upon routes and in areas where the character of the occupancy would not be detrimentally affected considering the character of structure proposed and the width of the existing street.

It has been possible to provide most of the benefits of true limited way construction by a special treatment of existing wide, grade streets. Thus 26.9 miles of the total 64 mile system are of this character of construction obtainable at an estimated cost of only $32,000 per mile which is approximately 50 per cent of the normal cost of curb setbacks for widening purposes under current conditions.

Elevated limited way construction constitutes 33.6 miles of the total 64 mile system or slightly more than 50 per cent of the total. This construction is estimated at a cost of $525,000 per mile. It should be noted that this elevated street limited way construction is not converted street capacity but is 100 per cent new street capacity and the cost factors should, therefore, be compared not with typical street widening costs but with alternative methods of entirely new street construction through the acquisition of right of way, grading, paving, lighting and the provision of other accessories. The elevated limited way construction proposed for San Francisco does not disturb the continued use of any existing route over which it may be built. Because of this condition it may be considered as entirely new or superimposed traffic capacity.

In considering cost factors, due attention must be paid to the relative capacities provided by widened grade routes or by newly constructed grade routes and by limited way construction. Exhaustive studies of relative discharge capacities of various types of roadway construction lead to the conclusion that unobstructed, free-flowing traffic lanes such as those automatically provided by limited way construction, have a discharge capacity, at speeds of 40 miles per hour or better, of as many as fifteen hundred vehicles per hour. It is believed more conservative, however, to estimate limited way capacity, under normal operating conditions, at 1,200 vehicles per hour. Typical urban grade routes operated under either uncontrolled heavy traffic conditions or under traffic signal control rarely show a discharge capacity in excess of 600 vehicles per lane per hour. Thus, a four lane limited way, that is two lanes in each direction, may be estimated as having a total discharge capacity of 4,800 vehicles per hour or a traffic carrying capacity equivalent to a newly constructed grade route with eight operating lanes.

Fig. 5—Sunrise Highway, Suffolk County, L.I., N.Y. Highway Grade Separation at Deer Park Ave., Babylon.

An examination of traffic volume requirements in the city and county of San Francisco has led to the conclusion that all of the current demands, or those of the reasonably near future, can be accommodated satisfactorily upon four lane limited way construction. There are, indeed, certain portions of the proposed limited way system that could be adequately serviced so far as gross discharge capacity is concerned and, at least, for the present with two lane construction. This, however, is not recommended for two reasons. In the first place, in a two lane divided limited way any vehicle failure would result in a complete blocking of one direction of flow. In the second place, a four lane roadway is the minimum roadway that will provide for the normal functional requirements of traffic flow, as it is the least width of roadway that will provide for a segregation of relatively fast and relatively slow traffic moving in the same direction without an impingement upon the opposed roadway.

With respect to weight capacities, the use of the standard H 10 load factor in design and construction is proposed. The use of the limited way system should be restricted to the vehicles of the private passenger car type or other passenger or commercial vehicles of similar weight and speed characteristics. With this class of traffic the H 10 construction is more than adequate in strength. There has been no failure to give due consideration to trucking and other heavy commercial operations. This type of traffic will benefit directly and materially from limited way construction which will remove from main routes of travel, and related parallel streets, the principal load of present private passenger car and light commercial volume. The segregation of the light, passenger car and commercial operation from trucking and heavy commercial operation is one of the fundamental steps in a complete solution of the problem of traffic accidents and traffic congestion and both classes of traffic will instantly and materially benefit from the separated operating routes.

Upon the major street system of San Francisco, as it exists today, there is daily operated in the twelve-hour day, from 7 a.m. to 7 p.m., a total of 900,000 car miles. the twenty-four hour day shows an average increase of 50 per cent over the twelve-hour day, making a total of 1,350,000 car miles per day. This is exclusive of traffic movements in the triangle bounded by Harrison Street, the Embarcadero, California Street and Van Ness Avenue. There is no way of giving a highly accurate estimate as to what percentage of this total of car miles will be transferred to the limited way routes as proposed in the San Francisco plan. With due elimination of local traffic and heavy commercial traffic, it may be safely computed that the balance of the through movements along the limited way routes will utilize the new structures and that the major proportions of other traffic originating within or destined to points within one-half mile of limited way routes will use those routes. Some proportion of this traffic at present follows existing grade routes parallel to those proposed for limited way construction and may be properly included in an estimate of total limited way utilization. This fact is clearly illustrated in customary practice in the East Bay district where substantial volumes of traffic between Oakland and Berkeley or more remote points follow a longer mileage route over the East Shore highway rather than the shorter mileage although more time-consuming route over existing streets. On the basis of the above considerations, it may be estimated that the comprehensive limited way plan as proposed for San Francisco, when constructed, will carry 670,000 car miles per twenty-four hour day or 49.6 per cent of the present total car mile movements in San Francisco. The traffic not carried will be primarily local in character or that traffic feeding to or being distributed from the limited way system. All of this residual volume of traffic as well as trade and residential locations will be benefited greatly by the transfer of large volume, high speed movements, from grade routes to the limited way system.

The above computations are based exclusively upon a logical conversion of existing traffic from present grade route operation to the higher efficiency limited way operation. It does not attempt to credit to limited way movements future normal increases in traffic volume throughout the community, though these will undoubtedly be substantial and will add materially to the percentage of total car mileage carried by the limited way system.

Now to consider what may be termed "induced traffic." It has been experienced universally throughout the United States that wherever an unsatisfactory traffic facility was replaced with a higher type facility the latter converted traffic volume from the former, and, in addition, generated a substantial volume of entirely new traffic commonly called "induced traffic." This results from the fact that many users of motor vehicles, having found the former low-type facility too inconvenient to warrant use, either did not make the trip between the points connected or used forms of transportation other than automotive.

In no place is the capacity of an improved traffic facility to induce traffic more clearly illustrated than in the case of the San Francisco-Oakland Bay Bridge. An examination of Chapter VII, "Estimate of Vehicular Traffic Available for the Bridge," in a "Report on Estimated Traffic and Earnings, San Francisco-Oakland Bay Bridge," July, 1936, by Coverdale and Colpitts, indicates that in the maximum year, 1930, the transbay ferries carried a total of 4,544,000 automobiles though by the year 1935 the transbay automobile ferry crossings totaled only 3,937,000. If the San Francisco-Oakland Bay bridge traffic were composed exclusively of converted ferry traffic, it is apparent that it could not exceed the total of that traffic. The volume of "induced traffic" on the bridge is indicated by the fact that it is now operating at a rate of approximately 10,000,000 vehicles per annum. Of this present total, 5,500,000 must be considered as entirely new or induced automobile traffic. In other words, the superior facilities provided by the bridge structure converted almost 100 per cent of the ferry traffic into bridge traffic and, in addition, created or induced a new volume of traffic equal to more than 100 per cent of the converted traffic. It is impossible to project a confident estimate of the amount of traffic by automobile not now existing, which would be induced by the limited way system. It would unquestionably be large and, in considering the relative facility provided, might readily equal the "induced traffic" performance of the San Francisco-Oakland Bay bridge. Automotive traffic has everywhere shown a startling vitality wherever obstructions to its free use have been removed. Large portions of the population in all cities have demonstrated their eagerness, and their economic ability, to provide their own private means of transportation and at their own cost wherever reasonably efficient facilities have been afforded. Naturally, any traffic volume induced by the limited way system would add to its relative importance as a carrier of the total car mileage of the community.

Comprehensive studies of speed and obstruction in current traffic involving more than 2,200 miles of test observations show that the average overall speed of vehicular traffic, during off-peak hours, is at present 17.35 miles per hour. The limited way structures proposed for San Francisco should be designed for safe operating speeds of 60 miles per hour, with the exception of those locations, comparatively few in number, where existing physical conditions or necessary connections require a type of construction placing a limitation upon maximum speeds. It is not recommended that traffic be permitted or required to operate at the full designed speed capacity as there should be a reasonable factor of safety. It is proposed, therefore, that a fixed speed, both minimum and maximum, be set for normal operating sections at 45 miles per hour. Vehicles incapable, or drivers unwilling to operate at this speed should not be permitted the use of the limited way facilities. Designated speeds of less than 45 miles per hour should be indicated for the comparatively few and short sections of the system where conditions of safety require lesser speeds. The 45 mile per hour operating speed will deliver an overall operating average speed of 40 miles per hour which is more than a 100 per cent increase over existing average experience. In terms of time, for the entire limited way system, and with an estimated daily volume of 670,000 car miles, this will result in a daily saving of 21,860 car hours, or on an annual basis in a saving of 7,978,900 car hours. There is here an interesting analogy. The San Francisco-Oakland Bay bridge is at present operating at the rate of 10,000,000 vehicles per year with an estimated saving of 26.4 minutes per trip, or, on an annual basis, in a saving of 4,400,000 car hours. Considering the investment of $77,000,000 in the bridge structure, which motorists have so generously indicated their willingness to repay, and considering the estimated cost of a comprehensive limited way system at $26,000,000, economic conclusions are obvious. Over and above all of these considerations, however, must be the recognition that even the present low facility of movement over grade streets is bought at a tremendous sacrifice in safety.

The prime consideration in any public improvement is that of the preservation of life and limb. Important as economic considerations may be, they become negligible in comparison with humanitarian considerations.

It might be possible, through elaborate and costly methods of education, enforcement and control, to bring some further reduction in the rate of traffic accidents and fatalities in San Francisco. It is to be doubted, however, in the light of experience in San Francisco and other American cities, if any of these remedies can materially affect the problem. Such gains as may be achieved can scarcely be other than at the cost of a further retardation in facility of movement.

Accidents and congestion arise from identical casual friction in traffic movement. Roadway design which eliminates the causes of congestion automatically eliminates the causes of accidents. An analysis of traffic accidents and fatalities clearly supports the conclusion that limited way construction would largely eliminate the present causes of accidents.

For that portion of the total major city traffic flow, or approximately 50 per cent of the whole, there would be no pedestrian accidents or fatalities as the limited ways are reserved exclusively for vehicular traffic and pedestrians have no reasonable access to the structures. (This statement does not apply completely to routes given limited way treatment at grade, to which pedestrians will still have access, though under protected conditions.) Of the total persons annually killed in San Francisco traffic accidents, 71 per cent are pedestrians struck by vehicles.

Turning now to personal injury accidents, including fatalities, current records show 71.5 per cent take place at intersections. As there are no intersections on any limited way route, this great group of accidents disappears insofar as the movements of traffic upon limited way structures are concerned. In addition to the elimination of intersectional accidents, however, it is apparent that no head on collisions would be possible as vehicles moving in opposite directions are physically separated. There could be no collisions with parked vehicles, persons, or fixed obstructions along the margin of the roadway, and the only classification of accidents of which any trace of cause remains is the so-called rear end collision. This type of accident would be eliminated almost entirely because of the free flowing character of the operating lanes, the provision of retarding and accelerating lanes, the segregation of relatively fast and relatively slow vehicles, the elimination of street cars and heavy commercial vehicles from the limited way routes and the resultant possibility of establishing a uniform rate of operation. These conclusions are fully verified by the almost perfect safety record of the Holland tunnel and the elevated Westside highway in New York City.

It seems probable that all or a substantial part of the proposed limited way system will be constructed in San Francisco. If it is, San Francisco can have a permanent congestion and accident solution for the major part of its traffic problem in the very near future, and at a cost of $26,000,000. As a pure matter of dollars and cents, let us see what will happen if the limited way plan is not executed. At the present time, San Francisco is spending approximately $2,000,000 per year in street widenings and related grade street improvements in an attempt to gain added traffic capacity and safety. Even though there be no increases in these expenditures in the future, at the end of twenty-five years San Francisco will have expended $50,000,000 and will have to show for it a street system which, with all of the possible improvements, will be inherently congested and hazardous. In limited way construction there are related economies over and above those involved in the capital expenditures for the structures themselves. A comprehensive system converts all existing streets into district routes largely of the feeder or access type and thereby eliminates the necessity for further costly improvements upon such streets and should indeed materially reduce current maintenance costs.

Even though the problem of urban accidents were considered unimportant and even though anyone were bold enough to believe that American cities can continue to carry the burden of increasing street congestion, it would appear that the mere consideration of dollars and cents would lead inevitably to the adoption of more economic and efficient planning and designing of traffic facilities.

It is the speaker's firm belief that in America we have never had a real opportunity to understand or appreciate the benefits of an automotive age. Automotive transportation in all of its forms has such a tremendous vitality that wherever it is permitted to operate with reasonable safety and decent convenience it has demonstrated enormous capacity for growth. Those of us who hold this firm belief can afford to be bold.

Engineering the Highways for Safety

C. A. Robbins, B.Sc.,
District Engineer, Toronto, Department of Public Highways, Ontario.

Paper presented at the Annual Meeting of The Institute in London, Ont., February 1st, 1938.

SUMMARY.—A brief discussion of the principal factors of highway design and construction which make for the safety of motor traffic.

No matter what engineers do to make the highways safe, by adopting the features of highway design and construction that contribute to the security of motor traffic, the final factor of safety rests with the driver of the motor vehicle. A road can be well designed for safety and volume, and yet can be made a veritable death trap by the reckless or careless driver. After studying data on the causes of accidents it becomes evident that in the final analysis the underlying cause of most accidents is not to be found in the design of the road or car, but in the incompetence of the driver.

Roads designed a few years ago for the lower speed limits then in force, are not now safe in all of their essentials for the present day limits. That is why roads which are but a few years old are so liberally sprinkled with caution signs. If the driver watches these signs and is guided by them, his trip will be safe, but if he chooses to ignore them, tragic fate surely awaits him not far away.

The design of highways is a new science, and, due to the extremely rapid increase in the number of cars and consequent demand for new roads, the engineer has had but little opportunity to develop designs that did not follow the cut and dried methods of the horse and buggy days. During the years of the depression, while road building was drastically restricted, engineers had time to think, and the results of that thinking are now becoming apparent in the new developments that are taking place. The new designs that are appearing stress three factors, namely, capacity, free movement, and last, but not the least important, safety.

Capacity and free movement play an important part in the safeness of our roads. Roads that are congested and with limited free movement tend to cause accidents through the lack of patience displayed by many of our drivers. Capacity and free movement are obtained in our modern roads by correct design of alignment, grades and widths.

The first element to be considered in design is, of course, alignment, and under present day conditions, curves are eliminated in so far as possible, but where necessary, designed with a radius of not less than 1,400 ft., and with sufficient tangent distance between the end of one curve and beginning of the next to permit of easy passing by fast moving vehicles. To obtain this condition it has been found necessary to construct long diversions, and in many cases to completely abandon existing routes. In Ontario new routes are being constructed between Gananoque and Brockville, and between Burlington and Niagara Falls, largely because the curvature on the existing routes made it impossible to rebuild them without almost completely destroying the present surface. There are other reasons for these relocations but a discussion of them has no place in a paper of this nature.

The spiralling of curves has become standard practice as it tends to easier and safer driving. All curves of 3 deg. and over should be banked to a fixed formula. It appears that the practice followed in Ontario is quite satisfactory, which is as follows:—

> "Super-elevation to be 4 in. per deg. of curve to a maximum of 30 in. starting at the beginning of spiral and increasing at the rate of one inch per 10 ft. reaching the maximum at the beginning of circular curve."

Vertical and horizontal sight distances are being steadily increased to provide a minimum clear view of 1,000 ft. Dead spots, due to dips in the grade line should be avoided by the use of long sweeping grade lines. On a first class road the maximum permissible grade should not be over 4 deg. This requirement is, of course, subject to drastic revision upward if the country is difficult.

Drainage has always been a serious consideration in road building, and the highway engineer has, for many years, followed the practice of the railroad engineer and established deep ditches just outside the travelled way. This practice leads to many serious accidents and the modern highway cross sections have eliminated these ditches almost entirely as is well illustrated in Fig. 1.

Fig. 1—Dual Highway—Toronto to Hamilton.

Fig. 2—Dual Highway—Toronto to Hamilton.

Subgrade drainage is provided where necessary by the installation of field tile in the shoulders outside of the pavement line.

Shoulders along pavements are now recognized as a very important factor from the safety standpoint, and have been steadily increasing in width until now it is conceded that a less width than ten feet is not desirable.

On our modern cross sections it is difficult to tell where the shoulders stop and the side ditch begins. On the more densely travelled roads the earth shoulder is being gradually hard surfaced for a width of three to ten feet from the edge of the pavement, materially adding to the safety of the road.

In the past there seems to have been an intense desire on the part of road officials to economize on the width of bridges. It is now recognized that the above ground part of these structures forms a serious menace to passing traffic and we now find that our bridges are being built to a width considerably greater than that of the adjacent pavement. Culverts are gradually disappearing from sight by the elimination of dangerous head walls. Head walls were never necessary, and the culvert, as now constructed, is simply extended to a length that takes it beyond the toes of the road fills.

Due to the increasing number of accidents at railway crossings a good deal of study is being devoted to their elimination, either by subways or overheads, or by diversions of roadways. On more lightly travelled roads, or on sections where it is not possible to otherwise eliminate the railway crossings, we find it advisable to install the standard type of bell and wig-wag warning. The design of subways and overheads has been discussed many times, and needs no elaboration here. By a careful study of routes, it is often possible to completely eliminate railway crossings from our trunk routes by means of a diversion which, upon final analysis, will be found cheaper to construct than the structures that would have been necessary on the original route.

Road intersections are danger points which require careful consideration in preparing road designs. Ontario has recognized this danger and, at the present time, is constructing grade separations. Two of these are in operation and are giving excellent service, and several others will be completed early next year. The large expenditure necessary to construct grade separations can, of course, only be justified by dense traffic. A simpler, less expensive, and yet a very satisfactory arrangement at busy intersections can be provided by the traffic circle. The diameter of the circle is very important, as too small a diameter results in congestion. The general rule to be followed is that there must be room to permit the sorting of traffic between the intersecting roads and it is felt that a diameter of less than 300 ft. can not be satisfactory. The success of a

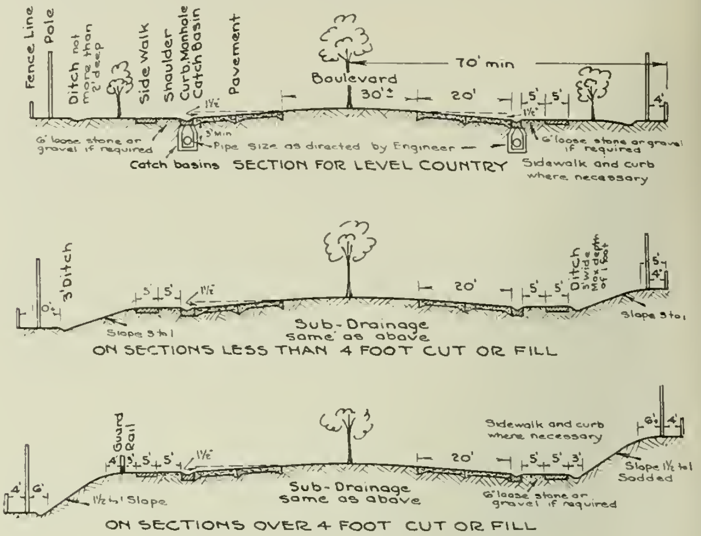

Fig. 3—Four Lane Construction.

circle or oblong island also depends on careful direction signing. In the United States, it has been found that circles otherwise well built were poorly signed with the result that considerable confusion developed.

The three-lane highway is used to a considerable extent, but from a safety standpoint is not desirable. When using the three-lane type—financial considerations force its use at times—it is desirable to add another lane on hill crests. The four- and six-lane highways have had such a disastrous record from an accident standpoint on high speed roads that they are being given but little consideration in the plans of the various Highway Departments. Every road authority is now either studying or actually constructing a new type of road, which is commonly called the "dual highway."

The dual highway can be compared to a double-track railroad and follows, of course, the same principle that

Fig. 4—Cloverleaf on the new Dual Highway between Toronto and Hamilton, underpassing King's Highway No. 10, Brampton to Owen Sound.

opposing traffic is separated. The separation of traffic may be by a narrow curb or by a grass plot of varying widths. The narrow curb is effective in that it separates traffic, but is not satisfactory for night driving, nor does it provide a solution of the difficulties of a car that wishes to make a left turn. It has been well established that 30 ft. is the narrowest width of centre strip that at least partially solves the question of night driving as well as solving the problem of the left turn. A dual highway with a 30 ft. boulevard is quite easy to drive at night, but if property damages are not too heavy, a greater width is desirable. The 30 ft. boulevard does solve the problem of the left hand turn except for probably the largest trucks. The percentage of this type of trucks is so small that they do not need to be given much consideration by the designing engineer. Cross-overs through the centre boulevard should be limited to cross-roads, with others at such intermediate points that the general spacing will average up at about fifteen hundred feet. The type of planting to be used in the central boulevard is of vital importance and if snow conditions will permit it should be continuous so as to effectively bar head-light glare from the cars on the opposite lane. Before leaving this particular subject, it may be pointed out that Ontario has approximately one hundred and twenty miles of dual highway either completed or under construction.

Too often the road authorities forget the pedestrian, and, in consequence, the death toll from cars striking pedestrians is appalling. In preparing any road design, provision should be made on the right-of-way for side-walks, and the necessary grading should be done at the time of the original construction. The correct location of side-walks with reference to the pavement in rural districts is, as yet, a controversial subject. Some engineers contend that it should be near enough to the pavement so that it would be illuminated by passing cars. Others contend that this location is dangerous, and that the side-walk should be placed at the outer limits of the right-of-way.

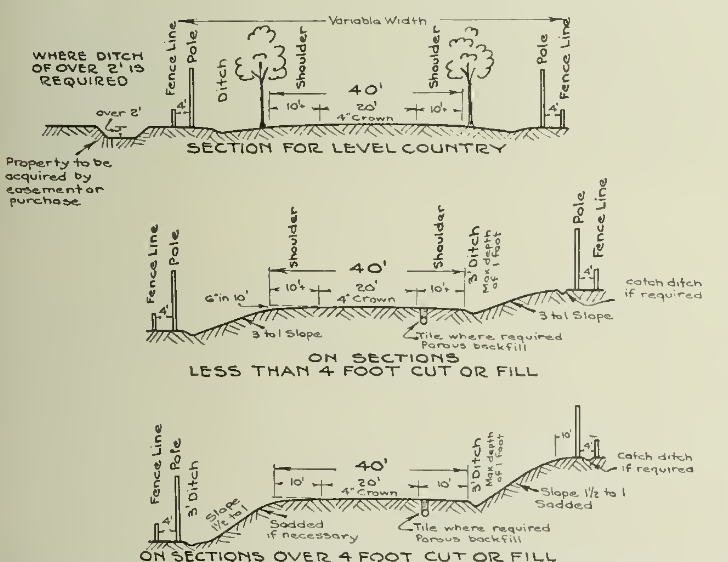

Fig. 5—Class A Earth Grading. (Note—For fills over 4 ft. in height, the width to be increased 1 ft. for every 3 ft. rise, maximum extra width not to exceed 10 ft.)

The author is inclined to agree with the latter contention. Pedestrian under-passes are of great value, particularly where there is concentrated foot traffic, such as at schools or at roads leading to play-grounds. The under-pass should be thoroughly lighted and provided with winter doors at the exits in order to eliminate snow difficulties in the winter time. Ontario has a few of these under-passes in operation opposite schools, and it is found that with the co-operation of the school principal the children use these passes faithfully.

The road surface has given the engineer great concern due to the increasing number of accidents from slippery pavements. In the case of concrete pavement the anti-skid properties have been very materially increased by a final brooming of the surface, which has not reduced the riding quality. In the case of asphalt pavements anti-skid surfaces have been developed to a point that is almost entirely satisfactory. This has been achieved by constructing a fairly open surface with asphaltic concrete containing a large percentage of very hard rock. Older asphalt or tar surfaces have had their anti-skid properties immeasurably improved by reducing the amount of bitumen used in the treatment, together with a drastic increase in the amount of stone cover.

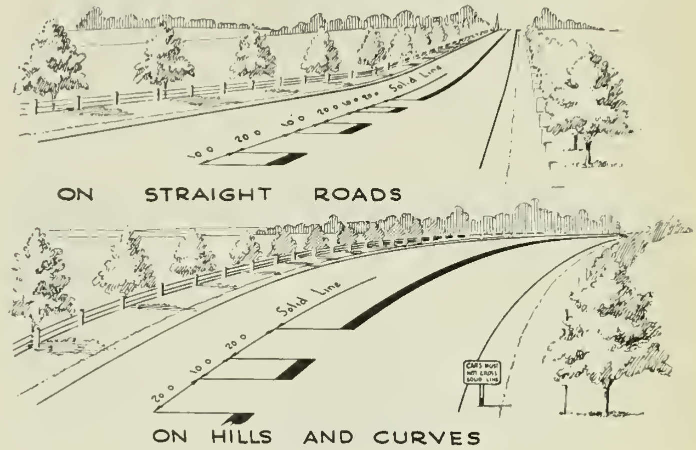

Fig. 6—Zone Painting.

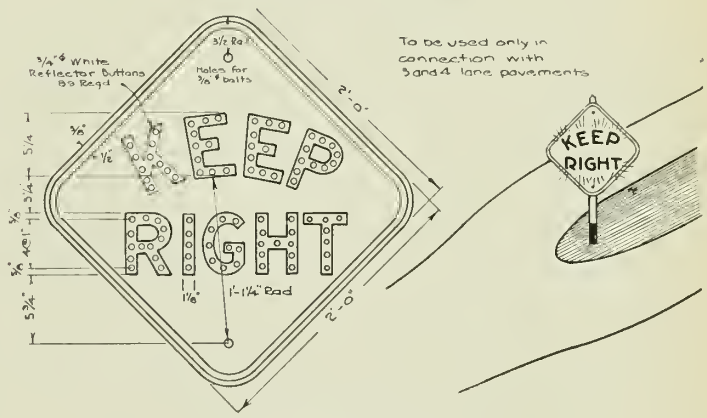

Fig. 7—Standard Sign.

The time is not far distant when our main highways will be fully lighted, so that night driving will no longer be a nightmare. At the present time Ontario is experimenting on a fairly large scale with both the incandescent and sodium type of lighting. These experiments have not proceeded sufficiently far for a definite expression of opinion as to which system will eventually be adopted.

There are just two things that an engineer does for the motor car operator: the first is to provide a safe and comfortable road surface; the second to direct the motorist safely to his destination by means of warning and direction signs. Discussing the latter feature for a few moments, it may be said that generally speaking road signs fall naturally into the following classifications: prohibitory, warning, and direction. The first class is well illustrated by the all too prevalent "Stop" sign. Personally the

Note—Figs. 5, 6, 7 refer to the standards of the Ontario Dept. of Highways.

author believes that the erection of "Stop" signs is very much over-done, and that, instead, a sign of cautionary nature would, in many cases, serve the purpose and not interrupt the steady flow of traffic as does the "Stop" sign. At several rather busy intersections within the author's knowledge fifteen mile per hour signs have been used to replace "Stop" signs with excellent results. The tendency of the motorist on the through highway is to

Fig. 8—Dual Highway—Toronto to Hamilton.

ignore the driver attempting to enter from side streets, whereas it is set forth very definitely in most Highway Traffic Acts that once the motorist on the side street has come to a full stop, the rule of the road applies. It is understood that Milwaukee has removed the "Stop' signs on one of their arterial highways with the result of a large reduction in the number of fatal accidents. Warning signs are of many types and character, but possibly the most successful one of this type is the one outlined in reflector buttons. This type of sign not only warns the driver well in advance, day and night, but indicates exactly what to expect, which is the function of a perfect sign. Warning signs of an indefinite nature are to be avoided, as they lead to congestion and confusion. Directional signs would seem hardly to have a place in a paper written around safety features, but many collisions and accidents are caused by strangers trying to find their way through areas of congested traffic. Direction signs are a study in themselves; the underlying principle is that there should be an advance warning, a definite direction sign at the point of change of direction, and finally a re-assurance sign after the turn has been made. If these simple directions are followed, no difficulty will be found in signing the most difficult intersection. One of the most effective methods of signing now in use is provided by the zone strip, which is painted on a "hit-and-miss" system where overtaking and passing is permitted. On hill crests, curves, and other points where overtaking and passing is not desirable, the zone strip is painted solid and signs erected at the ends of the solid line prohibiting crossing of the white line. Just recently a new sign has been introduced in the form of "road-bugs," which are used to mark the centre line of the road. These road-bugs consist of a cast iron frame in which is mounted reflector buttons. The cast iron frame is fastened to the concrete or asphalt pavement by means of expansion bolts, and can be removed for the winter months. Traffic lights are being used to a limited extent on highways in Ontario. All of the installations that are being made now are traffic operated, as the fixed time type of lights is found to be a hindrance rather than a help to traffic. A timely word of caution in regard to signing is given by Stanley Gale in a late issue of "Highways and Bridges," in which he says:—

> "As a means of improving traffic conditions and reducing accidents, traffic signs through indiscriminate and excessive use have defeated their object. Much more practical and bolder methods will have to be devised to make the highways adequate and safer to the needs of the increasing traffic volume."

In conclusion, it should be realized that while highway engineers seek safety on our roads, today as in the past, rapidly changing conditions as to speed and density of traffic make the problem an extremely difficult one. It is only necessary to pick up the daily papers and scan their records of the death and disaster that overtake our car drivers every day, to realize that the task set for the engineer is one of no mean proportions.

Canadian Steam-Electric Power Plants

C. A. Robb, M.E.I.C.,

Professor of Mechanical Engineering, University of Alberta, Edmonton, Alberta.

Paper presented at the Annual Meeting of The Institute in London, Ont., February 2nd, 1938.

SUMMARY.—This paper deals with the development and performance of Canadian power plants, with particular reference to the performance of steam stations, outlines developments in recent years and offers a comparison of the practice in Canada with that in other countries.

Steam central stations in Canada have not received the serious consideration which their possibilities would warrant, the popular imagination having been impressed by the abundance of presumably inexpensive water power. The purpose of this paper is to exemplify the possibilities of fuel driven stations in Canada, not only in areas where fuel is readily available, but also, it may be, at points to which fuel has to be brought.

In 1934 Canada led the world with an average of 1,950 kw.h. per capita as compared with 670 in the United States and 462 in the United Kingdom (excluding North Ireland).[1]* In 1935 the total energy generated in all stations was 23,283,033,000 kw.h. The revenue from sale of electric energy was $127,177,954 or 0.546 cents per kw.h. The average kw.h. per kva. of capacity was 3,858. This value shows a large variation between provinces. Quebec, 4,213, maximum; Prince Edward Island, 1,030 minimum; Saskatchewan, 1,184; Alberta, 1,685. This may be compared with 3,500 kw.h. per 1 kw. in the United States[2] for 1937. Total hydraulic stations had an output per kva. of 3,956 kw.h. and total fuel stations only 1,334 kw.h., showing that the hydraulic stations operate at a much higher plant capacity factor.†

The average cost per kw.h. for domestic service shows a wide variation from the national average of 2.08 cents; Prince Edward Island, 7.82, maximum; Manitoba, 1.01, minimum; Ontario, 1.68; Quebec, 3.22.

The total output of Canadian central stations has increased by 114.6 per cent during the past decade.

1. Steam Station Performance

The thermal performance of modern steam power stations was discussed[3] in 1929 and may be expressed as the annual average station performance (net output) in B.t.u. per kw.h. It will be convenient, for comparing the performance of Canadian stations with those of other countries, to adopt a station heat rate for standard plant represented by the formula:—

$$\text{B.t.u. per kw.h.} = 13{,}600 + \frac{100{,}000}{\text{Annual load factor (in per cent)}}$$

This has been represented by the curve shown in Fig. 1, which will serve as a basis of reference. The performance of Canadian and American stations, plotted in Fig. 1, may be identified from the details given in Table I. Two of the latter, Lauderdale and Trinidad, have maximum loads of 50,000 kw. and 86,000 kw. Trinidad burns high moisture Texas lignite in pulverized form. This interesting station has been described.[6] Stations in Great Britain[4] having a maximum net load of under 50,000 kw. have been selected for comparison and are plotted in Fig. 1. The three South African stations,[5] also shown, have the following maximum loads, one-half hour: Natal Central, 24,240 kw.; Durban, 33,000 kw.; Witbank, 89,954 kw.; and annual average load factors of 50.3, 41.7 and 77.3 per cent respectively. Canadian stations, plotted in Fig. 1, do not occupy a favourable position on the basis of thermal efficiency. Performance data of typical Canadian power stations and some American stations of comparable size are given in Table I (see Appendix).

†See Appendix, Table I.

*References to the bibliography at the end of the paper are indicated by superscript numbers thus [1].

Developments of the past twenty years have been reflected in the improvement of the station performance. Some American stations of 60,000 kw. and higher, placed in service in 1915, required 20,000 B.t.u. per kw.h.; stations of 1925 required 15,000; and an 80,000 kw. station placed in service in 1935 has achieved a record of 11,166[7] B.t.u. per kw.h. for the first six months of operation. One station, placed in service in 1920, which required 20,000 B.t.u. per kw.h. for the first year of operation, had reduced this figure to 13,300 by 1932.

Of the large stations in Great Britain, Battersea[4] (L.P.C.L.) had the highest thermal efficiency in 1936 and a performance of 12,350 B.t.u. per kw.h. Certain Canadian stations[8] have shown improvement in their thermal performance in recent years, notably since 1930. The percentages of auxiliary power and feedwater make-up have been reduced. Higher pressures have been adopted. In certain stations superposed turbines have been installed from which the exhaust is discharged to the low pressure steam mains of old plant, through any or all of the old low pressure turbines and their respective condensers. New high pressure steam-generating plant is required and the arrangement has the advantages of providing increased output and of approximating the performance of high pressure plant of equivalent capacity. Larger turbines have warranted two, and, where fuel cost is high, three extraction heaters. In certain cases heat recovery devices have been used in the turbine heat balance to heat the feedwater. In many cases the practice of providing heat exchangers to recover the waste heat from the generator air-cooler, bearing oil-cooler, steam-jet vacuum pumps and heater drips has not been adopted nor have its possibilities,

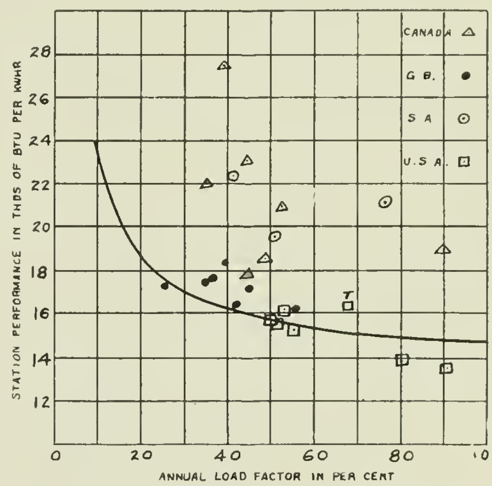

Fig. 1—Thermal Performance of Central Stations in Canada, Great Britain, South Africa and the United States of America.

maybe, been fully appreciated. Feedwater temperatures tend to fall below the standard set up by Reynolds[9] in 1929. Since the feedwater temperature is determined by the extraction point of the final feedwater extraction heater, the choice must be made at the time of purchasing the turbine. In regard to the above devices for recovering waste heat, however, it is possible, in certain cases, to substitute the condensate for the raw water formerly served to the bearing oil-cooler and other devices. In this way the temperature of the condensate can be served to the first extraction heater at a temperature of about 100 deg. F. In the case of new turbines the practice of providing sufficient capacity in the generator air-cooler to permit complete heat recovery by the condensate has the advantage that, in an emergency, a slightly higher capacity can be obtained from the generator by by-passing the condensate and serving cold water to the air-cooler. The regenerative cycle was used on turbines on this continent about 1922 and its possibilities have been discussed.[10] With the adoption of higher pressures and temperatures, turbine and plant heat rates obtainable in large modern power plants have been compared over a wide range of the pressure-temperature cycle realm.[11]

Power development in Canada has been rapid. New thermal plants will be built and new equipment added to present plants. Station performance may be expected to show notable improvement. Larger fractions of the stations will operate at higher pressures and temperatures as units under construction are placed in service and old plant is modernized by the installation of superposed turbine units and interposed feedwater heaters. Obsolete turbine heat balance arrangements will be remodelled by converting present heat exchangers to serve as heat recovery devices.

Interconnection and interchange of power between thermal and hydro systems will tend to reduce the reserve capacity presently required and the capacity of spinning reserves which are expedient in certain cases. It may be that the difference in performance of the large American and British stations can be accounted for by the urgency of interconnecting the various British systems which has tended to divert attention from possible improvements in individual stations. Interconnected steam stations may be operated on base load and it is usual for the most efficient stations to carry a larger fraction of the load.

The size of stations will increase with normal growth of load and comprehensive studies will be required to insure the best possible engineering design and construction of new plant. Before starting construction of a recently built station, over 150 studies on important subjects were made

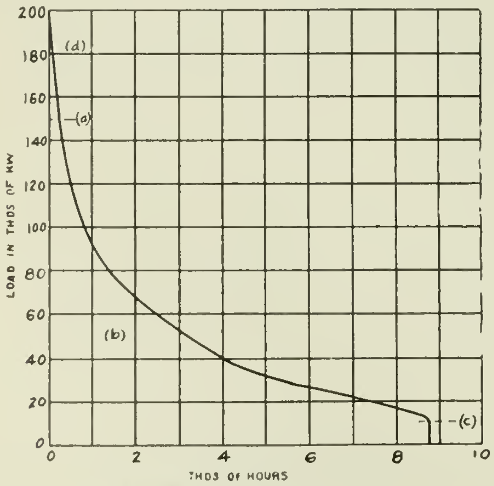

Fig. 2 Load Duration Curve.

on the basis of pure economics in order to assure the designers that they were not being blinded by prejudice in making their decisions. Comparisons were based upon fuel cost per hundred million B.t.u. and fixed charges of 13 per cent.

With the growing importance of this field, periodic interchange and publication of significant engineering data and round-table discussion of operating difficulties by station executives may be expected.

2. Cost of Power

The cost of generating steam power is vital in any proposals for interconnection of power systems and interchange of power. The effect of the annual load factor on the cost of generating steam power is not always well understood and there is often a lack of uniformity of practice in regard to fixed charges. The cost of steam power includes items for fuel, maintenance, operating labour and fixed charges. The trends of these separate items of cost and of total cost have been discussed.[12]

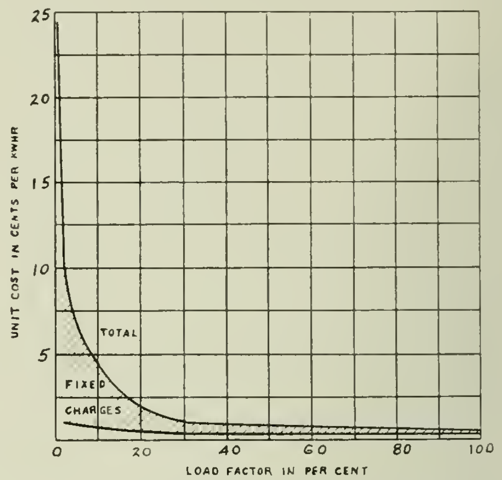

Fig. 3—Relation of the Annual Load Factor to the Unit Cost of Steam Power.

The relation of fuel cost and fixed charges to total cost may be seen from an example for which the load duration curve is given in Fig. 2. It is proposed to consider the cost of generating certain parts of the total load: (*a*) the top 25 per cent of the load; (*b*) the bottom 75 per cent; (*c*) full base load; (*d*) the upper 10 per cent. Plant cost may be taken at $100 per kw. Coal having a heating value of 13,500 B.t.u. per lb. costs $5 per ton. Fourteen per cent of the capital cost is provided to cover fixed charges. The station performance in B.t.u. per kw.h. may be calculated from the formula already discussed and the fuel cost per kw.h. determined. The peaks (*d*) and (*a*) are considered as on demand for two and three months of the year respectively. Labour and maintenance are functions of the total fuel consumed. The unit cost for energy for each case is shown in Table II (see Appendix) and Fig. 3.

It will be seen that at low load factors the burden of expense rests with the fixed charges.

Steam station investment and operating costs have been discussed.[13] Stations to produce a kw.h. for 12,000 to 13,000 B.t.u. have been built for the same price—including the cost of special engineering studies and in the design and manufacture of special equipment—as those built a decade ago, to operate at 15,000 to 20,000 B.t.u. per kw.h. New developments in the art and changed price levels have made this possible. Many of the older stations were designed for load factors not realized at present. In a representative group of modern stations, about 60 per cent of the total cost of power is in the fixed charges, and fuel alone represents about 27 per cent. Developments favourable to improvement in the performance of stations of moderate size are the improved performance of high heat-drop, high speed turbines, and improved generator efficiency in high speed units through the use of hydrogen as the cooling medium. High pressure non-condensing turbines, when used as superposed units, serve to bring usable low pressure condensing turbine equipment back into service as modern plant and give added capacity at a low investment cost. An industrial plant or group of plants, requiring steam at a moderate pressure for processing and heating, is enabled to produce power at a cost which is not available to the large stations which have to absorb the heat loss which characterizes condensing plant. A 3,500 kw., 3,600 r.p.m. turbine, operating at a throttle pressure of 430 lb. per sq. in. gauge and 750 deg. F., exhausting at 100 lb. per sq. in. gauge, in conjunction with steam-generating plant having an efficiency of 80 per cent, will produce a kw.h. at the switchboard for about 5,000 B.t.u. at the coal pile. The illustration is indicative of the saving which may be effected by superposition of high pressure units exhausting into the low pressure mains of obsolete plant.

3. Interconnection of Power Plants

Interconnection of power plants and interchange of power are notable developments in Canada, Great Britain and the United States. The history of water-power development in Canada[14] is a record of interconnection and interchange. The total turbine installation has increased from 173,323 hp. in 1900 to 7,945,590 hp. at the end of 1936. Development of the British grid system[15] has been described. A total of 539 separate systems were giving supplies in Great Britain in 1925, each relying entirely on their own individual stations. By a policy of concentrating the production of electricity in the more efficient stations, and interconnection of over 150 generating stations, it has been possible to reduce the annual fuel consumption over the old system by 2 million tons[16]—equivalent to 9 million dollars.

It is significant that, by 1934, over one-half of the total output was generated in 25 of the more efficient stations and nearly one-quarter more in 28 other stations. Thus, one-fifth of the stations accounts for three-quarters of the total output.[18] Total costs of energy sent out on local distribution systems[15] show provisional values for 1935-36 of 41.3 per cent for fixed charges and 30.9 per cent for fuel. It is stated that since 1914 the price of electricity in Great Britain has fallen more than in any other country.[17]

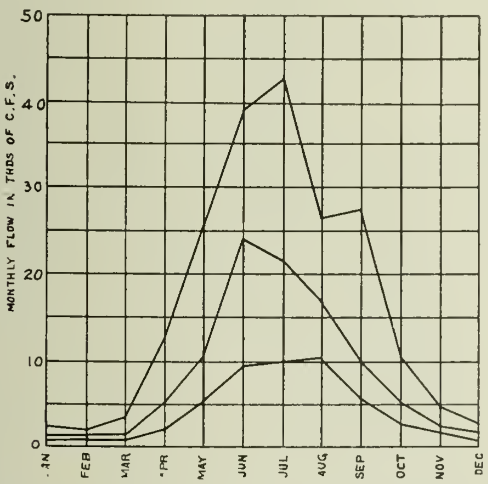

Fig. 4—Monthly Mean, Maximum and Minimum Flow of the North Saskatchewan River at Edmonton for the Years 1911-12 to 1934-35.

The output of electricity by the supply industry to March 31st, 1937, has shown an average rate of growth[19] of 16.7 per cent per annum on the figures for 1932-33.

Interconnection offers certain possibilities particularly favourable to steam-generating stations. The more efficient stations may expect improved annual load factors and, as smaller reserves are required, improved annual use or capacity factors. Reduction in the spinning reserves leads to improved station performance. Location of steam stations at strategic points where fuel is abundant, and where concentration of load is good, effects a saving by reducing transmission losses and may eliminate the expense involved in duplication of long transmission lines. New plant, to operate at high load factor, may be constructed as a one-turbine, one-boiler station.

It has been stated[20] that engineers no longer consider hydro and steam power as competitors but rather as complementary sources of power. Each should be developed as component parts of a system to the extent that such

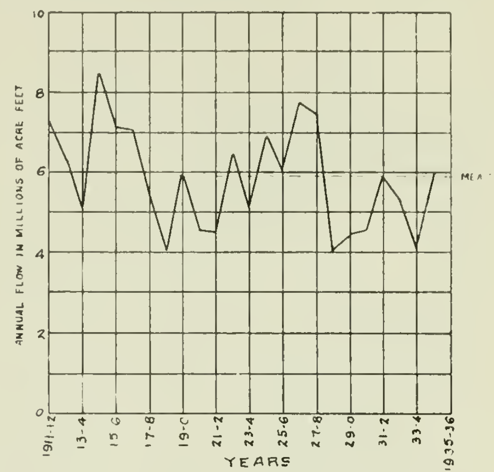

Fig. 5—Annual Flow of the North Saskatchewan River at Edmonton.

additions would result in lower total system costs for a given output.

Rivers which have their source in the mountains, as in Western Canada, present certain difficulties for normal hydro development. Flood conditions tend to prevail in spring, and normal full flow in summer when the electrical load is light. The normal run-off is small in winter when the load is heavy. Moreover, the monthly flow shows a wide variation from year to year. The monthly mean, maximum and minimum flow of the North Saskatchewan river at Edmonton is shown in Fig. 4 for the years 1911-12 to 1934-35, and the annual flow in Fig. 5.

When the added cost for summer storage of water in mountain lakes to care for the winter deficiency in run-off is excessive, periods of low flow may be taken care of by auxiliary steam plants. The total installed capacity of fuel-electric stations in Canada, operated as auxiliary to hydro, was 206,831 hp. in 1935,[14] of which steam turbines accounted for 178,453 hp. and oil and gas engines 9,069 hp.

4. Steam Power Plants

In 1935, there were 566 electric generating stations in Canada,[1] of which 397 were commercial stations and 169 were municipal stations. The former number is made up of 213 hydraulic and 184 fuel stations, the latter 103 hydraulic and 66 fuel stations. The total capital invested was $1,459,821,168 Revenue from the sale of electric energy was $127,117,954 including $79,341,554 for commercial stations and $47,836,400 for municipal stations. Taxes accounted for 9.45 per cent of the total expenses for all stations as compared with 8.02 in 1931; 20.7 per cent of the total expenses for commercial stations as compared with 16.5 in 1931; and 1.12 per cent of the total expenses for municipal stations as compared with 1.53 in 1931. The total number of persons employed was 15,342.

New plant has been installed recently or is under construction in public utility and industrial stations. The largest steam turbine in Canada was put in operation during 1937, replacing a 5,000 kw. low pressure unit at the Ford plant,[21] Windsor, Ontario. The unit has a capacity of 20,000 kw. This turbine, and a 5,000 kw. superposed turbine, are served with steam at 800 lb. per sq. in., 800 deg. F., by two new steam-generating units. At Glace Bay, a 7,500 kw., 3,600 r.p.m. superposed turbine to operate at 440 lb. per sq. in., 740 deg. F., and two steam-generating units having a capacity of 185,000 lb. per hr. each are in operation as No. 3* plant of the Dominion Steel and Coal Corp. At the Regina† station,[22] new steam-generating plant, capacity 150,000 lb. per hr., at 450

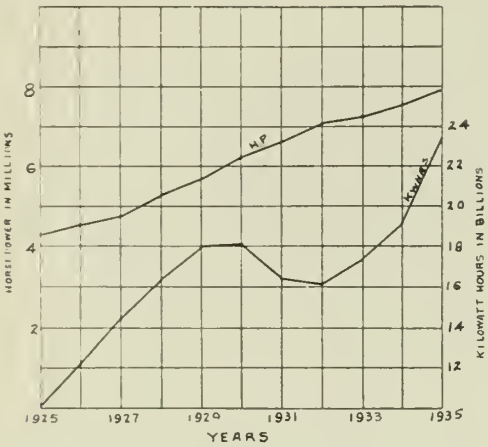

Fig. 6—Installed Hydraulic Horse Power and Energy Generated in Central Electric Stations 1925-1935.

lb. per sq. in., 825 deg. F., was installed and in operation in 1937. A new 15,000 kw., 3,600 r.p.m., turbine, to operate at 400 lb. per sq. in., 800 deg. F., vacuum 29 in., is under construction.

A 15,000 kw., 3,600 r.p.m. turbine, 375 lb. per sq. in., 750 deg. F., vacuum 29 in., and a steam-generating unit having a capacity of 155,000 lb. per hr., are under construction for Edmonton. In 1936, at the Grand Lake Station, a 6,250 kw., 3,600 r.p.m. turbine, 410 lb. per sq. in., 650 deg. F., vacuum 28.35 in., and steam-generating plant having a capacity of 100,000 lb. per hr., were placed in service.

The new steam-generating unit of the Bathurst Power and Paper Co., Bathurst, N.B., designed for 110,000 lb. per hr., 650 lb. per sq. in., 725 deg. F., is the first modern high capacity, high pressure unit in the Canadian paper industry. Power is produced and the back pressure steam is used for process work.

A record, maybe, for the engineering and construction, in a six months winter period, of a steam-generating plant to provide 300,000 lb. of steam per hr., on the site from which the old building and equipment required to be demolished, was accomplished by the Ontario Paper Co. at Thorold,[24] Ontario, in 1935-36. The installation replaced electric boilers installed in 1933 to utilize excess hydro power. Steam conditions were 450 lb. per sq. in. and 680 deg. F. Two 5,000 kw., 5,000 r.p.m, geared turbines, were installed[25] later to operate at 420 lb. per sq. in., 670 deg. F. Steam for process work is extracted at 125 lb. per sq. in., 40 per cent of the total steam being extracted at full load. The balance is exhausted at 30 lb. per sq. in.

A small plant was constructed at Picture Butte in 1936, consisting of a 1,250 kw. turbine,[26] 250 lb. per sq. in., 510 deg. F., and steam-generating plant[8] to provide 60,000 lb. per hr.

Seaboard‡ Power Plant,[27] and Harrison Lake Plant,[28] were completed in 1930 and 1931 respectively. Both burn high ash refuse coal in pulverized form.

*See Fig. 8 for details.
†See Appendix, Table III for details.
‡See Appendix, Table I.

Economic Factors

The output of Canadian Central Stations has resumed the upward trend of the 1926-29 period. The relation of installed hydraulic horsepower and energy generated in central electric stations[29] is shown in Fig. 6. The energy, in kw.h., is increasing in relation to the installed capacity.

General problems connected with the future growth of power load, and means for meeting such an increase, have been discussed,[30] and a steam station cost survey has been presented.[13] With the return to normal prosperity and the resumption of load growth, American manufacturers of steam power plant equipment are busy.[2] British manufacturers are offering later delivery dates than formerly, due, maybe, to preoccupation with extensions to the larger, more efficient stations which serve the "Grid" and the rapidly increasing penetration of electricity in Great Britain. The indications are that a substantial increase in generating capacity must shortly be provided in Canada by utilities and industries with small spare capacity, and that this new capacity must be installed at low cost and designed to give the greatest possible return per dollar invested.

The consumption of electricity for lighting and domestic services in Canada is about normal for this continent; however, the enormous consumption for industrial purposes is influenced by its large pulp and paper industries.[31] These industries require steam at moderate pressure for process work as well as power. Recent construction includes modern high-pressure, high temperature steam power stations at Thorold, Ontario; Baie Comeau, Quebec; Bathurst, N.B., and Liverpool, N.S.

The expensive pioneer work in high pressure, high temperature equipment has been done. Engineers have succeeded in constructing steam power stations with high thermal performance for about the same cost as the old low pressure stations. Substantial advances have been made in the art of station design. The cost of future equipment, its probable life, its overall station economy, and probable fuel prices, will govern the final decisions on new plant and reconstruction of old plant. These developments should be given consideration in projected load studies.

Superposition

Superposition consists in the addition of new high-pressure, high-temperature, low-heat-drop turbines which receive high-pressure steam from new high-pressure boilers, exhaust into the old low-pressure mains and through the serviceable old low-pressure turbines to the condenser. A feedwater heater may be provided to operate at the throttle pressure of the low-pressure turbine. Superposition has the advantage of increasing station capacity and improving station performance. Throttle pressures of 400 and 600 lb. per sq. in. are favoured in Canada. Extraction turbines supply steam for process work. These pressures provide a suitable margin for superposition in the rehabilitation of old plants. At the Dosco No. 3 station, a 7,500 kw., 440 lb. per sq. in., 740 deg. F. superposed turbine operates against a back pressure of 150 lb. per sq. in. and provides sufficient steam to serve all low-pressure turbines of the old station. At the Ford station, a 5,000 kw., 800 lb. per sq. in., 800 deg. F. superposed turbine operates against a back pressure of 175 lb. per sq. in. and is compounded with the present 10,000 kw. low pressure unit. In the United States, 28.6 per cent of the capacity of the new central station installations[2] were topping units. Recent rehabilitation of the Fisk station, first operated in 1903, and the earliest steam plant designed solely for steam turbines, has added 30,000 kw., to capacity, has salvaged much of the old equipment, and reduced the heat rate from 24,000 to 12,150 B.t.u. per kw.h. The Conner's Creek station,[33] Detroit, is an interesting example of the modernizing of old plant and of the accuracy with which engineers to-day can predict the average annual performance. The old station operated at 220 lb. per sq. in., 600 deg. F.; station performance, 19,000 B.t.u. per kw.h.; boiler efficiency, 78 per cent. The new plant operates at 600 lb. per sq. in. and 825 deg. F.; station performance, 12,800 B.t.u. per kw.h. (design), 12,560 B.t.u. per kw.h. for the year 1935; boiler efficiency, 86 (design) and 85.9 per cent for the year 1935.

The pause in steam power station construction in the years from 1931-1935, caused by reduced load and other factors, has given an exceptional opportunity for public utility engineers to review the economic aspects of past trends and accomplishments and to prepare for the future in an orderly manner by a study of new or improved methods of providing for future growth. The net results of the experiences of the past and thoughts for the future indicate that superposition of high-pressure equipment on existing stations will play a dominant part in the economical development of power supply, at least in the immediate future. Data on existing superposed installations have been tabulated.[34] At Battersea, two new boilers, having a capacity of 500,000 lb. of steam per hr. each, at 1,420 lb. per sq. in., 965 deg. F., will serve a compound unit. The 16,000 kw., 3,000 r.p.m., high-pressure turbine, will reduce the pressure to 600 lb. per sq. in., at which it will be supplied to the 84,000 kw., 1,500 r.p.m. turbine. Arrangements will be made to operate the high and low pressure units independently and the low-pressure unit can be operated from the existing boiler plant. There is much usable low-pressure turbine plant in Canada which warrants consideration in connection with proposed extensions and modernization. The operating conditions, 400 lb. per sq. in., 700 deg. F. were adopted in larger stations[32] in 1924, and by 1926 the conditions 600 lb. per sq. in., 750 deg. F. were available.[32]

Station Buildings

Station buildings require to be substantial, well lighted and clean. Architectural design has produced pleasing lines and landscaping of grounds has added beauty and charm. Public consciousness is becoming appreciative of beauty in the appearance of industrial plant which in pioneer days has tended to be drab. It has been stated that Battersea station is more photographed than St. Paul's Cathedral. Aluminum paint for equipment and light colours for walls and partitions facilitate lighting. Partitions are omitted between the boiler and turbine rooms. Vacuum cleaning has been adopted in some cases. Galvanized expanded metal gratings are used for stair treads and operating galleries. Heating and ventilation are required and roofing materials which inhibit condensation are needed when extreme winter temperatures are encountered. Chimneys are high to secure ample dispersion of the discharged gases.

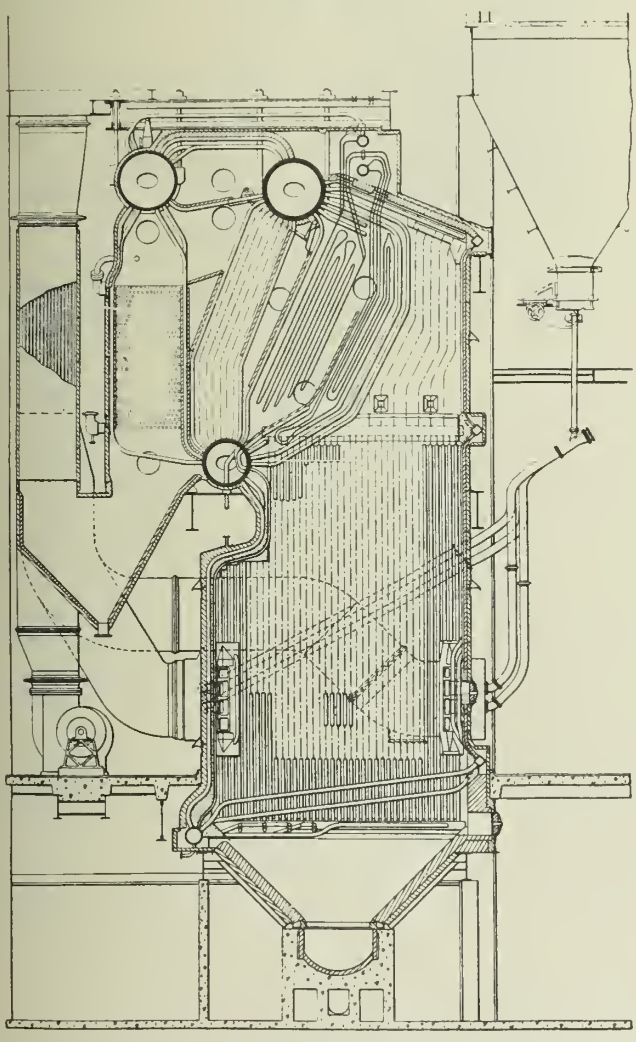

Fig. 7—C-E 3-Drum Bent-Tube Steam Generator for Windsor Station, Ford Motor Co., Windsor, Ont.

Fly-Ash Handling and Disposal

Coal and ash handling have been discussed.[8] Dust removal from flue gases is a recent development. Since 1931, as a result of public demand, new stations located within city limits or adjacent to other industrial plant, are usually provided with equipment for removing a satisfactory proportion of fly-ash. Electrostatic precipitators are expensive, but have an efficiency of from 90 to 95 per cent with a draft loss of 0.1 to 0.5 in. of water. Dust catchers of the cyclone type are less costly and have an efficiency of 70 to 90 per cent. Cyclones of newer design, it is claimed, will remove 70 to 80 per cent of the fine dust and almost 100 per cent of all larger than 325 mesh. Erosion of metal surfaces in contact with flow of dust, and possible corrosion of cyclones by sulphurous moisture in the flue gas, have been overcome to a considerable extent in one type of cyclone by the use of cast iron construction for the upper sections and inlet head of the cyclone, while another uses heavy steel plate. Data on fly-ash characteristics and the performance of dust catchers has been published.[35] British practice[36] has been summarized.[37]

The Brooklyn Edison Co. was one of the first in the central station field to begin an investigation of fly-ash control. The method and apparatus, developed for investigating the effectiveness of different types of dust separating equipment, have been described.[38]

A recent development in ash disposal[8] is reported,[35] in which fly-ash is used as a replacement for Portland cement in concrete. In the reconstruction of a dock at the Chester station, one bag of fly-ash having the same capacity as a cement bag, and weighing 45 lb., replaced one bag of cement, weighing 94 lb., in the mix, which thus contained 413 lb. of Portland cement, 45 lb. of fly-ash, 1,240 lb. of sand, and 2,100 lb. of $\frac{3}{4}$ in. graded pebbles per yard. Thirty U.S. gallons of water were found to be sufficient. The test cannot be used as a definite criterion of the value of fly-ash as a replacement for Portland cement in concrete, but the results are indicative of the truth of statements made that fly-ash can be used to replace Portland cement within certain limits without reducing the strength of concrete, and be effective in reducing the amount of mixing water required and improving its workability.

Steam-Generating Plant

Modern high-pressure high temperature steam-generating plant is characterized by large capacity, high effciency and an availability about equal to that of the turbine. Moderate pressures and temperatures prevail in Canada. The Ford station at Windsor is an exception and here two steam-generating units, having a capacity of 200,000 lb. per hr., operate at 900 lb. per sq. in., 820 deg. F. This is the highest pressure plant in Canada, is the first Canadian application of controlled superheat and the first to use tangential type burners. The units consist of a 3-drum boiler, convection and semi-radiant type superheater, plate type air preheater and water-cooled furnace. A sectional view of this unit is shown in Fig. 7. The heating surface, in square feet, in each of the units is 9,010, plus 4,325 in the water walls; economizer, 4,229; air preheater, 9,940. The most economical point of operation is at 62.5 per cent of capacity, which requires 11,270 lb. per hr. of 14,200 B.t.u. Pennsylvania and West Virginia bituminous coals. At 82.5 per cent of capacity, 14,930 lbs. of coal are required per hour.[21] Certain of the larger stations in the Maritime provinces burn high ash, 20-24 per cent, coals. These include Grand Lake,[23] Minto, N.B; Harrison Lake,[28] Maccan, N.S; Seaboard;[27] which has been described, and Dosco. No. 3 at Glace Bay, N.S. At this No. 3 station of the Dominion Steel and Coal Corp., two steam-generators having a capacity of 185,000 lb. per hr. each, have been in operation for a few weeks. The units consist of 4-drum, bent-tube boilers with pendant type superheater, economizer and tubular air preheater. Details are given in Table IV, contract "D." Operating conditions are 475 lb. per sq. in., 750 deg. F. and feedwater temperature 300 deg. F. The Liverpool, N.S., unit, capacity 60,000 lb., 420 lb. per sq. in., 553 deg. F., of the Mersey Paper Co., is shown in Fig. 8, and the Thorold, Ontario, unit, capacity 150,000 lb., 450 lb. per sq. in., 680 deg. F., of the Ontario Paper Co., in Fig. 9. A third and duplicate unit has been ordered for Thorold which will provide an independent steam supply with a total capacity of 450,000 lb. per hr. At Baie Comeau, Quebec, a 350-ton newsprint mill is under construction along the most advanced lines. The design for the mill power plant equipment is based upon experience gained at the Thorold, Ontario, plant. For Baie Comeau, two coal-fired boilers of similar design are being installed. One of the boilers is to be fired in the conventional way with pulverized coal and the other is equipped to burn either coal or wood or both. The combined capacity of the two units will be about 150,000 lb. per hr. The heat content of the bark is about 8,500 B.t.u. per lb. (bone dry weight). It is expected that about 40,000 lb. per hr. of steam will be developed from 10,000 lb. per hr. (dry weight) of wood alone, at an efficiency of 50 per cent. The unit is capable of burning 31,300 lb. of spruce bark per hr., containing 68 per cent moisture. Steam generating plant in Western Canada has been discussed by the author,[8] and elsewhere.[22]

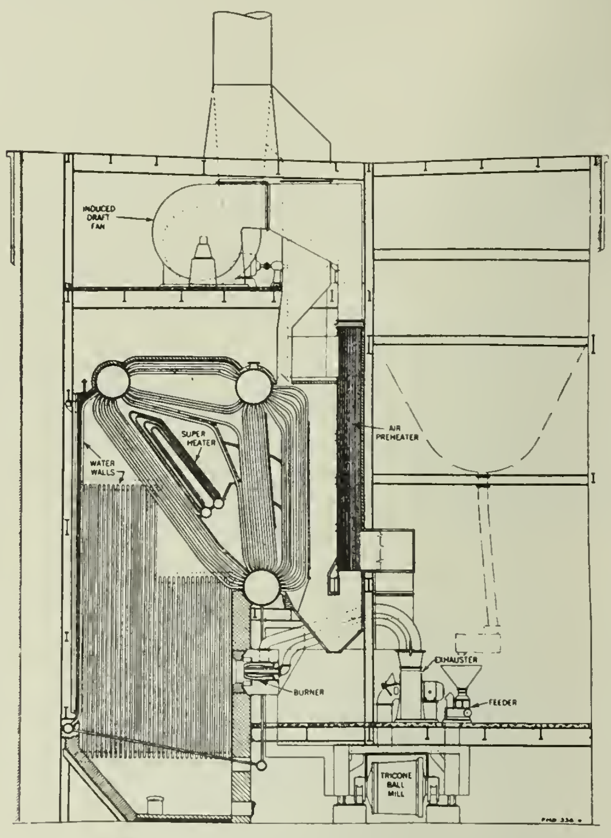

Fig. 9—F-W 3-Drum Bent-Tube Steam Generator, Thorold Station, Ontario Paper Company, Thorold, Ont.

Boilers

Boilers of the bent-tube type are favoured. Seventy-four per cent of the capacity in new central station installations in the United States were of this type.[2] The trend is toward a smaller number of drums and more and smaller tubes. A recent development, which has been favourably received in Canada where a compact, pulverized coal, gas or oil-fired unit is required, is the two-drum boiler in which integral waterwalls are provided. Two types are available, in one of these the circulation is crosswise, in the other, endwise of the drum. Nearly all high-pressure, high-capacity boilers are fitted with a furnace having waterwalls; and in the latest designs, the waterwalls are integral with the boiler circulation. The furnaces are also in most cases supplied with water-cooled furnace floors. Steam scrubbers or dryers are used to reduce the moisture content and carry-over to the superheater. The portion of waterwalled furnaces which require to be hot for ignition purposes are lined with plastic refractory. The trend is away from slag screens formerly used to inhibit "whiskers" or accumulation of slag among the boiler tubes. Furnaces are now designed on a basis which prevents molten ash entering the tube bank. Pulverized coal units predominate. Seventy-four per cent of the capacity in new central station installations in the United States were pulverized coal units, 16.3 per cent stoker fired, and the balance for oil and gas firing.[2] The temperature of the preheated air for pulverized coal units ranges from 350 to 450 deg. F. The highest efficiency of units using coal is obtained when the coal is burned in pulverized form and the efficiencies range from 84 to 87 per cent, depending upon the amount of air-heater and economizer equipment installed.

Treatment of boiler feed-water has been discussed briefly by the author.[8] Canadian central stations in Canada are increasing in size and importance. New operating conditions, introduced by higher pressures and temperatures, tend to emphasize the function of the chemist whose work has contributed largely in certain developments. Current problems, as, for example, turbine blade deposits, coal classification and spontaneous combustion in coal storage, boiler corrosion wherein copper is involved, and test methods for evaluating turbine oil, have been considered and reported upon.[39]

Fuels

The recent symposium on the burning of Canadian coals,[40] held at Montreal under the auspices of the Engineering Institute of Canada in connection with the Semicentennial meeting, will perhaps serve as a turning point in the economic utilization of fuel in the central stations in Canada. Canada has an abundance of fuel of varying types and grades. Transportation of the fuel presents certain difficulties. Nova Scotia has large supplies of bituminous coals. The larger central stations burn the refuse fuel called "splint" coal. This contains 20-24 per cent ash and is burned in pulverized form.[27,28] New Brunswick has supplies of low rank, high ash coal.[23] Coal is relatively expensive in Quebec and Ontario, due to transportation and other factors. As limitations are placed on the use of so-called "excess power" in electric boilers, the economic possibilities of refuse from pulp mills as fuel for steam boilers will receive consideration. Production of the high moisture lignites of Saskatchewan has increased in recent years. The necessary pioneer development work in the burning of high moisture, 31 to 34.5 per cent, lignite in pulverized form, has already been overtaken in connection with one of the Texas stations.[6] Similar development may be expected in Saskatchewan in future years. Saskatchewan central stations burn bituminous coal in pulverized form with oil as an alternative; Alberta lignites containing 18 to 24 per cent moisture are burned on chain grate stokers. The Moose Jaw station of the National Light and Power Co. has burned Alberta lignite coal in pulverized form from time to time since 1928. Alberta has an abundance of bituminous and lignite coal. Alberta lignite slack containing 24 per cent moisture was burned for the first time on chain grate stokers in 1914. No installations have been made in the central stations of Alberta for burning lignite in pulverized form. Development of fuel technique in connection with Alberta coals has been of a high order.[40] Methods are available which facilitate the determination of the heating values of coal, with sufficient accuracy for central station work. Periodic samples are analysed for ash and moisture content only and the heating value is determined from a coal chart. It has been found that with Alberta coals the heat value, proximate analysis, and ultimate analysis, vary in a regular manner with the ash and moisture percentages. It is therefore possible to prepare a set of charts, for any coal, from which can be read the heat value and analysis corresponding to any particular ash and moisture.[41] The expense for an analysis of ash and moisture only is a small fraction of that involved for even a proximate analysis and heat value determination.

Fuel costs in cents per million B.t.u. for certain stations are approximately as follows:—Edmonton, Alberta, 10.0; Saskatoon, Saskatchewan, 20.5; Regina, Saskatchewan, 21.25; Glace Bay, N.S., 15.8; Minto, N.B., 15.19. These values may be compared with the 14.82 given for the most efficient steam central station in the world.

5. Steam Turbines

Typical examples of Canadian central station turbine installations are given in Table I and their performance has been plotted in Fig. 3. The 15,000 kw. Parsons unit at the city of Regina station, installed in 1930, was the first condensing turbine of this capacity to operate at 3,600 r.p.m. Throttle conditions are 350 lb. per sq. in. and 725 deg. F. Three extraction heaters provide a final feedwater temperature of 280 deg. F. The Regina station has the best average annual station performance, 17,800 B.t.u. per kw.h., in the utility field in Canada for 1936. Old 200 lb. per sq. in. boilers were operated for 34 days, and the 400 lb. per sq. in. boiler was operated at a reduced pressure of 200 lb. per sq. in. for an additional 17 days. The station has an installed capacity of 28,000 kw. The Grand Lake station of the New Brunswick Power Commission, Minto, N.B., consists of two 2,500 kw. Oerlikon turbines and one Parsons 6,250 kw. turbine, making an installed capacity of 11,250 kw. This station had a performance in 1936 of 18,600 B.t.u. per kw.h. with coal containing 22 per cent ash, 8 per cent moisture, and having a heating value of about 11,200 B.t.u. per lb.

Canada is dependent upon other countries for large central station turbines, although steam-generating plant and other central station equipment are produced in this country. The turbine heat balance is the dominant factor in station design and the performance of modern turbines can be predicted with a high degree of accuracy. In addition to high turbine efficiency, the regenerative cycle and heat recovery devices in the turbine heat balance have contributed largely to the fine performance of modern stations of all sizes. Recovery of generator losses by the

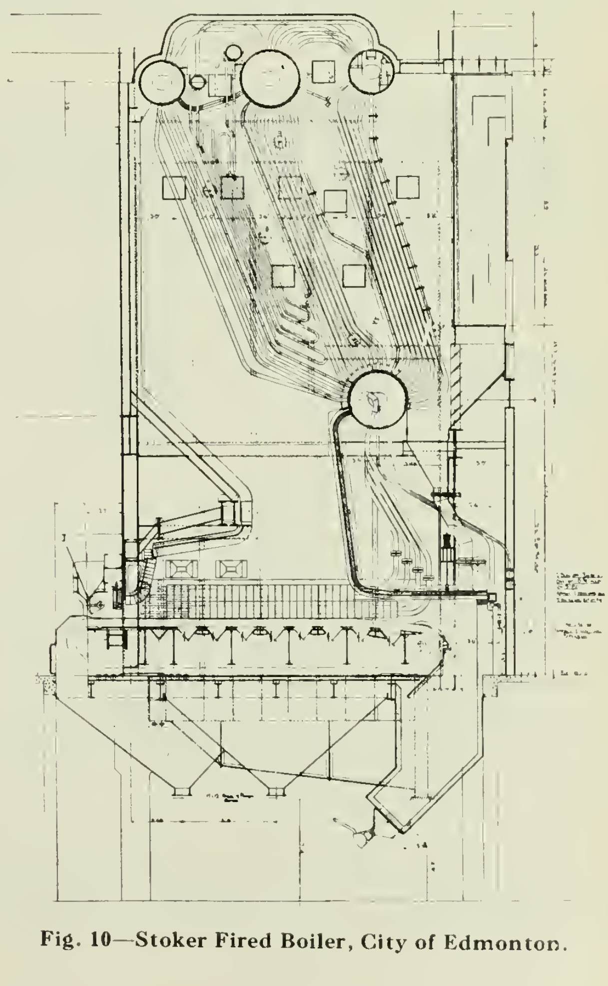

Fig. 10—Stoker Fired Boiler, City of Edmonton.

generator air-cooler, the mechanical losses of the turbine by the bearing oil-cooler, and application of the condensate as the cooling medium for the steam-jet vacuum ejectors, evaporator condenser and heater drips, are usually warranted and have the advantage in operation of keeping these devices scrupulously clean and free from scale.

Turbines received their full share of the discussion at the World Power Conference of 1936. American practice has been ably presented.[7] The tendency in Great Britain[42] is to stabilize steam pressures for units of 30,000 and 50,000 kw. at from 600 to 650 lb. per sq. in. and temperatures at 800 to 850 deg. F. For units of about 20,000 kw., 300 to 400 lb. per sq. in. and 730-775 deg. F. are favoured. Higher pressures are reserved for future base load plants. Increases of steam temperature above 850 deg. F. introduce more difficulties than further increases of pressure. The use of the regenerative feedwater heating is almost universal in present-day power plants, as it results in lower heat consumption, reduced wetness loss, and a smaller condenser for a given output.

Steam turbine condensing units having a speed of 3,600 r.p.m. and a capacity of 25,000 kw. have been offered in Canada.[30] While condensing units of this capacity have not been manufactured in the United States, 56 per cent of the capacity of their new central station installations were of this high speed. Hydrogen has been used as the cooling medium in 56 per cent of the capacity of all of these new installations.

In recent years initial steam conditions are usually chosen so that with the given turbine efficiency, the moisture content at exhaust does not exceed 12 per cent on the Mollier diagram. In many turbines, renewal of the last row of blades has been required, due to erosion caused by high moisture content in the steam at this point. Shrouding of the last row of blades with material developed to inhibit erosion has proved effective for the few years

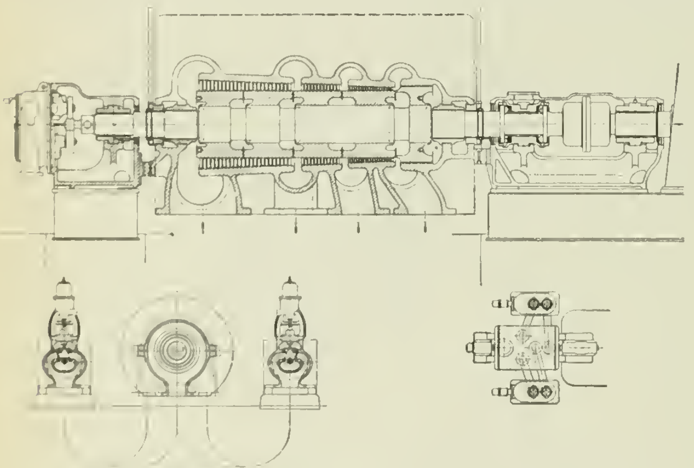

Fig. 11—Brown Boveri Topping Turbine, No. 3 Power Plant, Dominion Steel and Coal Corporation, Sydney, N.S.

in which satisfactory material has been in service. A British manufacturer has adopted hollow, forged blades, which give added stiffness. Water-sealed glands are standard on the vacuum ends of American turbines. They are also frequently used outside the regular high pressure steam glands to prevent leakage into the turbine room. Such leakage increases humidity and causes roofs to sweat in winter. In the earlier designs, water glands effected a small improvement in thermal performance. Condensers are also used to control humidity.

Recently built turbines of over 15,000 kw. capacity are provided with turning gears to rotate the spindle on starting up or shutting down. Rotation at 1 to 5 r.p.m. avoids harmful deflections or distortions which would otherwise cause rubs or vibration.

An open deaerator heater operating at slightly above atmospheric pressure is usual at one extraction point with a system of closed heaters. This deaerator reduces the oxygen content of the feedwater to about .03 cc. per liter. Feedwater storage combined with this heater is recirculated to prevent reabsorption of oxygen. Sodium sulphite is added to the feedwater to remove the last traces of oxygen. An evaporator, fed from an extraction point of the turbine, provides distilled water as feed make-up for the boiler.

Condensing surface in new units has been decreased to 0.562 sq. ft. per kw. Provision is made to reheat the condensate entering the hotwell to vacuum temperature. Retubing and relaning of old condensers has reduced the pressure drop and the undercooling of the condensate.[43] In one case the undercooling was reduced approximately 5 deg. F.

Circulating water to condensers is chlorinated to prevent the growth of algae and slimes inside the tubes. The heat of the steam supplied to steam-jet vacuum ejectors is recovered by inter- and after-condensers cooled by condensate.

6. Conclusions

The thermal performance of Canadian steam-electric plants does not compare favourably with that of plants of comparable size in some other countries.

Steam and hydro should be considered as complementary sources of power. A greater measure of uniformity of practice in connection with taxes and fixed charges will facilitate unbiased consideration of proposals for interconnection of power stations and systems and interchange of power. Development of these two sources of power should be on a basis which will result in the lowest total system cost. The situation in certain areas of Canada warrants study of the correlation of these two sources of power with a view to lower rates to customers.

Studies, based upon minimum system costs, reveal in true perspective the possibilities of steam-electric power plants and the significance of high thermal performance.

New plants and additions to present plants will be constructed, on the unit system (one turbine, one boiler), for operation at high pressure and temperature, equipped with extraction heaters and heat recovery devices, with due consideration for safety, reliability, and comfort, to generate electrical energy at a minimum unit cost.

Note:—Boilers with type designation "I.F.B." are integral furnace boilers.

NOTE.—While the author's intention was to deal with stations of 50,000 kw. capacity and under, the importance of the material so kindly submitted by Mr. Johnstone Wright, Chief Engineer, Central Electricity Board, Great Britain, and the significance of these stations made its inclusion seem imperative.

Table I—Performance
Period January 1936 to

		Canada		
1	Name	Regina	Grand Lake	Lethbridge (1935)
2	Owner	City of Regina	New Brunswick Electric Power Commission	City of Lethbridge
3	Location	Regina, Sask.	Minto, N.B.	Lethbridge, Alta.
4	Operating pressure gauge ..... lb. per sq. in. Operating temperature ..... deg. F.	400 p.s.i., 750 deg. F. 200 p.s.i., 600 deg. F.	440 p.s.i., 650-700 deg. F.	150 p.s.i., 580 d g F.
5	Total installed capacity ..... kw.	28,000	11,250	5,075
6	Unit capacity of turbines ..... kw and r.p m.	1—15,000 kw., 350 p.s.i., 725 deg. F. 2— 5,000 kw., 200 p.s.i., 550 deg. F. 1— 3,000 kw., 200 p.s.i., 550 deg. F.	2—2,500 kw., 3,600 r.p.m. 1—6,250 kw., 3,600 r.p.m.	3,375 kw., 3,600 r.p.m. 1,200 kw., 3,600 r.p.m. 500 kw., 3,600 r.p.m
7	Spinning reserve carried on system	Only when load is liable to exceed base load — turbine	None	
8	Type and size of steam reheater—Surface ..... sq. ft.			
9	Number of extraction heaters	3 on 350 p.s.i. turbine	2	None
10	Final temp. feedwater, full load ..... deg. F.	280	260	207
11	Total number of boilers	8—500 hp.—200 p.s.i. press. 1—400 p.s.i.—750 deg. F.	3	2
12	Boiler surface, per unit ..... sq. ft	8— 4,928 1—16,500	2—6,900 1—8,000	5,040
13	Economizer surface, per boiler unit ..... sq. ft.	8—1,928 at 200 p.s.i. none on 400 p.s.i. boiler		1,100
14	Air preheater surface, per boiler unit ..... sq. ft.	400 p.s.i.—20,368	2— 3,900 1—10,900	None
15	Max. steam generator output per boiler unit, lb. per hr.	8 at 35,000 1 at 175,000	1—100,000 2— 60,000 (have been exceeded 20 per cent in emergency)	
16	Average boiler plant efficiency per unit ..... per cent	81.55 (for whole plant)	88.0 (approx.)	78.6 (1936)
17	Furnace equipment	4-6 retort and 1-7 retort Riley stokers. 2-Pul. fuel Riley Attrita (2 burners per blower) 1-400 p.s.i. 13,000 cu. ft. furnace, 6 Foster Wheeler intervane burners 27 in.	Finwalls—All walls cooled—4 Foster Wheeler and 3 Combustion Engineering burners—All mills impact—7 mills	Stoker
18	Ash handling equipment	400 p.s.i. Newveyor suction 200 p.s.i. drag chain and elevator	Allen-Sherman—Hoff.—Hydro jet	
19	Condenser surface per unit ..... sq. ft.	15,000 kw.—19,700	Unknown	4,332
20	Max cooling-water temperature ..... deg. F.	75	80 extreme—65 summer average	80
21	Min cooling-water temperature ..... deg. F.	34	33 winter	32
22	Gross annual output ..... kw.h.	54,476,300	43,230,000	8,550,975
23	Auxiliary use ..... kw.h.	3,377,470	2,838,420	531,670
24	Net annual output ..... kw.h.	51,098,830	40,394,980	8,019,305
25	Auxiliary use ..... per cent	6.1	7.02	
26	Average cost of coal per ton (2,000 lb.)	$5.35 f.o.b.	$3.40 in bunker	$1.48
27	Heating value of coal ..... B.t.u. per lb.	Coal—12,580 Oil —19,200	11,200	
28	Average annual station performance (net output) B.t.u per kw.h.	17,800 on basis operating old boilers at 200 p.s.i. 34 days—8 high press. boilers reduced to 200 p.s.i. on 17 additional days.	18,600	25,900 22,500 (1936)
29	Annual load factor—*a* ..... per cent	42.5	44.0	50.0
30	Annual use or capacity factor *b* ..... per cent	22.0	40.9	29.0

a Annual load factor = The ratio of the gross annual output in kw.h. to the product of the maximum peak load of the year and the total hours of operation per year.
b Annual use or capacity factor = The ratio of the gross annual output in kw.h. to the product of the rated capacities of the units in the station and the hours of the year (8,760).

THE ENGINEERING JOURNAL

THE JOURNAL OF
THE ENGINEERING INSTITUTE OF CANADA

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

VOLUME XXI MARCH, 1938 No. 3

The London Meeting

The Annual Meeting just concluded in London, Ont., like that held at Quebec in 1927, is an example of the successful gathering which can be organized by an active and enthusiastic branch, even if its membership is not large. Many people believe that a somewhat smaller meeting has a more personal touch than can possibly be the case when registration approaches the thousand mark; individual members are not so hard to find, and thus the hospitality which our branches always extend so freely to visiting members affords more opportunity for the formation and renewal of friendships.

The programme at London this year was of a rather unusual character. At the suggestion of the branch committee, the papers and discussions at the technical sessions centred around two important topics, each of which has marked local interest. The first—highway safety—is a matter of special concern in Ontario, where highway construction is being carried on on so imposing a scale, and also vitally affects the great army of motorists and pedestrians all over the Dominion. The pressing nature of the problem dealt with in the second series of papers—flood control in Southwestern Ontario—was emphasized by the occurrence of quite respectable floods in the Thames and Grand River Valleys only a few days after the conclusion of the discussions at the meeting.

Perhaps the most important matter dealt with at the business sessions of the meeting was the present discussion regarding co-operation between The Institute and several of the Provincial Associations of Professional Engineers, a question on which the future of the engineering profession in Canada depends; a notable address of the Prime Minister of Ontario at The Institute's Annual Dinner was full of anecdotes and engineering information, delivered in his own inimitable style; the entertainment which followed the dinner was appreciated by everybody; at the luncheon addresses we heard about the remarkable results of psychoanalysing Robinson Crusoe, and were informed as to the difficulties surrounding the export of power from Canada; in fact there was no monotony of subject matter, and something was available for everyone's taste.

Thanks to the hard work and excellent organization of the local committee, the success of the meeting was undeniable. With a total registration of nearly three hundred and fifty, including delegates from the Maritimes and from British Columbia, Vice-President Buchanan and the branch members and ladies who formed his committees earned and received many expressions of appreciation of the results of their work and of the thoroughly enjoyable character of the meeting.

Presidential Duties During February

On Saturday evening, February 5th, the President attended the annual banquet of the graduates of L'Ecole Polytechnique at the Cercle Universitaire. Before the banquet he was accorded the honour of participating as an official witness in the ceremony of conferring the Honorary Degree of Doctor of Science upon S. A. Baulne, Professor of Reinforced Concrete at l'Ecole Polytechnique, by Mgr. Olivier Maurault, Rector of the University of Montreal. At the banquet which followed, the President had an opportunity of voicing the gratitude of The Institute for the contribution to its welfare made by graduates of L'Ecole Polytechnique. He called attention to the interesting fact that no engineering college in Canada has in proportion to its graduate strength given The Institute such a high percentage of executive officers, notably, Past-Presidents Ernest Marceau, Arthur St. Laurent, Arthur Surveyer, Albert Decary, Olivier Lefebvre, and G. J. Desbarats; Vice-President A. B. Normandin; Councillors Arthur Duperron, Hector Cimon, Aime Cousineau, Auguste Frigon, Bruno Grandmont and Alex Lariviere and the late Treasurer, J. A. Duchastel de Montrouge.

On Monday, February 7th, the President represented The Institute at the annual meeting in Montreal of the Canadian Forestry Association.

On Thursday, February 17th, at the annual smoker of the Montreal Branch he presented the following prizes: The Past-Presidents' Prize (Honourable Mention) to E. R. Jacobsen., A.M.E.I.C., and the Phelps Johnson Prize to G. Martin, Jr.E.I.C.

On this occasion, on behalf of the Council, he also presented to the recently resigned Assistant Secretary a piece of silver upon which the following inscription was engraved under the crest of The Institute:—

"Presented to John F. Plow, A.M.E.I.C.
February 17, 1938, in recognition of his
services to the E.I.C."

On Friday evening, February 18th, he presided at the regular monthly meeting of Council at which there was an unusually large attendance of outside members of Council.

On Saturday evening, February 19th, he represented The Institute at the Annual Banquet in Montreal of the Royal Architectural Institute of Canada, when the principal speaker, the Lieutenant-Governor of the Province of Quebec, paid an eloquent tribute to the Architectural Profession. On this occasion a member of The Institute, Mr. G. MacL. Pitts, was presented with a diploma indicating that he had been elected a Fellow of the R.A.I.C.

On February 24th, the President attended the luncheon meeting of the Ottawa Branch and presented the Gzowski Medal of The Institute to J. H. Parkin, M.E.I.C., Director, Division of Mechanical Engineering of the National Research Council, for his paper entitled, "North Atlantic Air Service, London-Montreal."

Mr. Challies took advantage of this opportunity to refer appreciatively to the prominent position members of The Institute were taking in advancing the cause of scientific and industrial research in Canada. The expressed policy of those in authority during the period around 1916-1920 when the Research Council was being established, that engineers should be "on tap but not on top," has long since and wisely been abandoned. Today members of The Institute were both "on tap and on top" at the National Research Council, as evidenced by the presence on the Council itself of Past President Julian C. Smith, Councillor Augustin Frigon, Dean A. L. Clark, Dean E. P. Fetherstonhaugh, Dean C. J. Mackenzie and its President, Major General A. L. McNaughton, and also by the fact that several of Gen. McNaughton's principal officers are members of The Institute, including Councillor Dr. Boyle, and the recipient of the Gzowski Medal, Mr. Parkin.

Recent Meetings of Council

Meeting of January 31st

A meeting of the Council of The Institute was held at the Hotel London, London, Ontario, on Monday, January 31st, 1938, at nine-thirty p.m., with President J. B. Challies, M.E.I.C., in the chair, and twenty-four past and present members of Council present.

The formal appointments were made of the Secretary, Treasurer, and the chairmen of the standing committees, together with other committee appointments.

On the recommendation of the Finance Committee, the secretary was directed to write to the secretaries of the various branches, enclosing a copy of the suggested uniform system for financial statements for the branches, as submitted by Mr. James McMillan of Calgary to the Round Table Conference in June 1937, with a request from Council that the branches adopt this system of classifying their accounts for their 1938 records.

Professor Spencer of Saskatoon, Chairman of the Special Committee on Membership and Management, presented an informal report of the situation in Manitoba, Saskatchewan and Alberta, as regards co-operation with the Professional Associations, in all of which provinces proposals somewhat similar to those which are being discussed with Nova Scotia were now under consideration. At the request of Council, Professor Spencer undertook to confer with the interested groups in these provinces on his return to the west. Professor Spencer remarked that in the western provinces there was a desire for some co-ordinating body for the Professional Associations, and he was requested to continue his discussions, explaining that The Institute Council is actively interested in working out arrangements generally similar to those for Nova Scotia.

Professor McKiel presented communications he had just received from Nova Scotia, including a revised draft agreement dated January 27th, 1938, in which a number of changes had been suggested in The Institute draft of the proposed agreement with the Nova Scotia Professional Association. After discussion, it was decided to place the consideration of this draft in the hands of a small committee consisting of the President and Councillors Newell and Busfield, who would confer with The Institute's counsel in regard to the changes suggested by Nova Scotia, the result of their conferences to be submitted to Nova Scotia for comment and possible approval.

The keynote of the discussion at this Council meeting was a strong desire on the part of all councillors for any action that might promote closer relations between The Institute and other professional engineering bodies, particularly the Provincial Professional Associations. Great satisfaction was felt at the prospect of an early conclusion to the negotiations looking to a compact between The Institute and the Nova Scotia Association.

Professor Spencer gave a report of the work of the Committee on Membership and Management, stating that necessary information regarding the organization of other societies had been collected and sent to councillors.

Mr. Busfield presented a verbal report of his Committee on the Publications of The Institute.

The Council rose at eleven forty-five p.m.

* * *

Meeting of February 18th

A meeting of the Council of The Institute was held at Headquarters on Friday, February 18th, 1938, at eight o'clock p.m., with President J. B. Challies, M.E.I.C., in the chair, and fourteen other members of Council present.

The Council noted with great regret the death of Kenneth Buchanan Thornton, and unanimously passed a resolution expressing sincere sympathy with Mrs. Thornton and family.

Discussion took place as to the organization and membership of the Papers Committee, whose functions are so important to the welfare of The Institute and the branches. It was decided that the committee for this year shall consist of vice-presidents in the various zones who will organize zone sub-committees consisting of representatives from each of the branches in their respective zones. It is hoped in this way to carry out more effectively the purpose of the committee in arranging for an adequate supply of papers and speakers, particularly for the smaller branches of The Institute.

In reporting progress on the proposed agreement with the Nova Scotia Professional Association, the President explained that a second draft, as revised by the Nova Scotia co-ordinating committee was now under consideration by The Institute's counsel.

In regard to the proposed new Section 76 of the by-laws, there was complete agreement as to the necessity of taking measures to secure a large and favourable vote, and, after discussion, it was decided that a telegram should be sent from the President to every branch chairman, asking each chairman to urge the corporate members of his branch to vote on this important question.

The report of the Finance Committee was presented, together with a draft budget for the year 1938, and, after discussion, this budget was approved as showing an estimated revenue of \$53,600 and an expenditure of \$52,200. It was noted that a small sum had been provided for much needed improvements in the headquarters building.

The resignations of two Associate Members and twelve Students were accepted. Four members were removed from the membership list. Three members were reinstated.

Consideration was given to the appointment of official delegates from The Institute to the Plenary Meeting of the International Electrotechnical Committee to be held in London in June of this year, and to the International Engineering Congress in Glasgow during the same month.

At the request of the Institution of Civil Engineers and the Institution of Mechanical Engineers recommendations were made as to the second award of the James Watt International Medal.

A number of applications for admission and for transfer were considered, and the following elections and transfers were effected:

Elections.		*Transfers.*	
Members	2	Associate Member to Member	2
Associate Members	10	Junior to Associate Member	4
Juniors	4	Student to Associate Member	6
Affiliate	1	Student to Junior	9
Students admitted	9		

The Council rose at eleven forty p.m.

John Bow Challies, C.E., M.E.I.C.

A review of the major progressive movements within both the Canadian Society of Civil Engineers and The Engineering Institute of Canada for the past 25 years reveals the fact that our 1938 President was constructively active in them all.

During that difficult transition period in The Institute's history, from 1915 to 1919, when the present organization was evolved from the Canadian Society of Civil Engineers and a new era of broadened outlook and enhanced usefulness for The Institute was inaugurated, the writer, as general secretary, had repeated cause for gratitude to J. B. Challies for the advice and assistance he rendered Headquarters, first as an officer of the Ottawa Branch, and then as a member of Council. He became the first and only chairman of the Ontario Provincial Division which was set up by Council for the sole purpose of leading the movement among the organized engineering bodies of Ontario for a licensing authority, with the result that there came into being the Association of Professional Engineers of the Province of Ontario. On the first Council of the Association he represented the Civil Engineers, in which position he served the Association during its formative period and until 1924 when he moved to Montreal. Elected to the Council of The Institute in 1920, he continued in office for two years, during which period he was chairman of the Special Committee on Policy that recommended important changes in the By-Laws of The Institute, all of which were subsequently endorsed by the membership. Perhaps the outstanding feature of these changes was the establishment of the basic principle that is the very warp and woof of The Institute's strength, namely, the right of every branch, large or small, to have direct and continuous representation upon Council and to select such representation from within its own membership. As a reward for his contribution to the licensing movement in Ontario, and to the clarification of the policies of The Institute, he was elected Vice-President in 1922. A member of the American Society of Civil Engineers and actively interested in promoting friendly relations with sister societies abroad, he became chairman of the Committee on International Co-operation in 1925. During 1935 and 1936 he assumed the treasurership, and in the period 1935-1937 was a member of the Consolidation Committee, when he strongly favoured a programme that would permit close co-operation between The Institute and the various professional associations on the basis of their present corporate status and without involving either the autonomy of The Institute or the independence of the Associations.

JOHN BOW CHALLIES, C.E., M.E.I.C.

A member of the famous 1903 Engineering Class of the University of Toronto, which class has already given The Institute a president and three vice-presidents, Mr. Challies commenced his professional career at Ottawa as an engineer of the Topographical Surveys of Canada. Subsequently he successively occupied the positions of chief hydraulic engineer, Department of the Interior; superintendent of Water Power for Canada; director and chief engineer of Water Power and Reclamation Service; director, Dominion Hydrometric Survey; member, Dominion Power Board; member, Dominion Fuel Board; consulting engineer to the Department of External Affairs. In the latter position, as adviser to four Federal premiers, he was for many years a familiar figure before the International Joint Commission and at Federal-Provincial conferences regarding international waterway matters. As its first director, he was largely responsible for the organization of the Hydrometric Survey of Canada, the Water Resources Papers of which are of great importance to engineers dealing with run-off or river flow problems. He took a leading part as special liaison officer representing the Federal Departments in the institution of the Research Council of Canada. Few contributed more constructively to the Dominion-wide movement among governmental employees for an adequate recognition of the engineer in the public service. He was one of the founders of the Professional Institute of Civil Servants. He represented the Government of Canada at the International Engineering Congress in San Francisco in 1915. The outstandingly successful character of Canadian participation in the World Power Conferences at London in 1924, at Berlin in 1930, and at Washington in 1936, was due in no small measure to Mr. Challies' initiative. While in the Federal Public Service he was a recognized authority on administrative, investigatory and international features of water resources and power matters. Since assuming, in 1924, a professional position with The Shawinigan Water and Power Company, of which Company he is now an Assistant General Manager, he has become equally well known in the electrical utility field.

Always a staunch supporter of any effort to advance the interests of the engineering profession, and with a successful record as engineer, administrator and executive, Mr. Challies assumes the presidency well prepared for its exacting duties. His promotion to the highest office in The Institute is a fitting reward for long and loyal service. Space does not permit reference to the President's extra-professional interests, except that his activities therein indicate a capacity for service that augurs well for a very successful presidency. (FRASER S. KEITH)

Address of the Retiring President

G. J. Desbarats, Hon.M.E.I.C.

Delivered before the Fifty-Second Annual General Meeting of The Engineering Institute of Canada, London, Ont., January 31st, 1938.

The ambitious title of President's Address is rather a misnomer in this case as I have no intention of giving an address, but propose to comment briefly on a few of the happenings in the last Institute year.

The outstanding event of the year was, undoubtedly, the celebration of the Semicentennial of The Institute at Montreal and Ottawa last June. It was a great privilege and a great pleasure to preside at this function, especially for one like myself who had known the Canadian Society of Civil Engineers in its early days when it was struggling for recognition and for its very existence. This great gathering, with a registration of about a thousand, amply repaid the organizers and was an inspiration to the Council and members of The Institute.

It was a pleasure for members of The Institute to welcome the delegates from sister societies and the calibre of these delegates was very flattering to The Institute. The leading Engineering Societies of Great Britain and the United States sent their presidents or vice-presidents to represent them to convey their greetings and present their congratulations to our Institute. These eminent engineers, busy men, took time, travelled long distances to be with us at our Semicentennial. It was a recognition of The Institute as the National Engineering Society of this country, representative of the profession in Canada and a token of the high position our Institute has attained in the engineering world.

The special number of The Engineering Journal issued at the time of the Semicentennial was a most creditable publication, a volume of over two hundred pages, containing the story of The Engineering Institute of Canada and a series of some twenty-seven articles by prominent Canadian engineers describing the growth of different branches of engineering.

During the past summer I visited all the Branches of The Institute from Sault Ste Marie to Victoria and later I visited the Branches in the Maritime Provinces. I also visited some of the Branches in the central portion but I wished particularly to visit the branches at a distance from headquarters which cannot have close relations with the administration of The Institute and very seldom meet The Institute's officers.

Needless to say I was very well received at all these branches. No doubt the warmth of the welcome was largely due to my official position as president but in every branch my stay was made very pleasant and I wish to thank the branches for the many courtesies extended to me.

It is difficult to over-estimate the importance of visits of this kind. They bring the officers and members of the branches in close personal contact with headquarters, they afford opportunities for discussion of Institute and Branch problems, they allow the branches to put forward in an informal manner valuable suggestions which would hardly be put forward in an official way, they provide opportunities for removal of misunderstandings and they promote friendly personal relations which are of great value to The Institute.

I was much impressed throughout my trip by the spirit of optimism which pervaded the branches. Unemployment among the engineers has practically disappeared, the engineers have had their full share of the better business conditions which have followed the depression and are looking forward to improved conditions in the construction trade and in government work.

It was pleasing to see the good relations which existed between the branches of The Institute and the Provincial Associations of Professional Engineers, but while these relations were of the friendliest nature it was apparent that steps should be taken to effect closer co-operation between these bodies so as to avoid duplication of effort and ensure joint action in all problems, local or national, of interest to engineers. This co-operation is particularly needed in the smaller communities where the comparatively heavy overhead falls on a small number of members.

Council has given particular attention to this problem and has worked on it continuously all year. The Plenary Council of June had it under consideration and appointed a Committee on Professional Interests charged especially to explore the relations with the Professional Associations and Council also appointed a special committee to discuss co-operation with the Nova Scotia Association. As a result of this activity conversations have been carried on with several of the Provincial Associations and in the case of Nova Scotia a tentative agreement has been drawn up and is now being discussed by the Association and the branches and I hope an arrangement will be made with the Nova Scotia Association which will be the precursor of similar arrangements in other provinces.

Before Council can enter into such an agreement it must be properly authorized and for this purpose it submitted the addition to the by-laws which was discussed here this afternoon. While this by-law defines the general lines on which the agreement is to be drafted it is sufficiently elastic to allow of meeting the special needs of the different Associations. Proper safeguards are provided to avoid any snap decision of Council. I hope that this by-law will obtain a large vote and will be adopted by a large majority.

I have sketched out in my mind a picture of the relations between a Professional Association and The Institute under a co-operative arrangement similar to the one now projected with the Nova Scotia Association. In a University city the students in Applied Science would be encouraged to join The Institute, the local branch would organize a students' section, would supply speakers to it, when needed would urge the students to contribute to its proceedings and also to attend the meetings of the branch. After graduating the student would become a Junior Member of The Institute and would attend the meetings of the branch, take part in its activities, come in contact and become acquainted with the older members. At the age of 27 this Junior would, if qualified, join the Association and automatically become an Associate Member of The Institute. At the age of 35 he would automatically come up for consideration and if qualified would join the member class of The Institute. It does not seem likely that many engineers under 27 years of age could qualify for membership in the Association or that they would feel the necessity for becoming legally Professional Engineers. I have used the age figures 27 and 35 because they are the age limits used by The Institute and because they seem suitable at the present time, but after experience has been gained other figures might be found better and if so would be adopted. The activities of the two bodies would be divided so that The Institute would handle all educational, technical and social activities, etc. The Associations would busy themselves in the legal sphere with questions of registration, remuneration, etc. At the present time a slight majority of the members of The Institute are also members of the Professional Associations. Under arrangements similar to the above, this majority would grow rapidly and The Institute would be composed of two groups, the larger and growing one composed of members of Professional Associations and a smaller one comprising, besides Students and Juniors, members residing abroad and the very small number who are not compelled by law to belong to the Professional Associations and do not wish to join them. Such an agreement would provide larger membership for both The Institute and the Associations, would ease the financial burden on the members, would avoid duplication of effort, provide practical identity of membership and uniformity of aims and prove a decided advantage to both bodies and to the Engineering Profession of Canada.

For the last few years the question of continuing the Engineering Catalogue has been debated every year. It was generally agreed that the Catalogue was a useful and creditable publication, its set up is attractive and it brings the name of The Institute before the public. Its financial results have, however, been disappointing and it was contended that The Institute should not engage in an enterprise of this kind. After canvassing members of The Institute, Council decided it would be advisable to abandon the Catalogue and has arranged to transfer its interests to Mr. N. E. D. Sheppard who has been connected with the Catalogue since its inception and who will continue its publication. The Institute will be relieved of responsibilities which are foreign to its general aims and will be assured that the publication which it has developed and nursed along and which fulfils a useful purpose will not be discontinued.

During the depression many of the members were unemployed and unable to pay their dues but were anxious to retain their membership in The Institute. To meet this situation, Council acting under by-law No. 37 formed a non-active list of members financially embarrassed who were excused from payment of annual dues while still remaining on the roll of members. In view of the improved conditions Council decided to do away with the non-active list and these members have either reverted to the active list or ceased to be members. Similar action has been taken regarding a number of Students and Juniors who were over the age limits. These members have either transferred to a higher class or been dropped from the roll. The list of members of The Institute is thus in a much healthier state than it was at the beginning of the year and gives a more accurate picture of the active membership of The Institute. The total membership of 4,536 shows an increase of 323 over last year. This is a reasonable increase and I hope it will be duplicated during the coming year.

At the close of my year of office I wish to acknowledge the great honour done me by my fellow members in electing me President of The Institute and to say that I appreciate the opportunity given me of serving The Institute and advancing the interests of the profession. I wish to thank the members of Council and the members of the various Committees of The Institute who have given time and effort to the work of The Institute and given me advice and assistance. I am also indebted to the Secretary whose experience and good counsel have been of great value to me and whose staff have worked faithfully during the year. Owing to the celebration of the Semicentennial the year has been an unusual one. I have found the experience very pleasant and I trust that my efforts will prove fruitful and of some use to The Institute.

Institute Prize Awards in 1937

W. H. Powell, M.E.I.C., awarded the *Past Presidents' Prize* for his paper on "The Need of the Engineer's Participation in Public Affairs," graduated from McGill University in 1909 with the degree of B.Sc., and was subsequently first assistant and articled pupil to Mr. B. J. Saunders, D.L.S. At the beginning of the year 1910 he was with the Maritime Bridge Company, New Glasgow, N.S., as a draughtsman, and in 1910-1911 was assistant on a Dominion

W. H. Powell, M.E.I.C.

E. R. Jacobsen, A.M.E.I.C.

Hydrographical Survey in the neighbourhood of Prince Rupert, B.C. In the following year Mr. Powell was in charge of a subdivision survey in northern Saskatchewan with the Topographical Surveys Branch, Department of the Interior, and from March to August 1912 he was in private practice on miscellaneous surveys. In August 1912 he was appointed city surveyor for the city of Vancouver which position he held for a number of years. In 1928 Mr. Powell became engineer for the Greater Vancouver Water District, and is at the present time engineer for the Greater Vancouver Water District and the Vancouver and Districts Joint Sewerage and Drainage Board, Vancouver, B.C. Mr. Powell was awarded the Gzowski medal for the year 1933-34 for his paper entitled "First Narrows Pressure Tunnel, Vancouver, B.C."

E. R. Jacobsen, A.M.E.I.C., received Honourable Mention for his paper submitted for *the Past Presidents' Prize.*

He was born at Calgoorlie, Australia, graduated from McGill University in civil engineering, 1929, and obtained his degree of M.Eng. from the same university in 1932. During his university course he was for three summers with McClave and McClave, as instrumentman and as field party chief for the State of New Jersey. In 1928 Mr. Jacobsen joined the Dominion Bridge Company Limited, Lachine, as designer, and has been loaned to their Winnipeg office and to the Canadian Bridge Company at Walkerville. He is at present structural designer for the Dominion Bridge Company Limited at Lachine, Que.

J. H. Parkin, M.E.I.C.

J. H. Parkin, m.e.i.c., awarded the *Gzowski Medal* for his paper on "North Atlantic Air Service, London to Montreal," was born in Toronto, Ontario, and graduated from the University of Toronto in 1912. From 1914 he was lecturer in mechanical engineering and then assistant professor of mechanical engineering. In 1926 Mr. Parkin was appointed associate professor of mechanical engineering, which position he held until 1929. In addition to his work at the University of Toronto, he was in 1916-1919 assistant to the engineer in chief, British Acetones, Toronto. In 1917-1929 in charge of aeronautical research and instruction at the University of Toronto, and in 1920-29 a consultant on machine and aeronautical questions. In 1929 he was appointed assistant director of the department of physics and engineering physics in charge of aeronautical research with the National Research Council, Ottawa, Ontario.

T. L. McCall, m.e.i.c., the winner of the *Leonard Medal* for his paper on "Some Coal Mining Practices of the Dominion Steel and Coal Corporation Limited," was born at Largs, Scotland in the year 1885. His mining engineering apprenticeship was begun in the year 1903 with Messrs. John and G. H. Geddes, m.e., Edinburgh, and in 1909 he successfully passed the British Home Office examination for 1st Class Colliery Manager. From 1910-1913 Mr. McCall was Assistant to the Managing Director of Ormiston Coal Company, Limited, Scotland, but in 1913 he went to the Federated Malay States where he was manager of Malayan Collieries, Limited until 1920. In 1921 he returned to Sydney, N.S., where he became assistant mining engineer with the Dominion Steel and Coal Corporation Ltd., advancing in 1929 to the position of chief mining engineer, which he holds at the present time.

J. R. Donald, m.e.i.c., has been awarded the *Plummer Medal* (gold) for his papers on "Fire and Explosion Hazards from Industrial Products" and "Chemical Engineering." He is president of the Donald-Hunt Company, Montreal, having graduated from McGill University in 1913, after which be joined the Nichols Chemical Company, Limited, at Sulphite, Ontario. The next year he was engaged in general consulting with the J. T. Donald and Company Limited. From 1916 until 1918 Mr. Donald was chief inspector of explosives and chemicals for the Ministry of Munitions, Canada, and in 1919 was appointed chemical engineer and chief chemist of the Canadian Packing Company Limited, Toronto, later joining J. T. Donald and Company Limited. When the Donald-Hunt Company Limited, inspecting engineers and metallurgists, was formed in 1934. he became president of that organization.

Edgar Stansfield, m.e.i.c., awarded the *Plummer Medal* (silver) for his paper on "The Burning of Low Rank Alberta Coals," graduated from Victoria University, Manchester, England, and came to Canada in 1906 as chemist with the Dominion Iron and Steel Company. From 1907 until 1910 he was chief chemist in an investigation of Canadian coals for the Dominion Government, and from 1910 until 1920 was chief engineering chemist for the Fuel Testing Division of the Department of Mines at Ottawa. From 1918 until 1921 Mr. Stansfield was also chief chemical engineer for the Lignite Utilization Board of Canada, and since 1921 has been chief chemical engineer for the Research Council of Alberta, and research professor of fuels at the University of Alberta, Edmonton, Alta.

D. C. McCrady, S.E.I.C.
Winner of the John Galbraith Prize.

T. L. McCall, M.E.I.C.

G. Martin, Jr.E.I.C.
Winner of the Phelps Johnson Prize.

The Fifty-Second Annual General Meeting

Convened at Headquarters, Montreal, on January 20th, 1938, and adjourned to the Hotel London, London, Ontario on January 31st, 1938.

The Fifty-Second Annual General Meeting of The Engineering Institute of Canada commenced at Headquarters on Thursday, January twentieth, nineteen hundred and thirty-eight, at eight o'clock p.m., with Vice-President J. A. McCrory, M.E.I.C., in the chair.

The Secretary having read the notice convening the meeting, the minutes of the Fifty-First Annual General Meeting were submitted, and on the motion of George R. MacLeod, M.E.I.C., seconded by J. G. Hall, M.E.I.C., were taken as read and confirmed.

Appointment of Scrutineers

On the motion of F. N. Harling, A.M.E.I.C., seconded by J. B. D'Aeth, M.E.I.C., Messrs. A. Turner Bone, A.M.E.I.C., and J. G. Hall, M.E.I.C., were appointed scrutineers to canvass the Officers' Ballot and report the result.

There being no other formal business, it was *resolved*, on the motion of J. L. Busfield, M.E.I.C., seconded by W. G. Hunt, M.E.I.C., that the meeting do adjourn to reconvene at the Hotel London, London, Ontario, at two thirty p.m., on the thirty-first day of January, nineteen hundred and thirty-eight.

Adjourned General Meeting at the Hotel London, London, Ontario

The adjourned meeting convened at three o'clock p.m., on Monday, January 31st, 1938, with President G. J. Desbarats in the chair.

After welcoming the members present, President Desbarats pointed out that the agenda as drawn up provided for the retiring President's address at five o'clock. He asked the meeting to approve of this method of procedure, which would involve the completion of the routine business regarding reports, etc., by that time.

On the motion of R. L. Dobbin, M.E.I.C., seconded by Geoffrey Stead, M.E.I.C., it was *resolved* that the routine business should terminate at five o'clock, and the retiring President's address be given at that hour.

The Secretary announced the membership of the Nominating Committee appointed to nominate the officers of The Institute for 1939 as follows:

Nominating Committee—1938

Chairman: H. F. Bennett, M.E.I.C.

Branch	*Representative*
Halifax Branch	C. A. D. Fowler, M.E.I.C.
Cape Breton Branch	W. C. Risley, M.E.I.C.
Saint John Branch	V. S. Chesnut, A.M.E.I.C.
Moncton Branch	T. H. Dickson, A.M.E.I.C.
Saguenay Branch	A. I. Cunningham, A.M.E.I.C.
Quebec Branch	L. P. Méthé, A.M.E.I.C.
St. Maurice Valley Branch	A. C. Abbott, A.M.E.I.C.
Montreal Branch	J. G. Hall, M.E.I.C.
Ottawa Branch	E. W. Stedman, M.E.I.C.
Peterborough Branch	W. M. Cruthers, A.M.E.I.C.
Kingston Branch	L. F. Grant, M.E.I.C.
Toronto Branch	G. H. Rogers, A.M.E.I.C.
Hamilton Branch	H. B. Stuart, M.E.I.C.
London Branch	D. S. Scrymgeour, A.M.E.I.C.
Niagara Peninsula Branch	G. H. Wood, A.M.E.I.C.
Border Cities Branch	J. Clark Keith, A.M.E.I.C.
Sault Ste. Marie Branch	A. E. Pickering, M.E.I.C.
Lakehead Branch	E. L. Goodall, A.M.E.I.C.
Winnipeg Branch	F. V. Seibert, M.E.I.C.
Saskatchewan Branch	W. E. Lovell, M.E.I.C.
Lethbridge Branch	J. M. Campbell, A.M.E.I.C.
Edmonton Branch	H. R. Webb, A.M.E.I.C.
Calgary Branch	S. G. Coultis, M.E.I.C.
Vancouver Branch	E. C. Thrupp, M.E.I.C.
Victoria Branch	F. C. Green, M.E.I.C.

Awards of Medals and Prizes

The Secretary announced the awards of the various prizes and medals of The Institute, stating that the formal presentation of these distinctions would take place at the Annual Dinner on the following evening:

The Past-Presidents' Prize to W. H. Powell, M.E.I.C., Vancouver, B.C., for his paper "The Need of the Engineer's Participation in Public Affairs." Honourable mention was awarded to E. R. Jacobsen, A.M.E.I.C., Montreal.

The Gzowski Medal to J. H. Parkin, M.E.I.C., Ottawa, "The North Atlantic Air Service—London to Montreal."

The Plummer Medal (Gold) to J. R. Donald, M.E.I.C., Montreal, "Fire and Explosion Hazards from Industrial Products" and "Chemical Engineering."

The Plummer Medal (Silver) to E. Stansfield, M.E.I.C., Edmonton, Alta., "The Burning of Low Rank Alberta Coals, Combustion and Control."

The Leonard Medal to T. L. McCall, M.E.I.C., Sydney, N.S., "Some Coal Mining Practices of the Dominion Steel and Coal Corporation Limited."

Students' and Juniors' Prizes

John Galbraith Prize (Province of Ontario) to D. C. McCrady, S.E.I.C., Peterborough, Ont., "Sanitary Analysis of Drinking Water."

Phelps Johnson Prize (Quebec—English) to G. Martin, Jr.E.I.C., Montreal, Que., "The Elements of Modern Combustion Engineering."

Report of Council, Treasurer's Report, and the Report of the Finance Committee

The Secretary then read the report of Council for the year 1937. The Treasurer's report was presented by Mr. Busfield and the report of the Finance Committee by Vice-President McCrory.

In connection with the report of the Finance Committee the President drew attention to the importance of continuous effort to increase The Institute's membership. For this purpose the spade work would have to be done by the branches, and he feared that in some cases that point had been overlooked. The duty of The Institute Membership Committee was really to stimulate and co-ordinate the activities of the membership committees set up by the branches. Increase in membership would the best way of solving the financial difficulty referred to in the reports of the Treasurer and the Finance Committee.

Reports of Committees

On the motion of F. Newell, M.E.I.C., seconded by Huet Massue, A.M.E.I.C., it was *resolved* that the reports of the following committees be taken as read:

Committee on Western Water Problems, Papers Committee, Committee on Professional Interests, Committee on Membership and Management, Library and House Committee, Employment Service Bureau.

Clarence M. Pitts, A.M.E.I.C., referred to the report of the Finance Committee, noting that the financial statement did not include the revenue and expenditure of the Semicentennial Fund. The Semicentennial celebrations had been a remarkable success, but he thought the membership should know what the expenses of the meeting were.

The President informed Mr. Pitts that while a list of firms and parties who contributed to the Semicentennial fund had been published in The Journal (July 1937, p. 589), and the thanks of The Institute had been extended to them at that time, the amounts of the individual subscriptions had not been published. The Semicentennial Committee had rendered a full statement of all expenditures and receipts, which had been properly audited, and was on file. Would the meeting like to hear that statement? Perhaps Mr. Busfield would like to speak on this matter.

Mr. Busfield stated that the contributions to the special fund amounted to approximately $5,000 of which the Semicentennial Committee had spent about $3,600 on general committee work, making good the losses on the functions of the meeting, and other committee expenses. Of the balance of $1,400, $1,000 had been handed over by the Semicentennial Committee to The Institute, to help defray the cost of the special Semicentennial number of The Journal, while the remainder had been left in the hands of the committee and had been used to pay the expenses of sending the illuminated addresses from branch to branch. Those addresses were at the moment hanging in the Georgian Room of the hotel for inspection. Mr. Pitts thanked Mr. Busfield for his statement.

Brian R. Perry, M.E.I.C., returning to the report of Council, noted in that report a statement that Council prepared an amendment to the by-laws as an alternative to those proposed by a group of thirty-one corporate members, and that Council's alternative amendment had been accepted by the group of thirty-one. As one of the members appointed by that group to represent the group in discussions with Council, Mr. Perry was of opinion that this statement was not technically correct. The amendments proposed by the group of thirty-one had been put forward in a sincere endeavour to co-operate with Council. In preparing them, anything felt to be contentious in the proposals of the Committee on Consolidation had been eliminated, and the group felt that their amendments would serve the purpose of The Institute better than the alternative put forward by Council. He felt that the proposals which resulted later from discussions between the representatives of the group and the representatives of Council, should be regarded as being the proposals of the thirty-one members, this being necessary in order to comply with the requirements of the By-laws. Mr. Perry desired to support the new Section 76 proposed by Council in every way, but felt that the formalities required by the By-laws should be applied in all cases.

The President agreed as to the practical correctness of Mr. Perry's statement, but remarked that a By-law had been prepared by Council and a draft of it agreed to by the representatives of the group—that draft had been sent to The Institute lawyers, who had suggested a few verbal alterations. Thus Mr. Perry was correct in saying that the wording of the proposed section 76 is not exactly the same as was put forward by his group, nor is it the exact wording put forward by Council. The altered version had been submitted to Mr. Perry and was understood to be satisfactory to him.

Gordon Pitts, A.M.E.I.C., remarked that Mr. Perry was trying to avoid the legality of the proposed By-law being questioned owing to its being put forward as a proposal of Council, instead of as a proposal from the group.

Mr. Perry agreed that it was incorrect to state that the proposals of the Council had been accepted by the group. Actually the proposals of the group were accepted by Council. Might not a single objector upset the By-law which everyone desired to see accepted?

J. B. Challies, M.E.I.C., felt that there had been no real departure from the procedure required by the By-laws. The By-law was the Council's original proposal and was subsequently accepted with fine grace by the three representatives.

Mr. Perry would like to see the statement in the Report of Council corrected so as to state that the proposal was put forward by the group and had been accepted by Council and made a *motion* accordingly. Mr. Gordon Pitts having read Section 75 of the By-laws, governing the procedure for introducing new By-laws, Mr. Busfield was of the opinion that the By-laws had been complied with by the procedure actually followed.

The President was doubtful whether an Annual General Meeting can amend a report of Council. Mr. Challies then *moved* that the meeting agree that the proposal for Section 76 should go out sponsored by Council. His motion was seconded by H. F. Bennett, M.E.I.C. The President thought Mr. Challies' motion was not relevant to the subject before the meeting, which was the Report of Council. Any resolution on the By-law such as that of Mr. Perry or of Mr. Challies could be discussed when the By-law proposal was being considered. This view was agreed to.

The President had no hesitation in saying that the By-law as presented by Council to this meeting was absolutely legal. The meeting could of course put forward any amendment to it, which would also have to go to ballot. If the By-law as proposed by Council and adopted or amended by this meeting goes to the membership for vote, he did not think the result could be challenged.

After further discussion, General C. H. Mitchell, M.E.I.C., *moved* that the report of Council be received, and the motion was *seconded* by P. L. Pratley, M.E.I.C. Mr. Clarence Pitts asked for a definite statement as to whether, a proposal having been presented to Council by a group within the terms of the By-laws, it was correct and legal for the proposal of Council to be the only ballot to go before the membership.

Further discussion took place during which Mr. Perry again urged that if any irregularity had occurred in connection with the proposals for a new By-law it would be possible for a single member to prevent its passage, a most undesirable event. General Mitchell's motion for the reception of the Report of Council was then put to the meeting and *carried.*

On the *motion* of J. L. Busfield, M.E.I.C., *seconded* by R. H. Findlay, M.E.I.C., the Treasurer's report was *received,* and on the *motion* of J. A. McCrory, M.E.I.C., *seconded* by J. A. Vance, A.M.E.I.C., the report of the Finance Committee was *received.*

On the *motion* of Mr. Newell, *seconded* by J. M. R. Fairbairn, M.E.I.C., it was *resolved* that the reports of the following six committees be *received*:

Committee on Western Water Problems, Papers Committee, Committee on Professional Interests, Committee on Membership and Management, Library and House Committee, Employment Service Bureau.

Branch Reports

On the motion of A Duperron, M.E.I.C., seconded by H. F. Bennett, M.E.I.C., it was *resolved* that the reports of the various branches of The Institute be taken as read and *received.*

Other Business

Robert F. Legget, A.M.E.I.C., drew attention to the omission from the printed reports of one from the Committee on Consolidation, whose activities were continued after the Annual General Meeting of 1937 until the result of the ballot had been made known. As secretary of the committee he had sent in a report to Council covering the operations of the committee from the last annual meeting until its discharge, and he would like to ask where the report was, and whether it would be presented to this meeting.

President Desbarats replied that the report had been received by Council; it had dealt with various topics, some connected with the consolidation question and some referring to other matters. It had been signed by the secretary and chairman of the committee, but statements had been received from certain members of the committee to the effect that they had not been consulted in regard to the report, and that they were not in agreement with it. Under these conditions it had seemed inadvisable to Council to bring forward that report.

Gordon Pitts, A.M.E.I.C., desired to point out that the report dealt with nothing that had occurred subsequent to the closing of the Committee on Consolidation, and referred to various matters which had come within the purview of the committee. The report was dated January 17th, 1938; the delay in presenting it had been due to the chairman's illness, and to the time necessary to send it to the various members of the committee for consideration. While consolidation in the form recommended by the committee and accepted by a Plenary Meeting of Council was no longer a live question, he did not think that that would be a sufficient reason for omitting the publication of the committee's report.

After further discussion, Mr. Pitts *moved* that the report be read to the meeting; the motion was *seconded* by Mr. F. Legget.

Having heard the motion, R. H. Findlay, M.E.I.C., begged to *move the previous question*, and his motion was *seconded* by Mr. Bennett.

The President pointed out that the acceptance of Mr. Findlay's motion would have the effect of closing all discussion on the matter before the meeting. On being put to the meeting Mr. Findlay's motion was *carried* by a vote of 28 to 6.

Entrance Fees

The Secretary reported that at the meeting of Council held on December 17th, 1937, it had been resolved that, subject to confirmation by the Annual General Meeting, the entrance fees for the year 1938 should be $10.00 for Members, Associate Members and Affiliates, and $5.00 for Juniors, the transfer fee in each case to be the difference between the entrance fee for the two classes. This arrangement would replace that which had been in force since October 1933, namely, a $5.00 entrance fee for all classes of membership. On the *motion* of Mr. McCrory, *seconded* by Mr. Newell, it was *resolved* that the meeting confirm Council's action.

Amendments to By-Laws

At the request of the President the Secretary read the notice for the introduction of a new By-law Section 76, and for amendments to the existing Sections 44 and 51, which had been mailed to corporate members on December 27th, 1937, and printed in The Engineering Journal for January 1938, pp. 40-41.

Proposed New Section 76

Professor H. W. McKiel, M.E.I.C., stated that as this amendment was vitally important to the scheme of co-operation which he, as a representative of Council, had been working out with the Provincial Association of Nova Scotia, he desired to *move* that it be approved by this Annual General Meeting and be sent out to ballot in the form contained in the printed notice.

After reviewing the history of the discussions which had taken place since the result of the ballot on consolidation had become known, Professor McKiel described the effect of the meetings held by C. A. Fowler, M.E.I.C., and himself with the Association and Institute branch officers in Nova Scotia, and he outlined the main provisions of the resulting draft agreement which had now been sent down to Nova Scotia for discussion there.

Professor McKiel pointed out that with regard to New Brunswick the incoming Council of the New Brunswick Association had been instructed at the Association's Annual Meeting to carry on negotiations with The Institute Council during the coming year, with the purpose of developing a similar scheme of co-operation in New Brunswick. That resolution had been carried unanimously.

In *seconding* Professor McKiel's motion, Mr. Gordon Pitts hoped that the tentative agreement now under consideration in Nova Scotia would be communicated to the meeting.

Professor McKiel stated that the document in question was somewhat long, and in its latest form, a draft dated January 27th, 1938, was in the shape which was suggested as being agreeable to the Association of Professional Engineers of Nova Scotia and the two branches of The Institute in that province.

The President pointed out that as that particular draft had not yet been considered by Council and was only a proposal sent from Nova Scotia for further discussion, it would be better that Council's original draft proposal should be read to the meeting. The President stated that while there was practical accord on the principles of the agreement, its wording was not yet in final shape.

Professor McKiel accordingly read the following draft agreement, dated January 4th, 1938, which had been approved by Council for transmission to Nova Scotia for discussion there:—

Preliminary Draft of Proposed Agreement Between The Engineering Institute of Canada and The Association of Professional Engineers of Nova Scotia

Dated Jan. 4th, 1938

MEMORANDUM OF AGREEMENT entered into this day of 1938, by and between The Engineering Institute of Canada, with head office at Montreal, P.Q., represented by its President and Secretary duly authorized for the purpose of signing this agreement by resolution of its Council dated day of 1938, hereinafter called the "Institute"

and

The Association of Professional Engineers of Nova Scotia, with head office at Halifax, N.S., represented by its President and Registrar, duly authorized for the purpose of signing this agreement by resolution of its Council dated day of 1938, hereinafter called the "Association."

WHEREAS it is desirable in the interest of the Engineering Profession that there be close co-operation between the Institute and the Association; and

WHEREAS such close co-operation will be promoted if, so far as is practicable, there is effected:

1. A common membership in the Province of Nova Scotia of the Institute and the Association,
2. A simplification of existing arrangements for the collection of fees;
3. A reduction in the total fees payable by those who are members of both the Institute and the Association.

NOW THEREFORE the parties hereto agree with each other as follows:

1. All present members of the Association and all joining in the future shall become members of the Institute or if they are already members shall continue their membership so that at all times all members of the Association shall also be members of the Institute.

2. Those members of the Association who on the date of this agreement are 35 years of age or older will be classified as Members (M.E.I.C.). Those members of the Association who on the same date are less than 35 years of age will be classified as Associate Members (A.M.E.I.C.).

3. Members joining the Association subsequent to that date shall be allocated to that class of membership in the Institute for which their age and professional experience qualify them under the By-laws of the Institute. All members of the Association on attaining the age of 27 years shall be classified as Associate Members of the Institute. All members attaining the age of 35 years shall be transferred to the class of Member, provided that their professional experience qualifies them for this class under the By-laws of the Institute.

4. The usual entrance fee and transfer fee of the Institute will not be exigible for members of the Association.

5. The Association agrees to collect one joint annual subscription from each of its members, from which it will remit to the Treasurer of the Institute as soon as possible after the 1st of January, and in any event not later than the 1st of June in each year, a fee at the rate of $6.00 per annum for each Member of the Institute (M.E.I.C.) and $5.00 per annum for each other member of the Institute. These subscriptions shall be in lieu of the annual fees due the Institute from these members pursuant to Section 34 of the Institute By-laws and will include the $2.00 annual subscription to the Journal.

6. The Association agrees to pay as soon as possible after the 1st of January, and in any event not later than the 1st of June in each year, to the Treasurer of the Halifax Branch of the Institute and to the Treasurer of the Cape Breton Branch of the Institute $...... for each member of the Association who is a member of the said branches. This payment shall be in lieu of the revenue hitherto received by the said Branches from the Institute, pursuant to Section 56 of the Institute By-laws.

7. This agreement shall be for a period of ..... years ending on December, 194 , and continued thereafter subject to either party giving notice of its desire to terminate same, such notice to be given not less than six months prior to the end of the calendar year.

Professor McKiel remarked that under the proposed agreement, while The Institute does not bind itself to refuse membership to any qualified engineer in Nova Scotia, so that there would still be some members of The Institute who would not be members of the Association, such persons would have to pay the regular Institute fee, an amount which would be greater than the combined fee for the same class of membership. There would thus be a substantial inducement to Institute members who had not yet joined the Association to do so.

Professor McKiel further pointed out that the income of The Institute under the proposed scheme would actually be slightly greater than the present net income of The Institute from its membership in Nova Scotia.

Professor R. A. Spencer, M.E.I.C., stated that at a joint meeting of the executive committee of the Association of Professional Engineers in Saskatchewan with the Saskatchewan Branch of The Institute, the meeting had gone on record as favouring similar proposals, and had appointed a committee to draw up details to submit to The Institute Council.

Before the question was put, Professor McKiel read his motion as follows:—

> That the new By-law, No. 76, be approved by this Annual General Meeting precisely in its present form, with a recommendation to the Council that the By-law be submitted to vote with the least practicable delay on a ballot separate from any other ballot and with a brief explanatory statement regarding its import.

Both Professor Spencer and Mr. Gordon Pitts rose to second this motion.

Mr. Gordon Pitts remarked that in seconding this motion he had desired to indicate that as far as the Committee on Consolidation was concerned the proposal had their thorough support.

The motion having been put to the meeting was *carried unanimously*, and it was noted, that as no amendments to the new section had been suggested, a pro and con committee would not be needed.

E. P. Muntz, M.E.I.C., remarked that the unanimous approval by the Annual General Meeting of the motion which had just been passed was an important event in the history of The Institute, and he *moved* that the meeting express its congratulations to Professor McKiel and Mr. Fowler for their endeavours on The Institute's behalf. Mr. Bennett, as a past councillor of the New Brunswick Association, and also of the Nova Scotia Association, had much pleasure in seconding the motion, which was *carried* by acclamation.

In expressing his thanks and appreciation, Professor McKiel said that his own reward had been in hearing the amendment approved, and he desired to add that the real power behind the movement in Nova Scotia to whom credit was due was actually Mr. C. A. Fowler.

A. L. Carruthers, M.E.I.C., as a member from the west, expressed admiration of the action which had been taken in Nova Scotia, and desired to say that the Victoria Branch had particularly asked him to express appreciation of the work, effort and thought which had been expended in this matter.

Address of Retiring President

At this point, in accordance with the resolution passed at the beginning of the meeting, President Desbarats delivered his retiring address, commenting on the various events in The Institute during the past year. (This address is printed on pages 147 and 148 of this issue of The Engineering Journal.)

Election of Officers

The Secretary presented the report of the scrutineers appointed to canvass the officers' ballot for 1938, and the officers named therein were declared duly elected as follows:—

President	J. B. Challies, M.E.I.C.
Vice-Presidents:	
Zone B	E. V. Buchanan, M.E.I.C.
Zone C	H. O. Keay, M.E.I.C.
Zone D	R. L. Dunsmore, A.M.E.I.C.
Councillors:	
Cape Breton Branch	A. P. Theuerkauf, M.E.I.C.
Moncton Branch	B. E. Bayne, A.M.E.I.C.

President Desbarats congratulated The Institute on the election as President of a man whose distinguished career was known to all. He had great pleasure in welcoming Mr. Challies to the presidency. The newly elected President was then conducted to the chair by Past-President O. O. Lefebvre, M.E.I.C., and Past-President C. H. Mitchell, M.E.I.C.

President Challies, after taking the chair, expressed his appreciation of the honour conferred upon him, referred to the dignity, tact and devotion to duty of Past-President Desbarats, and remarked that in his opinion The Institute was on the threshold of a new era, in which the policy of closer co-operation with engineering bodies, particularly the Provincial Associations, would be put into practice. During his term of office the prestige of The Institute, which had been so strikingly evidenced during the Semi-centennial celebrations in June, would be zealously guarded by him.

On the *motion* of Dr. O. O. Lefebvre, a cordial vote of thanks was accorded by a standing vote to the outgoing President, Mr. Desbarats, and to the retiring officers of The Institute, who had worked so faithfully for The Institute during the past year.

On the *motion* of Past-President Fairbairn, the hearty thanks of The Institute were extended by a standing vote to the London Branch in recognition of their hospitality and activity in connection with the holding of the Fifty-second Annual General Meeting.

On the *motion* of Mr. Muntz, *seconded* by E. R. Smallhorn, A.M.E.I.C., it was unanimously *resolved* that a vote of thanks be tendered to the scrutineers for their services in canvassing the vote on the election of officers, and also that the ballot papers be destroyed.

Proposed Amendments to the By-laws Sections 44 and 51

With regard to these proposals, Dr. O. O. Lefebvre *moved* that the proposed changes in the two existing By-laws, numbered 44 and 51, be received by this Annual General Meeting, and that Council be requested to send same to vote, the ballot to be separate from any other ballot and in a form that will permit a vote for or against each of the two proposals.

Dr. Lefebvre did not wish his action in making this motion to be interpreted as signifying his approval of the amendments referred to, to both of which he was personally opposed. He desired to point out, however, that the amendment to Section 51 is one which at present concerns the Montreal Branch only, and in sending this proposal to ballot, he thought that the attention of the membership should be called to this fact. In his opinion this amendment to Section 51 was a matter on which the members of the Montreal Branch should have the whole say.

Dr. Lefebvre's motion was *seconded* by J. A. Vance, A.M.E.I.C.

Huet Massue, M.E.I.C., remarked that as a member of the Executive committee of the Montreal Branch for a number of years, he had noted that the elected members of that executive committee attended a smaller proportion of the meetings than ex-officio members. These senior members took a great interest in the affairs of the branch, and he thought that it would be a pity to do without that experience.

Mr. Massue's views were supported by Mr. Pratley, who was personally opposed to both the proposed amendments, and did not think that the amendment to Section 51 should be considered until the Montreal Branch had been asked for their opinion.

Mr. Gordon Pitts desired to express some views which were partly his own, and partly those of elected members of the branch executive committee. He would support the change in Section 51 because, with the present arrangement, it was useless for the elected members of the committee to attend if the ex-officio members had already made up their minds. There had been an example of this in connection with the sending out of the questionnaire of the Committee on Consolidation. When this questionnaire came to the Montreal Branch the elected representatives had very little to say, and the ex-officio members, who were not in favour of the proposals of the Committee on Consolidation, practically decided the attitude of the committee. In his view the constitution of the Montreal Branch executive committee should be no different from that of the Toronto or any other branch of The Institute.

The President having inquired whether the ex-officio members of the committee had not in point of fact been elected as councillors by the Montreal Branch members, Mr. Pitts expressed the opinion that four ex-officio members would be enough as far as good advice was concerned and this was the reason for the proposal which was being discussed.

Mr. Findlay pointed out that the only ex-officio members of the Montreal Branch executive committee not elected by the branch members would be the President and possibly two vice-presidents. In fact, one vice-president and the Montreal members of Council are elected by the Montreal Branch.

Mr. Newell drew attention to the provision in the proposed amendment to Section 51 that the ex-officio members, not exceeding four in number, are "to be determined by the order of their official seniority." He inquired as to the interpretation to be given to this phrase; as to whether a president would be senior to a vice-president, and whether a vice-president would be senior to a councillor. He thought it would be undesirable to take away from the committee the ex-officio councillors who could interpret to the branch the wishes and desires of Council and to Council the wishes and desires of the branch. If the change went into effect, Mr. Newell thought that the branch would lose a great deal of help which could be given by its councillors.

Mr. Legget remarked that the proposal to amend Section 51 had arisen from a prolonged discussion at the Round Table Conference held in June, at which there was a general feeling that a reduction in the number of ex-officio members was desirable.

In Mr. Pratley's opinion, the members of the branch executive committee, not on The Institute Council, had every encouragement to attend if they so desired. As one of The Institute officers who had passed through the executive committee of the branch, he had been only too glad to retain connection with it and to be of assistance.

Mr. Brian Perry felt somewhat embarrassed in speaking, because he was the actual chairman of the Montreal Branch. He believed that the question had been brought up at the Round Table Conference by C. K. McLeod, A.M.E.I.C., who had been secretary of the Montreal Branch for many years. In Mr. Perry's opinion the proposal was not merely a question for the Montreal Branch but for The Institute as a whole. The elected members of an executive committee should be held directly responsible to the branch for the success of the branch operations. With the present constitution of the Montreal Branch executive committee these elected members did not have the control. In Mr. Perry's opinion this was undemocratic and un-Canadian. When Mr. Perry had first been elected to the Montreal Branch executive committee he found that the newly elected members, who were on unfamiliar ground, got very little experience in the branch in the guidance of branch affairs, and that, in his opinion, was the reason for the small proportion of attendance of the elected members. He desired to make it clear to the members of The Institute outside of Montreal that in the opinion of a great many members of the Montreal Branch the elected members of the executive committee should not be dominated by the ex-officio members, particularly when any contentious matter comes up for consideration and when the ex-officio members may have come to an agreement among themselves. During the past three years, at any rate, nominations for members of council for the Montreal Branch had in all cases been decided by the ex-officio members.

Past-President Shearwood, M.E.I.C., as one of the ex-officio members of the branch executive committee, could assure the meeting that he had never had any sort of agreement with other ex-officio members and he had been greatly surprised when the question came up. Mr. Shearwood had originally asked the executive committee of the Montreal Branch to discuss the matter and express their views, and in his opinion the question should be put to the Montreal Branch as a whole to find out their views on the subject.

J. H. Hunter, M.E.I.C., speaking as the oldest living chairman of the Montreal Branch, had always welcomed the advice given by the ex-officio members, but could not remember presiding at any meeting where the ex-officio members exceeded the elected members in number. Mr. Hunter was opposed to the amendment as tending to raise doubt as to whether the Montreal Branch is able to manage itself or not.

Mr. Vance was of opinion that the matter should be settled by the opinion of the Montreal Branch members, and inquired whether the amendment had been sponsored or discussed by them, or whether the branch had made any recommendation.

President Challies having replied in the negative to these questions, Mr. Gordon Pitts doubted whether many members outside of Montreal would vote on the ballot. He desired to point out, however, that the By-law originated with, and had been supported by, the executive committee of the Montreal Branch.

Mr. Busfield, as an ex-officer and past-secretary of the Montreal Branch, considered that it had been very advantageous to have the ex-officio members present at executive committee meetings. He desired to suggest that as opposition had been expressed to the proposed amendment to Section 51 it should go forward to ballot as provided by the By-laws, and the chairman should name a pro and con committee.

Past-President Desbarats joined issue with members who contended that this was not a matter for the whole Institute, as the situation now existing in Montreal might at any time arise in other branches, as, for example, in Ottawa, where, if the vice-president for Ontario happened to reside in the Ottawa Branch district, and if the branch membership increased slightly, there would be five ex-officio members. In his opinion there should be no indication given that the vote should be restricted to the Montreal Branch. As a past member of the Managing Committee of the Ottawa Branch he was sure that the advice of the ex-officio members was extremely valuable, owing to their long experience on the Managing Committee.

Mr. Brian Perry, noting Mr. Newell's suggestion as to the ambiguity of Section 51, asked whether Mr. Newell would propose an amendment with regard to the matter of seniority, but Mr. Newell was not prepared to do this.

There being no further discussion on Section 51, it was *agreed* that this proposal should go to ballot in the form submitted, and that the President would name a pro and con committee.

Mr. Gordon Pitts, with regard to the proposal to amend Section 44 by increasing the quorum of Council, remarked that this suggestion had developed from the experience of the Committee on Consolidation. Mr. Pitts had noted that last year, when the form of ballot on the consolidation proposals was under discussion, a legal opinion had been secured as to the effect of resolutions passed by an Annual Meeting, this opinion being to the effect that Council was not necessarily bound by resolutions of an Annual General Meeting. If this opinion was correct it meant that the representatives of four thousand members could make decisions which could be thrown out by five members of Council, over whom the membership of The Institute had no control. Under these circumstances, Mr. Pitts was of opinion that five members was not a sufficiently large quorum for the Council. In his opinion it should be eleven. The proposers of the amendment to Section 41 had noted the difficulty in obtaining the presence of eleven councillors at Council meetings, so that in order that the business should not be held up the amendment provided that five members could continue to carry on the regular business of Council, but any serious questions would have to be decided at a Council meeting at which there would be at least eleven members present.

Fraser S. Keith, M.E.I.C., inquired whether at the present time all important questions of policy were not presented for discussion at a Plenary Meeting of Council, the ordinary meetings of Council dealing very largely with regular routine business. During his period of service as General Secretary he could not recall any occasion when more than eleven members had been present at a Council meeting, and in many cases it had been difficult to secure the attendance of five. He understood that this condition still existed. In Mr. Keith's opinion the passage of the proposed amendment to Section 44 would make it extremely difficult to carry on the business of The Institute.

Dr. R. W. Boyle, M.E.I.C., was glad to have the opportunity of recognizing the hard work, thought and time expended on the affairs of The Institute by a small group of people in Montreal. In his opinion it would be better if this work were shared by a greater number. He had thought at first of a quorum of fifteen, but the group of members proposing the amendment under discussion had whittled this number down to eleven. In Dr. Boyle's opinion the only objection to the proposed amendment was the lack of funds to defray at least in part councillors' travelling expenses to Council meetings. Dr. Boyle would recommend that the funds now expended from time to time on Plenary Meetings of Council should be devoted to the payment of travelling expenses for councillors to regular Council meetings, of which at least fifty per cent should be held outside of Montreal. The matter had, however, now been referred to Professor Spencer's Committee on Membership and Management, and Dr. Boyle thought that that it should be decided by the membership at large only after having had the benefit of Professor Spencer's committee's study and report.

Mr. Massue pointed out that statistics of meetings of Council for the last four years showed that at sixty per cent of the meetings of Council there were less than eleven members present. The attendance of Montreal members at Council meetings was never less than seventy-five per cent, in spite of which it was evidently very difficult to secure an attendance of anything like eleven members. This difficulty was, of course, due to the geographical problem, The Institute's membership being scattered over such a large area.

Past-President Desbarats believed that the practical effect of the proposed amendment would be to hamper very seriously the business of Council. If he understood the wording of the amendment correctly, a meeting of Council at which less than eleven members were present could not take any executive action whatever, even in matters of urgency. The members of Council practically available for Council meetings are those within three hundred miles of Montreal, of whom the Montreal members, including the President and Vice-President, make up eight. Members can also come from Ottawa, Quebec, and Three Rivers. Kingston and Peterborough are not practically available on account of railway connections. This being so, in his opinion, it would not be practical to attempt to work on a quorum of eleven.

President Challies remarked that it is the present practice of Council to refer by letter ballot to the whole Council, all matters of great importance. In his opinion this method of securing a decision from Council as a whole was more practical and workable than the scheme embodied in the proposed amendment to Section 44.

President Challies emphasized his objections to both the proposed amendments, and particularly to any increase in the quorum of Council. In his opinion, the doubling of the quorum would seriously hamper and delay the business of Council at a time when Council should be free to act promptly and positively in furthering the widespread desire of the membership for closer co-operative relations with other engineering bodies, and especially with the Provincial Professional Associations.

It was than *agreed* that the proposals for the amendment of Sections 44 and 51 should go out to ballot in accordance with Dr. Lefebvre's resolution, and that pro and con committees should be appointed by the President.

Mr. Legget desired to draw attention to a matter arising from the report of Council. At the present time a Royal Commission on Dominion-Provincial Relations was sitting, headed by the Hon. Newton W. Rowell. That Commission was receiving briefs of great interest dealing with Dominion-Provincial relationships and other matters of practical concern to Canada. Mr. Legget desired to ask the following question:

"Arising from the report of Council, and in view of:

1. Section (1) of The Institute by-laws, items c, d, and f.
2. The difficulties of professional organization in Canada, due to a legal interpretation of one word in the British North America Act.
3. The opportunity presented by the sittings of the Royal Commission headed by Hon. Newton W. Rowell, for a consideration of this matter, an opportunity which can not recur for many years, it is asked if the Council of The Institute, in co-operation with Provincial Professional Associations and organizations in other professions, has yet taken any steps to bring before the Royal Commission on Dominion-Provincial Relations a submission regarding the difficulties of professional organization in Canada, and, if not, is there yet time for such action to be taken?"

President Challies stated that the point brought up by Mr. Legget would receive consideration by Council, and inquired what was the word to which Mr. Legget referred. Mr. Legget replied "education," and remarked that on more than one occasion troubles have arisen because in the British North America Act the professions are not named.

There being no further business the meeting adjourned at six fifty p.m.

Social Functions

An unusual and exceedingly pleasant introduction to the meetings was provided in the form of a tea on the afternoon of the 30th in the Georgian Room of the Hotel London, at which the President and visiting officers and ladies of The Institute had the opportunity of meeting the

President, Premier and Past-President

officers and members of the London Branch and their wives, preparatory to the business of the meeting. The morning of the following day was devoted to registration, the first function of the meeting proper being a luncheon at which His Worship the Mayor of London expressed the city's welcome to the visitors, his address being followed by one on Robinson Crusoe by Professor J. A. Spenceley of the University of Western Ontario, in which he threw an unusual light on the mentality of Defoe's hero.

The Annual Dinner of The Institute on Tuesday, February 1st, was notable for a witty speech by the Prime Minister of Ontario, in which Mr. Hepburn gave an interesting exposition of the Provincial Government's policies in various fields of natural resources development.

The dinner was followed by an excellent variety entertainment organized by the London Branch.

C. F. Davison, A.M.E.I.C., Windsor, G. A. McCubbin, M.E.I.C., Chatham, and E. M. Krebser, A.M.E.I.C., Walkerville, Ont.

The final luncheon on Wednesday, February 2nd, was addressed by Major F. C. Betts, Member of the House of Commons for London, who gave a concise and unbiassed exposition of the pros and cons of the problem of the export of hydro-electric power.

Throughout the meeting the visiting ladies were well looked after by the ladies of the branch, and were particularly interested in the admirable arrangements at the Byron Sanitorium where they took tea on Monday afternoon. All agreed that the theatre party on Monday, and the luncheon and bridge on Tuesday at the London Hunt and Country Club, were most pleasant episodes in the story of the meeting.

Technical Sessions

A somewhat novel feature of the General Professional Meeting was that the majority of the papers presented were devoted to two major topics, each of special interest to Southwestern Ontario. The sessions on Tuesday were concerned entirely with Highway Safety, and those on Wednesday mainly with Flood Control in the Grand and Thames river basins.

Of the two papers on the former subject, the first was by Mr. C. A. Robbins, District Engineer, Toronto, Ontario Department of Highways, who pointed out that in the final analysis the matter of safety rests with the driver of a motor vehicle, and passed on to consider the elements of design necessary to increase the capacity of roads, make for free movement of traffic, and thus reduce accident hazard.

The second address, by Dr. McClintock, Director of the Harvard University Bureau for Street Traffic Research, dealt with the subject from a somewhat different point of view, outlining the basic elements of 'limited way construction,' a system requiring the complete physical separation of opposed streams of traffic; special design of all entries and exits to and from the highway proper; separation of all intersections, and a design which permits proper segregation of relatively fast and relatively slow vehicles.

An active discussion followed, in which the speakers ranged over almost the whole field of highway design, construction and equipment, and referred to such matters as the necessity for the education of drivers, highway illumination, proper provision for pedestrian traffic, and the elimination of defective motor vehicles.

The four papers dealing with Flood Control each treated a separate phase of the subject. Mr. John Patterson, Controller of the Meteorological Service of Canada, furnished a large amount of data concerning rainfall, snowfall, temperature, and the tracks of pressure minima in Southwestern Ontario, pointing out that from a meteorological point of view the occurrence of damaging floods was dependent not only upon a maximum rainfall, but also upon the ground conditions which affect the rate of run off. These conditions are the results of large scale changes in the atmospheric circulation of the northern hemisphere.

Mr. Norman Marr, the chief hydraulic engineer of the Dominion Water and Power Bureau, Ottawa, gave striking data as to the extraordinary variations in flow which occur in the Thames and Grand rivers, both of which have maximum flood flows of thirty to forty thousand cubic feet per second and minimum discharges of about one thousandth of that amount.

Mr. McCubbin, consulting engineer, of Chatham, dealt with the possible effect of large agricultural drainage schemes upon flood discharge, the results of which he considered to have been practically negligible as regards maximum heights of floods.

Mr. F. P. Adams, A.M.E.I.C., city engineer of Brantford, and secretary of the Grand River Conservation Commission, contributed a paper which analysed the characteristics of the two watersheds, discussed possible control methods, and described the storage and regulating reservoirs contemplated for the Grand river.

Shawinigan, Starch, and Streams Commission. Huet Massue, M.E.I.C., J. H. Hunter, M.E.I.C., and S. F. Rutherford, A.M.E.I.C.

During the discussion which followed it was obvious that the whole question was one of wide concern. Several of the speakers urged the importance of giving close consideration to the problem of increasing the minimum flow as well as decreasing the maximum flow of the rivers in question. It seemed to be the general opinion that the need of the moment was not so much for engineering activity, as for a proper education of the public and the supply of accurate information regarding the financial aspects of the question.

E. P. Muntz, M.E.I.C., President of the Ontario Association of Professional Engineers, and G. T. Seabury, Secretary of the American Society of Civil Engineers.

In the field of mechanical engineering two outstanding papers were presented on the closing day of the meeting. Professor C. A. Robb, M.E.I.C., of the University of Alberta, dealt with the development and performance of Canadian steam-electric power plants, and Messrs McQueen and Molke described the design and construction of a large steel pipe line at Outardes Falls, Quebec. The former paper analysed the thermal performance of certain Canadian steam-electric plants as compared with plants of a similar size in some other countries, and suggested that steam and hydro should be studied as complementary sources of power. The latter paper explained the 'shell theory' on which the pipe line in question had been designed, and gave details of its fabrication and erection.

* * *

Throughout the meeting the local Committee left nothing undone which could add to the comfort and enjoyment of the visiting members; their efforts were greatly helped by the interest and assistance given by the civic authorities, the industrialists of the city, and the officers of the University of Western Ontario.

NOTE: *For the illustrations on these pages we are indebted to the London Free Press.*

ANNUAL FEES

Members are reminded that a reduction of One Dollar is allowed on their annual fees if paid on or before March 31st of the current year. The date of mailing, as shown by the postmark on the envelope, is taken as the date of payment. This gives equal opportunity to members residing in all parts of the country.

Newly Elected Officers of The Institute

E. V. BUCHANAN, M.E.I.C., newly elected vice-president for Ontario, was Chairman of the Committee on Arrangements for the Annual Meeting recently held in London, Ontario. Mr. Buchanan was born at Hamilton, Lanarkshire, Scotland, and received his education at the Royal Technical College, Glasgow. He came to Canada in 1910, and in 1911 became electrical and waterworks engineer for the city of London, Ontario. In 1915 he was appointed general manager of the Public Utilities Commission of London, which position he holds at the present time. Last year Mr. Buchanan was elected chairman of the Canadian Section of the American Water Works Association.

E. V. Buchanan, M.E.I.C.

R. L. Dunsmore, A.M.E.I.C.

H. O. Keay, M.E.I.C.

R. L. DUNSMORE, A.M.E.I.C., newly elected vice-president for the Maritime Provinces, is superintendent of the Halifax refinery of Imperial Oil Limited, at Dartmouth, N.S. Mr. Dunsmore was born at Seaforth, Ontario, and graduated from Queen's University in 1915 with the degree of B.Sc. His early engineering experience was with the Department of Public Works, Canada, at Fort William, Ont. From 1914-1919 he was with the Corps of Canadian Engineers overseas, from which he retired with the rank of major. In 1919 he was appointed assistant city engineer of Sarnia, Ont. Later in the same year he joined the engineering staff of the Imperial Oil Ltd., at Sarnia. In 1922 he was appointed engineer in charge of construction for the Imperial Oil refinery at Calgary, and later assistant superintendent. In 1926 Mr. Dunsmore went to Talara, Peru, S.A., for the International Petroleum Company as general superintendent, and was appointed to his present position in 1930.

HERBERT O. KEAY, M.E.I.C., newly elected vice-president for the province of Quebec, and Manager, Research Laboratories, of the Consolidated Paper Corporation, Three Rivers, Que., was born at Laconia, N.H., U.S.A., and graduated from the Sanborn Seminary, Kingston, N.H., in 1894, and from the Massachusetts Institute of Technology with the degree of B.Sc in mechanical engineering in 1900. From 1900-1901 he took a special apprentice course at the Nicholson File Company, Providence, R.I. In 1901-1902 he was assistant engineer of works, Pennsylvania Steel Company, Steelton, Pa., 1902-1905, chief draughtsman, motive power department, Boston and Maine Railway, Boston, Mass., and from 1905-1906 was mechanical engineer. From 1906-1908 Mr. Keay was assistant professor of mechanical engineering at McGill University, and from 1908-1917 he was professor of transportation. From 1917-1919 he was resident consulting engineer with the Laurentide Company, at Grand Mère, Que., and from 1919-1928 was manager of their research department. From 1928-1932 he was director of research, for the Canada Power and Paper Company, and from 1932 to date Mr. Keay has been manager of the research laboratories of the Consolidated Paper Corporation, Ltd. at Three Rivers, Que.

I. C. BARLTROP, A.M.E.I.C., assistant engineer of the Public Works Department for the Government of British Columbia, is the new councillor for the Victoria Branch. He was born in England, receiving his B.A. from Queen's College, Cambridge, entered the Royal Engineers in 1914, retiring with the rank of captain in 1920. In that year he received an appointment on the staff of the Canada Land and Irrigation Company Limited at Medicine Hat, Alberta. In 1925 he joined the Public Works Department as a draughtsman, receiving his present appointment in 1935.

B. E. BAYNE, M.E.I.C., the newly appointed councillor of the Moncton Branch, is with the Canadian National Railways in Moncton, N.B. He is an electrical engineer and graduated from the Nova Scotia Technical College in 1922. From 1922-23 he was with the New Brunswick Electric Power Commission and in the latter year entered the service of the Canadian National Railways. Since that time he has been on construction and maintenance work with the electrical department and on the maintenance of unit cars.

J. L. BUSFIELD, M.E.I.C., newly elected councillor for the Montreal Branch of The Institute, and managing director of Gardner Engines (Eastern Canada) Limited, Montreal, was born in London, England, and educated at the City of London School and Dulwich College. In 1907 he graduated from the Central Technical College (City and Guilds Institute) and London University. From 1907 until 1912 he was on the resident engineer's staff with the eastern division of the Grand Trunk Railway and in 1912 was appointed chief of party in charge of surveys and later office engineer with the Mount Royal Tunnel and Terminal Company. In 1916 Mr. Busfield joined the staff of Walter J. Francis and Company, and in 1922 became a partner in the firm of Beaubien, Busfield and Company, Montreal. In 1927 he entered the commercial field as president of

Busfield, McLeod Limited, and in 1935 accepted the appointment which he now holds. Mr. Busfield has previously held a number of offices in The Institute including those of councillor and treasurer. He is at the present time chairman of the Committee on Publications.

R. H. Findlay, m.e.i.c., newly elected councillor of the Montreal Branch of The Institute, and mechanical engineer for the Dominion Bridge Company Limited, Lachine, Que., was born in Glasgow, Scotland, and received his technical education at the Royal Technical College, Glasgow. In 1911 he came to Canada and accepted a position with the Dominion Bridge Company, and became chief mechanical draughtsman in 1919. In 1930 he was appointed assistant mechanical engineer, and in the same year was appointed mechanical engineer for the Riverside Iron Works Ltd., Calgary, Alta. Mr. Findlay returned to Montreal in 1931 to resume charge of the mechanical engineering department of the Dominion Bridge Company, at Lachine.

John Haddin, m.e.i.c., consulting engineer of Calgary, Alta., is the new councillor for the Calgary Branch. He was born in Scotland and his first engineering experience was in that country. In 1907 he became an assistant engineer in charge of waterworks and sewers at Banff, Alberta, and Maple Creek, Sask. He was later on the design and construction of sewers and sewage disposal work in British Columbia and Alberta. He became partner in the John Galt Engineering Company in 1910 and remained there until 1921 when he became a partner in the firm of Haddin and Miles with whom he is at present associated.

Otto Holden, a.m.e.i.c., newly elected councillor for the Toronto Branch of The Institute, and chief hydraulic engineer of the Hydro Electric Power Commission of Ontario, was born at Toronto, Ontario, and received his technical education at the University of Toronto, graduating with honours in 1913.

Mr. Holden was for a short time with the Public Utilities Commission of London, Ont., and then joined the engineering staff of the Hydro-Electric Power Commission of Ontario. In 1918 he was placed in charge of the design of hydraulic plants and since that time has been engaged on the developments at Cameron Falls, Ranney Falls, Queenston, Chats Falls and others. Mr. Holden has been assistant hydraulic engineer since 1923, and was appointed to his present position last year. Mr. Holden also served as chairman of the Toronto Branch of The Institute in 1936.

J. L. Lang, m.e.i.c., newly appointed councillor for the Sault Ste. Marie Branch, was born in England, receiving his technical education at the University of Toronto, from which he graduated with the degree of B.A.Sc. in 1907. Mr. Lang is a member of the firm of Lang and Ross with whom he has been associated for many years except for the period from 1916-19 which he spent overseas with the Canadian Expeditionary Forces.

A. Larivière, m.e.i.c., has been appointed councillor of the Quebec Branch. Mr. Larivière, who is a graduate of the Ecole Polytechnique from which he received the degree of B.Sc., is a commissioner on the Quebec Public Service Commission. He joined the Commission in 1916 on the completion of a post graduate course in electrical engineering, was appointed engineer in 1922 and in 1931 was made commissioner.

K. S. Le Baron, a.m.e.i.c., is replacing Bruno Grandmont, a.m.e.i.c., as councillor for the St. Maurice Valley Branch. Mr. Le Baron is a graduate of McGill University of the year 1923. In the same year he accepted a position as assistant engineer in charge of power with the Dryden Paper Company, Dryden, Ont., and in 1925 was appointed chief engineer of the company. In 1928 he became chief engineer of the Nashwaak Pulp and Paper Company and in 1929 plant engineer of the Canadian International Paper Company at Three Rivers, Que., which position he now holds.

H. A. Lumsden, m.e.i.c., county engineer for the County of Wentworth, Ontario, has been appointed councillor for the Hamilton Branch. A graduate of McGill University in 1912 he was for a time resident engineer for the Canadian Pacific Railway at Red Deer West, Alberta, and Maple Creek, Sask., and in 1915 was appointed assistant engineer for the Department of Highways of Ontario, which position he resigned to go overseas. He returned to Canada in 1919 and in 1921 rejoined the engineering staff of the Department Highways of Ontario as district engineer of municipal roads.

W. R. Manock, a.m.e.i.c., newly elected councillor for the Niagara Peninsula Branch of The Institute, and manager for the Horton Steel Works, at Fort Erie North, Ontario, was born at Farmer City, Illinois, U.S.A., and graduated from the university of Illinois in civil engineering. His first engineering work after graduation was as a draughtsman with the Chicago Bridge and Iron Works, becoming chief draughtsman in 1917, and assistant manager of operations in 1923. The following year Mr. Manock was appointed manager of operations with the Horton Steel Works Limited, and at the present time is manager of the company.

A. J. S. Taunton, d.s.o., m.e.i.c., is now councillor for the Winnipeg Branch. He was born in England, received his engineering education at Manitoba University from which he graduated in 1912. His early engineering experience was with the Canadian Northern Railway. From 1914 to 1919 he served overseas with the 27th Batt. of the C.E.F., obtaining the rank of major. From 1920 to 1930 Mr. Taunton was district bridge engineer for the Manitoba Government and from 1930 to 1933 was a member of the board of engineers and engineer in charge of the construction of a number of bridges in Winnipeg. In 1933 he became assistant engineer for the Department of Public Works of Canada and at the present time is managing secretary of the Veteran's Assistance Commission in Winnipeg.

A. P. Theuerkauf, m.e.i.c., has been elected councillor for the Cape Breton Branch of The Institute. He is a consultant in engineering matters for the Dominion Coal and Steel Corporation in Sydney, N.S. Mr. Theuerkauf received his education at the Royal School of Technology at Dusseldorf, Germany. Coming to Canada soon after graduation he joined the Dominion Iron and Steel Company, Sydney, as mechanical draughtsman. In 1909 he became designer for the Dominion Coal Co., Ltd., Glace Bay, and the following year joined the staff of the Canada Foundry Company, Toronto. In 1911 he returned to the Dominion Iron and Steel Company and was appointed chief draftsman and subsequently assistant chief and chief engineer of the company.

Ephrem Viens, m.e.i.c., director of Testing Laboratories, Department of Public Works, Ottawa, has been appointed councillor of the Ottawa Branch of The Institute. He graduated in Arts from McMaster University in 1905, specializing in chemistry and physics. Later he took post graduate work.

He was first employed as a chemist at the International Portland Cement Association in Hull, Quebec, which position he held from 1906 to 1907.

In April 1907 he joined the staff of the Department of Public Works as chemist in the Testing Laboratories and from this position rose to that of director of the laboratories.

Mr. Viens' whole time, since joining the staff of this department, has been taken up in specializing in the testing of materials used by the Department of Public works and a number of other departments of the Federal Government.

E. Viens, M.E.I.C.

J. T. Watson, A.M.E.I.C., city manager of Lethbridge, Alta., has been appointed councillor for the Lethbridge Branch. He was born and educated in Scotland, coming to Canada in 1900. In 1906 he was appointed assistant to the chief engineer of the city of Calgary power and light plant. From 1906 to 1916 he was superintendent of the Western Electric Company's plant at Red Deer, Alberta, and in the latter year was appointed chief engineer of the city of Lethbridge power and light and water plant. In 1928 he received an appointment with the East Kootenay Power Company at Coleman, Alberta. In 1929 he received the appointment which he now holds.

ELECTIONS AND TRANSFERS

At the meeting of Council held on February 18th, 1938, the following elections and transfers were effected:

Members

CHESTNUT, Kenneth Randolph, B.Eng., M.Sc., (Univ. of N.B.), asst. engr., National Harbours Board, Saint John, N.B.

WHITBY, Eugene Mortimer, deputy city engr., Hamilton, Ont.

Associate Members

BINNS, Frank, B.Sc. (Mech.), (Tufts College), M.Sc. (Mech.), (Purdue Univ.), instructor in engrg. drawing, Mount Allison University, Sackville, N.B.

DILLON, Marmaduke Murray, Capt., M.C. and Bar, consltg. structural engr., London, Ont.

LASH, Stanley Dale, B.Sc., M.Sc., (Univ. of London), Ph.D., (Univ. of Birmingham), instructor in civil engrg., University of British Columbia, Vancouver, B.C.

MACLENNAN, William Ewen, (Inverness Academy), asst. res. engr., Lake Sulphite Pulp Co. Ltd., Red Rock, Ont.

MORISSET, Joseph Eudore, (Quebec Tech. School), asst. mill engr., Donnacona Paper Co. Ltd., Donnacona, Que.

RYAN, Hollis Franklin, B.Sc. (Elec.), (N.S. Tech. Coll.), mgr., apparatus divn., Canadian General Electric Co. Ltd., Edmonton, Alta.

SHIELDS, William Fisher, B.A.Sc., (Univ. of Toronto), field engr., Lake Sulphite Pulp Co. Ltd., Nipigon, Ont.

THOMSON, William James Renwick, B.Sc. (C.E.), (Tri-State College), asst. engr., Ontario Dept. of Highways, Ottawa, Ont.

TUFF, John Henry, asst. chief engr., G. H. White & Son, London, England.

WRIGHT, Leslie Austin, B.A.Sc., (Univ. of Toronto), 2349 Grand Blvd., Montreal, Que.

Juniors

GISLASON, Stefan Ingnor, B.Sc. (C.E.), (Univ. of Man.), dftsman., Ontario Dept. of Highways, Kenora, Ont.

HUTTON, Francis Spence, B.A.Sc., (Univ. of Toronto), levelman, C.N.R., Hamilton, Ont.

MacNEIL, Duncan Paul, B.Eng., (N.S. Tech. Coll.), test engr., Dominion Coal Company, Glace Bay, N.S.

WILDE, William Clayton, B.Sc. (Elec.), (Univ. of Alta.), sales engr., Canadian Telephones and Supplies Ltd., Calgary, Alta.

Affiliate

KENT, Cecil Charles, (Univ. of London), mgr., Winnipeg office, Fetherstonhaugh & Company, Winnipeg, Man.

Transferred from the class of Associate Member to that of Member

JOST, Leslie Gordon, B.Sc., (McGill Univ.), chief struct'l. engr., Consolidated Steel Corpn. Ltd., Los Angeles, Calif.

MASSUE, Huet, B.A.Sc., C.E., (Ecole Polytechnique, Montreal), asst. engr., Shawinigan Water and Power Company, Montreal, Que.

Transferred from the class of Junior to Associate Member

BUTLER, Ernest W. R., B.Sc. (Mech.), (McGill Univ.), Western Canada Manager, Bailey Meter Co. Ltd., Winnipeg, Man.

DONNELLY, William David, B.Sc. (Mech.), (Queen's Univ.), mech. dftsman., Ford Motor Company of Canada, Windsor, Ont.

GRINDLEY, Frank Llewellyn, B.Sc. (Civil), (Univ. of Alta.), junior engr., Dept. of Agriculture, Dominion Govt., Medicine Hat, Alta.

PHIPPS, Charles Ferdinand, B.Sc. (Elec.), (McGill Univ.), asst. engr., trans. line design, Shawinigan Water and Power Company, Montreal, Que.

Transferred from the class of Student to that of Associate Member

BARNSLEY, Frank Richard, B.A.Sc., (Univ. of B.C.), mgr., air conditioning divn., Canadian General Electric Co. Ltd., Montreal, Que.

CAMPBELL, James Stouffer, B.Sc., M.Sc., (Queen's Univ.), supervisor, pricing and routing depts., Massey Harris Co. Ltd., Toronto, Ont.

CLARKE, Stephen Herbert, (Faraday House Elec. Engrg. College), elect'l. engr., Sladen Malartic Mines, Montreal, Que.

FERGUSON, Allan Andrew, B.Sc. (Mech.), (McGill Univ.), Reed, Shaw & McNaught Ltd., Montreal, Que.

FONG, William Hinn, B.Sc. (Elec.), (McGill Univ.), relay mtce., Montreal Light, Heat & Power Cons., Montreal, Que.

REES, Howard Sutherland, (Grad. R.M.C.), B.Sc. (Civil), (Queen's Univ.) asst. engr., aeronautical engrg. divn., Dept. of National Defence, Ottawa, Ont.

Transferred from the class of Student to that of Junior

BAKER, John Arthur, B.A.Sc., (Univ. of B.C.), sales engr., Taylor Electric Mfg. Co., London, Ont.

BERRINGER, Ormus Benjiman, B.Sc. (Mech.), B.Eng. (Civil and Elec.), (N.S. Tech. Coll.), paving inspr., Lunenburg, N.S.

BIESENTHAL, Clarence G., B.Sc. (Queen's Univ.), dftsman., Spruce Falls Power & Paper Co. Ltd., Kapuskasing, Ont.

BLACHFORD, Henry Edmund, B.Sc., (McGill Univ.), 133 Hillcrest Ave., Montreal West, Que.

HENDRICK, Max Morton, Flying Officer, R.C.A.F., B.A.Sc., (Univ. of Toronto), Officers' Mess, R.A.F., Cranwell, England.

MILLER, Donald Waters, B.Sc. (Civil), (Univ. of Man.), dftsman., Island Mountain Mines Co. Ltd., Wells, B.C.

PITFIELD, Barclay Wallace, B.Sc. (Civil), (Univ. of Alta.), asst. engr., Northwestern Utilities Ltd., Edmonton, Alta.

SOLES, William England, B.Sc. (Mech.), (Queen's Univ.), control engr., Gaspesia Sulphite Company, Chandler, Que.

WILKINS, Ronald Edward, Lieut., R.C.E., (Grad. R.M.C.), B.Sc. (Civil), (Queen's Univ.), Work Point Barracks, Esquimalt, B.C.

Students Admitted

BEGLEY, William, B.Sc., (Detroit Inst. of Tech.), student course, Canadian General Electric Co. Ltd., Peterborough, Ont.

CAMPBELL, Albert Murray, (Queen's Univ.), 44 Woodworth Ave., St. Thomas, Ont.

CAMPBELL, Kenneth William, (Queen's Univ.), 44 Woodworth Ave., St. Thomas, Ont.

HOPKINS, Peter McMillan, (R.M.C.), Royal Military College, Kingston, Ont.

LANTIER, Dunn Jacques, (R.M.C.), Royal Military College, Kingston, Ont.

MARTIN, Clifford Davison, (N.S. Tech. Coll.), P.O. Box 262, Amherst, N.S.

MERCIER, Jules M., (Ecole Polytechnique, Montreal), 6177 Durocher St., Outremont, Que.

NELSON, William Andrew, B.Sc., (Queen's Univ.), demonstrator mech'l. dept., Queen's University, Kingston, Ont.

TAYLOR, William Irwin, (Univ. of Man.), 218 Waterloo St., Winnipeg, Man.

OBITUARIES

Jules Alexandre Duchastel de Montrouge, M.E.I.C.

Members will learn with great regret of the death on February 20th of Jules Alexandre Duchastel de Montrouge, assistant manager of the Port of Montreal and Member of The Institute of long standing. He was in his sixtieth year and had just been appointed treasurer of The Institute.

Mr. Duchastel was the son of the late Baron Duchastel de Montrouge who served as Consul for France in New York and later in Montreal. Educated in Mont St. Louis College in Montreal, Mr. Duchastel graduated from the Ecole Polytechnique in 1901, working for a time with the Phoenix Bridge and Iron Works, Montreal and in the chief engineer's office of the Canadian Pacific Railway. In 1906 he became engineer for the city of Outremont and later was also appointed city manager. In 1924 he resigned to become manager of the Quebec Forest Industries Association Limited and filled that appointment for twelve years. In 1936 he was appointed assistant manager for the Port of Montreal, the position which he held at the time of his death.

Always prominent as an advocate of improved highways, Mr. Duchastel was a charter member of the Canadian Good Roads Association, being one of the group of road engineers and motor enthusiasts who formed the association in 1914.

J. A. Duchastel de Montrouge, M.E.I.C.

Mr. Duchastel joined the Canadian Society of Civil Engineers as a Student in 1899, became an Associate Member in 1904 and a Member in 1912. During the years 1922, 1923 and 1924 he carried out very ably his duties as councillor of The Institute.

William Alfred McLaren, A.M.E.I.C.

It is with deep regret that we record the passing of William Alfred McLaren, A.M.E.I.C., whose death occurred, following a brief illness, at Charlottetown, P.E.I., on January 5th, 1938.

Mr. McLaren was born at Brudenell, P.E.I., July 31st, 1886, where he received his high school education. In 1905 he joined the engineering staff of the Prince Edward Island Railway. From 1907 to 1915 he was employed on the construction of the National Transcontinental Railway. During the great war he served first as lieutenant in the 104th and 105th Infantry, and latterly, on construction of light and standard gauge railways, as lieutenant in the 7th Canadian Railway Troops. In 1919 he joined the engineering staff of the Canadian National Railways. In 1933 he became engineer on highway construction, and in 1937 was appointed engineer in charge of National Park construction in Prince Edward Island, which position he held until his death.

Mr. McLaren joined The Institute as an Associate Member on February 16th, 1923.

W. A. McLaren, A.M.E.I.C.

Francis C. McMath, M.E.I.C.

The Institute has lost a valued member through the death of Francis C. McMath, D.Eng., M.E.I.C., on February 13th in Detroit. Mr. McMath was born at St. Louis, Missouri, January 29th, 1867. After obtaining the degree of B.E. from Washington University, St. Louis, he became assistant engineer of the Detroit Bridge and Iron Works, advancing to the position of chief engineer in 1899. In this position he designed a considerable number of railroad bridges. In 1900 he resigned to organize the Canadian Bridge Company, of which he was president for 21 years. During this time he served in several other capacities and from 1911 to 1919 he was consulting engineer for the St. Lawrence Bridge Company, Limited, which built the cantilever bridge across the St. Lawrence river near Quebec. He also directed the construction of several other important spans in Canada and the United States.

Mr. McMath joined the Canadian Society of Civil Engineers as a Member, November 29th, 1904.

Alexander Forrester Stewart, M.E.I.C.

We regret to announce the death of Alexander Forrester Stewart, M.E.I.C., a Life Member of The Institute and formerly chief engineer of the Canadian National Railways, Atlantic Division, on October 30th, 1937. Mr. Stewart was born at West Bay, Cape Breton, N.S., on January 8th, 1864, attending Dalhousie University and graduating in 1887. His first engineering experience was on the Canadian Pacific Railway in Maine as chainman. Later he went to British Columbia where he was on surveys and also resident engineer on construction. In 1895 he went to South Africa as contractor's engineer on the South Coast Railway in Natal, becoming district engineer of surveys on railway work in the Transvaal in 1897 and later district engineer on construction for the Orange Free State government railways. He also did railway work in Zululand and Cape Colony. In 1901 he was district engineer of maintenance and reconstruction for the Imperial Military Railways in Transvaal.

Mr. Stewart was in the employ of the Orange Free State Government on railway location work prior to the South African war but left immediately on the outbreak of hostilities. At that time he was located at Harrismith near the Natal border and he crossed the border into British territory on horseback through the mountains, reaching Ladysmith just before the siege began. As a civilian he was obliged to leave Ladysmith immediately, going out on the last train before communications were cut. Upon reaching the coast at Durban he decided to proceed by sea to Cape Town where he eventually arrived offering his services to the military authorities.

After the peace treaty in 1902 the Imperial Military Railways were turned over to the civil authorities for administration under the name of the Central South African Railways, headed by the late Sir Percy Girouard, Hon.M.E.I.C. Mr. Stewart was at that time on leave in Canada and employed as division engineer of surveys on the Halifax and Southwestern Railways but at the request of Sir Percy returned to South Africa where he was assigned to the position of resident engineer at Pretoria with jurisdiction over the entire Delagoa Bay line. During his service with the Imperial and Central South African Railways Mr. Stewart had jurisdiction over the maintenance of way and structures and new works and his responsibilities were weighty as practically all bridges were destroyed during the war. In 1904 he accepted a position as district engineer in Cape Colony, returning to Canada in 1907.

Mr. Stewart became assistant engineer of construction for Mackenzie, Mann and Company of Toronto in 1907 and chief engineer in 1916. In 1916 he was appointed chief engineer of Eastern Lines, Canadian Northern Railway and Canadian National Railways successively at Toronto and in 1920 chief engineer of the Atlantic region of the Canadian National Railways at Moncton, N.B., retiring from this position in 1933. Mr. Stewart joined the Canadian Society of Civil Engineers as a Member in 1897.

A. F. Stewart, M.E.I.C.

K. B. Thornton, M.E.I.C.

E. A. Wheatley, M.E.I.C.

Kenneth Buchanan Thornton, M.E.I.C.

We regret to announce the death of Kenneth Buchanan Thornton, M.E.I.C., general manager of the Montreal Tramways Company, on February 10th, 1938. Mr. Thornton was born in Montreal on June 26th, 1873, but received his education in London, England, where he attended the Central Technical College of the City and Guilds of London Institute. In 1893 he returned to Montreal and began a course in electrical engineering at the Royal Electric Company's works. He remained with this company and the Montreal Light Heat and Power Company until 1905 in their manufacturing, testing and operating departments. From 1905 until 1911 he was connected with J. G. White and Company, New York City, where he successively held the positions of resident engineer and manager of Nassau Light and Power Company, Roslyn, Long Island, assistant manager of the operating department of the J. G. White Company and affiliated companies, Portland, Maine, and advisory engineer to the Canadian Light and Power Company.

In 1911 Mr. Thornton became chief engineer and operating manager of the Canadian Light and Power Company and chief engineer and general manager of the Montreal Public Service Corporation. A few years later he became consulting engineer to the president of the Montreal Tramways Company. This last position he held until he became assistant general manager of the company in 1925 and general manager in 1930. During these years Mr. Thornton had charge of the modernization of all departments of the system, the improvements including the renewal of track, purchase of new cars, revision of the power supply, and the introduction of extensive bus services. He served on the board of directors of the Canadian Electric Railway Association, of which body he was President in 1931.

Mr. Thornton joined the Canadian Society of Civil Engineers as a Student on January 4th, 1894, transferring to the class of Associate Member in 1899. He became a Member of The Engineering Institute of Canada November 23rd, 1920. During the years 1921, 1922 and 1923 he was on the Council of The Institute and served as Vice-President for the years 1925 and 1926.

His death brings to a close the career of a man well known throughout the Dominion, who was distinguished both in engineering and administrative work.

Edward Augustus Wheatley, M.E.I.C.

E. A. Wheatley, M.C., M.E.I.C., registrar and secretary-treasurer of the Association of Professional Engineers of British Columbia, passed away on February 2nd, 1938, in Shaughnessy Military Hospital, Vancouver. He was born in London, England, and was in his 53rd year.

His early engineering training took place in England where he attended the City and Guilds Technical College, London, and was later apprenticed with S. J. Johnson and Company Limited, Engineers, Stratford, England. He was next with Sir Hiram Maxim and the Electric and Maintenance Company and 1909 came to Canada. Here his first work was with the Canadian Pacific Railway in British Columbia. Later he was with the Edmonton Brick Company and from 1911 to 1914 he acted as engineer and superintendent with the Alsip Brick Company, Edmonton, Alta. From 1914 to 1918 he was overseas, latterly with the Royal Engineers, with whom he served with distinction. In 1918 he was seriously wounded and was invalided home with the rank of captain after spending several years in hospitals in England and France.

Following the war, Captain Wheatley returned to British Columbia and in 1921 was appointed registrar and secretary-treasurer of the Association of Professional

Engineers of British Columbia. In this position, with untiring enthusiasm and ability, he rendered invaluable service in the advancement of the Engineering Profession in British Columbia.

He joined The Engineering Institute of Canada as an Associate Member in 1921 and was transferred to Member in 1935.

PERSONALS

D. K. Addie, A.M.E.I.C., who has been with the Dominion Glass Company Limited, Montreal, for the past thirteen years, has accepted the position of supervising engineer of Ball Brothers Company, with headquarters in Muncie, Indiana. Mr. Addie is a graduate of McGill University of the year 1925, obtaining the degree of B.Sc. in Mechanical Engineering.

M. G. Taylor, Jr.E.I.C., is now acting general manager of the Venezuela Power Company Limited, Maracaibo, Venezuela, S.A. Mr. Taylor obtained his degree of B.Sc. from the Nova Scotia Technical College in 1927 and that of M.Sc. from the Massachusetts Institute of Technology in 1931. Mr. Taylor has been connected with the Venezuela Power Company since 1929. In 1931 he advanced to the position of manager of the Barquisimeto Branch of the company and in 1935 was made superintendent at Maracaibo, Venezuela.

Louis Trudel, S.E.I.C., who was formerly with the Provincial Electricity Board, has accepted a position with the Southern Canada Power Company Limited. Mr. Trudel, a graduate of the Ecole Polytechnique in 1936, was awarded the Ernest Marceau Prize in the same year for his paper "Etude Comparative sur Modèles Réduits." He is vice-chairman of the Junior Section of the Montreal Branch of The Institute.

Norman A. Link, A.M.E.I.C., has been transferred from the position of roadmaster, Canadian Pacific Railway, Wilkie, Saskatchewan, to that of assistant superintendent at Macleod, Alberta. Mr. Link has served the Canadian Pacific Railway in various capacities since his entrance into engineering work in 1913, although from 1916 to 1919 he was with the Canadian Expeditionary Force overseas and from 1927 to 1931 was superintendent of Duff, Flint and Company, contractors, in Regina, Sask. In 1931 he was made resident engineer at Winnipeg, in 1932 roadmaster at Nipawin, Sask., the latter position he held until 1936 when he became roadmaster at Wilkie, Sask.

Donald Ross-Ross, M.E.I.C., chief industrial engineer, who is in charge of industrial engineering, purchasing and cost accounting at the various divisions of the Howard Smith Paper Mills Limited and subsidiary companies, has also been acting as consulting industrial engineer and cost accountant to the Empire Cotton Mills Limited. Mr. Ross-Ross has now completed this work. He has been connected with the Howard Smith Paper Mills since 1925, when he entered the Cornwall Division of the Company as combustion engineer. In 1927 he became assistant to the mill manager, in 1928 production engineer and in 1931 chief industrial engineer.

Percy Sandwell, M.E.I.C., consulting engineer of Vancouver has been appointed chief engineer for the new Australian newsprint project to be started this year in the Derwent Valley, Tasmania. Mr. Sandwell has had extensive experience in pulp and paper work on the Pacific Coast where from 1922 to 1926 he acted as chief draughtsman and assistant resident engineer for the Powell River Company Limited. From 1926 to 1936 he was resident engineer and from 1932 to 1934 assistant manager of the same company. Since 1934 he has been in practice in Vancouver as a consulting engineer.

W. F. Angus, M.E.I.C., was elected to the Board of Directors of Montreal Light Heat and Power Consolidated at the annual meeting of shareholders held February 16th, 1938. Mr. Angus, who is replacing J. W. McConnell, resigned, is president of Dominion Bridge Company, president of Dominion Engineering Works, Limited, and vice-president of Canadian Car and Foundry Company, Limited. He is also a director of the following companies: Royal Bank of Canada, Montreal Trust Company, Bell Telephone Company, Northern Electric Company, Foundation Company of Canada, Canadian Locomotive Company, Eastern Canada Steel and Iron Works, Robb Engineering Works and Dominion Hoist and Shovel Company.

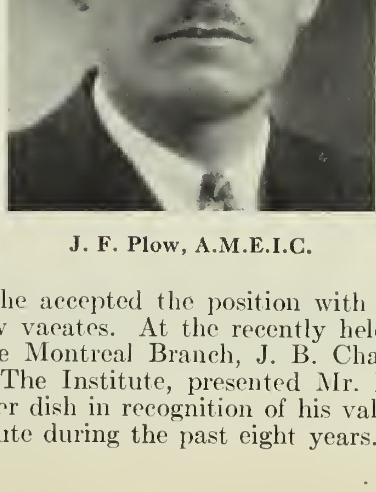
D. E. Blair, M.E.I.C., has been appointed general manager of the Montreal Tramways Company, to succeed the late K. B. Thornton, M.E.I.C., it was recently announced by R. N. Watt, vice-president and managing director.

Mr. Blair, who has been associated with the Montreal Tramways Company for thirty-five years, was born in Montmagny, P.Q., July 1877, and was educated at Quebec High School and McGill University, from which he graduated with a B.Sc. in 1897. He started his career in the transportation industry by entering the service of the Quebec Street Railway Company as electrical engineer. In this position he superintended the electrification of the Quebec, Montmorency and Charlevoix, formerly a steam railway. In 1903 he joined the Montreal Street Railway as assistant general superintendent. A year later he was appointed superintendent of rolling stock and became responsible for the design, construction and maintenance of all street cars used in Montreal. In 1925 he was promoted to the position of general superintendent, in charge of operation and maintenance.

John F. Plow, A.M.E.I.C., formerly assistant secretary of The Engineering Institute of Canada, has accepted a position in Montreal with Charles Warnock and Company, Limited, inspection and testing engineers.

Mr. Plow was educated in Montreal, graduated from the Royal Military College, Kingston, Ontario, in 1921 and afterwards attended McGill University. From 1922 to 1925 he was vice-president of B. Plow and Company Limited, Montreal, manufacturing stationers and printers. In 1925 he entered Price Brothers and Company Limited where from 1927 to 1930 he acted as assistant engineer in the mechanical department of the company's mill at Riverbend, Quebec.

During 1928 and 1929 Mr. Plow acted as secretary-treasurer of the Saguenay Branch of The Institute.



J. F. Plow, A.M.E.I.C.

In 1930 he accepted the position with The Institute which he now vacates. At the recently held semi-annual smoker of the Montreal Branch, J. B. Challies, M.E.I.C., President of The Institute, presented Mr. Plow with an engraved silver dish in recognition of his valuable services to The Institute during the past eight years.

BULLETINS*

Chlorination.—The Specialities Engineering and Service Company, Inc., Hoboken, N.J., have issued an 8-page bulletin which describes in detail the system and operation of their "W-B Periodic Process of Chlorination."

Capacitors.—Three 4-page bulletins have been received from the English Electric Company of Canada Limited, St. Catharines, Ont., featuring their capacitors in box, pole and rack type.

Insulating Brick.—The Canadian Johns-Manville Company Limited, Toronto, Ont., have issued a 4-page bulletin demonstrating their new JM-20 insulating brick and its application to twelve different types of furnaces.

Couplings.—A 12-page booklet from Hamilton Gear and Machine Company, Toronto, Ont., describes their flexible couplings for the protection of connected machines from misalignment, thrust and vibration.

Friction Materials.—Canadian Johns-Manville Co. Ltd., Toronto, Ont., have published a 6-page leaflet, Friction Materials for the Iron and Steel Engineer. This contains comprehensive data on brake linings and clutch facings for steel mill equipment.

Scale and Corrosion Control.—D. W. Haering and Co. Inc. 3408 Monroe St., Chicago, Ill., have published a 16-page pamphlet illustrated with graphs, formulae and equations of interest to the chemist and engineer responsible for scale or corrosion control in industrial operations.

Proportioning Systems.—A 24-page booklet received from D. W. Haering and Co. Inc., 3408 Monroe St., Chicago, Ill., describes a simple and accurate line of inexpensive proportioning systems.

*Copies of these bulletins may be obtained by writing to the companies mentioned.

BOOK REVIEWS

Biography of Benjamin Smith Lyman

By Gonpei Kuwada, Sanseido Co., Tokyo, 1937. 104 pp. 7¾ by 5¼ inches, cloth.

Benjamin Smith Lyman was born in Northampton in 1835. He attended Phillips-Exeter Academy and was graduated from Harvard University in 1855. From 1859 until 1861 he studied at the Ecole des Mines, in Paris, and later at the Royal Academy of Mines at Freiberg, Germany.

He was a member of a surveying party at Glace Bay, Nova Scotia, assistant geologist of the State of Iowa and made extensive surveys of the coal districts of Pennsylvania. He was engaged by the British Indian government on the survey of the petroleum fields of the Punjab, 1870, and from 1873-1879 was chief geologist and mining engineer in the employ of the Japanese government. He knew Europe, Asia, British America and his own country. Wherever he went he was a student of the country—its geology and mining, as a matter of course, its language, its literature, its art, its customs, its natural history.

The years he lived in Japan were the most interesting ones of his life and the most fruitful in their results. He made the first survey of the Northern Island of Hokkaido, and then surveyed the petroleum fields of the main island. The English translation of the government reports of these surveys are in the collection at the Forbes Library in seven volumes, 1874-1879, as are also most of the books in his extensive library.

Snow Removal and the Treatment of Icy Pavements

Bulletin No. 6 Compiled by the American Public Works Association, Committee on Street Cleaning. (American Public Works Association, Chicago, 1938.) 11 by 8½ inches. Paper, 54 pages, illus. $1.00

Municipal snow removal service has developed very rapidly during the past ten years not only to make city streets safer for traffic, but also to provide for the full-time use of expensive pavement systems. The safeguarding of city streets against the hazards of icy conditions has progressed exceptionally fast and has gained widespread public approval.

The American Public Works Association has prepared this comprehensive statement of the snow fighting problems and practices in American cities to aid municipal officials and others in securing the maximum efficiency in these important operations. A study of the experiences and practices of 78 cities in the snow belt forms the background for much of the data used.

This bulletin which bears the title "Municipal Snow Removal and the Treatment of Icy Pavements" discusses fully the necessity of having complete arrangements for handling these emergency conditions perfected well in advance of the winter season. The plans, organization, personnel, equipment, and methods of operation are treated in detail to make this bulletin of maximum benefit to public works officials. The conclusions and suggested procedures are those that have been found most effective in the communities that are successfully meeting this problem.

French Naval Architects Proceedings

The Association Technique Maritime et Aéronautique have issued their 41st Bulletin, giving a report of the Association's successful meeting held in June 1937, with the text of the papers and discussions at the meeting.

The volume contains 698 pages of technical material of value to anyone interested in shipping, shipbuilding and aeronautic problems.

It can be purchased from the Secrétariat Général, Association Technique Maritime et Aéronautique, 7 rue de Madrid, Paris, France. The price is 250 francs (postage 16 fr.).

1938 Competition of La Fondation George Montefiore

The Association des Ingénieurs Electriciens sortis de l'Institut Electrotechnique Montefiore announce a prize of 18,000 fr. in their 1938 competition. This prize will be awarded for the best original work presented on the advancement of science and on the progress of the technical applications of electricity in all fields. The papers submitted should bear the title "Papers submitted to the competition of La Fondation George Montefiore, 1938 Session." Entries should be printed or typed and addressed to: M. le secrétaire-archiviste de la Fondation George Montefiore, rue Saint-Gilles, 31, Liège (Belgique).

ERRATA

In printing Professor Smither's article on page 109 of the February Journal, Fig. 2 was slightly displaced in relation to Fig. 1, the vectors not being exactly parallel to the loads.

Please note also that Professor Smither is Associate Professor (not Assistant Professor) of Structural Engineering at the University of Toronto.

In "Canadian Steam-Electric Power Plants" by C. A. Robb, M.E.I.C., in this Journal, page 139, column 4, 4th line from the bottom of the page, for 2,760 substitute 27,600.

BRANCH NEWS

Border Cities Branch

J. F. Bridge, A.M.E.I.C., Secretary-Treasurer.
F. J. Ryder, Jr.E.I.C., Branch News Editor.

At the meeting held Friday, January 17th, 1938, about 30 persons were present to hear the paper presented by Mr. J. W. Houlden, who is in charge of the Ballistic Laboratory of Canadian Industries Limited.

The Fabrication and Testing of Shotgun Shells

A brief historic outline brought out that the bow and arrow was the first weapon that could propel a projectile any distance and still have any degree of accuracy. The discovery of black powder brought with it the ancestors of our present firearms and munitions. With the advent of smokeless powder came a greater degree of accuracy and fewer complaints.

Black powder used in cartridges gave off a heavy smoke, had a heavy recoil, was erosive and corrosive to the steel of the gun barrel and left a residue in the barrel which meant cleaning the gun often. Smokeless powder has none of these bad effects.

Mr. Houlden then explained the complete manufacturing process of an ordinary shell. A shell consists of a brass head, a primer cup which contains the detonating charge, and a paper or cardboard tube which fits into the brass head. The charge of powder, cardboard wads, followed by felt wads, the load of shot and the final wad make up the main parts of the shell. In order to perfect and finish one shell there are 142 complete and distinct operations performed. Throughout all these operations a very rigid inspection is maintained to assure a perfect shell. The finished product is coded so that complete records of each batch may be kept. At least one per cent of all production is tested in the firing laboratories in order to determine patterns, muzzle velocity, striking velocity and pressure in the gun barrel.

A display of a shell in its various conditions of assembly was shown to all which cleared up many of the points not clearly understood in the manufacture of the shell as narrated. A group of slides showing actual production views added further interest to an already very interesting paper.

The meeting was thrown open for questions, and the speaker had to rebuff a barrage of them, which he did to the satisfaction of all concerned.

C. G. R. Armstrong, A.M.E.I.C., moved a hearty vote of thanks to Mr. Houlden, which was enthusiastically endorsed by all.

Calgary Branch

Jas. McMillan, A.M.E.I.C., Secretary-Treasurer.
J. S. Neil, A.M.E.I.C., Chairman, News Committee.

On Tuesday, November 16th, 1937, the Branch was presented with a very instructive paper by J. W. Young, A.M.E.I.C., assistant city chemist, on micro-chemistry and other methods followed by expert witnesses called in to give evidence in the law courts. This unusual lecture was listened to with great interest and provided much food for thought as evidenced by the lively question period which followed Mr. Young's address.

An Hydrographical Survey

The next meeting on December 2nd, 1937, was devoted to subjects presented by two of the more recent members of the Branch—once each year it is the policy of this Branch to invite some of these members to present papers on any subject they wish. G. V. Eckenfelder, S.E.I.C., described the work of a hydrographical survey expedition sent north to chart the Tuktoyaktuk harbour near the eastern arm of the Mackenzie river delta. Tuktoyaktuk is on the Arctic coast and is the nearest deep water harbour available for transshipping ocean borne freight to the Mackenzie river and northern lake transportation system. Mr. Eckenfelder gave a clear exposition of the difficulties encountered such as compass bearings where the proximity of the magnetic pole made the needle sluggish and not to be depended upon. A lucid word picture of the appearance of this great territory in its summer raiment was painted, and was indelibly imprinted on the listeners' memory by means of photographs projected on a screen. Mr. Eckenfelder's lecture made everybody wish, despite the hardships and difficulties encountered, to go on a similar expedition to these open spaces.

Natural Gas Burners

The other paper presented was on "Natural Gas Burners." In this presentation Mr. Neil first described the various flame types used in the burning of gas and the types of burners required to produce each class of flame. This was followed by an outline of the design of a blue-flame burner in which was pointed out the cause of many burner troubles which are popularly ascribed to everything but the actual cause, which is inherent in the design of the burner itself.

Each paper was followed by lively discussion which showed that the interest of the meeting had been thoroughly aroused by the efforts of the "cub" engineers.

An Amateur Tries to Understand Our Weather

A. W. Haddow, B.Sc., A.M.E.I.C., city engineer of Edmonton, held the concentrated interest of members on Monday night of January 17th. Mr. Haddow reviewed the development of methods of gathering data from ancient to modern times. Then using diagrams he explained the views of numerous authorities regarding air circulation; source and effect of the trade winds, monsoons and chinooks. Chinooks, he said, probably give Alberta a greater variety of winter climate than is found anywhere else in the world. Mr. Haddow told some interesting facts concerning the chinook, which he had learned at Edmonton. Fliers, for instance, have found with ground temperatures of 30 to 40 degrees below zero, chinooks had been encountered at 2,500 feet with temperatures of 45 degrees above zero. The velocities of these chinooks at the higher levels reach as high as from 70 to 90 miles per hour with no wind at ground level.

Mr. Haddow's address, coming as it did in the midst of a mid-winter chinook, was followed with more than usual interest, and everyone present thanked him for imparting to them knowledge of our climatic conditions which were formerly veiled in mystery.

Edmonton Branch

M. L. Gale, A.M.E.I.C., Secretary-Treasurer.
F. A. Brownie, Jr.E.I.C., Branch News Editor.

A most interesting paper on "Oil Sand Coring in Trinidad" was presented by Dr. K. A. Clark at the January 20th meeting of the Edmonton Branch of The Institute. Dr. Clark is now Professor of Mining at the University of Alberta. Prior to the present university term Dr. Clark was on 18 months leave of absence. During this time he was engaged by a large British oil company to make investigations in regard to the coring of oil sands in the Trinidad field.

Oil Sand Coring in Trinidad

Dr. Clark's paper concerned itself chiefly with the usefulness of information obtained by coring, in the water-flooding of oil sands. He reviewed briefly the history of water-flooding which may be said to have started in the Bradford, Pennsylvania, oil field. In this field a very prolific water sand occurred at shallow depth. The technique of shutting off water in the early days was not very effective and often a hole became filled with water and ruined. However it was found that this hydrostatic head of water in one hole increased not only the immediate flow in surrounding wells but also the ultimate oil recovery. The idea of water-flooding of oil sands has now become established practice, where practicable, after the field has become fully exploited by ordinary methods.

Preliminary coring and laboratory study of the cores furnish invaluable information as to whether water-flooding would be possible, and if so, economical, and also as to the exact procedure to be followed.

The speaker described briefly the procedure followed in water-flooding and referred to the accuracy with which the results to be expected could be prophesied from a study of the cores.

Dr. Clark also described in a delightfully informal manner a number of his personal experiences in the course of his work in Trinidad and American oil fields.

An interesting discussion followed, which was also participated in by a number of members of the Canadian Institute of Mining and Metallurgy who were present.

Vice-chairman W. E. Cornish, A.M.E.I.C., presided.

Halifax Branch

R. R. Murray, M.E.I.C., Secretary-Treasurer.
A. D. Nickerson, A.M.E.I.C., Branch News Editor.

The combined annual banquet of the Halifax Branch of The Engineering Institute of Canada, and the Association of Professional Engineers of Nova Scotia, was held at the Nova Scotian hotel on January 19th, 1938. Approximately 200 members representing the two organizations gathered for this, their annual joint function. It has been the custom for many years to combine the January meeting of the Halifax Branch with the closing function of the annual meeting of the A.P.E.N.S. in the form of a banquet and get-together.

Toasts were proposed by Chas. Scrymgeour, A.M.E.I.C., and J. R. Kaye, A.M.E.I.C., and were responded to by I. P. Macnab, M.E.I.C., and Col. F. W. W. Doane, M.E.I.C.

D. Leo Dolan, Chief, Canadian Travel Bureau of Ottawa, was the principal speaker of the evening. In a humorous and genial manner, Mr. Dolan spoke of the importance of the tourist industry to Canada, and of ways and means by which that industry could be encouraged and stimulated. Paved roads, the speaker pointed out, were one of the greatest factors in drawing tourists to the Maritime Provinces in the past few years. The extension of this paving programme, together with other favourable factors, would result in a greatly increased tourist travel to the Maritime Provinces in the next few years, the speaker predicted.

Courtesy and naturalness are very necessary in dealing with tourists. Referring particularly to visitors from the United States it was pointed out that they did not expect, nor want, to find the United States flag flying from hotels, tourist resorts and roadside canteens. Neither did they want to eat a majority of canned foods or of foods that were very common in their own country. Tourists are anxious to find a distinctly Canadian or provincial atmosphere, and are glad to obtain distinctly local dishes wherever possible. Mr. Dolan spoke briefly of the work of the Canadian Travel Bureau at Ottawa.

Hon. A. S. MacMillan, Minister of Highways of the Province of Nova Scotia, spoke briefly of the work of the Department of Highways in assisting the tourist industry. Among other activities the Minister referred to a training course being conducted this winter in an effort to assist the managers of the smaller hotels and tourist resorts to meet the needs of the tourist trade. The Minister presented figures to show how the gasoline tax had made the highway paving programme possible, and further to show how an increase in the gasoline tax would make possible the paving of secondary as well as primary highways. These figures were given merely for information to a body of engineers, and not as a statement of government policy.

Mixed entertainment and favours for those present were provided by various local industrial firms. Mr. I. P. Macnab, Chairman of the Halifax Branch E.I.C., acted as chairman of the meeting.

Hamilton Branch

A. R. Hannaford, A.M.E.I.C., Secretary-Treasurer.
W. W. Preston, S.E.I.C., Branch News Editor.

ANNUAL BUSINESS MEETING AND DINNER

The annual meeting of the Branch was held on January 12th, 1938, at the Rock Garden Lodge, Hamilton. Sixty-seven members and guests sat down to a very enjoyable dinner which was followed with fifteen minutes of mysterious hilarity supplied by the "Magical Chatterbox," Sid Lorrain.

The minutes of the evening included the reading of the minutes of the last meeting and the reading of the business and financial statement prepared for presentation to Headquarters for the year 1937, which was duly approved by the meeting.

The following members were elected to form the Nominating committee for the year 1938: A. Love, M.E.I.C., chairman; W. L. McFaul, M.E.I.C., R. K. Palmer, M.E.I.C., W. Hollingworth, M.E.I.C., and E. H. Darling, M.E.I.C.

The Branch Nominating committee had put forward a list of names for the various offices and as no further nominations had been submitted, as required by the by-laws, the following were declared elected:

Chairman..............W. J. W. Reid, M.E.I.C.
Vice-Chairman.........V. S. Thompson, A.M.E.I.C.
Secretary-Treasurer.....A. R. Hannaford, A.M.E.I.C.
Committee.............R. E. Butt, A.M.E.I.C., one year,
A. B. Dove, A.M.E.I.C., one year,
J. R. Dunbar, A.M.E.I.C., two years,
W. A. T. Gilmour, A.M.E.I.C., two years.

L. W. Gill, M.E.I.C., proposed a very hearty vote of thanks to Col. E. G. Mackay, A.M.E.I.C., the retiring chairman, for his splendid work for the Branch during his term of office, and also to the Executive for the work done.

E. P. Muntz, M.E.I.C., spoke briefly of the work of the Branch during the year.

A. O. Wolff, M.E.I.C., chairman of the London Branch, tendered the greetings of his Executive to the Hamilton members.

The guest speaker of the evening, the Rev. Captain Norman Rawson, now followed with an address that will long be remembered by all those who were so fortunate as to be present to hear him.

In a challenging address he deplored the tendency of preachers and engineers to become so enveloped in their own fields that each failed to appreciate the problems of the other. Saying that he did not intend to pull his punches, Mr. Rawson declared that engineers have not been using their brains to the best advantage. He praised engineers for the advance that they have made in material sciences, but, when he considered success in terms of making the world a better place to live in, he considered that the engineer had made a miserable fiasco.

He said the trouble today is not material at all, it is spiritual.

The major problem facing the engineer is not with money, material or markets but with men, and the basic thing keeping us back is fear and distrust. Clever men are afraid to enter public life because of the abuse they receive from the hands of the public and the lack of confidence given to our governing bodies. The speaker thought that we have quite as good men at our helm as we deserve considering the apathy of the electors. He criticized industry for looking on men as tools and stated that fear would not be removed until men could bring children into the world with the assurance that they would have work and security to maintain them. If fear and distrust are to pass we must get back a sense of values, not of wisdom or power but of personality and the final great power of emotion.

He declared the country needs constructive thinking by intelligent people and spoke of the dangers that must be faced if we continued to be indifferent to the study of social economics. He pleaded for real leadership, the kind that confidently overcomes all obstacles; realizing that it required industrial daring and also national and international daring the problems of which he felt the engineer was well qualified and able to solve if they would enter more into the activities of public life and affairs.

The talk was interspersed with considerable repartee between the speaker and His Worship Mayor William Morrison, who, as a guest of the Branch, had spoken earlier in the evening.

Lethbridge Branch

E. A. Lawrence, S.E.I.C., Secretary-Treasurer.
R. F. P. Bowman, A.M.E.I.C., Branch News Editor.

The Lethbridge Branch held its regular dinner meeting in the Marquis hotel, on Saturday evening, January 22nd, 1938. During the dinner music was supplied by George Brown's instrumental quartette, followed by vocal solos by Mr. E. Rannard and community singing.

The guest speaker was Mr. A. K. Bayley, of the Dominion Department of Transport, Aviation Radio Branch, who gave a paper on "Radio Aviation." In his introductory remarks Mr. Bayley outlined the conditions necessary for the successful operation of an air-line and then gave a very lucid exposition of the operation of direction finding equipment and the radio beacon. An interesting discussion followed.

The Lethbridge Branch held a dinner meeting at the Marquis hotel on Saturday, February 5th, 1938. During the dinner instrumental selections were played by George Brown's instrumental quartette, followed by vocal solos by Mr. George Parsons and community singing.

The speakers of the evening were three young engineers who gave short addresses on various topics. The first speaker was Mr. W. E. Ross, of the Calgary Power Company, whose subject was "Generation of Hydro-electric Power." He outlined the importance of rainfall, run-off and seepage conditions, and the study of hydrographic and meteorological data, in determining the available, dependable flow of water for a proposed power project. This was followed by a description of some of the important factors in the operation of a hydro-electric plant, and a detailed explanation of the "losses method," of co-ordinating the various generating units in such a way as to produce a maximum of electricity with a minimum of water power.

The second speaker was E. A. Lawrence, S.E.I.C., of the Department of Natural Resources, C.P.R., whose topic was "The Rise of Early Modern Civil Engineering." Mr. Lawrence, after some remarks about engineering among the ancients, turned to the 17th and 18th centuries when applied mathematics and experimental science combined to produce the engineer as he is known today. He gave a general description of the development of surveying instruments, followed by a historical outline of the growth of various branches of civil engineering. Highways, canals, railways, bridges and tunnels were described, the locations of the various early projects being shown on maps which Mr. Lawrence had prepared for the occasion.

The third speaker was Mr. R. Craig, of Canadian Sugar Factories Ltd., whose topic was "The Electrical Equipment of a Beet Sugar Factory." The speaker gave a very complete description of the equipment of his company at their Picture Butte plant, which is recognized as the most modern plant on the continent. He described the steam plant and the turbo-generator which is the source of supply, and traced the various electrical services throughout the plant. Individual motor drives are almost exclusively used, many of these being interlocked in such a way as to protect the equipment in case of trouble in any one unit. Interesting applications of thermo-couples and potentiometers for the regulation of the processes were described.

A hearty vote of thanks was moved by Mr. G. S. Brown and was carried with applause.

London Branch

D. S. Scrymgeour, A.M.E.I.C., Secretary-Treasurer.
Jno. R. Rostron, A.M.E.I.C., Branch News Editor.

The 52nd Annual General and Professional Meeting of the Engineering Institute of Canada was held this year at the Hotel London in London, Ontario, on January 31st and February 1st and 2nd, consequently no regular monthly meeting of the Branch was held as all members were engaged in making arrangements for this event.

Complete detailed reports of this meeting will be found elsewhere in The Journal.

A total registration of 345, which included 45 ladies, was attained and it is safe to say that the meeting was a success viewed from every angle. This is confirmed by the large number of letters of congratulation and appreciation received from out-of-town visitors by the Chairman of the General Committee and the Branch Chairman.

The Branch is to be congratulated on having one of its prominent members, E. V. Buchanan, M.E.I.C., General Manager of the London Public Utilities Commission, elected at the Business Meeting to the position of Vice-President of The Engineering Institute of Canada.

The London Branch extends its thanks to the, then, President-elect and Mrs. Challies for their kind invitation to members and ladies to afternoon tea on Sunday the 30th January in the Georgian Room of the Hotel London in order to meet distinguished members from Headquarters. This social event was very well attended and many expressions of appreciation and pleasure at the kindness and thoughtfulness of Mr. and Mrs. Challies were heard from those who accepted the invitation. There is no doubt that everyone enjoyed themselves and realized that it made a capital "get together" for the ensuing meeting.

Moncton Branch

V. C. Blackett, A.M.E.I.C., Secretary-Treasurer.

ISLE OF ORLEANS SUSPENSION BRIDGE.

On January 26th, 1938, a supper meeting of the Branch was held in the Y.M.C.A. E. B. Martin, A.M.E.I.C., the Branch chairman, presided. D. B. Armstrong, A.M.E.I.C., chief designing engineer, Dominion Bridge Co. Ltd., Montreal, delivered a very instructive address on the "Pre-stressing and Erection of the Isle of Orleans Suspension Bridge." With the aid of slides Mr. Armstrong described in detail the many problems connected with the design and erection of this type of structure. The address was followed by a lengthy discussion. A vote of thanks was extended the speaker on motion of F. O. Condon, M.E.I.C., seconded by R. H. Emmerson, A.M.E.I.C.

Ottawa Branch

R. K. Odell, A.M.E.I.C., Secretary-Treasurer.

The first noon luncheon of the 1938 year was held at the Chateau Laurier, Thursday, January 27th, with W. F. M. Bryce, A.M.E.I.C., the newly-elected chairman, presiding. The guest speaker was W. Lindsay Malcolm, Professor of Municipal Engineering at Queen's University. In his address, which was illustrated with lantern slides, he described the newly-constructed Municipal Engineering Laboratory at Queen's University.

THE SANITARY ENGINEERING LABORATORY AT QUEEN'S UNIVERSITY

This laboratory was necessitated by the rapid advances technically in Highway and Sanitary Engineering, according to the speaker, primarily to the Civil Engineering students. He also hoped that the laboratories might be of some assistance to the medical students in their studies in public health and sanitation.

The Highway Engineering Laboratory, with provision therein for soil mechanics, is installed on the ground floor. In this the testing of stone, asphalts, and other materials used in road construction will be made. The various tests for soils, soil consolidation and stabilization will be possible in this new set up.

The Sanitary Engineering Laboratories constitute the major space in this new building. They consist of actually operating water and sewage treatment units. The water treatment units at present consist of three rapid sand filters 3 by 3 by 7 feet deep. All the necessary adjuncts for chemical feeding, control, backwashing, etc., will be provided. It is hoped later this year to add a slow sand filter. Odour and taste control experimental work will be gone on with.

On the sewage side a complete activated sludge plant is installed, with pre-sedimentation, aeration and final settling units being provided. Primary and activated sludge will be digested. The digester room contains 6 units which can be operated in various ways to make the experimental work of wide range. The digested sludge (and other sludges) will be dewatered on sand beds and on vacuum filters.

A trickling filter plant will also be installed in the sewage room, with various kinds of filter materials being provided in the units.

A chemical and bacteriological laboratory for control operations, and student instruction in Sanitary Engineering generally, is provided in the upper floor of the east end of the building. This laboratory has been completely equipped chemically and bacteriologically for this purpose.

TURNER VALLEY—A MAJOR OIL FIELD

At the noon luncheon on February 10th, 1938, G. S. Hume, Ph.D., of the Geological Survey of Canada, spoke on "Turner Valley—a Major Oil Field." Dr. Hume stated that as far as present production is concerned Turner Valley could not yet be classed as one of the major oil fields of the world but with the possibility of 30 to 35 more wells added to present production in the next year, the field had prospects of assuming major importance.

The field is quite exceptional in many ways. Structurally it is one of the most complicated in North America. Along with its three square miles of proven territory, there appears to be distinct possibilities for further development along its west flank and also to the south.

Dr. Hume traced the history of the field with its production of naphtha, crude oil and gas from the time of its discovery down to the present. He outlined the geology and described some of the particular problems that had to be solved. The Dominion Department of Mines and Resources has been making an intensive study of the field with samples taken for examination at every ten feet from the holes as they were being drilled. By such means the structural details of the geology may be worked out so that the information obtained may be applied in the actual development of the area itself or in the possible development of other areas as well.

Dr. Hume described methods of drilling, how the pore spaces in the limestone structure are opened up by the use of a hydrochloric acid solution, thereby allowing an easier flow, how the wells are cased with the bottom of the casing cemented to the oil-bearing rock, and mentioned the rather surprising fact that sometimes in the well-drilling the holes deviate as much as 30 degrees from the vertical. He also quoted figures giving an idea of the amount of production to date from this interesting field.

W. F. M. Bryce, chairman of the Ottawa branch, presided, and there was a particularly large attendance. The address was illustrated with lantern slides.

1937 ANNUAL REPORT OF THE AERONAUTICAL SECTION, OTTAWA BRANCH, ENGINEERING INSTITUTE OF CANADA, WITH WHICH IS INCORPORATED THE OTTAWA BRANCH OF THE ROYAL AERONAUTICAL SOCIETY

The officers for the year were:—

Chairman.—Dr. J. J. Green,
Division of Mechanical Engineering,
National Research Council,
Ottawa.

Secretary.—J. T. Dyment, A.M.E.I.C.,
Aeronautical Engineering Division,
Department of Transport,
Ottawa.

PROCEEDINGS

The following technical papers were given at evening meetings of the Aeronautical Section:

1937

Jan. 13—N. F. Vanderlipp, General Manager, Fairchild Aircraft, Ltd., **Vibration in Aircraft**. Attendance 32.

Jan. 22—J. T. Dyment, A.M.E.I.C., Aeronautical Engineering Division, Department of National Defence, **Stability and Control of Aeroplanes**. Attendance 33.

Mar. 4—Dr. C. Y. Hopkins, Division of Chemistry, National Research Council, **Use of Synthetic Plastics in Aeroplanes**. Attendance 22.

Mar. 18—W. I. Haskett, Patent Attorney, **Patents**. Attendance 10.

Mar. 25—S. Graham, District Inspector, Civil Aviation Division, Department of Transport, **Air Navigation**. Attendance 18.

Apr. 6—Dr. G. S. Farnham, Metallic Minerals Division, Department of Mines, **Fatigue of Metals**. Attendance 20.

April 14—Group Capt. E. W. Stedman, M.E.I.C., K. F. Tupper and Dr. J. J. Green, **Aerodynamic Laboratories of England, Italy and France** with accompanying motion pictures. Attendance over 400.

April 29—M. S. Kuhring, Division of Mechanical Engineering, National Research Council, **Selection and Installation of Aircraft Engines**. Attendance 31.

Nov. 19—Dale Atkinson, Operations Manager, Starratt Airways and Transportation Limited, **Northern Airline Operations**. Attendance 46.

The average attendance of 27 at lectures, excepting the one large meeting, was the same as the preceding year. As before, only ten affiliates attended and contributed their fee of one dollar. The consistent attendants were chiefly members of The Engineering Institute of Canada and/or the Royal Aeronautical Society.

FINANCIAL STATEMENT
From January 1, 1937, to December 31, 1937

Expenditures		
Cash in bank	$ 0 31	
Postcards	33 22	
Postcards owing	4 16	
Stamps	90	
Stamps owing	51	
		$39 10
Receipts		
Cash carried over from 1936	$ 3 70	
Bank balance from 1936	73	
Fees (affiliates)	10 00	
Grant from Ottawa Branch	20 00	
Total		$34 43
Debit Balance		$ 4 67

The financial statement indicates that the total receipts of thirty dollars were the same as the preceding year.

With each meeting costing four dollars and thirty cents, the number of papers should be limited to seven.

Two extra papers were permitted this year due partly to a balance from 1935 and partly by incurring a small temporary debt.

The officers of the Section corresponded with the Royal Aeronautical Society and it is hoped that the receipts of the section will be augmented by a grant from the Society.

A more extensive programme of technical papers would thus be possible.

(Signed) JOHN T. DYMENT, A.M.E.I.C., *Secretary.*

Victoria Branch

Kenneth Reid, Jr.E.I.C., Secretary-Treasurer.

The annual meeting of the Victoria Branch of The Engineering Institute of Canada was held on December 16th, 1937, and was preceded by a dinner, a large number of the resident members being in attendance. The meeting was followed be a period devoted to an examination of the display of illuminated addresses, presented to The Institute on the occasion of its semicentennial anniversary, which were on exhibition for the occasion. Great interest was evidenced by both the members and the many visitors present in the art and beautiful workmanship of the exhibit.

Following this intermission Mr. A. L. Carruthers, bridge engineer for the Province of British Columbia, then gave a short talk on some of the interesting features in the design and construction of the Pattullo bridge over the Fraser river at New Westminster, B.C.

Three films were shown which illustrated quite clearly the magnitude of the work and the methods adopted to carry it out to a successful conclusion.

The members present had read the very excellent paper by Major W. G. Swan, Consulting Engineer for the Government, in the October issue of The Engineering Journal and were therefore fairly familiar with the sub-structure work, with the result that quite an interesting discussion ensued particularly with reference to the size, type, construction and sinking of the main piers; the advantages of the Kane construction in the south approach reinforced concrete trestle; the steel erection by the cantilever method and the sodium lighting of the roadway.

The consensus of opinion seemed to be that a very interesting evening had been enjoyed by everyone.

EMPLOYMENT SERVICE BUREAU

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party.

Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted after a lapse of one month, upon request.

All correspondence should be addressed to

The Employment Service Bureau, The Engineering Institute of Canada

2050 Mansfield Street, Montreal

Situations Vacant

SALES ENGINEER, with mechanical ability and bi-linguist, to act as sales engineer in fire protection field, Montreal and vicinity. Apply to Box No. 1291-V.

SALES ENGINEER, with experience and connections in Montreal district, to sell line of tanks, structural steel and floor grating. Speaking French, preferred. Apply to Box No. 1726-V.

ASSISTANT ENGINEER. A general contractor and builder, A.M.E.I.C., in Quebec province, will require this Spring, a young and capable assistant possessing energy and initiative for estimating and organizing jobs. A graduate engineer with some experience preferred, but character and a desire to make the construction business his life work, essential. Apply to Box No. 1727-V.

ENGINEER, experienced in air conditioning work. Able to survey, estimate, layout and supervise erection. Apply to Box 1734-V.

Situations Wanted

INDUSTRIAL ENGINEER AND SUPT. Age 32, A.M.E.I.C., with combined electrical, mechanical and steel industry experience in several plants. Experience includes design and testing of various types of industrial electrical equipment, supervision of production and cost reduction, heat treating of steel, time study application in several plants, in United States and Canada. At present supt. of modern factory. Apply to Box No. 132-W.

SALES ENGINEER seeks position with a future. A mechanical engineer, JR.E.I.C., with thorough training in England and wide experience for past 8½ years in Canada is seeking a permanent position as sales engineer for manufacturer of industrial equipment, etc. Has had varied experience in sales work, mechanical engineering, heating, ventilating and power plant equipment. Of good appearance, ambitious, intelligent. Excellent references. Apply to Box No. 270-W.

INDUSTRIAL ENGINEERING EXECUTIVE, with wide experience including fourteen years in design, construction, maintenance and operation of pulp and paper mills and power developments. Now employed, desires change of location. Apply to Box No. 320-W.

STEAM POWER PLANT DESIGNER, with wide experience on high pressure steam-electric plant. Available at once. Apply to Box No. 525-W.

Situations Wanted

MECHANICAL ENGINEER, JR.E.I.C., university training, age 28, Married. Four years experience in administration and operation of business. Two years experience construction as instrumentman and field control, and inspection of concrete. Experience assembly line supervision one year. Read, write and speak French. Will go anywhere. Available immediately. Apply to Box No. 551-W.

ELECTRICAL ENGINEER, B.SC., E.E., age 38. Married. Ten years electrical experience; including, one year operation, one year maintenance, and four years on construction of hydro-electric plants and sub-stations. Four years electric maintenance and construction in pulp and paper mill. Also experience on highway construction and Geological Survey. Available at once. Apply to Box No. 636-W.

MECHANICAL ENGINEER, JR.E.I.C., technical graduate, bilingual, age 35, married, experience includes five years with firm of consulting engineers, design of steam boiler plants, mechanical equipment of buildings, heating, ventilating, air conditioning, plumbing, writing specifications, etc. Five years with large company on sales and design of power plant, steam specialties and heating equipment. Available on short notice. Apply to Box No. 850-W.

ELECTRICAL ENGINEER, B.SC. (McGill '28), age 34. Experience includes transmission line and rural distribution construction and design. Some installation of motors and equipment, also house wiring. Available immediately. Apply to Box No. 940-W.

SALES ENGINEER, age 30, graduate in electrical engineering, seeks position with more future. Experience in radio and telephone work and in electrical contracting. At present selling electrical supplies in Western Ontario. Apply to Box No. 1044-W.

CHEMICAL ENGINEER, grad. McGill '34, experienced in meter repairs, control work; and also chemical laboratory experience. Apply to Box No. 1222-W.

CIVIL ENGINEER, B.A.SC. (Toronto '33), S.E.I.C., age 27. Married. Five years experience includes highway surveys, bituminous and concrete paving, steel and reinforced concrete building construction, instrument work, draughting, cost accounting and estimating and some experience as foreman. Available immediately. Apply to Box No. 1265-W.

ELECTRICAL AND RADIO ENGINEER, S.E.I.C., B.SC. (Elec.) '32, M.SC. '34. Experience includes four years part time operator for radio broadcast station, repairs to radio receivers and test equipment, design and construction of amplifiers and inter-office communication systems. Available on short notice. Apply to Box No. 1283-W.

Situations Wanted

CONSTRUCTION SUPERINTENDENT, M.E.I.C. Age 49. Married. Twenty-two years experience as engineer, superintendent and manager in charge of hydro-electric, mechanical production, structural steel erection, also considerable experience in steam plants, combustion, transmission lines, millwright work, complete mine installations, rock work, rock crushers and conveyors. Executive ability. Speaking French fluently. Location immaterial. Apply to Box No. 1482-W.

RESIDENT ENGINEER, familiar with all types of surveys and construction work including, railway, roads, irrigation, drainage, buildings and air ports. Executive ability. Had charge of several large projects. Intimate knowledge of reports and estimates. Available immediately. Any location. Apply to Box No. 1567-W.

ELECTRICAL ENGINEER, B.SC. '27 (McGill), A.M.E.I.C. Age 36. Married. Bilingual. Three years experience in telephone work (installation of manual and automatic exchanges). One year electrical prospecting. Nine years experience with electrical power company. Apply to Box No. 1601-W.

CIVIL ENGINEER, graduate 1927, age 34 years, desires position as town engineer. Eight years municipal experience. Location immaterial. Apply to Box No. 1628-V.

CIVIL ENGINEER, B.SC. in C.E., A.M.E.I.C. Age 32. Married. Three years of pulp and paper mill experience, draughting, instrumentman and maintenance. One year as instrumentman on highway construction. Five years checking and designing reinforced concrete and steel. Apply to Box No. 1658-W.

ELECTRICAL ENGINEER, B.A.SC., U. of T. '24, A.M.E.I.C., single, age 44. Ten years in supervisory operating office and two years in construction division (office and field) of large city electrical utility commission. One year factory supervision and tool design in manufacture of small electrical equipment. Wide experience with internal combustion engines. Experience handling heavy machinery. Private pilot's license for light aircraft. Full details on request. Available on short notice. Apply to Box No. 1693-V.

MECHANICAL ENGINEER, young graduate with six years diversified experience in the pulp and paper industry. JR.E.I.C. Desires position as master mechanic, or, as assistant in large mill. Apply to Box. No. 1694-W.

MECHANICAL AND ELECTRICAL ENGINEER, age 47, graduate University of Toronto, 1911. Machinist's trade. Two years tool design and quantity production in the U.S.A. Twelve years Canadian shop experience design and producing heavy equipment. Twelve years as chief sales engineer and field man for one of the largest Canadian national concerns. Experience in manufacturing and sales of pumps, engines, paper mill equipment, power plant equipment and specialties, electrical machinery etc. Clean record, excellent connection. Apply to Box No. 1699-V.

ELECTRICAL ENGINEER, B.SC., E.E. (Univ. of Man '37). Experience in highway construction as inspector. Available at once. Apply to Box No. 1703-W.

ELECTRICAL ENGINEER, B.SC., A.M.E.I.C., age 44, married. Experience includes draughting, construction and maintenance. The last eight years holding the position of electrical superintendent, of a fair sized industrial plant. Apply to Box No. 1718-W.

The Admiralty Graving Dock at Singapore

On February 14, the Governor of the Straits Settlements, Sir Shenton Thomas, G.C.M.G., formally opened the graving dock which has been under construction for the last eight years at the Singapore naval base. The ceremony, which was attended by ships from all the Eastern stations and by vessels of the United States Navy, as well as by representatives from Australia, New Zealand, the Federated Malay States and Hong Kong, was not, as the public is inclined to suppose, the official inauguration of the naval base as such, but merely of the graving dock. With the dock completed and in working order, however, one of the prime requirements which led to the authorization of the new base is met, and the fleets stationed in Middle and Far Eastern waters will be, in effect, usefully augmented as a result of the increased docking facilities now available, quite apart from any actual increase in the number and size of the warships which political developments may require to be stationed in those waters.

The contract for the new dock, which has been designed in the Civil Engineer-in-Chief's Department of the Admiralty, was placed in the latter part of 1928 with Messrs. Sir John Jackson, Limited, Westminster, S.W.1, as a part of the contract for the complete dockyard. The work of clearing the site commenced in 1929, but the actual construction was considerably delayed as a result of decisions in favour of retrenchment made at the Imperial Conference in the following year. This policy was subsequently reconsidered, following the change of government, in the light of Eastern developments, and the work has since proceeded normally. The dock has a width of 130 ft. at the entrance and a length of 1,000 ft. The depth of water over the sill is 35 ft. at low tide. These proportions render the dock capable of dealing with any ship in the British Navy. The contract for the caisson was sublet to Messrs. Sir William Arrol and Company, Limited, Glasgow, and that for the pumping plant to Messrs. Gwynnes Pumps, Limited, Lincoln. No particulars of the dewatering pumps have been disclosed, but it may be assumed that they will compare in capacity with those of the King George V dock at Southampton, of the same width and about 140 ft. greater length, which can be emptied in four hours.

The estimated total cost of the naval base, when the contract was placed in 1928, was £7,750,000, but various modifications have since been made to the scheme, and the ultimate cost, including machinery, will probably approach £12,000,000. This amount, however, cannot be regarded as excessive in view of the magnitude of the undertaking, which will cover some 2,400 acres, or nearly four square miles, with a water frontage of about 4½ miles. In levelling the site and excavating the dock approximately 8,000,000 cub. yd. of earth have been removed, and the associated dredging has amounted to about 5,000,000 cub. yd. In the construction of the dock and other works, and of some 5,000 ft. of wharf walls, 1,000,000 cub. yd. of concrete have been deposited, together with granite blocks to the total of about 250,000 cub. ft. —*Engineering*.

Preliminary Notice

of Applications for Admission and for Transfer

February 23rd, 1938.

The By-laws provide that the Council of The Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in April 1938.

R. J. Durley, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the Council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science of engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of Student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

CAREY—ROGER PACKARD, of Sackville, N.B., Born at Sackville, N.B., Dec. 10th, 1910; Educ., B.Eng. (Civil), N.S. Tech. Coll., 1935; 1929 (summer), chainman, Topog'l. Survey, Prov. of N.B.; 1930-31 (summers), chainman, Dept. of Highways of N.B.; 1933 (summer), instr'man., Town of Sackville, N.B.; 1935 (summer), plant inspr, Milton Hersey Co. Ltd., controlling operation of paving plants during laying of asphaltic paving at Memramcook and Sackville, N.B.; 1936 to date, instr'man., Dept. of Public Works, Prov. of N.B., Highway Divn., permanent highway constrn., running location, setting grades for earth work, pavement, etc.

More Light—Free

According to W. J. Orr, Manager of the Lamp Division of the Canadian Westinghouse Company, we obtain to-day five times as much light for our dollar as we did thirty years ago from the first tungsten filament lamps, and ten times as much as from the carbon lamps which they superseded.

This is because more efficient and cheaper lamps are available to-day and the price of electric power has dropped steadily and continuously year by year.

The cost of the light produced by a lamp is determined by three factors. The cost of the lamp and the cost of the current are, obviously, two of these, but the third, the efficiency of the lamp, is actually the most important of the three.

The enormous improvement in the efficiency of electric generating and transmitting equipment, within the past generation, is a familiar story—many of us can remember when electricity for lighting in the average home cost 10.5c per kw.h. To-day, the average householder pays only 3c per kw.h.

Since 1907, the price of the typical Mazda lamp—the 60 watt—has fallen like a plummet from $1.75 to the present price of 20c. The increased efficiency of the lamp, however, which determines how many lamps and fixtures and how much current is required for a given lighting job and therefore affects lighting costs more directly and extensively than the other factors, has risen step by step, year by year, until now the modern 60 watt Mazda lamp is about twice as efficient as it was when first introduced and almost three and one-half times as efficient as the carbon lamp of 1906.

Efficiency in a lamp is expressed in terms of lumens (of light) per watt (of current). This corresponds to the term "miles per gallon" which measures the efficiency of an automobile. Research and engineering have increased the miles per gallon obtained with a modern car, steadily reducing the cost of transportation to the motoring public and this increased efficiency is an important contribution to transportation. The average automobile costs about $1000.00 and, during its life, it consumes about $750.00 worth of gasoline, so that doubling the miles per gallon would cut transportation cost by 21 per cent. The average size Mazda lamp—the 60 watt—costs 20c and, during its life, consumes $1.80 worth of electricity, so that with the lamp, doubling its efficiency would cut the cost of light by 45 per cent! While miles per gallon therefore is an important factor in determining the cost of transportation, lumens per watt or efficiency of an incandescent lamp is many times more important in determining the cost of light.

In 1907, the brand-new tungsten filament lamp was sold by means of the slogan "Three times as much light for the same money," but now, due to the decreased cost of the Mazda lamp and the current to operate it, plus the increased efficiency of the lamp itself, we get ten times as much light per dollar as we did at the turn of the century.

Pegmatites of Manitoba Among Oldest Known Rocks

How old is the earth? Close to two billion years at least, according to A. C. Lane, Emeritus Professor of Geology and Mineralogy, Tufts College, Massachusetts. His determinations were made in the course of his studies of uranium-bearing minerals of certain pegmatite dykes occurring on the Huron and Bear claims in southeastern Manitoba. These dykes are among the oldest known rocks of the earth's crust.

Professor Lane deals with some recent developments in determining the age of minerals in his paper appearing in the February issue of the Bulletin of the Canadian Institute of Mining and Metallurgy. An introductory editorial note explains briefly how the age determinations are made. Uranium, it states, is continually breaking down, or disintegrating in successive steps through radium to a final product which is lead, and the rate at which this change takes place is known. Minerals containing uranium will therefore contain lead also, and the lead-uranium ratio multiplied by a certain factor—approximately 7,600—will give the age of the mineral in millions of years. Thorium also disintegrates at a known rate to give lead as a final product, and the age of the mineral containing thorium can thus be calculated from the lead-thorium ratios. Thus the age of uraninite in a sample of beryl from the Huron claim is calculated to be 1,722 million years, and the age of monozite, also a constituent of the beryl sample, is determined at between 1,917 and 1,952 million years.

THE ENGINEERING JOURNAL

VOLUME XXI, No. 4 APRIL, 1938

Ste. Anne de la Perade Bridge

Paul G. A. Brault, A.M.E.I.C.,

Structural Designer, Dominion Bridge Company Limited, Montreal, Quebec.

Paper presented before a meeting of the Montreal Branch of The Engineering Institute of Canada on March 25th, 1937.

SUMMARY.—The paper deals with the design, fabrication and erection of the new all welded steel highway bridge over the Ste. Anne River, at Ste. Anne de la Perade, Que. The bridge is a six span continuous deck plate girder 644 ft. long, carrying a 24 ft. concrete roadway and two 5 ft. concrete sidewalks, and replaces three old steel pin-connected through truss spans 211 ft. 9 in. long. The new bridge, being situated on the same alignment as the old bridge, necessitated moving the existing spans to maintain traffic, altering the existing piers and abutments, and constructing three new river piers. These are also discussed in the paper, as well as the difficulties encountered due to the exceptional spring floods which occurred during construction.

In September 1935, the councils of the Parish of Ste. Anne de la Perade and of the Village of la Perade, joint owners of the highway bridge over the Ste. Anne river, requested a new design for a highway bridge to replace the existing structure (three 211 ft. 9 in. pin-connected through truss spans), which was then inadequate to carry modern heavy traffic. Their stipulations for the new design were: (*a*) minimum cost, (*b*) if feasible a deck type structure which would enhance the appearance of the neighbourhood, (*c*) grade to remain approximately at the level of the existing floor, (*d*) traffic to be maintained during operations. The location of the bridge is shown in Fig. 1.

Available information of conditions at the site of the proposed structure was very meagre. The following data were obtained from residents of the district. The existing bridge was built some 45 years ago and the piers were supported on pile foundations; the river bed was of fine loose sand, approximately seven feet deep and over clay or gravel. The river ice had rotted in place every spring for the last twenty years.

Two locations were considered for the new bridge. The first location, referred to as alternative A, was situated on the same alignment as the existing bridge. The second location, referred to as alternative B, was located on a new alignment in close proximity to the old. Alternative A had the advantage of being the shorter crossing and having existing piers and abutments which could be used, provided the new load upon them was not greater than their present capacity. The main disadvantage was the necessity of moving the old spans to maintain traffic. In alternative B the old spans could be left undisturbed, but on the other hand the crossing was longer, all new piers and abutments would be required and also expropriations for new approaches would be necessary.

The following schemes were designed and estimated for both alternatives. Concrete simple spans, composite steel and concrete simple spans, through steel truss spans, continuous girder spans riveted or welded. All designs for alternative B were too costly and for alternative A the all welded continuous girder design was adopted as the one most economical and at the same time most thoroughly satisfying the owners' stipulations. (See Fig. 2.)

Bids were invited and the general contract was awarded in 1936, to the lowest bidder, The Dominion Bridge Company Limited, at $107,650. The general contractor in turn sublet the foundation work as well as the bridge deck slab and asphalting to Messrs. Gauthier and Julien, contractors, of Portneuf, Quebec, and the bridge lighting system to the Northern Electric Company Limited, Montreal.

Substructure

The substructure work, necessitated by the accepted design, consisted of altering the existing abutments 0 and 6, shortening the existing piers 2 and 4, and of the constructing of three new piers 1, 3 and 5. To accomplish this, it was necessary to move the existing spans downstream on to timber bents placed directly opposite their piers and abutments, thus leaving the field clear for all foundation work and at the same time maintaining the old spans for highway traffic. (See Fig. 3.)

Temporary Crossing

The bents consisted of fourteen wood piles 35 ft. long and 12 in. diam. driven by drop hammer through holes cut in the ice, and then capped and braced. Slotted gusset

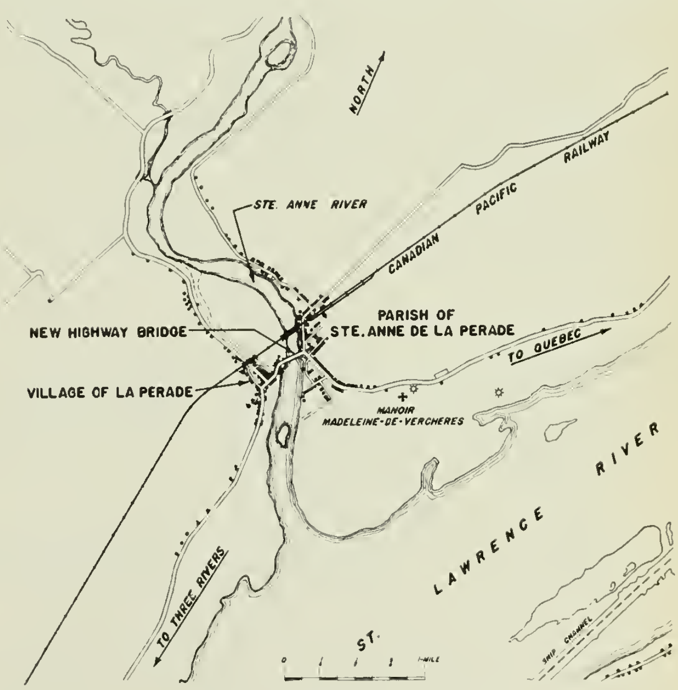

Fig. 1—Location of bridge.

plates, which engaged a 23 ft. jacking beam with cantilevered ends, were connected to the four corners of a span. The span was then jacked up 2 ft. 1 in., permitting runway rails and a truck beam on rollers to be placed under the span shoes. With the span brought down to bear, block and tackle and hand winches were used to move the span

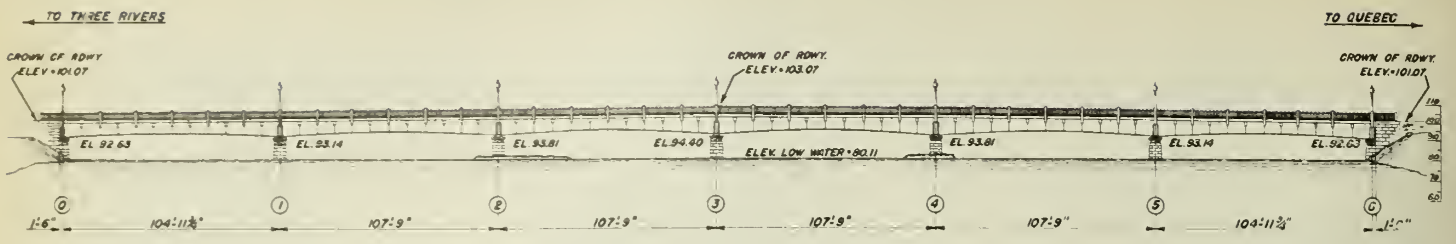

Fig. 2—Elevation of new bridge.

downstream a distance of 32 ft. The span was jacked up to release the truck beam and rollers, and then lowered 5 ft. 1 in. on to the bents. The same method and equipment served for all three spans. The net drop of three feet from the original floor level was made to eliminate unnecessary height and grade of the supporting bents and the timber bent approaches at either end.

Completed in early February 1936, this temporary crossing was destroyed on March 19th, following an unexpected movement of the river ice. Exceptionally high waters (common that spring throughout Eastern Canada and United States), aggravated by an ice jam three miles up the river, together with the fact that the flood gates of St. Albans dam were opened, caused the ice to shove. Floating at about 15 m.p.h. past the bridge site, the ice literally sawed through the timber bents supporting the old spans. The bent at pier No. 4 failed at 7.30 p.m., less than 30 minutes after the ice run started, throwing two spans into the river; at 4.30 a.m. the following morning the bent at pier No. 2 also failed, throwing the last remaining span. Fortunately due to the vigilance and alertness of those in immediate charge, no fatality occurred, and also the foundation sub-contractors, who had ample forewarning of the impending shove, were able to save all equipment they had on the ice.

The crossing was replaced by a trestle of 26 timber bents spaced about 24 ft. centre to centre. Each bent consisted of four 35 ft. piles driven approximately in the line of the current, then capped and braced. They supported three longitudinal rows of steel beams. In turn these steel beams, which were of stock lengths, carried 5 by 10 in. joists at 32 in. centres, which supported the floor plank, curbs and railing of the 16 ft. roadway. (See Fig. 4.)

Erection of the trestle started on March 30th and the new crossing was opened to traffic on Easter Sunday, April 12th, 1936.

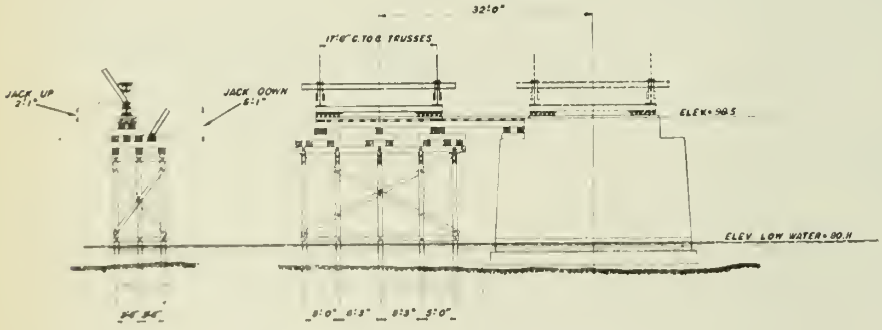

Fig. 3—Method of moving existing spans.

Abutment Alterations

The pier member seats of the old bridge were at elevation 98.5 while the bearings for the new structure are at elevation 92.63. Masonry was therefore removed to form a step in the front part of the abutment, 3 ft. deep, about 10 ft. high and extending across the full width of the abutment. On the base of this step a concrete cap was built to support the new girder bearings at their correct elevation.

Another change was necessitated by the fact that the new roadway is 24 ft. wide with a 5 ft. sidewalk on each side, whereas the old roadway was only 15 ft. 6 in. wide and without sidewalks.

The old abutment was 26 ft. 2 in. in overall width and had two masonry guard pylons protecting the approach to the old bridge. These pylons were removed and the whole top of the abutment covered with a reinforced concrete slab, 9 ft. long and of a section conforming to the outline of the new roadway and sidewalks. This slab is supported on two transverse reinforced concrete beams, cantilevered at each end to secure the required overall width. The rear beam rests on the masonry sidewalls while the front beam is integral with a vertical retaining wall built between the bridge seat and floor slab.

Identical alterations were made on abutment No. 0 and abutment No. 6.

Existing Pier Alterations

No plans or records of pier No. 2 and pier No. 4 were available. From enquiries made locally, it was learned that they had been constructed by the open cofferdam method and were founded on timber piles driven to a good depth by drop hammer. The pier shafts were of solid masonry, built with a superior grade of limestone from quarries at Deschambault, some 12 mi. from the site.

The bridge seat at these piers was changed by the new design from elevation 98.5 to elevation 93.8. The masonry was therefore removed for a depth of about 6 ft. and the remaining shaft then capped in concrete to the proper elevation. Concrete with an ultimate compressive value of 3,000 lb. per sq. in. was used in these caps and temperature reinforcing was placed at the top surface and coping sides.

Every effort was made by the sub-contractor to preserve the masonry removed, so that the stone could be re-used in constructing the shafts of the new piers.

New Piers

The piers were designed for total dead load plus live load plus 30 lb. wind. With a 48 pile layout, these loads yielded a maximum pile pressure of about 20 tons. The design of the new piers was based on that of the existing piers and inasmuch as the latter had withstood river current and ice pressure for over forty years without apparent movement or distress, it was assumed that this design was entirely satisfactory.

The cofferdam consisted of 16 in. at 30.5 lb. per ft. steel sheet piling 30 ft. long driven by drop hammer to about elevation 55.0. Unwatered, the sand was then excavated to elevation 66.5, this excavation being followed closely by three rows of strutted and braced 12 by 12 in. timber wales.

A 2,500 lb. hammer, with a drop of 20 ft., was used to drive the 25 ft. piles. A few of the piles were jetted about 15 ft., but jetting was abandoned as it was found that this caused the piles to drive out of plumb. In most cases penetration for the last ten hammer blows was from 10 to 12 in., and the final penetration about ½ in. An average allowable bearing value of 23 tons for each pile was indicated, using the Engineering News formula $P = \frac{2\,WH}{S + 1.0}$ The piles were sawn off 1 ft. above the excavation level. The average cut-off was about 2 ft., that is to say the total penetration of the piles averages approximately 22 ft.

Forms were erected inside the sheet piling and the concrete base was poured to elevation 79.21, the bottom waling being left in place, and the others removed as pouring progressed. A total of 206 cu. yd. was poured in two days, rubble concrete of one man stones being permitted. Sample test cylinders of this concrete showed an ultimate compressive stress of 2,690 lb. per sq. in. at 28 days, the mix being 1-3-4.

The main body of the pier shaft was built with a Deschambault limestone facing, and a concrete filled core. The procedure was to lay three tiers of masonry and fill the resulting core to within 6 in. of the top stones. This method was repeated until all the masonry was in place. The pier top was then formed and finished in concrete to the correct elevation. The concrete in the shaft core was of 1-3-4 mix, while that in the cap was 1-1½-2½. Test cylinders of the latter showed an ultimate compressive stress of 3,250 lb. per sq. in. at 28 days. There were 25 yd. of concrete in the pier cap, 43 yd. in the hearting and 40 yd. of stone facing. Specifications called for the removal of the steel sheet piling after completion of the pier.

A few difficulties, which may be of interest, were experienced during the construction of these piers.

At the time of the ice shove, pier No. 5 was poured to elevation 79.21, and the cofferdam of pier No. 3 was in place, unwatered, excavated, braced, and all piles driven.

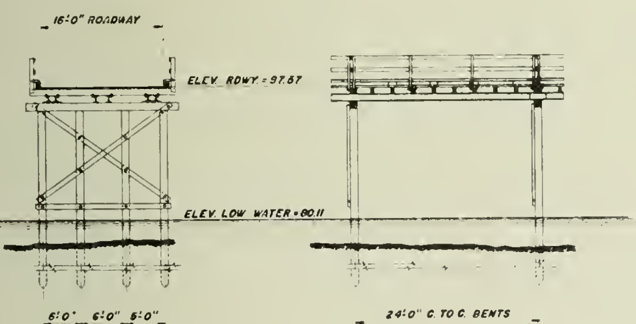

Fig. 4—New temporary crossing.

The ice did little damage to the cofferdam of pier No. 5 but that of pier No. 3 was pushed about 2 ft. out of plumb, and somewhat distorted. Furthermore, high waters up to elevation 88.0 completely flooded both cofferdams.

After the ice had cleared, a survey of the river bottom showed that there was a great deal of scouring all around both cofferdams and at some points to within 3 ft. of the bottom of the sheet piling. Also about 3 ft. of sand had been deposited in the bottom of cofferdam No. 3 by the flood waters.

This cofferdam was first successfully righted by means of block and tackle operated from a derrick scow and from pier No. 4. Due to the heavy scouring there was danger of water breaking through under the sheet piling if the cofferdam was unwatered under this condition. It was suggested by the foundation contractor that the deposited sand be pumped out, and a concrete seal be placed under water. This proposition was thought unsatisfactory as there would always be uncertainty of conditions at the base, and furthermore it appeared quite feasible to backfill around the cofferdams and re-excavate. The pier excavations and further soundings indicated that the sand extended to a depth of at least 30 ft. with very minor traces of clay and it was therefore decided to protect the piers permanently by leaving the sheet piling in place, driving the top to low water elevation after the pier was completed and

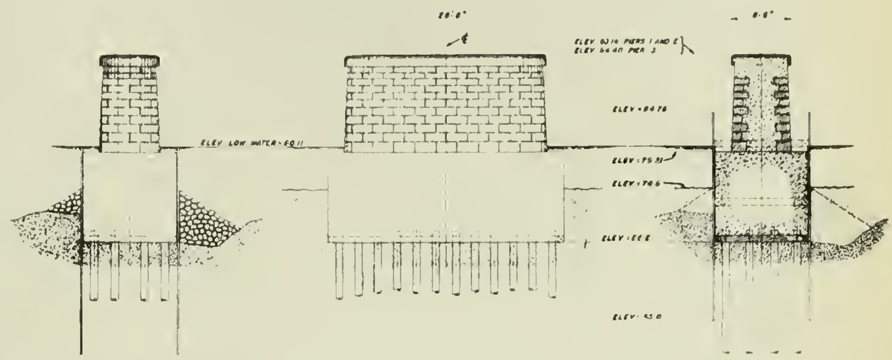

Fig. 5—New piers Nos. 1, 3 and 5.

also by placing rip-rap of one man stones around the cofferdam starting at elevation 71.0 and sloping at a bevel of 1 in 1½ to the river bed. At pier No. 3, brush mats were weighted and sunk alongside the cofferdam and the pockets refilled with stone and sand, topped off by rip-rap, which permitted normal completion of the pier.

At pier No. 1 the sub-contractors had excavated the cofferdam to elevation 66.0 but before the bottom wales were placed the east side pushed in at the bottom, canting some of the piling to a bevel of about 3½ in 12 vertically, and flooding the cofferdam. The remaining sides however, were undisturbed. It was necessary to partly refill the cofferdam, pull out the east side sheet piling and redrive. The pier was then completed without further incident.

Following the collapse of the old bridge, the owners feared that the superstructure design did not allow sufficient clear passage for the ice during spring floods, also that the three new piers would restrict the flow of water and encourage the formation of ice jams, with possible serious consequences to the bridge.

This last argument was largely disproved by the fact that the cofferdams of piers No. 3 and No. 5 were already in place forming an equivalent if not a more objectionable obstruction, and according to the evidence of eye-witnesses no jamming or upending of the ice took place. This might be expected, as the Canadian Pacific Railway bridge piers, located about 350 yd. above the highway bridge, break up any large sheets of ice. The decrease in the waterway due to the three new piers is only about four per cent. Figure 5 shows these piers as completed.

Observations indicated that the ice would have cleared the superstructure as designed by about 3 ft., but it was held to be a wise precaution to raise the bridge as much as possible without making the approach grades excessive. It was finally agreed by the councils to increase the clearance by 27 in., thus making the clearance of the new bridge only 3.5 ft. less than that of the old. This rise accounts for the top part of the pier shafts, below the coping, being built in concrete instead of masonry in order to obtain the desired increase in height at least cost.

Superstructure

Design

The superstructure is designed to C.E.S.A. standard specifications for steel highway bridges, A6-1929, using structural carbon steel.

The permissible unit stresses were as follows:—

Bending on extreme fibres:—	
Tension flange	18,000 lb. per sq. in.
Compression flange	$\left(18{,}000 - 170\frac{l}{b}\right)$ lb. per sq. in.
Shear on gross area of webs	12,000 lb. per sq. in.
Bearing on expansion rollers	600d lb. per lin. in.
Bearing on concrete	600 lb. per sq. in.
Welding, $\frac{5}{16}$ in. fillet	2,500 lb. per lin. in.
Butt welds	12,000 lb. per sq. in.
Vibrated concrete	f'_c = 3,000 lb. per sq. in.
	and f_c = 1,200 lb. per sq. in.
Reinforcing steel	20,000 lb. per sq. in.

Design dead loads were:—

Concrete	3,000 lb.
Asphalt	430 lb.
Steel	970 lb.
Total	4,400 lb. per lin. ft. of bridge

The following live loads were considered:—

Uniform live load:—
- On roadway, 98.6 lb. per sq. ft. to slab, cross beams and girders.
- On sidewalk, 98.6 lb. per sq. ft. to slab and cross beams. 20.0 lb. per sq. ft. to main girders.

Truck live loads:—
- One 20-ton truck, to slab, cross-beams and girders.
- Two 20-ton trucks, abreast, to cross-beams, at 25 per cent increased unit stresses.
- Two 20-ton trucks, abreast, to girders, at ordinary unit stresses.
- Impact, 30 per cent of truck loads.

The bridge cross section is shown in Fig. 6.

The bridge floor, consisting of a 24 ft. concrete roadway and two 5 ft. concrete sidewalks, is supported on cross-beams at 8 ft. 11¾ in. centres. The 7 in. roadway slab is of constant thickness, conforms to the contour of the 2 in. crown, and is protected by a 1½ in. asphalt wearing surface. It is designed for a positive moment between supports and a negative moment at supports. These moments are taken as 75 per cent of the simple span moment due to a 20 ton truck wheel concentration, with 30 per cent impact. The principal reinforcing consists of ⅝ in. round bars at 5 in. centres. This type of longitudinally reinforced slab is particularly advantageous when compared with a slab

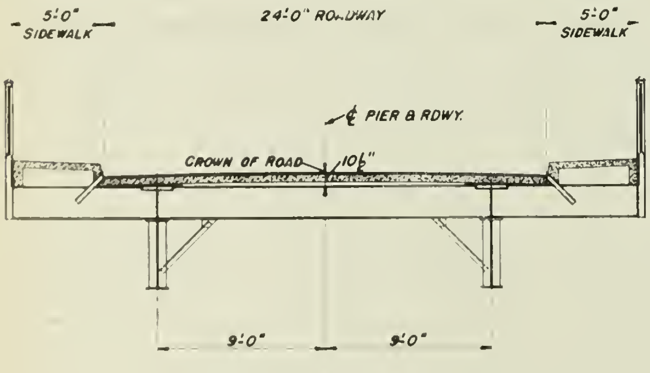

Fig. 6—Bridge cross section.

transversely reinforced, as a greater lateral distribution of concentrated loads is permissible.

The 4 in. sidewalk slab spans from an outside concrete stringer to the roadway curb, and drains towards the roadway with a total slope of ¾ in. The curb and stringer are designed as continuous reinforced concrete beams supported by the cross-beams.

Floor construction joints are located over the centre line of each pier and midway in each span. Galvanized plate drains with 8 by 4 in. outlets are placed along each curb at 53 ft. 6 in. centres.

The cross-beam is a 21 in. I beam at 59 lb. per ft., and was originally designed as a continuous beam supported on top of the main girders. It was accordingly ordered full

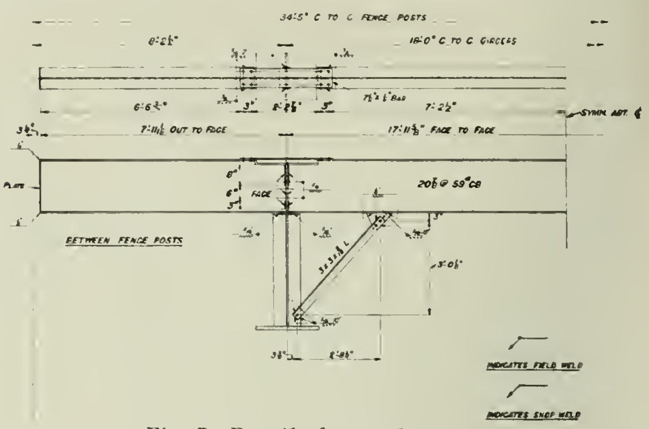

Fig. 7—Detail of cross-beam.

length from the mill. Due to the decision to increase the river clearance of the main girders, the cross-beam was lowered relatively to the main girders, until the top flanges of each were flush, thus gaining 21 in. of clearance. This necessitated cutting the cross-beams at the main girders, and required a welded detail connection which fully developed the shear and cantilever moment at the support. (Fig. 7.) The governing design moment occurs at the centre line between main girders, with two 20-ton trucks abreast. Under this loading the cross-beam is proportioned at 25 per cent increased unit stresses.

The main girder is designed as a beam of constant moment of inertia, continuous over six equal spans and seven unyielding supports. Under these assumptions, moment and shear influence lines for unit loads were determined for each point of investigation, which were the points of support and midpoint and quarter points of each span. From these influence lines, maximum bending moments, shears and reactions were computed. Actually the moment of inertia at the supports is about twice the moment of inertia midway in a span. This deviation from the assumption was studied and found to increase the negative moments over the supports by 12 per cent, and to decrease the positive moment in the first span by 4 per cent and the positive moment in the remaining spans by 15 per cent. The maximum moments were therefore corrected by these factors and the resulting quantities used in proportioning the girder flange material. Computations of the design are shown in Fig. 8 and details in Fig. 9.

The girder depth varies from 7 ft. 0 in. out to out of flange plates at the supports, to 5 ft. 6 in. out to out at the midpoint of each span. The bottom flange forms a parabolic curve of 1 ft. 6 in. rise between supports. The web plate is ⅜ in. thick for the full length of the bridge and the field splices are approximately at the quarter points of each span. The flange area required at any point equals the corrected moment divided by the effective depth and allowable unit stress, less ⅙ the web area. Compression flanges, at points of negative moment, are supported laterally for l/b by kneebraces to the cross-beams. An unusual feature of the flange proportioning is the use of a constant thickness and varying width of flange plate. This arrangement yielded greater economy and permitted simpler fabrication of the girders than the more conventional use of constant width and varying thickness of flange plates. An

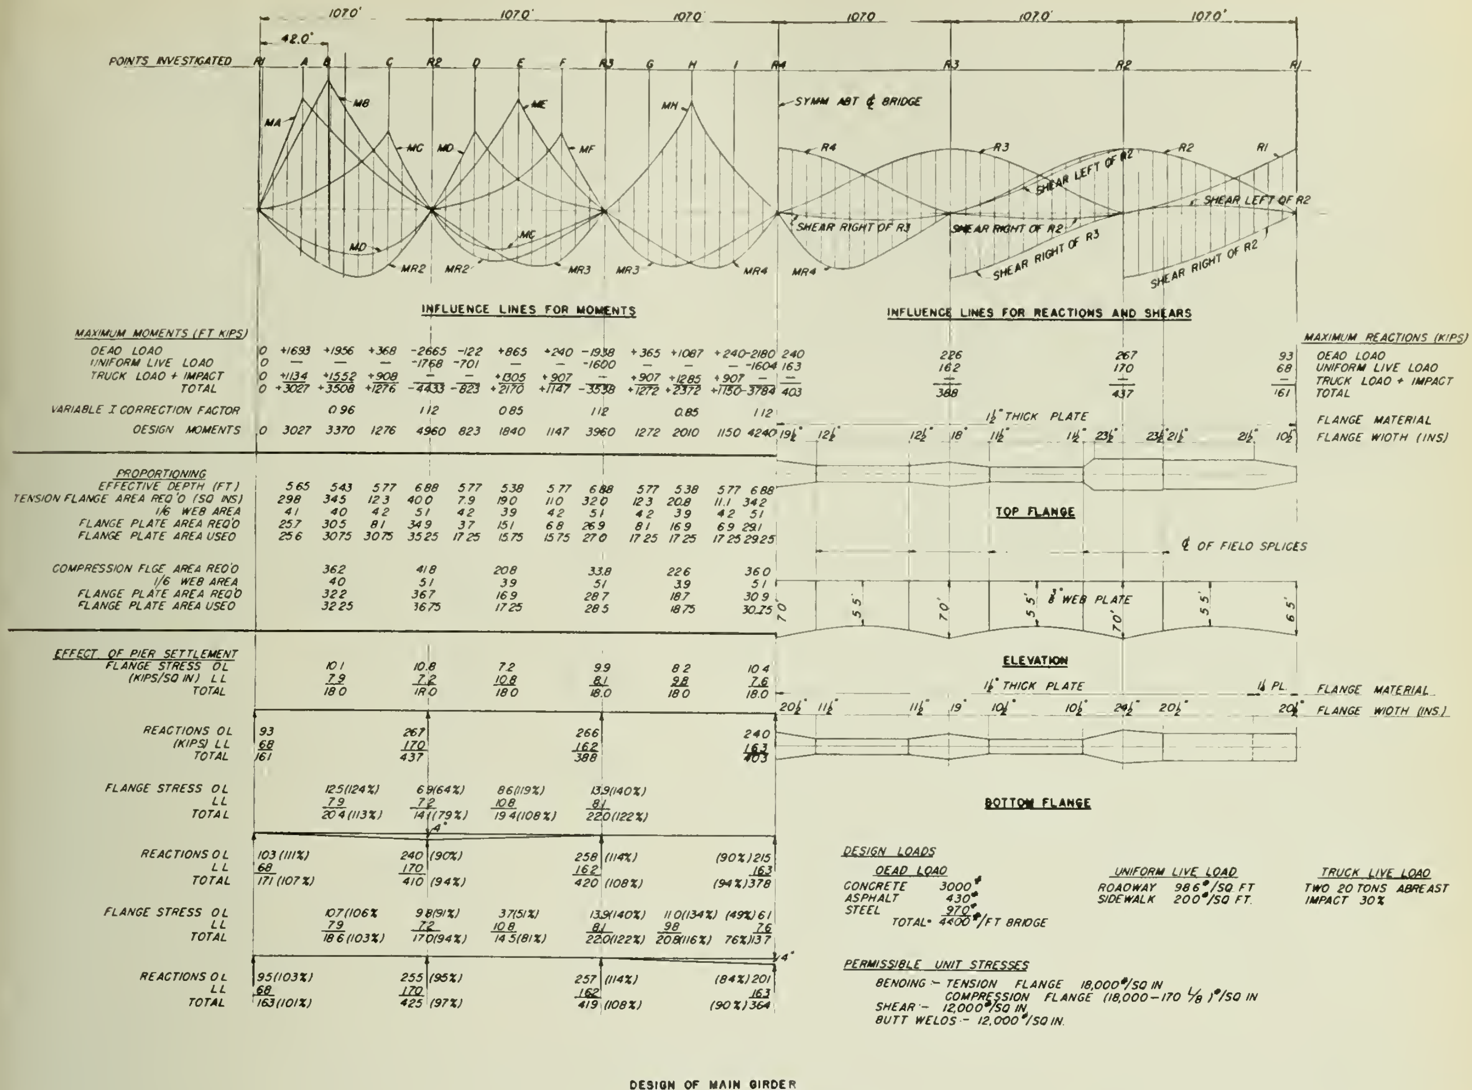

Fig. 8—Main girder design.

investigation of the effect of a pier settlement of 4 in. indicated a maximum increase of fibre stress of 22 per cent under full live load. In order to check any future settlements, if any, permanent brass plug benchmarks were established on all the piers and abutments are tied up with a geodetic benchmark on the church portico.

The jacking girders at each support also act as floor cross-beams and lateral brace frames. Dead load jacking stress at 50 per cent increased unit stresses governed the proportioning of these girders. The concrete floor slab is considered wholly adequate for lateral stiffness. Light temporary diagonal bracing was used during erection only, and removed after the deck was poured.

The main girders are fixed at the centre line of bridge on pier No. 3, and expand towards both ends. All pier members have disc type bearings between the girder and shoe plate. The expansion pier members consist of 8 in. dia. segmental rollers between shoe plate and bed plate. In each expansion pier member, one roller is guided top and bottom by side pintles, while the other rollers are guided from this one by pairs of flats at each end which engage tapped pins. The whole pier member is weatherproofed by bolted plates on all sides and presents a neat and uniform appearance. The fixed pier members consist of solid 7 in. bed slabs.

Fabrication

Shop detail drawings required for welded construction are very simple as compared with those required for similar riveted construction. Two girder sections over 50 ft. long are fully detailed on one drawing at a scale of ½ in. to the foot.

This would not be practicable with riveted girders. Due to the fact that the top flange of the main girder is a parabolic curve for the full length of the bridge and that the bottom flange forms a parabolic curve between each pier member it was necessary to establish convenient working lines for detailing and fabricating. The elevation of the crown of roadway was computed at each pier, a point chosen 2 ft. 9 in. below this elevation, and a straight line joined from point to point. These straight lines then served as working lines in determining the geometry of each fabricated section of girder. Ordinates from the working line to the top and bottom flanges were figured at the location of every cross-beam. All stiffeners between piers are placed at 90 deg. to the working line, only the bearing stiffeners at the pier members being truly vertical.

In general, fabrication divides itself into two principal operations; first, preparation of parts; second, assembly and welding of these parts. A description of the fabrication of one section of main girder will illustrate the procedure adopted throughout the job. This procedure was carefully planned to overcome as much as possible the ever-present shrinkage due to welding. Quarter inch covered welding rod, suitable for downhand fillet welds, was used for all shop welding. A single exception was the use of a free flowing covered rod for shop butt welds of thick flange plates.

All intermediate stiffeners are made from rolled bars which were first sent to the fiddle for straightening and then sheared to exact length plus $\frac{1}{32}$ in. Bearing stiffeners were sheared from plates and straightened before cutting to length.

The variable width flange plates were burned from rectangular plates by radiagraph on a track. The burned edges had to be smooth and without nicks. Where nicks occurred, it was necessary that they be welded and ground smooth. Due to the fact that flame cutting causes the same shrinkage characteristic as welding, a special sequence of burning was required to avoid lateral bowing of the finished flange plate. First, half of one side was burned, then all of the opposite side, and finally the remainder of the first side. This sequence also applies to the burning of web plates. Lower flange plates which occur directly over the pier members have a sharp bend 1 ft. 6 in. either side of the centre line of bearing. These bends were made on the fiddle to a templet. All other curvatures are so gradual they could be obtained by pulling down with clamps or jacking up from the floor when assembling to the web plates. Pairs of guide plates (washers, nuts, etc.) at about 3 ft. centres, were lightly welded and carefully remainder with a free flowing rod. When necessary the weld was peened to avoid excessive distortion. After the weld was complete the small backing bar was chipped off.

When the web of a girder section required one or more shop splices, these were made first, by preparing the abutting edges to form a 70 deg. groove, and welding. During this operation the plates were supported evenly along their length and also temporary stiffeners were tack welded close to the splices to prevent bowing of the plates. The web plate was then ready for marking. The working line was first scribed and then the centre lines of stiffeners were located and marked at 90 deg. to the working line. The spacing between stiffeners was increased $\frac{1}{32}$ in. to take care of subsequent contraction due to welding. On the stiffener lines, the ordinates to the top and bottom flanges were marked, and a smooth curved line made to join them by using a spline. The web was then carefully and accurately burned along these lines by means of a straight line templet and in the sequence referred to when burning the flange plates. Oiled paper templets with rectangular openings were used to indicate the location and length of welds on all stiffeners. When painted upon the surface of the web

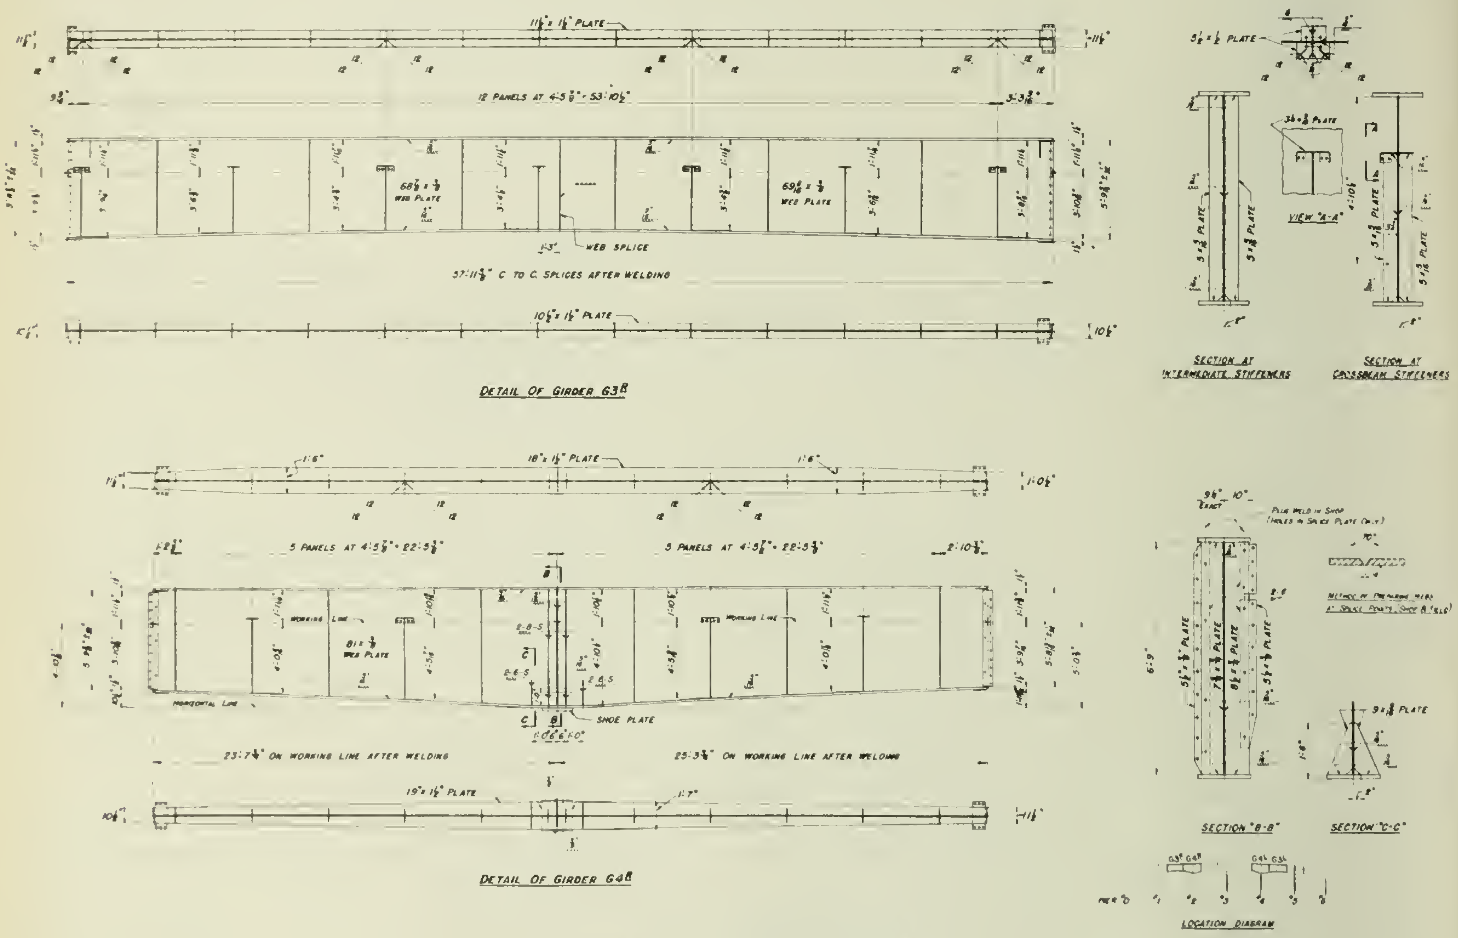

Fig. 9—Detail of typical main girder.

placed either side of the longitudinal centre line of flange plates, forming a centring groove for the web plate during assembly. These guides were removed after all shop welding was completed. Any necessary shop flange splice was welded before burning to shape. The ends were first burned to a 6 deg. bevel and then assembled together over a small backing up strip, leaving a space of ½ in. between top edges of plates. The plates were then dogged down, on either side of the groove, to a heavy block. At the same time the plates were allowed to droop slightly on each side. The first two passes were made with a fillet rod and the plate, the transverse distance between paint marks indicated the thickness of the stiffener, the width of paint mark was a gauge of the size of weld, and the distance between paint marks showed the length and location of each tack weld. There are two tacks opposite one another at each end of a stiffener and staggered tacks between these. The tacks are about 2 in. long and staggered about 6 in. centres. These templet paint marks greatly facilitated the assembly and welding of stiffeners.

All parts being prepared, main assembly of a girder section was commenced by welding the stiffeners to the web plate. The web plate was first placed on two longitudinal supports, allowing the outer edges to droop about ½ in. The stiffeners were then held in place by jigs and welded at one end. Welding then proceeded across the web, thus pulling the stiffeners into place on the web plate. This operation was repeated for all stiffeners and in any order of sequence. Care was taken to keep all end

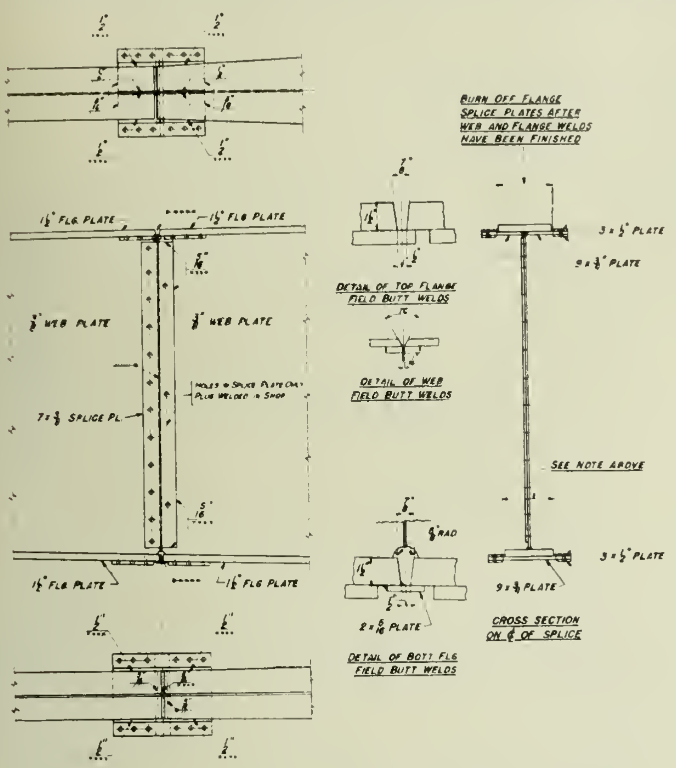

Fig. 10—Typical main girder field-splice.

welds clear of the outer edges of the web plate so as not to interfere with good bearing of the flange plates, and also, any craters had to be filled completely. After all stiffeners had been welded on one side, the web plate was turned over, marked, and the remaining stiffeners welded. All stiffeners were then checked for length and any that were more than $\frac{1}{64}$ in. longer than the web plate were chipped flush.

The flange plates were then assembled to the web plate in the following manner. The top flange plate was laid on rails, with the guide plates turned up, and shimmed to its proper curve. The web plate, with stiffeners, was then picked up vertically and set upon the flange plate between the guide plates. This was followed by lowering the bottom flange plate, with guide plates turned down, upon the web plate. Both flange plates were then pulled tightly against the web plate by long bolt clamps at both ends.

The continuous fillet welding of the web to the flanges required a special procedure to avoid the finished girder section bowing laterally or vertically due to shrinkage. In the following description a panel length means the distance between succeeding stiffeners, that is to say about 4 ft. 6 in. Two men welded at the same time, one man on the near side of the web and the other on the far side of the web. Starting at the centre of the girder section, the man on the near side welded half a panel towards the left, say, while the man on the far side welded half a panel towards the right. The man on the near side then started at the centre again and welded a full panel towards the right, while the man on the far side welded a full panel towards the left. The man on the near side then returned to the left side of the girder centre and starting where he had left off, welded a full panel towards the left. At the same time the man on the far side of the girder made a similar operation towards the right. This alternating method was repeated till about half of the first flange was welded. The girder was then turned over and the same procedure repeated until all of the other flange was welded. The girder was again turned (to its original position) and the remainder of the first flange welded. The girder section was then ready for the preparation of the end field joints.

The main girder field splice, as shown in Fig. 10, is the result of a good deal of thought and study. The splice had three conditions to fulfil. First, it had to be suitable for downhand field welding. Secondly, it had to provide sufficient temporary bolting strength to resist erection stresses. Lastly, it had to be neat in appearance when completed. The assistance obtained from the shop office aided considerably in arriving at this solution.

After the working line of the girder section had been re-established and checked, the girder was set up horizontally on level skids with the working line parallel to a squaring block at each end. Using a surface gauge, the centre lines of the field splices at each end were scribed on the web and all around both flange plates. Care was taken to obtain the exact overall length of the girder section, allowing $\frac{3}{32}$ in. increase of length to counteract the eventual shortening due to field welding. Secondary lines were also scribed 12 in. back from the centre lines of joints These were used for setting all splice plates and to assist in the accurate preparation of the main material for field welding. The edges of the web were prepared for welding by hand burning, leaving enough to finish-chip to a gauge templet. The flange plates were prepared by machine burning to the proper bevel and without chipping. The edges of the flange splice plates, nearest to the secondary

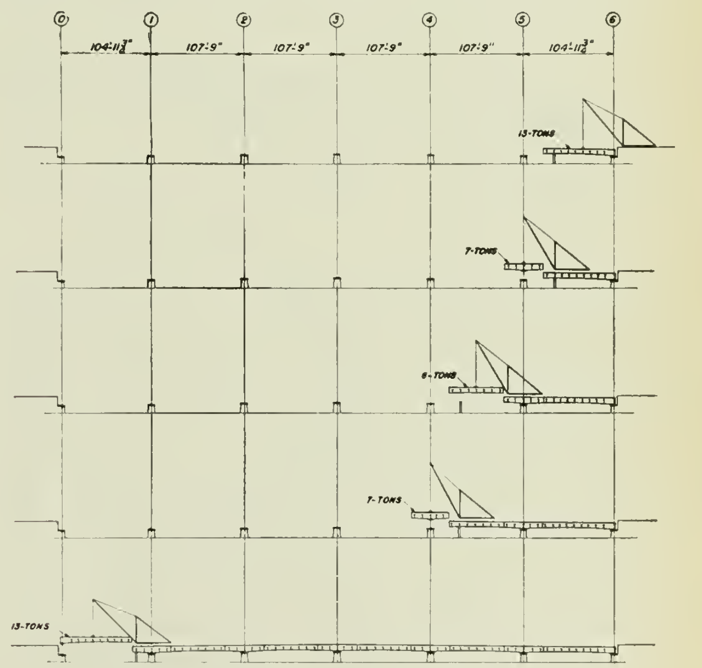

Fig. 11—Erection progress diagram.

scribed line, were milled to facilitate setting. Holes in the web were marked and burned, and then reamed with the same templet used to drill the web splice plates.

The procedure in fabricating the jacking girders was similar to that used for the main girder sections. Fabrication of the cross-beams, brackets, pier members and handrailing was routine and did not require any unusual methods. It may be noted however that the fence bars were not welded but their ends were turned and peened during assembly.

Erection

The erection method is illustrated in the progress diagram Fig. 11. A nominal 12 ton stiff leg derrick set up on a movable platform was used. All material was trucked from the railway siding in the village to the temporary crossing alongside the bridge and directly opposite its ultimate position. The first girder section and all centre sections were placed with the forward ends resting on pile bents. The third stage, placing a six ton centre section, shows the condition of loading which governed the temporary bolting strength of the main girder field splices. Placing the last 13 ton section, however, required a greater moment development. This condition was relieved by placing a bent directly under the derrick footblock. All girder splices, cross-beam connections, temporary bracing, etc., were fully bolted at each stage before the traveller moved on. Due to the difficulties encountered during the construction of pier No. 1, steel erection was somewhat delayed. While this postponement of erection lasted, the traveller was left standing over pier No. 2. Field welding was therefore started, commencing at pier No. 3, and working towards abutment No. 6, before erection was actually completed. By the time field welding was finished at abutment No. 6, the remaining steel had been erected, whereupon field welding started again at Pier No. 3 and was completed towards abutment No. 0.

Two welders, one on each side of the bridge, welded one jacking girder and twelve cross-beams, while at the same time two other welders, one on each girder, welded four main girder field splices. It took about five double shift working days to complete the welding of one span. The welders were handpicked shopmen who had worked on the fabrication. The fact that these welders were men from the shop and had never before been out on erected steel, required the use of special scaffolding to assure their safety and comfort while welding, as well as good workmanship.

The following procedure was adopted in welding a main girder field splice (Fig. 10). The vertical web splice was welded first, using a thick flowing 'all position' covered rod. Starting at about a foot below the top flange, the webs were welded upwards to the top flange. Then starting about two feet below, welding proceeded upwards to where the first weld was started. This method was repeated till the whole web was welded. Web field bolts were then removed and the open holes plug welded. The bottom flange plates were welded next. The first two passes were made with a fillet rod and all remaining passes were made with a free flowing rod. About 12 passes altogether were required to completely weld one flange. An original method was used in making these passes. Considering the plan view of the bottom flange splice and starting on the near edge a few inches to the left of the splice, the first pass was along this near edge, across the flange, and then a few inches along the far edge towards the right. The second pass started on the far edge, a few inches to the left of the splice, then along this edge, across the flange, and then a few inches along the near edge towards the right. Each pass alternated in this manner. This system built up weld metal at the ends of the splice and eliminated any possibility of craters occurring at these points. Welding of the top flange splice followed in exactly the same manner. The temporary flange splice plates were then removed. At the bottom flange they were burned off flush with the flange edges and then chipped off completely, after which the edges of the flange were ground smooth.

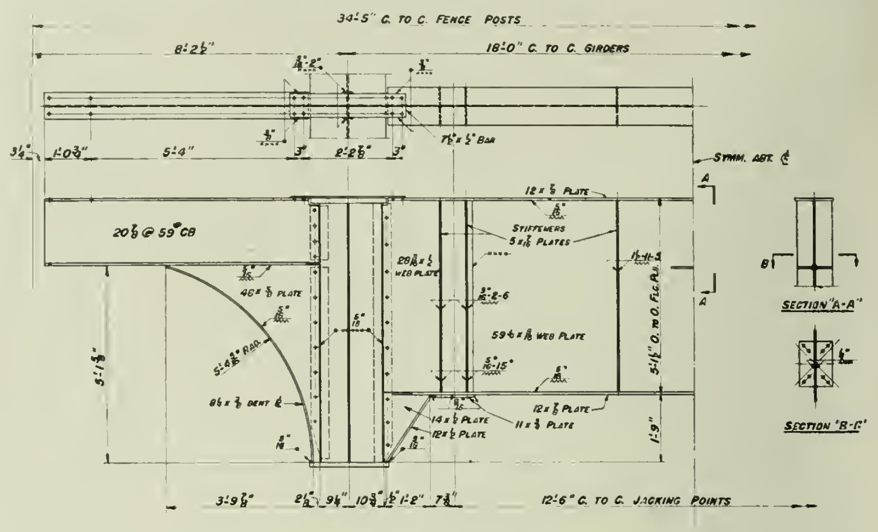

Fig. 12—Detail of typical jacking girder.

Only the small 2 by $\frac{5}{16}$ in. backing plate was left in place. At the top flange they were burned off flush with the flange edges and the parts of the plates underneath the flange were left in place as they did not show after the deck was poured.

Field welding the jacking girders (Fig. 12) consisted principally in welding the webs in the same manner as the main girder webs were welded. For the cross-beams (Fig. 7) the webs were welded first, followed by the welding of the 7½ by ½ in. moment straps and the bottom flange tacks.

Formwork for the concrete floor slab followed immediately after a span was welded. Concreting, form stripping, asphalting and lighting system completed the construction.

Conclusion

The following are a few quantities and facts in connection with the bridge. In the substructure, 145 twenty-five-foot piles were driven, 1,015 cu. yd. of concrete were poured and 2,000 cu. ft. of Deschambault limestone were placed. In the superstructure there are 318 tons of structural steel, of which 183 tons represent the main girders. The covered welding rods used were, ¼ in. Wilson No. 107 for fillet welds, ¼ in. Murex cresta for free flowing welds, and $\frac{5}{32}$ in. Stelco No. 304 for thick flowing welds. A total of 6,460 lb. of welding rod were used in shop fabrication, and 1,780 lb. used in field welding. There are 48 cu. yd. of concrete and 50 tons of reinforcing steel, in the deck slab. 170 sq. yd. of 1½ in. asphalt were required for the roadway surfacing.

The general contract was let on January 16th, 1936. The substructure was completed about July 31st, 1936. Erection of steel started on June 12th, 1936, and was completed on August 6th, 1936. The bridge was officially opened to traffic on October 25th, 1936.

The 18 Foot Diameter Steel Pipe Line at Outardes Falls, Quebec

Design and Construction

Paper presented at the Annual Meeting of The Institute in London, Ont., February 2nd, 1938.

SUMMARY.—Special supporting and stiffening members are needed if the elastic theory of thin membranes is to be applied to the design of large pipe lines. That application is illustrated by plotting the trajectories of the principal stresses on the pipe surface, noting the effect of the stiffening rings. The manufacture and erection of the pipe line at Outardes Falls are described.

In the design of the Ontario Paper Company's Outardes Falls hydro-electric development, it was necessary to provide some 6,580 ft. of waterway, this being the distance between the intake structure and the power house. The topography of the ground was such as to preclude canal or flume construction for any portion of this waterway. The entire length was therefore designed as a pressure conduit. It consists of the following major elements:

1. Wood-stave pipe, 17 ft. 6 in. internal diameter, 5,888 ft. long.
2. Steel pipe, 18 ft. 0 in. internal diameter, 445 ft. long.
3. Steel penstock, 14 ft. 0 in. internal diameter, 254 ft. long.

The combination of a pressure conduit of this length and size with a normal gross head on the turbines of 222 ft. made it necessary to introduce a surge tank as an integral unit of the waterways system. This was of importance for several reasons, not the least of which was the more than ordinary degree of stability required by the nature of the system load.(1)*

The location of the surge tank was governed by the fact that ledge rock at a suitable elevation was available only 255 ft. on chainage from the longitudinal centre line of the power house. This was of great advantage, since the closer the tank can be placed to the turbines, the more effective is its action.

The grade of the upper 5,900 ft. of the waterway was such that the computed pressures to be resisted permitted the use of wood-stave construction and a contract was let on this basis. This wood-stave pipe has an internal diameter of 17 ft. 6 in. and has been described elsewhere.(1)

Between the lower end of the wood-stave pipe and the upper end of the surge tank tee, the grade dropped approximately 62 ft. in a distance of about 400 ft. The design pressures in this section varied from 113 ft. to 177 ft.

It is this portion of the pipe line which forms the subject matter of this paper.

The profile of the original ground surface at this section, as well as the approximate location of rock, is shown on Fig. 1. Test borings had shown that the rock was covered by an overburden of well drained sand. Bearing tests on the sand were made and from these a unit bearing value was determined for purposes of footing design. The grade selected for the pipe was of necessity a compromise between that required for minimum hydraulic losses and minimum number and size of anchor blocks and that grade which would give the minimum excavation and consequently the least disturbance to the bank immediately upstream from the surge tank.

It was obviously more economical to construct this section of the line as one pipe rather than two parallel pipes. To design and build a pipe as large as this on an earth bank presented unusual and difficult problems. Specifications for several different types of construction were prepared and tenders secured. Of the acceptable designs, the lowest in cost was a steel pipe on spread concrete footings with insulation provided by backfilling up to the horizontal diameter and by building a suitable wood housing over the upper half of the pipe.

Immediately downstream from the surge tank, the pipe line is divided by means of a wye structure into two penstocks, each of which supplies water to one turbine. These penstocks have an internal diameter of 14 ft. and are encased in concrete. Accordingly, there were no unusual features of design in this section of the work.

Principle of Design

In line with modern practice for the design of large steel pipe lines, use was made of the elastic theory of thin membranes, or the so-called "shell" theory, for the 18 ft.

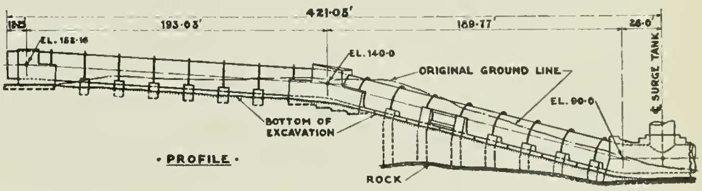

FIG. 1

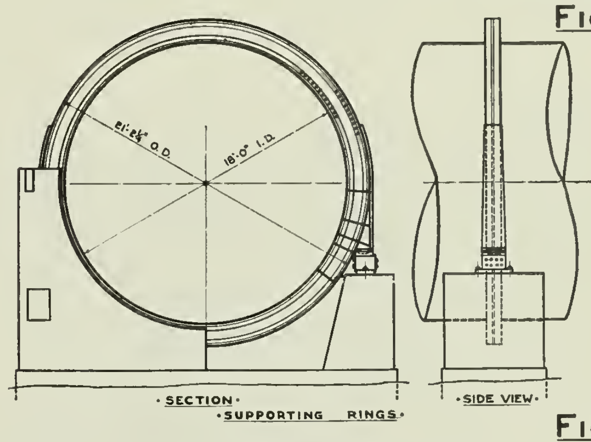

FIG. 2

Fig. 1—Profile of Pipe Line.
Fig. 2—Supporting Ring Girder.

diameter section. Engineers in Europe have designed according to this principle for a number of years, and only comparatively recently has the theory been used for pipe line design by engineers in the United States. As far as the authors are aware, the Outardes Falls pipe is the first to be designed and built in Canada according to this theory. The soundness of the principle has now been demonstrated by a number of structures. Its application

*Numbers in parentheses refer to the items in the list of references given at the end of the paper.

is not limited to pipe lines. The theory may be applied with equal effectiveness to large building roofs, submarine hulls, automobile and aeroplane bodies, large containers, in fact to any structure where thin curved membranes are required.

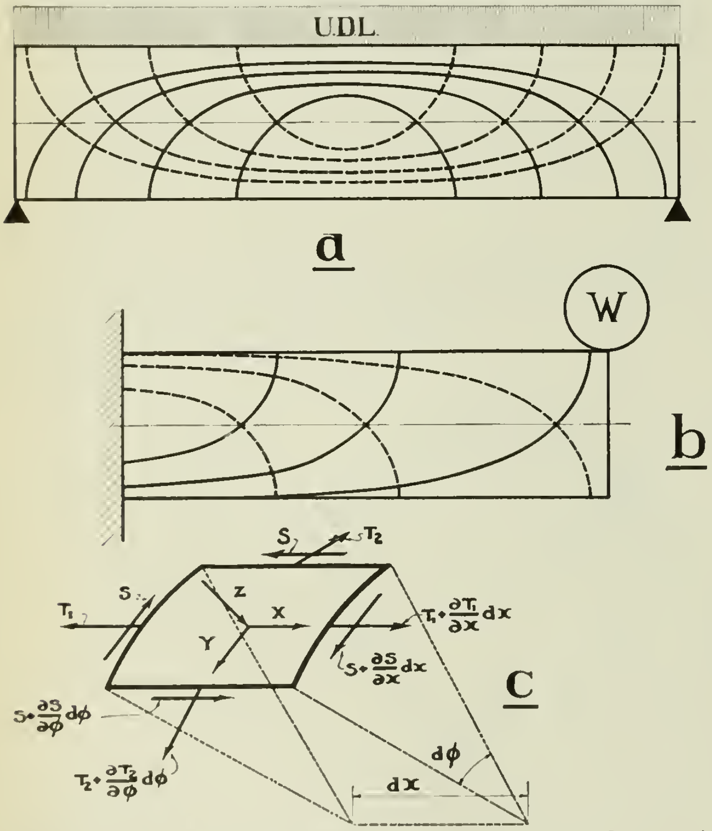
Some of the more recent pipe lines designed according to the shell theory that have come to the authors' notice are:—

Boulder Dam Penstocks[2]	30 ft. and 25 ft. dia.
Shannon River Penstocks	19 ft. 8 in. dia.
Platte Valley Pipe Line	13 ft. 4 in. dia.
Glines Canyon Penstock	11 ft. 6 in. dia.
Glines Canyon Pipe Line	10 ft. 0 in. dia.
Boquet Canyon Pipe Line	7 ft. 10 in. dia.*

In their paper on the Boulder Dam penstocks,[2] C. M. Day and Peter Bier state:

"Analytical work of the Bureau of Reclamation, confirmed by model tests of the Babcock and Wilcox Co., showed that a saddle type of support would have to be substantially continuous before it could support these pipes with reasonable stresses. This would have been costly and therefore stiffeners and supports were developed in line with the general type described by Herman Schorer[3] . . . The necessary formulas were worked out by engineers of the Bureau of Reclamation by applying to the problem the mathematical theory of thin cylindrical shells. The calculated stresses and displacements showed good agreement with those obtained from a model section of experimental pipe. The result was a substantial saving in cost."

In their discussion of Schorer's paper,[3] Templin and Sturm outlined their work of experimentation on and analysis of pipes supported on cradles extending over three



(Portions (a) and (b) reproduced by courtesy of D. Van Nostrand Company, Incorporated.)

Fig. 3. (a) Principal Stress Trajectories, Simple Beam.
(b) Cantilever Beam.
(c) Forces on Elementary Parallelopiped of Pipe Shell.

different arcs of the pipe shell and using different types of stiffeners. They began by investigating an existing 11 ft. diameter pipe which had been designed with the customary ring angle stiffeners and cradle type supports. The members had been proportioned according to a theory which gave satisfactory results on smaller sizes. Nevertheless, field tests of the 11 ft. pipe "showed that when the pipe was almost full of water, high stresses occurred in both the saddles and the stiffening rings at certain critical points, namely, in the shell near the ends of the saddles, in the saddle stiffener rings at the top of the vertical diameter, and at both ends of the horizontal diameter." As a result of mathematical analysis and model experimentation, Templin and Sturm finally arrived at a type of supporting and stiffening member such as is required by the membrane theory.

*Only the trestle portions of this line were designed on the basis of the shell theory.

Fundamentals of the Membrane Theory

Analysis and experience both show that, provided an appropriate type of support is used, the elastic theory of

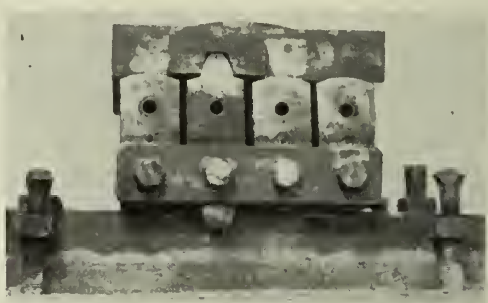


Fig. 4—Rocker Bearing for Supporting Ring Girder.

thin membranes may be used in designing the shell plates of a pipe. The major stresses in these plates are then found to be direct tensile and compressive stresses and shearing stresses. Bending stresses are so small that they do not materially affect the design, except in a narrow zone near the ring stiffeners as will be explained later. Thin shell construction may therefore be used, because of its ability to resist a direct stress system with economy of materials.

For a circular pipe an appropriate support may be provided by any one of many designs. One very simple method consists of a circumferential stiffener applied to the exterior of the pipe. It has the cross section of a simple plate girder and is supported by short steel posts placed near the ends of the horizontal diameter. This is essentially the construction used at Outardes Falls and is illustrated in Fig. 2. Other types are shown in Figs. 8, 9, and 10.

No attempt will be made here to give the mathematical analysis for these pipes. Much of it has been published elsewhere,[3],[4] and one of the authors hopes in a future paper to develop the theory still further.

The stress system in the shell of a pipe supported in such a way as to take full advantage of membrane action is apparently more complicated than that of many engineering structures. This is so only because the form of the structure is such that a more than ordinary degree of accuracy in the analysis yields important results that can be used to advantage in design, the result being that material can be used everywhere with high efficiency and therefore great economy secured. Even in the ordinary simple beam, the actual stress system is more complicated than the usual analysis indicates, but no practical economic significance attaches to a more accurate or precise determination.

One very adequate and comprehensive method of picturing the stress system under discussion is to draw on the developed surface of the pipe a number of the trajectories of the principal stresses. This diagram is then cut out, rolled, and the edges fastened in such a way as to simulate a section of the pipe. A discussion of the stress system in a pipe shell and its illustrations by such a graphical representation of the trajectories of the principal stresses is given in the following section.

ILLUSTRATION OF THEORY BY PRINCIPAL STRESSES

The stresses in a pipe may be analysed by considering the forces acting on a small elementary parallelopiped of the shell. The stresses and forces on such a small element are indicated in Fig. 3. Three general differential equations governing the equilibrium of the forces acting on the element may be written. These are the so-called Bauersfeld equations.[3] Their integration provides means for the calculation of the stresses.

It will be noted that no bending moment forces are shown in Fig. 3. A brief discussion on this point is given below. For a more detailed treatment reference should be made to the discussions of Schorer's paper on the "Design of Large Pipe Lines."[3]

As may be realized from Fig. 3, the Bauersfeld equations give the value of the direct and shearing stresses only in the axial and circumferential directions. A series of diagrams could be prepared showing the variation of these stresses at any number of selected sections and these undoubtedly would help in understanding the stress system of a pipe shell. However, the authors believe that a much better appreciation of shell action can be obtained by plotting the trajectories of the principal stresses. The consideration of shear is thus eliminated and the trajectory diagram gives a picture of the directions of the tensile and compressive stresses over the entire pipe surface.

It will be recalled that at any point in a stressed member two planes may be found, at right angles to each other, on which only normal forces act. Shearing forces on these planes do not exist. The directions of these planes are called the *principal directions*, and the stresses due to the normal forces have been given the name of *principal stresses.*

With this information two systems of curves may be constructed to represent the directions of the principal stresses. Tangents to these curves at any point are in the direction of the principal stresses at that point. Moreover, according to the definition given above, the tangents at the intersection of any curve of one system with any curve of the other system are at right angles to each other. These curves are the *trajectories of the principal stresses.* Except for the case of pure bending, the trajectories are not lines of constant stress intensity. The stress intensity along the trajectories changes progressively in amount and may even for certain conditions reverse its sign; that is, there may be a change fom tensile to compressive stresses, or vice-versa.

To illustrate the above point, on ground that is more familiar to most engineers, the principal stress trajectories for a simply supported beam with a uniformly distributed load and for a cantilever beam with a concentrated load at the outer end are given in Figs. 3 (*a*) and 3 (*b*) respectively.

Before discussing in more detail the stress distribution and deformations in pipes supported by stiffener rings, it may be helpful to consider first the mechanical function required from the pipe shell.

Take, for example, an ordinary fire hose. It lies flat on the ground until the water inflates it. As the water enters, the hose assumes first an oval shape, then as pressure is built up, the oval changes gradually until finally an almost perfect circular shape is obtained. While the hose is supported continuously on the ground, it can be imagined that only hoop tensile forces exist in the walls. If, now, the hose is lifted from the ground, longitudinal stresses must immediately come into existence because of the suspension action. The full hose will also distort at the point of support.

Similarly, in a steel pipe, circumferential tensile forces exist, acting to resist the internal water pressure. In amount, they are dependent only on the pressure and the radius of the pipe. With the pipe supported at intervals, there must also be a set of longitudinal forces, and possibly moment and shearing forces. It is these forces which transmit the live and dead loads to the supports, and their correct analysis constitutes the pivotal element of the entire problem.

In order to consider this problem of finding the stresses resulting from the above mentioned forces, it may be of interest to recall the beam theory commonly in use, and to point out its limitations as applied to large pipes. In most cases, a pipe line is carried on a series of equi-distant supports. There will, therefore, be restraint at the supports, and the following discussion will deal only with beams equally restrained at both ends.

According to the common beam theory, longitudinal forces exist at every section. These are compressive forces on one side of the neutral axis and tensile forces on the other, with a straight line distribution of intensity across the depth. Also, shearing forces exist throughout the section and have a parabolic distribution as shown in Fig. 11. The longitudinal forces elongate or shorten the

Fig. 5—Upstream Section of Steel Pipe Line Before Completion of Girder Wells.

Fig. 6—View from Anchor Block No. 1.

longitudinal fibres while the shearing forces tend to deform any square element of the beam into a rhombic shape. The stresses resulting from these two kinds of forces can be resolved into principal stresses (with the consequent elimination of all shears) and the trajectories obtained, as has previously been described. Ordinarily, shearing stresses are rather hard to visualize, and stress presentation by the method of principal stress trajectories reveals the actual stress distribution in a form easier to understand than by more customary methods.

In the ordinary beam theory, also, loads are considered as being applied in a very theoretical fashion to the beam

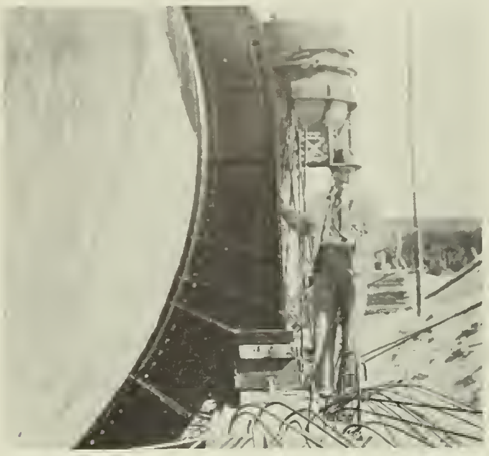

Fig. 7—Foot and Rocker Bearing, Supporting Ring Girder.

as a whole. Since this manner of application cannot be accomplished in practice, the stresses at any section due to the way in which loads are actually applied to the beam are totally ignored.

In addition, the only deformations considered are the deflections due to bending moment.

Approximations of the ordinary beam theory are sufficiently accurate for the majority of beams encountered in engineering practice. This is mainly because of their relatively large ratio of span to depth. For large pipe lines, however, the above statements are not true and a more accurate analysis is required.

On observing the trajectories of a rectangular beam, Fig. 16, it can readily be realized that the beam acts as if it were composed of a series of suspension and arch bridges, transferring the loads in either tension or compression to the supports. Looking at the beam in this fashion, the concept of moments and shears can be dispensed with altogether, the entire beam action being explained solely by a direct stress system. After all, if a sufficiently small element is imagined cut out from a beam in the direction of the principal stresses, it is only either under uniform compression or uniform tension, or a combination of both, in space. The concept of moment comes into consideration only when the element, as the section shown in Fig. 11, becomes so large that it is necessary to assume a varying amount of direct stress over the surface of the element.

However, there are types of structures where a uniform distribution of direct stresses over the whole thickness of the body may be readily assumed; for example, such a structure as an egg-shell, or a dome as indicated in Fig. 12.

Assume now that an evenly distributed surface load is acting on this dome. On the basis of the above discussion, it can be seen that the load elements will be taken to the supporting base by a series of direct stresses curved through the material of the dome membrane. One of these possible stress lines or trajectories is indicated in the figure.

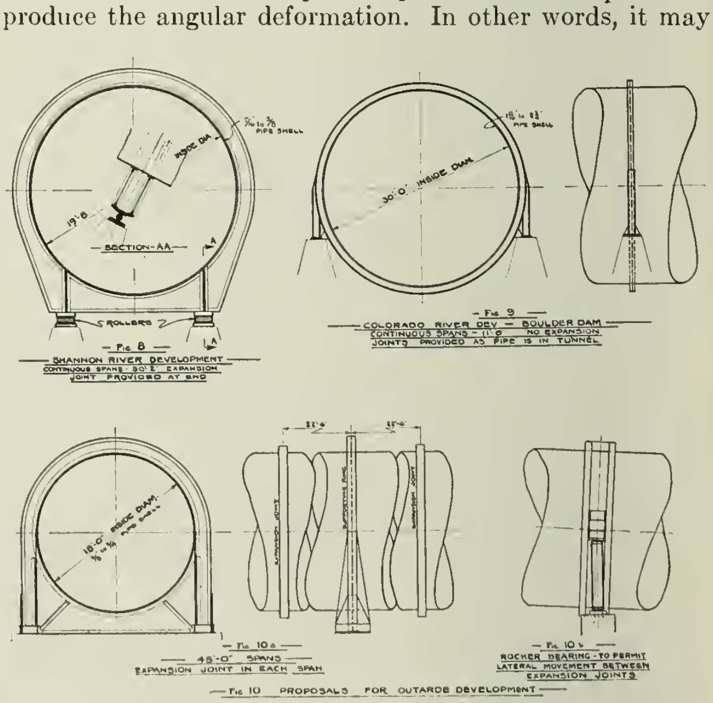
Similarly for Fig. 13, the water loads Z on a small element "A" of the pipe membrane create lines of direct stresses in the membrane which transmit the loads Z to the supports. The shape of these curves is governed by the intensity and distribution of the load elements Z over the pipe membrane, as well as by the elastic nature of the support or any other boundary condition. Thus, if an opening were made in the pipe near the stress line T_a, this curve would be forced to bend around the opening. In order to determine the stress distribution over the surface of the pipe, it is therefore necessary to set up equations which will include not only factors to take care of the loads Z and the shape of the surface, but also any boundary conditions that may exist.

Whenever equations are prepared for a series of stress curves, such as the trajectories T_a and T_b of Fig. 13, they must necessarily be based on a system of co-ordinates. The longitudinal stresses and hoop stresses discussed above (T_1 and T_2 respectively of Figs. 14b and 15) exist only as components, since, in general, the trajectories are neither straight lines nor circles, but other curves. For equilibrium it is therefore necessary to introduce additional forces, that is, the shearing forces.

To explain this concept of shear, consider a small piece of the pipe membrane cut along the trajectories T_a and T_b of Fig. 13. Such a piece is shown in Fig. 14. On the assumption that the forces T_a are compressive and T_b tensile, the section of pipe membrane would deform from a square to a rectangular shape. Any smaller square element "A" cut out along the trajectories T_a and T_b would undergo a similar proportional deformation.

Consider further a square element "B" cut from the same pipe section, but with two edges parallel to the pipe axis and the other two at right angles to these. Such an element can be referred directly to the chosen co-ordinate system. It is evident that the element "B" will not deform in a manner similar to element "A," but will take a rhombic shape, although the forces acting on elements "A" and "B" are identical.

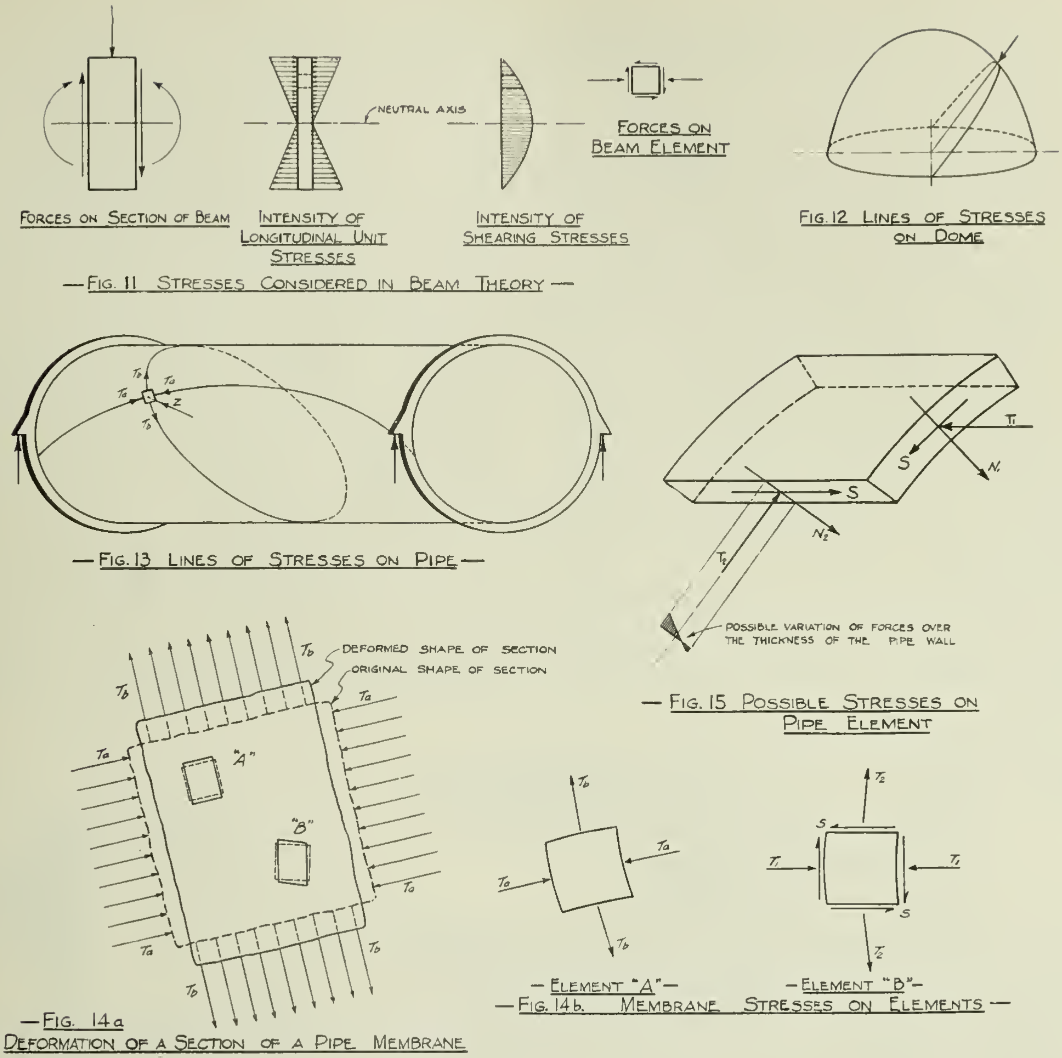
It follows that while element "A" has only forces acting normal to its edges, there must be shearing forces S acting along the edges of the element "B" in addition to the assumed forces T_1 and T_2. These are required to produce the angular deformation. In other words, it may



Figs. 8, 9, 10a, 10b.—Supporting Ring Girders.

be considered that the force T_a on element "A" is resolved into forces T_1 and S on element "B," and that the force T_b on element "A" is resolved into forces T_2 and S on element "B."

It must be noted that the concept of shearing forces was introduced only because a certain system of co-ordinates was selected. Shear may be eliminated if principal



Figs, 11, 12, 13, 14a, 14b, 15.

stresses only are considered. This is the chief advantage of plotting the trajectories of the principal stresses.

Having demonstrated that a set of trajectories may be drawn according to a possible distribution of stresses in the pipe membrane, it is in order to inquire if the initial assumption that was made is correct, that is, whether *all* the forces are direct forces in the plane of the pipe shell or whether there are not some stress components normal to the pipe surface.

Observation of pipe line deformations and of pipe line failures leads to the belief that there is some bending normal to the pipe surface. If an element is cut from the pipe wall, such as is shown in Fig. 15, then the following stress components could act on each of its edges:

(*a*) A component, *T*, in the plane of the plate.
(*b*) A component, *N*, normal to the plate surface.
(*c*) A component, *S*, along the edge.

Also, all of these components could have a varying intensity over the thickness of the plate.

It has been assumed that the pipe consists of a comparatively thin membrane and a series of stiffening rings. Any stress components lying outside of this membrane as well as any variation in the forces over the thickness of the membrane would cause deformation therein. Conversely, the pipe membrane would have considerable resistance to any components, *T*, provided they were located in the central plane of the element.

According to the principle of least work, any stress components resulting from a series of forces will be such as to cause the strain energy to be a minimum. Therefore, if any small element of the pipe shell can be kept in equilibrium by the use mainly of components *S* and *T*, which produce very small deformations, it follows that the components *N*, normal to the element, which produce relatively large deformations, must be small.

Following this reasoning, the problem is to find some means of supporting the pipe in such a way that equilibrium of the structure is obtained without the help of any forces normal to the pipe membrane. This cannot be done with cradle type supports, because the upper part of the pipe would be required to transfer the reaction from the water pressure to the support and this cannot be done along the surface only, without inducing components *N* and consequently bending in the shell.

On the other hand, ring girder supports will permit this transfer to be made with but very little bending in the membrane, as will be seen in the following discussion.

The trajectories of the principal stresses have been worked out for a pipe having an internal diameter of 17 ft. 6 in. and provided with stiffening rings and supports at 60 ft. intervals. An isometric representation of these is included in this paper for purposes of illustration.* Figure

*These were prepared some time ago to illustrate another paper and are the only ones at present available in suitable form for publication.

17 (*a*) shows the trajectories of the principal stresses for the condition of pipe just full. The broken lines represent tensile stresses and the full lines compressive stresses. Stress intensity is indicated by the width of the lines.

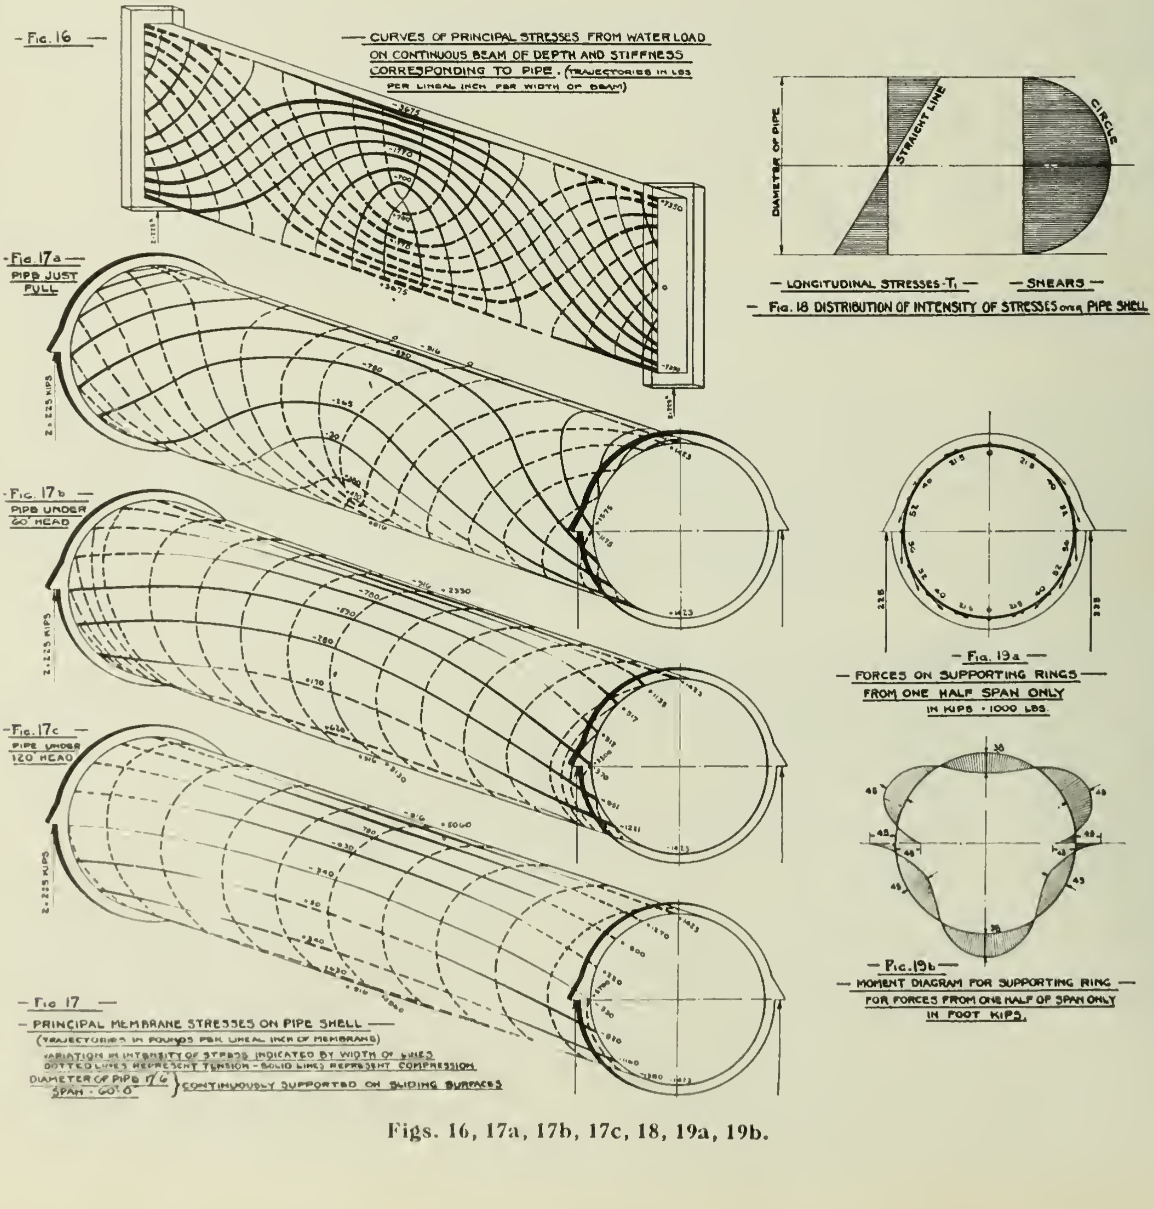
To illustrate these conditions, the pipe could be imagined as composed of a waterproof membrane, suspended by ropes (the broken lines) to the stiffening rings and stiffened by wires shaped to the solid lines representing the compressive stresses. All these imaginary ropes and wires would have to be completely within the membrane in order to give the true equivalent of the state of stress.

The forces acting on the stiffener rings are the resultant components of the principal stresses in the connecting pipe membrane. Since the principal stresses act *in* the shell of the pipe, these resultant components are tangential to the pipe shell at the junction of shell and stiffener ring, as can be observed from the diagram of stress trajectories, Fig. 17. Incidentally, these forces are the same for all pressure heads. Imagine now that the stiffening rings did not extend around the entire circumference of the pipe, but stopped short part way up, as in the case of the conventional cradle support. With this condition there would be no stiff member to take the reaction from the imaginary ropes and wires and the membrane would certainly bulge in this area. In other words, bending moments tending to deform the pipe will always occur with cradle supports. With circumferential ring supports these moments can be almost entirely eliminated from the pipe shell.

In Fig. 16 there are shown the trajectories of the principal stresses for a beam fully restrained at both ends, and having the same span, stiffness, and loading as the pipe of Fig. 17. Looking at the pattern of the trajectories, it can easily be seen that such a beam is composed of a simple central span supported by cantilever arms at both ends. There are also two distinct sets of trajectories, perfectly symmetrical about the neutral axis, one set representing the compressive stresses and the other the tensile stresses.

Similarly, it is possible to compute the stress pattern for a hollow cylindrical beam. But as mentioned above, the distribution of the live load over the surface of such a beam is of great importance, particularly if the walls of the cylinder are thin and if the ratio of beam depth to span is large. The ordinary beam theory neglects this point altogether, since it is of little importance with the usual shallow beams.

In addition, internal water pressure increases in intensity from top to bottom and the resulting ring stress will vary in like manner. Combining the hoop stresses with the beam stresses, there results the patterns of Figs. 17 (*a*) to (*c*). It is seen that with the pipe just full, the stress condition is similar to that of a rectangular beam. As the internal pressure increases, one set of the trajectories



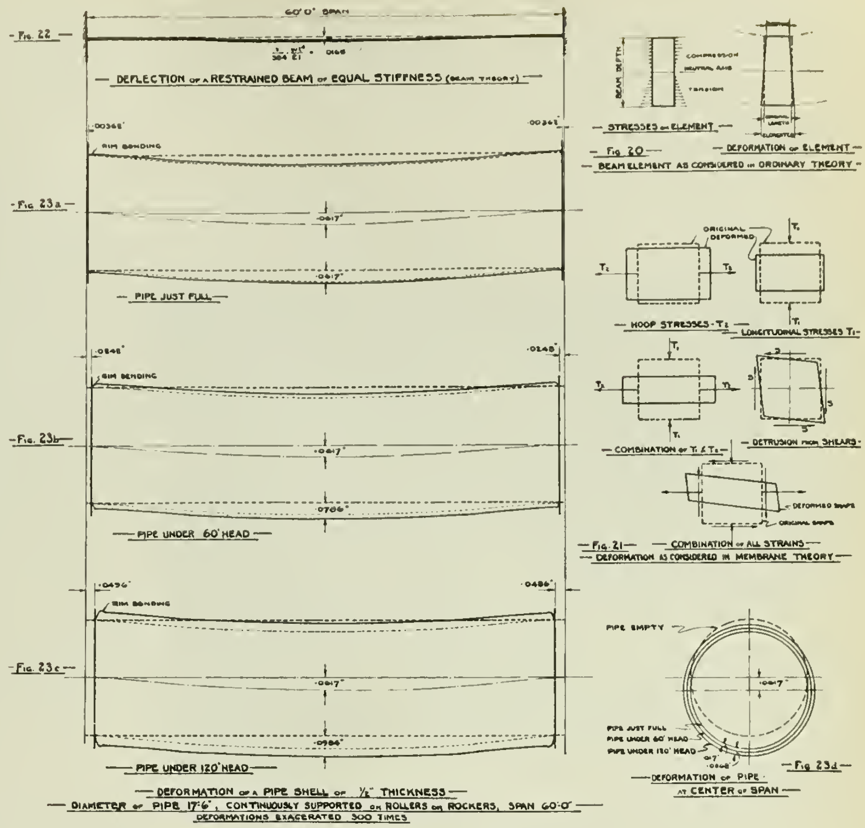
Figs. 16, 17a, 17b, 17c, 18, 19a, 19b.

develops into hoop stresses and becomes more and more pronounced as such both in shape and in magnitude. The other set of trajectories straightens out longitudinally with increasing pressures. Variations in intensity and in sign along the length of the beam may also be noted. The curvature of these trajectories increases with the distance between stiffening rings, but decreases with increase of internal pressure.

The Stiffening Ring

It will be noted that the trajectories at the pipe supports are not parallel to the horizontal axis of the beam, but are inclined thereto at slight angles which vary in amount across the section. This, of course, is due to the action of the shearing forces. Since equal restraint has been assumed at the supports throughout this discussion, the patterns of the trajectories on either side of the support are therefore identical but of opposite configuration. The horizontal components of the trajectories will be of equal intensity but opposite in direction and consequently in equilibrium. The tangential components in the plane of the stiffening ring produce shearing forces acting on the inner periphery of the ring. These, in turn, cause bending moments in the latter member.

The intensity of the shearing forces at any point is directly proportional to the sine of the angle locating that point. Plotting intensities (but not directions) at a point in a horizontal direction, a diagram similar to the right hand illustration of Fig. 18 results.



Figs. 20, 21, 22, 23a, 23b, 23c, 23d.

The bending moment diagram for the stiffening ring will depend upon the type of support adopted. For the support illustrated in Fig. 2, the approximate form of the bending moment diagram is given by Fig. 19 (*b*).

Rim Bending

Because of the amount of metal concentrated in the supporting ring, the latter will not expand under pressure as much as the shell. In other words, when the pipe is under pressure there is a slight constriction at each ring, accompanied by bending of the shell. This has been given the name of *rim bending* and the stresses caused thereby must be added to the longitudinal beam stresses. Fortunately, its effect is confined within a short distance on either side of the rings.

Stresses Due to Temperature

For a steel pipe, the intensity of the stresses caused by changes in temperature must be given serious consideration. In Canada it is usually necessary to insulate steel pipes to prevent ice formation on the inside of the shell during the winter. Adequate insulation will keep the temperature of steel pipes very close to the temperature of the water. The maximum range in water temperatures from summer to winter is comparatively small, but account must always be taken of the changes in temperature that may occur in the steel during periods when the line is unwatered for inspection, etc. It cannot be assumed that these periods will coincide with days when the air temperature is within the annual range of water temperatures. The pipe must therefore be designed for a range of temperature higher than its normal annual variation.

The temperature at which closure is made during construction will evidently be a determining factor in this connection. If closure could be made at or about the mean of the maximum range in temperature, this would be the correct procedure, but construction schedules may not always permit it.

With no provision for expansion and contraction and with the pipe ends fixed by anchor blocks, a longitudinal direct stress of at least 10,000 lb. per sq. in. must be contemplated for the range of temperatures normally occurring in Canada. The addition of stresses of this order of magnitude to the maximum longitudinal stresses would force the designer to use heavier shells, if standard working stresses are to be maintained.

Deformations

The ordinary beam theory is not sufficiently accurate for use in computing the deformations of a pipe shell. It is based solely on the change in length of the horizontal fibres under the action of bending, as indicated in Fig. 20. When applied to a pipe shell, the calculated displacements would be too small. Shearing stresses as well as hoop stresses contribute largely to the deformation of the pipe membrane. This is shown in Fig. 21.

Furthermore, it is necessary to consider the flow of material normal to the line of force application, i.e., Poisson's ratio must be applied.

The mathematical operation necessary for finding the deformation of a pipe shell is somewhat similar to solving a jig-saw puzzle. The shell is first cut into squares. These are then deformed according to the calculated membrane stresses and an endeavour is made to fit them together again. If they fit, it is said that the conditions for compatibility have been fulfilled and the calculations are correct. If they do not fit together, which may be caused by restraining conditions at the support, then either a mistake was made in the assumption for the membrane stresses or some other force must be assumed, such as a bending moment force, and the operation repeated.

Figure 23 shows the calculated deformations of the shell of the same pipe as in Fig. 17. Figure 22 gives the deflections of the equivalent restrained beam according to the ordinary formula.

It is to be noted that under all pressures (within the elastic limit of the pipe material) the central meridian deflects the same vertical distance. This movement is mainly due to the longitudinal and shearing forces in the pipe membrane. Hoop stresses will contribute an outward radial movement of the pipe shell due to the enlargement of the diameter.

Fig. 24—Downstream Section of Steel Pipe Line. Note concrete struts and copper expansion joint strips.

The stiffening rings, being much less deformable than the membrane, will materially decrease the radial movement in their vicinity, and the so-called rim bending deformation appears.

Another interesting feature is the tendency of the pipe to shorten under water pressure. This may be an important feature of design where no allowance for longitudinal movement of the pipe is made.

In examining the exaggerated shapes of Fig. 23, the meaning of the words "membrane" and "shell" as applied to the theory is very evident. Soap bubbles or rubber balloons blown from two straws at either end would behave in exactly the same way. Such thin films cannot resist bending moments and their shape is therefore a direct indication not only of their state of stress, but also of the deformations to be expected in shell structures. They supply additional confirmation of the essential correctness of the membrane theory, which states that under certain continuous conditions of load and with suitable supports, equilibrium can be attained without the occurrence of stress components normal to the surface of the shell. With knowledge of this theory it is possible to design extremely economical structures.

Description of the Outardes Falls Pipe Line

The general outline of the 18 ft. diameter pipe is given in Fig. 1. Plate thicknesses vary from ½ in. at the upstream end to ¾ in. at the downstream end and each ring is made of three plates. A short section of plate at each ring stiffener is ⅛ in. heavier than the corresponding plates on either side, in order to take care of rim bending stresses.

Each stiffening ring is fabricated in the form of a circular plate girder with a ⅜ in. by 18 in. web plate and two angles for each flange. A heavy bracket type foot is formed at each side. It is built of welded plate members. This transmits the loads from the pipe through the rocker bearings to the footings.

Computations showed that if no provision were made for free expansion of the pipe, the addition of thermal compressive stresses to the beam compressive stresses would result in stresses higher than those ordinarily used. A hollow cylinder is well adapted to resist axial compressive forces. But, in addition to direct axial loads, there would also be transverse bending of the pipe as a whole, as well as rim bending. These forces might have an important influence on the elastic stability of the pipe. No large scale experiments were known to the authors that would constitute verification or otherwise to any theory that might be developed. It was therefore considered advisable to make adequate provision for free longitudinal expansion.

Two slip-type expansion joints, therefore, have been provided, one on each side of the central anchor. As far as the downstream section of the pipe is concerned, this was the obvious location, since the axial dead weight component could be more easily taken care of by the lower anchor located on ledge rock. The slope of the upper section was small and the axial dead weight component therefore small also but nevertheless appreciable. The central anchor is located near the brow of the hill and it was decided to relieve this of as much of the thrust as possible. For the construction programme it was desirable to start erection of the pipe at both ends and work towards the centre. From the viewpoint of both design and construction, it was therefore better to reverse the more customary procedure and locate this expansion joint at the downstream end of the section.

To allow for free movement of each stiffening ring on its base, a train of four rockers is provided on either side at each support. These are similar in design to those frequently used on the free end of bridge spans. To prevent any creep of the rocker train on its sloping base, a bar formed with a 14 deg. involute tooth at top and bottom is fastened to one rocker of each train. It engages with a corresponding member on each of the rocker bearing plates. The upper plate moves with the stiffening ring and the lower plate is bolted to the concrete of the footing.

Fig. 25—Downstream Section of Steel Pipe Line. Girder wells have been completed and frost housing supporting beams are in place.

This bearing is shown in Fig. 4. The upper of the two side tie plates has been removed in order to show the construction adequately. The engaging member for the lower tooth had not been welded to the base plate at the time the picture was taken.

Since the pipe was to be backfilled up to the horizontal diameter, it was necessary to provide means to allow free movement of the ring stiffeners. This was accomplished by extending walls up from the concrete footings the necessary height to form a well. A watertight connection between these concrete walls and the pipe shell was made by a specially designed copper expansion strip which would allow both axial and radial movement of the shell. One edge of this strip was embedded in the concrete side wall of the well and the other fastened to the pipe by a cir-

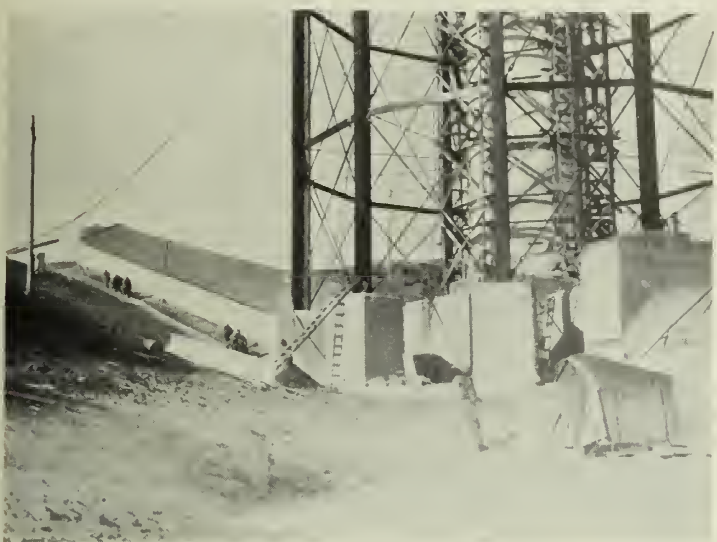


Fig. 26—Completed Frost Housing.

cumferential steel strap drawn tight by suitable lugs and bolts. The outer space between the shell, copper expansion strip, and concrete wall was filled with loosely packed rock wool to prevent the backfill entering and impeding the action of the joint.

Each ring girder and the shell ring attached to it were assembled in the manufacturer's shop and shipped to the job as a unit. The flange angles of the girder were riveted to the web plates. All other joints were made by electric arc welding. The three ring plates of the shell section were assembled on a spider and the longitudinal joints made by down hand welding. The ring stiffener was made in sections and tack welded to the pipe ring, after which the joints on the stiffener were made. Welding of the fillet joint between the shell plates and the toes of the girder flange angles was then completed.

To secure good contact between the shell and the girder angles, a portable bull press was used at each tack weld, the pressure being maintained while the tack metal was being deposited.

The ring stiffeners were placed on board the Ontario Paper Company's boats at the manufacturer's wharf in Montreal, transshipped at Baie Comeau to scows, which latter made the remaining 40 mile passage to the wharf at Outardes Falls. On arrival at the site of the work, they were placed on the previously prepared footings and rocker assembly, lined up, and blocked in position until the shell plates were welded to them.

The task of handling and placing the 7½ ton ring girders to exact position on rocker bearings with a sloping grade was not an easy one. Correct alignment of the upper and lower sections of the pipe was essential to secure proper functioning of the expansion joints. This work was carefully done and the measure of its success was demonstrated by the excellent fit secured at the central elbow, where closure was made.

As far as can be observed, both joints are now working in a perfectly satisfactory manner.

All shell plate joints were of the usual 60-deg., included angle, single vee, butt type, and were made by the electric arc welding process. Covered rod was used throughout the work, including all tack welds incorporated into the finished joint. The specifications required that welding be done only in the flat and vertical positions, except where definite permission was granted for overhead work.

The three plates for each shell ring were therefore assembled on a spider in the field and the longitudinal seams made in the flat position. The circumferential edges were prepared so that the upper two-thirds of these joints could be welded from the outside of the pipe and the lower one-third from the inside of the pipe. Backing-up strips were used which were later removed. The exposed root of the weld was carefully examined by the welding inspector and any defects or lack of reasonable smoothness were rectified.

For work of the type described herein it was of the utmost importance that high quality welding be secured. The quality of a welded joint is measured jointly by the specific process used and by the ability of the welding operator to apply that process, and in setting up a procedure for the investigation and inspection of welded work, these two phases in welded joint production must be clearly distinguished. The former of these comprises all the design variables, viz.:

1. Characteristics of the parent metal.
2. Characteristics of the deposited metal.
3. Characteristics of the welding current.
4. Shape of the welding groove.
5. Method of preparing welding groove.
6. Number of passes or beads.

As such, these design factors, in combination, must be carefully investigated to determine whether the joint will give the desired ductility, soundness, strength and impact resistance.

Given a specific welding process, all welding operators must be able to produce sound welds by that process, i.e., the weld metal must be properly fused, there must be no cracks, and slag inclusions and porosity must not exceed a specified maximum amount. These latter are the only requirements over which the operator has control. Testing of welding operators therefore was directed only towards these ends.

An experienced welding inspector was attached to the staff of the resident engineer at Outardes Falls for the period covering the welding of the pipe line and penstocks. The qualification tests for the various welding processes recommended by the manufacturer for his work were made in the latter's shops by the inspector before he proceeded to Outardes Falls.

Fig. 27—Side View of Ring Girder and Rocker Bearing.

The first batch of welding operators were also tested by the inspector in the shop. However, all operators were again given a qualification test immediately on arrival at the job. This was done to test their ability to pass the required standards under field conditions. Furthermore, all operators were made to re-qualify about every ten days to two weeks at the discretion of the inspector.

In addition to the inspection of all welding work as done, the periodical tests of the operators enabled the inspector to keep close check on the performance of all men, so that, in co-operation with the manufacturer's superintendent, operators were assigned to the various classes of work best suited to individual abilities.

This scheme worked very well. A high rate of production was secured and only a very small footage of seams was required to be chipped out and re-welded.

The various qualification tests were made in accordance with the "Tentative Rules for the Qualification of Welding Processes and Testing of Welding Operators," revision of June 1937, as published by the American Welding Society.

In addition to the requirements of these rules, a Charpy impact test was required for each welding process and for the testing of operators. The minimum impact value allowed was 30 ft.-lb.

All tests of shop welds, including the Charpy impact test, were extremely satisfactory.

Seven coupons were taken in the field from the pipe seams in various places and one from one of the ring girders. A one-inch strip was cut from the centre of each coupon and sent to the Ontario Research Foundation, Toronto, for machining and making the Charpy test. Etch tests were made in the field on the remaining two pieces of each coupon.

Two of these Charpy Test specimens broke at 30 ft.-lb. and two at 43 ft.-lb. with the remaining four between these two limits. The average of the eight specimens was just slightly under 37 ft.-lb. All of the etch tests met the specified requirements for penetration and fusion and maximum size of gas pockets and slag inclusions, with but one exception. This latter coupon was taken from a circumferential seam near the end of the horizontal diameter. The etch test showed one gas pocket in excess of $\frac{1}{16}$ in. diameter. A portion of the welded seam on either side of the coupon was chipped out and carefully examined by the welding inspector. No additional defects could be found and the seam was accordingly re-welded and passed as satisfactory.

This particular item of control did more than any other to keep the operators on their toes with respect to quality welds. A record was kept of the seams welded by each operator, and the coupons, of course, were selected at random so that no operator knew just when or where a determinative test of his work might be made.

The excellent quality of the work secured is evidenced by the record of the test specimens, and by the fact that no leakage whatsoever was observed after the pipe was filled and placed under pressure.

Protective Coatings

As stated sbove, the pipe was backfilled up to the horizontal diameter and the exposed portion enclosed with a wood housing. Before this work was done the upper half circumference was given two coats of coal tar paint, and that portion against which backfill was to be placed was given two coats of high quality coal tar enamel, with an intervening course of open mesh asbestos fabric.

These latter materials were selected on the basis of their record as long-lived protective agents for steel, and in the particular case of the enamel, its ability to resist soil stress and also its ability not to crack or spall at low temperatures.

No coating of any kind was placed on the interior of the pipe.

The pipe line was filled with water in September 1937, the elapsed time between this event and the letting of the contract being not quite nine months.

The contractors for the fabrication and erection of both the pipe line and penstocks were the Canadian Allis-Chalmers Limited of Toronto with the Canadian Vickers Limited, Montreal, acting as sub-contractors for the 18-ft. diameter section described in this paper and for the surge tank tee.

All shop inspection, including the inspection of shop welding, was made for the Ontario Paper Company by Charles Warnock and Company, Limited, Montreal.

The general contractors for the power development were the Foundation Company of Canada, Limited, who accordingly handled all regional transportation, earth work, concrete work, etc., associated with the pipe line.

The authors wish to make grateful acknowledgment to Mr. R. C. McMordie, A.M.E.I.C., for his work in making the necessary calculations and in drawing the diagrams of the principal stress trajectories and to Mr. H. S. Lundy and Mr. W. M. Stewart for their work in preparing the various figures.

As mentioned at the beginning of this paper, the pipe line described herein forms an important element of the Ontario Paper Company's Outardes Falls power development. The site of the work is on the north shore of the Gulf of St. Lawrence. For the entire power development Dr. H. G. Acres, M.E.I.C., Niagara Falls, Ontario, acted as consultant, associated with Mr. J. T. Jaeger, Chief Engineer of the Ontario Paper Company.

Some Difficulties of Maintaining Electrical Service

R. N. Coke, A.M.E.I.C.,
Vice-Chief Engineer and General Superintendent, Montreal Light, Heat and Power Consolidated.

Paper presented before the Montreal Branch of The Engineering Institute of Canada, November 11th, 1937.

In this paper an endeavour will be made to touch briefly the many causes of interruptions as experienced by our company in the province of Quebec, treating them from a hydro-electric point of view. Assuming that the equipment installed is capable of operating satisfactorily under both normal operating conditions and also under temporary overload conditions, conditions will be considered which are abnormal and under which service must be maintained, to the consumer.

Fig. 1—Ice piled up on road breaking pole.

A power system can be divided into three main sections:—

(1) Generation
(2) Transmission
(3) Distribution

GENERATION

Under generation one can consider the place where the energy is available and where water power is converted into electrical energy. Water power is really potential energy because of precipitation and evaporation of water resulting in the flow of water through streams and rivers in a downstream direction from the run-off areas above sea level to the sea. It is the fall of water from a higher level to a lower level which creates water power.

TRANSMISSION

Transmission can be considered the connecting link between the generating station and the centre where the power is to be distributed. Transmission usually involves (*a*) the necessary step-up transforming equipment, and (*b*) the equipment necessary to conduct energy from the power house to the consuming centre.

DISTRIBUTION

Under distribution can be classed the equipment necessary to take the electrical energy from the high tension switching terminals of the transmission system and to deliver it to the consumer. It consists of two parts:—

(*a*) Step-down transforming equipment.
(*b*) Distribution lines.

Adequate electrical service consists of three main functions and is the maintaining of (1st) continuity of electrical supply, (2nd) voltage regulation within certain limits, and (3rd) constant frequency.

The chief reasons for interruptions or failure of service are as follows:—

(*1*) *Failure of the supplying company's equipment to carry its load.*
(*2*) *Overloading equipment.*
(*3*) *Mistakes in operation.*
(*4*) *Failure of customer's equipment.*
(*5*) *Mistakes made by customers' operators, chiefly due to the pulling of disconnecting switches under load.*
(*6*) *Floods or low cycle periods of river flow.*

Rivers obtain their water from run-off areas which in turn obtain it from melting snow and rainfall. The run-off area determines the character of the river. The two main causes of curtailment of power in a hydro-electric power house are (1st) change in operating head, and (2nd) change in the volume of flow of the river. All rivers experience seasonal flow variation cycles and some have well defined weekly and even daily flow cycles, due to the operation of power plants located upstream.

Power system loads also experience seasonal and daily cycles of power demand. If the power available at low water periods coincides with the high demand power period and the demand required in power is greater than that available from the water then curtailment of power will result. Where storage pondage is available attempts are made to store water during periods of low load demand and to use it during periods of heavy load demand.

At the period of ice break up in the spring when the flow is increased, the possibility of jams caused by ice, trees and other floating debris is of considerable concern to the operating engineer. If the jam occurs below the power house it frequently raises the tailrace level reducing the operating head. If it occurs above the power house it backs up the water above the jam causing a temporary shortage of water below the jam with the resulting reduction

Fig. 2—Ice piled up on dam in front of power house.

in head at the power house. Formation of jams usually means the raising of the water level above the jam.

When the whole flow of the river has to be passed through sluice gates and the flood period is accompanied by the break-up of ice, a dangerous and worrying time is experienced by the operating staff. The passing of ice three or four feet thick, and in large sheets, through the sluice gates and the maintaining of the required power supply from the power house at the same time, is an operation which requires great care and exceedingly good judgment. It must be remembered that when ice jams occur and they are to be broken up, there must be an open water channel downstream of the jam to allow the broken ice to pass downstream; otherwise the jam will re-form immediately downstream. The possibility of floods, particularly in the spring, is greatly increased in rivers which flow from the south towards the north owing to the fact that the high water period occurs during the thaw in the south before the ice cover on the river in the north has broken up and moved out to the lake or sea.

(7) *Ice jams and variable river flows.*

The power development is the scene of many bitter and persistent battles against ice and frazil. Frazil is water which has been agitated usually by passing over rapids and which water is below 32 deg. F. It usually settles itself into a jelly-like substance consisting of fine particles,

Fig. 3—Limb of tree broken off by snow and wind, short-circuiting overhead conductors.

and packs below ice coverings. It mixes well with snow to make a sticky substance which forms a persistent packing below ice coverings. Wind in cold weather agitates the water and blows spray into the air where it immediately freezes and falls back into the water as frazil. It settles on gates, racks, turbine blades, etc. Under certain conditions it has been found to extend, in lakes, to approximately 70 ft. below the ice covering where the total depth is 90 ft., and in certain rivers it has been found to occupy 63 per cent of the total available space below the ice covering. It requires, under certain conditions, constant dynamiting and a passageway must be opened between the power house and some predetermined point in the forebay to allow the water to arrive at the power house rather than have it deviate by some other means to the main channel of a river. Tugs and dynamite are frequently used to force these passageways through the accumulations of ice and frazil.

When the forebay extends for a considerable distance from the power house upstream and where the flow does not exceed 2¼ ft. per sec. which, in this province, will permit the formation of an ice covering, then the possibility of frazil troubles at the power house in the winter are largely eliminated.

(8) *Sleet storms and snow storms.*

Sleet storms with the accompanying incrustation of ice on overhead conductors, insulators and supports, cause considerable damage to both transmission lines and overhead distribution systems. The glaze formation of ice usually forms to one side above and below the conductor. When formation of sleet is accompanied with rain, pear shaped formations of ice take place at intervals along the wire as well as the ordinary ice incrustation formation. Usually sleet forms in this province accompanied by an easterly wind at approximately 32 deg. F. The ice formation usually adheres to the conductors at temperatures up to approximately 35 deg. F. Not only is the additional weight to the supporting structures, etc., objectionable, but as the result of the ice formation on the overhead conductors an unnatural vibration sometimes referred to as "galloping" or "dancing" takes place. This unnatural vibration occurs at certain wind velocities, in this province at approximately 15 miles per hour, and when the ice starts to fall from the conductors. Ice incrustations have been found on conductors weighing two pounds per foot on No. 3/0 diameter 7/16 inch copperweld ground wire, and on another occasion ice weighing approximately four pounds per foot was found on aluminum transmission line conductors. Unnatural vibration must be distinguished from the natural vibration which takes place on a normal transmission line. The difference between these two forms of vibration is, however, that the natural vibration can be dampened out to a point where same can be considered not dangerous to the lines by the application of Stockbridge dampers, armoured rods, etc. Many experiments have been made and a great deal of data collected but up to the present there is no equipment on the market, that the writer knows about, that can be purchased which will dampen out the unnatural vibration called "dancing." The problem of thawing ice, by electric heating, from conductors is one which is being given considerable study and good results have been reported.

Snow storms are very objectionable particularly to overhead distribution systems when they occur before the leaves have fallen from the trees and when they are accompanied by wind storms.

(9) *Wind storms.*

Wind storms if of sufficient velocity often carry foreign materials into the overhead lines frequently accompanied by the resultant short circuit and the tripping out of the

Fig. 4—Formation of ice on string of insulators.

circuit. Frequently the short circuit, as well as the additional weight of the foreign material, breaks the conductors.

(10) *Electrical storms.*

Electrical storms cause damage to (1st) equipment supplying the lines with power, and (2nd) to the overhead circuits themselves.

According to recent observations made by the General Electric Company in studying lightning, they have proved that lightning is frequently a succession of strokes rather than one direct stroke. Lightning may either strike from the clouds towards the ground or it may leave the ground and travel towards the clouds, or two strokes—one may leave the ground and the other may leave the clouds and meet each other. The following two examples will illustrate the peculiar paths which are taken by lightning in its effort to find a good ground. In one case lightning struck a 90 ft. pine tree, travelling down the tree, ploughed up a furrow in the ground until it reached a pole carrying telephone wires, travelled up the pole splintering the wood behind it and finally found its ground after passing through the telephone wires. Another example which occurred is as follows: A few months ago lightning discharged through an apple tree, travelled through 37 ft. of earth, went through two metal beds, through the body of a boy, travelling from one foot to his chest, through a radio aerial to a secondary power circuit and finally came to ground through a telephone circuit. The boy was killed, several electric lighting circuits were put out of commission and the telephone system was damaged. Storms cause frequent trip-outs of circuits separating power houses

Fig. 9—Overhead telephone lines brought down by sleet.

Fig. 10—Limbs of trees weighed down by snow short-circuiting overhead conductors.

from the load centre and customers from the load centre. Considerable study has been given to the minimizing of damage from electrical storms such as the use of good grounds and ground wires, counterpoise, lightning arresters, surge absorbers, discharge gaps, etc. Excellent operating results are reported to be obtained with this equipment as far as the operating record is concerned.

(11) *Interruptions from outside sources.*

Interruptions from outside sources such as (*a*) cutting trees, causing them to fall across overhead lines, (*b*) stealing of conductors which are alive or dead, (*c*) breaking of poles by vehicles, and (*d*) damaging of insulators and equipment by persons shooting at them.

Overhead conductors up to voltages of 12,000 volts have actually been stolen when alive. Attempts have been made to steal 12,000 volt P.I.L.C. cables alive. Short circuits frequently follow the attempts to steal live lines with the resultant burning of the thief.

To supply adequate electric service, not only must the correct equipment be installed to supply normal loads but adequate provision must be made to carry abnormal loads in emergencies, caused by conditions such as have been mentioned above.

The staff of a power company supplying power has a heavy burden to bear. Not only must they operate in such a manner as to supply service under all conditions but they must keep their equipment in first-class condition and replace obsolete equipment before it gives trouble. The system must also be a financial success. Under the present conditions of rising prices for material and labour, increased taxation, and the tendency to lower rates, it is not an easy matter to fulfil the requirements of giving adequate service.

The author would like to extend his thanks to the Canadian General Electric Company and to the Shawinigan Water and Power Company for the use of photographs and information which have materially assisted in the preparation of this paper.

DISCUSSION ON

Engineering Efficiency into the Highways

Address by Miller McClintock, Ph.D.,[1] presented before the General Professional Meeting of The Engineering Institute of Canada, at London, Ontario, on February 1st, 1938, and published in The Engineering Journal, March 1938.

F. P. Adams, A.M.E.I.C.,[2] inquired how the side roads approach a 'limited way.' The author replied that special entrance lanes are placed at reasonable distances apart for the approach from the side and exit from 'limited way' highways.

W. M. Veitch, A.M.E.I.C.,[3] asked what had been done concerning the abuse of curb parking. The author remarked that the only place where he had recommended the complete elimination of curb parking is in the Loop area of about one and one half square miles in Chicago. Double parking is evidence of oversaturation. Parking meters have been used with success, but they should only be used where parking is intended, and a revenue is expected for this service. An intensive survey of the Loop district in Chicago was made and this definitely decided that curb parking was not in the interests of the merchants located in that area. The surveys were made by the operators of the various large stores. Sales slips were prepared to show the various classifications of parking and movement of traffic to and from the area. When purchases were made purchasers were asked as to whether they had arrived by street railway, bus or private car; whether thay had parked their cars at the curb, placed them in a garage or used a public parking space. It was interesting in this connection to learn definitely that only 1.5 per cent of the business came from curb parkers. Following this survey, the elimination of parking in the Loop district was recommended.

C. G. Moon, A.M.E.I.C.,[4] observed that centre line marking and border markings on highways were desirable in order to eliminate the very tired feeling that a driver gets after eight to ten hours' driving on unmarked roads; a definite centre line would be a great help. Grass borders are an improvement over the usual gravel borders which cannot be seen. A painted curb is a considerable aid. Painting the roads in suitable colours would increase heat absorption with a favourable result in the removal of ice.

A. L. Carruthers, M.E.I.C.,[5] inquired as to 'limited ways' paralleling local roads and the use of by-passes. The author expressed the thought that arterial highways would be by-passed around cities. A study has been made of the business originating from traffic using direct highways. It has been quite definitely determined that the extent of this business is limited to those very local stores such as hot dog stands, gas stations and so forth, which cannot be considered as a permanent local industry. It is apparent that main highways should not pass through thickly populated districts. They must pass by them, allowing entrance and exit by the usual by-pass methods. It is a shame that the highway traffic must fight its way through congested streets.

R. F. Legget, A.M.E.I.C.,[6] asked if pedestrians had priority over a car and whether it is economical to permit single-passenger cars to congest city traffic; further, could bus transportation be used in an effort to eliminate the parking evil. Mr. Legget also inquired if motorists financed these magnificent superhighways.

To this the author replied that the general public does not choose to go by means of mass carriers. For this reason it may be difficult to eliminate the single-passenger car. Motorists have been found willing to pay their own way, and this condition is found everywhere. Funds for the financing of these superhighways are available from motor transportation. In his opinion, the pedestrian must have the right-of-way; following that, the bus or tram carrying a large number of passengers. In business areas, pedestrians must always be able to move to and from business houses, and must therefore be given preference in movement.

DISCUSSION ON

Engineering the Highways for Safety

Paper by C. A. Robbins,[1] presented before the General Professional Meeting of The Engineering Institute of Canada, at London, Ont., on February 1st, 1938, and published in The Engineering Journal, March, 1938.

R. W. McColough[2]

The writer agrees with the author that irrespective of the length to which the engineer may go in designing the highway from a safety viewpoint the final factor of safety rests with the driver of the motor vehicle, and while engineers who are constructing highways are faced with many difficult problems, those who have the responsibility for motor vehicle control are perhaps faced with problems more difficult to solve.

The writer cannot agree with Mr. Robbins that the design of highways is a new science, but the design of highways for carrying high speed motor vehicles is new. While we may talk of motor vehicle control, speed limits and other highway safety measures, at the same time, in designing highways today in order to visualize what may be required of them in the future it is only necessary to look at what has taken place during the past few years—great increase in volume of traffic, in the weight of motor vehicles, and in the speed. The engineer having decided what type of highway is required having regard to the traffic requirements during the expected life of the roadway is still faced with a serious problem. Unfortunately, the roadway which is to be constructed to carry the traffic of the future must be built with funds available today and therefore he is faced with the problem of showing his government the necessity for such expenditures and the government in turn is faced with finding the funds available from today's traffic to take care of traffic which may develop in the future.

Given ample funds highway engineers can design highways almost entirely eliminating hazard as far as the highway itself is concerned. An example of this is the west side elevated highway in the City of New York which has no intersections, no opposing traffic and no pedestrian traffic. Such highways, of course, are far beyond the pocket of any of the provinces in Canada. The more densely populated provinces of Ontario and Quebec, of course, must lead the way in highway developments in the Dominion. Their resources are much beyond those of the province of Nova Scotia. Nevertheless, with the limited resources of such provinces as this, one must take cognizance of the requirements of the future, and highway construction in this province is being constructed from this viewpoint. Consideration is being given to alignment, curves are being super-elevated on much the same formula as Ontario, traffic lines are being marked on our highways. On two lane highways approaching sections where the vision is obscured the line marking is moved two feet towards the right hand side of the pavement on each approach to the crest of the hill, this so that the cars meeting at the crest will be carried four feet apart by the line marking. Signs prohibiting passing on the upgrade are placed on such sections.

Undoubtedly the four lane divided or dual highway will take care of a greater volume of traffic in safety than a four lane undivided highway, and in my opinion the dual type will be used largely in the future. As stated by the author, it is desirable that there be a separation of at least 30 ft. but even when this space is not available a divided highway is preferable to the undivided.

Accommodation for pedestrians is necessary both from the viewpoint of their safety and from the viewpoint of the carrying capacity of the highway. Pedestrians walking on a highway will slow up traffic to a marked degree, thus causing congestion of motor vehicle traffic.

With reference to the lighting of highways, the writer has driven at night over a number of sections of highway which were lighted. Frankly, up to the present time no great advantage to the motorist has been noted unless the roadway is patrolled and all operators of motor vehicles compelled to operate on the lower beam of their headlights; as divided highways largely do away with the difficulty of headlight glare moneys spent for highway lighting might give more benefit to the public if expended in another direction. The writer, of course, realizes that highway lighting is only in its experimental stages and one should not be too quick in passing judgment.

The placing of safety and direction signs is a part of the highway engineers' duties. These signs cannot be placed haphazardly, if they are they will tend to danger rather than to safety on the highway. Direction signs should be placed in advance of the point on the highway where the motorist must change direction. Signs placed at the intersection have a marked tendency to cause the motorist to stop at what is perhaps a dangerous intersection. Curve and other safety signs should be made with reflectors which will show up at night. Signs without reflectors are not always visible at night and this is the time when they are most required.

In this province advertising signs on the highways are practically prohibited. They are not only unsightly but are very often erected at a point which may cause a menace on the highway due to the diversion of the motorist's attention.

R. E. Jones[3]

While main highways have a considerable volume of traffic during hours of darkness, it is much lower than during the daytime. With the case of pleasure drivers this is to a large extent due to the reluctance of many to drive over darkened roads, particularly when wet. There is the greatly increased accident hazard both to the motorist and to the pedestrian.

Highways are now being lighted in such a manner that distant vision approaching the range of vision in the daytime is obtained. The passing of glaring headlamps is no longer troublesome as while they ordinarily appear very bright it is only relative on account of the dark area surrounding them.

For the economical lighting of highways proper design of the system is important.

As the intensity of light sometimes used in business districts is neither desirable nor necessary on the highway, advantage is taken of the silhouette effect. A driver is not interested in the colour or other details of an object but he does want to be able to see its outline clearly. This is the effect given by the light from distant points being reflected off the pavement towards the driver. For this reason it is very desirable to have pavements light in colour.

---

[1] District Engineer, Department of Highways, Ontario.

[2] Chief Engineer, Department of Highways, Nova Scotia.

[3] Assistant Engineer, Hydro-Electric Power Commission of Ontario.

The luminaire must be of a type which will project the light along the road instead of wasting a large part in the adjacent fields.

On account of the reflection required from the roadway the unit must overhang the pavement at least a short distance.

The light must be at sufficient height above the road to avoid direct glare but not so high that costly high supporting structures will be required and maintenance will be difficult.

At present there are two distinct types of luminaire suitable for highway lighting.

The incandescent type has the ordinary lamp enclosed in glassware which with the aid of a reflector above controls the direction of the light.

The sodium lamp emits a soft yellow light and is placed in an aluminum fixture which is so designed that no directing glassware is required.

Probably the most important point that should be emphasized is the necessity of using enough light. Records show that often a poorly lit road is more dangerous than a dark one.

A. C. Abbott, a.m.e.i.c.[4]

The Shawinigan Water and Power Company installed a half mile experimental installation of 10,000 lumen sodium lamps in 1934 on the Montreal-Quebec highway just west of Three Rivers.

The general features of this installation are given in a short paper written by the writer and published in The Engineering Journal of October 1934.

This original installation of sodium lamps was purely experimental on the part of the Shawinigan Company, and was left in service for approximately two years. It was then dismantled with the thought of reinstalling it, with additional lighting, on a more travelled highway north of Montreal. This reinstallation was not carried out for certain reasons but the question is now again being studied.

As regards the type of lighting which might be installed, the sodium lamp is still favoured as against incandescent, as the best form of lighting for the purpose, due to the character of the light and fine definition of objects on the roadway. As against this, however, the sodium is considerably more expensive than an equivalent installation of incandescent and, if a considerable section of highway is to be illuminated, the type of lighting made use of will probably be decided upon a cost basis, which is very definitely unfavourable to sodium.

J. P. Bickell[5]

The writer agrees with Mr. Robbins' analysis of the problem which places the major responsibility for accidents on the driver; he cannot, however, accept his unqualified reference to the incompetence of drivers unless a failure to exercise full foresight and concentration can be so classified.

The average driver who has passed a test and secured a driver's license is entirely competent to drive at average speeds under average conditions. However, he may and does fail to adjust himself to unusual conditions. Not that he fails to allow for darkness or rain or ice or snow or general conditions but that when an emergency arises or something occurs to distract him momentarily, he is very often unable to make the necessary decisions with adequate speed and accuracy.

With respect to railway crossing accidents, there is little evidence of increasing hazards at these points. There has been some increase, as there has been in all accidents, but the danger at these points is not as great as is popularly supposed. Railway crossing accidents amount to only about one or two per cent of the annual total of all accidents. They are, however, extremely serious in consequences and are spectacular and as a result receive publicity far beyond that given other accidents.

Separation of traffic at railway crossings is important but not in my estimation nearly as important as separation of traffic at congested highway intersections and the separation of two-way traffic on main roads by the construction of dual highways. The development of dual roads and clover leaf intersections is, from the standpoint of safety, the major achievement of highway engineering in recent years.

The most interesting statement in Mr. Robbins' paper is that lighting of our main highways is not far distant. A good many years ago, the writer expressed the belief that such lighting would be used eventually. Certain it is that if there is incompetence among drivers, it is most evident after dark. "Overdriving" headlights is probably the most common fault of motorists and while a relatively small percentage of all driving is done during darkness, statistics show that 40 per cent of all injuries occur during darkness, while in 1935 and 1936 fatalities were less numerous in daylight than at night.

The tremendous importance of darkness as an accident factor is most clearly demonstrated by these figures.

In conclusion the writer would refer to through highways and signs. There are altogether too many of both. Certainly the employment of through highway designations for the purpose of stopping traffic at dangerous intersections is a prostitution of the term, which was intended not to delay traffic on cross streets but to expedite movement on the through highway. Drivers encountering stop sign after stop sign at the entrances to highways carrying little or no traffic soon become contemptuous of such signs.

When signs are erected for trivial reasons, they not only make our instructions appear foolish but they give drivers the impression that they can be disregarded with impunity with the result that important signs may be passed without being given sufficient attention.

Another feature of this situation is the distraction of drivers. In the first paragraph of these remarks it was stated that lack of concentration was the most obvious indication of incompetence among drivers. Driving at modern speeds is a task requiring the unceasing concentration of driver and every sign or other object which causes him to divert his attention from the road for even an instant is a hazard. Therefore, no sign should be erected on a highway unless the hazard it foretells is greater than the possible danger in the diversion of the driver's attention. Then if the sign is warranted by such measurements, it should be capable of instantaneous interpretation so that the distraction may be of the shortest possible duration.

W. M. Veitch, a.m.e.i.c.[6]

The paper which has just been read on highway safety engineering impresses us again with the wonderful progress which has been made in highway engineering during recent years. The most notable example of this progress, in this part of the country at least, may be taken as the centre road between Hamilton and Toronto.

The author mentioned in his paper that the three-way highway was not desirable. However, the three-lane highway between London and Lambeth is a great improvement over the narrow pavement which existed previously. Doubtless, a four-lane highway is better, but both the financial aspect and the rapid increase in automobile traffic will

[4] Electrical Engineer, Commercial and Distribution Department, Shawinigan Water and Power Company, Three Rivers, P.Q.

[5] Registrar of Motor Vehicles, Motor Vehicles Branch, Department of Highways, Ontario.

[6] City Engineer, London, Ont.

make it necessary to convert present roadways into three-lane highways with the ultimate view, of course, of converting them, later, into six-lane, dual traffic roads.

The question of the pedestrian is one which city roadway engineers must keep constantly in mind. In London, in roadway design, street lighting and traffic regulations the pedestrian is always the first consideration. In traffic regulations, the mother with a baby carriage is considered as the limiting factor. School children traffic is a problem which is under consideration at the present time. Just at the moment a study is being made on the safety of children, having in mind the installation of flashing school signs operating by time clocks at school hours. The writer is not in favour of too much care being taken of school children; their safety must depend to a great extent on their own traffic consciousness and also on the safety education which they may obtain from their teachers.

The writer agrees with the author that the erection of signs is much overdone. This is especially true in cities and we are rapidly reaching the point where too many prohibitive signs, at least, are defeating the object for which they were designed. Some years ago, it was recommended that "stop signs" should only be placed at intersections where secondary streets enter through streets. Some fifty "stop" signs were removed and replaced with "slow" cautionary signs. This change has proved very successful.

Has the Department of Highways ever considered the zoning of areas with regard to speed? There are certain sections of road where the need for a speed limit seems unnecessary, and, again on other sections even the present limit makes driving dangerous. The question of highway curve signs has always been a mystery. While driving on the highways, more especially at night, one can never be sure what the nature of the curvature is from the sign. In many cases, a very slight curve is encountered. One gets indifferent. Is it possible that the degree of curvature might be shown by figures on the sign or by the curvature of the warning arrow?

The question of automobile horns is one which should be discussed. In a city at least the use of any noise-making devices on automobiles will be prohibited in the near future. The only present use for an automobile horn is to warn the cyclist or other motorist that he is not obeying the rules of the road. This surely is a matter for the police rather than for the motorist himself. Another objectionable use of the automobile horn seems to be for the purpose of scaring pedestrians, who, after all, should have the right-of-way at street intersections.

Another question which crops up almost continually is the question of Provincial Government aid in the construction and maintenance of highway roads and traffic regulation through the cities. We are constructing and maintaining miles of highway through cities for the use of tourist and truck traffic, which does not contribute any money for the use of these highways; all taxes on automobiles, trucks or gasoline, cannot be used, at the present time at least, either for maintenance or regulation of highway routes in the cities. In the last few years, we have constructed three bridges on highway-traffic routes in this city. Each one of these bridges has been constructed strong enough to ensure the safety of the heaviest bus or truck operating on the provincial highways. In each case, the City Council has approached the Government to pay at least a share of this extra burden on the municipality but each time their request has been refused.

A. K. Hay, A.M.E.I.C.[7]

The whole question of designing safe highways is closely allied with the yearly improvement in the design of the motor vehicle which permits it to travel at ever increasing speeds. This in turn brings one to a discussion of obsolescence in the highway structure. The author has pointed out a number of features which are now considered to be minimum requirements if a main trunk highway is to be made suitable for present day traffic. But if his paper had been given even four or five years ago one would have heard quite different requirements set forth as to what, for example, should constitute a proper grade and alignment. And no doubt four or five years from now the requirements will be even more exacting and more costly. The countryside is full of stretches of roadway which have become out of date in a comparatively short term of years not because the structure of the road has worn out but because they were not designed to meet present day traffic speeds.

It becomes proper then to ask if there will not soon be some limitation set in this costly race between road design and road usage. It is unreasonable to expect the automotive designer to set any limit on improvements in the vehicle but what might well be done is to set some speed in miles per hour as being the logical maximum at which the ordinary driver may be expected to operate his car with safety to himself and to others using the road. Some exhaustive set of tests on a large number of drivers could be made, measuring their reflexes or reactions under different sets of conditions and from this a figure could be determined as to the maximum safe speed for which the highway should be designed. Then we could go ahead and make our designs with some assurance that the roads would not be obsolete long before they were worn out.

Coming now to the question of what to do with the pedestrian on the highway it seems obvious that public opinion will soon be reflected in legislative action towards giving this "forgotten man" some better measure of protection. It appears reasonable that authorities who control the road should be given the power to construct or to force the construction of footpaths in semi-urban areas and that the cost of these should be borne in part by the local district and in part by the users of the highway who create the danger.

The organization with which the writer is connected has for some years past been building such paths in suburban territory in co-operation with the local municipal councils. As a result we have found very definitely that it is almost useless to construct alongside a paved roadway a path which has for its wearing surface cinders, crushed stone or gravel. Many pedestrians will not use it but will continue to walk on the road, more particularly at night and in wet weather. To give any degree of satisfaction the wearing surface of the pathway must be at least as attractive as that of the adjoining pavement. In practice this is not difficult of attainment as there are a number of moderate priced surfaces which answer the purpose quite well without going to the expense of a permanent city sidewalk laid to a right grade. The writer has found that a bituminous surface, either hot or cold-mixed, laid on a crushed stone, gravel or cinder base may be built for about 12 cents per sq. ft. under our particular set of conditions.

The writer was greatly interested in the author's remarks about the elimination of headwalls in culverts, and would like to hear as to whether or not his Department's experience with this practice has been uniformly satisfactory. Undoubtedly there is a saving in time and money in most culvert installation if one can get away from the extra form work, foundation problems etc., which are entailed in building a headwall. Insofar as the down-stream end is concerned there might not be much room for argument. But what about the upstream end? Is there not a real danger that during the season of spring floods water will percolate along the outside of the barrel

[7] Ottawa Suburban Roads Commission, Ottawa, Ont.

of the structure and cause a washout or at least some erosion and settlement in the roadway embankment above the culvert?

Hugh A. Lumsden, M.E.I.C.[8]

Few engineers are better qualified to speak on the subject of highways and their safety than the author. His long and wide experience has been the background enabling him to present such an instructive and interesting paper.

A hundred and two years ago John Loudon McAdam, a Scotch engineer, passed away. He it was who commenced an era of improved roads. He is said to have enunciated the theory that "roads should be built to suit the traffic and not traffic to suit the roads." This is as true today as ever, and the practices now being followed by the Department of Highways of Ontario, in order to meet traffic conditions, have been well outlined in the foregoing paper. It must be remembered, however, that only on a limited mileage can we hope to bring about many of the conditions spoken of, such as those attendant to a dual highway including alignment grade, clover leaf intersections, under passes, lighting, etc. Over a tremendous mileage in every province, including Ontario, we will continue to improve the roads at a much slower rate, not from choice but from financial necessity. Nevertheless the example set in the construction of the dual highways and by the inclusion therein of so many of the features mentioned by Mr. Robbins will be an inspiration which will be followed wherever practical.

In a recent annual report I suggested that in the estimates for the coming year not only in my own county but in every county, township and municipality, there should be set aside a definite sum for the express purpose of promoting safety. It may be for eliminating ditches, for erecting guard or guide rails, for putting up reflector signs, for building pathways or for any purpose which will render the roads more safe both for motorist and pedestrian.

The fundamental trouble which accounts for most accidents the last speaker has truly said "is not to be found in the design of the road or car, but in the incompetence of the drivers."

What then can be done to make drivers more competent? In making such suggestions it is feared I depart somewhat from the paper but if the highways are to be engineered for safety surely we must in some manner bring about greater responsibility on the part of those who use them.

1. *Education*—Teach in the schools the rules of the road so that both potential drivers and pedestrians may know what to expect.

   More frequent examination of all drivers for fitness and competence in driving.

   More frequent inspection of all vehicles using the roads.

2. *Regulation*—More traffic officers over all highways not necessarily for the purpose of prosecuting or persecuting but of regulating traffic on all roads.

   The elimination of "crocks." This may cause some disappointment to the boys who have rigged up a car of 1914 vintage, but it is absurd that many cars are allowed on the roads at all. For instance, four wheel brakes should be compulsory.

Again I wish to compliment Mr. Robbins, not only on his splendid paper but on the fact that in the district about Toronto over which he has charge, he is incorporating every device possible to assure safety.

[8] County Engineer, County of Wentworth, Ontario.

The Author

The author stated that a complete new road was being built from Toronto to Niagara Falls, thence to Fort Erie. The road between Burlington and Fort Erie is on a new location following the lake and river. Grades and curves have been practically eliminated with no level crossings. It is considered that the tourist traffic brought in about $300,000,000 to Ontario and Quebec in 1937.

J. A. Vance, A.M.E.I.C., inquired if there were not too many signs on the road, especially at curves. The department considered all curves dangerous and for this reason, the author said, signs are placed at all curves. A new plan is being considered, that of placing a maximum speed limit at curves graded 50 miles, 40 miles, 30 miles, etc.

W. C. Miller, M.E.I.C., brought up the question of ice retention on a road where bituminous paving and concrete paving are placed in parallel lines. The author agreed with Mr. Miller's remarks, saying that some hazard in the braking of cars was due to the fact that the black bituminous road, because of its heat absorption, permits the melting of ice at a more rapid rate than on concrete. Lighting of roads, especially where there are two types of paving, is a difficult problem.

Dr. Miller McClintock inquired if the trees in the centre boulevard strip were not an interference to night driving, due to the flickering of the lights among the trees. The author admitted that there had been some complaint about this.

F. P. Adams, A.M.E.I.C., asked if it were the intention of the Ontario Highways Department to plant trees along the roads. The author replied that the Department has two landscape artists working on proposals for highway beautification.

Replying to E. M. Krebser, A.M.E.I.C., the author stated that all the Canadian Provinces had joined in sign uniformity but they do not use uniform colours.

J. M. Fairbairn, A.M.E.I.C., brought forward the information that in the United States, at clover leaf crossings, they widen the highway at the point of leaving so that a car can be off the main highway as a separate lane for several hundred yards in which to pick up speed thus avoiding interference with traffic.

J. R. Rostron, A.M.E.I.C., asked whether there have been any experiments with dome lighting in the road pavement. The author made the reply that winter maintenance makes dome lighting in the pavement impossible. A suggestion has been made that each lane should be wider than 20 feet in order to give a greater freedom of movement. It is the author's opinion that if this were done there might be a risk of three cars attempting to pass where two only were intended. In the United States, where there are six-lane roads, the inner or centre pavements have been built ten feet wide, the second eleven feet wide and the outer pavements twelve feet wide. The author believes this was done in Massachusetts. In California the roads have been made eleven feet wide on the outer lane and twelve feet in the inner. Two eleven-foot lanes have also been used in other States on dual highways.

In reply to questions by F. H. Midgley, M.E.I.C., and D. S. Scrymgeour, A.M.E.I.C., concerning stop signs and lights at railway crossings the author described the methods used by the Province of Ontario. A 20-mile limit on all railway crossings is used. Busses must stop. Wig-wags have been installed with a combined automatic gate on the approaching lanes only. These have been used in the United States. A single wig-wag sometimes is obstructed by freight trains and accidents have happened. Some experimenting has been done with beams of red light across railway crossings. This has proved fairly successful.

The Engineering Journal

The Journal of The Engineering Institute of Canada

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

Volume XXI April, 1938 No. 4

The New General Secretary

Leslie Austin Wright, B.A.Sc., A.M.E.I.C., has been appointed by the Council as General Secretary of The Engineering Institute of Canada, the appointment having been made on the recommendation of a special committee of Past-Presidents. The new Secretary takes office at the beginning of April.

Council's action has been rendered necessary by the fact that after serving The Institute since the spring of 1925, the Secretary has felt obliged to ask to be relieved of his official duties. After carefully considering all the known candidates eligible for the position, the committee unanimously selected Mr. Wright, and their choice, having been considered and approved by the Finance Committee, with the concurrence of the present incumbent, and having been submitted by ballot to all members of the 1937 and 1938 Councils and to the Past-Presidents, was duly confirmed at the Council meeting on March 18th.

The new General Secretary was born and educated in Toronto, graduating from the University of Toronto in 1910 in Mechanical Engineering. During his university course Mr. Wright distinguished himself in athletics, particularly on the track and in basketball; he was editor-in-chief of the tri-weekly newspaper, The Varsity, and after graduation gained further experience in journalistic work with the Mail and Empire.

Later, his professional career began with four years in the bridge department of the City Engineer's office and a year with McGregor-McIntyre on structural work. Four years of railway construction and maintenance followed with the C.P.R. engineering department, largely on grade separation; then a period of general engineering with P. Lyall & Sons and the Foundation Company of Canada; an interlude as sales engineer with the Fletcher Manufacturing Company, and a term of eleven years of structural work with Kent-McClain Limited.

Mr. Wright has been a frequent contributor to engineering and architectural magazines, mainly on constructional topics, and has lectured at McGill University in an extra-curricular course of the Faculty of Engineering. He is an Associate Member of The Institute, a Member of the Corporation of Professional Engineers of Quebec, and is now President of the Montreal Branch of the University of Toronto Alumni Association.

With such a varied experience of men and affairs, it is felt that Mr. Wright is well equipped for the many-sided activities which fall to the lot of an Institute Secretary. The younger members will appreciate his familiarity with the problems of the undergraduate and the young engineer. His experience in organization and procedure will be helpful in dealing with questions affecting the general membership and branch affairs.

In all of these matters he can confidently rely on the willing co-operation of The Institute's members and officers.

The Editorial Chair

Observant readers of The Engineering Journal will notice on this page the name of a new editor. With that officer's kind permission, the retiring editor takes this opportunity of offering the most cordial welcome to his successor in the editorial chair. The tools of the editor's trade, including the official paste pot and scissors, the capacious waste paper basket and the blue pencil, have all been handed over with due solemnity; it is hoped that they will now be wielded with an increased measure of that sympathy for authors, and consideration for readers, which the retiring editor has tried to exercise in the past.

The incoming editor needs no introduction to Institute members; to other readers, the sketch of his career which appears above will give assurance that the fortunes of The Journal are now in good hands.

The retiring editor would bespeak for his successor and the branch editors collaborating with him, the active co-operation of the membership in making The Engineering Journal fully representative of the activities of The Institute.

Honour to Whom Honour is Due

This is not the occasion to pronounce any eulogy upon the splendid service rendered The Institute by the gentleman who, on April 1st, will, at his own request, be relieved of the exacting duties of the general secretaryship.

For thirteen years Richard John Durley has with distinction, dignity and widespread approval, occupied one of the most important positions in the gift of his brother engineers. That his services were faithfully and acceptably rendered is attested by the communications which have come to the sitting President from the Past-Presidents, and from members of both the 1937 and 1938 Councils, who during recent weeks have been consulted by letter ballot regarding the critical condition of the Headquarters executive following the resignation of the Assistant Secretary, the departure of the Publications Manager of The Journal, and the urgent request, on the advice of his physicians, of the General Secretary himself for early release from his official duties.

The general membership should know that Mr. Durley's going is greatly regretted by all the Past-Presidents and by Council, and by none more sincerely than the 1938 President.

Fortunately for The Institute, during the initiatory period at least of the new incumbent, Mr. Durley's advice and assistance will be available as he has accepted the invitation of the Council to carry on as Secretary Emeritus.

Mr. Durley's many warm friends throughout organized engineering everywhere, and particularly among the twenty-five branches of The Institute, will hope that release from regular office hours and relief from the heavy responsibilities he has carried, especially in recent years, will bring him that leisure and change to which his professional work and his personal worth so well entitle him.

De Gaspe Beaubien, M.E.I.C.
Treasurer

L. Austin Wright, A.M.E.I.C.
General Secretary

Meeting of Council

A meeting of the Council of The Institute was held at Headquarters on Friday, March 18th, 1938, at eight o'clock p.m., with President J. B. Challies, M.E.I.C., in the chair, and twelve other members of Council present.

The Council noted with regret the death of Jules A. Duchastel, the recently appointed Treasurer, and unanimously passed the following resolution, which the Secretary was directed to forward to Madame Duchastel:—

> "The Council of The Engineering Institute of Canada, having heard with deep regret of the death of Jules Alexandre Duchastel de Montrouge, so recently appointed Treasurer of The Institute, desires to record the loss sustained by The Institute, the engineering profession in Canada, and the public to whose service Mr. Duchastel devoted so much effort.
>
> The Council also begs to extend to Mme. Duchastel and members of the family the most sincere condolence with them in their bereavement."

It was unanimously resolved that de Gaspe Beaubien, M.E.I.C., be appointed Treasurer of The Institute.

The President reported as to the action taken regarding the changes in the executive staff at Headquarters rendered necessary by the recent resignation of the assistant secretary, Mr. Plow, the departure of the publications manager, Mr. Sheppard, and the retirement of Mr. Durley from the general secretaryship. As a result of careful consideration by a special committee of past-presidents convened to consider the situation it had been unanimously decided to recommend L. Austin Wright, A.M.E.I.C., for the position of general secretary. This selection, having been duly considered and approved by the Finance Committee, was submitted by letter ballot to all members of the Councils of 1937 and of 1938 and to the past-presidents, and received their approval. As a result of this vote the position of general secretary had been offered to and accepted by Mr. Wright.

After discussion it was unanimously resolved to appoint Mr. Wright as general secretary of The Institute, the appointment to take effect on April 1st.

Mr. Busfield, chairman of the committee appointed to report upon the publications of The Institute, presented a preliminary progress report outlining the changes in The Engineering Journal which the committee were prepared to recommend as a result of the replies to the questionnaire which had been sent out to the general membership. Mr. Busfield proposed that the committee's present report should be circulated to members of Council for their study, and that later a further questionnaire should be submitted to the membership. The report was received and the committee was authorized to proceed in accordance with these suggestions.

Certain changes in the membership of The Institute's Committee on Professional Interests and the Committee on Membership and Management were noted and approved.

Regarding the proposed agreement with the Nova Scotia Professional Association, the President reported that a revised draft had been approved by The Institute's legal advisers and had been sent to Nova Scotia for consideration by the joint committee there. As a result, certain changes had been suggested in one of the sections. In accordance with the President's report Council approved of the new section which had been forwarded from Nova Scotia, this agreement, with the new section, being now in the form which meets the views of the Council of The Institute and of the joint committee in Nova Scotia. It was pointed out that to become effective it was still necessary to take a ballot of members of Council and also of corporate members of The Institute within the province of Nova Scotia. The President and Secretary were directed to proceed accordingly, in the hope that all necessary formalities would be completed before the next meeting of Council on April 22nd.

Mr. Newell, as chairman of the Committee on Professional Interests, reported on the recent information which he had obtained from Professor Spencer respecting the progress of the negotiations in Saskatchewan.

Consideration was given to the possibility of holding a special meeting of Council in Halifax during the President's visit to the Maritimes, at which time it is hoped that the signature of the agreement between The Institute and the Professional Association will take place. It was decided that it would be very desirable to hold such a Council meeting.

The report of the Finance Committee was considered, and it was noted with approval that expenditures and receipts were running close to the budgeted amounts. The resignations of six Associate Members and three Students were accepted; one reinstatement was effected, and a number of special cases were dealt with.

The report of the scrutineers of the ballot for the proposed new Section 76 of the By-laws was presented and accepted. It indicated an overwhelming majority in favour of the new Section 76, and accordingly the new By-law was declared to have carried. The General Secretary was instructed to advise the secretaries of all the Provincial Associations of this significant endorsation by the corporate membership of The Institute of the principle of closer co-operation with the Provincial Associations.

The President drew attention to Subsection (*b*) of section 75 of the By-laws providing for the rewording and rearranging of the by-laws on the initiative of Council. It was unanimously resolved that Mr. Durley be asked to undertake the preparation of revised versions of such by-laws as appear to require clarification or simplification, and make suggestions to Council as to these, and as to their re-arrangement.

At the suggestion of Mr. Viens it was unanimously resolved to appoint H. L. Seymour, M.E.I.C., to represent The Institute with a watching brief at a meeting which it is proposed to hold in Ottawa with a view of urging the House of Commons to extend existing Housing Legislation so that it will more adequately provide for low rent housing projects. Mr. Seymour was asked to report to the Council regarding the proceedings at this meeting.

A number of applications for admission and for transfer were considered, and the following elections and transfers were effected:

Elections		*Transfers*	
Member	1	Associate Member to Member	2
Associate Members	5	Junior to Associate Member	2
Junior	1	Student to Associate Member	5
Affiliate	1	Student to Junior	16
Students admitted	20		

The Council rose at eleven twenty-five p.m.

Result of the Ballot for the Introduction of a New Section (76) of the By-laws

This proposal, put forward by Council for the purpose of empowering Council to enter into certain agreements with the Provincial Associations of Professional Engineers, was sent out to ballot on February 15th, and has now been approved by the membership of The Institute.

The report of the scrutineers appointed by Council to canvass this ballot was submitted and accepted at the Council meeting on March 18th. In it the scrutineers certify the following results:

Ballots received	1,581
Ballots rejected	65
Ballots accepted	1,516
Votes in favour	1,482
Vote against	34

According to the by-laws two-thirds of the accepted ballots are required for a favourable vote, or 1,011.

* * *

Accordingly the new By-law takes effect immediately; it reads as follows:

"*Section 76.* The council may co-operate with any association or corporation of professional engineers constituted by an Act of any Province of the Dominion of Canada (hereinafter referred to as "the Association") in furtherance of the mutual interests of the members of the Institute and of the Association. To this end, the council may, notwithstanding the foregoing By-laws, enter into an agreement with the Association regarding—

(*a*) The admission and classification as members of the Institute (in accordance with the foregoing By-laws insofar as the council in its discretion deems advisable) of applicants for membership in the Institute who are members of the Association;

(*b*) The amount, if any, and method of collection of entrance fees payable by applicants for membership in the Institute who are members of the Association;

(*c*) The amount and method of collection of annual fees payable by members of the Institute who are also members of the Association;

(*d*) Provision for the termination of the said agreement;

(*e*) Any other provisions necessary for the carrying out of the said agreement.

To become effective, the said agreement, after publication in the Journal of the Institute, must be sanctioned by—

(1) An affirmative vote of two-thirds of the letter-ballots cast by the members of council; and

(2) An affirmative vote of a majority of all valid letter-ballots cast by the corporate members of the Institute resident within the Province of the Association."

Proposed Agreement Between The Institute and The Association of Professional Engineers of Nova Scotia

The proposed agreement printed below is in the form recommended by accredited representatives of the Council of The Institute and of the Association of Professional Engineers of Nova Scotia.

It is now published in The Journal pursuant to the new By-law No. 76, which is now in effect, having been approved on March 18th, 1938, by the corporate members of The Institute.

The executive committees of the Halifax and Cape Breton Branches of The Institute have approved of this agreement.

MEMORANDUM OF AGREEMENT made in duplicate at the City of Montreal, in the Province of Quebec, this day of 1938,

BY AND BETWEEN

THE ENGINEERING INSTITUTE OF CANADA having its Head Office at the City of Montreal, in the Province of Quebec, hereinacting by its President and Secretary, duly authorized for the purpose hereof by a resolution of its Council passed at a Meeting duly called and held on the day of 1938, hereinafter called "the Institute,"

Party of the First Part

and

THE ASSOCIATION OF PROFESSIONAL ENGINEERS OF NOVA SCOTIA having its Head Office at the City of Halifax, in the Province of Nova Scotia, hereinacting by its President and Registrar, duly authorized for the purpose hereof by a resolution of its Council passed at a Meeting duly called and held on the day of 1938, hereinafter called "the Association,"

Party of the Second Part.

WHEREAS it is desirable in the interest of the Engineering Profession that there be close co-operation between the Institute and the Association; and

WHEREAS such close co-operation will be promoted if, so far as is practicable, there is effected:

(*a*) A common membership in the Province of Nova Scotia of the Institute and the Association;

(*b*) A simplification of existing arrangements for the collection of fees;

(*c*) A reduction in the total fees payable by those who are members of both the Institute and the Association;

NOW, THEREFORE, the parties hereto agree with each other as follows:

1. All persons who are, on the date of this Agreement or who may be hereafter during the term of this Agreement, registered as Professional Engineers under the provisions of Chapter 186 of the Statutes of the Province of Nova Scotia for the year 1920, and subsequent amendments thereto, and who are not on the date of this Agreement, nor on the date of such future registration, as the case may be, Corporate Members of the Institute, shall under the provisions of this Agreement automatically become Corporate Members of the Institute on and after said date, subject to the terms and conditions of this Agreement, as hereinafter set forth.

2. Registered members of the Association who at the date of this Agreement have reached the age of thirty-five years shall be accorded the status of "Member" (M.E.I.C.) in the Institute and those under thirty-five years of age shall be accorded the status of "Associate Member" (A.M.E.I.C.) in the Institute, and after reaching the age of thirty-five years shall be automatically transferred to the status of "Member."

3. Any person registered as a Professional Engineer in the Association subsequently to the date of this Agreement and who is not a Corporate Member of the Institute at the date of said registration shall be accorded the class of membership in the Institute warranted by the age, experience and professional qualifications of such person according to the By-laws of the Institute and the decision of the Council of the Institute. Any person over thirty-five years of age classed as "Associate Member" (A.M.E.I.C.) may, if dissatisfied with such classification, apply to the Council of the Institute for the status of a Member (M.E.I.C.) and shall be entitled to have his classification and qualifications for same reviewed by the Council of the Institute.

4. Registered members of the Association shall not be required to pay the entrance or transfer fees of the Institute.

5. In lieu of the ordinary membership fees of the Institute the Association shall pay to the Treasurer of the Institute the sum of six dollars ($6.00) per annum for each member of the Association having the Institute classification of "Member" (M.E.I.C.) and the sum of five dollars ($5.00) per annum for each other member of the Association. These fees shall entitle the members of the Association to all the privileges of the Institute membership and shall include the annual subscription to the Institute Journal.

These fees shall be due and payable to the Institute by the Association annually in advance on the First day of January of each year.

The provisions of this Section 5 of this Agreement shall not be effective until the First day of January, 1939.

6. It is agreed that the Branches of the Institute in Nova Scotia shall continue actively to function as such during the term of this Agreement, and to enable such functioning there shall be set up and continued from year to year during the term hereof a Committee of five members to be known as the Joint Finance Committee; two of said members shall be appointed annually by the Council of the Institute; two members shall be appointed annually by the Council of the Association and the fifth member, who shall be a Corporate Member of the Institute and a Registered Professional Engineer, shall be appointed annually by the four members aforesaid and the said fifth member shall be Chairman of the Committee. In case the four members aforesaid fail to appoint the fifth member, the said fifth member shall be appointed by the President of the Engineering Institute of Canada. The said Committee shall decide annually the sums of money to be paid by the Association to the Branches of the Institute for their operation. The Committee is further empowered to determine the time and manner of such payments and the Association shall make payment to the Branches in accordance with the Committee's decision.

7. The term of this Agreement shall be the period commencing on the date hereof and ending on the 31st day of December, 1942, on which date this Agreement shall terminate provided either party has given to the other a notice of termination at least six months prior to the 31st day of December, 1942, and if no such notice is given this Agreement shall continue after the 31st day of December, 1942, from year to year but may be terminated at the end of any calendar year by either party giving notice in writing to the other of such termination at least six months prior to the end of any calendar year.

8. The terms and provisions of this Agreement may be amended by mutual agreement, in writing, between the parties hereto, duly executed by them.

9. This agreement and the terms and provisions thereof shall not be applicable to the Institute members who are not registered with the Association.

IN WITNESS WHEREOF these presents have been duly executed on behalf of the parties hereto on the date and at the place first above written.

IN THE PRESENCE OF: THE ENGINEERING INSTITUTE OF CANADA

.... *Secretary*

THE ASSOCIATION OF PROFESSIONAL ENGINEERS OF NOVA SCOTIA

.... *President*

.... *Registrar*

Prize of $25.00

The Publication Committee offers a prize of $25.00 for the best design submitted by any member of The Institute, for a new cover for The Engineering Journal. Provision should be made in the design for an illustration, and the design should be sufficiently flexible to provide for a horizontal or vertical illustration, or perhaps even over the whole page.

This competition will close on June 1st, 1938. Designs should be submitted to the Chairman of the E.I.C. Publication Committee, 2050 Mansfield Street, Montreal, from whom further particulars can be obtained by prospective competitors.

OBITUARIES

Major Frederick Demille Burpee, Affil.E.I.C.

Members of The Institute will learn with regret of the death of Major Frederick Demille Burpee, Affil.E.I.C., in Ottawa on February 25th, after a lengthy illness. Major Burpee was born in Ottawa on April 25th, 1876, and at the age of 17 entered the Ottawa Electric Railway Company. His promotion in this company raised him to the position of vice-president and general manager in 1924 and this position he held until his death. Major Burpee was director of several companies, including the Capital Trust Corporation, and held a foremost position in the industrial and public life of Ottawa. During the Great War, he was engaged on the British front constructing standard and narrow gauge railways.

Major Burpee joined The Institute as an Affiliate in 1922.

Richard LaFontaine Haycock, M.E.I.C.

Richard LaFontaine Haycock, M.E.I.C., general engineer with J. R. Booth Limited, died on February 1st, 1938, at his home in Ottawa, after a brief illness. Mr. Haycock was born in Ottawa on December 22nd, 1874, where he attended Lisgar Collegiate Institute, later proceeding to McGill University, from which he graduated in 1897 with the degree of B.Sc. in Mechanical Engineering.

After graduation Mr. Haycock worked for short periods with the Canadian Atlantic Railway at Ottawa and the Canadian Pacific Railway in Winnipeg. Later he was employed with the Lackawanna Steel Company, Buffalo, and with the International Marine Signal Company, Ottawa, for which company he spent some time installing buoys in the harbour of Rio de Janeiro.

From 1910 to 1914 Mr. Haycock was associated with the late Mr. Noulan Cauchon as partner in the firm of Cauchon and Haycock. During this period he was retained as consulting engineer on many governmental and private projects in various parts of Canada. In 1914 Mr. Haycock was appointed by the Ottawa City Council as acting waterways and sewage engineer. In 1916 Mr. Haycock became superintendent of transportation with the Algoma Steel Corporation, Sault Ste. Marie, Ontario. In 1918 he joined the General Supply Company as a mechanical engineer. Later he entered private practice and to 1932 was connected with the Fraser-Brace Engineering Company.

For the past six years Mr. Haycock has been general engineer with J. R. Booth Limited and was in charge of all pulp wood handling machinery throughout the plant.

Mr. Haycock joined The Institute in 1916 as an Associate Member, becoming a Member in 1919.

David Wentworth Robb, M.E.I.C.

Members of The Institute will learn with regret of the death of David Wentworth Robb, a Life Member of The Institute and a prominent Nova Scotia industrialist. Mr. Robb was born on May 9th, 1856, in Amherst, Nova Scotia. After his early education in the Amherst schools, he was apprenticed from 1874 to 1877 in the foundry and machine shops of Alex Robb, Amherst. In 1877 he became superintendent in this company and acted in this capacity until 1879 when he became senior acting partner of the firm of A. Robb and Sons. In 1890 Mr. Robb came to fill the position of president of the firm Robb Engineering Company Limited. This company, founded by Mr. Robb's father, is now a subsidiary of Dominion Bridge Company, under the name of the Robb Engineering Works.

Mr. Robb was a former Mayor of Amherst and at one time president of the Amherst Board of Trade. In 1931 he was Maritime representative on the Dominion Government Commission which made an adverse report on the construction of a canal across the Chignecto isthmus connecting New Brunswick and Nova Scotia.

Mr. Robb joined the Canadian Society of Civil Engineers as a Member in 1894, and in March 1936 was made a Life Member of The Engineering Institute of Canada.

Charles Stephen, A.M.E.I.C.

The death of Lieutenant-Commander Charles Stephen, R.N. (Ret.), A.M.E.I.C., technical adviser of the R.C.M. Police, which occurred in Ottawa on March 14th, 1938, will be much regretted by members of The Institute. Commander Stephen was born in Liverpool, England, on August 9th, 1880. After attending Liverpool Technical College and Liverpool University he began his engineering training with Messrs. Wannup and Davies, engineers, Liverpool, remaining with them for 12 months. The next three years he spent erecting and repairing engines for the Cunard Engine Works and the following three and one-half years gaining engineering experience at sea and in Brazil for the Booth Steamship Company. Further experience in marine engineering was obtained as junior engineer on the S.S. *Planet Neptune* and later, on various ships of the White Star Line, and with Messrs. Harland and Wolff in Belfast, supervising construction on the S.S. *Olympic*.

Commander Stephen came to Canada and in 1911 was appointed superintendent engineer at Macdonald College, Ste. Anne de Bellevue, P.Q. When War broke out he reported for service in the Royal Navy, serving later as Engineer Lieutenant-Commander on H.M.S. *Glorious*. On his return to Canada in 1919, he was made resident engineer and chief engineer and superintendent at Macdonald College, resigning that position in 1930 when he was appointed to a newly created office of the Federal government, known as chief engineer and technical adviser, Department of Inland Revenue. This position Commander Stephen filled most ably until 1932 when he accepted the position which he held at the time of his death. In the capacity of technical adviser to the Royal Canadian Mounted Police, his wide experience in marine engineering proved of great assistance to the marine section of that famous organization.

Lieut.-Commander Stephen became an Associate Member of The Institute in 1916.

John Alexander Low Waddell, D.Sc., LL.D., M.E.I.C.

Dr. J. A. L. Waddell, a Life Member of The Institute, died on March 3rd, 1938, in New York. Dr. Waddell was born in Port Hope, Ontario, on January 15th, 1854, and there attended the public schools and from 1865-70 Trinity College School. In 1875 he graduated from Rensselaer Polytechnic Institute at Troy, N.Y., and after filling various positions went to Japan where he taught in the Imperial University at Tokio from 1882 to 1886. On his return to the United States he established an office in Kansas City, Mo., where his headquarters remained until 1920 when he came to New York.

Dr. Waddell enjoyed an international reputation as an expert in bridge design, having to his credit in Canada and the United States hundreds of bridges of all kinds. He also designed and constructed many important bridge structures in Mexico, Japan, New Zealand, Russia and Cuba.

Dr. Waddell was decorated by the Chinese, Italian, Japanese and Russian Governments for services he had rendered in those countries. Besides these honours he was the recipient of numerous others in Canada and the United States. He was awarded the first Clausen Gold Medal by the American Association of Engineers in 1931, for "having in the preceding half century done the most to advance the interests of the engineering profession in the United States."

Dr. Waddell joined the Canadian Society of Civil Engineers in 1903 as a Member, becoming a Life Member in 1935, of The Engineering Institute of Canada.

PERSONALS

De Gaspe Beaubien, M.E.I.C., the newly appointed treasurer of The Engineering Institute of Canada, consulting engineer of De Gaspe Beaubien and Company, is a member of the Electrical Commission of Montreal, director of Beaubien Limitée, President of David et Frère, Limitée, and chairman of the Montreal Housing Commission. Mr. Beaubien was born in Outremont on May 18th, 1881, the son of the Honourable Louis Beaubien of Montreal. Upon his graduation from McGill University in 1906 with the degree of B.Sc., Mr. Beaubien became demonstrator at that University. In 1908 he entered the Westinghouse Electric and Manufacturing Company, at East Pittsburgh, having obtained experience with the Montreal Light, Heat and Power as early as 1903. From 1908 until 1922 he was in practice as consulting engineer in his own name, then from 1922 until 1929 under the name of Beaubien, Busfield and Company.

Mr. Beaubien joined The Institute (then the Canadian Society of Civil Engineers) as a Student in 1903, becoming an Associate Member five years later, and being elected a Member in 1921.

R. C. C. Brown, S.E.I.C., has accepted a position as Junior Aeronautical Engineer in the Department of National Defence at Ottawa. Mr. Brown graduated from Queen's University, Kingston, Ont., in 1933 with the degree of B.Sc., and prior to his change of position was with the Fairchild Aircraft Company, Longueuil, Que.

Capt. John A. Creasor, M.C., A.M.E.I.C., formerly construction superintendent, Canada Cement Company, Belleville, Ont., is now with the Canadian Refractories Limited, at Kilmar, Que. Capt. Creasor graduated from McGill University in 1914 with the degree of B.Sc. and then served with the allied forces overseas.

F. Stewart Gumley, A.M.E.I.C., has been appointed manager of the structural department of Burn and Company Limited, Howrah Ironworks, Howrah, India. This company is now constructing a cantilever bridge over the Hooghly river. The main span of the bridge is 1,500 ft. with a cantilever span of 564 ft. Mr. Gumley was formerly designing engineer with Martin and Company at Calcutta, India, in charge of design and construction of bridges, buildings and engineering structures in structural steel. Prior to this he was works manager with J. and J. Lawrence Limited, in Edinburgh, Scotland, and at one time with the Western Bridge Company Limited, Vancouver, B.C.

F. E. Winter, A.M.E.I.C., formerly technical assistant of the Canadian Electrical Association, is now with the Montreal Engineering Company. Mr. Winter graduated from McGill University with the degree of B.Sc. in 1926.

John Kazakoff, S.E.I.C., has recently received an appointment with the Bolivian Power Company, La Paz, Bolivia. Since graduating from McGill University in 1935 with the degree of B.Eng., Mr. Kazakoff has been with the Canadian Ingersoll Rand Company Limited, Sherbrooke, Que.

Paul F. Sise, M.E.I.C.

Paul F. Sise, M.E.I.C., president of the Northern Electric Company Limited, Montreal, was elected director of the Shawinigan Water and Power Company, March 16th. In addition to being president of the Northern Electric Company Limited, Mr. Sise is director of the Royal Bank of Canada, of the Bell Telephone Company of Canada, Montreal Trust Company, Lake of the Woods Milling Company, Dominion Engineering, Industrial Acceptance Corporation, Amalgamated Electric Corporation, Belding-Corticelli, Limited, and Sherwin-Williams Company of Canada, Limited. After graduating from McGill University in 1901 with the degree of B.Sc., he was connected with the Westinghouse Company in Pittsburgh, New York and Montreal until 1904, when he entered the Northern Electric and Manufacturing Company as secretary-treasurer. In 1910 he was appointed managing director of the company. When the Northern Electric and Manufacturing Company was amalgamated with the Imperial Wire and Cable Company in 1914, he became vice-president and general manager of the new organization. He was appointed to his present position in 1919.

W. G. Mitchell, M.E.I.C., has recently established a consulting office at 680 Sherbrooke Street West, Montreal.

Mr. Mitchell graduated from McGill University in Mining Engineering in 1913 and spent a year in post-graduate research on ore dressing problems, qualifying for the degree of M.Sc. in 1914. He was for a short period associated with the Dominion Government Forest Products Laboratories of Canada from date of their establishment in Montreal and later (1916-1918) spent two years in varied engineering work in Russia, Siberia and Manchuria.

In 1919-1920 he made an extensive survey of technical and economic conditions of the pulp and paper industry throughout Europe for Canadian interests and on returning to Canada in 1921 joined the staff of Price Brothers and Co. Ltd. as assistant to the president, shortly thereafter assuming charge of the Company's pulp and paper mills and power plant operations in the Lake St. John District. During the period 1922-1930 he was closely associated with a large programme of expansion carried out by the Price Company, quadrupling its newsprint manufacturing capacity. He withdrew from the organization of Price Brothers and Co. Ltd. in 1932 and has subsequently been engaged in private practice in the southern United States and, since 1934, in Canada, acting for a time as technical adviser to the Canadian Pulp and Paper Association on matters relating to research and development policy.

Mr. Mitchell joined The Engineering Institute as Member in May, 1920, acted for two years as Chairman of the Saguenay Branch from the date of its inauguration, and later (1927-1930) served for four years as Vice-President of The Institute for Zone C (Quebec).

Mr. Mitchell's activities in recent years have been concerned largely with the economic and technical aspects of industrial development in relation to investment and management and it is to this field that his practice will be principally devoted.

H. L. Swan, M.E.I.C., has relinquished the appointment of district engineer, Department of Public Works, Province of British Columbia, and has been appointed administrator of the highway traffic branch of the Provincial Public Works Department. His new duties include the regulation and control of truck and bus traffic in the province, particularly in connection with the licensing of vehicles for various purposes as distinguished from the police regulation of traffic from a safety or ordinary motor vehicle licence point of view. It is gratifying to note the appointment of an engineer to this administrative post. Mr. Swan will serve as chairman of the Advisory Board which deals with highway traffic in this manner. The change in policy of the Provincial Government has been made necessary by the increasing importance of the work.

Fraser F. Fulton, A.M.E.I.C., has been appointed general sales manager of the Special Products Division of the Northern Electric Company Limited, Montreal. Since 1928 when he graduated from McGill University with the degree of B.Sc. in Electrical Engineering, Mr. Fulton has been with the sales department of the Northern Electric Company.

Gordon McL. Pitts, A.M.E.I.C.

Gordon McL. Pitts, B.Sc., B.Arch., M.Sc., F.R.A.I.C., A.M.E.I.C., was elected a Fellow of the Royal Architectural Institute of Canada during its Annual Meeting in Montreal in February. Mr. Pitts is a member of the firm of Maxwell and Pitts, architects, Montreal, and was the very active chairman of the Committee on Consolidation of The Institute.

Frank Tempest, A.M.E.I.C., has returned from South America where he was connected with the Tropical Oil Company as refinery engineer at Barranco, Bermeja, Colombia. He is now with Imperial Oil Limited, Calgary. Prior to going to South America in 1931 he held the position of construction engineer and plant foreman with the Royalite Oil Company at Okotoks, Alta.

ELECTIONS AND TRANSFERS

At the meeting of Council held on March 18th, 1938, the following elections and transfers were effected:

Member

GRANT, William Roy, B.Sc. (Civil), (McGill Univ.), president, Barnett-McQueen Co. Ltd., Fort William, Ont.

Associate Members

CARTER, Thomas Allen, B.Sc. (Elec.), (Queen's Univ.), elect'l. engr., Saguenay Power Co. Ltd., Arvida, Que.

LEEBOSH, Ilja, Mech. Engr., (Polytech. Inst., Coethen, Germany), engr., Canadian Bridge Co. Ltd., Walkerville, Ont.

McKINNEY, John E., divn. plant engr., Bell Telephone Company of Canada, Toronto, Ont.

McMANAMNA, Theodore Louis, B.Sc. (C.E.), (Univ. of Kansas), vice-president and mgr., International Water Supply Ltd., Fort Erie North, Ont.

TATE, George Harold, B.A.Sc., (Univ. of Toronto), power engr., Canadian Kodak Co. Ltd., Toronto, Ont.

Junior

SKERRY, Francis Stephen, B.Eng. (Elec.), (N.S. Tech. Coll.), 172 Windsor St., Halifax, N.S.

Affiliate

ALLWRIGHT, Ernest Gilbert, (Montreal Tech. Inst.), engr., Aluminum Company of Canada Ltd., Arvida, Que.

Transferred from the class of Associate Member to that of Member

FARROW, Richard Charles, district engr., Water Rights Branch, Prov. of B.C., Victoria, B.C.

KETTERSON, Andrew Robert, Major, D.S.O., (Royal Tech. Coll., Glasgow), engr. of bridges, C.P.R., Montreal, Que.

Transferred from the class of Junior to that of Associate Member

McDONALD, Donald J., B.Sc., (Queen's Univ.), foreign wire relations engr., Eastern area, Bell Telephone Company of Canada, Montreal, Que.

PATTERSON, Ian Stewart, B.Sc. (E.E.), (N.S. Tech. Coll.), industrial control specialist, Can. Gen. Elec. Co. Ltd., Montreal, Que.

Transferred from the class of Student to that of Associate Member

BENNETT, Robert Douglas, B.Eng., M.Sc., Ph.D., (McGill Univ.), head of organic dept., J. T. Donald & Co. Ltd., Montreal, Que.

BURRI, Henry William, B.Eng. (Mech.), McGill Univ., proposition engr., Mathews Conveyer Co. Ltd., Port Hope, Ont.

COLLISON, Lloyd S., B.A.Sc., (Univ. of Toronto), filtration plant operation, City of Hamilton, Ont.

DILL, Edwin Willson, B.A.Sc., (Univ. of Toronto), designing dftsman., The Carborundum Company, Niagara Falls, N.Y.

LYON, Grant MacKenzie, B.Sc. (C.E.), (Univ. of Man.), engr., Red Lake Gold Shore Mines Ltd., Red Lake, Ont.

TRUDEL, Louis, B.A.Sc., C.E., (Ecole Polytechnique, Montreal), Southern Canada Power Co. Ltd., Montreal, Que.

Transferred from the class of Student to that of Junior

BENJAFIELD, Philip Grant, B.Sc., (Queen's Univ.), instr'man., International Nickel Company, Copper Cliff, Ont.

BONNELL, Alexander R., B.Sc. (C.E.), (Univ. of N.B.), instrumentman, highway divn., N.B. Dept. of Public Works, Fredericton, N.B.

CRAIG, William Royce, B.Sc. (E.E.), (Univ. of Alta.), engr., Canadian Sugar Factories, Picture Butte, Alta.

CUNNINGHAM, Donald David MacC., B.Sc. (E.E.), (Univ. of N.B.), test engr., N.B. Electric Power Commission, Newcastle Creek, N.B.

DONOHOE, Gordon Miller, B.Sc., (Univ. of N.B.), 102 Guildford St., Saint John West, N.B.

HAYES, Herman Rutherford, B.Sc. (Civil), (Univ. of Alta.), industrial engr., Burns & Co. Ltd., Edmonton, Alta.

HURDLE, Harold Lancelot, B.Sc., (Univ. of Alta.), ap'tice. engr., Calgary Power Co. Ltd., Calgary, Alta.

JARVIS, Gerald Walter, B.Sc., (Queen's Univ.), dftsman., McColl-Frontenac Oil Co. Ltd., Montreal, Que.

LAWSON, George Whytall, B.A.Sc., (Univ. of Toronto), designer and dftsman., Dufferin Paving and Crushed Stone Ltd., Toronto, Ont.

PHILLIPS, Frederick Rene, B.Eng. (Civil), (McGill Univ.), asst. to J. S. Hewson, A.M.E.I.C., engr. and contractor, Montreal, Que.

SCHNYDER, Max, B.Eng. (Mech.), (McGill Univ.), dftsman., for John Stadler, M.E.I.C., Montreal, Que.

SHARP, William Gray, B.Sc. (E.E.), (Univ. of Alta.), installn. and service engr., Sharp's Theatre Supplies, Calgary, Alta.

SMITH, Owen Leonard, (N.S. Tech. Coll.), Canadian Comstock Company, Arvida, Que.

STIERNOTTE, Alfred, B.Sc. (Chem.), (Univ. of Alta.), lab. asst., Royalite Oil Co. Ltd., Turner Valley, Alta.

TAYLOR, Frederick Wm., B.A.Sc., (Univ. of Toronto), asst. to E. A. Cross, M.E.I.C., Consltg. Engr., Toronto, Ont.

THOMAS, James Macleod, B.Sc. (E.E. and C.E.), (Univ. of N.B.), res. engr., highway divn., N.B. Dept. of Public Works, Fredericton, N.B.

Students Admitted

BELLE-ISLE, Jacques G., (Ecole Polytechnique, Montreal), 3872 Berri St., Montreal, Que.

BROWN, Lindsay H., (R.M.C.), Britannia Heights, Ont.

CARRIERE, Murray Francis, B.A.Sc., (Univ. of Toronto), 299 Evelyn Ave., Toronto, Ont.

COUTURE, George Albert Elwood, (R.M.C.), 170 St. Louis Road, Quebec, Que.

DUPUY, Harry E. G., (McGill Univ.), 4051 Grey Ave., Montreal, Que.

ELLIOTT, Clarence W., (Univ. of Alta.), Edmonton, Alta.

FORSTER, Alfred Manning, (N.S. Tech. Coll.), 88 Walnut St., Halifax, N.S.

GODARD, Hugh Phillips, M.A.Sc., (Univ. of B.C.), c/o Dept. of Cellulose Chemistry, McGill University, Montreal, Que.

HEATH, Frederick Johnston, (Univ. of Alta.), 10122–124th St., Edmonton, Alta.

HOLE, Jack H., (Univ. of Alta.), 9421–108a Avenue, Edmonton, Alta.

JOHNSON, Frederick Paul, (Univ. of Alta.), 9924–87th Ave., Edmonton, Alta.

KOBYLNYK, Demetrius Frederick, (Univ. of Alta.), 11046–88th Ave., Edmonton, Alta.

MACKENZIE, Robert Kenneth, (R.M.C.), Kingston, Ont.

McCALLUM, Francis, (Univ. of Sask.), 801 Colony St., Saskatoon, Sask.

SENKLER, Edmund John, B.A.Sc., (Univ. of B.C.), 3637 University St., Montreal, Que.

SLATER, Stewart, (Grad. R.M.C.), 358 Brock St., Kingston, Ont.

STEVENSON, Herbert Irving, (Univ. of Man.), 73 Ethelbert St., Winnipeg, Man.

SUTHERLAND, Donald Henry, (Univ. of N.B.), Borden, P.E.I.

SYLVESTER, Jack Douglas, (Univ. of Alta.), 7935–111th St., Edmonton, Alta.

WARD, Kenneth Roy, (R.M.C.), 476 Victoria St., Kingston, Ont.

ADDITIONS TO THE LIBRARY

Proceedings, Transactions, etc.

American Institute of Consulting Engineers: Constitution and By-Laws and List of Members, March 1st, 1938. Proceedings of the Annual Meeting, January 17th, 1938.

Institution of Mechanical Engineers: Proceedings, Vol. 136, June-November 1937.

Mysore Engineers Association: Minutes of Proceedings of Twenty-Ninth Annual Session. Vol. XV, Nos. 3 and 4, June to December 1937.

Society of Engineers: Transactions, 1937.

Reports, etc.

American Society for Testing Materials: Symposium on Consistency, presented at Fortieth Annual Meeting, June 29th, 1937.

Canada Department of Labour: Twelfth Report on Organization in Industry, Commerce and the Professions in Canada in 1937.

Canada Department of Trade and Commerce Bureau of Statistics, Transportation and Public Utilities Branch: Statistics of Steam Railways of Canada, 1936. Ottawa, 1938.

Canadian Government Purchasing Standards Committee: Tentative Specifications: Low Titre Chip and Powdered Soap for Laundry Purposes; Schedule of Methods of Testing Textiles; Burned Fireclay Brick for Stationary Boiler Service. February 1938.

Electrochemical Society: Preprint 73-5 to 73-19, Anode and Cathode Weight Losses in Galvanic Corrosion; A Table of Electrochemical Equivalents; Transient Voltages at the Beginning of Discharge of a Storage Cell and their Relation to the Actual and Transfer Resistance of the Positive Plate; Motor-Electrolytic Potential; The Structure and Hardness of Electrolytic Chromium; A Study of Reaction Products and Mechanism in the Electrolytic Reduction of Ethyl Iodine; The Electrical Charges of Aqueous Colloidal Systems; The Causes of Porosity in Electrodeposited Coatings, Especially of Nickel on Steel; Alkaline Plating Baths Containing Organic Amines; The Chemistry of Bleaching Chemical Wood Pulps; Comparisons of Electro-Osmosis, Electrophoresis, and Streaming Potential and Their Theoretical Significance; Alkaline Plating Baths Containing the Ethanolamines; The Electrodeposition of Manganese from Aqueous Solutions; Chemical Modifications of Cellulose; The Application of Osmosis to the Recovery of Caustic Soda Solutions Containing Hemicellulose in the Rayon Industry.

Institution of Civil Engineers: Engineering Abstracts, Section 1, Engineering Construction; Section 2, Mechanical Engineering; Section 3, Mining Engineering. Vol. 1, No. 2, February 1938.
New York, Port of: Seventeenth Annual Report, December, 1937.
Ontario Hydro-Electric Power Commission: List of Electrical Equipment Approved by the Commission. 4th ed. August 1937.
Purdue University: Automatic Gas Fired, Storage Type Water Heaters, J. M. Krappe. (Engineering Experiment Station, Lafayette, Ind., Engineering Bulletin, Vol. XXI, No. 5.)
Quebec Bureau of Mines: Annual Report for the year 1935, Pt. D. Quebec, 1936.
Underwriters' Laboratories, Inc.: Report on Steel Pipe Lines for Underground Water Service (Special Investigation 888, July 22nd, 1936).

University of Washington: Moment Equations, a Method of Analysis for Continuous Beams and Rigid Frames. (Engineering Experiment Station, Bulletin No. 92.)

BOOK REVIEW

Theory of Statically Indeterminate Structures

By W. M. Fife and J. B. Wilbur. McGraw-Hill, New York, 1937. 248 pp., 6 by 9 inches, $3.50.

Reviewed by S. R. Banks, A.M.E.I.C.*

"Only a knowledge of the basic principles of stress analysis can serve as a safe basis for departure from methods more rigorously correct . . . If approximate methods are to be introduced, they must be carefully studied in order to ascertain that they may be safely and properly applied to a given problem." These words of the authors, which might well be considered as their apology for the presentation of this work, constitute perhaps a timely admonition to the present-day engineer, to whom empirical and short-cut methods make an appeal that increases inevitably with the pace of modern times.

With the courage of this conviction, the authors (who are Associate Professors of Civil Engineering at Massachusetts Institute of Technology) have confined themselves to the theoretical treatment of ideal structures, developing the standard methods of analysis from the fundamental elastic laws. These latter are enunciated and explained in the first of the five chapters into which the book is cleanly and logically divided. Under the heading of "Deflections," presentation is made of some half-a-dozen ways of computing distortions of structures, and the Williot-Mohr graphical approach to the subject is dealt with lucidly. Two chapters, entitled respectively "Stress Analysis" and "Influence Lines," are devoted in their entirety to statically indeterminate structures, and in these are to be found applications of the various traditional analytical expedients. It is of interest to note, however, that the Hardy Cross method of distribution of end-moments is given an equally prominent place: and an example of its validity is provided by comparison numerically with the method of slope-deflection equations. The final chapter treats in several ways of the well-worn problem of secondary stresses in the simple truss.

Throughout the volume, definitions and explanations appear to be made with care and precision, a generous discussion, for instance, of the characteristics of determinate and indeterminate structures forming part of the discourse on "basic concepts." Attention is always drawn to the probable significance of errors arising from any particular assumption, and the limitations of the different systems of analysis are indicated. It is a feature of the book that the theory is illustrated at all stages by fully-worked numerical examples: and a series of some fifty problems is provided at the end for the reader's exercise.

The book, not unnaturally, in view of its subject and authorship, bears the academic impress, and will evidently find its greatest sphere of usefulness as a text for students specializing in structural work; though at the same time it will by no means be out-of-place in the reference library of the designing engineer.

*Assistant Engineer, Monsarrat and Pratley, Consulting Engineers, Montreal.

Air Conditioning Brings Problems to Water Men

One of the new problems confronting those concerned with city water supply is the enormous demand for water in some cities resulting from air conditioning of theatres, stores and factories. In many cities such equipment now consumes millions of gallons of water daily, often taxing the capacity of the water system. If air conditioning expands as rapidly as some expect, many cities will be forced to enlarge their plants and reach out for new sources of supply.

The Camera and Airplane in Canada

Extracts from address before the Ottawa Branch of The Institute on March 10th, 1938, by A. C. T. Sheppard, B.A.Sc., D.L.S., Bureau of Geology and Topography, Department of Mines and Resources, Ottawa, Ont.

The application of the camera and airplane to mapping in this country and the problems associated with it are distinctly those of a pioneer country. In the United States, for instance, the major problem is that of preparing detailed maps of settled country; in Canada the biggest problem is that of preparing maps showing the topography of areas hitherto unmapped and largely unsettled.

The results obtained so far in Canada have been impressive, according to Mr. Sheppard. Before 1922 approximately 240,000 sq. mi. were mapped in a more or less adequate manner, whereas now 720,000 sq. mi. are mapped, a large share of which has been by the use of air methods. The work may be divided into two parts: the flying and photographic operations, and the reduction of photographic information to map form. While there is a close relationship between the two operations, so far as government work is concerned the former lies within the province of the Royal Canadian Air Force and the latter with the technical mapping services of the Department of Mines and Resources, and the Department of National Defence. An Interdepartmental Committee on Air Surveys and Base Maps keeps the work co-ordinated and an Associate Committee on Survey Research of the National Research Council looks after research problems.

After consideration of the various types of planes available on the market, the R.C.A.F. has given preference for their photographic operations to the Northrop Delta to which can be fitted wheels, floats or skis, depending upon the nature of the area in which operations are to be carried out. For northern work in summer, floats are used on account of the multitude of water areas that provide convenient landing places.

At the conclusion of the War, the old free nose flying boats were used in Canada for photography. They had a limited range of photographic flight at an altitude of 5,000 ft., not exceeding 225 mi., which was a serious handicap to effective mapping. The change to cabin aircraft, equipped with floats, more than doubled the duration of flight and greatly improved the performance. The altitude for oblique photography was increased to 8,000 ft., and the spacing between parallel flight lines from six to eight miles. Camera mounting was also changed from the cockpit, pointing in the direction of the route, to a position inside the cabin pointing in general along the track of the aircraft.

Lines of flight are laid out in an east and west direction. For vertical photography the flying is usually at 10,000 ft., and is so arranged that one strip of photographs will overlap another without intervening gaps. The spacing for these is usually from 1¼ to 1½ mi. apart so as to give an overlap of 40 per cent if the flights are flown as projected. North and south cross flights to help "tie in" the east and west flights are made at the easterly and westerly limits of the map sheet and at suitable intervals in between. When the area is particularly hazardous the flying height for vertical photography may be increased to 12,000 or even 15,000 ft. Cameras, camera mounts, auxiliary equipment, camera film and paper used were briefly touched upon by the speaker as well as office instrumental equipment and methods of plotting.

All photographic negatives are kept by the Royal Canadian Air Force. The Department of Mines and Resources maintains an Air Photographic Library in which prints of all negatives are filed. These prints are available for use by Federal and Provincial services as well as by private organizations and individuals. By means of the index and filing system which has been adopted, complete information is readily available regarding any operation, flight, or individual photograph. The library now contains 725,000 individual index prints, an increase of 35,000 during the past year. The extent of the library's activities may be judged by the turnover of 100,000 prints sold, loaned or used in the library during the year. Of this number 40,000 were used for purely mapping purposes.

In summing up the value of some of the services rendered by air photography to Canada Mr. Sheppard stated that much interesting work is being carried out with respect to the identification of geological features and formations, and for studying physiographic problems. The Forestry Service is also developing a technique for identifying tree types and for estimating their height and from this, surprisingly accurate estimates of stands of timber are being made. Already over 100,000 sq. mi. of forests have been classified in this way, at a much lower cost than ground surveys.

The Hydrographic Service is making valuable use of air photographs in charting shore lines and in locating submerged features. The Department of Agriculture is deriving material assistance from air photography in problems connected with the drought area. Even in the field of legal surveying, the surveyor in re-establishing lost corners is able to get much evidence which when assembled is very valuable in helping to untangle many a legal mix-up.

It is hoped that eventually the whole country will be covered with maps at least of a reconnaissance nature and meanwhile rapid progress is being made with the detailed mapping in fields of economic importance.

BRANCH NEWS

Border Cities Branch

J. F. Bridge, A.M.E.I.C., Secretary-Treasurer.
F. J. Ryder, Jr.E.I.C., Branch News Editor.

The regular monthly dinner and meeting was held in the Mural Room of the Prince Edward hotel, on February 28th. Approximately forty members were present to hear the paper presented by Mr. Charles Hopper, resident engineer of C. A. Parsons and Company Limited, Newcastle-on-Tyne, England.

Prior to the presentation of the paper our branch councillor, H. J. A. Chambers, A.M.E.I.C., gave a report of the general meeting that was recently held at London, Ontario.

Boyd Candlish, A.M.E.I.C., introduced the speaker, Mr. Hopper, whose subject was "Some Improvements in Modern Turbine Practice."

Some Improvements in Modern Turbine Practice

The last half century has been an 'engineer's era' insofar as most developments have been along scientific lines. The steam turbine was first developed by Sir Charles Parsons in 1884 as a land engine. The older types of turbines were single cylinders operating under low pressure steam and were commonly called 'steam-eaters.' In order to advance the thermal efficiency of the turbines, engineers have introduced higher temperatures and pressures which call for many changes in the old type of turbine. This has developed two new types, namely, the 'tandem' with two cylinders and single exhaust and the 'single cylinder duplex' having two sets of low pressure blades.

The increase in temperature and pressure has called for the improvements in materials used particularly in the shafts. The introduction of the high pressure oil pumps for lubrication was designed to lift the shaft from its bearings, leaving the shaft floating in oil, thus overcoming the starting friction and reducing the starting torque in the shaft. Pressures in such pumps run from 1,500 to 2,000 lb. per sq. in.

The electrical heating of bolts now assures the engineer of fairly uniform stress to a pre-determined amount in each bolt. The nut is first tightened by hand, then the bolt is electrically heated and the nut further tightened. The contraction of the bolt while cooling gives the necessary pressure for clamping the casing. The reverse is true when it is necessary to remove the casing.

Low carbon, stainless steel has been found to be the best material for blading. Further, the method of rolling the steel always in one direction, improves its use for blading and does away with surface defects so commonly found previously.

The best thermal efficiency obtained in a modern steam turbine with reheated exhaust is between 29 and 36 per cent.

At present a machine is being designed to operate on 2,300 lb. pressure.

After the usual barrage of questions and answers, T. H. Jenkins, A.M.E.I.C., moved a hearty vote of thanks to Mr. Hopper to which all unanimously agreed. E. M. Krebser, A.M.E.I.C., extended the appreciation of the branch to the speaker and also welcomed our visitors.

Edmonton Branch

M. L. Gale, A.M.E.I.C., Secretary-Treasurer.
F. A. Brownie, Jr.E.I.C., Branch News Editor.

The guest speaker at the February dinner meeting of the Edmonton Branch, held on the 25th at the Macdonald hotel, was Mr. W. Dixon Craig, K.C. His subject was "Expert Evidence."

Expert Evidence

That this, in some respects controversial, subject was of great interest to local engineers was indicated by the large attendance of members. Mr. Craig opened the subject by outlining the fundamental principles of our method of settling disputes in the courts. Once the question before the court is defined, the next step is to set up and interpret the facts of the case. This interpreting of the facts is the duty of the jury, if there is one, or in other cases, of the judge acting in place of a jury. The third step, the application of the law, is the duty of the judge.

The primary function of witnesses is to place the facts before the courts. Originally there was no exception to this rule—witnesses dealt in facts only, not opinions. Gradually however, and especially in cases involving scientific matters, there has grown up the practice of admitting "opinion" evidence submitted by "experts." This is only justified when such witnesses have such special knowledge or skill that they can assist the jury by interpreting for it facts which would otherwise be meaningless to the ordinary individuals comprising the jury. Naturally since the general rules of evidence are being relaxed to admit such evidence, the "experts" are required to show that they are qualified to express sound opinions on the field of knowledge in question.

Mr. Craig then presented a brief outline of the history of technical evidence, citing a number of interesting cases to illustrate the gradual growth of its acceptance in the courts. He then went on to show how necessary such evidence is and yet how open to criticism it is in a number of respects.

For the courts to attempt to study scientific questions by the inductive method, going back to the beginning and developing for itself a complete body of theory in a certain field of knowledge, would be impossible. Even if possible in other respects the time required would be prohibitive. For this reason the court must rely on the testimony of scientific men, subject to cross-examination.

On the other hand, the method in general use of obtaining such evidence is open to grave criticism. Expert witnesses, being human, and being paid agents of one side of the case, are not unbiased. Their evidence is chosen, not for fairness to both sides but for the benefit of one side or the other. Since their evidence is based on opinion they cannot be indicted for perjury. And finally, with experts definitely attached to one side or the other and subject to cross-examination, the result is often very confusing—the jury is set to decide "where doctors disagree."

Notwithstanding these criticisms, Mr. Craig expressed the highest regard for the probity of the engineering profession.

The speaker closed by indicating his own opinions as to the solution of these difficulties mentioned above. The discussion which followed, concerned itself mainly with this point and indicated how interesting the members had found Mr. Craig's address.

Branch chairman J. D. Baker, M.E.I.C., presided.

Halifax Branch

R. R. Murray, M.E.I.C., Secretary-Treasurer.
A. D. Nickerson, A.M.E.I.C., Branch News Editor.

About forty members gathered at the Halifax hotel on February 24th, 1938, to hear Professor H. W. McKiel, of Sackville, N.B., give a report on the annual meeting of The Institute, held at London, Ont.

Professor McKiel, M.E.I.C., referred particularly to the attitude of the annual meeting with respect to the proposed scheme of co-operation between the E.I.C. and the Association of Professional Engineers of Nova Scotia. He pointed out that the annual meeting was very enthusuastic about the Nova Scotia scheme. Referring to the ballot now being taken by The Institute on amendments to the by-laws, the speaker suggested that all members should vote in favour of the proposed amendments in order that The Institute may be empowered to enter into co-operation agreements with the Professional Association in various provinces.

Professor McKiel's remarks were brief and to the point, and were enthusiastically received by the meeting. At the conclusion of his address, he answered various questions asked by the members present.

C. A. Fowler, M.E.I.C., moved a resolution of thanks to Messrs. G. J. Desbarats, Past-President, and J. B. Challies, President of The Institute, for their co-operation with the Nova Scotia Committee in preparing plans for a closer union between The Institute and the A.P.E.N.S.

C. H. Wright, M.E.I.C., suggested that a notice be sent to all members of the Halifax Branch asking them to vote in favour of the proposed amendments to the by-laws and pointing out that this favourable vote is necessary to enable The Institute to enter into the proposed co-operation agreement with the A.P.E.N.S. This suggestion was approved by the meeting.

The Secretary announced that at the March meeting of the Branch a paper will be presented by W. S. Wilson, A.M.E.I.C., chief engineer of the Dominion Steel and Coal Co., on the new power plant recently installed by that company in Sydney.

Hamilton Branch

A. R. Hannaford, A.M.E.I.C., Secretary-Treasurer.
W. W. Preston, S.E.I.C., Branch News Editor.

At the monthly meeting of the Hamilton Branch on February 16th, 1938, in McMaster University, Dr. R. K. Stratford, Chief Research Chemist for Imperial Oil Company, Limited discussed "The Practical Significance of Laboratory Tests on Lubricating Oils." He described the tests employed and compared the results obtained from actual tests on oils from different sources and oils which had been put to different service in combustion engines. Dr. Stratford was introduced by A. B. Dove, A.M.E.I.C., chairman of the local Papers Committee.

Testing Lubricating Oils

Petroleum products such as lubricating oils are difficult to standardize, the speaker stated, because they are organic and vary widely in composition. At present most of the standard tests are physical tests based on empirical considerations, but much research is being conducted in an attempt to find a more scientific yet practical method of classification. Dr. Stratford outlined the current tests with the aid of lantern views of the equipment used. The properties thus determined are A.P.I. gravity, flash point (the temperature at which the sample first ignites momentarily in the presence of a small jet of fire), fire point (the temperature at which it burns), viscosity at 100 deg. F., viscosity at 210 deg. F., viscosity index (relationship of viscosities at two set temperatures), pour point, carbon residue, and colour. The properties of lubricating oils are so varied that specifications establish certain ranges of permissible properties rather than definite characteristics. The properties of oils from different sources, Dr. Stratford showed by means of results of analyses, are markedly different. He claimed that the chief merits of the standard tests were to determine the source of an oil and to see if it were up to standard.

Lubricating oils can also be evaluated by oxidation tests, stated the speaker. The ability of an oil to resist oxidation determines its value.

Because the accepted methods of analyzing oils are empirical, continued Dr. Stratford, it is difficult to know when to discard an oil. He presented the results of analyses on oils before and after they had been put to varying amounts of severe service. The properties compared were, A.P.I. gravity, flash point, viscosity at 210 deg. F., pour point, colour, neutrality number (degree of acidity), sludge, water, dilution and ash. Abnormality in one of these properties often affects other properties. For this reason Dr. Stratford urged that a complete analysis be made of used oils. Only in so doing can the true trouble be discovered and the proper time for discarding be learned.

Dr. Stratford told his hearers that the terms film strength, heat resisting, oiliness, faster penetration, and corrosive, commonly used by combustion engine makers, had no great significance.

Also, he prophesied that motorists will gradually change from their present practice of using heavy oils in favour of low viscosity oils. He warned that a light oil should be watched closely and tested periodically. The rate at which it is consumed, he said, will probably govern its adoption.

Following a well supported discussion E. T. Sterne, of Brantford, proposed a vote of thanks to Dr. Stratford. W. J. W. Reid, A.M.E.I.C., was chairman, and the attendance was seventy-five. Refreshments in an adjoining room climaxed the meeting.

Addressing the Hamilton Branch at McMaster University on March 16th, 1938, Mr. A. K. Jordon, sales engineer with Aluminum Company of Canada, stated that we use aluminum products unwittingly many times a day. Our breakfast, he continued, is cooked in aluminum pots, and we pour our coffee from an aluminum percolator. His topic was—

The Use of Aluminum in Industry

The speaker first reviewed the history, production and properties of aluminum. This element was discovered in 1825 but had no importance for sixty years. Canada's aluminum industry began in 1901 at Shawinigan Falls, and now produces 50,000 tons of the metal a year. One third of the earth's crust contains aluminum but the ore used in Canada, high-grade bauxite, is obtained from open mines in British Guiana. It is smelted at Arvida, Quebec, by an electrolytic process involving the use of "cryolite" from Greenland. The familiar properties of aluminum are its light weight and high conductivity of heat and electricity. Commercially pure aluminum has a tensile strength of 14,000 p.s.i. "Common alloys" such as 1 per cent manganese or 5 per cent silicon have greater strength and lower elongation. "Strong alloys," one of which has 4 per cent copper and 48,000 p.s.i. tensile strength, have properties similar to common steel.

Before the introduction of "strong alloys" in 1910 the uses of aluminum were limited to cooking utensils and novelties, stated Mr. Jordon. Nowadays its chief consumer is the transportation industry whose aim is to reduce the weight of bicycles, automobiles, trucks, busses, railway cars, aeroplanes, zeppelins and boats. The second most important market is in the field of electrical conductors. The manufacture of cooking utensils, machinery like washing machines, and electrical appliances such as radio parts is also important. The iron and steel industry uses aluminum for deoxidizing. In the construction field it is used on store fronts, and in making mining skips and cages, booms for excavation equipment and floor systems for bridges. The chemical industry has aluminum containers for certain chemicals. Ground aluminum is a common base for paint. Food, particularly candy, is wrapped in aluminum foil. Caps for bottles, and tubes for pastes are also made from aluminum. Recently powdered aluminum has been added to the air in mines to combat silicosis. "No matter where you go," declared Mr. Jordon, "you come in contact with aluminum products."

To show the scope of the aluminum industry in Canada the speaker showed a number of lantern views and pointed out that there are twenty plants which employ 4,000 people and represent an annual payroll of $5,000,000. Domestic consumption is small but exports appreciable. Canada ranks third to United States and Germany in world production. The production of aluminum in the last twenty years has increased 800 per cent, many times more than any other metal.

J. W. J. Reid, M.E.I.C., was chairman of the meeting. A. B. Dove, A.M.E.I.C., introduced the speaker, and A. Love, M.E.I.C., proposed a hearty vote of thanks following a discussion in which most of the thirty-three present took part. Refreshments climaxed the evening.

Lakehead Branch

H. Os, A.M.E.I.C., Secretary-Treasurer.

Visit to Lake Sulphite Mill

On the invitation of A. T. Hurter, A.M.E.I.C., engineer in charge of Lake Sulphite Mill construction, 22 members and guests motored to Red Rock on November 22nd.

The visitors divided into groups and each party was conducted on a tour of inspection by a member of the engineering staff. A dinner was served in the staff dining room.

A vote of thanks was moved by J. M. Fleming, A.M.E.I.C., and seconded by R. J. Askin, A.M.E.I.C. W. H. Hurd, Secretary of the Lake Sulphite Company, responded to the address.

A dinner and dance meeting was held on Wednesday, January 26th, 1938, at the Shuniah Club, Port Arthur, Ont.

Members and guests with their ladies were seated at 7.30 p.m., after singing of "O Canada." The dinner was followed by community singing. The chairman, G. R. Duncan, A.M.E.I.C., expressed pleasure at having the ladies present. J. R. Mathiesen Jr.E.I.C., proposed a toast for long life and happiness to the ladies. Mrs. G. H. O'Leary replied to this toast. Representatives of sister professions brought the best wishes of their respective professions.

The Branch also took this apportunity to honour one of their members, J. M. Antonisen, M.E.I.C., on the occasion of his having been elected to Life Membership in The Institute. R. J. Askin, M.E.I.C., in a brief résumé, outlined Mr. Antonisen's achievements through a long and eventful engineering career in Canada and other countries. The speaker more particularly complimented Mr. Antonisen on the splendid services he had, through many years, given as city engineer of Port Arthur. Miss Antonisen was presented with a bouquet of flowers for Mrs. Antonisen who was unable to attend. Mr. Antonisen replied thanking his fellow members for the singular honour bestowed upon him.

This concluded the programme of the meeting and dancing and bridge was enjoyed by the members and their ladies.

The regular monthly dinner meeting was held February 16th, at the Prince Arthur hotel. E. Lorne Goodall, A.M.E.I.C., vice-chairman, presided in the absence of the chairman, G. R. Duncan, A.M.E.I.C.

A talking picture of "Heat and its Control" prepared by Johns-Manville Corporation was shown by Mr. A. G. Sinclair, representative of the Company. This picture is the first sound movie ever to be made on the subject and depicted the story of heat from the time man worshipped the sun to present-day methods of development and manufacture of heat conservation materials. Special sets, accurate in detail, were used to show James Watt's invention of the steam engine and other historical milestones in man's efforts to attain mastery over heat. Actual laboratory demonstrations, animated drawings and shadowgraphs were used to visualize the nature of heat and other efforts toward the scientific conservation of heat, the activity in a modern heat research laboratory, and how modern materials for conserving heat are developed, manufactured and utilized.

A vote of thanks was tendered to Mr. Sinclair and the Johns-Manville Corporation by S. E. Flook, M.E.I.C., and seconded by J. M. Fleming, A.M.E.I.C.

London Branch

D. S. Scrymgeour, A.M.E.I.C., Secretary-Treasurer.
Jno. R. Rostron, A.M.E.I.C., Branch News Editor.

The regular monthly meeting was held on February 23rd, 1938, in the Council Chamber, County Building, London, and the speaker of the evening was Mr. W. A. Osbourne, Vice-President of Babcock-Wilcox and Goldie McCulloch Ltd., Galt. His subject was "Babcock Integral Furnace Boilers."

A number of members of the Canadian Association of Stationary Engineers were present as guests and they with our own members accounted for a large attendance, 53 being present.

The chairman, A. O. Wolff, M.E.I.C., welcomed the guests and after a few appropriate remarks he called upon H. L. Hayman, A.M.E.I.C., to introduce the speaker.

Mr. Osbourne's talk was illustrated by a large number of excellent slides. This particular unit, the Integral Furnace Boiler, is so called because everything required for the generation of steam is contained in the one unit, even the furnace. Pulverized coal is used as fuel and full details of the pulverizers were shown—the crushing element being steel balls. A very ingenious device is employed for automatically regulating and controlling the supply of coal dust and air at the burner. The arrangement of tubes was shown and also the path of the heat. The tubes have studs welded to them and these again have a thick coating between them and around the tubes of a hard mastic compound. Models and sections of the various parts were exhibited. Mr. Osbourne said that others were also making progress but he was confident that his firm was producing a steam boiler outfit in which they had every confidence.

Many questions were asked and answered and a lively interest in the subject shown.

A vote of thanks to the speaker was proposed by D. M. Bright, A.M.E.I.C., heating engineer, London, seconded by Major W. E. Andrewes, A.M.E.I.C., and unanimously carried.

The appreciation of the members of the Canadian Association of Stationary Engineers, who were present, was voiced by one of their number.

Owing to the holding of the General Meeting of the E.I.C. in London last January, the annual dinner meeting and election of officers of the Branch, which is usually held in that month, was cancelled. However a meeting of members was called for the election of officers for 1938 prior to this meeting and this resulted as follows:

Chairman	A. O. Wolff, M.E.I.C.
Vice-Chairman	H. F. Bennett, M.E.I.C.
Committee	Major W. E. Andrewes, A.M.E.I.C.
	D. M. Bright, A.M.E.I.C.
	W. C. Miller, M.E.I.C.
	V. A. McKillop, A.M.E.I.C.
	J. R. Rostron, A.M.E.I.C.
Ex-Officio	E. V. Buchanan, M.E.I.C.
	J. A. Vance, A.M.E.I.C.
Secretary-Treasurer	D. S. Scrymgeour, A.M.E.I.C.
Auditors	R. W. Garrett, A.M.E.I.C.
	F. C. Ball, A.M.E.I.C.

Montreal Branch

E. R. Smallhorn, A.M.E.I.C., Secretary-Treasurer.

BRIDGING A CENTURY

A sound film entitled "Bridging a Century" was shown by the Branch on January 27th. This described the fabricating of the cables of the Golden Gate Bridge. It was presented through the courtesy of the Roebling Company. Their representative, Mr. A. R. Kirsch, was present. Prior to the meeting a courtesy dinner was held at the Windsor hotel.

Chairman: P. L. Pratley, M.E.I.C.

THE WILLANS LAW IN THE ANALYSIS OF STEAM PLANT PERFORMANCE

On February 3rd, 1938, J. T. Farmer, M.E.I.C., of the Montreal Engineering Company, presented a paper on the above subject. Mr. P. W. Willans, designer of the well-known high speed engine, in the course of his investigations of steam engine performance, enunciated a principle which has proved to be very general in its application.

In the case of a steam turbine, a Willans Law connects the rate of total steam consumption to the proportion of rated load carried.

For a steam boiler this law connects the fuel consumption rate with the rate of steam production, and so on.

Chairman: R. E. MacAfee, M.E.I.C.

JOINT MEETING WITH THE INSTITUTE OF RADIO ENGINEERS

On February 9th, W. P. Dobson, M.E.I.C., Chief Testing Engineer of the Hydro-Electric Power Commission of Ontario, gave a talk on "Hydro and the Interpretation of Radio Rulings." Mr. Dobson dealt with: 1, Methods used to enforce code rulings; 2, Relations of the Hydro Laboratories to C.E.S.A. and Provincial Authorities; 3, Interpretation of the code; 4. Specifications and their need.

WELDED STEEL PIPE

C. R. Whittemore, A.M.E.I.C. of the Dominion Bridge Company, on February 10th presented a paper in which he discussed the economical construction of welded pipe which is largely influenced by the use of semi-automatic and automatic welding processes, the advantages of concrete lined pipes, the manufacture of the pipe from sheet steel, and the protection of the outside of the pipe.

JUNIOR SECTION

"Concrete in the Field" was the subject of an address given before the Junior Section on February 14th, 1938, by E. McKinstry of the Dominion Concrete Company at Kemptville, Ont. Mr. McKinstry received his engineering training at Ohio State University which he left in 1925. On his return to Canada, he was employed by John McRae, consulting engineer in Ottawa. He has also acted as architects' superintendent on jobs and further as a designer of concrete and reinforced concrete structures. Mr. McKinstry was well qualified to speak on the subject he chose which had particular reference to the making of concrete pipe. An exhibit of some of the older engineering books in The Institute Library were on display in the lecture hall.

ANNUAL SMOKER

A most successful smoker was held on February 17th at the Windsor hotel. About 400 hundred members and guests were present and enjoyed an excellent entertainment. President Challies presented the Past-Presidents' Prize and the Phelps Johnson Prize during the evening. C. C. Lindsay, A.M.E.I.C., chairman of the Reception Committee of The Institute, which was responsible for the smoker, was given a hearty vote of thanks for his efforts in organizing such an enjoyable gathering.

WAVES, WORDS AND WIRES

On February 24th Dr. J. O. Perrine of the American Telephone and Telegraph Company addressed the Montreal Branch on the subject of "Waves, Words and Wires." He discussed and demonstrated long distance telephone circuits and radio programme network circuits. The demonstration showed the required characteristics and also the undesirable ones, which must be kept under control, such as electrical echo, singing, overloading of amplifiers, and noise. A high fidelity microphone and loud-speaker, along with other apparatus were set up for this meeting. Bell system circuits from Montreal to Toronto and from Montreal to New York were used.

Prior to the meeting a courtesy dinner was held at the Windsor hotel. Prof. C. V. Christie, M.E.I.C., was chairman. Members of the Institute of Radio Engineers were invited to the lecture and dinner.

ELECTRO-GALVANIZING

Mr. A. Weisselberg, M.A.S.M.E., a consulting engineer of New York City, gave a most interesting lecture on March 3rd, 1938, before the Montreal Branch. Mr. Weisselberg is a graduate of Vienna University and well qualified to speak on the subject he chose. In his talk on the development of electro-galvanizing, he particularly referred to wire and described and illustrated modern equipment and methods. The L.P.G., or German process, for galvanizing wire was described and the author commented on the quality of products obtained by this process. The lecture was illustrated by means of slides.

Prior to the meeting a courtesy dinner was served at the Windsor hotel.

Chairman: E. C. Kirkpatrick, M.E.I.C.

HEAT AND ITS CONTROL

A talking motion picture entitled "Heat and Its Control" was presented before the Montreal Branch on March 10th, 1938. This picture, produced by the Canadian Johns-Manville Company Limited, told the story of heat from the dawn of history, through the development of the steam engine, the discovery of the true nature of heat, and finally the development of insulation materials. The setting up of air currents in air spaces, and convection currents around heated pipes, etc., were shown by shadowgraphs. This picture was of interest to those concerned with problems of heat conservation. One of the engineers of the Canadian Johns-Manville Company Limited was on hand to answer questions and join in the discussion.

Chairman: J. G. Hall, M.E.I.C.

JUNIOR SECTION

On March 14th, 1938, the Junior Section of the Montreal Branch heard a paper by Victor I. McCallum on "Modern Treatment of Asbestos Ores." Mr. McCallum is a student in third year mining at McGill University and has spent considerable time at the asbestos mines at Thetford Mines, Que. In his paper he described the various methods of treating ores as employed here in Canada, how the machinery is used and the reasons for each step in the process.

Chairman: Guy Bélanger, S.E.I.C.

HOUSING SURVEYS FOR MONTREAL

The lecture on March 17th, 1938, "Housing Surveys for Montreal" by Réal Bélanger, C.E., was of great interest to those concerned with social problems and with town planning. These surveys were made under the control of the Department of Planning and Research of the Metropolitan Commission, with the help of the Health Department of the City of Montreal. The living conditions of low income families and slum conditions of this city were the main points of study.

Mr. Bélanger graduated from the Ecole Polytechnique in 1925. He was employed by the City of Montreal in the Technical Service and Sewer Commission, and is now with the Metropolitan Commission in the Department of Planning and Research.

Invitations to attend the lecture were issued to members of various public bodies and to the Architects Association of the Province of Quebec.

Chairman: Aimé Cousineau, A.M.E.I.C.

Niagara Peninsula Branch

G. E. Griffiths, A.M.E.I.C., Secretary-Treasurer.
J. G. Welsh, S.E.I.C., Branch News Editor.

The Niagara Peninsula Branch of The Institute held a general meeting in the Welland Club, Welland, Ontario, on Thursday, March 10th, 1938.

Approximately seventy members and friends sat down to a very enjoyable dinner served by the club staff. Following dinner the chairman, L. C. McMurtry, A.M.E.I.C., suggested that the five immediate past-presidents of the branch form a nominating committee for the executive for the coming year, as has been the custom in the past.

The chairman then introduced R. L. Hearn, M.E.I.C., chief engineer for the Dominion Construction Company, who showed their moving pictures with sound description of the Abitibi Power Construction. The picture very clearly described and showed the construction of the project through most of its various stages and in places where photographing of the work was too difficult the construction procedure was cleverly shown with diagrammatic sketches and cross-sections.

Following the showing of the picture W. R. Manock, A.M.E.I.C., moved a hearty vote of thanks with which everyone unanimously agreed.

After adjournment of the meeting those present were privileged to look over several cross-sectional construction drawings of the project, brought by Mr. Hearn.

Ottawa Branch

R. K. Odell, A.M.E.I.C., Secretary-Treasurer.

At the noon luncheon at the Chateau Laurier on February 24th, 1938, C. A. Bowman, A.M.E.I.C., editor of the Ottawa Citizen, spoke upon the subject of "Pax Nipponica."

J. B. Challies, M.E.I.C., of Montreal, newly-elected President of The Institute, was also present and made the presentation personally to J. H. Parkin, M.E.I.C., of the National Research Council, Ottawa, of the Gzowski Medal which had been awarded to him recently by The Institute.

PAX NIPPONICA

"When Great Britain has come to terms with Germany and Italy," Mr. Bowman said during the course of his address, "it should be easier to send a strong British fleet to the Far East, but Japan cannot afford to await the arrival of new British naval power. Japan is in the most desperate situation of any great industrial country. There has to be Japanese expansion into the Chinese and Pacific markets as the only apparent way to avoid revolution at home."

The responsibility for Japan's threat to world peace, in Mr. Bowman's view, is largely due to the influence of western nations. He traced the present conflict of forces in the Far East from the arrival of British traders in China a century ago, followed by the opening up of

Japan in 1860 under the pressure of American, British and other investors in foreign markets. Japan turned to a modern constitution, patterned after western policies in 1867—the year of Canadian confederation. Between 1870 and 1930 the population of Japan doubled: the present Japanese population is more than 68,000,000, crowded on a group of islands about three times the area of Newfoundland.

Japan's great industrial expansion came during the war years, after 1914. Encouraged by the Allies, largely to allow British shipping to be used for other purposes, Japanese export trade expanded by 78 per cent into other Asiatic countries, by 427 per cent into North America and by 385 per cent into Africa. The Japanese are determined to hold on to the captured markets; they believe the very existence of the nation is dependent upon exporting more to markets abroad. This dependence upon foreign trade, said Mr. Bowman, is one result of Japan being persuaded to copy Western national policies.

In the same war period of expansion between 1914 and 1918, Japanese industrial power increased 34 per cent. Some details of increased output quoted by the speaker were: electric power 206 per cent, spindles in cotton industry 44 per cent, yarn output 55 per cent, pig iron 143 per cent and steel products 116 per cent. Workers were attracted from agriculture into the factories so that the industrial population increased by 63 per cent.

The Japanese were faced with restrictions on trade in so many western countries, and even more restrictions on migration, they had decided to rely on military force to expand along an imperial path on the continent of Asia. They spoke of the Chinese market as Japan's lifeline; but China offered no outlet to Japan for surplus population. Nor could the Japanese expand into Siberia, even by conquering Soviet Russia. They were essentially dwellers in the warmer climates; many experienced observers in the Far East were of the opinion that Pax Nipponica would eventually include a Japanese empire to embrace some of the desirable island groups further south. "But perhaps the new British fleet may have been built for the Pacific arena," said Mr. Bowman, "and Hong Kong may have been developed into a naval base equal to Singapore, before the Philippines, the Dutch East Indies, Australia and New Zealand are brought within the orbit of Pax Nipponica."

One alternative would be to find a civilized way to carry on trade and industry without financial imperialism and commercial war, but the speaker could see no sign of any such Utopian solution on either the western or the eastern horizon.

William Bryce, A.M.E.I.C., chairman of the local branch, presided, and a number of Montreal and other out-of-town members were also present.

At the noon luncheon at the Chateau Laurier, Ottawa, on March 10th, A. C. T. Sheppard, B.A.Sc., D.L.S., of the Bureau of Geology and Topography of the Dominion Department of Mines and Resources, gave an address on "What Canada is Doing With the Aid of Camera and Airplane." W. F. M. Bryce, A.M.E.I.C., chairman of the Branch, presided.

A résumé of Mr. Sheppard's address appears on page 207 of this Journal.

Peterborough Branch

W. T. Fanjoy, A.M.E.I.C., Secretary-Treasurer.
J. L. McKeever, Jr.E.I.C., Branch News Editor.

At the regular meeting of the Peterborough Branch held on January 21st, 1938, the speaker was Mr. F. D. Bowman of the Carborundum Co., Niagara Falls, N.Y., who spoke on the subject "The Manufacture of Carborundum Abrasive and Refractory Material."

Mr. Bowman briefly outlined the story of carborundum, from its development in 1891 by Dr. Acheson, and traced it through progressive stages to its present prominent place in industry.

The film which the speaker presented, entitled "Jewels of Industry," was a historical record of carborundum from its discovery by Dr. Acheson in 1891. Its first uses were for polishing jewels, grinding valves, dentist's drills and small wheels. After development of Niagara Falls and consequent large supply of electrical energy, manufacture of carborundum was begun on a large scale.

Carborundum is made from coke, sand, sawdust and salt, heated electrically to about 4,000 deg. F. For a 70,000 lb. mix, about 2,000 hp. hours of energy are required, after 36 hours outer layers are broken off and crystals obtained. These crystals are crushed, graded into size, bonded and moulded in ceramic clays, and vitrified. Final operations consist of inserting hubs and truing and dressing stones.

Carborundum wheels are used for low tensile materials, and "Alaxite" is used for high tensile material. The majority of alaxite wheels are made in the Canadian plant of this company.

The final part of this film showed the wide range of applications of this product, including automotive cylinder grinding, body grinders, tool room grinders, cutting and polishing marble, wood products, etc.

Mr. Bowman's talk was most interesting and was much appreciated by the Branch.

Attendance 55.

Saskatchewan Branch

J. J. White, M.E.I.C., Secretary-Treasurer.

Continuing the series of joint meetings for the benefit of the profession in Saskatchewan, the local branch of The Engineering Institute of Canada met on January 21st, 1938, at the Kitchener hotel, Regina, with members of the Association of Professional Engineers of Saskatchewan and the local branch of the American Institute of Electrical Engineers.

The chairman of the meeting was Stewart Young, M.E.I.C., chairman of the Saskatchewan Branch of The Engineering Institute of Canada.

The meeting was preceded by a dinner at 6.30 p.m., at which seventy engineers were present.

Following the dinner F. E. Estlin introduced Mr. M. C. Lowe of the Canadian General Electric, Winnipeg, Manitoba, as the speaker of the evening, his subject being "The Mining Industry in Manitoba and Western Ontario." This industry, Mr. Lowe pointed out, is second in importance and its development has involved that of other industries closely allied. The cost of transportation to the mines by rail, water and air was discussed and considerable attention given to the question of power supply to the mines.

Following the address and a general discussion a hearty vote of thanks was moved by Messrs. McGavin and Lewis.

Vancouver Branch

T. V. Berry, A.M.E.I.C., Secretary-Treasurer.

Through the courtesy of the United States Bureau of Reclamation the Vancouver Branch were fortunate on January 20th, 1938, in entertaining Major S. E. Hutton, Assistant Director of Information, U.S. Bureau of Reclamation, who lectured before the Branch on the Grand Coulee Dam in the York room of the Hotel Georgia.

Grand Coulee Dam

About one hundred and fifty members and others listened to Major Hutton unravel a saga of human skill, courage and organization against physical conditions that sometimes appeared overwhelming.

Major Hutton's lecture was illustrated by over one hundred slides. He described the excavation of the site and the disposal of the surplus by means of a complicated system of endless belts. The various steps in the control of the Columbia river by cofferdams for the purpose of excavating the foundation to bedrock and the concreting of the foundations were described by Major Hutton in an interesting manner replete with technical detail and information.

To one who had not visited the Grand Coulee project in the State of Washington the lecture and the pictures impressed with the vastness of the structures. To date, more concrete has been placed in the foundations of the dam than in the whole of the Boulder dam.

The speaker concluded the lecture with a description of the excavation, segregation and transportation of the aggregates for the concrete to the spoil piles preparatory to mixing in the two central concrete mixer plants situated one on each side of the river.

The thanks of the meeting were conveyed to the speaker by Dr. E. A. Cleveland, M.E.I.C. The congratulations of the Branch to T. H. White, M.E.I.C., Life Member and oldest member of The Institute, whose ninetieth birthday occurred on January 27th, was proposed by James Robertson, M.E.I.C., and heartily responded to by the meeting.

Winnipeg Branch

J. Hoogstraten, A.M.E.I.C., Secretary-Treasurer.

The annual meeting of the Winnipeg Branch of The Engineering Institute of Canada was held in Theatre B, University of Manitoba, on February 3rd, 1938, at 8.15 p.m.

Moving pictures of the latest developments in modern transportation facilities, mining, and oil production on the McKenzie river and in the North West Territories were shown through the courtesy of Mr. R. McKinnon of the Imperial Oil Company.

Mr. Fred V. Seibert, Superintendent of Natural Resources, Canadian National Railways, gave an interesting review of transportation problems in the North encountered by surveyors of a decade ago.

Professeur A. E. Macdonald, retiring chairman of the Branch, in his address reviewed the events and proceedings of the past year before turning over the chair to W. D. Hurst, newly elected chairman for the year 1938.

The following officers were declared elected for the year 1938:—

Chairman of the Branch	W. D. Hurst, A.M.E.I.C.
Vice-Chairman	L. M. Hovey, A.M.E.I.C.
Secretary-Treasurer	J. Hoogstraten, A.M.E.I.C.
Executive Committee	G. C. Davis, A.M.E.I.C.
	V. H. Patriarche, A.M.E.I.C.
	J. T. Rose, A.M.E.I.C.
Chairman Programme Committee	W. F. Riddell, M.E.I.C.
Chairman Membership Committee	C. V. Antenbring, A.M.E.I.C.

Messrs. C. H. Attwood and J. A. MacGillivray each have one more year to serve on the Executive committee, and Messrs. A. E. Macdonald and H. L. Briggs continue as immediate past chairman and immediate past secretary-treasurer respectively.

Modern Methods of Sludge Treatment

On February 17th, 1938, Mr. Albert A. Genter of Baltimore, Maryland, spoke on "Modern Methods of Sludge Treatment."

Mr. Genter opened his address by likening the processes of the sewage disposal plant to the processes of the self-purification of a stream.

In the sewage treatment plant, large particles and grit are removed by the use of screens and grit chambers, followed by the removal of a large part of the suspended solids by sedimentation.

In the activated sludge process, the sewage flows into the aeration tank where it is mixed with about 30 per cent of activated sludge, and where air is blown through it. This addition of oxygen results in bacterial action which produces flocculation and facilitates further sedimentation.

The treatment of sludge consists of the addition of coagulating compounds followed by pressing or vacuum filtering. In another process, the sludge is digested before passing to the vacuum filters. In this process, the raw sludge is maintained at a temperature favourable to the growth of anaerobic bacteria, which act on the sludge to the extent of reducing its volume approximately fifty per cent.

The sludge from the digester may be subjected to the elutriation process which consists in thoroughly mixing water with the sludge for a few minutes and allowing the solids to settle. This elutriation reduces the percentage of certain soluble ammoniacal decomposition products in the sludge. Since these products enter into composition with ferric chloride and other similar coagulants, their removal by elutriation reduces the quantity of coagulant necessary prior to vacuum filtering.

W. D. Hurst, A.M.E.I.C., J. T. Rose, A.M.E.I.C., and H. G. Hunter, M.E.I.C., participated in the discussion which followed. A vote of thanks to Mr. Genter was moved by H. G. Hunter of Montreal.

Polar Exploration

On March 3rd, a meeting of the Branch was addressed by Captain Innes-Taylor on the subject "Polar Exploration."

The Antarctic continent contains 5,000,000 sq. mi., ninety per cent of which is covered with ice and snow, ranging in depth from a few feet to 12,000 ft. The polar region is a plateau 10,800 ft. above sea level, which can only be reached by climbing mountain passes.

Ross was the first to penetrate the pack ice and reach land. The first Scott expedition found tree fossils, out-croppings of coal, and two active volcanoes. Using Eskimo methods, Amundsen reached the pole in 1911, while the second Scott expedition, using man haulage, reached it thirty days later. The distance which must be travelled across ice and mountains is 850 mi. each way.

The first Byrd expedition, in 1929, reached its base in Little America in an old mine sweeper and a wooden sealer built in 1882. Byrd flew a triangular course over and around the pole on November 29th, 1929.

The second Byrd expedition likewise was transported in two ships, one of which was a whaler built in 1878. They took four planes, 7 tractors, 157 huskies, and 55 men, of whom 16 were scientists. They discovered that the Ross ice shelf, reaching 500 mi. from the continental margin, is anchored in place by islands as high as 1,200 ft. above sea level, yet submerged under 600 ft. of ice. Gold and copper ores were discovered, and also an estimated 200,000 sq. mi. of lignite and anthracite coal deposits. There are no living creatures in the interior, but on the edge of the ice shelf are large numbers of penguins, seals, and whales.

A vote of thanks was moved by Major A. J. Taunton, M.E.I.C.

EMPLOYMENT SERVICE BUREAU

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party.

Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted after a lapse of one month, upon request.

All correspondence should be addressed to

The Employment Service Bureau, The Engineering Institute of Canada

2050 Mansfield Street, Montreal

Situations Vacant

MINING AND METALLURGICAL ENGINEER, experienced in manganese mining and manufacture of ferro-manganese. Must be familiar with markets, operation and development of a property in Eastern Canada. Available on short notice. Give technical education and brief summary of practical experience, and if possible Toronto references. Apply to Box No. 1710-V.

SALES ENGINEER required for western agents with well established connection. Applicant must have electrical experience with reasonable mechanical engineering knowledge to efficiently handle sales of motors, transformers, switchgear, pumps, hoists, chain drives, etc. State age, experience, salary required. Box No. 1743-V.

Civil Service Vacancies

DRAUGHTSMEN (Four Vacancies)

Comp. 27541. Three vacancies in the above class are required to be filled in the general engineering division of the Department of Transport, Ottawa, Ontario, and one vacancy in the chief engineer's branch, Department of Public Works, Ottawa, Ontario.

Note: *Temporary appointments only may be made at present.*

Salary.—In the event of permanent appointment the initial salary of $1,500 per annum will be increased upon recommendation for meritorious service and increased usefulness at the rate of $60 per annum until a maximum of $1,800 has been reached.

Duties.—Under supervision, to draw maps and plans; to plot survey notes; to perform other related work as required.

Qualifications Required.—High school graduation; at least three years of experience in a drafting office, including map drafting, or three years of drafting experience in an engineering office; ability to prepare completed drawings from sketches, survey notes and engineers' instructions; ability to make simple engineering computations; proficiency in lettering and printing and in the making of neat and accurate maps and plans; good knowledge of the work of an engineering office. For one position in the Department of Transport, credit will be given for experience in the design of freight sheds, involving details of electrical wiring. For the present vacancies preference will be given to qualified applicants who are not more than approximately thirty-five years of age on the last day for the receipt of applications.

Application forms properly filled in must be filed with the Secretary, Civil Service Commission, Ottawa, Ontario, **not later than April 16, 1938.**

Applications forms are obtainable at all city post offices, the post offices in the larger towns, the Offices of the Employment Service of Canada, The Engineering Institute of Canada or from the Secretary, Civil Service Commission, Ottawa, Ontario.

Situations Wanted

PAPER MILL ENGINEER: B.A., B.A.Sc. Married. Age 34. A.M.E.I.C. Ten years experience in paper mill costs, maintenance, design and construction. Now employed as cost engineer in Southern States. Hard worker with excellent references. Available immediately. Apply to Box No. 150-W.

ELECTRICAL ENGINEER, B.Sc. '28. Two years student apprenticeship at Can. Westinghouse Co., including test and electrical machine design. Also about two years experience in operating dept. of large electrical power organization. Available on short notice. Apply to Box No. 660-W.

ELECTRICAL AND CIVIL ENGINEER, B.Sc. Elec. '29, B.Sc. Civil '33. Jr.E.I.C. Age 32. Experience includes four months with Can. Gen. Elec. Co., approximately three years in engineering office of large electrical manufacturing company in Montreal, the last six months of which were spent as commercial engineer, also experience in surveying and highway work. Year and a half employed in electrical repair. Best of references. Apply to Box No. 693-W.

CIVIL ENGINEER, B.A.Sc. (Toronto '27), age 34, married. Five years railway and construction work as building inspector and instrumentman. Level engineer and on construction of a long timber flume for a pulp and paper mill. Field engineer for a sulphite company, in charge of the following mill buildings, acid, digester, blow pit, barker room, chip storage and acid towers. Available immediately. Apply to Box No. 714-W.

Situations Wanted

SALES ENGINEER, age 30, graduate in electrical engineering, seeks position with more future. Experience in radio and telephone work and in electrical contracting. At present selling electrical supplies in Western Ontario. Apply to Box No. 1044-W.

ELECTRICAL ENGINEER, B.Sc. '29, age 30. Single. Eight and a half years experience on maintenance, on construction, floorman and operator on hydro-electric system. Desires construction, service, sales or research work. Any location. Excellent references. Apply to Box No. 1062-W.

CHEMICAL ENGINEER, grad. McGill '34, experienced in meter repairs, control work; and also chemical laboratory experience. Apply to Box No. 1222-W.

CIVIL ENGINEER, B.A.Sc. (Toronto '33), S.E.I.C., age 27. Married. Five years experience includes highway surveys, bituminous and concrete paving, steel and reinforced concrete building construction, instrument work, draughting, cost accounting and estimating and some experience as foreman. Available immediately. Apply to Box No. 1265-W.

ENGINEER SUPERINTENDENT, A.M.E.I.C., R.P.E., Que. and Alta. Age 47. Twenty years experience as engineer and superintendent in charge of hydro-electric, industrial, railroad, and irrigation construction. Specialized in rock excavation and suction dredging. Intimate knowledge of costs, estimating and organizing. Available immediately. Apply to Box No. 1411-W.

CIVIL ENGINEER, graduate 1927, age 34 years, desires position as town engineer. Eight years municipal experience. Location immaterial. Apply to Box No. 1628-W.

CIVIL AND ELECTRICAL ENGINEER, Jr.E.I.C. (Univ of Man.). Married. Age 25. Good draughtsman. Four months draughting, one year instrumentman on highway location and construction, inspection and miscellaneous surveying and estimating. Six months as field engineer on pulp and paper mill construction. Prefer electrical or structural design. Available at once. Apply to Box No. 1633-W.

CIVIL ENGINEER, B.A.Sc. '33, O.L.S. Age 27. Married. One year and a half in charge of power plant construction. Four summers on land surveys and one summer on mine survey work. Also experience in draughting, electrical wiring, and highway engineering. Apply to Box No. 1757-W.

ELECTRICAL ENGINEER, N.S. Tech. Coll. Single. Age 25. Experience in sales, electrical installation, and construction work. Available immediately. Will go anywhere. Apply to Box No. 1758-W.

CHEMICAL ENGINEER, graduate, Toronto '31. Seven years experience in paper mill, meter maintenance, control work and chemical laboratory. Speaking French and English. Location immaterial. Available at once. Apply to Box No. 1768-W.

Preliminary Notice

of Applications for Admission and for Transfer

March 23rd, 1938.

The By-laws provide that the Council of The Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in May 1938.

R. J. Durley, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the Council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science of engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of Student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

CHARLES—ROBERT SIMPSON, Jr., 181 Elmwood Ave., London, Ont., Born at Salem, Ill., U.S.A., Sept. 17th, 1909; Educ., B.A., Amherst College, Amherst, Mass., 1929. Home study. 1 year training in water treatment plant design; 1924-25 (6 mos.), dftsman., 1926-27-28 (9 mos.), supervision of pump installn., Layne New York Co., Inc.; 1929-31, res. engr. on constrn. of 10 M.G.D. supplementary well water supply for the city of New York, for Layne New York Co.; 1931-32, asst. field engr. on constrn. of well water supplies totalling 60 M.G.D. in France, for the city of Paris and others; 1932-33, field engr. i/c constrn. of a well water supply for the city of Tangier, Morocco, for the International Water Co.; 1933-35, field engr. i/c constrn. of 30 M.G.D. well water supply for the cities of Saigon and Cholon, French Indo-China, incl. 13 water treatment plants having a total capacity of 17 M.G.D., for same company; 1935-36, research engr. on design and constrn. of water treatment plants, for W. I. Klein, consltg. engr.; Sept. 1936 to date, field engr. i/c of water supply and water treatment plant design and constrn. in Canada for International Water Supply Ltd., London, Ont.

High-Alumina Cements

Pending the issue of a British Standard Specification dealing with the subject of high-alumina cements, the Institution of Structiral Engineers has drawn up and issued a report on the use of such cements in structural engineering. As is also the case with Portland cement, the chemical reactions occurring after setting are not yet fully elucidated, and the recommendations now set forth must be accepted as being rather of an empirical than final character, and although on the safe side they must also be considered in some respects as not altogether supported by practical experience. The conclusions of the report may be summarized as follows:—

High-alumina cement when tested by setting time should invariably be gauged with 22 per cent of water. The setting time may vary widely without the other characteristics of the cement being affected, an initial setting time of between 3 hours and 6 hours is quite normal, while the final set usually takes place within 1½ hours of the initial set. If this initial set is more than 6½ hours, or the final set more than 1½ hours after the initial set, the cement should not be used.

The testing of high-alumina cement for strength is a delicate operation and should be entrusted to professional testers, skilled in the testing of this type of cement. A suitable test would be a compression test on cubes of about 3 in. made by gauging three parts of standard sand with one part of cement and 12½ per cent of water by weight of the cement. Metal moulds should be employed, the bottom edges being smeared with grease to make them water-tight. After filling, the mould should be kept moist for 24 hours. Cubes intended for breaking at a greater age than 24 hours should be removed from the moulds and placed in water. Made in this way, cubes should give a strength of at least 5,000 lb. per sq. in. at the age of 24 hours and 7,000 lb. per sq. in. at the age of 7 days. The strength of such cubes will be found to approximate closely to the strength of a good 4:2:1 washed ballast concrete of the same age and made with the same cement. Cement which, when tested as above, gives a strength of less than 4,000 lb. at the age of 24 hours should not be used, irrespective of the strength which it may give at 7 days.

Most of the aggregates suitable for Portland cement concrete are suitable for high-alumina cement concrete. There are, however, certain exceptions and high-alumina cement is less tolerant of fine dust than is Portland cement in this respect. On the other hand, high-alumina cement is a harder material than Portland cement and the fraction of the fine aggregate between the No. 25 sieve and the 52 sieve is very useful for giving improved workability. Owing to the harshness of high-alumina cement the mixing should be more thorough than is common in mixing Portland cement concrete.

The amount of water theoretically necessary to complete hydration is 40 per cent by weight of the cement. For any mix the ideal amount of water (including that in the aggregate) is 6 gallons per cwt. of cement. Sufficient inert aggregate should be used so that the mix will carry this 40 per cent of water by weight of the cement. It is rarely necessary to use mixtures richer than about 5:1, with an aggregate of ¾ in. maximum size. A richer mix may not produce a stronger concrete, as it is possible that the amount of aggregate will not carry sufficient water for complete hydration.

The damp curing of high-alumina cement concrete is of more importance than in the case of Portland cement concrete and neglect of this precaution will probably be fatal to the production of good concrete. High atmospheric temperatures of the order of 80 deg. F. to 120 deg. F. have an adverse effect upon the strength of high-alumina cement concrete.—*Engineering.*

The Combustion of Pulverized Coal

Henry Kreisinger,

Engineer in Charge of Research and Development, Combustion Engineering Company, Inc., New York.

Paper presented before a joint meeting of the Border Cities Branch of The Engineering Institute of Canada and the Detroit Section of the American Society of Mechanical Engineers, November 16th, 1937.

SUMMARY.—The basic principles of pulverized coal burning in modern furnaces are set forth, as developed from detail studies of the processes of combustion of powdered fuel. The author considers the effects of the nature and quantity of the primary and secondary air supply, the fineness and character of the fuel particles, the characteristics of the ash, the turbulence of the gas streams in the furnace and the furnace temperature.

He describes experimental work on the burning periods of fuel particles at various temperatures and discusses the advantages and difficulties of powdered fuel combustion.

This paper deals with the combustion of pulverized coal with special reference to water-cooled furnaces. It discusses the effect of various factors on ignition and follows the process of combustion through the furnace. The factors considered are the amount of primary air, admission of secondary air, fineness of coal, the percentage of moisture and volatile matter in coal, characteristics of ash, mixing, oxygen concentration and the furnace temperature.

The two most outstanding features in the progress of steam generating equipment within the last 15 or 20 years are the application of pulverized fuel and the development of the water-cooled furnace.

Advantages of Water-Cooled Furnaces

Water-cooled furnaces made possible very large steam generating units, and high rates of combustion. They also practically eliminated furnace maintenance. Water-cooled furnaces can be made large because they are built of tough steel instead of fragile refractories. Expansion and contraction can be easily taken care of because the temperature of the water-cooled walls varies over a much smaller range than the temperature of refractory furnace walls. The temperature of the metal in water-cooled furnaces varies over a range of about 500 deg. F.; the temperature of refractory walls varies over a range of 2,000 deg. F.

High rates of combustion can be used because the sweeping of the burning mixture over furnace walls does not damage the water-cooled steel walls. High rates of combustion require intensive mixing in the furnace in order that nearly complete combustion may be obtained, and intensive mixing in the furnace is always accompanied by sweeping of the flame over the furnace walls. In some designs water-cooled walls are used to change the direction of the flow of burning mixture, and this change of direction produces mixing. Without the intensive mixing in the furnace at high rates of combustion many of the larger particles of coal would pass out of the furnace only partly burned and the flue dust would run high in combustible.

Water-cooled furnaces absorb large quantities of heat, thereby lowering the temperature of the furnace gases and of the ash carried by the gases so that these ash particles do not stick to the boiler tubes and the superheater elements. Such sticking of the ash to the boiler tubes and superheater would clog the gas passages and would make high rates of combustion impractical. At present the limit to high rates of combustion is the slagging of boiler tubes and superheater.

Drawbacks of Water-Cooled Furnaces

There is a general impression that it is difficult to light a fire in a water-cooled furnace, that the fires are unstable at low ratings and that the absorption of heat by the water-cooled furnace walls retards combustion. However, these drawbacks are more imaginary than real; refractory furnaces are just as cold as water-cooled furnaces when fires are started, and the stability of fire at any rating is largely a matter of burner design, air adjustment and a steady fuel supply to the furnace. For easy lighting and stable fires at low ratings the burners should be so designed that only part of the air needed for the complete combustion is supplied with the coal. This makes a rich mixture which ignites readily. Because of this small weight of air the mixture is heated quickly to ignition temperature. When we start a cold automobile engine we choke the air to obtain a rich mixture which ignites readily. In a boiler furnace the additional air needed for complete combustion should be supplied beyond the zone of ignition.

Beyond the temperature required for quick ignition of the fuel nothing is gained by going to higher temperature. In fact there are experimental indications that high temperatures retard the combustion. In some industrial processes we use high temperatures to break down compounds into elementary substances.

Why Pulverized Coal is Favoured

The main reason why pulverized coal firing is favoured over other methods of burning coal is the feature that pulverized coal burns like gas, and therefore, the fires are easily lighted and controlled. Almost any kind of coal can be reduced to powder and burned like gas. A change of coals upsets the operation of pulverized coal plant to a much smaller degree than a stoker fired plant. Pulverized coal furnaces can be readily adapted to burn other fuels that burn like gas.

What is Pulverized Coal?

Pulverized coal is a mixture of small particles of coal varying in sizes from about one millionth part of an inch to about one fiftieth part of an inch, which is a very large range in sizes. If we would magnify a small sample of pulverized coal a thousand times, the smallest particles would be the size of small grains of sand and the largest ones would look like boulders about two feet in diameter; there would be a great many grains of sand to each boulder. Between these two extremes there would be all the sizes imaginable. We would also find many of the smallest size particles clinging together in clusters and others adhering to the surfaces of the large size particles.

Coal is reduced to pulverized form so that it can be kept in suspension in moving air and supplied to the furnace in a stream as a mixture of air and coal. The air gives the mixture its fluidity so that it can be handled and burned like gas.

Another reason for reducing the coal to powder is to make it possible to bring the air closer to the surface of the coal particles so that the oxygen can come readily in contact with it. At a furnace temperature of 2,000 deg. F. a piece of coal one inch in diameter requires for its complete combustion a volume of air contained in a sphere one yard in diameter. If the piece of coal were in the centre of this sphere of air, the average distance of the oxygen molecules within this sphere from the piece of coal would be about 13 in. A particle of coal 0.006 of an inch in diameter, which is the largest size passing through 100 mesh screen, requires a volume of air contained in a sphere 0.22 of an inch in diameter. With the particle of coal located in the centre of this sphere, the average distance of the oxygen molecules within this sphere from the coal particle is less than 0.09 of an inch.

Determination of Fineness

The fineness of pulverized coal is determined by running a sample through a set of screens and obtaining the percentages going through each screen. The usual sizes of screens used for such determination are 200, 100, 50 or 40 mesh screens. Thus, the fineness of pulverized coal may be described as 70 per cent through 200 mesh, 90 per cent through 100 mesh and 98 per cent through 50 mesh screen. The percentage on 50 mesh screen should be small, because this oversize coal usually does not stay in the furnace long enough to be burned to ash. Much of this large size coal is deposited in the soot hoppers or is carried out of the stack only partly burned. It is more important that the percentage on 50 mesh screen be low than to have a high percentage to go through 200 mesh screen. The largest particles going through 200 mesh screen are about .003 of an inch in diameter. The number of these large particles is comparatively small. There are a great many small size particles approaching one millionth part of an inch. These very small particles are mere dust and stay in suspension a long time even in quiet air. Although the total weight of these very small particles is small their number is very large. When pulverized coal is brought into a furnace these very fine particles ignite readily and burn quickly. These particles help to a large extent to start the ignition.

Combustion of Pulverized Coal

It is impossible to make accurate observation of a particle of coal burning in a boiler furnace. Most of the particles are small and hard to see in a burning mixture; they also move fast and burn quickly.

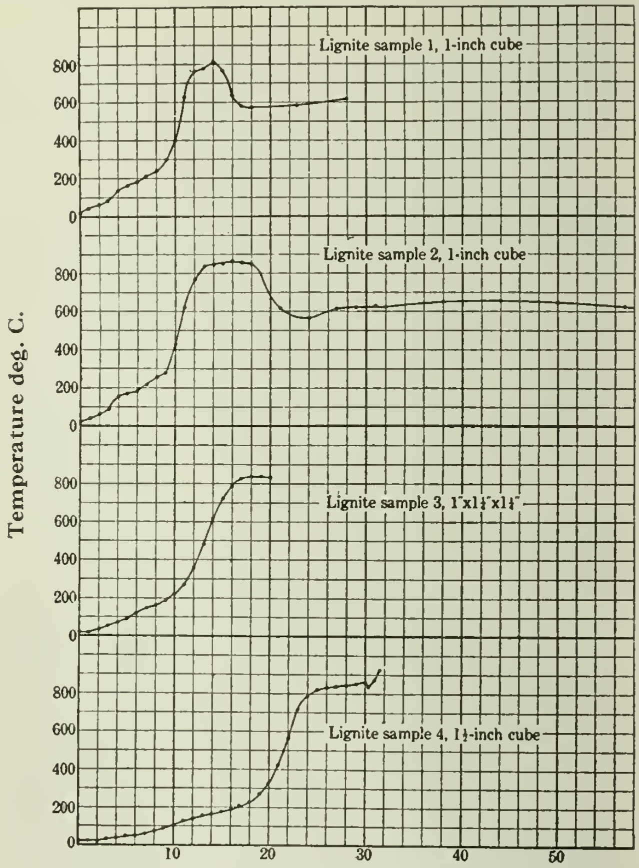
In some cases, however, when the percentage of the oversize coal is high, the very large particles can be seen beyond the tips of the luminous flame as large flaming dots about a quarter of an inch in diameter. This apparent large size of the particles is due to the envelope of flame indicating that the volatile matter is still coming off and burning. After all the volatile matter has been distilled and burned these burning particles appear as bright specks much smaller than the flaming dots.

The length of time coal particles take to go through the process of combustion depends on (1) the size of the particles, (2) the moisture content, and (3) the volatile matter content. The very small particles burn instantaneously. The largest particles take one or two seconds or even more time and many of them never burn completely. Coal with high moisture takes more time because the moisture must be driven off first before the temperature can rise high enough to distil and burn the volatile matter. While the volatile matter is being distilled off, no oxygen can penetrate to the surface of the particle because it is caught by the volatile matter and is combined with it.

Combustion of Cubes of Lignite

The various stages of the process of combustion can be observed in detail with a larger piece of coal. If we take a small cube of coal, put a thermocouple in the centre of it and place the cube in a laboratory muffle furnace, heated to about 850 deg. C., we can observe the rise of temperature inside the cube and study the stages of combustion in detail. Figure 1* shows the rise of temperature at the centre of four such cubes of lignite when they were placed in a muffle furnace. During the first minute the heat received by the cube was used mostly to evaporate moisture. This stage was lengthened by the high moisture content. During the second minute smoky gas could be seen coming out of the surfaces of the cube and at the end of the second minute flame appeared and enveloped the cube. The distillation and burning of the volatile matter continued and at the end of four minutes the edges of the cube became cherry red and small pieces were chipping off. Cracking continued but a large part of the cube stayed together for about fifteen minutes. The temperature at the centre of the cube rose very slowly during the first ten minutes while the moisture and volatile matter were driven off, and then rose rapidly. In the case of a 1½ in. cube the evaporation of the moisture and the distillation of volatile matter took almost twenty minutes.

The remnants of the first two cubes were taken out of the furnace at the end of fifteen minutes and placed on



Time, minutes counted from the instant cube was placed in furnace.

Fig. 1—Temperature Rise in the Centres of Small Cubes of Lignite.

Placed in a muffle furnace heated to a temperature of 850 deg. C. The temperature in the centre of the cubes rises slowly while moisture and volatile matter is driven off.

*Taken from "Combustion Experiments with North Dakota Lignite," U.S. Bureau of Mines Technical Paper 207 (1919).

an asbestos sheet. The temperature in the interior of the cubes dropped to about 600 deg. C. at which point it remained constant for some time. The surfaces of the cube were covered with ash but through the cracks in this ash layer dull red was visible. Evidently enough air penetrated through the layer of ash to the unburned carbon to support a slow combustion which maintained the temperature at about 600 deg. C. Although the ash prevented to a large degree contact of oxygen with the combustible under the ash layer, it also prevented rapid dissipation of heat.

This experiment shows that the heat absorbed by the cube during the first few minutes is used to drive off the moisture and the volatile matter. The temperature of the fixed carbon does not rise appreciably until the volatile matter has been distilled off. The evaporation of the moisture and the distillation of volatile matter takes place first in the outer layers of the cube and gradually penetrates to the centre. The edges and corners are more exposed to the heat and therefore absorb heat faster and lose the moisture and volatile matter in a shorter time. They are brought to glowing temperature before the body of the cube, and the fixed carbon in them would start to burn if the envelope of burning volatile matter had permitted oxygen to come in contact with it. When most of the volatile matter has been distilled off and oxygen can come in contact with the fixed carbon, the latter starts to burn. The fixed carbon burns and leaves the cube in the form of CO_2 but the ash stays behind, gradually forming a protective layer of ash over the remaining fixed carbon. The oxygen that does penetrate the layer of ash and comes in contact with the fixed carbon combines with it to form CO_2 or other carbon compound. This CO_2 thus formed under the layer of ash has the same difficulty penetrating the layer of ash on its way out as the oxygen had on its way in. Thus, the CO_2 is delayed under the ash layer and is in the way of more oxygen making contact with the fixed carbon.

In the burning of pulverized coal the various stages are much shorter, but their relative length and sequence is the same. The length of the stages is greater with the large particles than with the small ones. The ash residue is also a greater hindrance to oxygen making contact with the remaining carbon because there is more of it in the larger particles.

What is Combustion?

The combustion process in a boiler furnace takes place in two steps; first, the coming of the combustible in contact with the oxygen, and second, the chemical combination after the two have come in contact. Obviously the chemical combination can not occur any faster than the contact-making. This is true whether the combustible is in a gaseous or solid state. Above the ignition temperature the chemical combination is instantaneous. Therefore, the rapidity of combustion depends on the rapidity of oxygen coming in contact with the combustible. The rate of contact-making determines the rate of combustion. This is a fundamental principle of combustion in boiler furnaces.

Speed of Chemical Combination

At lower temperatures the speed of the chemical combination is about doubled for every 10 deg. C. temperature rise. It is not known how far up the temperature scale the doubling continues, but assuming that it holds between 100 deg. C. and 700 deg. C., the latter point being approximately the ignition temperature of coal, the speed of chemical combination would be doubled sixty times. The speed is known to be appreciable at 100 deg. C. because if coal is heated to this temperature and loss of heat is prevented, the coal will soon catch on fire. On the above assumption, if the speed at 100 deg. C. is equal to R, the speed at 700 deg. C. would be $R \times 2^{60}$. Thus, supposing that at 100 deg. C. the speed of chemical combination is one molecule per quarter of a century, then at 700 deg. C. there would be one million oxygen molecules combining in one one-thousandth part of a second. It is certain however that this doubling of the speed does not go up to 700 deg. C., but it is also reasonably certain that

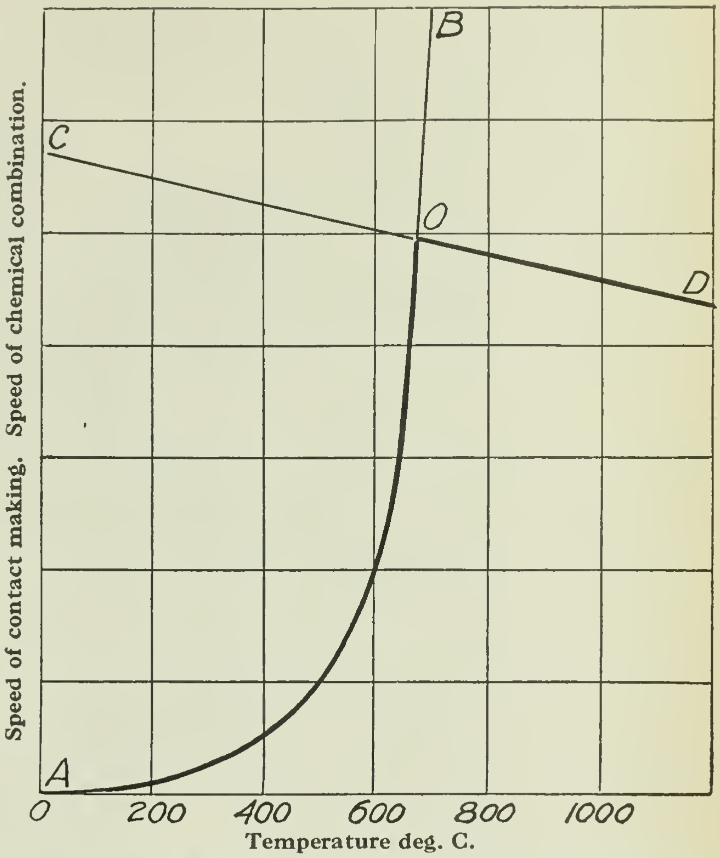


Fig. 2—Relation Between Temperature and Rate of Combustion.

Curve *AOB* represents the variation of speed of chemical combination with temperature. Curve *CD* represents the speed of contact-making. At the left of the intersection point *O* only some of the molecules of oxygen that make contact combine with the combustible; at the right of point *O* all oxygen molecules that make contact combine with the combustible. The speed of combustion is represented by the lines *AOD*.

the speed continues to increase (although at a decreasing rate) up to a temperature of 700 deg. C., and beyond that point to a considerably higher temperature. Eventually a temperature is reached beyond which there is not only no further increase in the speed, but where dissociation comes into play and increases with further rise in temperature until the compounds dissociate as fast as they are formed. However, it is safe to assume that at the temperatures attainable in a boiler furnace the speed of chemical combination is very high, and for all practical purposes is instantaneous at and above the temperature of ignition. Hence the rapidity of combustion depends entirely on the rapidity with which contacts are made.

The relation between the rate of combustion and temperature is shown graphically in Fig. 2, in which the horizontal scale is the temperature, and the vertical scale the rate of chemical combination and also the rate of contact making. The rate of chemical combination is very low at atmospheric temperature but increases rapidly as the temperature rises. It is represented by the curve *AOB*. The rate of contact making is represented by the line *CD* crossing the curve *AOB* at *O*. At the low temperature many molecules of oxygen make contact with the coal particle but only comparatively few combine with the combustible. At these low temperatures the speed of combustion is equal to the speed of chemical combination. As the temperature rises, an increasingly greater proportion of the molecules that make contact combines with the combustible until the point O is reached where all the molecules that make contact with the combustible combine with it. This point may be called the ignition temperature. Above this temperature the speed of combination is as high as the speed of contact making, and the speed or the rapidity of combustion depends entirely on the speed at which contacts are made. The oxygen and combustible must make contact before they can combine. The speed of combustion follows the line AOD. If we wish to increase the speed or rapidity of combustion we must raise the line CD, particularly the part OD. This is done mainly by increased mixing.

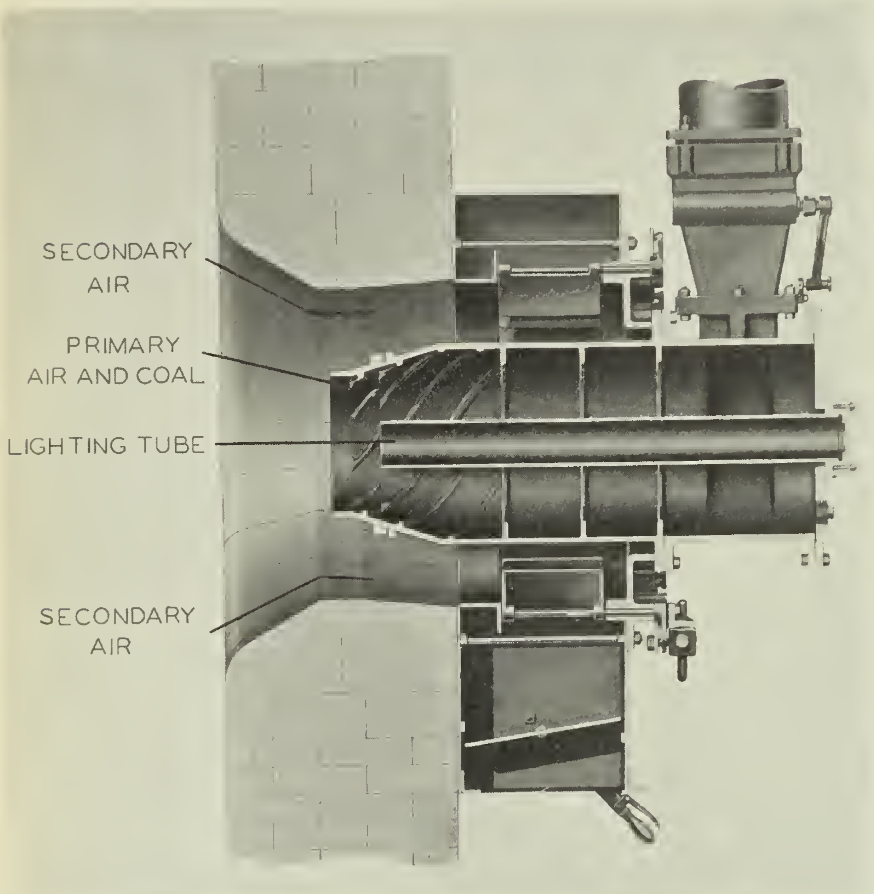

Fig. 3—Burner for Horizontal Firing.

Primary air and coal moves with a rotary motion through the coal nozzle. Secondary air moves with similar rotary motion outside of the coal nozzle and hugs the refractory throat of the burner. The mixture of primary air and coal ignites before the secondary air intermingles with it.

Designing Pulverized Coal Furnaces

The problem for the designer of pulverized coal furnaces is to provide conditions favourable to ignition temperature close to the burner, and rapid contact-making in the burning mixture. Conditions favourable to quick ignition close to the burners are a small amount of air with the coal, fine pulverization, and turbulence. When fires are started in a direct firing system the mill is operated at low milling rate with reduced air flow through the mill. Such operation results in fine pulverization. Rapid contact making is produced by intensive mixing of the burning mixture, and fine pulverization. Intensive mixing takes the burning particles of coal from one place where most of the oxygen has been used up to another place where there is still free oxygen available for combustion. Fine pulverization brings the combustible close to the oxygen.

Bringing Ignition Close to the Burners

Bringing the ignition close to the burner is easier with coals high in volatile matter than with low volatile matter coals. It is difficult with anthracite coal. The quantity of air to be supplied with the coal as primary air should be just about enough to burn the volatile matter. With high volatile matter coal the primary air can be 35 per cent of the total air needed for combustion, with anthracite coal less than 10 per cent. In other words, the amount of primary air expressed in percentage of total air is about equal to the percentage of volatile matter in the coal. This approximate rule is much easier to follow in a storage system than in direct firing in which the quantity of air supplied with the coal can not be reduced below the minimum at which the mill can be operated satisfactorily.

Control of Primary and Secondary Air

In vertical firing the coal is fired vertically downward and the burning mixture makes an upward turn near the bottom of the furnace. Primary air brings the coal in through the coal nozzle. A small amount of air is supplied through the burner around the coal nozzle. Secondary air is supplied progressively through air ports in the front wall after the coal mixture has ignited. This method of firing is well adapted for burning coals with very low volatile matter content, such as anthracite.

In horizontal firing the coal is usually fired through round horizontal nozzles in the centre of the burner as shown in Fig. 3. The mixture of coal and primary air flows through the nozzle with a rotative motion which tends to concentrate the coal in a rich mixture near the walls of the nozzle. The rotative motion also causes the mixture to bush out when it leaves the nozzle and produce turbulence. The secondary air is supplied around the coal nozzle. It enters the burner through a set of vanes in a number of streams so directed to give the flow a rotative motion. This rotation keeps the air close to the throat of the burner and away from the mixture of coal and primary air. The underlying principle is to get the mixture thoroughly ignited before it is diluted by the intermingling of the secondary air. This type of burner is rather sensitive to the volatile matter content in the coal, and is not suited for burning coals very low in volatile matter such as anthracite. With coals high in volatile matter the flame has a tendency to be drawn into the burner and damage it by heat; the throat should be made small. With coals low in volatile matter the ignition starts too far from the burner and is unstable; the throat should be large.

In corner firing there are one or more burners (as shown in Fig. 4) in each corner of the furnace. The streams of coal and primary air are directed towards the centre of the furnace tangent to a small circle. The secondary air is supplied partly around the coal nozzles and partly through secondary air ports either above or below the coal nozzles. The air around the coal nozzles is regulated to keep the ignition close to the burners without backing into them. Most of the mixing occurs in the furnace where the streams of coal and air meet. This method of firing is suitable for coals low in volatile matter.

Starting and Holding Ignition

The mixture of coal entering the furnace is heated by the flame of the already burning mixture near the burner. The heating of the coal distils the volatile matter which makes a readily ignitable mixture with the primary air. When this mixture is ignited it burns with a hot luminous flame which radiates heat to the incoming mixture of coal and air. The hotter this flame the more heat is radiated by it to the incoming mixture, and the quicker the volatile matter will be distilled and the gaseous mixture brought up to ignition temperature.

To hold the ignition close to the burner the incoming mixture or part of it is brought in with a turbulence. That is, part of the stream of the mixture is made to branch off on each side of the main stream nearly at right angles to the general direction of flow, thus producing eddies or turbulence, greatly reducing the velocity of that part of the mixture in the direction from the burners into the furnace. Thus, the velocity of the mixture in the coal nozzle before the branching off of parts of the stream may be 100 ft. per sec. In the parts that are branched off two thirds of this velocity may be spent in eddies or turbulence, leaving only one third of the velocity in the original direction away from the burner. The slowing down in this direction causes the stream to bush out and expose a wider front to the radiant heat. The result is that this turbulent part of the stream becomes heated to ignition temperature before it moves an appreciable distance from the burner. The temperature of the flame after ignition has started is necessarily much higher than the ignition point because the mixture must be brought to this temperature to start the ignition, and when combustion is started the heat generated by it greatly elevates the temperature of the burning mixture, causing it to expand and producing additional bushing out of the stream.

Figure 5 shows three methods of producing turbulence at the burner. The tips of the coal nozzles are modified to produce eddies and bushing out of the stream of the coal mixture. In *A* two strips are placed in the tip of the nozzle; in *B* the tip of the nozzle is serrated; in *C* the tip of the coal nozzle is riffled. These methods are applicable to vertical firing and tangential or corner firing.

Enlarging the cross section of the coal nozzle and thereby reducing the velocity of the entire stream of the mixture will not accomplish the desired results, because the energy for mixing is lacking. Furthermore, the reduction of the velocity of mixture in the delivery pipe and the burner nozzle is likely to cause the larger particles of coal to drop out of suspension and result in drifting.

Concentration of Oxygen in a Boiler Furnace

When air is supplied to the furnace, it contains nearly 21 per cent of oxygen. As the process of combustion goes on the oxygen is reduced at first very rapidly and then more slowly to about 2 per cent at the point where the gases leave the furnace. Simultaneously, CO_2 is formed, taking the place of free oxygen. The very small particles burn first because they have a small amount of combustible in them and because most of the oxygen needed for their combustion is near to them. The large particles of the coal burn only partially while the free oxygen is at high concentration. Their combustion must be completed after the concentration of free oxygen in the furnace gases has been greatly reduced. It becomes increasingly more difficult for the unburned part of the large particles of coal to make contact with the free oxygen, because these oxygen molecules are far apart and the inert gases, nitrogen and CO_2, are in the way of their free movement. If we had to depend on natural diffusion the rate of contact making of the oxygen with combustible would be slow. To speed up the rate of contact making intensive mixing is needed. The coal particles must be moved from places where all the oxygen has been used up, to others where there are still some free oxygen molecules.

Mixing requires energy which is usually supplied in the form of high velocity air streams. Such air streams are directed to produce turbulence. Usually these air jets are made to impinge against one another, or give the burning mixture a rotative motion nearly at right angles to the general flow of the gases through the furnace. In this rotative motion the furnace walls play an active part, because they force the burning mixture to make turns. Only water-cooled walls can be used for this purpose; refractory walls would be damaged. In many commercial boiler furnaces practically all of the secondary air is supplied through the burners or near them. There is intensive mixing near the burners, but by the time the burning mixture has moved a comparatively short distance from the burners the energy brought in by the air is all spent, and the gases then flow through the remaining part of the furnace in parallel streams with very little intermingling between them. All the factors for producing rapid combustion, fine coal, turbulence, and high oxygen concentration are in action near the burners. The fine coal particles are burned completely near the burners; the large particles must complete their combustion in the last part of the furnace where the concentration of oxygen is low and where there is only a limited turbulence.

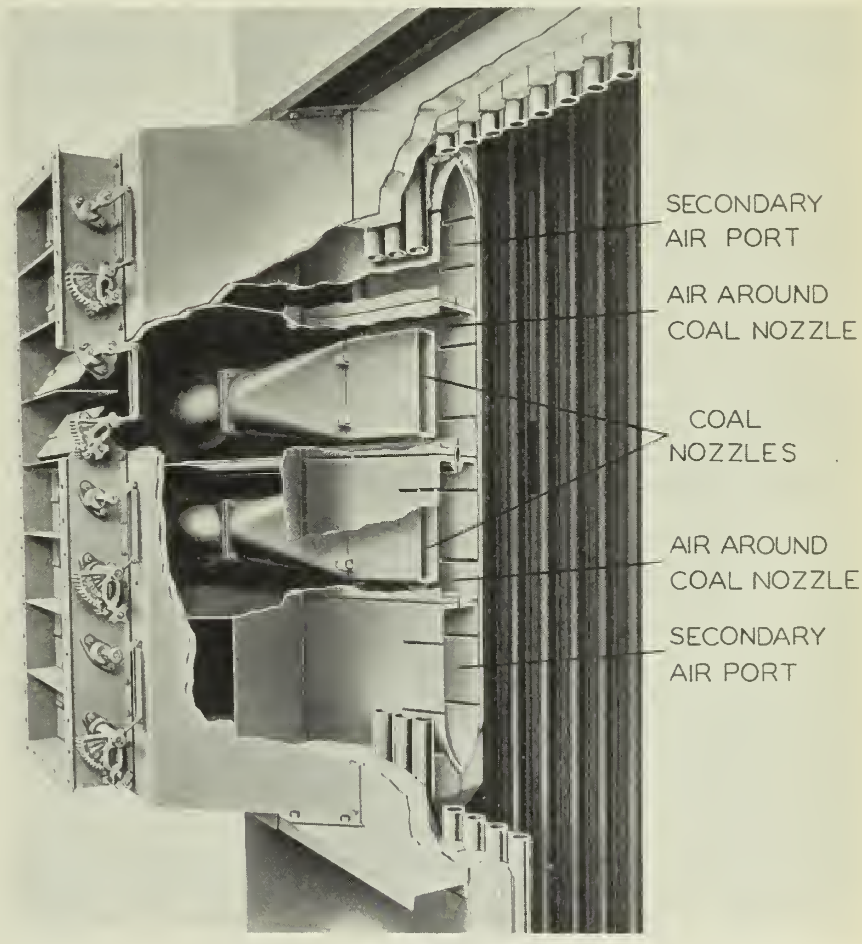

Fig. 4—Burners for Corner Firing.

Primary air and coal flows through the coal nozzles. Secondary air flows through the air ports above and below the coal nozzles and intermingles with the coal mixture coming from the nozzles after ignition has started. When flame is too close to the burner some secondary air is admitted around the nozzles.

In Fig. 6, curve *A* shows graphically the concentration of oxygen along the path of the burning mixture through the furnace. The drop in oxygen concentration is proportional to the rapidity of combustion. At the burners just when the ignition starts the concentration is nearly 21 per cent. The mixture consists of all the coal and the primary air which is about 40 per cent of the air needed

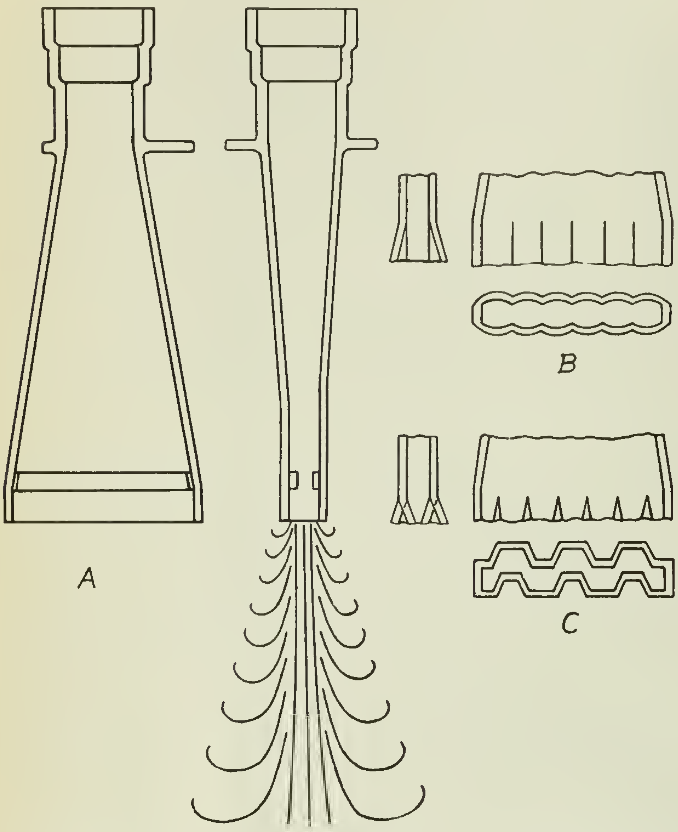

Fig. 5—Methods of Producing Turbulence at the Tip of the Coal Nozzle.

In *A* turbulence is obtained by inserting two strips in the tip of the nozzle. In *B* the tip of the nozzle is serrated. In *C* the tip has the shape of a riffle divider.

for complete combustion. Just beyond the point of ignition the secondary air is supplied either through the secondary air ports of the burners or through separate air ports near the burners. This secondary air consists of the remaining 60 per cent of air needed for combustion plus about 15 per cent excess air. The slow drop in the concentration of the oxygen up to this point is due to the addition of the secondary air. The concentration of oxygen then drops very rapidly due to the high initial concentration, intensive mixing produced by the addition of secondary air, and large percentage of superfine particles in the coal. As the energy brought in with secondary air is spent in mixing, and as the very fine coal particles are burned up, the concentration of oxygen becomes low and drops more slowly until in the last part of the path of the burning mixture the drop of oxygen concentration is very slow. It is during this last part of the path that the large particles of coal must complete their combustion. Some of these large particles do not complete their combustion and are deposited in the soot hoppers or pass out with the gases. They form most of the combustible found in the flue dust.

Supplying Secondary Air at More Than One Point

A better air supply design would be to supply the secondary air in three stages; about 55 per cent through or near the burners after the ignition has been well started, 10 per cent at about one fourth of the path of the burning mixture from the burner, and another 10 per cent about half way in the furnace. The two last additions of the air should be supplied at as high velocity as possible in order to bring in a large amount of energy for mixing. The concentration of oxygen under this condition of air supply would be somewhat like that shown by the dotted curve *B*. The lower oxygen shown at the end of the furnace indicates more complete combustion of the large particles caused by the additional mixing.

Observation of Burning Particles in Furnace

The burning of what is left of the large particles of coal at the end of the furnace can be seen by looking against the darker surface of the furnace walls or boiler tubes. These burning particles appear as bright hot specks in the passes of the boiler, and sometimes they come out through an observation door and complete their combustion outside the furnace. They are hard to see against the background of bright hot refractory furnace walls so that it is easy to reach the conclusion that there are not any, and that the combustion is complete. However, a closer observation shows their presence.

Excessively High Temperature Not Needed for Quick Combustion

Water-cooled furnaces absorb heat and thereby lower furnace temperature. It is a common impression that this reduction in furnace temperature retards combustion. The basis for this impression is the common observation that rapid combustion is accompanied by high temperature. We are apt to reason that the high temperature produces quick combustion and that we must have high furnace temperature to obtain rapid combustion. However, the fact is that the rapid combustion causes the high temperature, and that the rapid combustion is caused by intensive mixing, fine pulverization, or some other factors.

But there is a good experimental evidence that high temperatures beyond the ignition point actually retard combustion. Table I* gives the results of experiments made at the U.S. Bureau of Mines. These experiments were made to determine the burning periods of carefully sized fuel particles at furnace temperatures varying from about 670 to 1,000 deg. C. (1,238 to 1,832 deg. F.). The table shows that the burning periods are considerably longer at 1,000 deg. C. than they are at 750 deg. C. That is, raising the furnace temperature from 750 to 1,000 deg. C. increased the length of time necessary for burning about 65 per cent.

Table I

Temperatures and Indicated Burning Periods of Certain Sizes of Fuels

Furnace temp. deg. C.	−45 +50 Coal milliseconds	−45 +50 Semicoke milliseconds	Coal, same weight particle as −45 +50 Semicoke milliseconds
750	282	275	214
800	317	308	240
850	367	342	276
900	386	374	308
950	436	410	336
1,000	406	455	368

The experiments were made in a small furnace shown in Fig. 7. The furnace was about 3 ft. high and hexagonal in cross section, the sides of the hexagon being 1 in. wide. The sides of the furnace were made of nichrome ribbons and were heated by passing electric current through them. There were slots about ½ in. wide in two opposite corners

*Tables I and II and Figs. 7, 8 and 9 are taken from Co-operative Bulletin 50, U.S. Bureau of Mines, Mining and Metallurgical Investigations (1931).

TABLE II
WEIGHT OF FUEL PARTICLES

Fuel	Mesh	Number of particles weighed	Weights per 100 particles
			Mg.
Coal	−45 +50	1,000	2.8
Semicoke	−45 +50	1,000	1.4
Charcoal	−45 +50	1,000	1.8
Coal	−50 +60	500	1.9
Coal	−80 +90	1,000	0.73
Beehive coke	−45 +50	1,000	3.1

of the hexagon, covered by mica and forming windows for observation. The outside of the furnace was protected by insulation against rapid cooling. During any one set of experiments the temperature was kept nearly constant. Carefully sized fuel particles were dropped in and the period of their combustion was recorded through the mica windows on a photographic film which was attached to a revolving drum. The burning particles showed tracks on the film, and with the speed of the rotation of the film known the period of combustion could be determined within 5 milliseconds.

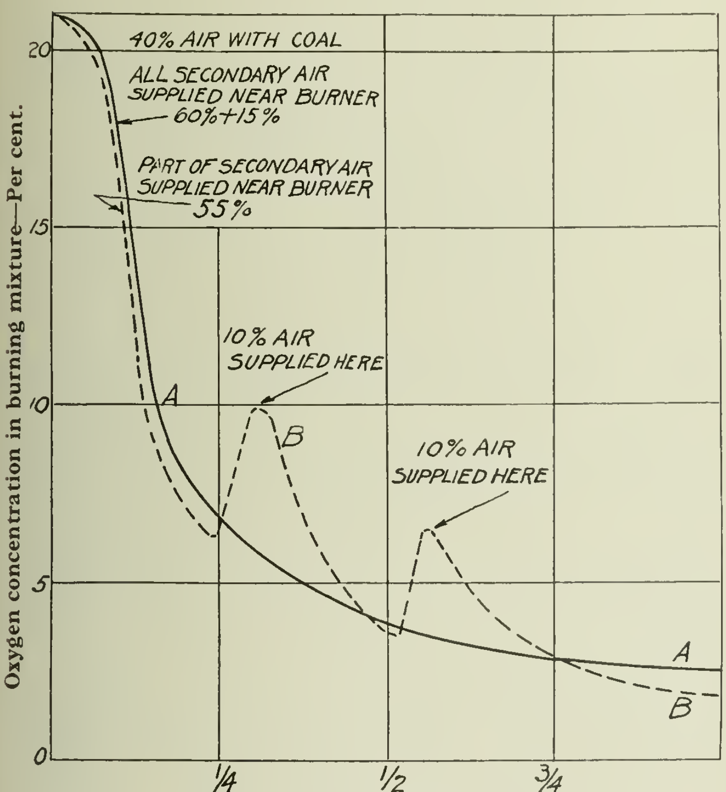

Fig. 6—Curves Showing Oxygen Concentration in Furnace Gases.

Curve *A* shows the oxygen concentration when all of the secondary air is supplied near the burner. Curve *B* shows the concentration when the secondary air is supplied at three points along the path of the burning mixture to maintain turbulence. Total air is 15 per cent excess in both cases.

Most of the tests were made with bituminous coal and semicoke of the following analysis:

	Coal	Semicoke
Moisture	1.4	2.1
Volatile matter	32.5	13.8
Fixed carbon	56.3	71.6
Ash	9.8	12.5
Sulphur	1.0	1.1
B.t.u. per lb.	13,260	12,760

Figure 8 shows the tracks of burning particles of bituminous coal burned at a furnace temperature of 1,000 deg. C. Note the initial short thick portion of the track which represent the combustion of the volatile matter which burned with flame. After the volatile matter has burned the combustion of the fixed carbon showed a narrow track indicating combustion without luminous flame.

Similar photographs of burning charcoal particles showed the absence of the thick initial portion of the track; there being practically no volatile matter to burn, there was no flame.

Figure 9 gives a graphical summary of the results of the experiments. Note the definite and pronounced lengthening of the periods of combustion with temperatures.

The results of these experiments somewhat surprised the experimenters because the results were contrary to the common conception. The experimenters are sure that the combustion was complete at all temperatures, and that the results are trustworthy. They are not able to explain the retardation of combustion by higher temperatures.

Why should higher furnace temperatures retard or speed up combustion of pulverized fuel?

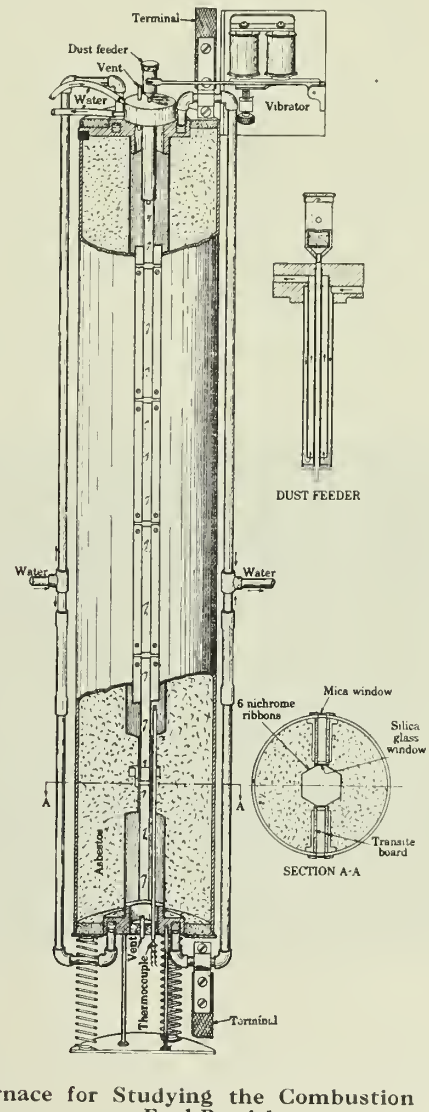

Fig. 7—Furnace for Studying the Combustion of Individual Fuel Particles.

It has been stated in this paper that the rate at which oxygen makes contact with the combustible determines the rate of combustion. If we can find how rising temperature affects the rate of contact making, we can find the answer to the above question. The oxygen is a part of the gaseous mixture in the furnace. The combustible is the solid carbon in the particle of pulverized fuel. The furnace temperature is the temperature of the gaseous mixture in the furnace. The temperature of the burning particle of fuel is higher than the temperature of the surrounding gaseous mixture because the heat generated by its combustion raises its temperature above that of the surrounding gases. There is a sharp temperature gradient from the burning particle to the surrounding gases. The following factors come into play with rising furnace temperature:—

(*a*) The molecular speed increases as the square root of absolute temperature. This greater molecular speed causes the oxygen molecules to hit harder when they make contact with the carbon particles, and thereby may increase the velocity of chemical combination. However, inasmuch as the rate of chemical combination is already very high and the rate of combustion depends entirely on the rate of contact-making, the harder hitting does not affect the rate of combustion.

The molecular speed affects directly the rate of contact-making, therefore, the rate of contact-making should increase as the square root of the absolute temperature.

(*b*) The density of the furnace gases decreases as the absolute temperature rises. There are fewer oxygen molecules in a given volume of furnace gases, and the rate of contact-making should decrease in proportion to the density. This decrease should be inversely proportional to the absolute temperature.

(*c*) The viscosity of gases increases with temperature. That is, as the temperature rises the resistance to movement of the particle of coal through the gases increases. It requires greater force to move the particle of coal out of one place where all the free oxygen has been consumed to another place where free oxygen is available; or, the same force causes a slower and shorter movement. The higher viscosity

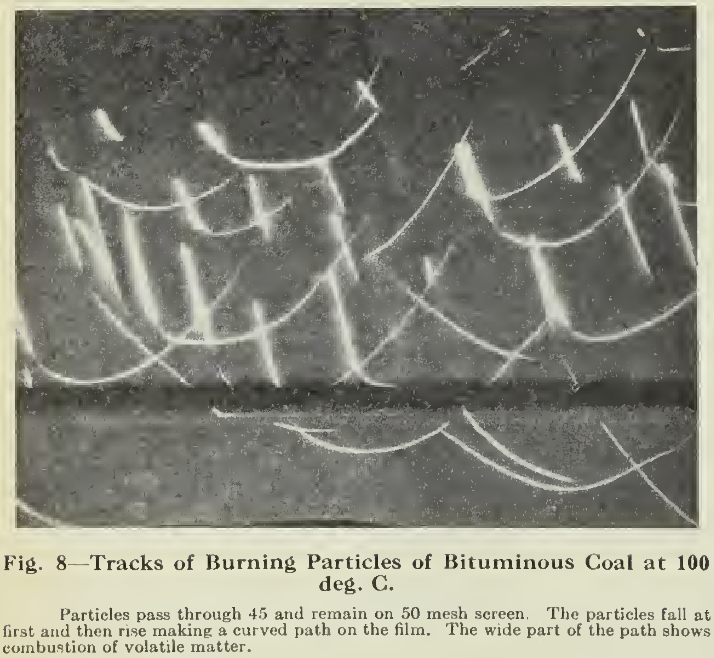

Fig. 8—Tracks of Burning Particles of Bituminous Coal at 100 deg. C.

Particles pass through 45 and remain on 50 mesh screen. The particles fall at first and then rise making a curved path on the film. The wide part of the path shows combustion of volatile matter.

causes the moving coal particles to drag with them the CO_2 formed by the combustion, thus reducing the access of free oxygen to the surface of the particles.

The combined effect of the higher molecular speed and lower density of furnace gases caused by the rise of furnace temperature from 700 to 1,000 deg. C. may decrease the rate of contact making in the ratio of 1.14 to 1, and at the same time the viscosity increases 20 per cent thus probably decreasing the rate of contact making in the ratio of 1.20 to 1. The combination of these factors would decrease the rate of contact making in the ratio of 1.37 to 1. In other words, the lengthening of the burning period would be about 37 per cent. The observed lengthening of the combustion period was 65 to 70 per cent.

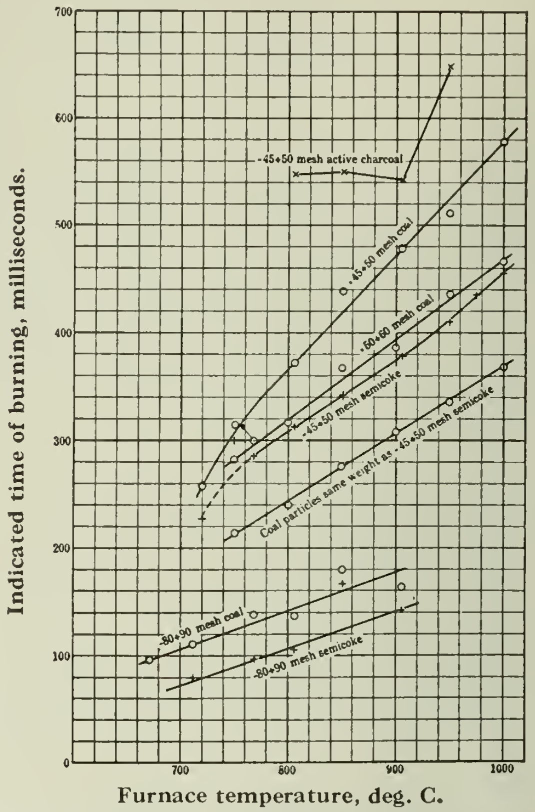

Fig. 9—Time Required for Burning Powdered Fuels of Three Sizes at Various Furnace Temperatures.

The combustion in the experimental furnace was quicker than it is in a boiler furnace, because the oxygen concentration in the experimental furnace was kept constant at 21 per cent. In a boiler furnace the concentration varies from 21 to about 2 per cent. The average concentration in which the large particles burn probably does not exceed 6 per cent. The rate of contact-making and, therefore, the rate of combustion is proportional to the concentration.

There may be a tendency to belittle the value of the results of the experiments because they were made in a small laboratory furnace. However, laboratory methods are the best means to acquire exact knowledge. In studying a process like combustion which depends on so many factors, only one factor at a time should be varied, keeping the other factors constant. The laboratory apparatus is designed to make this possible.

The experimenters did this, and thus were able to determine the effect of furnace temperature, size of fuel particles, and the kind of fuel on the rapidity of combustion.

In an attempt to make a similar study with a boiler furnace it is impossible to control the various factors with any degree of accuracy. The result is that one factor may be credited with the benefit caused by others. The results of the laboratory experiments cited in this paper may help us to turn our inquiry more directly to the real causes of our present troubles.

Most of the difficulties with pulverized coal combustion occur at low ratings and it is easy to put the blame on cold furnaces. The true cause may be too much air with the coal, supplying secondary air too close to the burner and thus interfering with ignition, and supplying both the primary air and secondary air at very low velocity, too low for any effective mixing. The coal delivery pipes, the coal nozzles, the secondary air ports are designed for the full capacity of the unit. The cross section areas of these parts are made to give sufficiently high velocity for good mixing and good combustion at full rating. The low ratings are left to take care of themselves. It should be borne in mind that the velocity of the coal mixture, and of the secondary air entering the furnace is a measure of the amount of energy supplied to the furnace for mixing. At half rating the velocity is about one half, and the energy is one fourth, of what they are at the full rating; at one quarter rating the energy is about one sixteenth of the energy at full rating. Lower flow is obtained by partly closing the dampers in the air ducts which dissipates the energy at the damper; the cross section areas of the coal nozzles and air ports remain unchanged. The worst factor at low rating is the use of more air with the coal than is required for good ignition. The velocity in the coal delivery pipe cannot be reduced below a certain minimum, otherwise there would be coal deposition and drifting in the pipe, which would result in intermittent coal supply to the furnace and even plugging of the pipes. In direct firing there must be a certain amount of air flow through the mill which is seldom the right amount for quick ignition. All these factors affect the combustion and their effect can not be nullified by a refractory furnace.

The association of rapid combustion and high temperature is so familiar that we do not stop to inquire which is the cause and which is the effect. The reluctance to question accepted and apparently obvious conceptions is an old trait of man. He has observed the sun moving across the sky for thousands of years and was thoroughly convinced that the sun was moving. It was obvious, he could see it moving with his own eyes. Nevertheless the sun was standing and the earth was moving all that time.

The water-cooled furnaces have many good qualities to recommend them. They also have some drawbacks, but apparently retarded combustion is not one of them.

DISCUSSION

Ralph Briscoe[1]

In his paper the author has apparently taken into consideration the basic principles of combustion of pulverized coal in connection with the most modern design of boiler and furnace. He stated that water-cooled furnaces absorbed a large quantity of heat, thereby lowering the temperature of the furnace gas and of the fly-ash carried by the gas. As a result these entrained ash particles do not stick to the boiler tubes and the superheater elements.

In the writer's opinion, the application of pulverized coal antedated the development of the water-cooled furnace as we now know it by a good many years. There were, though, very few installations made burning pulverized fuel that did not have some water cooling of the furnace even if it was only a hearth screen. The operation of these furnaces was very interesting from the standpoint of attempting to maintain low and constant furnace temperature over a wide range of rating and maintain these conditions over long periods of operation of the boiler.

In this connection furnaces were designed of relatively large size to keep down the heat liberation per unit of volume. Also knowledge of the time element necessary for complete combustion of pulverized coal in suspension was very limited. The writer wonders if the latter was not more the reason than the former. Pulverized coal furnaces were designed for a heat liberation not much in excess of the stoker, and the stoker installations had been tolerated without water-cooled furnaces because we did not know any different. With the stoker, apart from the high furnace maintenance cost, most of the trouble due to clinker and slag was in the stoker itself. With pulverized coal burning in suspension, the ash would be in suspension and might stick or adhere to the walls with results only too well known. And stick it did in the early installations, not only on the walls but on the hearth where in some cases it was removed with chisel bars and sledges.

The use of pulverized coal had come to stay. For the expected increase in efficiency, greater flexibility and adaptability to larger installations looked very desirable to the power plant designer in comparison with the then stoker. However, something had to be done with the furnace. The early installations demonstrated that the solid refractory wall was far from being suitable, and, in fact, would be the retarding factor in the application of pulverized coal. But at this time, the air-cooled wall was developed. This generally consisted of a 9 in. refractory wall held back to another outer wall by rows of headers with an air space between the two. A part of the air for combustion was admitted with the coal and the balance circulated between the two walls.

The thought that prompted this was that the inner wall would be kept sufficiently cool with the circulating air so as to help keep the furnace temperature down somewhat and keep the refractory from melting and the ash sticking to it, but, more particularly, the writer believes it was expected to reduce the thermal stresses that would be set up in a thick, heavy wall.

Space will not permit of a review of all the interesting experiences obtained in the operation of large furnaces 25,000 cu. ft. in volume and over 60 ft. high, built with the so-called air-cooled wall.

On these refractory walls, there was a tendency to accumulate, even if it was fragile, a layer of slag over parts of the refractory surface which shaded some of the heat-absorbing surfaces, and which, in turn, resulted in softening this slag, perhaps forming a ledge and then a concentration of flame on this part of the furnace with detrimental results. There would be some coating of the front bank of tubes and what little extra cooling medium was employed, with slag or ash in different forms, necessitating periodic cleaning and scraping to bring the furnace temperature back somewhere near that desirable and tolerable.

The writer has always thought of the change in furnace temperature with this change in furnace conditions as "furnace sensitivity," all brought about by the ash sticking to the side walls, the front bank of tubes and the hearth screen. The writer wonders how much or what would be the furnace sensitivity of a completely water-cooled furnace burning pulverized coal of low ash-fusing temperature, operating at a comparatively high rating. Can the furnace temperature be maintained sufficiently low so that the ash when projected at high velocity against the tubes won't be so molten as to stick to the tubes?

The author has pointed out that almost any kind of fuel that can be pulverized can be burned. He also pointed out that temperature above that required for ignition

[1] Plant Engineer, Trenton Channel Power House, Detroit.

are not necessary, and, in the writer's opinion, are very undesirable, for, if we are to burn coals with low fusing temperature ash, the furnace temperature should be kept as low as possible. For at high ratings, we are apt to have high velocities of the gases entering the first bank of tubes and the superheater. If these gases carry the very fine ash in a molten condition at high velocity, it will be projected against the tubes.

Can a water-cooled furnace be designed with a very low sensitivity rating? Can the designer, within reason, predict in advance what the furnace sensitivity will be when burning a certain grade of coal? With the boiler proper reaching a greater perfection in design from a mechanical standpoint and with a furnace of low sensitivity and refractory maintenance costs practically eliminated, is the cleaning of the furnace and cleaning off of the tubes and the water-cooling surface to be the cause of the major outage factor as is now the case in some refractory installations?

There is another very important factor not to be lost sight of in connection with furnace sensitivity. That is the superheater design. It has been recognized for some time that a nearly straight line of temperature for the superheated steam is desirable. It seems that outside methods—that is, methods used outside the boiler setting—to obtain straight line superheat have given way to the control of the distribution of the gases over the water and steam heat-absorbing surfaces. With low furnace sensitivity, the designer's problem is much easier. It is unfortunate that the author was not asked to review the design of superheaters and the control and distribution of the gases through the boiler passes and over the superheater in connection with his paper. His knowledge of the subject in connection with large installations would have made it very interesting.

The author states that the impingement of flame against the side of the furnace does not damage the water-cooled wall. It is the writer's belief that impingement of flame against water tubes is undesirable unless circulation is exceptionally good.

He has also stated that the stability of fire is largely a matter of burner design. Has not the use of preheated air played a great part in the stability of fire, reduction of carbon in the ash and high rates of combustion? Is there an upper limit from the combustion standpoint above which it is not desirable to go? A discussion of this question would be of interest.

With the older style of furnace when only a small portion of the air for combustion was admitted with the coal, it was an interesting experiment, mostly cut and try, to determine where and in what portions the balance of the air should be admitted at each place. Contrary to some opinions combustion should not be completed close to the burner, but should envelope the whole of the furnace and be complete before entering the boiler tubes.

The changes which have taken place in the last 15 years in the application of pulverized coal, the development of the equipment to produce it in proper form and the development of the water-cooled furnace, have been so great that only those who have had experience with an installation of recent design are in a position to discuss them with authority. From the bin and feeder system of 15 years ago to the present unit system with its improved burner, improved mill and classifier, and the all water-cooled furnace is a very great step. Again it is unfortunate that the author was not asked to discuss, if only in a limited way, the part the mill with its complement of auxiliaries plays in connection with success of any pulverized coal installation. Coal in all its different forms is a very complex mixture and to reduce a larger share of its different forms in one piece of apparatus to usable material in pulverized form is an achievement.

The author in presenting the basic principles has left nothing to be desired.

E. A. Sitter[2]

The author has stated many advantages of using water-cooled furnaces and has covered them very thoroughly with the exception of the one pertaining to feedwater treatment. Before heat absorbing surfaces surrounded our furnaces the question of feedwater treatment was not of such vital importance as it is today. The installation of the water-cooled furnace has made it necessary to treat the feedwater to the extent of keeping the heating surfaces entirely free from scale and dirt and to maintain them so continuously. Not only has this practice effected a saving in maintenance costs but it has also contributed largely to higher boiler and furnace efficiencies.

Pulverized fuel fired in water-cooled furnaces makes a very flexible arrangement. Changes in steaming rate of the boiler can easily be followed, but they also set up a problem of water level control in the boiler. A sudden change in steaming rate will tend to change the level of the water because of the difference in density of water in circulation through the wall tubes. The writer would like to ask Dr. Kreisinger if he has had any trouble maintaining water level in pulverized fuel fired boilers where there were wide fluctuations in steaming rate.

Pulverized fuel is sometimes difficult to ignite in the case of starting a fire, but this is not because the furnace is water cooled. The difficulty lies in the fact that the air which carries the fuel from the pulverizer to the furnace and that supplied for combustion is at a temperature below that at which pulverized fuel will readily ignite. The temperature of the air and the coal must be raised to and maintained above the igniting temperature by lighting torches of ample capacity until such time as preheated air at reasonably high temperatures is available. A question arises regarding the fuel that should be used for the torches, What are the advantages and disadvantages of fuel oil versus natural gas?

Pulverized fuel fired furnaces lend themselves very easily to maintenance of fuel air ratios and thus maintain a low excess air value in combustion at all times; however the design must be such that an interruption in coal feed from one pulverizer will not seriously reduce the steaming rate of the boiler and the combustion control regulators must be easily and quickly adjusted to establish a new correct fuel air ratio, otherwise the furnace efficiency will be considerably lower and there is danger of losing ignition. What precautions should be taken when taking one pulverizer out of service where two are supplying fuel to one boiler? Where in the conventionally designed tangential burner will the greatest heat release occur?

The writer would like to ask the author whether it is possible to obtain bituminous coal so low in volatile matter that ignition cannot be maintained? What changes in distribution of air entering the furnace should be made for coals of high volatile content as compared with coals of low volatile matter? Where a plant has a load which varies from high rating to low rating on boilers is it advisable to select a fuel with high volatile content rather than low volatile content to support ignition at low rating loads? In the plant in which the writer is, they have always admitted the major volume of air around the coal nozzles, believing this method will stimulate turbulence. Is this method preferable to the one that admits secondary air through the regular air passages and retards the flow of air around the coal nozzles? Is it not a fact that considerable

[2] Chief Engineer of Power Plants, Chevrolet-Forge Division of General Motors Corporation.

savings can be made with a pulverized fuel plant versus a stoker fired plant where operation is on a five-day per week basis because of the fact that no banking is required?

They have had some interesting experiences in burning wet coal. Recently ⅜ in. Pittsburgh No. 8 screenings containing 10.6 per cent moisture were pulverized. No difficulty was experienced anywhere along the coal path from the bunker to the Richardson scales, to the feeders located fifteen feet above the pulverizers, in the pulverizers, nor in the coal pipes to the burners with one exception, that was in the coal pipes between the feeders and the pulverizers. The design of these pipes is such that the coal fell about 12 ft. and then turned an angle of 25 deg. to the pulverizer. It was at this turn that stoppage occurred. The design of the pipe was altered to eliminate this angle as much as possible by dividing it between two angles of approximately 11 deg. and 14 deg. respectively. While this alteration improved conditions materially it did not produce a satisfactory solution, some stoppage still occurred. It was then decided to admit sufficient preheated air to the feeder pipe to maintain 140 deg. temperature air within the pipe; this was done with satisfactory results, no stoppage has occurred since these changes were made. It appears as though preheated air could be used in the mill feeder pipes advantageously, as standard practice. The writer wonders what the experiences of other operators of pulverized fuel plants has been in this respect.

C. Showers[3]

The writer was particularly interested in the experimental data submitted by the author showing the indicated burning periods of certain sizes of fuels at various furnace temperatures and his explanation of why they are at variance with what is usually true of chemical reactions. While there undoubtedly remains a great deal to be learned about the art of steam generation by powdered fuel firing a tremendous amount of dependable data has been accumulated during the past ten years. Designers and operators can go about their work today with much greater confidence than was the case only a few years ago.

While it is true that the most important source of heat for ignition lies in the propagation of flame along the fuel stream, or along eddy currents of that stream, and that a well designed burner will maintain ignition in the open air, it is also true that for boilers up to 1,500 boiler hp. where one direct firing mill and one burner is used and continuity of operation is important, it is safer to have some uncooled refractory in the furnace wall in which the burner is located so that in case of a slight interruption in the fuel supply to the burner due to mill feeder stoppage, caused by wet coal or foreign material, the heat from the refractory will ignite the coal stream immediately when it again issues from the burner.

It might be well to point out that regardless of the fact that combustion of fuel progresses more rapidly at lower temperatures, it is also true that the rate of heat absorption by water walls drops much faster than the furnace temperature. For instance, one square foot of projected tube area will develop 2.4 boiler hp. at a furnace temperature of 2,350 deg. F. whereas the same area will only develop 1.2 boiler hp. or half as much at 1,900 deg. F., so that on a basis of first cost it is possibly more economical to design for the highest furnace temperature possible with respect to the fusion temperature of the ash and try to design the burner so that the coal particles pass through the furnace by such a tortuous path that they have sufficient time to burn before entering the tube bank.

[3] Assistant Chief Engineer, Windsor Works, Canadian Industries Limited.

J. R. James[4]

Pulverized coal firing has its advantages but there is also a disadvantage and that is the collection and disposal of fly ash in those localities where public policy demands it.

In speaking only of dry bottom furnaces there are two methods which are successful in the cleaning of the flue gases. One is the scrubbing of the gas by water sprays and the other the use of electrostatic devices. However, as more uses for fly ash develop it is reasonable to believe that the collection of the ash in a dry state will predominate, for in that condition it is in a more saleable state.

Large sums of money have been spent in research by various agencies endeavouring to discover uses for fly ash. The present situation, however, is that there is no well-known generally accepted use for this by-product. This may be explained possibly by the fact that a depression is a fine time to think and study such problems but it takes times of prosperity before private capital will venture into the use of new materials.

Fly-ash as collected by electro-precipitators has been used as follows:

1. Due to its puzzolanic properties it has been used as an admixture to Portland cement.
2. It has displaced clay as a raw product in the manufacture of Portland cement.
3. It has been used as a filler in the asphalt and rubber industry.
4. Light weight concrete.
5. Building block.
6. Insulation.

The Detroit Edison Company has developed a light weight concrete (100 lb. per cu. ft.) composed of fly ash, prepared cinders and cement. A mixture of five parts cinders, two parts fly ash and one part of cement by volume gave a concrete testing of 3,000 lb. per sq. in. at twenty-eight days. This same proportion by weight, using damp cinders and fly ash is: 1,500 lb. cinders, 650 lb. fly ash, 500 lb. cement.

This company has also developed a building block similar in shape to ordinary cement or cinder block. This block which is 18 in. long instead of the usual 16 in., is of a slate colour due in part to carbon in the ash, and for an 8 in. block weighs about 28 lb. in contrast to 40 lb. for a concrete or cinder product. It has ample strength in compression but has to be handled carefully during construction as its sharp edges are readily chipped. A bare 8 in. wall as tested at the University of Minnesota gave a heat conductivity test of 0.318 B.t.u. per sq. ft. per hr. per deg. of temperature difference. After its hollow cells were filled with rock wool it gave a coefficient of 0.16. The rock wool was removed and the spaces refilled with ordinary dry fly ash. The coefficient was 0.18.

The process for making this building block is similar to that of a sandlime products plant. A mixture of 100 per cent ash, 10 per cent hydrated lime, 0.6 per cent rosin with about 20 per cent water is mixed in a wet pan for about eight minutes. A tamping machine receives this material and forms about 360 8 in. blocks per hr. Loaded on cars the blocks are placed in a steam kiln at about 120 lb. pressure where they remain for about seven hours and are then taken to stock piles.

To date about ten homes, ranging in value from $3,000 up to $10,000, two churches, and several breweries have been constructed. At the present time, The Detroit Edison Company is constructing a six-storey service building, all the floors of which are formed of fly-ash cinder concrete,

[4] Senior Engineer, Engineering Division of the Detroit Edison Company.

about 3,500 cu. yd. In this building will be used more than 100,000 blocks.

The process used in the manufacture of the building block is controlled by the Rostone Company of Lafayette, Indiana. The three uses of fly-ash as developed commercially by this company, namely: fly-ash cinder concrete, building block and its use as an insulation in connection with the block, appear to have an encouraging future, especially so in that private capital has recently shown its willingness to take over the manufacture and sale of these products.

T. W. Jeffords[5]

The author has called attention to supposed difficulties experienced in maintaining combustion in water-cooled furnaces. An interesting experiment was run at the Mistersky power station, which throws a further sidelight on this question. In 1932 the City of Detroit faced a situation of having no place to dispose of its garbage. The Common Council instructed the Public Lighting Commission to experiment with the disposal of the city's garbage by dehydrating and burning it in the powdered coal furnaces at our Mistersky power station. These furnaces are of the usual vertical firing design, being approximately 19 ft. square at the base and 30 ft. high. In carrying out these experiments an inclined hearth was constructed on top of the water screen at the bottom and rear of the furnace. This hearth was composed of cast iron blocks, attached to the water screen, extending the full width of the furnace end to within about 5 ft. of the front wall.

The garbage was fed in on top of this hearth through openings at the rear of the furnace. The powdered coal was fed into the furnace vertically through the arch at the top of the front wall. The powdered coal flames were allowed to follow the usual U-shaped path encountered in vertical fired storage systems, excepting that the flame was shortened up so that it turned just above the garbage on the hearth. The radiant heat from the powdered coal flame drove off the moisture from the garbage as it was pushed down the hearth. Actual burning of the garbage took place, after it had become sufficiently dried, at the lower end of the hearth.

This bed of garbage at the bottom of the furnace formed a black heat absorbing surface producing an effect similar to that of a water wall. In addition, however, volumes of water vapour were driven off from this bed of garbage, thus producing a still further cooling effect upon the powdered coal flames. It was found possible to burn approximately 9 tons of dehydrated garbage per hour. The moisture content of this garbage averaged between 50 and 60 per cent, which means that it was necessary for the powdered coal flames to evaporate between 4 and 5 tons of water per hour, which passed off with the gases. At no time was any difficulty experienced in keeping the powdered coal flames burning or in carrying low ratings on the boiler. The only change which was found necessary in the operation of the furnace was to carry a higher percentage of excess air. Normally the CO_2 at the boiler outlet on coal alone averages approximately 15 per cent. It was necessary to reduce this to approximately 13 per cent while burning garbage.

It is believed that these garbage burning experiments have again proved that the powdered method of firing coal is quite flexible in that it can not only be burned in conjunction with blast furnace gas and oil but also with waste products such as rubbish, garbage, etc.

[5] Superintendent of Power Production, Public Lighting Commission, Detroit.

W. D. Drysdale[6]

This paper brings out the fact that a water-cooled furnace absorbs a large quantity of heat, thereby lowering the temperature of the furnace gas and of the fly ash carried by the gas. What provision has been made when burning low fusion ash coal, to be able to maintain the temperature of the superheated steam at a steam load output between 50 to 75 per cent of boiler rating? As higher steam pressures and superheater temperatures are coming into use, the cooling of the gases to a point of preventing the fly ash from sticking on boiler and superheater tubes becomes a major problem in maintaining the desired superheater outlet temperature.

Also, as a boiler operator and thinking of safety first operations when lighting a burner using pulverized coal, oil or gas, the safe thing to do is to open the boiler outlet damper so as to purge the furnace before applying the torch and feeding pulverized coal, oil or gas to the torch. This reduces the hazard of a puff blowing back on the operator when applying the torch to the burner.

A. C. Pasini[7]

The writer agrees with the author as to the use of pulverized fuel and the use of water-cooled walls. But the advent of pulverized fuel and the use of water-cooled walls also stimulated the development of stoker fired furnaces. The use of water walls in the Conners Creek plant stoker fired furnaces has produced a tremendous change in the design. In the old stoker fired furnaces the refractory walls had always been a source of worry because of their inherent weakness. The use of refractories also required carrying higher total air values in the furnace. With continued high ratings the replacement costs for refractory walls were very much too high. Water-cooled walls have completely changed the picture so far as stoker fired furnaces are concerned.

In the fall of 1934 the first new high pressure boiler went into service at the Conners Creek plant. This boiler is stoker fired, equipped with automatic metered air control and 100 per cent water walls. It has a furnace volume of 11,000 cu. ft. as compared to a furnace volume of 25,000 cu. ft. in the pulverized fuel furnaces at Trenton Channel. The maximum heat release in the Conners Creek furnace is 50,000 B.t.u. per cu. ft. per hr. comparable to some pulverized fuel installations and greater than most pulverized fuel fired boiler furnaces. This heat release has been maintained for as long as 12 hr. without any trouble. At this rate the dust loading in the stack was approximately 1.3 lb. cinders per 1,000 lb. dry gas. The carbon content at this loading was approximately 55 per cent. The sieve analysis at normal rating showed 30 per cent passing through a 325 mesh, 13 per cent through a 200 mesh, 28 per cent through a 100 mesh, 28 per cent through a 50 mesh and only 1.2 per cent retained on a 16 mesh.

Water walls, while an aid in cooling the gases and fly ash in large furnaces, do not tend to keep fly ash adherence from the boiler tubes where the furnace volume is small and heat release high. In the Conners Creek furnaces the tubes must be sprayed with water approximately every two days, this despite the fact the flame travel is very small on the stokers.

No trouble has been experienced in lighting fires nor in steaming at small ratings with stokers and water walls.

With metered air control equipment on our stokers, no secondary combustion has been noticed. 16.5 per cent CO_2 with no CO, can be maintained at the superheater outlet. The semi-radiant superheaters are located in the

[6] Assistant Engineer of Power Plants, Detroit Edison Company.
[7] Technical Engineer, Conners Creek Power House, Detroit Edison Company.

first pass and the convection superheater in the second pass.

As to stoker maintenance from November 1934 to January 1937, the cost of all iron replacement was 50 per cent less in the new stokers using metered air control equipment as compared to the old stoker fired furnaces. This low cost was maintained even though the new stokers operated with 360 to 400 deg. F. preheated air temperatures.

The author has not mentioned ash disposal. The Conners Creek plant is able to dispose of all its ash at a profit—no small item when one considers that the plant consumes approximately 1,500 tons of coal per day.

T. C. Tayler[8]

The fundamental way in which the author has attacked the problems of combustion of pulverized fuel makes his paper a real contribution in a broader field than just that of boiler furnaces. The best proof of a theory is to carry it to its extremes. A boiler furnace with its demands for short flame constitutes one extreme: a rotary lime kiln furnace demanding long flame is the opposite extreme.

Ideal conditions call for a flame 50 ft. long in a horizontal furnace 4 ft. 6 in. inside dia. by 100 ft. long. The cooling surfaces consist of the insulated fire brick walls and partly and completely calcined lime varying in temperature from about 200 deg. F. at 50 ft. from burner up to 2,300 deg. F. about 25 ft. from burner and continuing at this temperature as it moves to the burner. Our conditions demand that a flame temperature be maintained at 2,500 deg. F. from the burner tip to a distance of 50 ft. To hold the flame temperature down to 2,500 deg. F. at all points the walls and lime must absorb heat as generated. There will be little absorption in the first 10 ft. from burner and almost constant absorption in each foot from 10 to 50 ft. from the burner tip. Quick ignition at the burner tip is required, slow rate of combustion in the first 10 ft., then a faster but almost constant rate for 40 ft.

The problem of combustion is complicated by the facts that, first, petroleum coke is burned which is about 85 per cent fixed carbon and 14 per cent volatile, and, second, because the entire volume of combustion air is preheated to 1,000 deg. F. Moisture in fuel and cold air admitted to fuel pulverizer reduce primary air only enough to eliminate pre-ignition.

The author names three factors as necessary for quick ignition:

1. Small amount of primary air.
2. Fine pulverization.
3. Turbulence.

It is not difficult to obtain all three. Quick ignition is needed, but having obtained it the opposite problem of preventing almost complete combustion close to the burner comes up. If the above three factors give quick ignition and short flame, the opposites should give long flame. Hence one might expect to find it necessary in this case to simultaneously supply both small and large amounts of primary air, both fine and coarse pulverizing and have both great and little turbulence. These combined conditions may not be quite as impossible as might at first appear. One can have a burner that supplies a rich mixture at low velocity around the rim while it supplies a lean mixture at high velocity in the centre, both fine and coarse fuel simultaneously, and great turbulence at one point, less at another.

When burning with an exceptionally small amount of excess air and with high preheat, there is no difficulty in getting quick ignition; the difficulty is to get sufficient heat into the space 35 to 50 ft. from the burner without having too much in the space 20 to 30 ft. from the burner.

The author's paper seems to eliminate fuel sizing as a factor in control of our flame temperatures. There is evidence in the Belle Isle Lime Company that the larger particles failed to burn.

On the strength of the facts, as the author presents them, it seems that we will have to go farther with burner design to get rich mixture at low velocity around the rim and lean mixture at high velocity in the centre and also go farther in our attempts to increase turbulence without effect upon the streams from the burner. Design may take the form of means to create a slight whirl to secondary air, the burner being in the vortex but having no whirl of its own unless perhaps in the opposite direction.

It is interesting to note that instead of water-cooled walls, lime-cooled walls are used, the rotating furnace carrying the heated walls under the bed of lime to give up some heat during a part of each revolution. Controlled rates of combustion rather than high rates are sought; and retarded mixing which is difficult in a rotary kiln where all fuel and air must enter through the end wall within two feet of the burner. One seeks also to avoid cooling lime close to burner by putting a blanket of 1,000 deg. F. air between flame and lime. The author says excessive furnace temperatures are not desirable. He tries with water-cooled walls to extract heat as it is produced; this company also tries to extract heat as produced but for a different reason; namely, temperatures above 2,500 deg. F. cause overburning of lime tending to flux acid brick with basic lime.

In conclusion it is interesting that the experiences under conditions which represent the opposite extreme from boiler furnace combustion are in harmony with the author's experiences and as a result of his paper one is forced to rule out fuel sizing as a factor in plans to control flame. It is hoped, through concentrating efforts on the burner velocities and turbulence in combustion space, to eventually approximate ideal combustion conditions.

A. W. Thorson[9]

The data on furnace temperature versus time for combustion are very interesting, and seem to agree with subsequent work at Carnegie Institute of Technology on coal carbonization. It has been found that when coal is heated, the amount and composition of distilled products depend upon the rate of heating. As this rate is increased due to higher furnace temperature, more products of heavier molecular weight are distilled off which require more time for combustion. In addition, a less reactive residue coke remains as the carbonizing temperature is increased. Both tend to increase the time required for combustion.

The statement that water-cooled furnaces do not retard combustion is further borne out in a more practical way. Recent furnace designs for travelling-grate stoker firing show a replacement of the conventional front ignition arch made of refractory by a long rear arch made of water-cooled tubes which in many cases are left uncovered. The rear arch deflects the flame from the burning fuel over the incoming fresh fuel which is quickly ignited by direct contact with the flame as well as by radiant heat from the flame. The rear arch furnace responds readily to sudden demand for more steam without danger of loss of ignition because the latter does not depend on heated refractory. Results with rear arch installations show reduced solid carbon loss and increased burning rates.

There are three questions the writer would like to ask:

(1) Replacement of mill fan blades is one of the larger items of maintenance in a pulverizer plant. There has been a recent tendency to locate the mill fan on the clean-air side of the pulverizer. How much does this reduce fan

[8] Vice-President, Belle Isle Lime Company, Detroit.

[9] Production Department, Detroit Edison Company.

maintenance, as compared to that of a fan handling both air and coal?

(2) There has been some discussion on the relative ability of underfeed stokers and pulverized fuel to pick up load. Some with the bin and feeder system find it faster than the stokers in their plants, whereas some with direct pulverizer firing find that slower than the stokers in their system, operating on the same coal; presumably due to lack of storage in mills, and to boiler lag. The latter is reported to be a factor in the case of slag-tap furnaces where slag gives up heat when dropping load and absorbs it when increasing load, thereby contributing to boiler lag. The writer would like to hear the author's observations on this point.

(3) A recent compilation showed that of all new capacity under construction or recently placed in service, over 80 per cent was pulverized coal. Is this the result of a tendency toward a wider latitude in fuel selection? The writer would like the author's explanation of this trend.

F. J. Linsenmeyer[10]

In this short discussion of the paper the writer's views may be considered in the nature of support for pulverized fuel applications. The use of pulverized fuel has brought a great many benefits and improvements to industrial and central-station plants, it has opened up opportunities to the designer for some real ingenuity in the selection of water and steam circulation. The older form of Stirling boiler with vertical or horizontal tubes, gives way to circuits which permit steaming in any or all banks of tubes. The direct result is that the stoker furnaces have also adopted new circuits. The writer has always wondered why boiler designers resisted any attempt at steaming in the water walls. Certainly the pulverizer designers lead the way here. These same water and steam circuits may have been the incentive for high pressure plants such as the Loeffler, Schmidt and Benson boilers. While all Americans may not agree with such unconventional designs, they are adopting some of the fringes of these designs.

It seems that the very nature of the pulverized fuel approaching the suspended particle condition is in its favour as having greater potentiality for a complete combustion with minimum excess air.

Actually the fly-ash difficulty is ever present. May there not be a possibility of still better preparation of the fuel until the fly-ash will be so fine as to be suspended further in the atmosphere and carried away by the wind?

The writer believes also the particle size may be a little small. 1/1,000,000 in. is 1/25,000 micron which is fairly small. This comes well below the scale of "smokes" as indicated in the A.S.H.V.E. scale of air-borne solids. If we say *none* would go through a 1,000 mesh scale (if we had a 1,000 mesh scale) we may use this figure for comparison. Assume the particle is 10 microns.

Area of surface..	0.0003 sq. mm.
Volume of particle..........	0.0000005 cu. mm.
Volume per lb..............	30,000 cu. mm.
Particles per lb.............	600,000,000,000
Surface area per lb..........	180,000,000 sq. mm.

Compared with a single one lb. piece the pulverized coal has 600,000,000,000 times as many particles with 8,000 times the surface.

It would seem if the particles could be kept from fusing together fly-ash would be 1/10 as small or at least 1/10 the density (if as large).

Another item that the writer does not quite understand is the time allowed for combustion. It would seem that the maximum would be a second instead of two or more. The writer would close by asking for more detailed information on the final stage of combustion, namely, that of the burning of fixed carbon. Assuming 10,000 lb. coal per hr. produces 5,000,000,000 cu. ft. of combustion gases per hr. in a 900 sq. ft. furnace, then the velocity would be 150 ft. per sec. and the time therefore less than one second.

[10] Professor of Mechanical Engineering, University of Detroit.

W. D. Canan[11]

The author's paper deals largely with theory and design, but there are several matters in connection with the operation of pulverized fuel equipment which are worthy of some consideration, and the writer would therefore ask that he give us more information in connection therewith.

1st: The matter of the power consumption of the coal preparing and firing equipment, referring to auxiliaries such as the pulverizers, primary air fans and coal feeders. Is the power used by this equipment a considerable proportion of the total energy output of the boiler? When it is taken into account is the resulting overall boiler efficiency equal to or better than a stoker fired job?

2nd: Is the emission of fly-ash from the stack a serious problem, and what if anything is being done to solve it? The writer has been quoted figures ranging from 20 to 80 per cent of the total ash produced as being the amount which would pass up the stack. It would therefore appear that, especially in locations where there are a large number of manufacturing plants and residences, considerable objection would be raised to the emission of any such quantity as the above amount of ash. Some users object to using it on account of contamination of the product which they manufacture.

In addition to the fly-ash nuisance there is also the matter of the disposal of the ash taken from the boiler. This ash is not desirable for fill, nor can it be dumped into rivers. Some other method must, therefore, be suggested for its disposal if neither of the above methods of disposal are available. Some years ago several wet gas washing systems were given prominence as a means of collecting and disposing of the fly-ash, but our experience with this type of system has led one to believe that it will not satisfactorily solve the problem.

3rd: Can a pulverized fuel installation be made entirely safe from an operating standpoint? Are explosions in the boiler furnace itself due to incorrect design, or is it entirely a matter of operation? If it is a matter of operation, what, if any, safeguard can be incorporated in the design of the equipment to guard against explosions?

4th: The author has stressed the advantages of water-cooled furnaces, and their desirable features have not been overstated. Almost every boiler installation that goes in today has more or less of this type of construction. There is a tendency to cut down boiler heating surface and add water walls, and the writer is wondering how long it will be until the boiler heating surface as such disappears entirely. In this connection it might be interesting to know what proportion of the total heat absorption of a boiler of modern design takes place in the water walls.

The Author

Mr. Briscoe refers to the change in furnace temperatures caused by a slag or ash deposit on the water-cooled furnace walls and the first row of boiler tubes as 'furnace sensitivity.' Such slag or ash deposit reduces the heat absorption by these surfaces, thereby raising the temperature of the products of combustion when they enter the boiler and superheater. This higher gas temperature raises the superheat and may also result in slag or ash deposit in the superheater and boiler.

With most water-cooled furnace designs the slag or ash accumulates to a certain degree and then begins to

[11] Rust Engineering Company, Pittsburgh, Pa.

drop off as fast as it is deposited. The temperature then remains nearly constant. This nearly constant condition of slag deposit and temperature depends a great on the adjustment of burners, air supply, and the fineness of coal. The slag deposit is less when the coal is fine and when the burners and the air supply are so adjusted that the combustion is nearly complete when the gases reach the boiler. Delayed combustion is the greatest factor in the deposition of slag on heating surfaces. The air supply should be adjusted according to excess air or CO_2 content in the gases leaving the furnace, and not at the exit from the boiler, economizer, or air heater, where the gases may be greatly diluted by air leakage. Careful operation and good maintenance of the mills, furnace and setting is as important for good results as good design.

Low temperature of gases entering the boiler or superheater eliminates much of the slag trouble, but there is a limit to which this temperature can be reduced, particularly in an installation with high superheat temperature. The gases must be hot enough when they enter the superheater to contain enough heat at sufficiently high temperature to produce the desired superheat. If the temperature difference between the hot gases and the steam is too small a very large and expensive superheater is required.

Large cross section of the gas passage at the entrance into the boiler results in lower gas velocity and greatly reduces the slagging of the boiler and superheater. Careful operation contributes much towards the elimination of slagging. However, with coals having very fusible ash some slag deposits must be periodically removed. Therefore, it is desirable that facilities for cleaning during operation should be provided when the steam generating equipment is designed. There are many installations which are kept in operation for many months at a time. If any cleaning of slag is necessary it is done without any interference with operation.

The temperature of superheated steam rises with rating. The following methods are used to keep the superheat nearly constant over a desired range in steaming rate.

(*a*) The superheat is kept nearly constant by a damper controlled gas by-pass which permits a varying volume of the hot gases to by-pass the superheater. The superheater is designed for the lowest steaming rate at which the full superheat is desired. As the steaming rate rises above this point, part of the volume of hot gases is made to by-pass the superheater. Thus, the rising temperature of the hot gases entering the superheater is compensated by their decreasing volume. This method of control requires a larger and more costly superheater, an idle gas pass around the superheater and a damper to regulate the volume of gases flowing through the by-pass. The regulation of the by-pass damper can be done manually or by an automatic control.

A modification of this method is used in a double boiler with a large superheater on one side and a smaller one on the other side. Varying quantities of gases are passed through the two sides. Superheat is controlled by regulating the flow of gases through the two sides of the unit.

(*b*) The superheat can be controlled by the manipulation of the fires. In this method burners are placed at different heights in the furnace. At low rating the burners located in the upper part of the furnace are put in operation and the fires are brought closer to the superheater. At high rates of steaming the lower burners are used. For superheat control over a very wide range of rating this method can be used in combination with a by-pass damper method.

(*c*) Superheat is maintained nearly constant by the combination of radiant with convection superheater. The radiant superheater is placed in the furnace as a part of the wall cooling surface, or, part of the superheating surface is placed between widely spaced boiler tubes in the first bank of the boiler. The surface in such locations is exposed to radiation from the furnace and absorbs a greater proportion of heat at low rating. The main part of the superheater is located in the usual place back of the first bank of boiler tubes and absorbs heat by convection. The steam flows first through the radiant section and then through the convection superheater. This method of superheat control is largely a matter of proportioning the amount of surface in the two parts of the superheater. It may be combined with the methods outlined under (*a*) and (*b*).

(*d*) The superheat can be controlled by a separately fired superheater. In this method the superheater is set over a separate furnace and the superheat is controlled by the amount of fuel burned. This method has the widest steaming range with constant superheat. It is also the most expensive and is now seldom used.

(*e*) The superheat can be controlled by partial desuperheating at the high rates of steaming. In this method the superheater is designed to give full superheat at the desired low rating. At higher ratings the steam is partly desuperheated after it has gone about half way through the superheating process, the extent of the desuperheating being controlled by the final temperature. The superheater is installed in two parts with the desuperheating apparatus between them. This method of superheater control is rather complicated and is seldom used in this country.

Direct impingement of concentrated flame against water-cooled walls is not desirable, but flame sweeping or brushing over the walls is not objectionable. By direct impingement is understood the condition in which the flame strikes the wall nearly at right angles a short distance from the burner. A flame is sweeping over a water-cooled wall when the flame moves nearly parallel to the wall a considerable distance from the burner. In tangential firing the flame may sweep over the walls after it has travelled nearly diagonally across the furnace.

Preheated air helps the ignition because less heat is required to bring the incoming mixture of coal and air to ignition temperature. The ignition is quicker and closer to the burner. There are practical limits to the temperature to which air can be preheated. This limit is usually set by the efficiency of the steam generating unit. If high efficiency is desired the temperature of gases entering the air heater should not exceed about 650 deg. F. It is not economical to bring the temperature of preheated air closer than about 100 deg. to the temperature of gases entering the heater because the air heater would become very large and expensive. The weight of gases is always higher than the weight of air to be heated. The specific heat of the gases is also higher than that of the air. Therefore, the temperature rise of the air is greater than the temperature drop of the gases. The weight of gases is equal to the weight of air going through the air heater plus the air leaking into the setting plus the weight of the ash-free fuel. The specific heat of the products of combustion, particularly with high hydrogen and high moisture coals, is 10 to 15 per cent higher than the specific heat of air. Usually for every 300 deg. of the temperature rise of the air there is only about 200 deg. drop of the temperature of the gases. Thus, if the temperature of the gases is to be reduced from 650 to 350 deg. F. the temperature of air would rise from 100 to 550 deg. F. If the temperature of gases entering the air heater were 900 deg. F. it would require a very large air heater to bring the temperature of air to 800 deg. F. The air temperature rise would be 700 deg. and the gas temperature drop would be about two thirds of 700, that is, about 466 deg. F. The resulting temperature of gases would then be 434 deg. The overall efficiency of the steam generating unit would then be about 2 per cent lower than when the gases leave the air heater at 350 deg. F.

A further disadvantage of the highly heated air would be the oxidation of the air heater and air ducts, more expensive expansion joints, and insulation covering. To reduce the oxidation of the air heater and the ducts they would have to be made of heat resisting steel alloy. There is no limitation to the temperature of preheated air from the standpoint of combustion.

During the last few years efforts have been made to develop a mill which would pulverize coal to more uniform fineness with lower power consumption and lower maintenance. By more uniform fineness is meant the reduction of the percentage of oversize and the superfine coal.

Mr. Sitter brought up the question of the necessity of feedwater treatment with water-cooled furnaces. The water-cooled furnace walls absorb heat at a high rate and must be kept clean internally to prevent their over heating. With internally clean tubes the temperature of the metal seldom rises over 50 deg. above the temperature of the water inside of the tube. To keep the surfaces internally clean the feedwater should be properly treated to prevent scale formation. All make-up water should be treated in a separate feedwater treatment plant. This primary treatment should be followed by a secondary treatment with phosphate which is supplied directly to the boiler through a separate line. The methods of feedwater treatment have been sufficiently developed that there is no excuse for the formation of scale inside of the boiler.

Very widely fluctuating loads require large steam drums to take care of the variation in water level and at the same time leave sufficient space in the drum to separate the water from the steam. It is much easier to obtain clean steam with a steady rating than with widely fluctuating load.

Oil torches are more stable and are preferable to gas torches for lighting pulverized coal fires. The oil torch has a hot and luminous flame and if the torch is blown out the furnace is not filled with explosive gas as may be the case with gas lighting torches. Oil leaks are more easily detected than gas leaks particularly leaks due to incompletely closed valves.

To take one mill out when two mills are supplying the fuel to one boiler the output of the mill to be taken out should be reduced in about three equal steps to the minimum output at which it will operate satisfactorily. At the same time the output of the mill to remain in operation should be increased by similar steps. The air supply should also be shifted to maintain the stability of flame. When the operator has assured himself that the flame remains stable, the mill to be taken out is shut down and the load fully taken by the other mill.

There are coals which are classed as bituminous coal with the percentage of volatile matter as low as 14 per cent. When the volatile matter drops below 20 per cent a delay in the ignition becomes quite noticeable. For burning such low volatile matter coals, provision must be made for the reduction of primary air. This is at times difficult to do in direct firing because the mill must have a definite minimum quantity of air to operate satisfactorily. This minimum air for the mill may be too much air with the coal to produce good ignition. When low volatile coal is burned in a tangentially fired furnace the air supply around the coal nozzle should be cut off and the secondary air should be supplied through the air port above the upper burner. With high volatile coal the air around the coal nozzle should be reduced to bring the ignition to the burner without the flame backing into it. The air ports above and below the burner should be kept fully open, and the air supply should be controlled by the air pressure at the burner, by regulating the speed of the pressure fan or the damper in the air supply line. Such air regulation supplies the greatest amount of energy to the furnace for mixing. The greatest heat release will occur in the centre of the furnace in the plane of the burners where the streams of coal and air meet and where the mixing is more intensive. Any mixing that is done at the burners should be done to quicken the ignition. Mixing for rapid combustion is done in the centre of the furnace away from the burner where the secondary air does not interfere with the ignition.

High volatile coal is better suited for a widely fluctuating load particularly with direct firing. The ignition is more stable because the volatile matter makes rich mixture which ignites readily even with wide fluctuation in the air supply.

Irregular flow of coal to the pulverizer due to moisture and excessive fines is one of the drawbacks of direct firing. If the hanging of coal is between the feeder and the pulverizer, hot air supplied to the pipe connecting the two may prevent the hanging, but increases the flow of air through the mill which at times may not be desirable for good ignition. If the hanging of coal occurs before the feeder it is difficult to remedy.

Mr. Showers points out the advantage of some refractory surface in a pulverized coal furnace. Such surface when hot re-ignites the fires after a short interruption in the fuel supply to the furnace. In many of the pulverized coal installations with horizontal firing such surface is on the front, or the burner wall. This wall is made of refractory for structural and economic reasons; it is easier to make the front wall of refractory than of water-cooled surface, because the water-cooled tubes have to be bent around the burners and can not be made to cover completely the burner wall. Slag may stick to such refractory surface and accumulate and may have to be removed by hand tools. In other cases the refractory may wash out and the wall require frequent patching. The re-ignition of the fuel after a short interruption may not occur promptly. It may be delayed until the furnace is filled with coal mixture and then ignite with a violent puff which causes leakage into the setting. If feeding of coal to the furnace is unreliable a small oil burner is a better security against a loss of fire.

The temperature of a pulverized coal flame even in a completely water-cooled furnace is considerably above 2,000 deg. F. At lower rating the flame may be reduced to a smaller volume but the temperature of the flame is practically as high as it is at high ratings. A match can be burned in a completely water-cooled furnace with an average rate of heat liberation of fraction of a B.t.u. per cu. ft. of the furnace volume. The flame will occupy a volume less than a cubic foot and have a temperature of about 2,000 deg. F. Furnaces are made completely water-cooled to avoid refractories in the furnace, the sticking of slag to them, and also to get away from the maintenance of such refractories.

It is largely the extent of the surface of the flame that determines the amount of heat radiated to the water-cooled walls. At low rating the surface is small because the volume of the flame is small. The amount of heat radiated to the walls is small because of the small flame surface. At high ratings the flame fills the furnace almost completely. The surface is large and a large amount of heat is radiated to the furnace walls.

Mr. James presents interesting and complete information on the use of pulverized coal ash. His discussion is a valuable addition to our knowledge about the use of pulverized coal.

Mr. Drysdale brings up an interesting point in connection with maintaining nearly constant superheat with varying steam output. This problem is more difficult to deal with in the design of high steam pressure and temperature units. The gases entering the superheater must be hot enough to give the desired superheat and they should not be too hot to cause slagging of the boiler and superheater. The designer has to work between two serious limitations. The methods for obtaining nearly constant superheat have been described in connection with Mr. Briscoe's discussion. The method outlined under the manipulation of fires promises a satisfactory solution. This method strives to maintain the temperature of gases entering the superheater nearly constant regardless of their volume.

Mr. Thorson asked three questions which can be answered as follows:

The maintenance of mill fans averages about 0.5 cents per ton of coal pulverized. If other maintenance remains the same, placing the mill fan ahead of the mill would reduce the overall mill maintenance by 0.5 cents. There are some objections to such mill fan location. The mill is put under pressure and there may be leakage of coal dust from the mill and particularly from the coal feeder. Coal dust may be forced into bearings and increase their maintenance.

It does not seem likely that a stoker installation would have a quicker pickup than a direct fired pulverized coal installation. It takes time to build up a good stoker fire that will carry heavy load over extended periods. Banked stoker fires or low rating fires are not usually in good condition for heavy load.

There is a decided trend towards pulverized coal firing which is probably due to wider latitude in fuel selection. "Change of coals upsets the operation of a pulverized coal plant to a much smaller degree than a stoker fired plant."

Explosions in pulverized coal furnaces are usually caused by faulty operation. The explosions are generally less disastrous than explosions in oil or gas fired furnaces. Coal is pulverized to make it more inflammable or combustible. The greater inflammability makes it more explosive. The greatest asset of safety is a good operator who does not take risks.

Originally the boiler was made to evaporate water. In modern high pressure steam generating units the boiler performs mostly a structural service. The boiler supplies rigid water-cooled walls, water-cooled supports for the superheater, water-cooled frame for partitions for gas passages through or around the superheater, and a water-cooled chamber for the economizer. The water evaporating duties have taken secondary place. We shall always have a boiler to perform the structural service.

A water-cooled furnace makes 25 to 50 per cent of the steam made by the steam generating unit.

Professor Linsenmeyer asks about the time required for combustion. This time depends on the size of the particles, the very fine particles burn instantaneously, the very large ones require more than two seconds because they contain many times more combustible than the very small ones, and because their combustion must be completed after the concentration of free oxygen in the furnace gases has been greatly reduced. In the last part of the path of gases in the furnace the oxygen concentration is 2 or 3 per cent. In fact some of the very large particles never burn completely.

Mr. Canan's questions may be answered as follows:

The power consumption of coal preparation and burning equipment in a pulverized coal plant is greater than it is in a stoker fired plant. In general the difference probably does not exceed two per cent of the energy represented by the boiler output, and is offset by a higher overall operating efficiency. The application of pulverized coal is about fifteen years old and has ceased to be a novelty. There must be a tangible reason for the preference for pulverized coal. There are undoubtedly some cases where stokers have an advantage over pulverized coal.

The emission of fly ash is greatly reduced by various dust collecting devices. Some of the mechanical devices can be installed at low cost. They collect most of the coarser dust which would settle near the plant if allowed to go out of the stack. The emission of stoker cinders has also become objectionable and in some cases provision must be made for collecting them. If dust collectors must be used with either firing, engineers apparently prefer to use pulverized coal.

The disposal of the collected dust is a problem that seems to lack a good general solution. There are apparently many special solutions: Mr. James presented one of them.

Ground Resistance Measurements at Large Substations

J. M. Crawford, A.M.E.I.C.,
The Shawinigan Water and Power Company, Montreal, Quebec.

Paper presented before a meeting of the Montreal Branch of The Engineering Institute of Canada on November 11th, 1937.

SUMMARY.—**After briefly outlining several methods of making ground resistance measurements, the author discusses some of the difficulties encountered in carrying out such tests, and describes the procedure and results obtained in a number of actual cases.**

The problem of measuring the resistance to earth of the grounding network at a large terminal station or powerhouse is quite an important one on an extensive power system. Current can flow to earth through the station ground due to breakdown of insulation, or through the grounded neutrals of power transformer banks. During a fault, currents of the order of several thousands of amperes may frequently occur. If the value of resistance is not sufficiently low, the station ground potential may be raised above that of true earth by several thousand volts. This may result in blowing fuses on telephone lines, as well as the possible breakdown of insulation on low-voltage equipment. At the same time dangerous potential gradients may result in the immediate vicinity, with consequent hazard to life.

It is quite apparent that not only must the value of ground resistance at a large substation be determined, but a reasonably accurate method of measurement should be used. Although in theory such tests are relatively simple, considerable difficulty is sometimes encountered in their practical application. It is not proposed to enter into a detailed discussion of the various methods of measuring low-resistance grounds, or of the different types of equipment available on the market today. A brief outline of the principles involved in the three best known methods is given for the purpose of showing the limitations which they impose under certain conditions. The results obtained in a number of actual cases will then be described.

A source of power, together with an ammeter and a voltmeter, can be used in any of these cases. Earth testers are also now on the market, embodying all the requisites in the form of a single portable instrument.

Methods of Measurement

The simplest method is generally referred to as the "loop-resistance" test. The series resistance of an auxiliary ground and that under test, along with the lead between the two grounds, is measured, and the required ground resistance obtained by simple arithmetic. This auxiliary ground, which is absolutely necessary in this procedure, must be: (1) located sufficiently distant from the substation to ensure that the total resistance area is covered by the loop measurement, (2) of known value, (3) of a comparatively low value if the ground under measurement has a resistance of one ohm or less. In this case a low-resistance lead is necessary between the two grounds. It is not often that all of these conditions are satisfied at any one particular location under consideration.

Some cases lend themselves more readily to the "three-point" method of measurement. Two auxiliary grounds are required, but their resistance values need not be known. They must, however, both be

(1) Located at a suitable distance from the station,
(2) Of a comparatively low value.

The loop value of each pair in turn is measured, and the resistance of the ground under test calculated by means of the well-known formula $R=\frac{R_1+R_2-R_3}{2}$. This method does not readily lend itself to the measurement of low resistance as the result in such cases is rather inaccurate, and sometimes negative in value, unless considerable care is exercised in obtaining good auxiliary grounds. In sandy or rocky territory this is rather difficult, if not impossible.

The "fall-of-potential" method is probably the most applicable in difficult cases. Auxiliary probes are again necessary, but their resistance need not be particularly low. A current is circulated through a suitably distant probe and the substation ground. By means of an intermediate probe the potential drop across the grounding network is measured. The ratio of potential to current gives the required resistance. Readings are taken with the potential probe located at various distances from the substation, and a curve drawn with resistance readings as ordinates, and potential probe spacings as abscissae.

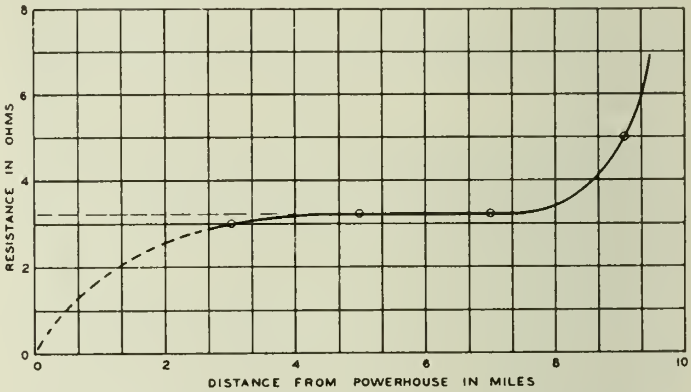

Fig. 1—Ground Resistance Curve at a Large Powerhouse.

When the curve contains a horizontal section, the test engineer knows that the auxiliary probes have been placed at a suitable distance, and a true value of resistance is given by the reading shown on the flat portion of the curve.

With these methods available, what procedure should be followed in testing a grounding network with a resistance of the order of one ohm or less, located in territory where the soil consists of pure sand to a depth of fifteen or twenty feet, and no low-resistance auxiliary ground is available within many miles? Quite obviously the "loop-resistance" and "three-point" methods are out of the question. On paper the solution is obvious, viz. use the "fall-of-potential" test, locating the auxiliary probes at a sufficient distance from the substation. In the case where water-pipe systems or transmission line ground wires are connected to the substation structure, this distance may be a matter of miles. Fortunately there is generally a telephone line from the location to a remote point, but the difficulties do not end here. In sandy or rocky soil the resistance of ordinary driven probes may well be 2,000 ohms or more. While a reading may be obtained with an earth tester, it might not mean a great deal, and in some cases sufficient energy is not available to operate the instrument through such high resistances. When using a separate source of power quite inaccurate results are very apt to be obtained unless special meters and high values of voltage and current are used. It is thus seen that the measurement of ground resistance in rocky or sandy territory is not always an easy problem, and on occasion is out of the question unless a considerable amount of time and money are expended. Each case requires special study, and the method to be employed depends upon a number of factors. A few practical examples will serve to illustrate some of these points.

Data from Field Tests

The design and measurement of the grounding network at a 220 kv. terminal station was rather interesting. At this particular location test holes showed a depth of fifteen to twenty feet of sand, a layer of hard pan, and then blue clay. Previous tests made on buried cable in somewhat similar soil had given rather disappointing results. At one site 800 ft. of No. 00 cable buried to a depth of 18 in., and attached to seven 8 ft. driven rods, had a resistance of 30 ohms. The grounding medium must obviously reach the permanently moist low-resistance clay, so that plates were out of the question for economic reasons, and the choice was easily made in favour of driven pipes. A number of one inch pipes were installed, and resistance measurements made on these by means of the "three-point" method. The following tabulation presents data obtained while driving one of the pipes in the bottom of a 14 ft. test hole.

Depth below ground level	Ground resistance
19½ ft.	420 ohms
20½ "	170 "
22 "	81 "
24 "	33 "
26 "	24 "
29 "	18 "
34 "	15 "

With these figures available, the grounding network was designed and the installation completed with 41 pipes driven to a depth of 40 ft. and nine pipes to a depth of 20 ft., covering an area of approximately 400 ft. by 500 ft. These individual grounds were, of course, connected together by heavy copper cable.

As the soil in this whole district is sandy, it would have been rather difficult to obtain good auxiliary probe points, so a conveniently located grounding network about 3½ mi. away was used. Not only was the resistance of this system known, but it was quite low—of the order of 0.13 ohms. In addition a transmission line was available between the two points with conductors of 336,400 c.m. A.C.S.R., giving a low-resistance connection with all three wires connected in parallel. The resistance of the line conductors was first obtained, and then the loop measurement made of substation ground, connecting conductors and auxiliary grounding system, from which the required resistance value was found to be 0.67 ohms. At a later date connection to overhead ground and buried counterpoise wires lowered this value somewhat. This case is unusual as one does not often have a set of low-resistance conductors leading to a low-resistance reference point suitably distant from the substation.

Another interesting case on which the author worked was that of a large powerhouse ground consisting of penstocks, a water-pipe system to the operators' houses, and a 220 kv. transmission line with overhead ground and buried counterpoise wires, all connected together. The surrounding terrain was quite rocky.

A telephone line ten miles in length was available, remote from the transmission line, with a fairly good ground, of unknown value, at the far end. At occasional points along this telephone line swampy sections were found where auxiliary probes could be driven, having resistance values of 400 and 500 ohms. An earth tester was used in the "fall-of-potential" method, and corrections applied to take care of the high-resistance potential points. The series of values obtained were plotted in curve form as shown in Fig. 1.

To obtain an accurate reading when using the "fall-of-potential" method of measurement, the potential probe point should be located at a distance from the substation of at least five times the diagonal of the rectangle covered by the station grounding network. A greater distance is preferable in most cases. A practical demonstration of this principle was obtained in measurements made on a station ground covering an area of 100 ft. by 112 ft. An attempt was made to make a test with the current probe located at a distance of 600 ft. and potential probes at intermediate points. The result was curve No. 1 in Fig. 2. A second test was completed with a telephone line to the operator's house about 1,500 ft. distant. Good results were obtained as plotted in curve No. 2, giving a ground resistance value of 12 ohms.

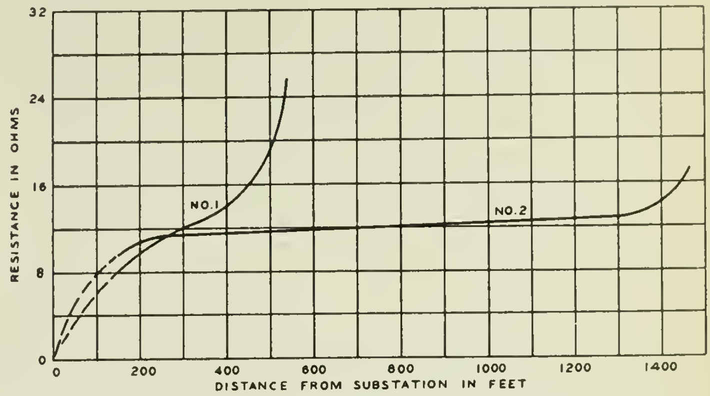

Fig. 2—Resistance Curves Taken with the Current Probe Located at a Distance of (1) 600 ft., (2) 1,500 ft.

At one location where the ground covered an area of 300 ft. by 800 ft., but was tied into a large water-pipe system, fairly good results were obtained by utilizing a section of telephone line 2.2 mi. long. The resulting data are shown in Fig. 3. In still another case a telephone circuit 2.8 mi. in length was used at a small powerhouse to measure the resistance value of the ground system, which was connected to a dam structure some 2,000 ft. distant. Reasonably satisfactory test results were obtained but longer leads would have given more accurate data.

Telephone Line Used for Connecting Leads

This method of utilizing the two wires of a telephone line as leads to the auxiliary probes is one which has been successfully used by the author in a number of cases. It is often the only way in which a connection can be made to reference points located at a sufficient distance from an extensive grounding network to ensure that the total resistance area involved is included in the measurement. The line, of course, must be cleared of all telephone and protective equipment before making the test. Certain

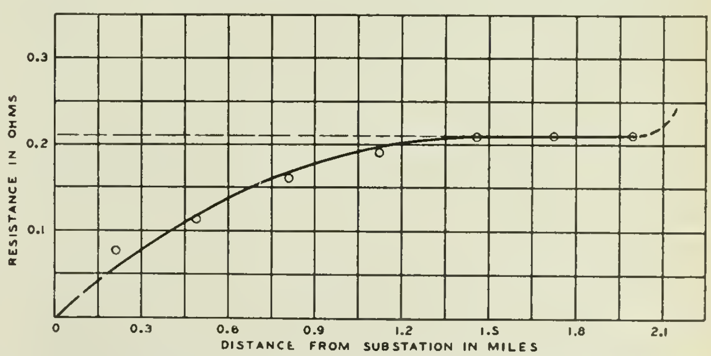

Fig. 3—Resistance Curve of a Substation Ground Which Was Connected to a Large Water Pipe System.

precautions must be taken to reduce the magnitude of inaccuracies caused by induced currents from parallel power circuits, as well as other errors which may creep into the results. In one case, after an earth tester had been used on a telephone line almost 3 mi. long in the "fall-of-potential" method, it was possible to check the result obtained against the value of resistance as measured by the "loop-resistance" test. The discrepancy between the two values was less than two per cent.

Difficulties Encountered in Tests

The difficulties encountered in conducting resistance tests on a large substation ground are recapitulated below.

(1) The area covered by the grounding network of high-voltage stations is inherently large. Whatever type of test is considered best, auxiliary grounds or reference points must be established at quite some distance to ensure the inclusion of the total resistance area in the test. Test leads up to several miles in length may be necessary.

(2) The lower the value of resistance to be measured, the more care must be taken to obtain good auxiliary grounds; the requisite low value depending upon the method used and the magnitude of the resistance to be measured. In rocky or sandy territory this requirement leads to a great deal of extra work.

(3) When the substation ground is connected to the water mains of a city, it is somewhat of a problem to decide how the measurement should be made, and what relation the value of resistance so obtained bears to any particular ground contained within the resistance area of the large interconnected ground network.

The above data have been selected from the results of a large number of ground resistance tests made by the company with which the author is associated. These tests covered all the company's substations and powerhouses, both large and small, and were for the most part commenced with very little preparation and completed in a relatively short period of time. These tests were followed up by additions to the grounding networks when a study of the various factors involved showed that improvements were necessary.

DISCUSSION ON THE PAPERS ON

Flood Control in Southwestern Ontario[1]

Presented at the Annual Meeting of The Institute, London Ont., February 2nd, 1938

O. Holden, A.M.E.I.C.[2]

For the purpose of studying methods to be used for amelioration of flood damage, far more data are required than are available at this time. Mr. Marr, in addition to the tabulation of records of past flow in the Grand and Thames rivers and their tributaries, has made a statement as to the maximum flow at the peak of the flood. It is the writer's understanding that the south branch of the river was far beyond the limits of any cross-section in which flow measurements had actually been taken. No doubt Mr. Marr has been able to supplement the published records from data collected by observers on the ground, and this, with his experience in interpreting field data of this character, has enabled him to determine the figures for maximum flow submitted.

It is to be regretted that, in such events as the recent severe floods, particularly that on the Thames river, local organizations do not succeed in collecting more accurate and more authentic data, although at such times there are so many matters of great urgency that this omission can readily be understood.

In approaching the study of flood conditions, one of the most serious handicaps is the paucity of accurate data concerning the run-off from the drainage areas. On the Thames river, for many years, only two gauges have been maintained, one on each branch near London; and on the Grand, since 1923 only one gauge, that at Galt. That is to say, in these watersheds, having a combined area of over 5,000 sq. mi. and running through one of the most densely populated sections of the province, continuous records of water level and flow on the streams are really only available at three points.

Any estimate of the distribution of flow over the various portions of the drainage area must necessarily be based on very broad assumptions. For example, the run-off from the Conestogo, one of the principal tributaries of the Grand river, which has at times contributed 47 per cent of the total run-off at Galt, has been recorded for a period of only three years.

From a study of the available records of the flow of these rivers during flood periods, one is impressed by the rapidity of the increase and corresponding decrease in discharge. These rivers are very 'flashy,' a natural consequence of the comparatively steep gradient in the upper reaches particularly, and the fact that not a single natural reservoir in the form of a lake is to be found. The writer believes that these are the main factors in giving the extremes of high and low flows that are experienced. On account of the comparatively short duration of the high flow, the volume of water involved is relatively small. If, by the provision of protective works at critical points along the rivers, a reasonable increase in flow could be passed without damage, it will be seen that the retention of a relatively small volume would be sufficient to reduce the flow to the amount within the capacity of the channels. Unfortunately, the information available with regard to the flows during the course of the floods is so meagre that some uncertainty exists as to how much surplus water must be handled to eliminate damage.

There is a further factor which, in some instances, has contributed to the increase in river levels during high flows, namely, the encroachment on the channel by various structures, which in times of extreme floods act as restrictions to the free passage of the water.

While the general subject dealt with in the papers is essentially flood control, the writer would like to draw attention to the other side of the picture, namely, the low flows. In Mr. Marr's paper low flows as well as the maxima are listed.

On the Grand river a flow as low as 26 cu. ft. per sec. at Galt is recorded, and while the hazard and loss consequent on high flows is more spectacular and more forcibly impressed on one, the disadvantages resulting from the low summer flows cannot be overlooked. It is possible that the advantages to be gained by an artificial increase in the low summer flows may be equal to those resulting from improvement of flood conditions.

The writer would like at this point to remark on the excellent service that Mr. McCubbin has rendered in indicating the contrary effects of drainage on floods under different conditions. A critical examination of his paper will show too, the difficulty of obtaining experimentally definite results in connection with so complex a subject as the effect of drainage on floods.

---

[1] Papers published in The Engineering Journal, February 1938.

[2] Chief Hydraulic Engineer, The Hydro-Electric Power Commission of Ontario.

The problem is one upon which very divergent opinions are held, many of them based purely on inductive reasoning, on account of the difficulty and expense of securing accurate experimental data on the many factors that bear on the question. Thus it is desirable for everyone to consider carefully the opinions expressed in this discussion no matter how much they may differ from his own.

W. H. Breithaupt, M.E.I.C.[3]

Grand River Conservation

It is pertinent at this time to draw renewed attention to the practicability of conservation on the Grand river, which drains the central part of the peninsula of Southwestern Ontario.

The question is not new. As long ago as 1905 the writer read a paper on the Grand river before the Canadian Society of Civil Engineers. He has repeatedly since then spoken on the subject, notably at a meeting of the Hamilton branch of The Engineering Institute of Canada, in 1924.

Precipitation data on the watershed are scant, but it seems fairly well established that, though varying in cycles, precipitation has not materially changed since beginning of observation. What has greatly changed with deforestation is the rate of run-off, the carrying off of water by the streams. A great regulation asset, about 400 sq. mi. of swamp in the headwater area of the river, was, by mistaken government policy in assisting its drainage, destroyed.

The regimen of the river is regular in that large floods are always in the spring, on snow melting, and invariably originate on the upper river. They depend on water-content of the ground, on accumulation of snow, on the rapidity of its melting and on accompanying rainfall.

A topographical survey of the river from Galt to Elora and up the Conestogo tributary, made by the Hydro-Electric Power Commission after the disastrous floods of 1912 and 1913, revealed three large basins with capacities as follows:

In Pilkington Township just below Elora	2,800,000,000 cu. ft.
At Hollen on the Conestogo	1,200,000,000 " "
At Blair	1,300,000,000 " "

For the Pilkington basin a dam 2,400 ft. in length and about 60 ft. in average height would be required, not a difficult dam in view of what has been done. In the Muskingum improvement just completed in Ohio the Bolivar dam is over twice the length and height of that proposed for Pilkington. A number of the Muskingum Conservancy District dams are earth dams with permeable foundation sites.

The Pilkington dam as an earth dam would require 800,000 to 1,000,000 cu. yd. of earth, depending on detailed examination of the site, which, at 30 cts. per cu. yd. in place, would amount to at most $300,000, leaving $700,000 to complete the dam for $1,000,000. It seems imperative that the Pilkington basin should be the first to be considered, in any project of Grand river improvement. It has six times the capacity of the proposed storage at Waldemar, has more than twice the watershed behind it, and is twenty miles nearer Kitchener, the first main population centre down stream. The need of the population above Elora for river improvement does not compare with that of the cities, towns and villages below Elora.

The Pilkington storage could, on conservative estimate, give a minimum summer flow of 400 to 500 cu. ft. per sec., a boon to Kitchener in the way of water supply and as a diluent of its sewage disposal effluent. Galt and Brantford would also very greatly benefit.

There is another possibility, that of power development.

The total annual flow of the river at Galt is probably well over thirty-six billion cubic feet, equivalent to a continuous flow of over 1,100 c.f.s. With the basins mentioned and additional storage above Elora and on the Conestogo, and storage on the Speed and its branch the Eramosa, the total storage above Galt could probably be brought up to seven billion cubic feet, which should give an all the year flow of 700 to 800 c.f.s. or more at Galt.

Galt is a little more than 600 ft. higher than Lake Ontario and is near the Niagara escarpment, 18 mi. or so from the Dundas marsh and the old Des Jardins canal, which extended navigation to Dundas before Hamilton was a port.

The recorded minimum summer flow at Galt in 1937 was 26 c.f.s. and from Brantford a minimum flow of under 50 c.f.s. is reported.

Physically there is nothing to prevent diversion of say 600 c.f.s. from below Galt to Lake Ontario and developing power to the extent of 30,000 to 36,000 hp. A large natural basin at Flamboro, just above Dundas, improves the situation in that it would enable night storage and thus give more water for the next day. And as to diverting water from the river, any one who prevents the present destructive floods and gives a minimum low water period flow of five or six times what it is now should well be entitled to use of the surplus water. Furthermore the minimum flow below Paris could be greatly increased by impounding the Nith river, as could well be done a short distance above its outlet into the main river at Paris.

What an ideal solution of full conservation of the Grand river this would give, and paid for by force of the river itself, and of what inestimable value to the entire Grand river watershed!

Stanley Shupe, M.E.I.C.[4]

There are now at hand practically all the data relevant to the subject, the facts of weather statistics as presented by Messrs. Patterson and Marr, the effect of agricultural drainage by Mr. McCubbin, and the progress to date and proposals of stream regulations by artificial storage by Mr. Adams. The suggestions of Mr. W. H. Breithaupt, who is the father of the scheme in general, vary as to location and detail, but the idea of storage is apparently agreed to by all as the only answer and should therefore be proceeded with as soon as plans may be approved.

Otherwise money will surely be expended in equal or greater amounts in repairing damages, sewage treatment, water supply, loss of flats for growing trees and in other unsatisfactory outlets over the whole basin. There is also no doubt that the tendencies are toward greater extremes in river flow.

As compared to agricultural drainage, let us consider the effect of the storm drain systems in towns and cities. A normal rate of run-off for forest or swamp may be as low as 5 per cent, agricultural lands 20 per cent, residential districts 45 per cent and business districts up to 90 per cent. It is apparent that the run-off is increased and delivered to the rivers faster as settlement proceeds. In fact, storm drains are designed for concentrations of 2 in. per hr. rate for the first ten minute period, which means minimized retention of water from the average storm.

A summary follows of the meteorological records from the Kitchener station, showing an average rainfall and snowfall over five years as 22.08 and 42.55 in. respectively, also a chart compiled primarily to show snow shovelling costs in relation to amount. There, as in flood dangers, it is the amount of accumulation rather than total precipi-

[3] Consulting Engineer, Kitchener, Ont.

[4] City Engineer, Kitchener, Ont.

tation as intervening thaws may remove much from time to time.

Also in rainfall it is noted a slow rain may soak in while a fast rate of downpour is a cause for more concern. For instance, 1.3 in. of rain fell all day January 14th, 1937, in Kitchener and despite frozen surfaces, caused no harm, whereas on February 21st only a half inch fell but so quickly that severe washouts and erosions of the softened surfaces resulted and drains were taxed to capacity.

Primary treatment of sewage may be obtained up to 60 and 70 per cent at a cost of $22 per million gallons by use of a combination of: coarse screens, fine screens, detritors, settling tanks, Imhoff tanks, and septic tanks. Effluent from a primary treatment plan requires about ten times dilution to leave a stream safe for, say, boating, fishing or bathing.

Without such dilution, secondary treatment is necessitated to reach 90 per cent at a gross cost of capital and operating expenses of say $40 per million gallons per day, which is most burdensome to a municipality, since it requires additionally one or more of the following: slow sand filters, trickling filters and humus tanks, activated sludge treatment and final sedimentation, chemical precipitation, etc. to say nothing of sludge handling facilities.

Contamination of streams may not be decently tolerated, so that the minimum flows of a river are of vital concern. A very small minimum flow in a populated area practically justifies proceeding with conservation works.

The following notes as to local conditions in Kitchener may be of interest.

The usual January thaw caused some washouts but the unusual heavy rain of Sunday, February 21st, 1937, culminated in floods and severe erosions, causing immediate expenditures of $600 and more at later dates, such as storm drain on Filbert Street at Spring Street, extra inlets at Union and Esson Streets, protection as requested by the Town of Waterloo at Ferdinand Street and extra roadway repairs, and was the reason for the Board of Works deficit.

The spring floods were, fortunately, very moderate on the Grand river despite the disastrous effect along the Thames river from the excessive rains of April 25th and 26th.

The unusual open winter required street sweeping during January and February to the extent of a few hundred dollars and minimized the snow shovelling service.

To satisfy the courts, storm drains should be designed for rates of downfall of 2 in. per hr. for periods of ten minutes with corresponding reductions in rate and time spread, the run-off co-efficient being applied as a factor to suit the district concerned. It is seen that this Department is much concerned with concentrations and requests aid in securing the additional recording devices for the local Government Meteorological Station.

The following tables were compiled from records of N. C. Helmuth, local government representative:

1937	Mean Temperatures		Precipitation	
	Maximum	Minimum	Rain	Snow
January	34.3	21.16	4.25 in.	3.0 in.
February	32.32	18.63	1.55 "	4.25 "
March	31.42	19.93	....	6.5 "
April	50.17	35.48	3.97 "	1.0 "

E. T. Sterne[5]

With the information in the papers presented this morning, along with that in the MacIntosh Report or the Hogg Report of the Ontario Hydro-Electric Commission, sufficient information of at least one specific river is now available to make it possible to take the next steps, to put the remedial works into effect. It is true that more information would be desirable and possibly could be secured on specific points, but that is true of all engineering.

Between $400,000 and $500,000 has already been spent in Brantford to put up a dyke system as a protection against flood. Theoretically those dykes could be raised as high as Haman's gallows if need be and keep the water out, but in addition to the money expended on the dyke system there have been very serious losses from loss of time by factories during floods, loss of material, reduction of wage bills and all that goes to stop the industry of a community.

Galt, in more recent times, has had to pay a heavy toll for the same cause. There, to a certain extent, as in Brantford, the payment has been made on an individual basis. There is no redress for the factory whose cellar was flooded or to the merchant on the main street who had to take his own loss. Some of the losses in flood damage have been tremendous.

The Hydro-Electric Commission have given a very complete report of the Grand river and in respect to Mr. Breithaupt's comments, there was a perfectly definite reason, the writer believes, for selecting the dam site in the upper reaches of the river.

If the Elora dam were first built on the Grand, the river, which is dry at the summer time at Fergus, would continue to be dry and there are communities further up that need water as well as the lower communities.

[5] Consulting Engineer, Brantford, Ont.

The writer himself feels satisfied with the quality and the accuracy of the data that have been presented and does not feel free to criticize or comment on them.

There is one phase, however, that may or may not be directly connected with this particular discussion that he wishes to bring up. The discussion at this Annual Meeting of The Engineering Institute covers the control and conservation of the waters of a large area in which the engineers living in that area are definitely and specifically interested, but it is not solely their problem. Every citizen within a watershed is equally interested in that problem, but the engineers in addition have two responsibilities in any project. First, to secure the information necessary to appraise the problem and to devise from that information the solution of it. A still higher duty of the engineers is to see that that information in an accurate form is continually kept before their fellow citizens who are equally interested in the correction of the trouble.

There is another thing engineers must realize; namely, that it is only by a community effort of the people of the whole watershed that the necessary corrective measures can be actually brought about.

Mr. Adams, in his paper, indicated that as far back as 1912 deputations had approached the various provincial governments to have something done about this particular problem. They were received, the writer believes, with the greatest courtesy. They had their talk, but the river still continued to flow, rushing in the spring and with low flows in the summer months. It is always easy to persuade people that the problem is one of spring floods, of flood control. Actually flood control is probably less than half the problem. The low water flow in these rivers is a greater problem in the summer time than the flood condition is in the spring. Further, nothing has been said yet about the effect of river flow on the ground waters, on communities lower down and yet one knows that the two are definitely connected together. In places like Kitchener, as the river has gone down, the level of ground water in their wells has been going down. That water didn't come from Lake Huron or some place up there by some mysterious method. It is exactly the same with the problem here. Everybody including the farmer is interested in the problem and it will have to be undertaken in a co-operative manner.

The Grand Valley Board of Trade was formed when deputations were sent down and it was realized that it was a watershed effort and not individual effort. They approached the Government and by virtue of the fact they were working as a unit, reaching the business men of a watershed that houses 375,000 people that paid very large amounts in wages and taxes, convinced the Government that it was an area to be protected and the result was that the Ontario Government had their very able report prepared.

They also passed an Act authorizing the formation of a Commission, representative of the various municipalities within the valley. Fortunately for the writer, and unfortunately for Brantford, he happened to be their Commissioner, hence his interest in this particular subject. The problem has been under consideration for the last four years, but progress has been slow. The engineers, within the valley, have helped materially in keeping the subject alive by putting out information that was reliable and that the people as a whole could depend on.

The point has been reached where the Provincial Government is prepared and has promised to accept a very large proportion of the cost of the work to be done in the valley. The estimate of the total work there is about $2,000,000, of which they will take a proportion, but also they insist that the municipalities pay part of their way.

The project cannot be laid on the government's doorstep with no thought of its maintenance or construction. If the Federal Government takes the expected steps, it will be possible to build the immediate works that will produce the result of 350 ft. per sec. minimum flow at Brantford and a corresponding flow further up the river.

Mr. Shupe only indicated the trouble he has had from time to time with his sewage effluent. Nothing has been said of industrial effluent coming into the river at various points, industrial effluent that is objectionable and at the same time is almost untreatable in a normal municipal sewage disposal plant.

The Grand valley problem, the Thames valley problem, or the problem of any of the rivers flowing into Lake Huron or into Lake Ontario, will be individually somewhat different from the problem at Brantford. Consequently they will probably have to be treated individually, but if the work which has been laid out in the Grand valley is accomplished, and the results achieved which the engineers have predicted, then the solution of the problems in the other valleys should come with increased rapidity and with greater ease. The writer was in Miami last spring. Their problem is quite a different one, purely a flood prevention proposition. In the Grand valley it is a question not only of flood prevention but of water conservation.

The writer would like to again impress the fact that the engineers of Southwestern Ontario must be prepared to give leadership, not only as engineers, but also as citizens, in a co-operative effort within every individual watershed and between watersheds, if they are going to correct the situations in which they now find themselves.

Prof. John D. Detwiler[6]

The writer has listened with much interest to the several addresses on flood control in Southwestern Ontario. In these addresses there were presented: (1) an analysis of the meteorological conditions that preceded the major floods in our two main rivers, (2) a comparative evaluation of the surface run-off in the basins of these rivers and their main tributaries, (3) a discussion of agricultural drainage and its possible relationship to floods, and (4) a brief geophysiographical description of the watersheds involved, followed by a review of present and proposed flood control structures on the Grand river. These addresses necessitated the assembling and analysis of much data and provided very pertinent information, but the writer feels that something fundamental was omitted.

As our understanding of the significance of floods and their control broadens, a new concept will arise, namely that the solution lies not wholly in the river channels but also in part back in the headlands, where the rains fall and the snows melt; that there must be a co-ordinated scheme that combines a watershed programme with the downstream engineering fortifications.

In the country to the south, where floods and history have grown up together, and where the flood menace has been, of necessity, studied from all angles, the conviction has arisen that an adequate flood-control programme includes preventive treatment of lands from whence floods arise, as well as construction of levees, dams, revetments and other defences along the major streams. To such an extent, in fact, has this interpretation been accepted that Congress in 1936 included in its national flood control legislation, provisions authorizing the Secretary of Agriculture to carry out headwater surveys and watersheds treatment. This Act paved the way, as H. H. Bennett, Chief of the U.S. Soil Conservation Service, said in 1937, "for a scientifically sound and thoroughly practical flood-control programme."

Everyone who has studied the problem very closely must admit that we cannot afford to overlook entirely the

[6] Professor of Applied Biology, University of Western Ontario, London, Ont.

intimate relationships between run-off from denuded and eroded soils and the accumulation of waters in the main channels.

The writer recently returned from a trip to the Muskingum Watershed Conservancy District in Ohio, where he visited a 1,200 acre laboratory in which the U.S. Soil Conservation Service will attempt to find out just what effects the various soil conservation practices will have on a watershed as a whole. The project calls for the inclusion of 5,000 acres of privately owned land as an additional area from which to collect data. Watersheds, of which there are 100 on this federally owned plot, are being studied and classified for purposes of comparisons, In one of the projects outlined, for example, watersheds will be studied in pairs. One of each pair will be farmed according to the practices now in vogue and the other will be treated according to the most approved conservation methods. From the forty wells a check will be had on the effect of conservation farming on ground water levels, and from the stream gauging station, built on the stream that drains the whole watershed, will be learned the influences of these practices on stream flow and hence on floods. All in all, important and basic information will be had on the effects of approved conservation farming practice on watersheds. This may take ten years and even more, but the outline of studies has provided for a long-time investigation.

On the findings of such surveys of the watersheds involved would depend the extent to which such measures as agricultural drainage, strip cropping, contour farming, and the retirement of critical areas to forest and pasture should be instituted. That such a programme may be beneficial has been well demonstrated over large areas in the United States and in other countries. Correct watershed treatment is a co-ordinated scheme of the various approved practices and only critical areas are recommended to be retired to forests.

The writer is quite aware of the fact that our floods in the Thames and the Grand usually take place in spring and at a time when the earth may still be frozen. The extent to which this has been responsible, however, for our floods is still an assumption and based largely on circumstantial evidence. Whatever its importance may be, and it is no doubt considerable, we should remember that the major flood on the Thames, previous to the one of 1937, took place on July 11th, 1833. The single argument, therefore, that of the possible coincidence of frost and flood, cannot justify a unidirectional flood control policy—one in which watershed engineering receives no attention.

Before concluding the discussion of watershed treatment, the writer would like to draw attention to an accompaniment of floods that needs no attempt at proof, and that is the load of soil the swollen streams usually bear. When swiftly flowing, silt-laden streams meet quieter waters, they unload their burden and the result is a filling-in of a reservoir behind a dam or of a water channel. The rate of silting is largely dependent on the nature and the condition of the land from which the waters have collected, and it has been well proved that proper watershed treatment may do much to anchor the soil. Adequate watershed engineering, therefore, may serve three purposes at the same time, that of retention of water in the watershed, the conservation of the soil and the amelioration of the silting menace. On the question of silting, it is well to bear in mind that the particular reservoirs being filled in may be the only ones possible in that region due to the lack of other suitable damsites.

There are other interesting problems associated with the flood control programme: climatic research, for example, providing a knowledge of storm morphology of the region; the recreational possibilities of the artificial lakes created; the biological possibilities of these retarding basins and the improved rivers and, finally, the post-construction responsibilities. Most require at least preliminary investigation before embarking upon a construction programme. The recreational and biological possibilities, for example, may be impaired for all time to come unless provided for in the original plans.

The writer's main plea in this discussion is for an adequate investigation of the problem of watershed treatment as a part of a co-ordinated flood control programme.

Dr. H. G. Acres, m.e.i.c.[7]

Twenty-five years ago it was the writer's duty to initiate and organize the hydrometric surveys in the Province of Ontario. At that time the main problem, as related to the rivers in the southwestern portion of Ontario in particular, was to locate controls sufficiently accessible in location and sufficiently permanent to furnish reliable data over reasonably long periods.

As a matter of fact, so far as the Thames and Grand rivers were concerned, it was found at that time that the authenticity of the records must be largely discounted by reason of the naturally flat river gradients, and in the lower reaches, by shifting channel conditions; the result being that so far as winter flow and the higher stages of freshet flow were concerned, it was almost impossible to obtain inherently accurate records from the gauge heights and rating curves of the metering stations. Probably Mr. Marr, who now has charge of the operations in question, is labouring under the same disability to-day.

This phase of the situation no doubt accounts for the fact that a large number of the stations established twenty-five years ago have been discontinued. The results obtained from them were presumably not sufficiently authentic to justify operating expenses, with the result that there is now only one permanent station on the Grand river and one permanent station on the Thames.

Such being the case, it should be realized that while the statistical figures which we have available to-day are as authentic as it is physically possible to make them, compilations and unit reductions derived from them may be arithmetically precise, but their inherent authenticity is purely a matter of surmise.

Furthermore, a complete study of the problem involved requires not only the available hydrometric statistics but also much more comprehensive and accurate data than are now available with regard to the time factor of flood crests, and the manner and frequency of incidence of the flood crests of lower tributaries. This latter type of data is very essential and will require a field organization beyond and supplementary to the organization which is now functioning.

Any river improvement scheme involves two fundamental considerations, the first being the problem of flood control, and the other the prevention of flood damage. Both elements ultimately converge to the one end, but in specific cases flood control may be the preponderating factor while in other cases the prevention of flood damage may be the main element of the problem. This distinction will be referred to later.

The disabilities associated with the character and comprehensiveness of existing fundamental data, as outlined in the foregoing paragraphs, have up to the present time tinged all discussions and all reports on the flood problem in Southwestern Ontario with reservations and limitations which do not tend to influence very favourably the reaction of the public mind. Inasmuch as the public is either directly or indirectly going to pay the cost, it would appear advisable from now on to give some thought to the matter of marshalling basic facts which the public can

[7] Consulting Engineer, H. G. Acres and Company, Niagara Falls, Ont.

accept with confidence as indicating the physical and economic justification for either, or both, of the improvement schemes that have been under discussion for many years on the Grand and Thames rivers.

Despite the disabilities above referred to, there are certain facts available which could be honestly used, with good effect, to produce an active response in the public mind. Other conditions being reasonably equal, it can be assumed in the first place that inasmuch as the flood prevention and river improvement schemes now under consideration are in the public interest, the higher up in the watershed the initial improvements can be located the more evident and comprehensive will be the resultant public benefit.

In the case of the Grand river, it is an established fact that there are in the upper reaches of its basin topographical and other natural conditions which are definitely favourable to the inauguration of river improvements, so that the bulk of the residents in the Grand river watershed will be benefited by these improvements from the start. It is also a fact that the topography and the ultimate use to which the watershed should be put are such as to justify the construction of positively controlled retention dams. It is an established fact that suitable sites for such structures exist. It is also a reasonably well-established fact that such dams will control fairly well-established volumes of run-off from the higher gradient regions of the watershed.

To be more specific one should have no hesitation, with these facts in mind, in recommending to the enabling and financing authorities that work be commenced immediately on what are known as the Waldemar site and the Luther Marsh site in the Grand river basin. The authorities in question could be assured that while the results which would accrue from the construction and operation of these specific units of the Grand river scheme could not be set forth in precisely accurate figures, nevertheless assurance could be given that the ends which these works were designed to attain would be of definite benefit to the riparian interests in the lower portion of the watershed, not only from the standpoint of flood control, but also as related to the rectification of minimum flow conditions and the dilution of sewage effluents and of industrial wastes, and that, in general, the cost of these works would be amply justified by the direct and incidental benefits which would result.

It would appear that the situation which exists in the Grand river watershed at the present time identifies it as primarily a problem of flood control.

On the other hand, based upon such information as is now available, it would appear that the problem on the Thames river is primarily one of prevention of flood damage. This distinction is based upon the surmise that, while positively controlled retention basins are feasible in the upper regions of the Grand river watershed, the conditions in the Thames basin are such that free-discharge detention basins must be considered as the only feasible alternative. This would mean that in the Thames basin flood peaks would be modified, but minimum flow would not be improved, while at the same time supplementary works for the prevention of flood damage will be required at vulnerable points along the lower reaches of the river.

Mr. Adams' paper has exemplified the principle above alluded to, in connection with the availability of a sufficient number of what might be called common sense facts, to justify at this time the presentation of a construction programme free of limitations and uncertainties, and sets forth definitely the engineering features and estimated cost of the structures involved.

Mr. Marr's statistical summary is admittedly, by virtue of surrounding circumstances, a statistical summary of the hydrometric data available in connection with the two watersheds, which is subject to the limitations under which it necessarily had to be obtained and compiled.

Mr. McCubbin's discussion of the influence of artificial drainage seems to justify the statement that the effect of this is a more-or-less negative element in the present problem. The drainage systems which have already been developed in the lower reaches of the watershed are certainly an advantage rather than otherwise, inasmuch as they give a freer outlet for flood water in the low gradient sections of the watershed. On the other hand, so far as drainage in the upper reaches of this watershed is concerned, it may be assumed that the accelerated run-off, if it actually occurs, will be flattened out by the development of artificial storage, particularly in the case of the Grand river.

Mr. Patterson's paper has been most interesting, not so much by reason of its relationship to the engineering and construction phases of river improvement, but because there is in it and in the data that he has submitted, something that is of very vital importance as related to the subsequent operating problem. It might be worth while to examine the organization of the Meteorological Bureau in the light of whether or not the Bureau is organized and equipped to supply meteorological information from day to day, and possibly from hour to hour, which will furnish the operating agency with an index of when to open and when to close sluice gates. Damaging flood peaks are normally of short duration, and the operation of controlled storage basins might be very definitely influenced over periods of a very few hours at a time if meteorological information could be made available to indicate, for instance, whether a storage basin within ten per cent of being full should be let go or whether it should be held.

In conclusion, it is suggested that an effort be made from now on to make the academic aspects of this problem more or less subservient to its practical implications, and to provide something in the form of a technical and financial brief which will give facts without uncertainties, and definite assurances without reservations. In other words the time has come, paraphrasing Mr. Sterne's observations, to do some missionary work, and to defer for the time being any long-drawn-out discussion of technical implications and complexities.

Wilfred G. Ure, A.M.E.I.C.[8]

Mr. Acres is to be congratulated on the way he has discussed the general aspects of this whole subject. The writer would confine his remarks to certain local aspects, along the lines of some description of the flood effects in the upper reaches of the Thames valley and some development of Mr. McCubbin's discussion of the effect of drainage on flood run-off.

The upper watershed of the Thames, say above the city of London, is a rich agricultural country of a rolling nature, in which artificial drainage has been very extensively practised. It may be said to be all cleared land except for the odd hundred acres of bush and the small woodlots which many farmers have been farsighted enough to maintain to provide fuel for themselves during the winter. The artificial drainage is practically always in the form of tile drains up to the point where the flow of water becomes so great that a covered drain is no longer economically feasible, at which point the drain changes to an open channel. As Mr. McCubbin has pointed out it is generally the case that the outlet of the improved watercourse is a mile or more above the main stream.

Oxford county lies near the upper end of the watershed along the south and middle branches. For a good many years the tile drains in that county have been designed on

[8] City Engineer and Consulting Engineer, Woodstock, Ont.

the basis of a run-off of one-quarter of an inch per day, and for a typical drain in that type of country this basis has proved quite satisfactory. It assumes that freshet water will at times flow over the surface of the ground, the owners accepting the proposition that it is not economically sound to provide for all the water underground. A smaller basis of design was used for the earlier tile drains and quite a few of these have been found too small and have been rebuilt with larger tile.

Being located so close to the headwaters one would not expect flooding to be a very serious problem to the city of Woodstock and in fact a few thousand dollars would cover all the damage to both municipal and private property in spite of the giving way of a dam above the city. The south branch skirts the city but the river flats are only pasture land. A tributary known as Cedar creek flows through the south part of the city but the flats of this creek are mostly park lands. Generally speaking the areas subject to flood are not used for building purposes and hence damage due to flooding is not extensive.

The section between Woodstock and Ingersoll was not so fortunate. Here there are several large industries operating limestone quarries and from the very nature of their business they have to locate right in the river valley; in fact they have moved the river around so much in the course of their operations that it is almost impossible in places to determine the original location. During the flood the river broke through the embankments and all of these quarries were flooded. The total of the damage during this last flood and the cost of providing additional safeguards against future floods will run into hundreds of thousands of dollars. One quarry alone had to pump out nearly a hundred million gallons of water in order to get back into operation. Some preventive work has been done in the past summer in the way of channel straightening, involving the relocation of roads and bridges in co-operation with the municipalities concerned. When the new dykes become consolidated, it is hoped that they will withstand future floods.

During the recent flood six highway bridges, each with a span of about one hundred feet, went out on the main river streams, one on the middle branch and five on the south branch and there were several others which required extensive repairs to the foundations. Five out of these six bridges were carried on cut stone masonry abutments, generally set on wooden mudsills, and with the stone work not extending far below the bed of the stream. All failed through undermining of the foundations. Most of these bridges were old and due for replacement in any case, the one on the main highway in Ingersoll having been built in 1879. It seems a reasonable inference that these bridges had never before been subjected to as severe a flood as that of last April, because here we have five bridges of similar construction standing up around fifty years and all going out at the same time.

It is interesting to note that Mr. McCubbin's graphs of the maximum flood flow in Ontario rivers do not indicate any increase in flood flow due to the period of extensive artificial drainage following the Great War. The investigations given into the flows of the Des Moines and Iowa rivers point the same way, and the investigators state that if the extensive drainage had affected the factors of flood flow, the fact would easily have been discerned in their analysis. After listening to the papers and the discussion thus far the feeling of the speakers seems to be unanimous that the effect of drainage is practically negligible on heavy floods.

Flood prevention works cost money and somebody has to pay for them. This question has an important bearing on the distribution of the burden of the cost of such works. If the premise be accepted that deforestation and drainage of farm lands do not materially affect flooding any great distance downstream, then the basic legal principles underlying the drainage law of Ontario would relieve the upper owners from liability. Land owners in the upper part of the watershed should not be penalized because they have cleared, drained and cultivated their land, merely in order that other owners far downstream may convert to building purposes lands in the river valley which are subject to overflow when a natural sequence of weather events produces an exceptional flood, the valley under similar conditions having been subject to similar flooding since the present geology of the region was established.

S. W. Archibald, m.e.i.c.[9]

The papers which have been presented on precipitation, surface run-off, agricultural drainage, flood control, and water conservation contain the available information on the subject. In addition to flood control and water conservation, the necessity for pollution prevention must be considered.

Legal considerations, if no others, demand pollution prevention. "To send down polluted water is always actionable"[(1)], "He whose dirt it is must keep it that it may not trespass"[(2)], are but two of very many axioms contained in court decisions.

The papers given admirably present the why; the how and when remain to be dealt with. With regard to the how, it is suggested:

1. That the experience of England can be used to Ontario's benefit.
2. That existing legislation should be used.
3. That general provincial legislation is necessary.

Comparing the drainage in England with that of Ontario, the average area of 101 catchment areas of England is 459.4 sq. mi. The Thames, the third largest of these, has an area of 3,812 sq. mi. The Thames of Ontario total watershed area is 2,250 sq. mi. Our Thames compared with the Tennessee, covered by the Tennessee valley authority, is the comparison of a postage stamp with an envelope. In England, the report of the Royal Commission on land drainage presented December 1927 states a main issue, "The necessity of having a supreme authority in each catchment area which should be in charge of the main channel and banks of the river and work in closest collaboration with the drainage authority concerned with the internal drainage of the catchment area."[(3)]

With regard to the second point that existing legislation should be used, the Municipal Drainage Act R.S.O. 1927 Chapter 241, as explained by Mr. McCubbin, aims at drainage for a community and the Act does not limit the size of the area or the scope of its application. Apparently the chief objection to applying the Drainage Act, as it is, would be the right of a comparatively few individuals or a single municipality to commit a large area to works and expenditures without permitting the right to assist in determining whether or not the works are necessary, and if necessary, their nature and method of being financed.

With regard to the general legislation, while necessary amendments to the Municipal Drainage Act or a new Act would entail careful drafting and study, a suggestion for a basis for discussion would be the addition between subsections 3 and 4 of section 2 of the following section or sections:

"Where the area described to be benefited lies downstream from a drainage area comprising more than 100,000 acres, or where other sufficient reason exists, the Council of the Municipality receiving such petition may, after giving notice to the upstream municipalities of its intention so to do, apply to the Minister of Lands and Forests, or Public

[9] Consulting Engineer, London, Ont.

Works, or Municipal Affairs, or Agriculture of the Province of Ontario—in England it is the Minister of Agriculture and Fisheries—to have established a river board or catchment area on said river or part thereof."

"The Minister may cause to be prepared a map of a designated catchment area on which shall be shown... (details regarding natural and artificial drainage conditions). The Minister may appoint a board not to exceed ( ) in number:... (say one-third by the Minister, two-thirds by the Municipalities interested)."

In a paper to the American Institute of Electrical Engineers at Milwaukee June 1937, Dr. Bush, Dean of the School of Engineering, Massachusetts Institute of Technology, said: "Our Government is called upon to decide momentous technical matters, most of which are so complex that they can be fully understood, if at all, only by experts. Such questions involve finance, sociology, economics, engineering. They cannot be grasped completely and intelligently by the general public. They cannot be grasped by the elected representatives of that public, who must, in the nature of things, be specialists principally in the political art. How then are they to be decided wisely in a democracy?

Much depends upon the answer to this question. We are in competition with nations in which absolutism and intense nationalism control. The maintenance of our position, our relative standard of living, depends upon the skill with which our affairs are handled. Under an absolute ruler all specialists of every sort become government specialists. A dictator can make final, binding, prompt decisions upon weighing their recommendations. Will we, with our exceedingly loose system, be similarly able to bring to bear the best of intelligent judgment upon the technical problems of the day? We must do so, if we are to hold our place."(4)

Last week the Attorney-General of this Province speaking at Whitby is reported as follows: "Our people are coming more and more to look upon governments as the panacea of all ills, the ever-present help in time of distress and the source of all wealth. Too great an extension of social services and too much paternalism may wreck the entire economic and social structure."(5)

Also, last week, a well known Member of the Federal Parliament, speaking at Quebec, is reported as follows: "Canada, with more to do and more to do with, is doing less to take advantage of her opportunities than any other nation."(6)

It is unnecessary to labour an explanation that these statements are applicable to the question being discussed.

Lt.-Col. W. M. Veitch, A.M.E.I.C.[10]

Referring to conditions in London, Ont., during and immediately after the flood of April 1937, it may be noted that the section of the city known locally as London West is the only section which is protected by embankments or dykes from more than normal floods.

The April 1937 flood began on April 26th, and it is believed that up until 5 a.m. on that date the River Thames at London had not exceeded normal flood level. During the early morning, it was noticed that considerable low-lying lands were being flooded. At 11 a.m., observers reported that the flood level was rising at the rate of one foot per hour. At this time, the local newspaper was requested to broadcast by radio a warning to all citizens living in low-lying locations to prepare to vacate their homes.

[10] City Engineer, London, Ont.

Only two sections of the city reported any property damage prior to noon on April 26th. There had also been flooding of streets in West London due to water gaining entrance to storm sewers through improperly closed flap gates on their outlets through the dykes. This condition, however, happens occasionally in normal floods without serious damage.

At 1.15 p.m. on April 26th, the flood waters overtopped the earthen embankment near Dundas Street bridge. This was followed by at least two other overflows within 15 to 30 minutes. At 6 o'clock in the evening the flood waters were flowing over practically the whole length of the dykes protecting London West.

The flood appeared to reach its maximum height at 2 a.m. on April 27th, and remained at that level until approximately 4 a.m. when it began to recede. The fall of the flood level was noticeable throughout the day. At 5 o'clock in the afternoon it was again possible to walk, dryshod, the entire length of the London West protective dykes, with the exception of one small section in the southwest corner of the area which had been entirely washed away. There is some doubt with regard to both the time and the direction from which this washout occurred; it has been impossible to ascertain definitely whether the pressure was exerted by the river or by the water entrapped in London West, or a combination and weakening by both. This particular section had been known, for many years, as one of the weak sections of the embankments.

At 11 p.m. on April 27th, the area was again free of flood water, the river having again returned to a level below even normal flood levels.

From our observations, the north and south branches of the River Thames were at their flood peak at approximately the same time. This is a condition that has never happened before in the memory of the residents. In spring freshets, it is usual for the south branch to clear itself of ice before the ice in the north branch has started to move, or vice versa.

It may, therefore, be seen that the actual period of the April 1937 flood was only 28 hours. During this flood, the river rose from normal to abnormal and fell again to normal flood level in less than two days. The time taken for the rise from normal flood level to high level was almost exactly the same as the fall from high level to normal flood level—a period of 13 hours.

Flood Protective Works

Over one hundred thousand dollars has been expended in the construction of protective embankments on the river bank adjacent to West London.

Up until the flood of April 1937, we found that the hydraulic gradient of all previous floods had conformed very closely to the levels of the top of the embankments. This was not true during the last flood, for example, between Oxford Street bridge and Dundas Street bridge, the two extremities of the protective works on the north branch of the river: the normal summer level shows a difference of 7 ft. 9 in.; the difference in the top levels of the embankment is 5 ft. which in every other flood has shown a very close relation to normal flood level. The 1937 flood showed a hydraulic gradient of 2 ft. 9 in.

Between Carrothers Avenue and Dundas Street, a distance of 1,820 ft., the embankment has been faced with concrete. The elevation at the north extremity is 61.3 ft. and at Dundas Street 60.0 ft., a difference of 1 ft. 3½ in.

The maximum flood level over this breakwater was 62.2 ft. or 1 ft. 3 in. over the north end of the breakwater and 2 ft. 2½ in. at a point 400 ft. north of Dundas Street bridge.

West of Dundas Street bridge, where the flood water first entered London West, the elevation of the river bank was approximately 54 ft. The flood level at this point was 62.1 ft. The flood level, therefore, had a depth of approximately 8 ft. over what was at that time private property.

Between Wharncliffe Road bridge and Douglas Avenue, which is the westerly extremity of the earthen embankment, the flood levels were 62 ft. and 61 ft. respectively, approximately 3 ft. over the earthen embankment then in place.

In June 1937, the writer recommended to the Municipal Council that the protective embankments should be repaired or rebuilt only to such a height as would protect London West from floods of normal proportions, that is to say, that private property should be purchased and embankments erected in the two locations where private ownership of the land had made this erection impossible prior to the 1937 flood, and, further, that all embankments should be rebuilt, where necessary, to conform to a hydraulic gradient two feet below that shown in the flood of 1937. It is the writer's opinion that the cost of constructing embankments, with the necessary raising of bridges, to a sufficient height to ensure against flooding from all known floods would exceed any expenditure which the city of London might be expected to make.

The writer believed that the construction of the embankments to the levels he had indicated was all that the municipality should do and that any floods which would exceed this height should be taken care of by a flood-control programme sponsored by the government; a scheme which would protect not only London but also all municipalities on the River Thames and its branches. The writer did, at that time, submit that in his opinion it was possible to build a control dam on the north branch of the river, some ten miles from London, and, further, that a similar dam might be built on the south branch at a like distance from London. Since that time, further study has convinced him that a dam on the north branch only in the vicinity of London is necessary, and that if a dam is required on the south branch it should be east of Ingersoll. It is his opinion that these two dams would protect the whole Thames valley from flooding, always excepting floods due to ice jams.

Work Occasioned by the Flood

This work as described is only work of a municipal nature; the City Council gave very definite instructions immediately after the flood that repair work must not be done by civic employees on private property.

The work which was done immediately prior to the overflow of the banks was a hopeless attempt to withhold a situation which one knew to be inevitable. Gangs of men were employed in the filling of sand bags until such time as the flood water made it impossible for further work.

The next work was the evacuation of the people in the flooded area. In addition to all the private cars and privately-owned trucks, 17 trucks were in operation in the flood area. Five of the city trucks, in addition to many privately-owned cars and trucks, had to be abandoned while waiting for the residents to make up their mind to evacuate the area. Arrangements had already been made with the District Officer Commanding the London Military District for the use of the local armouries for the reception of the flood refugees. The military authorities immediately took the situation in hand and, before the first arrivals at the armouries, heat had been provided, army cots were on the way, army cook-stoves were held in readiness. The local Red Cross Association then took charge of all feeding and housing arrangements for the flood refugees. The evacuation of the area was a difficult task: the people showed a marked inclination to disbelieve the fact that the embankments were not sufficient to protect them from flooding. The trucks and cars were instructed to take the refugees to any address they might suggest; failing this, to the main armouries building.

The fact that there were two or three sections of the embankments where the top level was not in conformity with the hydraulic gradient was a factor in the evacuation without loss of life. The flood waters entered the area more gradually than they would otherwise have done had the embankment levels conformed exactly to the hydraulic gradient of the flood. In that case, the water would have poured over a mile and a half of embankment at exactly the same instant.

Immediately the use of trucks and automobiles had to be abandoned, another method of evacuation had to be adopted: all available boats in London were commandeered, and additional boats and crews were brought from Port Stanley. These boats worked throughout the night in total darkness and against strong and dangerous currents. One boat was swamped by, it is believed, striking an obstruction, and the volunteer rescue worker was drowned, the only death, in London, during the flood.

Advance rescue stations were established where the rescued might be taken by boat, there to be given coffee and sandwiches, make arrangements with friends for their reception or await road transportation to the main armouries. The local company of the Royal Canadian Regiment gave valuable assistance both in the transportation and in the work of the reception of the refugees at the armouries.

The work of April 27th was a work of watching as far as the Works Department was concerned. Every bridge had to be carefully inspected and guarded, and, at one time during that day, of the eleven main bridges in the city only one was in operation. The cause in most cases was the inability to proceed further after having crossed the bridge due to flood water. At 5 o'clock in the evening, as the flood receded, it was necessary to place special police on all flooded areas to prevent looting. At 11 p.m. on the night of April 27th, the writer walked along Dundas Street towards Wharncliffe Road; it was possible to reach that intersection by wading through approximately 2 ft. of mud in places. The depth of water, seven hours previously, had been from 6 to 8 ft. in this locality.

Two days ago, this had been a peaceful and orderly section of the city. Now, not a board fence was in place; garages stood in the middle of the street; motor cars lay upturned on the streets; verandah steps were torn from almost every house and piled in grotesque groups in back yards. One home that did not boast a car, far less a garage, now had three garages in the back yard. Our first reaction that night was the feeling of impossibility of ever being able to straighten out, or even clean up, this stricken area.

The work of organization of gangs started at daylight on April 28th, and by 8 a.m. gangs and trucks were already at work. Garages and out-houses had to be removed from the streets; verandah steps were a drug on the market; all were taken to the dump, and residents were instructed to claim a set that would most nearly fit their particular verandah. Teams were employed for weeks reclaiming structures of value from the flat lands along the river banks; these structures were stored in dumps and were reclaimed from there.

A very strict police guard was placed in all flood areas; no one was allowed to enter without police permission and all persons had to be clear of the area before darkness set in in the evening. Even workmen were required to wear tags which were handed in by them before leaving work each day. Residents were not allowed to again occupy their houses until they had been examined and passed by the Medical Officer of Health.

Red Cross stations were set up within the flooded area for the free distribution of medicines, water chlorination tablets, and coffee, all in an effort to counteract any epidemic which might arise.

The cost of the work made necessary by the April flood was $65,283.52 up to the end of the construction period last year. It is estimated that, to complete the repairs, approximately $10,000 more will be expended this year on replacement of sidewalks, fencing and lighting cable and standards on the embankments. The total of $75,000 is made up as follows:

Labour, material and police guard during the flood	$ 7,500
General clean-up	26,000
Repairing, raising and strengthening of embankments	33,500
Repairs to roadways, sidewalks and sewers	3,000
Repairs to bridges	5,000

Wellington bridge, a pin-connected structure erected in 1882, was damaged by the 1937 flood to the extent of $10,000. In the writer's opinion, it would have been necessary to replace this bridge within the next five years. He, therefore, recommended that any expenditure on repairs would be wasted. This bridge has now been replaced by a modern structure.

The Public Utilities Commission, who operate the electric light and power, water and parks in the city of London, lost a considerable amount of equipment during the flood. This has been repaired or replaced at an estimated cost of $50,000.

During the flood of April 1937, 745 acres, or 15 per cent of the total area of the city of London, were flooded; 4,184 persons resided in this area, representing approximately 5½ per cent of the total population. As a great deal of this area was flat, low-lying land, the assessed value of the property in the area was not great; it approximated two million dollars which is equivalent to 2.7 per cent of the total assessment. It is estimated that there were 1,064 buildings flooded and that the flood waters rose to a height 7½ ft. higher than the highest recorded flood since the July flood of 1883. The flood of that year was 3 ft. lower than the flood under consideration.

February 1938 Flood

Exactly one week after The Engineering Institute meeting in London, which discussed the matter of flood control, the city of London was again threatened by floods. On February 6th, both branches of the River Thames rose to an alarming height, or at least alarming in the minds of the citizens who had gone through the flood of 1937. Records, however, show that the flood of February was not above normal and at no time was there danger to either person or property, with the possible exception of flooded basements. The peak of the flood was reached at 3.15 a.m. on February 7th, and was 7 ft. 6 in. below the maximum height of the April 1937 flood and 5 ft. 9 in. from the top of the embankment.

As darkness came on on Sunday evening, February 6th, almost a panic ensued: memories of the last flood, coupled with advice given by persons living outside the flood area and by curious sightseers, were responsible for this condition. Movers and truckers were also to blame for the 200 persons who moved their belongings out of the flood area; they were known to be canvassing the people in the hope of obtaining work.

In order that this state of panic may not obtain again, the writer recommended to the City Council that whenever the river approaches major flood proportions official bulletins be broadcast over the radio every hour or half-hour, as necessary, and that the police will control all traffic entering or leaving the flood area and will exclude all curious sightseers from that area.

A. J. Connor[11]

Dr. Acres having asked:—"If an up-river flood-control dam were impounding water to near the maximum level and a sudden flood were impending from approaching rain, could the Meteorological Service, with its organization as at present constituted, give us sufficient warning to let the water go in time? Or could they advise us to hold it?" The writer would reply that this would involve considerable expense. If the Canadian Meteorological Service is to take over flood-warnings of the kind undertaken by the United States Weather Bureau, many additional observers and daily telegrams to Toronto would be necessary. Some fifty observers to measure daily the snow-cover, ice on the ground, water held in snow-cover, depth of soil frozen, rainfall and perhaps temperature, would be required in this region for sending daily messages to Toronto. Additional staff would be required there to keep a daily map of conditions on the Grand and Thames watersheds and so be prepared to make a forecast of probability of an expected rain causing flood and to what intensity. No suggestions to control engineers would be advisable but a forecast of flood only. The writer would point out that in a country larger than Europe, with only eleven million population, many more suggestions for federal expense were being made than the population could afford. One could not say whether such expense would be sanctioned by the Department of Transport.

In reply to a question by Col. Veitch, whether a forecast of character and intensity of spring flood could be made at the end of February, the writer replied that if a flood-warning division of the Meteorological Service were set up (as outlined in reply to Mr. Acres) one could tell at the end of February if the watershed were in such condition that a heavy rainfall would result in almost total run-off. Under present arrangements most reports were received by mail too late for such forecasts and were not sufficiently detailed in any case in respect to snow and ice covering the soil.

VOLUME XXI MAY, 1938 No. 5

Greetings!

This is a new editor speaking. The timorous voice and quaking knees may not immediately be apparent to the audience, but to the editor himself they are painfully in evidence. After some weeks of contemplation, and a few days of experience, the magnitude of the undertaking has more fully dawned upon him, and with this appreciation comes some realization of the obligations and opportunities of the position. Who would not be nervous under such conditions?

The change of editors on any established publication is always an important development. Unfortunately, the mere passage of time makes many changes necessary, which of themselves may not be desirable. This change answers that description. Under the previous editorship The Journal has attained unusually high ranking with all members of The Institute and readers everywhere. It has been interesting, attractive and dignified, a credit to its editor and to The Institute which it represents. It seems unfortunate, therefore, that the guiding hand which has done its work so well for the past many years should have to be lifted now, but it would not be fair to hold it longer to its task when the desire and need of rest and change have been so clearly expressed by Mr. Durley himself and by his physician. It is a great comfort to his successor to know that the wisdom, experience and ready assistance of Mr. Durley has been made available to him, without which the outlook would be most discouraging. With it much should be accomplished.

The new editor, and general secretary, has much to learn to be equal to his task. He has great need of the patience, tolerance and kindly assistance of the membership. With these, he hopes to realize his ambitions and to make the most of the opportunities which are now his. There is a great chance in this position to render a real service to the engineers of Canada. It is his sincere wish, and his determination, to be equal to this opportunity. To this end he asks your patient indulgence during his initiatory period, and your kindly assistance throughout his entire term of office. After all, The Journal is largely a co-operative effort, and without the loyal and helpful assistance of many members, its publication in useful and acceptable form would not be possible. The new editor will be very grateful for the help which you may give him.

"A Three-Fold Cord Is Not Quickly Broken"

Recently the President of The Engineering Institute tendered a dinner to the President and members of the Dominion Council of Professional Engineers, during their three-day conference in Montreal. During the course of the evening he explained to them that his own concept of the function of the Engineering Triad—the Provincial Professional Associations, the Dominion Council and The Engineering Institute—was "United we stand, divided we fall."

Believing that an understanding by all engineers of the basic issues discussed by the President is in the best interests of the profession, the Council of The Institute has directed that his remarks to the Dominion Council appear on the editorial page of The Journal. Accordingly, on page 248, will be found a summary of what was said. Members are asked to read it carefully, for we believe that therein may be seen the suggestion for a solution of a problem that is interesting and vital to us all.

The Journal Looks at Itself

Changes in the form and content of The Journal have been under consideration for some time. The Publication Committee, at a recent Council meeting, made a very interesting and comprehensive progress report on the whole situation, based on the returns of the questionnaire which was recently submitted to the members, and investigations of engineering journals published in New York by the Founder Societies, and certain other commercial publications of interest to engineers. Out of these investigations and deliberations some considerable good will come, but the process will probably be one of evolution rather than revolution.

A notice appearing in last month's issue gives the first outward sign of these possible changes. A prize has been offered by the committee for the best suggestion for a new cover design. An amplification of the rules and regulations that will apply may be found elsewhere in this issue. It is hoped that many members will give the matter thought. You may not win the prize but your recommendations cannot help but be of assistance to the committee, and eventually you may feel that you share in the credit for any improvements that are brought to pass.

Presidential Activities

On May 1st at Halifax a special meeting of Council was held, which was attended by all five Maritime Councillors and by a delegation from Headquarters including the chairman of the Finance Committee, Vice-President J. A. McCrory, and the Chairman of the Special Committee on Professional Interests, Councillor F. Newell. By direction of Council, the chairmen of the four Maritime Branches, also former Vice-President McKiel, of Sackville, and Mr. J. A. Fowler of Halifax, were invited to attend.

* * *

Arrangements were made for the President and the General Secretary to visit the various Maritime Branches, on the following dates:—

Halifax, April 30th to May 2nd
Sydney, May 3rd
Moncton, May 4th
Saint John, May 5th

* * *

The annual meetings of the Toronto Branch on Thursday evening, May 12th, and of the Niagara Peninsula Branch at Niagara Falls on Friday evening, May 13th, will be attended by the President and the new General Secretary.

According to present plans, it is expected that following a special meeting of the Hamilton Branch early in October, these officers will make a tour of all the Branches in Western Canada.

The Nova Scotia Agreement

In the March issue of The Journal, there appeared a draft of the proposed agreement between The Institute and the Association of Professional Engineers of Nova Scotia as recommended by accredited representatives of both bodies. While there is understood to be some doubt about the Association's legislative authority to complete the agreement precisely in the form negotiated, the necessary preliminaries have now been completed as far as The Institute is concerned. As already announced, the new enabling By-law No. 76 was approved by an all-time record vote. Pursuant to the authority in this new By-law, the three necessary conditions have been met by The Institute so far as an agreement with the Nova Scotia Association is concerned, namely, the Agreement has been published in The Journal, it has been approved by letter ballot of The Institute Council with only one dissentient opinion, and it has also been approved almost unanimously by letter ballot of the Corporate Members of The Institute resident in Nova Scotia. The practically unanimous verdict thus given by the interested Institute electorate is most gratifying, as showing The Institute's definite support of the idea of an entente with the Nova Scotia Association.

It is a point of interest to note that at no time during the negotiations has The Institute Council made any suggestion for immediate action on the part of members of the profession in Nova Scotia looking to closer co-operation with The Institute. Should the Association for any reason think it desirable to make haste slowly in this important matter, the Council of The Institute will be found quite agreeable to such a course.

Ballot on the Nova Scotia Agreement

In accordance with Section 76 of the By-laws, the proposed agreement between The Institute and The Association of Professional Engineers of Nova Scotia has been submitted to the corporate members of The Institute resident in that province.

The ballot was returnable on April 20th and was canvassed with the following results:

Total valid ballots received...	63
Votes approving agreement...	61
Contrary votes...............	2

Meeting of the Dominion Council of Professional Engineers

Knowing that the general membership of The Institute is greatly interested in the functioning of the Dominion Council of Professional Engineers, the editor of The Journal has asked the President of the Dominion Council for a brief summary of the Conference held recently in Montreal. The Journal is pleased to publish the following report which has been submitted by C. C. Kirby, M.E.I.C.

The Dominion Council of Professional Engineers met in Montreal, April 4th to 6th, at the offices of the Corporation of Quebec. Representatives from seven Provincial Associations attended the meetings.

The principal business before the meeting was consideration of the differences between the various Provincial Associations of Professional Engineers in respect to Charters, By-laws and methods of procedure, with special reference to those features governing inter-Provincial practice.

The Council agreed upon a number of recommendations to be made to the Councils of the constituent Associations with a view to obtaining a greater degree of reciprocal action in the exercise of the privileges of inter-Provincial practice and transfer of registration.

The meeting regretted the absence of Manitoba from these deliberations and passed a motion that the Association in that Province be again asked to co-operate.

It was agreed that steps be taken to obtain approval of the member Associations for the formation of a Central Examining Board and basic details for such a Board and its functions were considered and agreed to.

The committee on admission of foreign engineers to temporary practice in Canada reported on the co-operation obtained from the Department of Immigration on this matter. Mr. P. M. Sander is chairman of this committee.

The meeting received a communication from the Secretary of The Engineering Institute advising it of the negotiations then proceeding with the Association of Nova Scotia for a form of local co-operation in that Province. The status of somewhat similar proposals for other Provinces was also discussed. It was noted that these proposals do not in any way alter the functions of the Associations concerned or provide any machinery to achieve the objectives and purposes for which the Dominion Council is constituted.

The officers of the Dominion Council for 1938 appointed were; President, Mr. C. C. Kirby; Vice-President, Mr. Archie B. Crealock; third member of Executive Committee, Mr. H. Cimon. It was agreed that no Secretary should be appointed for the present.

On Monday evening, April 4th, the Dominion Council were the guests of the President of The Engineering Institute of Canada at a dinner at which local members of The Institute Council were present. This afforded an opportunity for making the acquaintance of the new General Secretary of The Institute.

On Tuesday, April 5th, the Dominion Council were the guests of the Council of the Quebec Corporation at luncheon.

The Dominion Council of Professional Engineers at Meeting April 4th-6th, 1938, at Montreal

Reading from left to right:

F. W. W. Doane, M.E.I.C.—Halifax. Representative for Nova Scotia. Formerly City Engineer of Halifax, now in private practice. Was a student member at time of foundation of E.I.C. in 1887.

D. A. R. McCannel, M.E.I.C.—Regina. Representative for Saskatchewan. City Engineer of Regina. Former member of E.I.C. Council.

P. L. Lyford—Vancouver. Representative for British Columbia. Vice-President B.C. Association, acting as substitute for Mr. C. V. Brennan, President of the Association, who was unable to attend. Mr. Lyford is a consulting forest engineer.

C. C. Kirby, M.E.I.C.—President and representative for New Brunswick. District Engineer of New Brunswick District, Canadian Pacific Railway at Saint John. A former member of E.I.C. Council and a member of the Committee of 13 which framed the "Model Act" in 1919.

H. Cimon, M.E.I.C.—Quebec. Representative for Quebec Corporation. Engineer for Price Brothers. Member of E.I.C. Council.

Archie B. Crealock, M.E.I.C.—Vice-President and representative for Ontario. Registrar of the Association of Ontario. A former member of Council of E.I.C. Consulting Bridge Engineer, Toronto.

P. M. Sauder, M.E.I.C.—Lethbridge. Representative for Alberta. Manager, Lethbridge Irrigation District. Former member of E.I.C. Council.

"All for One and One for All"

The President Entertains the Dominion Council

The following paragraphs contain the remarks made by the President at an informal dinner given by him to the President and members of the Dominion Council during the time of their recent three-day meeting in Montreal. These are the remarks referred to in the editorial columns under the heading, "A three-fold cord is not quickly broken."

'It is my conviction that wherever and whenever The Institute Council may appropriately do so, it should co-operate frankly and freely with the Dominion Council. Should the day come, which many in The Institute fondly hope for, when compacts are completed between The Institute and all eight provincial associations and a common Dominion-wide membership has been achieved, it is conceivable that the associations might desire to have the Dominion Council associated in some form with the Council of The Institute.

'Pending that time, my concept of the inter-relation of The Engineering Institute of Canada, the associations and the Dominion Council can be briefly summarized as follows:—

1. The associations under provincial enactments will, of course, continue to supervise the actual practice of engineering in their respective provinces by administering the licensing laws.
2. As it is not constitutionally feasible for the provincial associations to be consolidated into one federal corporation, they must continue to function as provincial bodies.
3. For the purpose of encouraging uniformity in licensing procedure, the maintenance of high standards of entrance qualification and in general for the strengthening of legal control over the practice of engineering, the associations will no doubt desire to maintain a co-ordinating agency like the Dominion Council.
4. The associations will be wise if as such they confine their functioning very largely to the objectives set out in the three previous paragraphs.
5. The Engineering Institute of Canada is the only federally constituted purely professional national engineering organization in the Dominion that embraces all divisions of engineering. Because of its fine traditions, its half century of service and its twenty-five active branches, The Institute is so constituted that it can, if properly financed, function well and worthily for the entire profession in nearly everything but matters of registration and licensing and those provincial activities that are ancillary thereto.
6. While all three—the associations, the Dominion Council and The Engineering Institute—should function freely and positively in their respective spheres, and while there may be some overlapping and some duplication, there should be close cooperation in supporting each other's general objectives. If such co-operation can be effectively maintained for a few years, the inevitable result will be an approach to a common membership between The Institute and the associations. When that time comes, the Engineering Profession should be getting into a position to enjoy a prestige comparable to that of the other professions.

'Manifestly the above functional outline is not a complete picture of the Engineering Profession in Canada, because it does not comprehend the activities of certain established branches in the Dominion of the "Founder Societies" and other important engineering bodies of the United States. In this respect the situation in the Province of Ontario is the most complicated, and, to a much less extent but for the same reason, it is confused in one or two of the Western Provinces. However, it is hoped that the multiplicity of organized engineering bodies in Canada will not be further increased, for those in authority among the governing bodies of the American Societies will come to realize that while their membership in Canada may grow, the setting up of new branches north of the international boundary line will inevitably add confusion to, and therefore will weaken, an already unduly complicated engineering profession. Notwithstanding the existence of branches in Ontario of the American Society of Mechanical Engineers and the American Institute of Electrical Engineers, I believe that eventually a pact between The Engineering Institute and the Ontario association comparable to that for Nova Scotia will be found desirable and feasible. I think members of the said branches of American bodies having regard to the well-being of the whole profession in Canada will not seriously object to an Association-Institute compact.

'Then again in certain parts of the Dominion where mining is very active, there is an understandable preference for the Canadian Institute of Mining and Metallurgy, and with this preference there is a natural hesitation for some mining engineers to support an Association-Institute compact. I believe a clear understanding between the Councils and the Secretariat of The Engineering Institute and the Canadian Institute of Mining and Metallurgy, particularly as to the purposes of the new By-Law No. 76, will clarify this situation.

'It seems obvious to me that The Engineering Institute having been very largely responsible for the inauguration of the Provincial Associations must now be prepared whole-heartedly to do that which any parent would do when he realizes that his numerous offspring have come of age, that in their own right they are as strong and as wise as he and that each has very special opportunities for rendering notable service for the good of the family. Surely such a parent would take advantage of every opportunity for a family council. And that is precisely what I think this and similar occasions should be: not a meeting of representatives of the Associations, the Dominion and The Institute Councils, but rather a meeting of selected administrators of the engineering family taking counsel regarding the individual and the collective welfare of its members.

'Perhaps all I have attempted to say about the Associations, the Dominion and The Institute Councils might be epitomized by Dumas' famous motto for the "Three Musketeers"—

"All for one and one for all."

'I am sure the members of the Dominion Council will understand that the motive which prompted this attempt of one member of The Institute Council to clarify but not to codify the relationship between the provincial associations, the Dominion Council and The Engineering Institute of Canada is simply and solely an earnest desire to promote concord and co-operation primarily within this engineering trinity and secondarily between it and other recognized engineering bodies.'

Montreal, April 4th, 1938.

The Canadian Institute of Mining and Metallurgy

By invitation, the President was privileged to represent The Institute at the annual banquet of the Canadian Institute of Mining and Metallurgy at the Royal York Hotel, Toronto, on March 16th, when he felicitated this great sister society upon the splendid contribution its members have made in the development of Canada.

Council Holds Meeting in Toronto

Seated (left to right): W. E. Bonn, Councillor, Toronto; F. A. Gaby, Past-President, Toronto; Robert W. Angus, Honorary Member, Toronto; E. Viens, Councillor, Ottawa; Arthur Surveyer, Past-President, Montreal; E. V. Buchanan, Vice-President, London; G. J. Desbarats, Past-President, Ottawa; J. B. Challies, President, Montreal; L. Austin Wright, General Secretary, Montreal; F. Newell, Councillor, Montreal; J. A. McCrory, Vice-President, Montreal; C. E. Sisson, representing chairman of Toronto Branch; J. L. Busfield, Councillor, Montreal; H. A. Lumsden, Councillor, Hamilton. Standing (left to right): H. J. A. Chambers, Councillor, Walkerville; W. R. Manock, Councillor, Niagara Peninsula; L. F. Grant, Councillor, Kingston; J. A. Vance, Councillor, Woodstock; O. O. Lefebvre, Past-President, Montreal; O. Holden, Councillor, Toronto; R. H. Findlay, Councillor, Montreal; W. R. Boyle, Councillor, Ottawa; de Gaspe Beaubien, Treasurer, Montreal.

Council Meets in Toronto

One of the best attended and most successful meetings that has been held by Council in a long time took place on Friday, April 22nd, 1938, at two o'clock p.m., in the Royal York hotel. President Challies was in the chair, and six past-presidents and two vice-presidents were present. Robert W. Angus, Hon.M.E.I.C., and C. E. Sisson, M.E.I.C., representing the chairman of the Toronto Branch, were guests. Every branch in Ontario, with the exception of two, was represented. A party of ten came up from Montreal, this bringing up the attendance figure to an unusually high number.

A Joint Dinner

A resolution was passed unanimously at the Council meeting in London in January of this year, favouring close co-operation with the Councils of the Provincial Professional Associations. Towards this objective a definite step was taken on Friday, April 22nd, when a joint dinner was held at the Royal York hotel, Toronto, by the Council of The Institute and the Council of the Association of Professional Engineers of the Province of Ontario. The purpose of the gathering was the promotion of friendly relationships between the two bodies and their members, and from all appearances the objective was readily reached. Approximately fifty councillors, past-presidents and guests shared the good food, and the progressive ideas that were advanced by the speakers of both organizations.

The chair was occupied by Eric P. Muntz, M.E.I.C., a past councillor of The Engineering Institute, and President of the Ontario Association, who opened the proceedings with an excellent talk on the engineering situation in Ontario, leading up to a toast to The Institute. President J. B. Challies, one of the founders of the Ontario Professional Association, replied, paying a tribute to that body in which he reciprocated the good wishes of Mr. Muntz, concluding with a toast to the Ontario Association. Several speakers followed in alternating order, all urging definitely the advantages and desirability of friendly co-operation between the two engineering organizations. It was a great compliment to all the speakers that the attention of the entire company was held without interruption for over two hours. The additional speakers on behalf of The Institute were Past-Presidents J. M. R. Fairbairn, C. H. Mitchell, Arthur Surveyer and O. O. Lefebvre.

Journal Cover Prize Competition

In the April issue of The Engineering Journal an announcement was made of a prize of $25.00 to be given for the best cover design submitted to the committee by members of The Institute. Below are further notes for the guidance of contestants.

Designs submitted should contemplate a finished size of cover—8¾ in. by 11¾ in.

In selecting the design to be used, consideration will have to be given to cost of reproduction, and therefore a design which can be reproduced in one colour may be preferable to one requiring two colours.

It is apparent that some form of illustration on the cover is the general desire, the design should therefore be sufficiently flexible to carry a picture in either a horizontal or vertical position, or possibly covering the whole space. It must also be borne in mind that notwithstanding such variations being made from issue to issue, there must be sufficient standardization of some part of the design to insure instant recognition of the publication.

It is not expected that contestants should do more than submit their *idea* in the best possible pictorial form, that is to say, they need not prepare a drawing which in itself is immediately suitable for reproduction.

The Publication Committee does not guarantee to use any design submitted, but does undertake to award the $25.00 cash prize to the member who submits the design which in the opinion of the Committee is the best.

Any design which is accepted becomes the property of The Engineering Institute of Canada without further obligation.

Members are not limited to the submission of one design only.

Designs should be submitted to:—

THE CHAIRMAN,
E.I.C. Publication Committee,
2050 Mansfield Street,
Montreal, P.Q.

Closing date July 1st, 1938 (previously announced as June 1st).

OBITUARIES

Edward Henry James, M.E.I.C.

Edward Henry James, M.E.I.C., died in Montreal on April 1st. Mr. James was born at Farnham, Surrey, England, on December 30th, 1886. His technical education was obtained at the City and Guilds Institute, London, from which he received the diploma of Associate in 1906. In 1907 Mr. James entered the firm of A. Handyside & Company Limited, Derby, England, remaining until 1909 when he entered the employ of Easton Gibb and Son Limited, Rosyth, Scotland. He continued his work of drafting and design until 1910 when he was made assistant engineer and placed in charge of sinking monolith foundations. In 1913 Mr. James came to Canada and became associated with the Foundation Company Limited in Montreal. Here he was assigned small foundation work and later made assistant superintendent at Little Current, Ont., on the construction of railway terminals and timber docks. His work with this company also included the laying of bridge foundations at Bear River, N.S. In 1914 Mr. James left the employ of the Foundation Company, joining the J. S. Metcalf Company Limited where for a few months he was on the design of an extension of No. 1 Elevator, Montreal.

Mr. James served overseas with the 2nd Canadian Signals and 92nd Field Company of the Royal Engineers. He later became instructor in explosives and Assistant Bridging officer G.H.Q.

On his return to Canada Mr. James became associated with A. D. Swan, consulting engineer, Montreal, and went to Vancouver where Mr. Swan was the Harbour Board's consultant engineer. In 1920 Mr. James became resident engineer in charge of all Mr. Swan's work in British Columbia. This work included the construction of the Ballantyne Pier, the Wallace Dry Dock and the Second Narrows Bridge in Vancouver and foundation work for No. 1 Elevator extension and No. 2 Elevator. During the six years Mr. James spent in Vancouver he supervised the construction of harbour works valued at ten million dollars. In 1926 he entered into partnership with Mr. Swan. Prior to the inauguration of the National Harbours Board he was consultant to the Montreal Board of Harbour Commissioners. Among other works on which Mr. James was occupied during recent years was that of the construction of the harbour of Port Alfred, Que.

Mr. James joined The Institute as an Associate Member in 1920, becoming a Member in 1925.

Adhemar Mailhiot, M.E.I.C.

Members of The Institute and of the Quebec Corporation of Professional Engineers will learn with deep regret of the sudden death, on April 21st, 1938, of Dr. Adhemar Mailhiot, Dean of the Ecole Polytechnique of Montreal. Dr. Mailhiot was born at Ste.Julienne, Que., on March 11th, 1884. He received his early education at the primary school of St. Brigide of Montreal, and then entered the classical colleges of L'Assomption and Montreal, attending the latter from 1899 to 1906. In 1910 he graduated from the Ecole Polytechnique with the degrees of civil, chemical and mining engineer. Upon graduation he was appointed Assistant Professor of Geology and Mining at the Ecole Polytechnique, but did not take up his duties until he had finished a year's post graduate studies in mineralogy and geology at the Ecole Nationale Superieure des Mines and at the Musée d'Histoire Naturelle in Paris. Dr. Mailhiot held the Assistant Professorship from 1912 until 1918, when he became Professor of Mining, Engineering and Metallurgy. In 1920 he was named Professor of Mineralogy and Geology at the University of Montreal.

In 1913 when the International Geological Congress met in Canada Dr. Mailhiot acted as French secretary on

Dr. Adhemar Mailhiot, M.E.I.C.

their geological trips as well as taking an active part in the organization of the congress.

In 1935 Dr. Mailhiot received the honorary degree of Docteur ès Sciences Appliquées from the University of Montreal and in the same year became Dean of the Ecole Polytechnique. He contributed greatly to our knowledge of Canadian geology and mineralogy, having been in charge of many important surveys in the Gaspé, Abitibi and Eastern Townships districts. He published a number of scientific papers dealing with different topics in these fields, many of which were published by the Geological Survey and the Quebec Bureau of Mines as well as in the Transactions of the Canadian Institute of Mining and Metallurgy, in the Revue Trimestrielle Canadienne and in the Canadian Mining Journal.

Dr. Mailhiot acted as consulting engineer and mining geologist for a number of public bodies and mining companies in Canada and in the United States, among these organizations being the Consolidated Mining and Smelting Company, Limited, the Quebec Streams Commission, the Beauharnois Power Company, Limited, the Aqueduct Commission of the City of Montreal and the Montreal Public Service Corporation.

Dr. Mailhiot was Director of the Provincial Mines Laboratory, and served until his death as the first registrar of the Corporation of Professional Engineers of the Province of Quebec, in the founding of which he took a prominent part; he was also active in the work of the Canadian Institute of Mining and Metallurgy.

Dr. Mailhiot joined The Institute as a Member in 1933, and his death will be a great loss to The Institute and to his friends and associates in it. A resolution was passed by Council extending the sympathy of The Institute to Mme. Mailhiot and her family and to the Ecole Polytechnique.

PERSONALS

J. L. Busfield, M.E.I.C., and F. S. B. Heward, A.M.E.I.C., recently visited New York on behalf of the Publication Committee of The Institute, and spent some time discussing "Publications" with the American Society of Civil Engineers, American Society of Mechanical Engineers, and also with the Founder Societies Library organization. Needless to say, they were given a most cordial reception, information and data of every description being freely placed at their disposal.

J. P. Coates, A.M.E.I.C., has recently been appointed Assessor and Building Inspector for the City of Trail, B.C. For his services in the War, Mr. Coates was granted the rank of Honorary Captain, R.E., in 1920. Since that time he has been employed by the Department of Public Works, British Columbia, as locating and resident engineer.

J. K. Wyman, A.M.E.I.C., is now General Superintendent of Elevators, National Harbours Board, Montreal. Major Wyman is a graduate of McGill University, having received the degree of B.Sc. in civil engineering in 1910, and until he began his service overseas was connected with the John S. Metcalf Company, the Bathurst Lumber Company and the Foundation Company of Canada. He has a very distinguished War record, and subsequent to demobilization in 1918 he served in the military engineering service in India until March 1924. On his return to Canada Major Wyman became connected with the Department of Railways and Canals. In 1927 he took over the duties of superintendent of the government elevator at Port Colborne, Ont. For the past year Major Wyman has been superintendent of the Prescott Elevator, National Harbours Board, Prescott, Ont.

Thomas Foulkes, A.M.E.I.C., has accepted the position of Superintendent of Material Handling on the staff of the J. R. Booth Company of Ottawa, Ont. Mr. Foulkes graduated from the University of New Brunswick in 1926 and since that time has been associated with the Canadian General Electric Company, the Spruce Falls Power and Paper Company at Kapuskasing, Ontario, and latterly with Montreal Cottons Limited at Valleyfield, Que., as Assistant Mechanical Superintendent.

S. G. Porter, M.E.I.C., of Calgary was at Headquarters recently to attend a meeting of the committee on Western Water Problems. A programme of papers on this important topic was mapped out, to be delivered later at an appropriate time and place.

A. U. Sanderson, A.M.E.I.C., chief engineer, Water Supply Section, Department of Works, City of Toronto, Ont., attended the Annual Convention of the American Water Works Association, which was held in New Orleans, Louisiana, April 24th to 28th.

Trevor Holland, S.E.I.C., has just been appointed vice-president of Brandram-Henderson Limited. Mr. Holland graduated from McGill University in civil engineering in 1932. After spending a year at the University of Paris, he returned to Montreal and joined Brandram-Henderson Limited as plant engineer. The construction of a modern varnish plant, as an addition to the Brandram-Henderson headquarters' plant in Montreal, was recently carried out under his supervision.

H. B. Dickens, A.M.E.I.C., has been appointed co-ordinating officer by the British War Office for the new filling factory at Glascoed, South Wales, and will be stationed at the Woolwich Arsenal. The factory will take over two years to build and will cost about £2,500,000. For the past year Mr. Dickens has been with H. A. Brassert and Company Limited, Karabuk Iron and Steel Works, Karabuk, Turkey, as resident and civil engineer. Mr. Dickens was surveyor and assistant manager at the Amrir tin mine, Nigeria, West Africa, during 1913-1915 and was on active service in the Cameroons and Nigeria, West Africa, from May 1915 to September 1919. Following the War, Mr. Dickens was engaged on timber limit surveys in Northern Ontario, later joining the engineering staff of the Underwriters' Survey Bureau, Toronto. In 1923 he was employed with Frank Barber and Associates; in 1924 with the township of East York, and in 1925 with the Welland Ship Canal at Port Colborne, Ont. Later Mr. Dickens was associated with Messrs. Lang and Ross in connection with the Flin Flon mine and then accepted a position with the Dominion Reinforcing Company at London, Ont. Prior to leaving Canada Mr. Dickens held the position of reinforced concrete designing engineer for the city of Hamilton, Ont.

Harold L. B. Seifert, S.E.I.C., is now employed with the Canadian Cellucotton Products, Niagara Falls, Ont. Mr. Seifert graduated from McGill in 1937, receiving the degree of B.Eng. in chemical engineering.

Past-President J. M. R. Fairbairn, M.E.I.C., Chairman of the International Relations Committee of the Council, early in April presented the new General Secretary of The Institute to the New York officials of the Founder Societies of the United States.

W. Lawrence Langlois, A.M.E.I.C., has recently been appointed engineer of Hastings County, Ontario. After his graduation from the University of Toronto in 1923, Mr. Langlois became assistant town engineer with the Canadian International Paper Company, at Temiskaming, Que. He then joined the staff of the City of Hamilton Department of Works during the construction of the waterworks filtration plant. Latterly he has been assistant district engineer with the Ontario Department of Northern Development, at Sudbury, and divisional engineer in charge of the Renfrew district.

R. E. McMillan, A.M.E.I.C., has accepted a position with the Montreal Cottons Limited, Valleyfield, Que., as assistant mechanical superintendent. Mr. McMillan graduated from McGill in 1926 in electrical engineering. Prior to taking his present position Mr. McMillan was plant engineer for the British Rubber Company of Canada, Montreal, until 1937 when he entered Canadian Industries Limited, Montreal.

Dr. John Stephens, M.E.I.C., Professor of Mechanical Engineering at the University of New Brunswick, is being retained as consulting engineer for the hydro-electric power development on the Upsalquitch river, near Campbellton, N.B.

Harry J. Crudge, A.M.E.I.C., building engineer of the Canadian National Railways in Moncton, has been appointed to the advisory committee of the National Research Council of Canada in the preparation of a national building code. Mr. Crudge has been located in Moncton since 1915 but prior to this was connected with the engineering department of the Canadian Pacific Railway in Montreal. He has served as a councillor of The Institute and is past-president of the New Brunswick Association of Professional Engineers.

Horace L. Seymour, M.E.I.C., of the Extension Department, University of Toronto, recently gave a week's lecture course at Timmins, Ont., on the establishment of a community centre. Mr. Seymour has been retained for the third year as consultant for the Town Planning Commission of Saint John, N.B., which intends to complete the planning of that city.

J. N. McCarey, Jr.E.I.C., is now employed in the engineering department of the Wabi Iron Works, Limited, New Liskeard, Ontario. Mr. McCarey, a graduate of Queens University in 1935 with the degree of B.Sc., has been with the Canadian International Paper Company, Temiskaming, Quebec.

Hugh A. Lumsden, M.E.I.C., county engineer for the County of Wentworth, Ontario, and councillor for the Hamilton Branch, is to be congratulated as the author of a handbook for roadbuilders entitled "Road Construction and Maintenance" which has recently been released by Davis-Lisson Limited, Hamilton, Ont.

A. V. Armstrong, A.M.E.I.C., is now sales manager of Canadian Cutler-Hammer Limited, Toronto, Ont. Mr. Armstrong, who is a graduate of McGill University, was formerly manager, power apparatus and special products, Ontario Division, Northern Electric Company Limited.

ELECTIONS AND TRANSFERS

At the meeting of Council held on April 22nd, 1938, the following elections and transfers were effected:

Member

HUTTON, Charles Hyde, B.A.Sc., (Univ. of Toronto), chief engr., Hamilton Hydro-Electric System, Hamilton, Ont.

Associate Members

CAMPBELL, William Fisher, technical work for County of Haldimand, Cayuga, Ont.
ENOUY, William George, B.A.Sc., (Univ. of Toronto), manager, Montreal District Office, H. H. Robertson Co. Ltd., Montreal, Que.
McGUGAN, Angus, (Royal Tech. Coll., Glasgow), designing engr., Williams and Wilson Ltd., Montreal, Que.
WYCKOFF, Edwin Gerald, B.A.Sc., (Univ. of Toronto), i/c of mfg. depts., Otis-Fensom Elevator Co. Ltd., Hamilton, Ont.

Juniors

CAREY, Roger Packard, B.Eng., (N.S. Tech. Coll.), instr'man., Dept. of Highways of N.B., Sackville, N.B.
LAMB, John Alexander, B.Eng., (Univ. of Sask), 520 Markham Street, Toronto, Ont.
RAYMER, Denzill Edwin, B.A.Sc., (Univ. of Toronto), detailer, plate and boiler dept., Dominion Bridge Co. Ltd., Lachine, Que.
RETTIE, James Robert, B.Sc., (Univ. of Man.), engr., Anthes Foundry Ltd., Winnipeg, Man.
RUSSELL, Leonard James, B.A.Sc., (Univ. of Toronto), dftsman., Horton Steel Works Ltd., Fort Erie North, Ont.
TURNBULL, John G., B.Sc., (Queen's Univ.), field engr., Brunner Mond Canada, Amherstburg, Ont.

Transferred from the class of Associate Member to that of Member

FLEMING, John Murray, B.Sc., (Univ. of Man.), president and general manager, C. D. Howe Company Ltd., Port Arthur, Ont.
LeCLAIR, William James, (Univ. of Toronto), secretary-manager, White Pine Bureau, Toronto, Ont.

Transferred from the class of Junior to that of Associate Member

BROWNIE, Frank Austin, B.Sc. (Univ. of Alta.), asst. engr., Northwestern Utilities Ltd., Edmonton, Alta.
CHISHOLM, Donald Alexander, B.Sc., (N.S. Tech. Coll.), res. engr., Dept. of Highways of Nova Scotia, Mulgrave, N.S.
McKAY, Robert Donald, B.Sc., (N.S. Tech. Coll.), sanitary engr., Dept. of Public Health of Nova Scotia, Halifax, N.S.
TAYLOR, Morley Gladstone, B.Sc., (N.S. Tech. Coll.), M.Sc., (Mass. Inst. Tech.), acting gen. mgr., Venezuela Power Co. Ltd., Maracaibo, Venezuela.

Transferred from the class of Student to that of Junior

WILSON, Thomas Whiteside, B.A.Sc., (Univ. of Toronto), salesman, Hugh C. MacLean Publications Ltd., Toronto, Ont.

Students Admitted

CALLUM, John P., (Queen's Univ.), 363 Cromwell St., Sarnia, Ont.
CAMERON, Adam K., (McGill Univ.), 1511 Crescent St., Montreal, P.Q.
CRAIG, Clarence Edward, (Queen's Univ.), 82 Taylor Ave., Kirkland Lake, Ont.
COX, Robert Edward, (Grad. Montreal Technical School), 1986 Rachel St. E., Montreal, P.Q.
DOUGLAS, Lloyd Robert, (Univ. of Man.), Franklin, Man.
DUNCAN, G. Paterson, (Univ. of Man.), 601 Rosedale Ave., Winnipeg, Man.
HAYWARD, Vernon A., (Univ. of Alta.), 10523-127 St., Edmonton, Alta.
HUBBARD, Sewell Fortescue, (McGill Univ.), 3429 Peel St., Montreal, P.Q.
KAY, Bruce E. A., (McGill Univ.), 1390 Sherbrooke St. W., Apt. 16, Montreal, P.Q.
KAYSER, James N., (McGill Univ.), 317 Claremont Ave., Mt. Vernon, N.Y.
KING, Hector I., B.Sc., (Univ. of N.B.), Bathurst, N.B.
MacDONALD, Arthur Lamond, (N.S. Tech. Coll.), Queen Hotel, Halifax, N.S.
MacKENZIE, John James, (Univ. of Man.), 419 Kingston Crescent, St. Vital, Man.
MAGEE, Edward D. B., (R.M.C.), Royal Military College, Kingston, Ont.
MARTIN, Percival Ralph, (McGill Univ.), 4540 Coolbrook Ave., Montreal, P.Q.
McPHERSON, Eugene Lionel, (Univ. of Alta.), Box 67, Vulcan, Alta.
NEAL, Eugene L., (Queen's Univ.), 159 Bergemont Ave., Quebec, P.Q.
RAMSAY, Robert D., (Queen's Univ.), 147 Kathleen Ave., Sarnia, Ont.
SILVERBERG, David Max, B.Sc., (E.E.), (Univ. of Man.), 291 Manitoba Ave., Winnipeg, Man.
SIMPSON, Charles Cecil, B.Sc. (E.E.), (Univ. of Alta.), 11631 95A Street, Edmonton, Alta.
SPENCER, George H., (R.M.C.), Royal Military College, Kingston, Ont.
STANLEY, James Paul, (McGill Univ.), 559 Lansdowne Ave., Westmount, P.Q.
THOMPSTONE, Robert Edward, (R.M.C.), Royal Military College, Kingston, Ont.

Annual Meeting of the A.S.T.M.

The 1938 (forty-first) annual meeting of the American Society for Testing Materials will be held at Chalfonte-Haddon Hall, Atlantic City, June 27th to July 1st. Among other interesting features of this meeting there will be a symposium on the subjects of impact failure and impact testing. This symposium will present an integrated series of papers covering the basic theories underlying impact tests, data on the factors affecting impact and papers covering the practical application of impact tests to metals, organic plastics and welds.

BOOK REVIEWS

Engineering Law

By R. E. Laidlaw and C. R. Young. University of Toronto Press, Toronto, 1937. 380 pp. $5.00.

Reviewed by Harry D. Anger, K.C.

The authors of the above book, R. E. Laidlaw, assistant regional counsel, Canadian National Railways, special lecturer in Engineering Law, University of Toronto, and C. R. Young, Professor of Civil Engineering, University of Toronto, are filling a long-felt need by their work. As they state in their preface, it has grown out of courses of lectures in Engineering Law and Engineering Contracts and Specifications given by the authors for many years to students in engineering. No other work published in Canada has hitherto been available and works published abroad require too much adaptation to be satisfactory here.

The authors throughout have the practising engineer in mind and have presented those phases of law which concern his acts, duties and liabilities, and, in so doing, they have consistently treated their subjects from the viewpoint of the engineer rather than of the lawyer. To the same end, they have avoided technical legal terms and highly subtle legal distinctions, appreciating that in important matters engineers will consult their legal advisers.

A further attractive feature of the volume is its conciseness, comprising but 380 pages in all, including comprehensive index and appendices of forms. Nevertheless the work has a wide scope as is indicated by the following synopsis of contents: Duties and Liabilities of Engineer; Contracts; Specifications, General Conditions; Agreements; Arbitration, Expert Evidence; Trade Unions; Combines, Industrial Disputes; Workmen's Compensation; Promotion and Organization of Companies; Building Trades, Factories, Shops, Public Buildings; Railways, Highways, Boundaries, Surveys, Easements, Drainage; Professional Engineering Legislation.

An engineer is required to have a working knowledge of the general rules of law affecting his profession and covering both public and private rights. This requirement imposes a very real burden upon him. For instance, statutes or regulations passed under their authority, or local municipal by-laws, require that special notices be given, permits be obtained, plans be approved and filed, inspection be made, and safety measures be adopted. An engineer's ignorance of such statutory or local law might make the work impossible to execute or use, and expose his employer to penalty or demolition, the engineer suffering accordingly. Again, the engineer must have knowledge of building restrictions, rights of air and light, right of support, the effect of conditions and provisions in building contracts, the effect of building alterations on those provisions and any security bonds held by his employer, and other matters that affect his advice to his employer. When one realizes that absence of the required legal knowledge is evidence of the engineer's want of reasonable care, one can appreciate the practical guiding assistance afforded to the engineer by this volume. Furthermore, the care expended on the agreements and other forms required by the engineer and appearing in the context with discussion or in the appendices, should be of the greatest assistance. All in all, both the author and the engineering profession are to be congratulated upon the excellence of this work.

Roads, Construction and Maintenance, a Handbook for Roadbuilders

By Hugh A. Lumsden. Davis-Lisson, Hamilton, Ont., 1938. 128 pp., 6¾ by 4 inches, $2.00

The responsibility of planning and executing important main highway projects in Canada generally falls upon the officers of government departments or municipal corporations, who are guided by wide experience and the results of experiment and research dealing with their special branch of engineering. But there are many engineers, road superintendents and contractors, who are concerned with highway construction and maintenance on a somewhat smaller scale. To these in particular the concise reference book which Major Lumsden has prepared will be a valuable aid in their work.

The author deals with the many aspects of the subject from his own point of view as engineer for an important Ontario county and much of his material is drawn from his own experience. As examples of the practical nature of his advice, one may mention such points as the instructions for taking a traffic census, hints on weed killing, his remarks on surface treatment and retreading, or the notes on snow control and removal. In regard to nearly all of the topics of which he treats, a number of cost figures are given, which, while they do not avoid the necessity of detailed estimates, do make it possible to form an approximate idea of the cost of a proposed piece of work. Major Lumsden rightly emphasizes the importance of proper cost-keeping methods.

Of handy pocket size, the little book is well indexed, its diagrams are clear and a list of recent text books serves as a guide to more detailed study of special points. It is legibly printed and suitably bound; there are a few typographical errors (e.g. Deisel for Diesel) which might well be corrected in a later edition.

ADDITIONS TO THE LIBRARY

Proceedings, Transactions, etc.

American Institute of Electrical Engineers: Year Book, 1938.

Institution of Civil Engineers: List of Members, 1938.

Institution of Mechanical Engineers: Proceedings of the General Discussion on Lubrication and Lubricants, October 13th-15th, 1937. Vols. 1 and 2. London, 1937.

Institution of Water Engineers: Transactions, Vol. 42, 1937.

CORRESPONDENCE

The Editor,
The Engineering Journal.

Dear Sir:—

Issue of February 1938 (p. 104) carries an article by Professor W. J. Smither entitled, "A Statical Determination of the Reactions at the Points of Contra-flexure in the Columns of a Steel Mill Building Due to an External Wind Load." The article gives an interesting graphical solution of this well known problem. This writer has never seen quite the same method used before. The solution differs from the more or less standard graphical method principally in the construction of the final force triangle (*NMB*), and there is admittedly less construction involved than in the corresponding part of the standard solution. However, it seems that the saving in the construction is completely offset by having the vectors for the two reactions come out to an odd scale. It will require an additional graphical construction or an equivalent analytical computation to finally get the numerical values for the reactions.

The loading used in the example given in this article seems rather odd. It is quite possible that Professor Smither in order to simplify the presentation merely assumed a system of forces without attempting to figure them from an assumed wind velocity. The writer believes, however, that it is very doubtful if the assumptions made for the position of the points of contra-flexure in the columns and also for the distribution of the horizontal force between the two reactions are valid for this loading if applied to a bent of the usual proportions. I doubt if sufficient attention is paid to the validity of such assumptions.

Respectfully submitted,
R. M. Hardy,
Dept. of Civil Engineering,
University of Alberta.

Edmonton, Alta.
March 31st, 1938.

New and Revised C.E.S.A. Specifications

The Canadian Engineering Standards Association has issued the following new and revised Standard Specifications:

S 6—1938. Standard Specification for Steel Highway Bridges. 3rd ed. March 1938. Price $0.50.

G 26—1938 and G 27—1938. Standard Specifications for Commercial Bar Steels. 3rd ed. March 1938. Price $0.50.

B 44—1938. Safety Code for Passenger and Freight Elevators. March 1938. Price $0.50.

Copies of the above may be obtained by writing to: The Secretary, Canadian Engineering Standards Association, Room 3064, National Research Building, Ottawa, Ont.

Boulder Canyon Project Final Reports

The U.S. Bureau of Reclamation is publishing a series of forty-one bulletins on the Boulder Canyon Project. They will be grouped under seven headings: introduction, hydrology, preparatory examinations and construction, design and construction, technical investigations, hydraulic investigations, cement and concrete investigations.

Bulletin 1—Model Studies of Spillways and Bulletin 2—Model Studies of Penstocks and Outlet Works are now available for distribution at $1.00 per paper bound copy and $1.50 per cloth bound copy in the United States, Canada and Mexico. For distribution to other foreign countries, the prices are $1.15 per paper bound copy and $1.70 per cloth bound copy. A review of these two bulletins will appear in the next issue of The Journal.

Orders for copies may be addressed to the U.S. Bureau of Reclamation at Denver, Colorado, or Washington, D.C.

The Sanitary Analysis of Drinking Water

Donald C. McCrady, S.E.I.C.[1]

Paper presented before the Peterborough Branch of The Engineering Institute of Canada, April 8th, 1937.

The examination of drinking water has in recent years become a very specialized science; a great amount of labour has been expended in experimentation, in attempting to find suitable methods of employing a laboratory analysis of a water sample, to confirm decisions which, by ordinary inspection, might be made on the supply. Emphasis must, however, be laid on the fact that this visual inspection of the supply and its surroundings for possible sources of pollution, is still of extreme importance, and that the analysis of the water in the laboratory is merely a check, not a definite test in itself. A simple example will illustrate the point. Samples taken from a brook may yield satisfactory analytical results; but if inspection discovers a sewer, discharging intermittently into the stream above the point of collection of the samples, the water is evidently unsafe despite the results from the analysis. (The samples were obviously taken at a moment when the water was not appreciably polluted.) The examination of a supply, then, consists of first, an inspection of the location itself, and second, a laboratory analysis of samples collected from the supply. Any decisions on results from the inspection are based on common sense and require no explanation. This paper will therefore be devoted principally to the methods which are employed to-day, of examining drinking water samples in the laboratory from a sanitary standpoint; obviously this does not include chemical tests for acidity, hardness, iron and so on, which are also performed in the health laboratories which deal with drinking water samples. The author had the opportunity of being employed with the Quebec Provincial Bureau of Health Laboratories in Montreal for several summers, so that the methods which will be discussed are as employed in these laboratories. Sanitary analysis, however, is practically a standardized procedure to-day throughout Canada and the United States.

In order to set up laboratory methods of testing water for its safety, one must first consider what evidences of danger might be found. A water is dangerous when it contains pathogenic, or disease organisms, such as typhoid, dysentery, and others. It is impractical, however, to examine a sample for these bacteria; principally because they do not occur in large numbers, and the chance of finding them in a small sample, such as would be placed under a microscope, is slight. Some other method for detecting a dangerous water is therefore necessary, and the principle which is employed is that pathogenic organisms, practically wherever they occur, are present in conjunction with the intestinal discharges of man or animals. Examination is made, therefore, for traces of feces and urine in the water, and if they are found, the supply is condemned; this is justifiable, since the presence of such matter in a drinking water supply, even if at the moment of sampling it does not contain disease bacteria, constitutes a potential danger. This fecal matter would not generally occur in large concentrations in the water, so that methods of extreme accuracy must be employed to detect its presence.

The material itself consists of partially decomposed chemical compounds, mostly of an organic nature, and containing a large proportion of nitrogen. There are very large numbers of various types of bacteria present, nearly all of them being quite harmless, which grow well at 37 deg. C. (body temperature). These are the organisms which decompose or oxidize the organic material; one group may carry the oxidation process to a certain point, and another may carry it a little further, and so on. That is, a single group of bacteria does not necessarily perform completely the process of oxidation. There is one particular organism among these groups of fermenting bacteria which always occurs in feces in large numbers, and seldom or never anywhere else; it is known as the Bacillus Coli, and is ordinarily quite harmless. The indications of the presence of sewage are therefore nitrogenous organic material in considerable quantity and in various stages of oxidation, large numbers of bacteria which grow well at 37 deg. C., and many organisms of the Coli type. Examinations are therefore made for all three of these indications, and the results, considered together and in conjunction with the inspection of the supply, determine whether or not the water is safe for the community. It is interesting that the only specific organism for which a test is made, namely the Bacillus Coli, is generally a non-pathogenic one.

One series of tests to be made is of a chemical nature, tests for the organic materials present in sewage, although obviously examination cannot be made for all the chemical constituents. It has been mentioned that sewage contains a large proportion of nitrogen. This is combined with other elements to form organic materials which yield ammonia gas when treated with a strong alkaline permanganate solution. After the bacteria present have processed the material to a certain extent, the nitrogen is converted to free ammonia gas which dissolves in the water present. After further oxidation, nitrites and finally nitrates are formed from the nitrogen content of the original organic material. Tests are therefore made for these four nitrogen compounds. First, a portion of the sample is treated with permanganate solution and tested for ammonia gas. The result is known as the "albuminoid ammonia" content of the water, and is a rough measure of the amount of unstable organic material present. A second test is made on a portion of the sample for "free ammonia" gas. Finally, the nitrite and nitrate contents of the sample are determined. The author will not attempt to dwell on the reactions which are employed, as they are complicated, and would add little to the interest of this paper. It may be noted, however, that these reactions are all of a colorimetric type; that is, a definite amount of reagent of known strength is added to a certain quantity of the sample, and, after certain manipulations, a pigment is formed in the water, the intensity of colour depending on the concentration of the substance being determined. The shade of colour of the mixture is compared with those of fixed standards set up for the purpose, each colour standard representing a definite concentration of the substance for which the test is made. Free ammonia gas can be detected down to 0.001 parts per million by weight in the water; quantities over 0.06 parts per million lead to suspicion. These figures are mentioned, merely to indicate the order of precision of the methods which are used, and similar precisions are secured in examining for nitrites and nitrates. The chemical examination is of extreme importance in cases where the bacterial content of the water is likely to be indefinite or slight, and the accurate methods are necessary due to the fact that the concentrations of the materials are generally small.

The second examination of the water sample is made for the number of bacteria which grow well at 37 deg. C. A cultural method is used for this purpose; that is, the bacteria are allowed to grow under favourable conditions, until indications of their growth may be detected. The principal piece of apparatus which is employed is a so-called "plate" or "petri-dish." This consists of two circular glass dishes, each about three inches in diameter, with vertical sides about one-half inch high, which fit into one another, forming a flat, circular box. A measured quantity, say 1 cc. of the sample, is placed in the dish by means of a graduated pipette. About 15 cc. of culture medium are added, and mixed well with the sample by rocking the dish to and fro. This medium consists of food for the bacteria, and agar, dissolved in water. The food includes peptone, which supplies the necessary nitrogen and carbon, and beef extract, supplying mineral and accessory constituents. Agar is a material similar to gelatin in that it will form a jelly when dissolved in water and allowed to set. The medium is thus poured into the plate, mixed well with the sample, allowed to set, and finally the plate is incubated at 37 deg. C. for about 24 hours. Now each organism present multiplies by growing to a certain size and breaking in half; each half then grows to that size and breaks again. This occurs about every fifteen minutes, so that during the 24 hours, an extremely large number of new bacteria are formed. These are all held in practically the same position as the original organism by the jelly-like property of the agar. The point is, that wherever there was originally one quite invisible germ, there are, after the period of incubation, millions of bacteria, all crowded together, forming a visible spot or "colony" in the transparent medium. The area of the plate, the depth of medium, and quantity of sample are so chosen, that it is unlikely more than one organism was originally located at the same point in the plane; that is, underneath one another. The number of colonies may easily be counted with the aid of a magnifying glass, and the result is the number of bacteria present in the 1 cc. of sample chosen, which grow well at 37 deg. C. Naturally chance enters into the problem; that is, every cc. chosen may not contain the same number of bacteria. Rough figures only, however, are required, and the "plate" method supplies the information desired.

The most important set of tests which are performed on the water sample determine the Bacillus Coli content of the supply. It has been mentioned that organisms of this type occur in feces in large numbers, and seldom in other materials. The Bacillus Coli is one of the Coli-Aerogenes group of bacteria, and differs from the Aerogenes bacillus in that the latter is found principally in top soil and on plants. Since the presence of Aerogenes in a water is an indication that dirt is entering the supply, a condition which is, of course, undesirable, no attempt is made in routine work to differentiate between Coli and Aerogenes: the presence of any of the Coli-Aerogenes group is considered an indication of undesirable contamination.

The tests for members of the Coli-Aerogenes group, or "B. Coli" as they are commonly termed, are based on certain characteristics of the organisms in question, which are as follows. First, B. Coli ferments lactose (milk sugar) with the production of certain gases. Second, it is aerobic, or grows in the presence of air. Third, it is not a spore-former; the spore is a seed-like state into which some bacteria change, and when in that state, the organism is able to resist extremely unfavourable conditions. The spore appears under the microscope as a highly refractile body, rounded in shape, similar to a small glass bead, whereas the bacillus appears rod-shaped and quite opaque. Finally, the B. Coli is "Gram-negative." Bacteria may be separated into two general groups, Gram-positive and Gram-negative, according as they do or do not retain the blue components of a certain "Gram" stain, consisting of red and blue dyes. Thus B. Coli, when so stained, appears under the microscope as a short red-coloured rod. The tests based on these characteristics are arranged in such an order that the examination constitutes a process of elimination, and they follow one another in logical sequence.

The first characteristic of the Coli group which is considered, is that it ferments lactose with the production of gas. A piece of apparatus, known as a fermentation-tube, is employed. It consists of an ordinary test tube containing the liquid medium, in which is inserted a small

[1] Mr. McCrady was awarded the John Galbraith Prize for this paper for the prize year 1936-37.

inverted vial which is also filled with the medium. A definite quantity, say 10 cc., of the water sample is placed in the tube, and the whole is incubated at 37 deg. C. for about 24 hours. As gas is formed, part of it rises to displace the liquid in the vial, and can readily be seen. The medium consists of peptone, beef extract, and lactose dissolved in water. The incubation is done at 37 deg. C. because the B. Coli grow well at that temperature. If any gas is formed in the vial, the result is considered positive. If not, then the examination need not be continued, as it is certain that no B. Coli were present in the portion of sample chosen. Suppose the result is positive; then the next test is made on material from the fermentation-tube, since there are bacteria which do ferment lactose with the production of gas, but which are not of the Coli group.

The B. Coli is an aerobic organism; consequently, if some of the material from the fermentation tube is spread over the surface of a suitable agar medium and incubated, any Coli organisms present will grow and produce colonies, such as were obtained by the "plate-count" method. The plate is employed for this test, and is made up with a layer of agar jelly in it. This jelly contains water, agar, beef extract, peptone and lactose, together with two dyes, methylene-blue and eosin. A small amount of material from the fermentation tube is transferred to the plate, by spreading it over the surface of the jelly with a platinum needle. The plate is incubated at 37 deg. C. for 48 hours. The B. Coli, in growing and multiplying, produces certain organic alcohols and acids, which dissolve the dyes present in the medium, and when these liquids evaporate, a layer of concentrated dye is left on the surface of the colony which is formed by the bacterial growth. That is, the Coli colony has a characteristic bluish-green colour which is not produced by most of the other bacteria which are likely to be present.

There are, however, some bacteria which produce this type of colony aerobically, and which do not ferment lactose, and even some which do ferment lactose, and yet are not of the Coli group. Therefore, one of the colonies is chosen for confirmation; a small amount of material from the colony is transferred to another lactose fermentation tube and the latter is incubated as before, in order to ascertain whether or not the organisms forming the colony are among those which produced a positive result during the first fermentation test. If the result is negative, another colony is chosen, and when two or more colonies have been examined, all giving negative results, the original portion of the sample taken is considered to be free from bacteria of the Coli type. If one of these colonies gives a positive result, some of the organisms in the colony are then stained with Gram stain and examined under a microscope. Since spore-formation is favoured by mass growth on a medium more favourable than one containing dyes, some of the colony is transferred to a simple agar medium, in which the organisms can multiply profusely. After incubation, a secondary culture is thus produced, some of which may be spread on a microscopical slide, and stained.

Examination of this slide may lead to three possibilities. First, spores may be present. Second, Gram-positive (blue-coloured) bacteria may be present. Finally, Gram-negative (red-coloured) bacteria may be present. If either spores or Gram-positive organisms, or both, are found, all the positive results so far obtained may be due to these organisms, even though there are Gram-negative bacteria present as well. Thus, in order to confirm the presence of the Coli type, Gram-negative organisms alone must be found on the slide. In the event that the final result is negative, another colony must be chosen from the agar plate, and the procedure repeated. If two or more colonies yield negative results, B. Coli are considered to be absent from the volume of sample taken.

Thus far, the examination which has been described is strictly qualitative, giving a result positive or negative for the portion of water chosen. It gives no indication of the Coli content of the sample. However, the tests are made quantitative by using a number of portions of the water. Suppose five 10 cc. quantities are completely examined. The results will be in the form 0 out of 5, 1 out of 5, 2 out of 5, and so on, as positive. If the result is 4 out of 5; that is, of five 10 cc. quantities of water, four of them indicate the presence of B. Coli, the most probable number of organisms of this type present in the sample per 100 cc. is then 16. This figure is based on the laws of probability and is arrived at by purely mathematical formulae. One might expect the figure to be 8, since 40 out of the 50 cc. examined indicated positive results. However, the positive result in any one portion might have been due to more than one organism, and mathematically a result of 4/5 indicates that most probably there was an average of two B. Coli organisms present in each quantity of the sample chosen. The figures for the various possible results are: 1/5, 2; 2/5, 5; 3/5, 9; 4/5, 16. The result 5/5 is indeterminate, since any number of B. Coli greater than 4 may have been responsible. Since this result is frequently encountered, a second series of tests is performed on five other portions of the sample, each of 1 cc. The figures for the possible results of this series of tests are: 1/5, 22; 2/5, 52; 3/5, 91; 4/5, 160. The range of results which may be obtained from this combination of tests of five 10 cc. portions and five 1 cc. portions of sample is thus from 2 to 160 bacteria of the Coli-Aerogenes type per 100 cc. of water. It is well to notice that the quantitative result is not very accurate, since chance enters so largely into the problem. But for practical work, this method of testing has proved satisfactory.

The three different examinations which have been described furnish information regarding the nitrogenous content of the water, the bacterial count at 37 deg. C., and a rough estimate of the number of organisms of the Coli-Aerogenes group which are present. With this information, together with that obtained from a visual inspection of the surroundings of the supply, an expert can usually estimate the degree of potability of the water. It is difficult to state any limiting values of the test results, as many exceptions and special cases enter into their interpretation. The author will attempt to illustrate the method of interpretation, by a few simple examples.

Suppose upon inspection of the surroundings of a shallow well, a cesspool is found to be located, say 50 ft. away. In this case, regardless of test results, the supply would very likely be condemned; in all probability the results would indicate a poor water, but it is just possible that an uncontaminated sample might be obtained at a time when no sewage was reaching the well. If, however, the source of contamination were at a distance of 500 ft. from the supply, or at a distance great enough to prevent immediate condemnation of the water, some material from the cesspool might reach the well; but after having travelled so great a distance underground, the bacteria should have been filtered out. Furthermore, most of the organic material present should be completely decomposed, the nitrogen converted to the nitrate form. The question is whether the soil has performed this process of filtration satisfactorily. If the pollution was extremely heavy, the soil might have become "loaded"; that is, undecomposed material might be distributed throughout the soil between the cesspool and the well; in such case, the bacteria might be transported in this material, and finally contaminate the water.

Under these conditions, if any B. Coli are found; that is, more than one or two per 100 cc., the supply is usually condemned regardless of all other test results; the reasons for such a decision have already been explained. If the pollution were slight, however, no B. Coli might be present in the sample at the moment of collection, and judgment, therefore, would have to be based upon the chemical test results. If a large amount of both "free" and "albuminoid" ammonia are found (more than 0.06 parts per million), together with varying amounts of nitrites and nitrates, the supply would probably be condemned; for these results show that the soil is loaded, and that the water contains organic material in various stages of decomposition. Presence of only "free" ammonia in large quantities, or of only "albuminoid" ammonia, is usually of little significance. Decomposition of vegetable matter might have yielded "albuminoid" ammonia, whereas inorganic reactions might have produced "free" ammonia in the water. The nitrite results supplement the others; if there is doubt regarding the significance of the ammonia content of the sample, for example, the presence of an excess of nitrites in the water would serve to confirm the doubt of its quality. If, however, these three nitrogen forms are found only in traces or not at all, the presence of a large amount of nitrates (30 to 50 parts per million) in the sample serves as an indication that, although the soil may be functioning properly as a filter, and although the organic material is being decomposed before it reaches the well, the soil must be reaching the saturation point. That is, the water may be safe for the moment, but at any time the extremely heavy pollution may penetrate through the soil and contaminate the well water.

Low bacterial plate counts are of particular importance in the case of well water; for if any of the other test results are almost but not entirely satisfactory, a low plate count is reassuring. A well water may be perfectly safe, however, even though it contains thousands of bacteria per cc., for a mass of still or slowly moving water, especially if it contains a trace of vegetable matter, is well adapted to the growth of harmless bacteria. A high plate count, therefore, may be of little significance.

In the control of a city water supply which is filtered and chlorinated, a plate count at 20 deg. C. is of great importance. Here, the purification system is expected to remove practically all of the organisms, and a sudden increase in the plate count means that this operation is not being performed successfully. The presence of B. Coli in excess of one or two per cc. in such a supply would also lead to suspicion of its quality. The nitrogen tests, on the other hand, are of little use here, and, in fact are not often performed on treated waters.

The foregoing examples serve to illustrate briefly how the laboratory results are employed. No one test is usually employed to determine the potability of a supply; it is the combined results from all the various tests which decide. And often the information obtained from an inspection of the supply and its surroundings is of greater importance than any number of test results.

The author has not attempted to describe the detailed methods of rapid manipulation of the apparatus employed in the examinations indicated, but such methods are obviously necessary when one considers that over ten thousand samples were analysed last year in the Quebec laboratories, and numbers of a similar order in other provincial laboratories.

Methods are changing with new discoveries and the extensive research which is being conducted. But the fundamental principles have been, and probably will be for some time to come, essentially those described. The laboratories do a vast amount of work for the cause of sanitation, and it remains for the public to co-operate fully, by rigidly obeying all regulations concerning water supplies, and by collaborating with the health departments for the examination of those supplies which are not known to be safe.

BRANCH NEWS

Border Cities Branch

J. F. Bridge, A.M.E.I.C., Secretary-Treasurer.
F. J. Ryder, Jr.E.I.C., Branch News Editor.

The regular monthly meeting and dinner was held Friday, March 18th, 1938, at the Prince Edward hotel. The speaker for the evening was W. L. Thompson, A.M.E.I.C., sales and service engineer, the Bailey Meter Company Limited, Montreal.

T. H. Jenkins, A.M.E.I.C., introduced the speaker to the 33 guests who had gathered to listen to his paper on "Meters and Combustion Control."

Meters and Combustion Control

After a brief synopsis of the history of metering, Mr. Thompson explained that since the advent of the steam engine it has always been desirable to have some method of visualizing and recording just what was happening inside of the boiler with various loads and operating conditions. The present metering devices are the outcome of a great deal of experimental work and the results of overcoming the many difficulties that were encountered.

A meter consists mainly of a primary and secondary element. The primary element is some type of orifice inserted into the medium to be measured so as to create a pressure differential in the flow of that medium. Following are some of the types of orifices used depending on the conditions and the medium to be metered: circular concentric, circular eccentric, and segmental orifices, terminal flow nozzles, adjustable orifices, and standard venture tube. In placing the orifice, one must remember to keep the flow of medium in a straight line leading to orifice to prevent swirling and to thus avoid creating a false pressure differential. When an orifice is set into a pipe line one must see that it is flush or even a little back of the interior surface of the pipe.

The secondary element consists of some mechanical means of transferring this pressure differential to some recording device, the Duvell system being used by the Bailey Meter Company. The differential produced varies as the square of the flow so that at ten per cent of flow there would hardly be enough power to overcome the friction in the mechanical parts. In metering, then, the problem is to obtain enough power to overcome the friction and yet not to create such a pressure differential as to cause a loss of pressure in the line. Bailey meters measure and record steam flow, gas flow and gas temperature, these records being of great assistance to the operator.

Combustion control depends principally on a pilot valve which is accentuated by any drop or rise in the pressure. This valve in turn operates the necessary control to feed more air, fuel or water to the boiler. The steam flow measurement is the most important, as all other controls revolve about this. Mr. Thompson passed around typical charts of actual performances. He also illustrated his talk with slides and diagrams, showing views of actual installations.

Boyd Candlish, A.M.E.I.C., moved a hearty vote of thanks to Mr. Thompson, to which everyone agreed.

Edmonton Branch

M. L. Gale, A.M.E.I.C., Secretary-Treasurer.
J. A. Brownie, Jr.E.I.C., Branch News Editor.

One of the Edmonton Branch's most enthusiastically greeted programme announcements in many months was that for the March 15th meeting. Over sixty members and guests were in attendance at the Corona hotel to see the Bethlehem Steel Company's sound motion pictures of the "Building of the Golden Gate Bridge."

The picture was a well edited description of the spectacular project with emphasis on the structural steelwork. Although the film was designed to be of general interest rather than of interest only to engineers it was very much enjoyed by the large audience.

Deputy branch chairman W. E. Cornish, A.M.E.I.C., presided.

Halifax Branch

R. R. Murray, M.E.I.C., Secretary-Treasurer.
A. D. Nickerson, A.M.E.I.C., Branch News Editor.

One of the largest meetings ever held by the Halifax Branch gathered at the Halifax hotel on March 24th, 1938, for the regular monthly meeting. I. P. Macnab, M.E.I.C., chairman of the Branch, presided.

H. S. Johnston, M.E.I.C., councillor for the Halifax Branch, announced that the ballot recently taken on the amendment to the By-Laws of The Institute was very decidedly in favour of the amendment. The final draft agreement of co-operation between the E.I.C. and the N.S. Professional Association is now completed, and has been approved by the Council of the A.P.E.N.S., and by the executive of the Halifax and Cape Breton Branches of the E.I.C. Legislation prepared by the A.P.E.N.S. to make this agreement legal is now ready for introduction into the Provincial House. Following a ballot of the Nova Scotia members of the E.I.C. it is expected that the agreement will be signed late in April of this year. Financial arrangements will become effective on January 1st, 1939.

New Steam Electric Generating Plant at Sydney

W. S. Wilson, A.M.E.I.C., chief engineer of the Dominion Steel and Coal Co., of Sydney, N.S., was the principal speaker of the evening. His paper was illustrated with numerous photographs and it was followed with very keen interest by the members.

Large quantities of blast furnace gas are available for fuel at the steel plant in Sydney, but this gas must be supplemented by coal to provide continuous energy. The old power plant consisted of 40 boilers designed to burn blast furnace gas, but provided with auxiliary grates for burning coal when required. Gas was burned at an efficiency of about 70 per cent.

A growing demand for electricity, and for process steam, coupled with a desire for a more efficient power plant led to studies for a new plant. The final design selected provided for two boilers having an output of 185,000 lb. of steam per hr. each, and designed to burn either blast furnace gas or pulverized coal or a combination of these two in any proportion. The new units are of the four drum type and operate at 500 lb. pressure. Superheated steam from the boilers is supplied to a new 10,000 kw. turbo generator unit, and the exhaust at 150 lb. pressure (the old working pressure) is used to supply various processes and services in the steel plant. A reducing valve is provided to supply steam at 150 lb. pressure when the turbine is not operating. Steam at the reduced pressure is de-superheated before entering the service main.

Since condensate from many of the plant services and processes cannot be recovered, about 50 per cent new feed water is required. An elaborate water treatment plant is provided. After three months of operation there is no scale in the boiler. Due to the abrasive action of dust present in the unwashed blast furnace gas, a fan of special design having blades ¾ in. thick is required to move it. This is driven by a 300 hp. variable speed turbine.

Coal is pulverized very fine before being fed to the boiler. Traps in the stack remove all fly ash from the chimney. The amount of fuel entering the unit is automatically regulated by the steam pressure, and the exact quantity of air required for combustion is regulated automatically by the volume of fuel entering the unit. This applies both for gas and pulverized coal or for any combination of the two. Explosion ducts are provided in both furnaces.

Tests on the new units show that an efficiency of approximately 80 per cent is being obtained from the blast furnace gas. With pulverized coal it is possible to generate 1 kw.h. per 1.08 lb. of coal. Automatic controls are used very extensively throughout the plant. A staff of three men per shift operate the boiler room.

Canadian materials were used as much as possible in the construction of the new plant. The turbine unit was made in Switzerland and the boiler drums in the United States.

A hearty vote of thanks was extended the speaker. Numerous questions from the floor were answered by him. A number of students from the N.S. Technical College were present at the meeting.

Hamilton Branch

A. R. Hannaford, A.M.E.I.C., Secretary-Treasurer.
W. W. Preston, S.E.I.C., Branch News Editor.

Speaking before the annual joint meeting of the Hamilton Branch E.I.C. and the Toronto Section, American Institute of Electrical Engineers at the Westinghouse Auditorium on April 8th, 1938, Dr. Joseph Slepian, Fellow A.I.E.E. and Associate Director of Research for the Westinghouse Electric and Manufacturing Company, described the ingenuity of research engineers in developing the ignitron to rectify heavy alternating current, that is, to change it to direct current.

Mercury Arc Rectifiers and Ignitrons

Research on rectification, stated the speaker, was based on a study of the unsteady electric arc turning on and off very rapidly. A device was needed which would change from a conductor to an insulator in a fraction of a second. Under certain conditions gases were found to have this property. Dr. Slepian explained the phenomenon by the theory of ionization, and described how an obstructing layer due to "space charge" formed near the cathode, and let only a small amount of current pass between the electrodes even at high voltage. To improve this condition a cathode of suitable material could be heated to the proper temperature as in the thermionic tube, but the same result was obtained by striking an arc: a "cathode spot," taking the place of the heated electrode, was formed at the cathode and permitted high current density at low voltage. On this principle the construction of the mercury rectifier is based.

The mercury arc rectifier, continued Dr. Slepian, consists of a glass bulb with a pool of mercury at the bottom, and a metal electrode in contact with the mercury, and an anode near the top of the bulb. With the current flowing in an auxiliary circuit, the metal electrode is pulled a short distance out of the pool. An arc leaps to the mercury and forms a cathode spot on it. The mercury is continually boiling away but, being a liquid, flows back to the pool. In the main circuit, alternating current, which reverses its direction 120 times a second for 60 cycle current enters at the upper anode and passes to the cathode spot. Direct current leaves the rectifier.

About 1927 electrical engineers were puzzled by the fact that the cathode spot formed at random intervals on the anode, causing an arc-back or short circuit. The explanation is still in doubt.

"It occurred to me," Dr. Slepian said, "that if the cathode spot on the mercury pool could be put out every other half cycle when it was not needed to carry the back flowing current, it would be impossible for the cathode spot to form on the anode."

He accomplished his task with an auxiliary relay tube, and introduced the ignitron. In it the auxiliary electrode which dipped in the mercury was carborundum, and the cathode spot formed when a certain current density was reached.

The ignitron is used extensively in electric welding. In the past it has not been possible to generate direct current with sufficiently high voltage to carry it over long distances, but it is predicted that the ignitron, now capable of rectifying 600 volt alternating current, will revolutionize the transmission of electric power.

W. J. W. Reid, M.E.I.C., chairman of the Hamilton Branch E.I.C., introduced the speaker, subsequently turning the meeting over to R. E. Jones, chairman of the Toronto Section A.I.E.E. W. P. Dobson, testing engineer of the Hydro-Electric Power Commission of Ontario, moved a vote of thanks to the speaker, coupling with it the thanks of the combined Engineering Societies to the Canadian Westinghouse Company for its hospitality. After the meeting refreshments were served to 174 members and guests.

Members of the Hamilton Branch, meeting at McMaster University on April 12th, heard their fellow member, Charles E. Church, A.M.E.I.C., patent solicitor, explain how inventors may get the greatest protection for their creations. Introduced by A. B. Dove, A.M.E.I.C., Mr. Church spoke under the caption,

Patent Laws for Engineers

The granting of rewards to individuals in England were known as monopolis before 1623. The favoured courtier could collect a tax on common articles of merchandise and necessities of life. The system became a burden and all monopolies were repealed in the reign of James I. Under the same Act patent laws were established whereby inventors were granted patents for 14 years from date of issue on inventions which did not harm the state. A necessary provision was that the inventor had to keep someone informed in the use of his invention so that it would not be lost at his death. A public record of the description of an invention was first required in the reign of Queen Anne.

The United States Congress in 1790 enacted the first American patent statute giving a monopoly for 17 years from issue. The latest Canadian Patent Act of 1935 provides the same period of protection. Nowadays the Canadian Patent Office issues about 300 patents per week, and the U.S.A. Office about 700 to 800.

The first question an inventor asks, stated Mr. Church, is "Does the invention contain novelty which can be patentably protected?" The inventor must see something others have failed to see. It may be something absolutely original or it may be a distinct improvement on another person's idea. Herein lies the most contentious question in patent law. Patents have been granted and later declared void in the courts on the grounds of lack of invention. The best test of an invention is its acceptance by the buying public. In the law of patents the person who makes the final or decisive step is the inventor. Before an inventor completes his invention he should learn if his idea is really new. This information is secured by searching the prior patents; usually only those of U.S.A.

The second question asked: "Is it possible to obtain patent protection that is sufficiently broad to protect the inventor against infringement?" To be a sound venture the invention should be one which could not readily be replaced by another construction, not infringing the patent but attaining the same end. Assuming the invention be worthwhile, the breadth of protection secured under the patent depends on the skill and knowledge of the patent attorney drawing up the specification and claims, and prosecuting the application before the Patent Office. Mr. Church advised inventors to obtain a thorough grasp of their written claims, and to test them by devising many different constructions that would apply to the invention, and seeing that the wording in the claim protected them against these constructions. It is often a question of competition rather than of infringement.

The third question is, "If the invention is put on the market, will it be free from infringing somebody else's prior patent?" A patent is not a license to manufacture or market the invention. It simply gives the inventor the right for 17 years to exclude all others from making or using anything within the scope of the patent claims. Another inventor may make a model of the patented invention with the idea of improving it, but if he is using it for his or others' commercial gain he is infringing. An invention may contain new and patentable matter, and at the same time infringe somebody else's prior patent which is still in force. If the earlier invention had limited sale both inventors will benefit by holding a cross-license. The inventor of the prior patent gives the inventor of the improvement a license to manufacture under the prior patent, and the inventor of the improvement gives the inventor of the prior patent a license to use his improvement.

Frequently an invention made in one field is applicable in another field. All possible applications should be specified in the patent.

Mr. Church closed with a motion picture of the John's conveyor which was developed from an invention of a machine for filling bags with powdered material such as cement. He also showed a number of slides of amusing old inventions and read the humorous specifications which accompanied them.

Mr. Church was thanked on the motion of E. Muntz, M.E.I.C. W. J. W. Reid, M.E.I.C., was chairman and attendance 52. Refreshments followed.

Lethbridge Branch

E. A. Lawrence, S.E.I.C., Secretary-Treasurer.
R. F. P. Bowman, A.M.E.I.C., Branch News Editor.

The Lethbridge Branch held a dinner-meeting at the Marquis hotel on the evening of Saturday, February 19th, 1938, at which the members entertained their ladies.

During the dinner Mr. and Mrs. George Brown's instrumental quartet provided music, followed by vocal solos by Mrs. C. Geiger and Professor Tink.

The speaker of the evening was Major F. G. Cross, M.E.I.C., Superintendent of Operation and Maintenance of the Irrigation Branch of the Canadian Pacific Department of Natural Resources. Major Cross is an artist of nation wide repute and an Associate of the Royal Canadian Academy, and he addressed the meeting on "Art." The value of art as a relaxation from the stresses of everyday life was emphasized together with its significance in making for us a better and fuller life.

Major Cross outlined the historical development of modern painting and dwelt on the different matters of technique which the artist must consider. Following his address he exhibited some of his work to illustrate the matters he had discussed.

London Branch

D. S. Scrymgeour, A.M.E.I.C., Secretary-Treasurer.
Jno. R. Rostron, A.M.E.I.C., Branch News Editor.

As a mark of appreciation of the services and efforts of the ladies at the Annual General Meeting, the Executive decided to turn the next regular meeting of the Branch into a "Ladies Night." Accordingly on March 30th a dinner meeting was held at the Hotel London to which the ladies were invited and a social evening enjoyed afterwards.

The Chairman presided and proposed a toast and hearty vote of thanks to the ladies for their splended co-operation and efforts in connection with the 52nd Annual and General Professional Meeting of The Institute held in London on January 31st to February 2nd inclusive. Much of the credit for the harmonious gathering, spirit of good will and fellowship which prevailed was due to the ladies and this "Ladies Night" had been dedicated as a token of appreciation by the members of the Branch.

Mrs. Buchanan and Mrs. Wolff responded suitably to the toast.

Greetings and good wishes were also extended by the Chairman to the Vice-President, E. V. Buchanan, M.E.I.C. Councillor J. A. Vance, A.M.E.I.C., in a short address referred to the past efforts and record of the London Branch and Mr. Buchanan's relation to it. Brief speeches were also made by V. A. McKillop, A.M.E.I.C., and H. F. Bennett, M.E.I.C.

Vice-President E. V. Buchanan duly responded and proposed a toast to the Ontario Association of Professional Engineers, which was suitably replied to by W. C. Miller, M.E.I.C., recently appointed councillor to that body. Mr. Miller outlined the purposes and aim of the Professional Association as relating to engineers generally and The Institute in particular.

After the dinner a delightful social evening was enjoyed by all, some of the party participating in bridge. Entertainment was provided in the shape of moving pictures of the Canadian Rockies, this being a film produced by the Sky Line Motor Club. The whole was interspersed by music, and an informal concert was thoroughly appreciated.

About thirty-four were present, and the hope was expressed unanimously that such an evening might be repeated very soon.

Montreal Branch

E. R. Smallhorn, A.M.E.I.C., Secretary-Treasurer.

Radioactivity

On March 24th, 1938, Dr. Karl K. Darrow addressed the Montreal Branch on the subject of "Radioactivity," discussing its nature, the progress made in the study of natural radioactive bodies from 1896 to 1933 and the very remarkable developments from 1933 to date made possible by the advent of transmutation. The importance of radioactivity in modern physics, its medical applications and the personalities of its important investigators have brought it to the attention of the general public. Dr. Darrow entered the Bell Telephone Laboratories (then the Engineering Department of the Western Electric Company) in 1917 after study in the United States and Europe. He has been engaged largely in writing on various fields of physics and allied sciences, and it was a priviledge to hear such an authority on this subject.

The meeting was a joint one with the Sigma Xi Society. The chairman was Dr. A. Norman Shaw.

Soil Mechanics in Foundation Engineering

Professor William P. Kimball addressed the Montreal Branch on March 31st on the subject of "Soil Mechanics in Foundation Engineering." Professor Kimball is professor of Civil Engineering and Soil Mechanics at the Thayer School of Civil Engineering at Dartmouth College, and has been connected with the foundation investigations for a number of projects, including the Huey P. Long Bridge at New Orleans and the San Francisco-Oakland Bay Bridge. He is a graduate of Dartmouth College.

Professor Kimball's paper described the contributions which have been made to the design and construction of foundations by the relatively new science of soil analysis, soil mechanics. It described applications of soil mechanies to practical work. The treatment of the paper being specific but not highly technical, it was of general interest to engineers rather than for specialists in soil mechanics. The topics discussed included: settlement observations and similarity of foundations, exploration of soil conditions, general methods of soil analysis, control and interpretation of field loading tests, use of allowable bearing values, soil mechanics in building codes, the effects of piles on soil, and general methods of settlement predictions. Lantern slides illustrated the paper.

Dr. O. O. Lefebvre, M.E.I.C., was chairman.

THE DESIGN AND CONSTRUCTION OF PIE IX BOULEVARD BRIDGE

The paper presented before the Montreal Branch on April 7th by Dr. S. A. Baulne dealt with the recently completed multiple-arch bridge over Riviere des Prairies, between the Island of Montreal and Isle Jesus. This structure, known as the Pie IX Boulevard Bridge, embodies several unique and interesting features; the principal one being the combination of steel arch ribs with a composite steel concrete post and deck system. Dr. Baulne discussed the general features of design, fabrication, erection, and construction methods used, illustrating his paper with lantern slides.

Chairman: Ernest Gohier, M.E.I.C.

TECHNICAL MEN IN INDUSTRY

On April 14th three short papers were presented before the Montreal Branch. Mr. Paul Gnaedinger, of the Dominion Rubber Company discussed, "Methods of Cost Control in Industry"; Mr. B. K. Reid, of Canadian Industries Limited, spoke on "Technical Sales Work" with particular reference to the marketing of Neoprene, and Dr. A. R. M. MacLean, Technical Director of the Elmhurst Dairies Limited, delivered an address on the "Application of Research to Industry." The three papers stressed particularly the effect of the technical man on these phases of industry. A discussion followed.

J. L. Busfield, M.E.I.C., acted as chairman.

RAILWAYS PROGRESSING TOWARDS CONTINUOUS RAIL

Mr. Harcourt C. Drake, Director of Research of Sperry Products, Inc., Brooklyn, N.Y., spoke to the Montreal Branch on April 21st on the subject "Railways Progressing Towards Continuous Rail." Mr. Drake described briefly the development of continuous rail from 1889 to 1937, when the longest recorded single stretch of 7,770 ft. was laid. He also discussed the behaviour of continuous rail in track; its performance under temperature variation; and the restraining forces preventing abnormal movement. The development of the flash butt weld, and the equipment and methods used for welding, transporting, and laying were described. The paper concluded by reviewing the advantages gained by the use of continuous rail. Interesting motion pictures and lantern slides were shown in connection with this paper.

J. M. R. Fairbairn, M.E.I.C., acted as chairman.

JUNIOR SECTION

On Saturday, April 23rd, the Junior Section visited the plant of Crane Company, Limited, Montreal. This visit included trips through the most modern valve plant in Canada, the foundry, chromium and nickel plating departments, pipe fabricating shops, electric and acetylene welding departments, and galvanizing department (both hot-dip and electric processes). Following the trip a motion picture of the Crane Company's Chicago works, entitled "Flow," was shown.

Ottawa Branch

R. K. Odell, A.M.E.I.C., Secretary-Treasurer.

At the noon luncheon, March 24th, 1938, an address was given by P. G. Johnston on the recently-formed Trans-Canada Air Lines, of which he is vice-president. Mr. Johnston briefly traced the history of flying in Canada and told what it is hoped to accomplish with the Trans-Canada Air Lines. W. F. M. Bryce, local chairman, presided.

TRANS-CANADA AIR LINES

"We are trying to develop a system of air lines in Canada," Mr. Johnston stated, "that can compare with anything in other countries. It means insistent and diligent study and the formation of a closely-knit organization which can function without any extraneous interference." Haste is being made slowly, the speaker continued, so that the result can merit the full patronage of the people of Canada.

Canada for a number of years has been the only large country without a regular scheduled airmail service, Mr. Johnston told his audience, although on the other hand the airplane has played an important part in the opening up of the northern areas of the country.

At the present time experimental flying operations over the Trans-Canada Air Lines are under way with five airplanes in use, each having a cruising speed of 165 miles an hour. By early fall it is intended to have another ten added to the equipment which will have larger power units and a faster speed. Inasmuch as the type of flying will be somewhat different to most flying hitherto, a special training school is being maintained at Winnipeg for pilots, ground despatchers, and mechanical personnel.

The Trans-Canada Air Lines will be affiliated with the Canadian National Railways and it is not desired unnecessarily to duplicate services. The new organization will therefore make use of some of those already in existence for the railway system itself, such as the purchasing, medical, publicity and other departments.

When the system is in proper operation much of the flying will be at night. Leaving Montreal at eight o'clock in the evening, mail will reach Vancouver in time for the first afternoon delivery on the following day. The air route will be by way of Ottawa, Toronto, North Bay, Winnipeg and Lethbridge with connections at a number of points for other cities off the main route. Passengers and express will also be carried and by connecting lines and railways, transportation to most parts of Canada and United States will be very much speeded up. The speaker, however, would make no definite predictions as to when the complete service would be put into operation.

ELECTRONIC DEVICES

"Electronic Devices" was the subject of a noon luncheon address given on April 7th, 1938, by J. T. Thwaites, Jr.E.I.C., of Hamilton. The address, which was of a technical nature, was illustrated with lantern slides and actual examples.

Mr. Thwaites described some of the types of devices from the simplest to the more complicated, mentioning that the radio furnished probably the most well-known example of the use of electronic devices at the present day.

Some rather remarkable operations were carried on by such means, stated the speaker. Lighting effects to fit the mood of the music played in the ballroom of the new Canadian National hotel in Vancouver would be operated by a system of 45 electronically controlled circuits. By such means it would be possible for the orchestra leader to choose the mood in his music and the lights would be changed to suit the mood. With this system it would require a million years to run through all possible sequences of variations of colours and lights.

In the electric welding of various metals, where either spot and seam welding is required, electronic control makes it possible to carry on such work continuously much more accurately and effectively than by manual control. The welding of stainless steel, for instance, which was formerly a bugbear to the welding engineer, is an example. Brass also can be so welded and also copper, even though no one has yet been able to measure the plastic range of the last mentioned. The extremely fine control of heat possible by electronic devices enables this metal to be handled with very great accuracy. With some of the modern alloys, also, such accuracy of control is likewise becoming more and more necessary and here again these electronic devices have their place.

W. F. M. Bryce, A.M.E.I.C., local chairman, presided.

Peterborough Branch

W. T. Fanjoy, A.M.E.I.C., Secretary-Treasurer.
J. L. McKeever, Jr.E.I.C., Branch News Editor.

At the regular meeting of the Peterborough Branch held on February 24th, 1938, the speaker was Mr. J. H. Daynes of the Air Conditioning Division, Canadian General Electric Company, who spoke on the subject of "Air Conditioning."

Mr. Daynes pointed out that there is an erroneous idea on the part of the general public to the effect that air conditioning is a very new art. On the contrary it had a start as early as 1897 and was considerably applied in the early part of the present century by the textile industry. Its application to the furthering of human comfort however, is fairly new and the speaker directed his remarks more particularly towards this phase of air conditioning.

Air conditioning was defined as the simultaneous control of temperature, humidity, air motion, and air purity. The term has been used very loosely and in a misleading fashion by various vendors, and there has therefore been a demand to standardize terms. Equipment may be described as "Winter Air Conditioning," "Summer Air Conditioning," or "Year Round Air Conditioning," if it performs the functions according to the following chart:—

Year Round {
*Heating
*Humidifying
*Cleaning †
*Circulating †
*Ventilating †
Cooling †
Dehumidifying †

*Winter. †Summer.

Equipment not completely fulfilling one of these groups of functions should be otherwise described.

The psychometric chart was shown and explained and it was stated that this chart was of the same importance to the air conditioning engineer as the steam tables to the mechanical engineer.

Winter and summer comfort charts were shown. It was pointed out that these were not necessarily indicative of the healthiest conditions because these were not exactly known. However, it was assumed that the healthiest conditions were approximately those of maximum comfort.

Mr. Daynes mentioned that practically all germs are carried on dust particles hence the importance of filtering. Proper dry filters will remove 95 per cent of the dust from the air.

The members of the Branch took considerable interest in the subject judging by the discussion which followed the presentation of the paper. The attendance was 59.

The Branch meeting held on March 10th was the annual "Students' and Juniors' Night." A. L. Malby, Jr.E.I.C., the chairman of the Students' and Juniors' Section of the Branch, introduced the speakers, who were R. E. Edson, S.E.I.C., J. R. Demarais, S.E.I.C., M. F. Carriere, S.E.I.C.

Mr. Edson spoke on "Sand Casting of Crank Shafts for the Automobile Industry." He described in detail the building up of the moulds from the sixteen separate sections for each shaft and pointed out the precautions taken to keep the dimensions of the finished casting within the extremely close limits demanded. Mr. Edson's paper was very well illustrated with slides and he followed through the whole process from the making of the moulds to cleaned casting ready for the various machining operations.

Mr. Demarais chose as his subject "The Purification of Water," and although he made mention of the processes involved in treating water for industrial purposes, he concentrated on the filtration of water for town and city use. The speaker described in detail the construction of the two main types of sand filters in general use and told how the precipitation of suspended matter and the extraction of bacteria were effected.

Mr. Carriere spoke on the subject of "Metallic Arc Welding." He mentioned the other welding processes in general use and then briefly recounted the history of arc welding in order to emphasize the tremendous growth in its application in a comparatively short time. Mr. Carriere went on to describe the nature of the arc and the relation of the required current and voltage to the type of material to be welded.

In thanking the speakers, V. R. Currie., A.M.E.I.C., the Branch chairman, urged upon them the desirability of entering their papers for the annual prize.

The attendance was 38.

At the regular meeting of the Branch held on March 24th, 1938, the speaker was Mr. T. B. McKeown of the Ethyl Gasoline Corporation, Toronto, and his subject was of course "Ethyl Gasoline." Mr. McKeown had with him a sound film, "The Long Road," the showing of which took up a large part of the meeting. This film showed the progress of transportation up to the time when the gasoline engine came into common use, and from then on, showed the search for a fuel which would increase the output of the engine and at the same time prevent knocking. Many varied compounds were tried mixed with the gasoline, some of which had a certain beneficial effect, but a compound known as tetra-ethyl lead was finally adopted.

By means of quartz windows in the cylinder walls and high speed cameras, the film showed the difference in the burning of a gasoline which caused knock and one which did not. With ethyl fluid added to the gasoline, the burning spread from the plug points at an even rate across the piston head whereas with ordinary gasoline which knocked, a sudden ignition of the unburned gasoline took place, starting from the side opposite the spark plug.

Following the showing of the film, Mr. McKeown showed some slides of power curves, etc., with different gasolines and explained the meaning of octane number as well as the necessity for setting the spark to suit the octane number of the gasoline used.

Many questions were asked which were ably answered by Mr. McKeown and it was quite evident that the Branch had spent an extremely interesting evening. The attendance was 57.

STUDENTS AND JUNIORS SECTION

The final meeting of the season of the Students and Juniors Discussion Club was held on April 4th, 1938, at which the speakers were A. DeMaio, S.E.I.C., on "Plant Layout," and Mr. V. B. Coxworth on "Photo Cells and Their Applications." Eight meetings have been held since the Club was formed last autumn and the willingness of the members to contribute papers combined with the efforts of the chairman, A. L. Malby, Jr.E.I.C., have made the Club a distinct success. Before the close of the meeting elections were held for the office of chairman for next season. The successful candidate was W. F. McMullen, S.E.I.C., under whose energetic leadership the success of the second season of the Club should be assured.

Saguenay Branch

C. Miller, A.M.E.I.C., Secretary-Treasurer.
J. W. Ward, A.M.E.I.C., Branch News Editor.

On February 11th, 1938, T. M. Moran, A.M.E.I.C., chairman of the Industrial Management Section of the Montreal Branch, delivered a paper to the Saguenay Branch entitled "Technical Men in Industry."

TECHNICAL MEN IN INDUSTRY

The technical graduate's training prepares him for administrative positions of a general character and in connection with production, development and distribution.

Management is primarily the leadership of men. Obviously such a function needs an ordered body of knowledge to which all who carry administrative responsibility can refer—a set of principles and a proved technique which will serve as a guide in the discharge of administrative duties.

Such an applied service will not be developed through theory alone but rather by the combination of the best abstract and technical thought on management with the practical experience of those actually engaged in responsible tasks.

To this end facilities of The Engineering Institute may well be utilized, and in forming its recently established Industrial Management Section, the Montreal Branch has had this purpose in mind.

PAPER UNLOADING FACILITIES AT PORT ALFRED

On February 25th, Mr. Frank Calder, of the Aluminum Company of Canada, Limited, addressed the Saguenay Branch on "Paper Unloading Facilities at Port Alfred."

A large proportion of Saguenay terminals business consists in handling of paper for water shipment. Prior to the construction of the paper storage shed at Port Alfred the paper had been handled directly from the mills to the side of the boats by train and to a lesser extent by truck.

Shipments from the mills could therefore only be made at the time boats were available at Port Alfred to receive the paper. The result was that the Roberval and Saguenay Railway was compelled to provide a large amount of rolling stock which could be used only intermittently during the summer and not at all during the winter. The investment required for this rolling stock was more than the railway was justified in making. They therefore rented equipment from the Canadian National Railway when and as required.

With the idea of smoothing off this intermittent traffic and also to provide storage for both mills, construction of a paper storage shed and handling equipment was commenced in October 1936, and completed sufficiently to receive paper for storage at the beginning of April 1937.

The general layout of the plant consists of a train shed, paper storage shed and conveyors. The cars of paper are spotted in the train shed, the paper unloaded and placed on a conveyor which takes it to the storage shed. Here it may be rolled off for storage, but for direct loading it passes on to other conveyors which take it to the wharf where it is then handled by the ships' gear. Consolidated Paper Corporation's paper is handled by a conveyor direct from their finishing room to the storage shed.

Saskatchewan Branch

J. J. White, M.E.I.C., Secretary-Treasurer.

The annual meeting of the Saskatchewan Branch of The Institute was held on March 18th, 1938, in the Kitchener hotel, Regina. Forty-five persons sat down to a very enjoyable dinner.

Stewart Young, M.E.I.C., the Branch chairman, was in charge of the meeting which assembled as a joint meeting of The Engineering Institute of Canada, the Association of Professional Engineers of Saskatchewan and the American Institute of Electrical Engineers. Immediately after dinner the chairman suggested that the entertainment be provided in order that the Branch could assemble in annual meeting later.

Moving pictures were screened of the Boulder Dam, on loan from the United States Department of the Interior, Bureau of Reclamation. Mr. D. D. Low read a brief synopsis of administration and construction of the dam.

Subsequently the guests retired and the meeting convened as an annual meeting of the Branch. The general business of reading of minutes, reading of the business and financial statement which was prepared for presentation to Headquarters for the year, auditors' report and the reports of the various committees were all approved by the meeting.

The Branch Councillor, R. A. Spencer of Saskatoon, was present to give his report as Councillor and also give a report as chairman of a Joint Committee on Consolidation. Progress is undoubtedly being made with regard to consolidation within the province, and after considerable discussion all members felt that some form of consolidation would be consummated within the next year.

The report of the scrutineers showed the following officers had been elected for the coming year:—

Chairman	I. M. Fraser, A.M.E.I.C., Saskatoon.
Vice-Chairman	J. McD. Patton, M.E.I.C., Regina.
Executive	A. P. Linton, M.E.I.C., Regina.
	P. C. Perry, M.E.I.C., Regina.
	E. K. Phillips, A.M.E.I.C., Saskatoon.
Nominating Committee	H. R. MacKenzie, M.E.I.C., Regina.
	C. J. McGavin, M.E.I.C., Regina.
	W. E. Lovell, M.E.I.C., Saskatoon.
	H. M. Bailey, A.M.E.I.C., Yorkton.
	J. C. Todd, A.M.E.I.C., Rosetown.

Mr. Young declared these officers elected and installed the new chairman, Professor I. M. Fraser, who thanked the members for the honour conferred upon him.

A. P. Linton presented a Past-Chairman's Gold Badge to Mr. Young, at the same time thanking him for the splendid work he had done for the Branch as Chairman and Councillor.

Sault Ste. Marie Branch

N. C. Cowie, Jr.E.I.C., Secretary-Treasurer.

The Sault Ste. Marie Branch of The Engineering Institute of Canada held a general meeting at the Windsor hotel, Sault Ste. Marie, Ont., Friday, March 4th, 1938.

This, a dinner meeting, was attended by twenty-two members and guests.

Following the dinner and a short business meeting, the chairman, J. S. Macleod, A.M.E.I.C., introduced E. M. MacQuarrie, O.L.S., M.E.I.C. Mr. MacQuarrie presented a timely and interesting paper on the subject, "Development of the Helen Mine." The speaker reviewed the history of this iron ore deposit, its growth since its discovery, its extent, properties and the methods used so far in mining the property. Following this, Mr. MacQuarrie discussed the methods now proposed for extracting, handling and transporting the ore and for bringing it up to a commercial grade.

Toronto Branch

J. J. Spence, A.M.E.I.C., Secretary-Treasurer.
A. E. Berry, M.E.I.C., Branch News Editor.

The meeting of the Toronto Branch on January 20th, 1938, was given over to a paper on "The Application of the New Science of Seeing to Lighting," with J. W. Bateman, manager of the Lighting Service Department of the Canadian General Electric Company, as the speaker

The fundamental question on lighting design is the one dealing with the objective to be accomplished. Definite and measurable scientific facts have come out of an orderly programme of research.

Man has been essentially an outdoor creature, with eyes evolved to function in daylight and for long distance seeing. Man's plan of living is in contrast to nature's plan.

Light is the one controllable factor in seeing. The four factors in seeing are: size of object, the contrast, time, and light. More light is only part of the story. One of the most undesirable factors of quality is that of glare.

Modern lighting installations are adopted to the science of seeing. Office lighting utilizes three kinds of lighting—indirect, semi-indirect and semi-direct. In industrial lighting the need for higher intensities of illumination has been realized.

Street and highway lighting is related to modern transportation and accidents. Present-day automobile headlights are still inadequate to provide the necessary light under the conditions encountered.

STUDENTS NIGHT AT TORONTO BRANCH

A novel plan was adopted at the meeting of the Toronto Branch on February 24th, 1938. On this occasion the programme was given by engineering students at the university. The evening opened with an interesting film on the "Golden Gate Bridge." Then five students competed for prizes, each giving a paper on a subject of his own choice. The material offered and the manner in which it was presented was excellent. The competition was closed and the judges had difficulty in making the decision. The final winners were: First prize, I. W. Smith; second prize, a tie between Bernard Etkin and J. L. Hemphill.

Vancouver Branch

T. V. Berry, A.M.E.I.C., Secretary-Treasurer.

The modern manufacture of lubricating oils was the subject of an address given by Dr. W. F. Seyer, Associate Professor of Chemistry, University of British Columbia, before the Vancouver Branch on Wednesday, March 16th, 1938, in the Georgia hotel.

Dr. Seyer, who has been directing research at the University of British Columbia for a number of years on the treatment of the hydrocarbons of petroleum and the extraction and refining of lubricating oils, traced the use of animal and mineral oils in the lubricating of machinery during the latter part of the last century to the present use of mineral oils from petroleum in the lubricating of modern high speed machinery.

The speaker discussed the characteristics both physical and chemical of modern lubricating oils under the headings—1, viscosity; 2, viscosity index; 3, volatility; 4, chemical stability.

Flow sheets were exhibited by Dr. Seyer which indicated the modern methods of separation of the waxes and sludges from the lubricating oils of varying viscosity indices by means of propane and sulphur dioxide treatment.

Excellent slides of a large refining plant were also shown.

The vote of thanks to Dr. Seyer was proposed by Dr. Victor Dolmage, M.E.I.C. The attendance was 32.

Winnipeg Branch

J. Hoogstraten, A.M.E.I.C., Secretary-Treasurer.

At a general meeting held on Thursday, March 17th, 1938, thirty-eight members and visitors were present to hear Mr. P. C. Watt, Terminal Manager, United Grain Growers Terminals, Ltd.

THE HANDLING OF GRAIN IN LARGE ELEVATORS

In 1883, the first terminal elevator at the Head of the Lakes was built at Port Arthur, with a capacity of 250,000 bushels. During the next five years, the Canadian Pacific Railways established a few terminal elevators at Fort William, but these had very little in the way of grain cleaning equipment, and were actually considered as a part of the transportation system. During that period, before grain fields became infested with weeds, the problem of grain cleaning did not exist, and elevators were constructed primarily for the purpose of transferring grain from cars to boats, and later for storage purposes.

The railway companies began to realize, in about 1910, that the handling of grain through terminal elevators was no longer a matter of transportation, but was fast becoming a highly technical business. Thereupon they began to lease their elevators to private companies, and in a few years were entirely out of the business of operating terminal elevators.

A modern terminal elevator consists, commencing at the top, of a head floor, garner floor, scale floor, distributing floor, and bin floor. Below these are the workhouse or cleaner bins, and then the main floor or cleaning deck.

Elevating legs for receiving and shipping are of 20,000 bushel per hour capacity at the Port Arthur plant. Many kinds and varieties of grain cleaning and separating machines are required, and in most elevators, it is this equipment which limits the rate of operation of the plant.

The cleaning and separating of grains might be described as involving length, breadth, thickness and weight of the materials handled. The cylinder machines, depending for efficient operation on the proper balance between weight and centrifugal force, have proved to be the most flexible type of equipment.

In the construction of the five million bushel terminal at the Head of the Lakes, the tanks were built farther apart, and the interspaces divided into four bins, each capable of holding two or three carloads of grain. The effect of this change from the conventional design was to provide a total of 406 bins of various sizes as against 190 bins in the standard design. It was found that in the years which followed the construction of this elevator, the tremendous increase in the number of grades more than justified the additional expenditure involved.

Moving pictures, depicting various aspects of the problem of grain handling were then shown, followed by a discussion in which G. L. Shanks, A.M.E.I.C., N. M. Hall, M.E.I.C., G. C. Davis, A.M.E.I.C., and T. L. Woodhall, S.E.I.C., took part.

The vote of thanks, proposed by Professor G. L. Shanks, was heartily responded to.

At a meeting held on April 7th, 1938, the E.I.C. prize winning papers were presented by Messrs. J. W. McBride and R. T. Harland, students in engineering at the University of Manitoba.

Mr. McBride spoke on "The Effect of Boundary Layer Control on the Efficiency of a Draft Tube." After developing the various formulae involved, Mr. McBride showed, by applying his theory to an actual draft tube of the Moody spreading cone type, that the efficiency could be raised from 93 to 94.7 per cent by controlling the boundary layer by suction.

Mr. Harland spoke on "An Analysis of a Low Power Hydro-Electric Plant," and gave a description of the No. 3 unit in the power house at Chateau Lake Louise, where he has been employed for several summers. The efficiency of the unit and the design of a proposed governor were fully discussed.

The presentation of these papers was followed by a lively discussion, and the vote of thanks proposed by D. M. Stephens, A.M.E.I.C., was cordially responded to by all those present.

BULLETINS*

Pipe Joints.—The Dresser Manufacturing Company Limited, 60 Front Street, West, Toronto, Ont., has just released a 16-page booklet on their No-Thread Fittings Style 65. Unique types of self-contained pipe joints that connect pipe without treading are described.

Heat.—"Heat" is the title of a 48-page booklet published by the Canadian Johns-Manville Company, Toronto 6, Ont. The five chapters of the book deal with the history of heat; the three methods of heat transfer and the use industry makes of this knowledge; the development of methods of heat conservation; modern materials available for conserving heat and the specific uses of these materials. Illustrations and charts accompany the text.

Electric Snow Melters.—Canadian General Electric Company Limited, 212 King Street West, Toronto, Ont., have published two pamphlets on the characteristics of electric snow melters and their installation and operation.

Conduits.—"Transite Conduit and Korduct" are subjects of a 21-page booklet published by the Johns-Manville Company Limited, Laird Drive, Toronto, Ont. This booklet includes data on the strength, resistance to corrosive soils and electrolysis of the transite conduit in underground distribution systems and information on the use of transite korduct in concrete envelopes. Many pictures are used to illustrate the text.

Oil Seal. In a 12-page pamphlet the Garlock Packing Company of Canada Limited, Montreal, describe their new oil seal called the

*Copies of these bulletins may be obtained by writing to the companies mentioned

Garlock Split-Klozure. This new patented oil seal can be easily installed without dismantling the machine.

Dust Arresters.—A 4-page leaflet has just been received from the Northern Blower Company, Cleveland, Ohio, describing their Norblo Screen Type Dust Arresters.

Meter Testing.—A 4-page descriptive leaflet has been received from Bepco Canada Limited, Montreal, covering "Crompton" apparatus for meter testing, D.C. potentiometers, indicating dynamometer wattmeters and moving coil and moving iron instruments. These instruments comprise a range which has been designed by Crompton Parkinson Limited.

Roofs.—A new 36-page brochure "Johns-Manville Bonded Built-up Roofs" has been received from Canadian Johns-Manville Company, Toronto 6, Ont., which contains complete detailed specifications on all J-M built-up roofs. Drawings illustrate the applying of roofing materials to various types of roof decks. Various methods of base and cap flashing are outlined accompanied by diagrams to show how flashing should be installed. Roof insulation is also gone into with detail.

Grinding Machine.—Brown & Sharpe Manufacturing Company, Providence, R.I., have issued a 2-page leaflet on a new grinding development, a plain grinding machine which, being electrically controlled, offers more profitable production grinding.

Kelvin Medal Awarded to Sir Joseph J. Thomson

The seventh award of the Kelvin Gold Medal has been made to Sir Joseph J. Thomson, O.M., D.Sc., F.R.S., Master of Trinity College, Cambridge, in recognition of his eminent services to engineering science. A brief account of the establishment of this award will no doubt be of interest. It may be recalled that the executive committee of the Memorial Fund to Lord Kelvin, set up by a general committee representative of 19 British and American institutions, decided that the balance of the fund, after defraying the cost of a window to the memory of Lord Kelvin in Westminster Abbey, should be applied to the establishment of a Kelvin Gold Medal. The window was unveiled in July, 1913, but the award of the first medal, which it was decided should be presented triennially as a mark of distinction in those fields of engineering work or investigation in which Lord Kelvin was particularly interested, was delayed by the European war. It was not until 1920 that the first award was made to the late Dr. W. C. Unwin, F.R.S. The second medal was awarded to Dr. Elihu Thomson in 1923; the third to the late Sir Charles A. Parsons in 1926; the fourth to Mr. Andre Blondel in 1929; the fifth to the late Marchese Marconi in 1932; and the sixth to Sir John Ambrose Fleming in 1935. The trust and administration of the Medal Fund are in the hands of the Institution of Civil Engineers, and the award is dealt with by a committee, sitting in London, and consisting of the presidents for the time being of the Institutions of Civil, Mechanical, Electrical and Mining Engineers; the Institutions of Naval Architects and Mining and Metallurgy; the Iron and Steel Institute; and the Institution of Engineers and Shipbuilders in Scotland. Recommendations received from similar bodies in all parts of the world are taken into consideration when the award is discussed. The medal for 1938 will be presented to Sir Joseph J. Thomson by Lord Rayleigh at the Institution of Civil Engineers on May 3, at 5 p.m., and after the presentation Sir Frank Smith, K.C.B., F.R.S., will deliver a lecture entitled "Disorderly Molecules, Refrigeration and Engineering." Sir Frank was elected an honorary member of the Institution of Civil Engineers at a meeting held on February 22. At the same meeting, H.M. Leopold III, King of the Belgians, H.R.H. The Crown Prince of Sweden, and Sir Robert Elliott-Cooper, K.C.B., senior past-president of the Institution, were also elected honorary members.—*Engineering.*

Joint Meeting of Canadian Chemical Association and Society of Chemical Industry

An important gathering of chemists and chemical engineers will meet in Ottawa in June, when the annual meeting of the Society of Chemical Industry, the great British industrial chemical society, will be held in conjunction with the twenty-first Canadian Chemical Convention. A large party of British chemists, including representatives of Government technical departments, professors and industrialists, headed by Lord Leverhulme, Governor of Lever Brothers, Ltd. and of Uni-Lever, Ltd., will visit Canada on this occasion and they will be joined in Ottawa by many chemists from the United States. Canadian chemists from all parts of the Dominion will be the hosts of the British and American visitors.

The meetings in Ottawa extend over three days, June 20 to 24. Technical sessions will be held each morning. Visits to plants and to places of interest around Ottawa and various social functions complete the programme. Dr. L. H. Baekeland, the well known American industrial chemist, inventor of bakelite, velox photographic paper and many other important chemical developments, will be the recipient of the Messel Medal. There will be a symposium on "The Utilization of Canada's Natural Resources Through Chemical Research."

In addition to the meetings in Ottawa, the British party, accompanied by many American and Canadian chemists will visit some of the chemical centres and principal cities in Eastern Canada.

Congratulations to the R.A.I.C.

The Hon. W. D. Euler, Minister of Trade and Commerce, has announced the result of a Dominion-wide competition for an architectural design for the Canadian Government pavilion to be erected at the World's Fair which will be held at New York next year. The competition gave Canadian architects an opportunity to produce a distinctively Canadian design for the special pavilion to represent Canada. The Royal Architectural Institute of Canada was appointed by the Department of Trade and Commerce as its adviser in judging the competition. The first award, carrying with it the commission to prepare detail drawings and specifications, went to W. F. Williams of Nelson, B.C.; the second to Ernest Barott, of Montreal; and the third to Ross and Macdonald, also of Montreal.

A Shaft Sinking Job at Falconbridge

A sinking of a shaft through a 100 ft. layer of overburden at the Falconbridge Nickel property, as described at the Toronto meeting of the Canadian Institute of Mining and Metallurgy by R. M. Oliver, the company's chief mine engineer, involved some interesting features. Consisting of gravel, sand, and boulder, with bands of very fine silt, the overburden usually is found to contain a layer of water-bearing quicksand adjoining the rock surface, which in previous shafts sunk at Falconbridge had given considerable trouble. The method of sinking through this overburden, briefly described below, was adopted after several other plans had been considered.

Sinking proceeded with a shaft crew of seven men and a leader by digging inside of a steel shield, which was jacked down as the work advanced, one man being stationed at each corner during jacking to keep the shield level. Sand was prevented from running in at the corners by plugging with burlap. Working three eight-hour shifts, an advance of approximately six feet a day was made.

The chief difficulty was encountered at a depth of about 100 ft., where, after sinking through a three and a half foot ledge, it was found that the shaft had hit a knoll, and that the bedrock fell away very steeply on one side, and was almost a sheer cliff on one corner. Dowel holes were drilled, and a twenty-inch wall of concrete was poured inside the shield to a height of five feet around the portion of the shaft down to rock. Interlocking steel piling was then driven around the remaining third of the shaft inside the timber, and hammered with air drills on to the rock.

The cost of sinking through the overburden to the bearing in rock totalled $35,225, or $282 a foot, the figures being exclusive of any cost of plant or power.

Eldorado's Operations at Great Bear Lake

Mining and milling methods, and other features in the operation of Eldorado's pitchblende-silver deposits at Great Bear lake, are the central topics of a paper by E. J. Walli, superintendent, and by other members of the company's staff, which appears in the February issue of the Bulletin, Canadian Institute of Mining and Metallurgy. Discovered by Gilbert LaBine in 1930, the mine is situated twenty-eight miles south of the Arctic Circle and 1,140 miles by airline from Edmonton.

To overcome the problem of transportation the company embarked upon both water and air freighting on its own account, and now operates a Bellanca plane with a payload of 4,400 pounds, and a complete water transportation system. Modern steel boats, oil tankers, and barges were added to the fleet last season. As a result of direct ownership of carriers, water-borne freight is now quoted to the mine at $110 a ton, as compared with $240 a ton four years ago.

To avoid delays and shut-downs, well-equipped shops, with complete facilities for general repairs, are maintained at the mine, and lumber is also manufactured on the property. All buildings are of modern, well-insulated construction, and offices and men's quarters are provided with steam heat, running water, electric light, showers, and washrooms. A recreation hall, equipped with two billiard tables, and a sundries shop are provided for the use of employees.

Skilled labour is brought in on one-year contract, and with the assistance of the skilled men, others are trained on the property with very good success.

Food supplies are shipped in during the water navigation season. Fresh vegetables are secured from posts along the Mackenzie river, and these supplies are augmented by fresh fruits, greens, and meats brought in by airplane.

The general geology, structure, and ore deposition and mineralization are among the features discussed by J. P. Ryan, assistant superintendent, in his section of the paper. He also outlines the methods employed in mining the ore-bodies. D. A. G. Smith, concentrator superintendent, comments on the special problems encountered in the concentration of the ores, and notes that the test work of the Department of Mines and Resources at Ottawa has been of invaluable aid in reaching the present efficiency.

—*Canadian Institute of Mining and Metallurgy.*

Preliminary Notice

of Applications for Admission and for Transfer

April 30th, 1938.

The By-laws provide that the Council of The Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

The Council will consider the applications herein described in June 1938.

R. J. Durley, Secretary.

*The professional requirements are as follows:—

A Member shall be at least thirty-five years of age, and shall have been engaged in some branch of engineering for at least twelve years, which period may include apprenticeship or pupilage in a qualified engineer's office, or a term of instruction in a school of engineering recognized by the Council. The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate for election who has graduated from a school of engineering recognized by the Council. In every case the candidate shall have held a position in which he had responsible charge for at least five years as an engineer qualified to design, direct or report on engineering projects. The occupancy of a chair as a professor in a faculty of applied science of engineering, after the candidate has attained the age of thirty years, shall be considered as responsible charge.

An Associate Member shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science of engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

A Junior shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examinations of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

A Student shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school, or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of Student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

An Affiliate shall be one who is not an engineer by profession but whose pursuits, scientific attainments or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

FOR ADMISSION

BRYDEN—DONALD CHARLES, of 115 Gerard St., Winnipeg, Man., Born at Birmingham, England, July 27th, 1904; Educ., B.Sc. (E.E.), Univ. of Alta., 1928; 1928-30, ap'tice course, Can. Westinghouse Company, Hamilton, Ont.; 1930 to date, power sales engineer, Winnipeg Hydro-Electric System, Winnipeg, Man.
References: J. W. Sanger, H. J. MacLeod, W. E. Cornish, R. H. Andrews.

CHAPUT, OMER Jr., of Arvida, Que., Born at Ottawa, Ont., July 10th, 1914; Educ., B.Sc. (E.E.), Queen's Univ., 1936; 1936 (May-Aug.), with L. H. Carreau, patent attorney, Ottawa; 1936-37, gen. engrg. work, Saguenay Power Co.; Feb. 1937 to date, apprentice engr., at present on constrn., with Aluminum Co. of Canada, Arvida, Que.
References: A. C. Johnston, R. H. Rimmer, L. T. Rutledge, D. S. Ellis, R. A. Low, F. L. Lawton.

CLARKE—ROBERT ARTHUR, of Lewisville, N.B., Born at London, England, July 12th, 1884; Educ., 1902-05, Crystal Palace School of Engineering, obtained all diplomas, 1905; 1903-05, ap'ticeship, dist. engr.'s office, London, Brighton & South Coast Rly.; 1908, instr'man., Sir John Mowlem Co.; 1909-10, instr'man., Benguella Rly. Survey, Portuguese Angola, West Africa; 1911-14, chief asst. engr., Bolivar Rly. Co., Venezuela; 1910-11, chief asst. engr., Lagos Govt. Rly., West Africa; 1914-15, acting in charge, Public Works Dept., Lagos Govt., Lakoja Niger Province, W. Africa; 1932-34, chief field engr. on refinery constrn., in Mexico, U.S.A., and Montreal; 1934-36, inspr. on paving constrn. in the maritimes, for Milton Hersey Co. Ltd., Montreal; 1937 to date, res. engr., highway divn., Prov. of N.B., Dept. of Public Works, Fredericton, N.B.
References: G. B. Mitchell, P. B. Motley, H. W. B. Swabey, C. G. Grant, M. F. Macnaughton, D. G. Anglin.

COOK—CLARENCE ARTHUR, of 301—31st St. W., Saskatoon, Sask., Born at Saskatoon, Nov. 20th, 1907; Educ., B.Eng. (Civil), Univ. of Sask., 1933; 1928 (summer), surveying, rodman and chainman, Phillips, Stewart & Phillips, Saskatoon; 1929-30-31 (summers), A. W. Heise Co. Ltd., estimating, dfting, designing and constrn. on work which included Saskatoon power house, dairies, bakeries and office bldgs.; 1933-36, with the Hi-Way Refineries, Saskatoon. Stillman having complete charge of one shift. Work included charge of operation during running; also mtce., design of improvements, chem. testing, lab. work, design of fuels, all chem. work pertinent to refining. Products manufactured, gasoline, distillates, kerosene and diesel fuels; at present, teacher at Bedford Road Collegiate. Subjects—senior chemistry, senior maths., junior science (chemistry and physics), junior maths.

FOR TRANSFER FROM THE CLASS OF ASSOCIATE MEMBER TO THAT OF MEMBER

ARMSTRONG—ARNOLD VICTOR, of Toronto, Ont., Born at Montreal, Que., Oct. 9th, 1901; Educ., B.Sc. (E.E.), McGill Univ., 1923; 1919-22, summer work with Shaw. Water & Power Co., Riordon Pulp Mills, Montreal Tramways Company and Dominion Bridge Co. Ltd.; 1923-31, engr. in sales dept., English Electric Co. of Canada Ltd., St. Catharines, Ont. and Toronto, i/c of estimating dept., and of handling of elect'l. machy. jobs and contracts of all classes in the power apparatus field incl. generating plant, switchgear, transformers, motors and control, rly. equipment, steam and hydraulic turbines; 1932-34, illumination engr. with Northern Electric Co. Ltd., Toronto, i/c of illumination divn.; 1935-38, with same company as engr. in charge of power apparatus and special products divns. for Ontario, covering motors and control, switchgear, transformers, generating plant, condensers, rectifiers, etc., also municipal signal systems incl. fire alarm, police alarm systems, traffic signal systems, police radio, also broadcasting station equipment and public address systems; March 1938 to date, sales manager, Canadian Cutler-Hammer Ltd., engrg., designing, and manufacturing and applying electric control apparatus. (*St. 1920, Jr. 1929, A.M. 1936.*)

References: R. E. Smythe, F. J. Bell, A. G. Dalzell, S. Shupe, G. E. Sancton, C. V. Christie.

CRASE—GEORGE HOBART, of 440 Durie Street, Toronto, Ont., Born at Butte, Montana, Sept. 27th, 1892; Educ., B.C.E., Univ. of Mich., 1915; 1915-17, dftsman, Pittsburgh Des Moines Steel Co.; 1917-18, engr., 1918-24, contracting engr. and sales manager, Canadian Des Moines Steel Co., Chatham, Ont.; 1924-30, contracting engr., 1930-35, district manager, and 1935 to date, general sales manager, Horton Steel Works Ltd., Toronto, Ont. (*A.M. 1930.*)

References: W. R. Manock, W. Storrie, W. L. McFaul, H. G. Acres, T. H. Hogg, J. C. Keith.

DICKENS—HARRY BLUNDELL, of 20 The Grove, North Cray, Kent, England, Born at Nottingham, England, May 17th, 1892; Educ., I.C.S., Surveying, Mapping and Civil Engrg.; 1913-15, Amiri Tin Mine, Nigeria, West Africa; 1915-19, active service in the Cameroons and Nigeria; 1921, timber limit surveys in Nor. Ontario; 1922, dftsman., Underwriters' Survey Bureau, Toronto; 1923, instr'man., i/c survey dfting., Frank Barber and Associates Ltd., Toronto; 1924, instr'man., East York Township; 1925-28, Welland Ship Canal, i/c section dfting office, and employed as engr. for constrn. of breakwall and docks; 1928-29, surveyor on trans. line location in Sask.; 1929-30, chief engr., London, Ont., office, Dominion Reinforcing Steel Co. Ltd.; 1931-32, reinforced concrete designing engr., City of Hamilton; 1933, civil engr., John Lewis Partnership, London, England; 1934, designing engr., Johnson's R-C Engrg. Co., Westminster; 1935-36, chief designing engr., Twisteel Reinforcements, New Malden, Surrey; 1936-38, civil engr., Ebbw Vale Steel Works development, for Richard Thomas & Co., with H. A. Brassard & Co.; also civil engr., Karabuk iron and steel development, Turkey, for same company; Feb. 1938 to date, co-ordinating officer, design and constrn., for new filling factory, Glascoed, for the War Office. (*A.M. 1925*) (*R.P.E. of Ontario since 1927.*)

EMPLOYMENT SERVICE BUREAU

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party.

Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted after a lapse of one month, upon request.

All correspondence should be addressed to

The Employment Service Bureau, The Engineering Institute of Canada

2050 Mansfield Street, Montreal

Situations Vacant

DRAUGHTSMAN, experienced in tool and die design for the production of small metal and plastic parts. Must be capable of checking. Company is located in Niagara Peninsula. State full particulars of experience and salary required to Box No. 1752-V.

NATIONAL RESEARCH COUNCIL OF CANADA

Electrical engineer, appointment to the electrical engineering laboratory. Applicants must possess a degree in electrical engineering or electrical physics from a recognized university. Preference given to British subjects. Candidates should have aptitude and experience qualifying them to undertake research in electrical engineering. Position carries a minimum annual salary of $2,100. Applications accompanied by information respecting academic degrees and honours, training and experience, and a general statement indicating what is considered to be special fitness for this position should be addressed to The Secretary-Treasurer, National Research Council, Ottawa, Ontario.

Situations Wanted

PAPER MILL ENGINEER: B.A., B.A.Sc. Married. Age 34. A.M.E.I.C. Ten years experience in paper mill costs, maintenance, design and construction. Now employed as cost engineer in Southern States. Hard worker with excellent references. Available immediately. Apply to Box No. 150-W.

PAPER MILL ENGINEER. If you are willing to pay around $5,000 per year for the services of an engineer, age 36, with twelve years experience in paper mill design, construction and operation, apply to Box No. 482-W.

CIVIL ENGINEER, B.A.Sc., A.M.E.I.C. Married. Experienced in engineering and architechtural design and in supervision, office management, etc., wants to round out experience in the contracting field. Ten years experience since graduation. Present location Toronto. Address Box No. 576-W.

ELECTRICAL ENGINEER, B.Sc. '28. Two years student apprenticeship at Can. Westinghouse Co., including test and electrical machine design. Also about two years experience in operating dept. of large electrical power organization. Available on short notice. Apply to Box No. 660-W.

Situations Wanted

ELECTRICAL AND CIVIL ENGINEER, B.Sc. Elec. '29, B.Sc. Civil '33. JR.E.I.C. Age 32. Experience includes four months with Can. Gen. Elec. Co., approximately three years in engineering office of large electrical manufacturing company in Montreal, the last six months of which were spent as commercial engineer, also experience in surveying and highway work. Year and a half employed in electrical repair. Best of references. Apply to Box No. 693-W.

CIVIL ENGINEER, B.A.Sc. (Toronto '27), age 34, married. Five years railway and construction work as building inspector and instrumentman. Level engineer and on construction of a long timber flume for a pulp and paper mill. Field engineer for a sulphite company, in charge of the following mill buildings, acid, digester, blow pit, barker room, chip storage and acid towers Available immediately. Apply to Box No. 714-W

CONSTRUCTION ENGINEER, Grad. Toronto '07. Experience as resident engineer and superintendent on railroad, municipal, hydro-electric and industrial construction. Intimate with organizing, layout, survey, estimates and costs. Available immediately. Apply to Box No. 886-W.

CIVIL ENGINEER, B.Sc. '29, JR.E.I.C., R.P.E.M. Age 31. Married. Experience includes railway and highway surveys and construction, land and mineral claim surveys, 4 years draughting, structural and hydraulic design, preparation of plans and estimates for hydro-electric development, sewage disposal project, water treatment plant, subway construction, buildings, etc. Experienced in reinforced concrete design including statically indeterminate frames. Also capable of preparing designs in steel and timber. Desire permanent employment, preferably in structural design. Available immediately. Apply to Box No. 1023-W.

SALES ENGINEER, age 30, graduate in electrical engineering, seeks position with more future. Experience in radio and telephone work and in electrical contracting. At present selling electrical supplies in Western Ontario. Apply to Box No. 1044-W.

ELECTRICAL ENGINEER, B.Sc. '29, age 30. Single. Eight and a half years experience on maintenance, on construction, floorman and operator on hydro-electric system. Desires construction, service, sales or research work. Any location. Excellent references. Apply to Box No. 1062-W.

Situations Wanted

CHEMICAL ENGINEER, grad. McGill '34, experienced in meter repairs, control work; and also chemical laboratory experience. Apply to Box No. 1222-W.

CIVIL ENGINEER, B.A.Sc. (Toronto '33), S.E.I.C., age 27. Married. Five years experience includes highway surveys, bituminous and concrete paving, steel and reinforced concrete building construction, instrument work, draughting, cost accounting and estimating and some experience as foreman. Available immediately. Apply to Box No. 1265-W.

ENGINEER SUPERINTENDENT, A.M.E.I.C., R.P.E., Que. and Atla. Age 47. Twenty years experience as engineer and superintendent in charge of hydro-electric, industrial, railroad, and irrigation construction. Specialized in rock excavation and suction dredging. Intimate knowledge of costs, estimating and organizing. Available immediately. Apply to Box No. 1411-W.

CIVIL ENGINEER, graduate 1927, age 34 years, desires position as town engineer. Eight years municipal experience. Location immaterial. Apply to Box No. 1628-W.

CIVIL AND ELECTRICAL ENGINEER, JR.E.I.C. (Univ of Man.). Married. Age 25. Good draughtsman. Four months draughting, one year instrumentman on highway location and construction, inspection and miscellaneous surveying and estimating. Six months as field engineer on pulp and paper mill construction. Prefer electrical or structural design. Available at once. Apply to Box No. 1633-W.

CIVIL ENGINEER, B.Sc. in C.E. '34. S.E.I.C. Age 27. Five years experience, including harbour construction, highway paving, one and a half years paper mill construction, instrument work, draughting, estimating, interested in design. Available on short notice. Apply to Box No. 1737-W.

CIVIL ENGINEER, B.A.Sc. '33. O.L.S. Age 27. Married. One year and a half in charge of power plant construction. Four summers on land surveys and one summer on mine survey work. Also experience in draughting, electrical wiring, and highway engineering. Apply to Box No. 1757-W.

ELECTRICAL ENGINEER, B.E. in E.E., N.S. Tech. Coll. Single. Age 25. Experience in sales, electrical installation, and construction work. Available immediately. Will go anywhere. Apply to Box No. 1758-W.

CHEMICAL ENGINEER, graduate, Toronto '31. Seven years experience in paper mill, meter maintenance, control work and chemical laboratory. Speaking French and English. Location immaterial. Available at once. Apply to Box No. 1768-W.

CIVIL ENGINEER, B.A.Sc., JR.E.I.C. (Toronto '35). Age 24. Experience in structural design, construction and surveying, including one year in South America. Details on request. Apply to Box No. 1784-W.

For Sale

Transit Theodolite fully equipped for observations. Apply to Box No. S-25.

THE ENGINEERING JOURNAL

VOLUME XXI, No. 6 **JUNE, 1938**

Sewage Disposal

William S. Lea, M.E.I.C.,

Consulting Engineer, Montreal, Que.

Paper presented before the Montreal Branch of The Engineering Institute of Canada, November 25th, 1937.

SUMMARY.—This paper deals with principles and processes rather than equipment and describes five common types of treatment used in various plants, as well as some of the patented processes. The disposal of sludge by incineration and digestion, and the pollutions of streams is also given considerable attention.

In the Province of Quebec very little is done in the way of sewage treatment. The town of Noranda is the only municipality with a plant capable of a high degree of purification. Apart from Noranda, a few institutions and eight or ten small towns partially treat their sewage. All told less than two per cent of the sewage discharged from municipal systems in this province is given any treatment at all.

The reason Quebec has less artificial agencies (sewage treatment plants) than some other Canadian provinces and most American states, is because this province has more abundant natural agencies for purifying sewage in close proximity to its larger centres of population. In other words, most of the cities are situated on the St. Lawrence and its larger tributaries.

It would appear appropriate therefore in a paper of this kind before the Montreal Branch to discuss rather fully the principles on which sewage treatment practice is based and the purification it is practicable to achieve, rather than enter into a detailed description of the equipment, and of the capital and operating costs of the various types of sewage treatment plants. Those desiring such particulars are referred to a paper read before the Montreal Branch about three years ago by Edmund B. Besselievre and published in the January 1935 issue of The Engineering Journal. This concise and comprehensive paper bears the title "Modern Sewage Treatment Practice" and is well worth reading. To keep in line with Besselievre, gallons referred to herein mean U.S. gallons. His figure of 100 gal. per capita per day will be taken as the average dry weather sewage flow. As a matter of fact it is a commonly accepted figure.

Sewage teems with bacteria. George W. Fuller in "Sewage Disposal" writes, "In 1894 the author computed from his studies of Massachusetts sewages that on an average, city sewage contains some 320 billions of bacteria to each person connected with the sewer system." It is the daily number that is referred to. Fortunately most of these bacteria are harmless or useful, but as the discharges of human beings account for a lot of them, the germs of intestinal diseases such as typhoid and dysentery may be present. The removal or destruction of bacteria is therefore one of the reasons why sewage is treated and from the hygienic point of view it is the most important reason. Another reason for treating sewage is that it always contains organic matter, which being a bacterial food constitutes a rich culture medium for more bacteria, hence its decomposition by bacteria is capable of creating a nuisance. Although there is comparatively little of this organic matter, less than a pound of it in a ton of sewage, it is the main factor nevertheless, in the capital costs, operating costs, and difficulties of sewage treatment.

Sewage varies greatly in its composition not only between different towns but from hour to hour in the same town. The dry weight of the suspended solids in say 1,000,000 gal. of sewage from one town may average almost twice that in another. Moreover different sewages do not react alike to similar treatment. For instance the percentage removal of suspended solids by a fine screen or a sedimentation tank under the same load conditions may average 50 per cent or more higher in some plants than it does in others. The same is true of the day to day results in the same plant. Usually the reason for such disparities is more or less obvious, but it quite often remains obscure even when one knows, or rather thinks he knows all the facts. Repeated qualifications are so tiresome and confusing that it is proposed to sacrifice accuracy to clarity in this paper, by dispensing with a recital of exceptions to statements concerning designs, efficiencies, quantities and costs. In short, practically all figures are averages. For instance where later on it is stated that two hours settling will remove from sewage 50 per cent of its suspended solids, it would be closer to the truth to say from 30 to 60 per cent depending upon the character of the sewage. For the same reason all living organisms found in sewage or which have anything to do with its purification are called "bacteria" irrespective of their type, or whether belonging to the lower orders of plants or animals.

The average quantity of sewage discharged in a day from a sewerage system serving 10,000 people will at 100 gal. per capita amount to 1,000,000 gal. If the sewage is allowed to remain practically quiescent in a tank some of the solids it contains will settle to the bottom. The most of them which can be separated from the sewage in this way will settle after two hours' detention. This deposit will be called herein the "settleable solids" and for 1,000,000 gal. of sewage amounts to about 1,000 lb. dry weight.

If it were practicable to pass the 1,000,000 gal. of settled sewage through a laboratory filter, another 1,000 lb. dry weight of solids would be removed from it. These solids were too finely divided to settle and are appropriately referred to as the "non-settleable solids." The ton of solids, that is to say, the combined weight of the settleable and non-settleable solids, constitute what is known as the "suspended solids" and in spite of their complete removal the filtered sewage is not clear, it is still a cloudy liquid.

The cloudiness is caused by the "colloids," that is to say, semi-solid matter which passes with the liquid even through a laboratory filter. In practice usually the non-settleable solids and the true colloids are removed from the sewage by the same treatment, and as there is not a great deal of difference between them except perhaps to technicians, "colloids" from now on will be considered herein to include both non-settleables and true colloids.

Although the preceding definitions of both settleable solids and colloids are not strictly correct nothing that really matters is misrepresented thereby. The points worth remembering are, that 1,000 lb. of solids, at least two-thirds of which are potentially offensive, can be removed from 1,000,000 gal. of sewage simply by two hours' sedimentation. Also that the colloids cannot be removed to any useful extent even by prolonged sedimentation. Moreover they amount to 1,000 lb. in 1,000,000 gal. of sewage, and not only make it cloudy but are, if anything, more offensive than the settleable solids.

Dead organic matter whether originating in toilets, kitchens, laundries, abattoirs or elsewhere is capable of creating a nuisance from offensive odours, but as everybody knows can be rendered inoffensive by burning. This idea is as old as the hills. It was an injunction of Moses, that unclean matters were to be carried outside the camp and burnt. When organic matter is burned all that happens to it is that it combines with the oxygen of the air.

Since organic matter is rendered inoffensive by oxidization it is logical to infer that its affinity for oxygen is a measure of its potentiality for creating a nuisance. In sewage treatment practice technicians determine the five day, rather than the total, oxygen demand of a sample of sewage or plant effluent and call it the "Bio-chemical Oxygen Demand" of the sample, commonly expressed by the abbreviation B.O.D. It is synonymous with pollution. Some of the B.O.D. is due to the solids and some to the liquid. For an easily remembered distribution the following statement may be taken as substantially but not strictly true, viz. one third of the B.O.D. of sewage is contained in the settleable solids, one third in the colloids, and the remaining third in the liquid. Probably one would not be so far out to take the same distribution for the bacterial content of sewage.

Bacteria are not peculiar to sewage, but are widely distributed in the air, soil and surface waters, ready to seize upon and render organic wastes inoffensive. By bacterial action organic matter is oxidized at quite ordinary temperatures without the evaporation of its moisture as must be done before it can be burned. In fact, moisture is necessary to the activities of the bacteria. The so called aerobic bacteria will convert organic wastes into inoffensive forms by oxidization, without any nuisance whatever, provided the conversion takes place in the presence of air, or to be more exact in intimate contact with oxygen. If free oxygen or air becomes exhausted, the anaerobic bacteria take over the job. These bacteria derive the oxygen for their own needs from the organic matter itself and in time convert it into a sort of humus which although not completely oxidized is inoffensive. However while this is going on very objectionable gases and odours may be released. Anybody who has broken a rotten egg has become acquainted with that form of anaerobic decomposition called putrefaction. Only an insignificant part of the ceaseless supply of organic wastes the world over is converted into an inert and inoffensive form by incineration. It is the bacteria which accomplish this herculean task, and although it is true that disease germs can cause pestilence and death, the useful bacteria really keep the world fit for life. These myriads of tireless workers constitute therefore a great economic asset. Probably there is no country in the world which could afford to trade its bacteria (disease germs excluded) for Canada's gold mines.

Expressions herein to the effect that sewage solids, or the liquid, or sewage as a whole, or other organic wastes of any kind have been "stabilized" or rendered "stable," mean that these potentially offensive matters have been so changed by oxidization or otherwise that they will no longer create a nuisance.

One or more of three yardsticks are commonly used as a measure of the efficiency of sewage treatment processes, viz. the percentage removal of suspended solids, B.O.D. and bacteria. As will be explained, sewage treatment renders sewage unobjectionable in the aesthetic sense by removing or transforming the polluting matters in it, and from the hygienic point of view by removing or killing the bacteria it contains. In this connection it must be noted that the efficiency of sewage treatment plants will be expressed in terms of *removals* only, irrespective of whether the purification is effected by the removal, transformation, or destruction of the objectionable contents of the sewage. Moreover whenever the weight of solids is mentioned herein, it means their dry weight unless otherwise plainly implied by the context.

It is now proposed to describe in the inverse order of the degree of purification effected, five fairly common types of sewage treatment plants, viz. "fine screening," "plain sedimentation," "chemical precipitation," "trickling filters" and "activated sludge." To give some idea of the actual and relative weights of the solids removed, it is assumed that the plants described serve 10,000 people, that is to say, have a capacity for treating on the average 1,000,000 gal. per day.

These five treatments remove or reduce by somewhat different methods some of the solids, B.O.D. and bacteria contained in the crude sewage. The means by which the solids which have been removed from the sewage are disposed of in a stable form are common to all except perhaps fine screening plants, the solids removed by which are called "screenings" and by the other four plants "sludge." Where bacterial removal is of prime importance all of the treatments except perhaps "activated sludge" must be supplemented by sterilization with chlorine to reduce the bacterial content of the plant effluents to a reasonable count. Taking Fuller's estimate already referred to, there would be 2,000,000 bacteria in a glass of the effluent from a plant with a bacterial efficiency of 99 per cent although possibly but not probably without a single disease germ amongst them. Therefore in describing the plants their efficiencies will be compared, in the first instance, with respect to the removal of suspended solids and B.O.D. only, deferring for the time being a discussion of bacterial removals and sludge disposal.

Irrespective of the type of plant, pre-treatment devices are practically always provided in the form of bar screens to remove the larger solids, and grit chambers or detritors to remove the grit. Detritor tanks are comparatively small affairs providing for a detention therein of only a minute or so, because the bulk of the grit settles out readily at a velocity of flow through the tank of about one half to one foot per second. Of course both the large solids and the grit could be removed in a sedimentation tank along with the settleable solids and skimmings but it is obviously better to get rid of them in advance of the piping valves pumps, etc., in the main plant.

Some recent installations install a so called comminutor instead of a bar screen to comminute the coarser solids without removing them from the sewage thereby rendering some of the larger floating solids settleable by liberation of their buoyant gases. In other plants a so called shredder is provided to comminute the coarse screenings removed from the sewage by a bar screen. The shredded solids are returned to the crude sewage or otherwise disposed of. In many plants a so called grease separator is provided immediately preceding the primary settling tank, in the form of a tank equipped with compressed air diffusors. The tank is comparatively small, providing for a detention of about five minutes only, and it is stated that the air used amounts to from 0.10 to 0.20 cu. ft. per gal. of sewage.

In most fine screening plants the sewage is passed through a slotted plate in the form of either a revolving drum or a revolving disc. The slots are usually 2 in. long and anywhere from 3/64 to 1/8 in. wide. Screening plants remove from 5 to 15 per cent of the suspended solids.

In a plain sedimentation plant the sewage is passed slowly through a tank providing two hours nominal detention. That is to say, the volume of the tank is equal to the average quantity of sewage passing through it in two hours. A plain sedimentation plant removes 33 per cent of the B.O.D. and 50 per cent of the suspended solids amounting to 1,000 lb. per 1,000,000 gal. treated.

Fig. 1—Circular Sedimentation Tanks Equipped With Up-flow Magnetite Filters.

Sewage enters tank at centre and flows radially under baffle and up through filter. Note solenoid washer suspended from rotating arm.

Though vastly improved in appearance the settled sewage is still quite cloudy because of the colloids in it, and unless promptly and adequately diluted, may in a matter of hours, rather than days, become a nuisance.

If a clear effluent together with better removal of both suspended solids and B.O.D. is desired, it can be obtained by dosing the sewage before it enters the settling tank with a coagulant, usually lime and some iron compound such as ferric chloride. The special field of usefulness of such chemicals in sewage treatment is to render the colloids settleable. About 80 per cent of the suspended solids, amounting to 1,600 lb. per 1,000,000 gal. treated, will be removed in the sedimentation tank together with about 900 lb. of solids due to the chemicals, and in addition with some sewages a substantial weight of solids in solution may be precipitated.

Chemical precipitation, as this treatment is called, will produce an effluent of very satisfactory appearance because enough of the colloids have been flocculated and settled out to remove most of the cloudiness. However this treatment does not help much towards the removal of the organic solids in true solution. Consequently the B.O.D. of the crude sewage is reduced only 65 per cent or so.

Apart from chemical storage and chemical feeding facilities and the enlarged capacity of sludge disposal equipment, the additions to the plant structures involved in the conversion of a plain sedimentation plant into a chemical precipitation plant would be limited to the provision of a mixing and flocculating tank ahead of the settling tank, with compressed air facilities or mechanical stirrers. Their combined capacity is equivalent to about one quarter that of the settling tank. For the results obtained the capital cost of a chemical precipitation plant is relatively low, but operating costs are another story. At current prices in the Montreal district, the chemicals required to treat 1,000,000 gal. of sewage for 80 per cent removal of suspended solids might amount to about $10.

Chemical precipitation plants permit of great flexibility in respect to the degree of purification accomplished, ranging practically all the way from a settled effluent (no chemicals) to the effluent resulting from what might be called maximum chemical dosage with 90 per cent suspended solids, and 75 per cent or more B.O.D. removed. Slightly lower figures, 80 per cent and 65 per cent are taken, because often enough these removals approximate the economic limits of the process as a continuous treatment. It is well to bear in mind however that unless the characteristics of the sewage are known in advance, prophecies with respect to operating efficiencies and costs may be wide of the mark with any treatment, but particularly so in the case of chemical precipitation.

If still better purification is required, that is to say if it is desired to carry the attack against the liquid sewage itself, the sanitary engineer takes a lesson from nature and turns to bacteria to help him out. Given a sufficiency of air (oxygen) and of the proper kind of bacteria and surroundings where they can thrive, these organisms can be relied upon in large measure to oxidize or otherwise stabilize the pollution in solution and at the same time convert the colloids into settleable solids just as chemical precipitation does.

Obviously an oxidization process is not such a simple treatment as plain settling. The plants cost much more to build, and are more troublesome and costly to operate and more likely to be a nuisance. There are three kinds of these oxidization plants, which in the order of their development are "contact beds," "trickling filters" and "activated sludge" plants. As trickling filters and activated sludge plants have in large measure superseded contact beds in modern practice on this continent, a description of the contact beds will be omitted.

In a trickling filter plant the primary tank effluent, that is to say the effluent from a plain sedimentation plant, is distributed as uniformly as practicable over a bed of gravel or broken stone from five feet to ten feet deep. Six feet to eight feet is the common range. It is better practice to place the filter medium in a tank with tight walls so that if found expedient the beds can be temporarily flooded to help control the fly nuisance to which trickling filters are at times subject. In operation the sewage has a free discharge from the bottom of the bed. Consequently there is a loss of head involved equal to the depth of the bed plus the head required to distribute the sewage over it. The latter varies according to the method of distribution. For plants of moderate capacity anyway the revolving distributor is at least as good as any and for it 18 in. is sufficient.

The stone in the filter becomes coated with organic matter teeming with bacteria over which the sewage passes in thin films on its descent through the bed. As there is a free circulation of air the stage is set for natural purification. Consequently a good deal of the pollution in solution is oxidized and about 20 per cent of the suspended solids applied to the bed, i.e. 200 lb. per 1,000,000 gal., are gasified or liquefied. Although the bed is too coarse to act as a strainer, the treatment tends to render the colloids settleable. The effluent from a trickling filter is therefore settled in a final sedimentation tank or humus tank, as it is commonly called, for one hour or more. About 85 per cent of both the suspended solids (1,700 lb. per 1,000,000 gal. treated) and B.O.D. are removed overall, and the final effluent though somewhat cloudy is quite stable. It will be noted that sewage sprayed on to the surface of the bed containing all its original colloids and two-thirds of its original B.O.D. will be collected at the bottom after five minutes or so with scarcely one-fifth of its B.O.D. remaining and with its colloids so largely converted into settleables, that a reasonably clear final effluent issues from the humus tank. This great improvement is effected by bacteria, one might say almost in the twinkling of an eye, a conspicuous example of many hands making light work.

It entails very considerable additions to the structures in a plain sedimentation plant to make a trickling filter plant out of it. Half an acre will be required to filter 1,000,000 gal. per day and roughly speaking, the volume of the filter tank plus the humus tank is about 15 times the volume of the plain sedimentation tank, but their combined surface area is about 24 times as great, because the settling tanks are nearly twice as deep as the filter. Moreover between 5,000 and 6,000 cu. yd. of broken stone are required for the filter bed besides the distributors and underdrains.

In activated sludge plants even better results are achieved by a system which differs more in form perhaps than in principle from trickling filters. The settled sewage is passed through a tank providing five or six hours detention where it is aerated, and the effect of the treatment is not only to oxidize much of the pollution in true solution, but it also renders the colloids settleable, by flocculating them into clusters. The most of this floc is removed when the effluent from the aeration tank is subjected to two or three hours settling in a final sedimentation tank. Some of the sludge from this tank is re-circulated through the aeration tank, the quantity amounting to from 20 to 25 per cent of the sewage flow. Because of the re-circulated sludge the sewage in the aeration tank contains a heavy load of flocculated solids, amounting to 10 tons or more dry weight per 1,000,000 gal.

The air is blown into the sewage in fine bubbles from diffusers placed at or near the bottom of the tank. In their escape to the surface the bubbles keep the floc in suspension and in constant motion, thereby sweeping, or in a sense, filtering out of the sewage bacteria and finely divided solid impurities, which become incorporated in the spongy floc particles. Consequently with an abundant supply of air (oxygen) the floc becomes rich in oxidizing bacteria, in other words becomes so called activated sludge. In essentials the conditions are quite similar to the conditions prevailing in a trickling filter. That is to say, the sewage is brought into intimate contact with myriads of bacteria thriving in an environment much to their liking, with its abundance of oxygen, water and food in the form of organic matter, the "fat of the land" to them. Naturally the return to the aeration tank of a voluminous portion of this floc, as a dilute sludge, accelerates the purification of the effluent from the primary settling tank constantly flowing into the aeration tank.

Both the volume and the area of the aeration tank plus the final sedimentation tank, are roughly five times that of the primary sedimentation tank. Therefore in converting a plain sedimentation plant into an activated sludge plant very considerable expenditures are required, not only for the additional structures but also for the air compressor equipment and for the piping and diffusors in the aeration tank. This treatment when it is working well, will approach closer to perfect purification with respect to bacterial, B.O.D. or suspended solids removal, than any other purely artificial treatment. The solids removed from a 1,000,000 gal. of sewage amount to at least 1,800 lb.

The efficiency of the various plants is summarized in Table I.

Table I

Plant	Percentage Removals of		
	Sus. Solids	B.O.D.	Bacteria
Fine screens (2 in. by $\frac{1}{16}$ in. slots)	10		10
Plain sedimentation	50	33	40
Chemical precipitation	80	65	65
Trickling filters	85	85	80
Activated sludge	90	90	97

The relative efficiency of the oxidization processes as indicated by round numbers in Table I is somewhat low for the activated sludge treatment. However, as nitrification is effected to a greater degree in trickling filters, the B.O.D. removal is not perhaps a fair criterion of the purification accomplished by this treatment, if one considers that nitrates may be useful as a sort of standby at critical junctures when the oxygen content of the stream receiving the effluent approaches depletion.

The average bacterial removals as listed in Table I are, it will be noted, rather low for all the plants except activated sludge. Moreover the percentage removals are subject to wide variations, particularly in the less efficient plants. Consequently where the bacterial efficiency of the treatment is important, as it may be to protect water supplies or bathing beaches, all but one or two per cent of the disease germs surviving the treatment process are killed by the application of a sterilizing agent. As chlorine is the agent commonly used, it alone will be considered herein. Wherever chlorination is adopted for other purposes in sewage treatment it always effects at least partial sterilization. The additional capital cost entailed in providing a chlorination plant is comparatively moderate. The equipment for feeding the chlorine requires very little floor space. After the application of chlorine to the effluent it must be detained in a tank or an outfall pipe or both from 5 to 15 min. before its discharge into the receiving body of water, but effluent storage can be dispensed with where pre-chlorination is practised. Since chlorine incidentally is an oxidizing as well as a sterilizing agent, chlorination permanently reduces the B.O.D. of the effluent to a real but variable degree and appreciably arrests decomposition, so as to place the effluents of practically every treatment process more nearly on a par with respect to demand for oxygen at and immediately below the point of discharge. As will be explained this may under certain circumstances be of great practical and economic importance in sewage treatment.

In the following tabulation (Table II) the performance is shown of the five treatment plants under discussion, when supplemented by chlorination. S.S. = suspended solids. Chlorine per M.G. = the chlorine required to effectively sterilize 1,000,000 gal. of the effluent from plants treating fairly fresh sewage.

Table II

Plant	Removals of		
	S.S.	B.O.D.	Chlorine per M.G.
Screens	10 per cent		120 lbs.
Plain sedimentation	50 "	50 per cent	85 "
Chemical precipitation	80 "	75 "	55 "
Trickling filters	85 "	90 "	35 "
Activated sludge	90 "	95 "	20 "

If the crude sewage is stale or becoming septic when it arrives at the plant, the chlorine required to sterlize the effluent from a screening plant or plain sedimentation plant will be considerably more than shown in Table II. For uniformly high removals it is particularly important in the case of these two plants to apply enough chlorine to leave a residual of two or three pounds in 1,000,000 gal. after 15 min. contact. On the other hand it should be remembered that a lot of chlorine can be saved, if one is content to tolerate somewhat less than 98 or 99 per cent bacterial removal, which requires complete satisfaction of the chlorine demand of the effluent to leave a residual.

In 1931 Dearborn, Michigan, installed a sewage treatment plant in which the effluent from a settling tank was filtered through a bed of magnetite sand three inches deep cleaned by a solenoid washer. While not constituting a complete treatment in itself, this patented device developed by Laughlin of New York, worked without trouble from the start, and is now installed in eleven plants with a combined capacity of 275,000,000 g.p.d. Its function is to supplement sedimentation by removing some of the colloids and rendering them settleable. Its adaptability as an aid to established sewage treatment processes, is indicated by the fact that of the eleven installations, eight are incorporated in plain sedimentation and chemical precipitation plants, three in trickling filters, and one in an activated sludge plant. The effective size of the filter medium in these installations ranges from about 0.60 mm. to 1.0 mm. and the rated capacity of the filters from 2 to 3 g.p.m. per sq. ft.

Apart from Owen's published accounts of the operation of the Dearborn plant, the only records of magnetite filters to which the author has had access, were from more or less experimental installations furnished by the company controlling this equipment. The largest installation in the Minneapolis-St. Paul plant is just nearing completion, and the Denver plant has been placed in service only recently. However from the data to hand the indications are that magnetite filters improve the efficiency of a plain sedimentation plant in removing suspended solids as shown in the following table.

Table III

Removals of Suspended Solids by

Plain Sedimentation	Plain Sedimentation + Magnetite Filters
30 per cent	55 per cent
40 "	63 "
50 "	70 "
60 "	75 "

It will be noted that when the tank has an off day, the filters do more than usual. In fact all of the records so far examined show that the use of magnetite filters with any kind of pre-treatment, results in a more uniform, as well as a better effluent.

When magnetite filters are incorporated in chemical precipitation plants less chemicals are required. It would appear that usually the saving in the cost of chemicals due to the filters would amount to from one half to one third for 90 per cent removal of suspended solids and from one half to two thirds for 80 per cent removal. Moreover the quantity of chlorine required to sterilize the effluent from any kind of plant would probably be reduced by 25 per cent or more if the effluent were filtered. The author wishes to make it clear that all these figures relating to magnetite filters are merely his own approximations based on fragmentary records.

A competitive type of filter has recently been installed in four small chemical precipitation plants in New Jersey with a combined capacity of about 5,000,000 g.p.d.

For reasons stated near the beginning of this paper the preceding description of five different types of plants is confined to what might be called conventional designs, suitable for treating sewage without any unusual characteristics emanating from industrial wastes or other sources. Moreover, the tabulated efficiencies of these purification processes indicate only a reasonable expectancy. Actual performances may be better or worse. It is to be noted also that of the two main reasons for treating sewage, it is the removal of suspended solids and B.O.D., that is to say, of pollution, rather than the removal of bacteria, which calls for the more expensive and more complicated

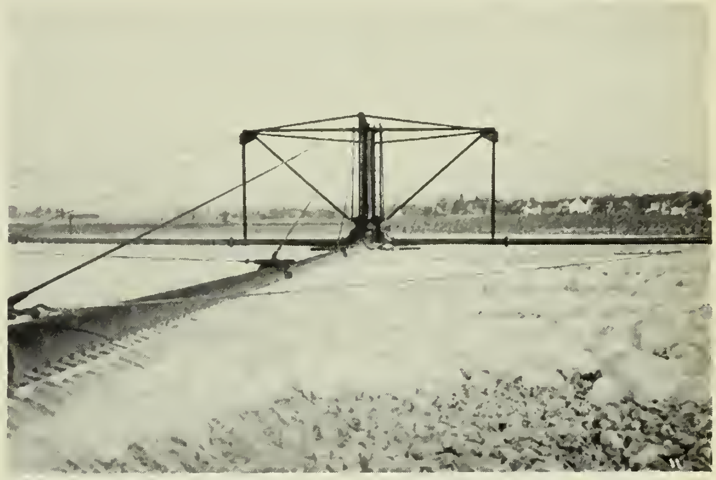

Fig. 2—Trickling Filter Equipped With Hankin Revolving Distributor.

Photo shows bed starting to clear itself of snow after shut down in winter.

plant, because by chlorination of the effluent even the simplest and cheapest kind of a plant can compete fairly well with the best available in so far as bacterial removal is concerned.

Plants handling heavy loads of abattoir, brewery, canning and such wastes sometimes bear little resemblance to any which have been described. A single installation may embody in its design fine screening, chemical coagulation, aeration and treatment by trickling filters. On the other hand some of the steps in the process can be wholly or partially dispensed with, in plants treating a relatively weak sewage. For instance, in a few activated sludge plants, including one of the earliest and largest on this continent, there is no primary settling at all. The effluent from the grit chambers or detritors is passed through fine screens, and thence directly to the aeration tanks. Moreover, in some recent activated sludge plants, and very large ones at that, there is neither fine screening nor sedimentation in the ordinary sense ahead of the aeration tanks. The detention in the primary settling tanks is so short that they do not amount to much more than glorified grit chambers. According to report, research and experiment indicate that both the capital and operating costs of the oxidization processes may be substantially reduced by modification of their conventional design. This is particularly the case in respect to the trickling filters. If what is expected or hoped for in the way of high filter rates is only partially realized this fundamentally sound and reliable process will become competitive in a much wider field.

Quite a few developments in sewage treatment have appeared as patented processes. Two or three of them about which the author happens to know something will be briefly described. A 9,000,000 g.p.d. chemical precipitation plant of the Guggenheim type has been in service in New Britain, Conn., for about a year now. The treatment includes primary settling for 1 hour, 1½ hours' aeration and 2 hours' final settling. Enough sludge is returned from the final settling tank to the aeration tank to maintain a load of suspended solids therein of about 1,500 parts per million (1,500 p.p.m.), equivalent to 6¼ tons per 1,000,000 gal. A coagulant is applied to the sewage as it enters the aeration tank and sometimes also at the inlet to the primary sedimentation tank. The total dose per 1,000,000 gal. at New Britain is stated to average about 70 lb. of iron in the ferric state and the air less than 0.20 cu. ft. per gal. It will be noted that apart from the use of chemicals the Guggenheim plants are very similar to activated sludge plants, but cost less to build, because the tanks are scarcely half the size and much less is required in the way of air equipment. It is claimed that less chemicals will suffice if more air is used, and that within limits the quantities of air and chemicals used can be varied to suit local prices, also that the effluent can be chlorinated to a residual with 25 lb. of chlorine per 1,000,000 gal. The Guggenheim process is believed to have been adopted at New Britain in preference to conventional oxidization or chemical treatments because of the particular characteristics of a widely fluctuating load of industrial wastes carried by the sewage. From unofficial figures it would appear that so far the plant has yielded an effluent satisfactory to the State authorities (30 p.p.m. suspended solids and 45 p.p.m. B.O.D.) at a total cost (fixed + operating) of about $1.00 per capita per year.

A small plant was installed by the Bio-Reduction Co. at Davidson, N.C., about three years ago. Chemical coagulation and circulation of sewage solids constitute part of this treatment also. An iron salt is used for coagulation, but whereas in the activated sludge and Guggenheim plants sludge from the final settling tanks is returned, at Davidson it is the so called bio-loam, the fairly dry stabilized solids, which are re-circulated. The sequence of events in this treatment is as follows: the screened sewage is dosed with about one ton dry weight of bio-loam per 1,000,000 gal., mixed for 20 min., settled for 20 min. in the primary settling tank, dosed with 50 lb. more or less of iron as a ferric salt, flocculated for 20 min. and finally settled for one hour. The sludge from the primary and final settling tanks is mechanically de-watered and stabilized under aerobic conditions in ten days or so. It undergoes such active oxidization in the stabilizer that most of the water is driven off. The introduction of the bio-loam accelerates the clarification of the sewage by sedimentation, and it is further claimed absorbs all odours and breaks down the organic matter.

At Davidson, the effluent was filtered through charred bio-loam. The company controlling the process advise that their method of stabilizing sludge under aerobic conditions yields an end product in the form of bio-loam, particularly rich in fertilizing properties and dry enough for the purpose as removed from the stabilizer. They are further confident that this method of stabilizing and drying is applicable to the sludge from any kind of a treatment plant. It would appear therefore that it is this feature of the process wherein very complete de-watering of the sludge solids is incidental to their stabilization which possesses the most important and interesting possibilities. The effluent it is claimed compares favourably with an activated sludge effluent in every particular. However in so far as the engineering profession in general is informed, this process is still in the experimental stage.

A large plant 45,000,000 g.p.d. recently completed for Niagara Falls, N.Y., is attempting something new in making a sort of filter out of a Riensch Wurl screen by applying a layer of a cheap grade of fine coal to the screen through which the sewage is filtered. Peak loads during wet weather can be taken care of by omitting the coal and allowing the installation to function as a fine screening plant. On the face of it, the treatment would appear intermediate in efficiency between fine screening and plain sedimentation.

Experiments at Woonsocket, R.I., Baltimore, and Lancaster Pa., give promise of greatly increased efficiency in the removal of grease and scum in grease separators by the injection of chlorine gas into the air used for grease flotation. Fifteen to 25 lb. of chlorine per 1,000,000 gal. treated with only five minutes or so detention effected a marked improvement. "Aero-chlorination" as it is called may therefore solve or at least ameliorate a troublesome feature of plant operation, because grease is a real hindrance to the efficiency of some treatment processes and is a help to none. Moreover, it is a trouble which is likely to become worse because of the trend to get rid of all sorts of municipal wastes by means of the sewers.

If aero-chlorination fulfils its early promise in combatting grease it will not be the first instance where chlorine has supplied the answer to an operating puzzle. Whenever troubles persist in cropping up in any step of the treatment, which seemingly might be remedied by a sterilizing and oxidizing agent, it does not cost much to try chlorine, nor does it take much time because usually if chlorine will serve the purpose at all it acts with immediate and telling effect. Moreover permanent chlorination facilities can usually be fitted into any stage of any treatment process with but little trouble and at a moderate capital expenditure. Although its most important role is the destruction of disease germs chlorine is a multidexterous agent in the sewage disposal field, preventing and curing odours, protecting concrete against disintegration and metals against corrosion, maintaining suitable conditions in sludge thickeners, correcting pooling on trickling filters and bulking of activated sludge. In fact chlorine may be useful for some purpose all along the line, in the sewers, in the treatment plant, and even in the stream receiving the effluent, either to control undesirable growths or to afford relief from seasonal nuisance by arresting the decomposition of a partially purified effluent until the stream merges with a larger body of water or receives accessions from less polluted tributaries.

So far no reference has been made to the major problem of sewage treatment, the disposal of sludge (solids removed from the sewage). No matter how pure the effluent discharged from any plant, the solids as removed from the tanks will usually show a high bacterial count and will become offensive in a day or two, somtimes in a few hours. It will be recalled that the dry weights of solids in the sludge removed from 1,000,000 gal. of sewage by a plain sedimentation, chemical precipitation, trickling filter and activated sludge plant amount respectively to 1,000, 2,500, 1,500, and 1,800 lb. To explain the 1,500 lb. for trickling filters it will be recalled that the total of 1,700 lb. removed includes 200 lb. digested in the filters. It will also be recalled that the 2,500 lb. for the chemical precipitation plant was based on using both lime and ferric chloride for coagulation. Where ferric chloride alone is used the weight of solids in the sludge would be reduced by about one third.

A few plants dispose of the sludge as a fertilizer, in which case, unless used locally, it is usually de-watered and dried to such a low moisture content that bacteria cannot live in it. That is to say, the organic sludge solids while still potentially offensive will remain stable so long as they are kept dry. So far the use of sludge in the fertilizer field has not had an impressive record as a business venture, and although it is a growing practice to get rid of at least part of the sludge in this way, it is not likely to supplant two other methods for stabilizing sludge, viz. digestion and incineration. Digestion is an old, incineration a comparatively recent, method. Unless one goes into details, a description of the disposal of plain sedimentation sludge by digestion or incineration or both is applicable for the most part to all sewage sludges and the description will therefore be confined to the disposal of the sludge from 1,000,000 gal. of plain settled sewage which contains 1,000 lb. dry weight of suspended solids.

As drawn from the sedimentation tank the sludge is mostly water, the solids constituting only a small proportion, say from 4 to 8 per cent of the mixture. Calling it 6 per cent, the sludge from 1,000,000 gal. of sewage amounts to 2,000 gal. or one fifth of one per cent of the volume of the sewage from which it was derived. If the sludge is held in a tank for a day or two it tends to concentrate by flocculation and sedimentation. Sludge thickeners, as these tanks are called, are usually provided with a mechanism for gently stirring the sludge, and sometimes as much as 50 per cent of the water can be drawn off as a supernatant. The 2,000 gal. of 94 per cent moisture sludge can therefore be thickened to say 1,500 gal. of 92 per cent moisture sludge.

Fig. 3—Aeration Tank in Activated Sludge Plant.
Note surface agitation from escaping air.

Prior to the advent a few years ago of sewage sludge incineration, concerning which more anon, digestion was the only practicable method for stabilizing it. Sludge is digested by detention in heated (80 deg. to 100 deg. F.) tanks called digesters for two or three months, where by decomposition, mostly on an anaerobic basis, it is converted into stable humus compounds.

About 30 per cent of the 1,000 lb. of solids in the sludge is an inert ash, but the balance, the so called volatiles, have a high calorific value and as a whole raw (undigested) sludge solids may approximate 8,000 B.t.u.'s to the pound. With 50 to 60 days two-stage digestion about two thirds of the volatiles disappear. Consequently 1,500 gal. of raw sludge containing 1,000 lb. of solids (about 30 per cent ash), with an average calorific value of 8,000 B.t.u.'s, will be digested to 750 gal. or less of digested sludge containing 530 lb. of solids about 55 per cent ash, having a calorific value of 5,000 B.t.u.'s.

The digesters are provided with gas tight roofs and the gases evolved during digestion are collected and burned, or used as a fuel for internal combustion engines. In the latter case about 25 per cent of the heat in the gas is converted into work and upwards of 50 per cent can be recovered from the jacket water and exhaust gases. Depending on design and capacity one b.hp. hour is available from about 9,000 to 12,000 B.t.u.'s supplied to the engine. For the 1,000,000 g.p.d. plant under consideration the engine output would average about 20 hp., equivalent to 1 hp. for every 500 people tributary to the plant.

Of course the greater the proportion of organic industrial wastes in the sewage, the higher the removal of solids, and the more complete their digestion, the greater the average daily per capita gas yield. The dependable power available is influenced also by the gas storage provided and by seasonal fluctuations in the strength of the sewage. Some unofficial figures to hand of digester-gas-engine driven generator output, indicate one kw. for every 500 people served by the plant, a plain sedimentation plant at that, with only 50 or 60 days two stage digestion, and about one day's gas storage.

Two particularly valuable features of digestion are that it renders the sludge solids inoffensive and accomplishes this result without creating any nuisance, because all the gases are burned at temperatures destructive of odours. Moreover it reduces the bulk and weight of the solids by about 50 per cent. For the digestion periods and temperatures already mentioned it also probably kills all the disease germs except perhaps an occasional die-hard. However digested solids cannot be burned as readily as raw solids, and lose 50 to 60 per cent of their nitrogen and phosphoric acid during digestion. Moreover such of these fertilizing constituents as remain, are of a lower order of availability for plants than they are in the undigested solids. Nevertheless a dressing of digested sludge is often worth while, because its humus compounds not only enrich the land but have a beneficial physical effect on some soils.

The 750 gal. of digested sludge containing 530 lb. of solids issue from the digester as a somewhat viscous fluid from which 70 to 80 per cent of the water has to be separated to leave the solids in a convenient form to handle. In the past open or covered beds of sand were usually provided for this purpose but current practice, in the northern part of this continent anyway, resorts to mechanical de-watering on vacuum filters. The sludge must be conditioned for filtration by treatment with a coagulant which for the sludge under discussion may be iron in the ferric state such as ferric chloride alone, or ferric chloride and lime. The filter cake, as the de-watered solids are called, will contain from 65 to 75 per cent moisture. It can be stored in a pile without any nuisance and will accumulate at a rate of roughly 1⅓ cu. yd. per day which is equivalent to about 1⅓ cu. ft. per year for each person served by the plant.

Although digestion and de-watering suffice to stabilize the solids removed from sewage, the accumulation of filter cake may in itself become a disposal problem. The quantity of cake per capita may be much greater than in the case cited. In the first place, 0.20 lb. per capita per day used herein as a basis for the suspended solids in sewage is low for large manufacturing cities. Moreover in a plain sedimentation plant the removal of solids is low and their loss during digestion high compared to more complete treatments. If Greater Montreal for instance were located on a small stream, instead of on a very large river, necessitating the treatment of the sewage of about 1,000,000 people by the activated sludge process, a single year's accumulation of digested sewage solids in the form of filter cake would cover about 10 acres if stored in a pile 10 ft. high. Obviously that would not do at all on Montreal Island. Prior to 1935 the only alternatives would be to use it for filling low areas, to transport it to a locality where it could be allowed to accumulate, or to sell it for fertilizer purposes. None of these alternatives can be regarded as a permanently satisfactory method of disposal, but today the answer would be found either in incineration alone, or in the sale of part of the sludge for fertilizer with incineration of the remainder. Modern incinerator equipment can be used either for burning sludge or for drying it for sale. If none of it were sold, the disposal problem is vastly simplified by incineration, because the ash bulks only about 15 or 20 per cent of the cake. Moreover the ash is entirely suitable for filling which is more than can be said of the cake.

The first plant to resort to incineration for the disposal of sewage sludge is at Dearborn, Mich., where early in 1935 a Nichols Herreshoff incinerator was put in service to burn the sludge from a chemical precipitation plant. Like their other pioneer venture with a magnetite filter the Dearborn incinerator seems to have worked satisfactorily from the start. Since then Nichols incinerators have been installed in, or adopted for, fifteen or more sewage treatment plants including the large installations at Minneapolis-St. Paul, Cleveland, and Detroit, while a competitive furnace developed by the Combustion Engineering Co. has been adopted for Buffalo and by the Chicago Sanitary District for two very large plants, Calumet and South West Side. The ultimate capacity of the latter is about 500,000,000 g.p.d., a world record for size.

The reason for its immediate and extensive adoption is because incineration is the most expeditious, certain, and inoffensive method available for the destruction of the potentially offensive organic wastes and potentially dangerous disease germs in sewage sludge. Once incineration became available digestion was no longer imperative because the solids removed from the sewage could be de-watered and burned before decomposition sets in. Indeed it may happen at times that solids entering the plant with the sewage in the morning leave it before night on their way to the ash pile.

Judging by current practice there is a conflict of opinion with respect to the advisability from economic or other points of view of installing digesters.

If digesters are adopted smaller vacuum filter and incineration plants will suffice partly because there are less solids to handle but particularly because peak loads of sludge can be stored in the digesters. It is rather difficult to make out a case for the digestion of activated sludge, because it is the richest in fertilizing properties, the most troublesome to digest and the aeration tanks afford an opportunity for considerable peak load storage.

The relatively small quantity of solids removed by fine screening plants contain less moisture, are easier to de-water and burn more readily than sludge. Screenings are de-watered by roll presses, centrifuging and perhaps by other methods. Furnaces for burning screenings were developed and in service long before the first sewage sludge incinerator was installed at Dearborn.

It is reported that the digested sludge of one large plant in Europe serving 500,000 people is de-watered by centrifuges of the Escher-Wyss type. On this continent centrifuges for de-watering both fine and coarse screenings (ground) are in service but so far there is no plant solely dependent on centrifuges for de-watering sludge except possibly at Collingswood, N.J.

The preceding meagre account of digestion itself, and of the economics of digestion in sewage sludge disposal will for lack of space have to suffice. The author wishes however to refer briefly to another important factor in this connection, a comparatively recent development called "elutriation." Genter originated the idea a few years ago and Keefer confirmed his laboratory work by extensive field tests at Baltimore.

The kind and average quantity of coagulant required for conditioning unelutriated raw and digested sludges for vacuum filtration is listed in Table IV below. These figures are after Dr. Fischer," The Economics of Various Methods of Sludge Disposal," Sewage Works Journal, March 1936. The chemical dose is expressed as a percentage by weight of the suspended solids in the sludge. Although not shown in the table the digested sludges of the first four plants can also be conditioned by using from six to seven per cent of ferric chloride alone. Note that for some sludges the quantities of coagulant may vary widely from those tabulated.

Table IV

Plant	Raw		Digested	
	CaO	$FeCl_3$	CaO	$FeCl_3$
Plain sedimentation	10%	+ 3%	10%	+ 2%
Chem. precipitation ($FeCl_3$)	10%	+ 5%	12%	+ 2%
Chem. precipitation ($FeCl_3$ + CaO)	8%	+ 3%	10%	+ 2%
Trickling filters	12%	+ 3%	12%	+ 2%
Activated sludge	0%	+ 6%	0%	+ 8%

The chemicals add to the weight of the solids in the filter cake. The increase in weight is 0.66 lb. for each lb. of ferric chloride converted into ferric hydroxide, and 1.78 lb. for each lb. of lime converted into calcium carbonate. Obviously therefore where lime has to be used the additional weight may be an appreciable factor in the cost of the subsequent disposal of the cake.

There is not much to the elutriation treatment itself. It consists simply in diluting and washing digested sludge solids with relatively pure plant effluent or other water and again concentrating the washed solids to a thicker final sludge by sedimentation. This removes from the original sludge undesirable chemical compounds that accumulate in the sludge liquor during the natural processes of decomposition or digestion, which if left in the sludge render the use of more chemicals imperative for sludge de-watering. Elutriation eliminates the use of lime entirely and materially reduces the amount of ferric chloride normally used on unwashed sludges. This treatment therefore may effect an important saving in the operating cost of vacuum filters because the cost of chemicals is the major item of expense. But this is not the whole story. Elutriation largely frees digested sludge from the gelatinous precipitates which smear and blind the filter cloths, and makes it easier to turn out an odourless cake under odourless operating conditions. Moreover there is only one chemical to look after and as lime is never used, generally there is considerably less filter cake to dispose of.

The first installation was at Washington, D.C. It has now been installed or definitely adopted in ten or more large plants serving a population of about 5,500,000 people. Washington and Winnipeg are the only plants so far in service. Both are of the same type, plain sedimentation with digestion. The author's information about the merits of elutriation in practical operation is limited to the results at the Winnipeg plant which has been in service a few weeks only. However so far all concerned are satisfied it was worth while adopting.

Nature has provided sewage purification agencies both on land and water. In primitive times when but little water was used for washing or cooking, human wastes were effectively disposed of by burial. The essential attributes of an agency for the inoffensive destruction of organic wastes may all be found in the surface layers of the soil; bacteria, air, moisture and a certain capacity for the absorption of odours. Some animals seem instinctively aware of this providential provision. Quoting from Rideal, "It will be noticed that the instinctive effort to cover their dejecta is most prominent in the carnivora, in which the matters are most nitrogenous, and therefore more highly offensive, whereas in the herbivora no such natural propensity is observed."

With the use of more and more water about the house, domestic wastes which in earlier times, though full of moisture, could be handled and disposed of more or less like solids, were converted into a liquid (sewage) of much greater weight and volume. To get rid of the sewage pits were dug from which the sewage leached away into the ground. These cesspools as they are called still suffice for isolated dwellings but cannot satisfactorily cope with a large volume of sewage. Consequently the installation of a system of sewers is usually an imperative sequel to the installation of a water supply system.

Sewerage systems were in use long before artificial sewage treatment processes were developed and where for reasons referred to later crude sewage could not be discharged into rivers or other bodies of water, it had to be disposed of on the land. Of course the liquid has to get away somewhere as fast as it is applied and sandy soils are therefore better adapted to such a purpose than clay soils.

The first sewage treatment plants were in effect irrigation schemes on a small scale. That is to say, the sewage was used to irrigate growing crops thereby getting rid of it with but little offence, purifying it to a high degree, and presumably realizing on its value as a fertilizer. This natural method of sewage treatment required large areas compared with modern sewage treatment plants. As much as a 100 acres might be required to dispose of 1,000,000 gal. per day of sewage. Because of this and certain other drawbacks sewage farming or broad irrigation, as this method of sewage disposal was called, is being superseded by modern sewage treatment processes in the Old Country where it originated, but it is still quite common in some countries.

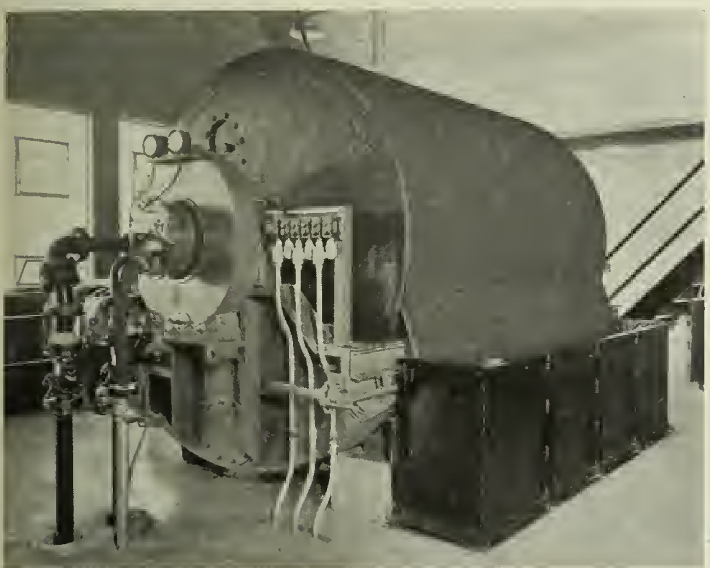

Fig. 4—Continuous Vacuum Filter.

The de-watered sludge (filter cake) is released from filter cloth by air pressure and removed from steel blade and from the drum.

Where natural deposits of sand and gravel occur, such as the glacial drifts of New England, sewage can be disposed of on the land at much higher rates than are suitable for irrigation. About 15 acres will suffice for 1,000,000 gal. per day. If the sewage is pre-settled the capacity of the filters is about doubled. The natural surface is levelled off into beds separated by low embankments and the beds are underdrained by tile laid in trenches. Facilities are provided for applying the sewage intermittently and this particular land treatment is called intermittent filtration.

These old fashioned filters are simple affairs compared with modern plants, but when not overloaded and given proper attention yield a better effluent than any artificial process. Where a high degree of purification is required for a relatively small quantity of sewage, from an institution say, and natural deposits suitable for the purpose are handy, intermittent filters are still as good a choice as any, perhaps even in this climate.

As already stated practically all of the sewage in this province and a great deal of it elsewhere is disposed of by dilution. That is to say, it is discharged directly into rivers or other bodies of water with but little if any pre-treatment. Whether or not this practice is accompanied by offensive conditions in the rivers depends mainly on the degree of dilution. The Chicago Drainage Canal Commission about fifty years ago expressed the opinion that the canal would not become a nuisance if enough water were diverted from Lake Michigan to maintain a flow of $3\frac{1}{3}$ cu. ft. per sec. for every 1,000 people contributing sewage to the canal. This is equivalent to an average dilution of 21.5 to 1 (at 100 gal. per capita). As a matter of fact it proved insufficient at Chicago.

Considering the great variety of conditions encountered the world over in the disposal of sewage by dilution, with respect to the character of both the sewage and the diluting water, the range is surprisingly small between dilutions which are safe against a nuisance and dilutions which are not. Commenting on the data collected during the investigation at Chicago, the chief engineer of the Commission said: "that information in regard to sewage disposal by dilution was available from Paris, Hamburg, Magdeburg, in Europe, from a large number of cities in England, from the Blackstone River in Massachusetts, and the Des Plaines River in Illinois, and that when all this information was plotted, it was astonishing to note the correspondence of these different data, and the indication from all of them that a dilution of from 2.5 to 5.0 c.f.s. per 1,000 people, appeared to be satisfactory."

The reason the organic matter in sewage can be inoffensively disposed of by dilution is because the essential agencies to that end are present in the water. That is to say, as the sewage is dispersed throughout the diluting water its organic matter is brought into intimate contact with bacteria and with the oxygen dissolved therein. Consequently its decomposition proceeds on an inoffensive aerobic basis, and as the store of oxygen begins to be depleted thereby, the water strives as it were to replenish it by absorption from the atmosphere. If re-aeration is equal to the task, well and good, but if it is not, and the oxygen is exhausted the river water reeks with putrefactive odours. Long before this stage is reached fish life for the most part has become extinct.

It goes without saying that if full advantage is to be taken of dilution, sewer outlets must be so located as to insure prompt dispersion of the sewage in the river water. Otherwise the theoretical dilution based on the total river flow is no measure of the actual dilution. If discharged close inshore the sewage may hug the shore for surprisingly long distances down stream. The fact that it has been subjected to what is called complete treatment is not always a valid excuse for a shore outlet. Down stream bathing beaches on that side of the river might be nearly as well off if an outlet discharging at midstream were substituted for the treatment plant.

Irrespective of the size of the river dilution sometimes has its limitations with respect to the satisfactory disposal of the heavier and lighter suspended solids in crude sewage. If the velocity of the river is low in the vicinity of the sewer outlet, accumulations of sludge may become objectionable even if the oxygen is never exhausted in the overlying water. Moreover floating solids of obvious sewage origin are less likely to be broken up and may be stranded on the beaches. To enjoy immunity from such troubles care must be exercised in the location of outlets whether into the Little River St. Pierre or into the St. Lawrence. Although multiple outlets at points of maximum velocity will help a lot in preventing such local nuisances, generally speaking the special field of usefulness of the dilution method of disposal is the oxidization of the colloidal and dissolved organic substances in sewage. No artificial sewage treatment process will do it better, and to save the cost of such treatment by utilizing this natural agency is frequently just as proper and sensible as hanging out the wash to dry on a bright clear day, instead of resorting to artificial heat indoors.

The degree to which sewage must be treated before it is permissible to discharge it into a river or other body of water depends of course not only on the dilution afforded by the river but also on the use which is to be made of it. So far the discussion has been confined to the prevention of a public nuisance by so restricting the pollution that the receiving body of water will not be offensive either to sight or smell. Higher standards however may be imperative as a public health measure, or for other reasons such as the preservation of fish life. This province is mostly concerned in keeping its rivers fit for sources of municipal water supplies, because over 80 per cent of the water so used is derived from rivers. Usually however surface supplies are not safe without filtration, and modern water filtration coupled with chlorination is a reliable treatment for rendering moderately contaminated supplies safe and suitable for domestic use. In a sense this treatment puts repentance on a par with innocence, in as much as the typhoid rates of some cities using a filtered water from a polluted source compare favourably with the rates reported for cities enjoying a water supply drawn from virgin sources.

The control of the pollution of rivers to keep them fit for bathing is a difficult problem for health authorities to handle. Modern standards require a much lower bacterial content in the water at a bathing beach than at a domestic water supply intake to a filtration plant.

These standards will be hard to live up to considering uncontrollable pollution reaching the rivers from surface run-off and from storm water overflows. While this is a matter concerning which the author is imperfectly informed one may perhaps be permitted to wonder whether the sanitary benefit from keeping many of, the rivers fit for bathing according to modern standards is commensurate with the cost.

The total population served by municipal sewerage systems in the Province of Quebec is about 1,700,000 and at least 75 per cent of the sewage from these systems is discharged directly into the St. Lawrence, or into tributaries with short runs to the St. Lawrence. The bulk of the sewage originates in the vicinity of Montreal. That is to say, the drainage from 1,200,000 people, more or less, is discharged into the St. Lawrence and the branches of the Ottawa in this district. The minimum flow of the St. Lawrence just below Montreal approximates 225,000 c.f.s. equivalent to about 185 c.f.s. per 1,000 people immediately tributary to it. Considering that in the light of experience a flow of from 5 to 10 c.f.s. is sufficient to assimilate the sewage from 1,000 people without a nuisance, the St. Lawrence will obviously continue immune on that score for many a day.

One reaches the same conclusion from a check of its ability to satisfy the oxygen demand of the sewage. About 150 tons of oxygen per day would suffice to stabilize the sewage from a population of 1,200,000 people, whereas the oxygen content of the daily flow of these rivers past the Island of Montreal amounts to 5,000 tons probably during the warm weather and to 50 per cent more in the winter. The St. Lawrence with its lake expansions and rapids is generously equipped with the means of self purification of the pollution discharged into it. Moreover most of the disease germs do not as a rule survive longer than a few weeks after their discharge from the sewers. Consequently storage rids the water in the great lakes of the disease germs discharged into them. In so far as water borne disease germs in St. Lawrence river water is concerned the population inhabiting the immense watershed west of Port Hope or thereabouts is not a factor. The commission of five engineers reporting on the proposed Montreal water intake in 1936 estimated that filtration of Ottawa river water would cost the City $400,000 a year more than it does to treat St. Lawrence river water. If the St. Lawrence were not as big and clean as it is, it might also cost the City around $2,000,000 a year for the fixed and operating charges of sewage treatment plants and works incidental thereto.

A survey of the cities and towns in this province not situated on the St. Lawrence shows that with two exceptions, all of any size discharge their sewage into rivers affording dilutions which, while not comparable to the St. Lawrence, are away beyond the danger zone so far as nuisances are concerned. It would appear therefore that for the present and immediate future anyway, Quebec's necessities if any can be satisfied with a sedimentation plant here and there, supplemented probably by chlorination. A plant of this type is compartively simple and cheap both to build and to operate, and is more of a help to the rivers than one might infer from its B.O.D. removals. If filtration also is provided one can reasonably count on a practically sterile effluent with removals of from 65 to 75 per cent suspended solids and from 50 to 60 per cent B.O.D. With some sewages pre-flocculation and longer settling might prove a satisfactory substitute for filtration.

Before attempting more one should be very sure of the need of it and should bear in mind it is particularly true of sewage treatment as of most endeavours of life that the closer we approach perfection the less we get for what we do. Under present economic conditions neither public nor private expenditures begin to cope with the multitude of public health demands. And perhaps at times the money spent in polishing effluents would yield higher dividends in health and happiness if placed at the disposal of Social Agencies.

Aircraft Engine Selection and Installation

M. S. Kuhring,
Engine Laboratory, National Research Council, Ottawa.

Paper presented before the Aeronautical Section of the Ottawa Branch of The Engineering Institute of Canada on April 29th, 1937.

SUMMARY.—The author outlines the more important features that are to be considered in the selection of engines, keeping in mind the conditions under which the machine is to operate. Air cooled or liquid cooled, location of the engine itself, fuel system exhaust system, controls, propellor, cabins, cowling, fire protection, are some of the features that are given consideration.

The installation of aircraft engines embraces a very large field. In the past an engine was selected for various reasons and fastened to the airframe by some precarious method which would satisfy the constructor. Various connections including the fuel line and throttle were attached rather easily, for at that time the engine was a relatively simple affair.

From time to time various accessories were added to the engine. This required new controls, and of course an override, in case the automatic features of the control got out of order. In addition, engines became more discriminating with regard to their diet and their method of consuming this diet. Then too, speeds became much higher and it was discovered that odds and ends jutting out into the slipstream caused a considerable increase in the drag of the aeroplane.

These points and a great number of other equally important factors have led to a very large amount of research in connection with the best way in which various bits and pieces may be located so that they will function in a satisfactory manner.

Unfortunately, the subject of engine installation is a very large one, if one is to consider all the factors. To cover all the work that has been done, in detail, would require a cumbersome volume which would be out of date before it was finished. On the other hand, one cannot generalize too freely, or the relatively minor features will be neglected.

It is the intention of this paper to treat some of the more important points and summarize them as briefly as possible.

Choice of Powerplant

In most cases the choice of the powerplant is made before the aeroplane passes the design stage. Reasons for the choice are largely economic and include the important points of reliability and service. If the engine is at all cranky the chances of the aeroplane being a success are extremely slim.

In spite of the large number of engines available, many of these will immediately be ruled out of the final choice for various reasons, such as power range, service facilities, reliability, cost, type, etc.

Provision must be made for accessory drives, and automatic controls must be given serious attention.

Provided that all engines within the required power range have an equal number of the desired characteristics, it becomes necessary to select a type; that is, whether it shall be air or liquid-cooled. Whether the engine shall be radial, in-line, V, X, H or flat will depend upon the actual engine selected.

In this country at the present time, the air-cooled radial engine is more used than any other type. This is largely due to the fact that service facilities have been better for this particular type of engine than for the liquid-cooled variety. In addition to this, there has been the feeling that water-cooled engines are not for this climate, because of the low temperatures experienced in winter. This latter point actually has little bearing on the matter as suitable anti-freeze solutions are available which are entirely satisfactory, and starting presents no difficulty.

There are, however, one or two other considerations in connection with the final choice between the two main classes of engines.

Against the liquid-cooled engine there is the addition of an extra circuit in which trouble may develop. Unless the operator of commercial machines is convinced that his aeroplane is not going to be stranded miles from civilization, in winter, with a leaky cooling system, he is going to be doubtful about purchasing this type. At the present time it may be safely assumed that the cooling systems of liquid-cooled engines will give entirely satisfactory service, and local hot spots are fairly well eliminated.

The whole question of cooling the larger power engines is due for serious consideration. Figures given by Mr. H. Wood,[(1)] show that while the fin area of a large air-cooled engine was increased 90 per cent the cooling increase was only 40 per cent. In the liquid-cooled engines it was generally only necessary to enlarge the radiator and liquid passages. The use of cylinder baffles and twin row engines has been the answer of the manufacturers of air-cooled engines to this problem, and it is highly probable that ducted cooling will be used for both types in the future. This will be more fully covered in the section on cooling.

Component	Liquid-Cooled Mr. Wood	Air-Cooled Mr. Wood	Air-Cooled Mr. Anderson
Propeller	360	360	371
Cowling	60	100	71
Mounting	60	100	51
Exhaust system	35	120	87.5
Radiator	63		
Header tank	15		
Pipes	8

Fuel pipes	20	25	8.5
Oil pipes	10	10	13
Tanks	110	110	
Carburettor inlet duct and valves			22.5
Generator			35
Starter			32
Misc.			27.5
Weight of engine			1,163
Total, exclusive of engine	866 lb.	850 lb.	749 lb.

Fig. 1—Table of Weights, Air-cooled vs. Liquid-cooled Engines.

In the higher powers the liquid-cooled engines have some advantages over the air-cooled engines. Operating temperatures of the various parts may be more readily controlled and fuel and oil consumptions are slightly lower, although this latter difference is becoming less and less.

The choice of air-cooled engines is more varied on this continent than is the case with liquid-cooled engines, but in Europe and particularly in England, France, Germany and Italy the liquid-cooled engine has kept pace in development with the air-cooled engine.

In general, engines may be classified as military, commercial and private. The military engine is required primarily to give a maximum of power, whether or not economy is obtained; although economy and reliability are still of importance if the range of the aircraft is to be great.

Commercial engines are required to give many hours of reliable service at a minimum cost.

Engines for private aeroplanes are expected to perform in much the same manner as engines for commercial ships, although the power range is much lower.

Particularly among the engines of larger power it is the custom to supply powerplants in quite a range of models. For instance, one engine may be direct drive or geared. It may also be normally aspirated, moderately or fully supercharged.

To avoid a duplication of engine parts and to increase the performance of aircraft, the practice is growing on this continent of using an engine which is fairly highly supercharged. This engine will be rated at a certain power when operated on, say, 87 octane fuel. When 80 octane fuel is used, the rated manifold pressure and power are necessarily less. In consequence, production costs may be lessened and the purchaser, if he has been operating on a low octane fuel, may at any time increase the power by changing to a higher grade of fuel, assuming of course that the aircraft can stand the added power.

The fully supercharged engine as originally designed, was intended for use with the fighter and interceptor aircraft. The moderately supercharged engine was intended for use in flying boats and other aircraft where good take-off was desired, and with a rated altitude in the order of 5,000 ft. It was also intended for long range with low fuel consumption. Normally aspirated engines were intended for use in bombers, reconnaissance and co-operation aircraft with long range and low consumption. The present demand for performance has led to the practice of using supercharged engines for practically all purposes.

Reverting to the comparison of liquid-cooled and air-cooled engines, it is interesting to compare weights for an engine of 1,000 hp. given by Mr. Wood(1) of Rolls Royce and a second table of weights given by Mr. Anderson(2) of the Wright Aeronautical Corp. These will be found in Fig. 1.

In some ways this list would appear to favour the liquid-cooled engine, as in this case the rams-horn exhaust stubs are considered. If a collector ring or manifold and tail pipes were considered as in the case of the air-cooled engine, it would mean an additional 80 to 100 lb.

The weight of the engine in Mr. Anderson's list includes reduction gear, magnetos, ignition system, automatic controls, propeller hub attachment parts, cylinder baffles and accessory drives.

No doubt there are numerous points in the above tables of weight which are open to criticism, but they give some indication as to the relative weights and the difficulty in comparing the two types.

Location of Engine

While it is theoretically possible to locate the engines wherever the designer may wish, it is surprising how few places are actually practicable when a particular type of aeroplane is considered.

Figure 2 gives a few of the conventional arrangements, and also shows how hard it is to be original in engine location.

The arrangement of the wing or wings of the aircraft is outside the scope of this paper and no attempt will be made to consider this problem other than to state that there is a strong feeling among the operators that for commercial aircraft in this country, a high wing monoplane is desirable so that the danger of damaging the wings during taxiing and docking will be minimized. This fits in well with the demands of a suitable location for the engines if they are to be mounted in the wings, as they are then well clear of the water or ground, permitting the use of large diameter propellers without the necessity of unduly long undercarriage struts.

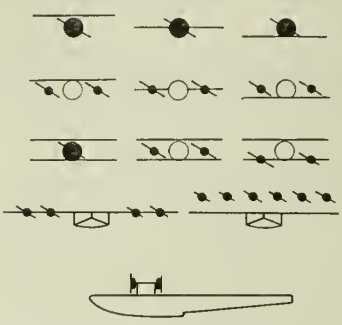

Fig. 2—Engine Arrangement in Various Designs.

Owing to the difficulty experienced by operators, of starting engines in the winter, the preference lies with single engine aeroplanes.

When engines are mounted on the wing, they should be fitted to the leading edge, or better still, in the wing. A pusher arrangement is slightly more efficient but the problem of providing a suitable driveshaft and steady bearing at the relatively thin trailing edge makes this almost impracticable at the present time. The driveshaft of course has been used for some time.

At the present time engines are being planned or built which may be enclosed in the wing structure. This would appear to be very desirable and would of course involve ducted cooling before it can be considered successful.

The disposal of the cooling air without destroying the air flow over the wing, presents a rather difficult point.

In multiple engine aircraft, the nearer the engines are to the centre line of the aeroplane the less "crabbing" will be necessary when flying with one of the engines cut-out, but placing the engines too close to the fuselage will cause interference.

An interesting engine installation recently produced is that of the Empire Boats. Among the more outstanding features is the exhaust arrangement whereby the tail pipe is brought out through the top surface of the wing, discharging into a region of relatively low pressure, reducing the back pressure on the valves and directing the sound upwards.

Fig. 3—Nacelle and Servicing Platform of Empire Boat.

Except in the experimental Atlantic ships, fuel tanks are placed in the wings close to the motors, thus simplifying the plumbing.

Oil coolers are hidden in the leading edge and air enters and is discharged through slots. The cabin is heated by air passing over the exhaust pipe, but the heater muff is enclosed in the wing.

For examination of the engines, part of the leading edge folds down providing a service platform on which the mechanic may stand. This is shown in Fig. 3. The controllable cowling is also shown in this illustration.

Mounting

It is generally conceded that a tubular metal engine mounting is the strongest for a given weight. This mounting must be so designed that all parts of the engine which require adjustment or removal may receive the attention they demand without undue interference, otherwise the maintenance will be expensive or neglected.

Where possible, a careful examination of the actual engine itself is desirable, as important points do not always show up on the engine assembly drawings, which often enough are only drawings of an earlier engine due to the fact that changes are continually being made in the engine. This is particularly true where only a limited number of engines are being purchased.

Examination of the present trade journals shows a large number of interesting methods of mounting engines, and there is a tendency towards more originality.

Figure 4 shows an engine mounting used by the Bristol Company about 1924. With this arrangement the engine compartment could be opened like a cupboard door. While this undoubtedly would have the advantage of making the rear of the engine more accessible, it would necessitate very flexible controls and cables which are not desirable. The actual fastening would also tend to become cumbersome.

Where possible the mounting should be bolted to the engine and where the mounting is connected to the airframe as few bolts as possible should be used. It is not likely that this number will be less than four. This will permit the removal of the powerplant unit for inspection or service with a minimum of effort. It will of course be necessary to make provision for breaking all controls, wiring and piping at this section, but this is desirable from the standpoint of noise transmission from the engine to the airframe.

Figure 5 shows flexible mountings used with the Bristol Pegasus engine.

The stress requirements of the mounting are similar to those of the fuselage and may be found in detail in the British Air Ministry Publication A.P. 1208 Leaflet B3.

Actually, the engine, mounting, cowling exhaust system and all associated parts should be assembled by the engine manufacturer and sold as a unit.

Fuel System

The installation of the fuel system is of course extremely important. The location of the fuel tanks depends upon the aeroplane design.

Everybody has heard in the past two years of 100 octane gasoline. Perhaps it is not fully understood what this means to the engine. Nearly all the modern engines in commercial work are supercharged. With a supercharged engine it is not possible to open the throttle fully when on the ground owing to the fact that the density of the charge will be too great and the engine will be severely damaged by detonation. Most of the modern engines in use in this country are designed to operate on 87 octane fuel although perhaps using 80 octane fuel. With any fuel there is a limiting manifold pressure. If the anti-knock quality of the fuel available is raised, it is permissible to use a greater manifold pressure with a resulting increase in engine power. This of course must be covered by type test certificate for the engine. At the present time 100 octane fuel is comparatively expensive, but it is becoming the practice to have two fuel tanks—one relatively small tank for 100 octane fuel for take-off and the other tank or tanks for the 87 octane fuel which is used for cruising. The same principle may of course be applied to 80 and 87 octane fuels.

Figure 6 shows a good arrangement for the fuel systems of a twin engine aircraft.

Unless duplicate fuel pumps are used, a gravity tank of at least 30 minutes capacity at full throttle, must be fitted. The head of fuel must of course be suitable for the carburettor.

Fig. 4—Swinging Engine Mounting of the Bristol Brandon Biplane.

A fuel gauge must be fitted to warn the pilot when only 30 minutes' supply of fuel is left.

When a pump is used, a pressure gauge must be supplied.

A filter must be fitted between the tank and the carburettor.

The flow of fuel at the carburettor intake must be 10 gal. per hr. plus 120 per cent of take-off requirements or 100 per cent in excess of the engine requirements at full throttle level flight at sea level; full rich.

Figures given by Mr. Anderson(2) for common practice in the U.S.A. are as follows:

Fuel consumption 30 gal. per hr. or 300 hp. ⅜ in. O.D.
Fuel consumption 60 gal. per hr. or 600 hp. ½ in. O.D.
Fuel consumption 100 gal. per hr. or 1,000 hp. ⅝ in. O.D.
(The figures given are in U.S. gallons.)

When flexible tubing is used the dimensions are taken as inside diameter.

Fuel line temperatures should be kept as low as possible and must not exceed 140 deg. F. with the present fuels. This is to avoid vapour lock.

Great care must be taken to arrange the piping bends so that they will not be too abrupt. There should be as little surface roughness in the lines as possible. The flow through the lines should be relatively slow so that air or vapour bubbles will not be drawn into the carburettor. These bubbles of air or vapour may easily cause failure of the engine. Fuel lines should not rise and fall in their passage towards the engine.

When passenger aircrafts are carrying large quantities of fuel, jettisoning valves for the fuel tanks are required. The outlets must of course be carried to a point where the escaping fuel will not be ignited by the engines.

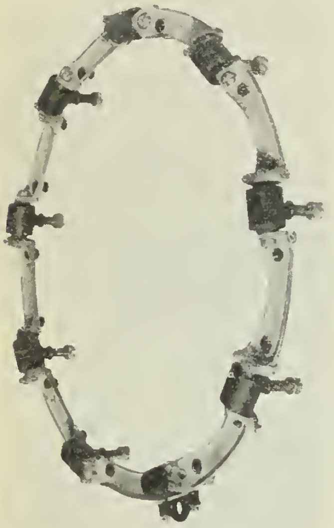

Fig. 5—Bristol Flexible Engine Mounting.

The selection of a fuel gauge is of prime importance. The author has seen very few that do not appear to be out of order a large part of the time. A fuel gauge which is not accurate is more dangerous than no gauge at all.

Control Gear

The early engine controls were extremely simple. The pilot simply reached into the engine and pushed the necessary lever. There was no backlash and if he didn't lose a finger in the exposed gearing the adjustment was made.

As aeroplanes improved the engine was moved further and further from the pilot. It then became necessary to extend the controls. At first, these controls were relatively simple. Usually there was the throttle, mixture control and possibly the ignition advance. We now have in addition oil cooler controls, heater controls, cabin heater controls, cowling controls, gun gear controls, fuel jettisoning controls, fuel tanks selector valves, flap controls and as many others as the designers can devise. In addition automatic controls have been designed with an additional control to cut these out in case of emergency.

Where possible push-pull rods with ball bearings are as satisfactory as any. Unfortunately it is not possible to use these in all places.

Bowden cables are apt to give a certain amount of slackness although certain of these have been improved to a marked degree. These generally use chain or rollers in conjunction with rods for the straight sections. The controls are of course especially formed for a particular installation.

Hydraulic control gear is used and has proved satisfactory. It is necessary when using this type to be sure that the fluid used will not become sluggish at the lowest temperatures encountered nor leak past the pistons at the high temperatures. Great care must be taken to avoid trapped air in the system.

Controls must be arranged to open or turn on with the lever in the forward or down position. The mixture control must be linked with the throttle to give full rich when the latter is closed.

Spring loading of controls is advisable to take up slack or where there is the least possibility of failure of the control gear.

As many of the engine controls as possible should be fully automatic and should be operated by flying conditions or by the engine, and should not pass back to the cockpit. This takes the responsibility away from the pilot and permits him to devote more attention to flying and navigation.

At the present time there are a number of automatic engine controls which are more or less satisfactory in operation and which give more accurate adjustment than the pilot can maintain.

For the benefit of those who are not familiar with the more common of the automatic controls a brief résumé is given here.

Supercharger Regulator or Boost Control

When an engine is supercharged it is the intention of the designer that the engine shall not be operated above a certain boost or manifold pressure. To permit this pressure to be maintained to the rated altitude the supercharger will naturally develop more than the rated boost below the rated altitude. To ensure as far as possible that the rated boost will not be exceeded the designer has provided a boost pressure gauge on the instrument panel on which is marked the take-off boost, the rated or international boost and the recommended cruising boost. From this the pilot may see what the boost or manifold pressure is at any time.

Either through ignorance or carelessness there have been cases where the engine has been severely damaged because this boost has not been carefully watched. In addition, with the modern aircraft the pilot is kept busy navigating and flying. The engine manufacturer may now provide a boost control unit. This unit will permit the throttle lever to be fully opened without exceeding the rated boost. To permit the extra boost for take-off, there is an override control. There is one feature against this type of control and that is this change-over or override control. It is possible for a pilot to attempt to take-off with the rated boost control in operation. In some cases this is over 300 hp. difference and may easily mean the difference between a good take-off and a crash. It is very well to say that the pilot should watch this, but the number of controls is on the increase and it is possible to forget.

These automatic boost controls consist of a sylphon on which the manifold pressure acts, and which actuates a servo motor. This servo motor admits oil from the pressure lubrication system to a plunger moving it in or out as the pressure variation dictates and the effective length of the throttle lever is varied correspondingly, opening or closing the throttle to correct the manifold pressure. (See Fig. 7.)

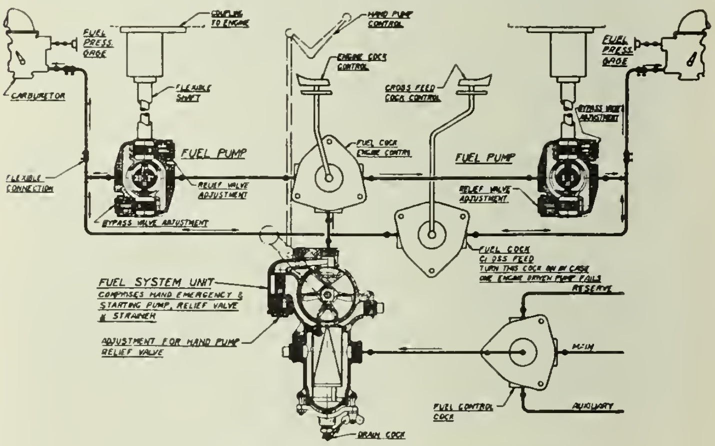

Fig. 6—Typical Twin Engine Fuel System.

Naturally, as the aircraft climbs the boost pressure would tend to drop if the throttle were not opened. The automatic unit takes care of variation in altitude.

One of the drawbacks to this type of control is the fact that when the throttle is opened past the point at which the rated boost is obtained, no further opening of the throttle occurs. This leaves quite an appreciable "dead" spot in the throttle lever's travel. The variable datum boost control has been designed to eliminate this.

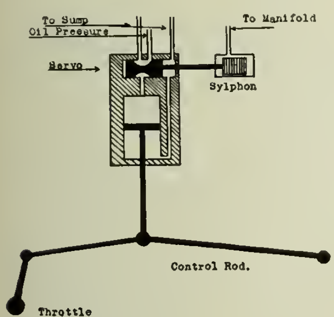
When the throttle lever is moved a coarse pitch thread moves the control sylphon bodily so that there is no dead spot on the travel of the throttle lever. (See Figs. 8 and 9.)

Automatic Mixture Control

As the mixture of an engine becomes progressively weaker the power at first becomes greater then falls off. At the same time the temperature increases to a maximum but falls off rapidly shortly after the power begins to fall. (See Fig. 10.) Of course the mixture cannot be leaned out too far at rated power as the cooling capacity of the engine is not great enough, but at cruising speeds and power a very considerable saving in fuel can be accomplished by running at a reduced mixture.

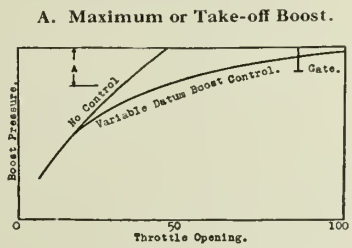
There are several automatic mixture control devices on the market. The Hobson Penn automatic mixture control has an automatic rich and an automatic weak position with a super rich position for emergency power. Those in use in the U.S. work on the same principle with the positions marked automatic cruise, automatic climb, automatic take-off and full rich. It has been claimed that the installation of an automatic control will give 20 per cent better consumption than the best manual control.

Details of these controls have appeared in the technical press.[3, 4] Both types are controlled by a sylphon which automatically compensates for changes in altitude by controlling the pressure balance.



AUTOMATIC BOOST CONTROL

Fig. 7—Diagram of Automatic Boost Control.



Boost Pressure at Various Throttle Openings With and Without Variable Datum Boost Control.

Fig. 8—Throttle Opening vs. Boost Pressure.

Ignition Control

The Hobson Company have developed an automatic ignition control which is governed by the manifold pressure. This unit retards the spark for starting and idling. For cruising the ignition is advanced fully and somewhat retarded for full power. For take-off the spark may be even more retarded. As the aircraft passes its rated altitude the ignition does not advance even though the manifold pressure drops. A carburettor heater control may be combined with this unit to provide warm air for cruising and idling and cold air for full power. An override should be fitted to give warm air and prevent freezing of the carburettor when necessary. It should be remembered that the temperature of the venturi is anywhere from 50 to 80 deg. F. below the atmospheric temperature.

Propeller Control

With modern engines the controllable pitch propeller is becoming a necessity. There are two general classifications of the control of this device. The propeller may be set in one of two positions or it may have the constant speed control. Oil pressure from the engine holds the pitch of the propeller against the force of the counterweights which tend to twist the blades in the opposite direction. A governor which is driven by the engine, controls the amount of oil pressure which will act on the pistons actuating the propeller pitch. Provision will have to be made in either case for control of the device from the cockpit.

Provision should also be made for cowling control, either the adjustable front cowling or controllable outlet low drag cowling. The oil heater, cabin heater, fuel cocks, starter control, fire extinguisher, and possibly fuel jettisoning valves must be considered.

Fig. 10—Effect of Mixture on Temperature and Power.

All these controls must pass from a point within easy reach of the pilot to the location of the part to which they apply.

A great deal of thought should be given to the path of these controls as they must not foul parts of the engine which require attention thus interfering with service routine. The opinion of the pilot and mechanic has a large influence on whether the aeroplane will be a success or failure.

Exhaust System and Cabin Heater

At the beginning of this section it should be stated that the author has a very healthy regard for the influence of carbon monoxide on the human body, and if in the opinion of some readers, this topic is unduly stressed it will be appreciated if it is remembered that this is an honest opinion.

The problem of conducting exhaust gases from the engine to a point where they will pass well clear of the aeroplane without unnecessary noise, drag, and back-pressure still remains a difficult problem.

Some cabin aircraft draw the air from the cabin by means of ventilators, and if the exhaust passes near the fuselage, a very appreciable amount of this gas is inevitably drawn into the cabin through small openings and joints with the result that the concentration of carbon monoxide is higher than the safe limit.

Tests conducted by the N.A.C.A. resulted in the statement that 0.02 per cent of carbon monoxide in the air at sea level is the maximum allowable limit. At 15,000 ft. this limit drops to 0.005 per cent.

The practice of taking the cabin heat from the exhaust system of aircraft engines, while a comparatively simple arrangement and rather attractive from the point of view of saving waste heat, still leaves a lot to be desired. It only requires a small perforation or crack in the tube to cause a lethal dose of carbon monoxide to enter the cabin. For this reason an exhaust system that can be readily examined is desirable.

It is not necessary for carbon monoxide to kill the pilot outright to provide a crash. It is only necessary for it to affect his judgment. An exhaust system that is hard to remove may not receive proper attention.

The poppet type exhaust valve in spite of salt cooling still remains an overworked part of the modern engine. Excessive back-pressure in the exhaust will shorten the life of these valves and is to be avoided as far as possible. Five to six inches of water is about the maximum advisable back-pressure, and of course should be less if this can be managed.

Besides having a low back-pressure, the exhaust system if it is to be effective must be low in weight and drag and must damp the exhaust flame.

Mr. Wood stated that the conventional tail-pipe gave a resonant note which was very annoying to the pilot. This would indicate the need for an efficient silencer.

The Rolls Royce Company makes use of a rams-horn type of exhaust. For each bank of six cylinders there are three lobes each serving two cylinders. These three lobes project through the side of the cowling and together make a streamline form. The exhaust issues through slots in the bottom. For aircraft where the engine is mounted in the nose of the fuselage this would not appear to be good as there is no provision for carrying the exhaust past the cabin or cockpit. It is claimed, however, that there is a

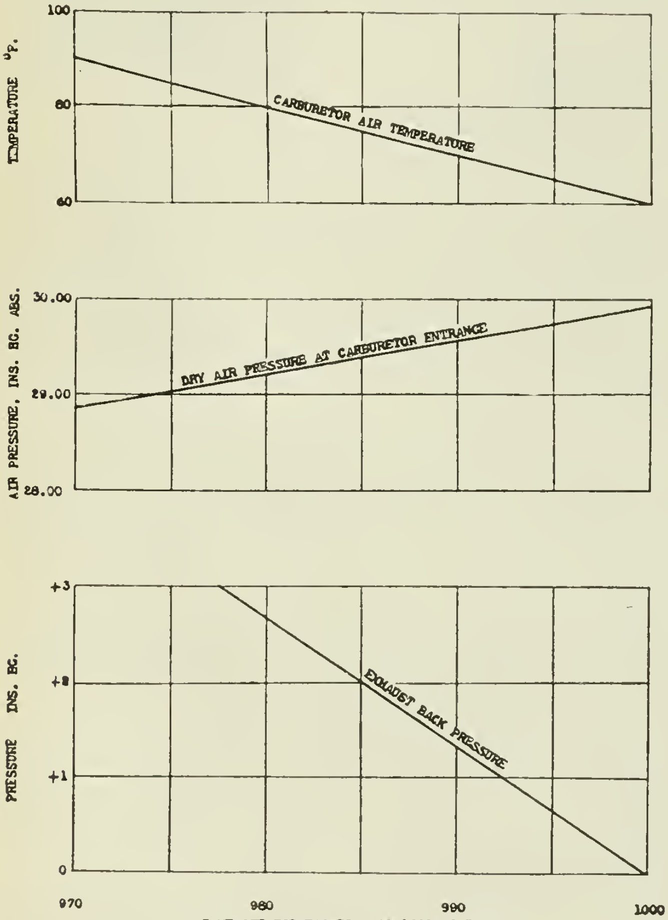

Fig. 11—Relation of Back Pressure and Temperature to Engine Power.

reduction in weight of 40 per cent over the conventional tail-pipe. The sound reduction over open exhaust stacks is 6 decibels and there is an appreciable reduction in drag.

Collector rings on radial engines may be designed to reduce the noise of the engine appreciably. Where the collector ring is used it should be easily removable for examination and should have flexible connections between each cylinder for expansion.

Whether the collector ring should be placed in front or behind the cylinders appears to be an open question. Both methods are still in use.

In Mr. Anderson's paper(2) the size of the exhaust collector may be calculated from the following:

Cross section area = hp. per cylinder by number of cylinders exhausting into ring by 0.04.

Where an internal heater pipe is used the factor 0.04 should be increased to 0.045.

Mr. Anderson also states that no part of the ring should be within 1½ in. of the cylinders.

Figure 11 shows the relation of exhaust back-pressure to engine power.

Proper attention to the arrangement and location of the exhaust outlet will help to reduce the back-pressure even with quite a long tail-pipe.

Stainless steel is probably the best material for the construction of the exhaust system.

Figure 12 shows the exhaust arrangement of the Wright Cyclone engine.

Silencers of varying merit have been designed for aircraft engines. Up to the present time a sound reduction of about 25 decibels with a back-pressure of ¼ to ½ lb. would appear to be the most satisfactory. This particular type is of the acoustic variety. No figures on the life of the sound absorbing material are available.

Most cabin heaters obtain their heat from a muff on the exhaust pipe or by a tube inside the exhaust pipe through which air passes. (Fig. 12.)

As stated earlier this method leaves a great deal to be desired from the point of view of exhaust gas contamination, but it is attractive from the standpoint of saving otherwise waste heat. Any other secondary circulating system while desirable puts the weight up and introduces complications, although this method is in use also.

Mr. Wood(1) has suggested that warm air from the radiator and oil cooler could be used for this. The air would pass through a ducted radiator and from here to the cabin or through a by-pass to the outside. This is on the face of it a great advantage and if carefully designed would remove the objections to other types, although it would not be so easy to apply to air-cooled engines.

Heater muffs if used should not be exposed if this can be avoided. A particularly good installation is that of the Empire flying boats where this muff is enclosed in the wing.

Care should be taken to ensure that the outlet from the heater will not discharge a hot blast at one part of the passenger or pilot while there is a cold draught striking him elsewhere.

Carburettor Air Heater

To give proper distribution and freedom from icing of the carburettor it is necessary to provide some means of heating the intake air.

There are several methods of doing this. The scoop which fits around the cylinders nearest the intake has been used with satisfactory results, but it is apt to cause uneven cooling of these cylinders. Alternatively a heater muff or a pipe running through the collector ring in the same manner as the cabin heater is used very effectively. Oil jacketing of the carburettor is another method of obtaining this heat, although it adds to the plumbing of an engine. With the exhaust type heater it is important to avoid contamination by exhaust gases as this can cause an appreciable drop in engine power, and detonation.

There should be a heater control which will be automatic, as intake air that is too hot will cause a large drop in power and reduce the anti-knock value of the fuel. Figure 11 shows the effect of air temperature on engine power.

A good thermometer should be fitted. The air intake should be so arranged that it will not take in dust during take-off or landing, and the area of the duct should be at least 10 per cent greater than the combined areas of the venturis.

Cowling

Many forms of cowling have been developed for aircraft engines. Those designed for liquid-cooled engines, with the exception of the forming of the actual material, are relatively simple when compared with the cowling required for the air-cooled engine. All that is required is that the engine shall be covered so as to cause as little drag as possible. This is of course apart from the accessories, radiator and oil cooler. In the case of air-cooled engines, the cowling must permit the proper amount of air to be directed against the parts of the engine requiring it.

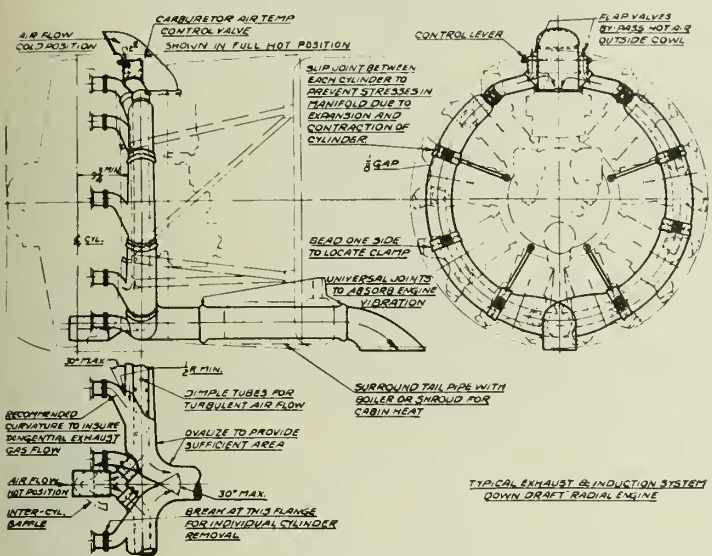

Fig. 12—Exhaust Arrangement of Wright Cyclone Engine.

For routine inspections, the cowling must be easily removable. It must also be light, and still be rigid enough for flight. These factors do not make for ease in design particularly where a limited production is in question.

Cowling fasteners when fitted must indicate clearly whether or not they are in the locked position.

For all engines, the cowling must permit the cooling of the accessory compartment, and must not permit any part of the engine to reach too high a temperature. This of course does not include the work of the cooling fins.

In the case of in-line air-cooled engines, it is sometimes necessary to fit an involved system of cooling ducts to obtain adequate cooling of all cylinders.

Many types of cowling have been developed for radial engines, starting with the circular trough of the rotary engines.

Probably the first important development was the Townend ring. This was closely followed by the low-drag cowling developed in the U.S. by the N.A.C.A. This consists of what might be considered as an extended Townend ring, and some models have controllable flaps on the trailing edge. An inner cowling is also used.

In conjunction with these two types of cowling, it has become necessary to use inter-cylinder baffles, both between cylinders and between the head and the cowling to secure the required air flow. The design of these baffles is a very tricky problem, and fortunately for the aircraft designer is done by the engine manufacturer.

Several interesting forms of cowling are in development among which is the Wright reverse flow cowling. (Fig. 13.)

Cooling must be provided for some of the accessories such as the magnetos, and where generators are heavily loaded, they must be cooled. The temperature of the accessory section should not exceed 140 deg. F. with the present gasoline and preferably should be considerably lower than this. If the accessory compartment reaches too high a temperature, trouble may be experienced with vapour lock.

There should be no unfilled holes in the cowling as these cause drag. The minimum requirements for accessory cooling on all Wright engine models is a pressure drop of 1 in. of mercury across the baffles at 1,300 r.p.m. on the ground and 3 in. of mercury at rated power and speed in flight; this is a reasonable figure for all similar engines. For high altitude aeroplanes of the future the cowling may have to include the supercharger intercooler. An example of this is shown in the Bristol altitude record aeroplane.

Oil Cooler

As a part of the heat of the engine is removed by the lubricating oil (1,400 B.t.u. per min. for 1820-G2 Cyclone engine) an oil cooler is necessary. The shape of the element may vary with different designs, but the unit consists of a cooler through which the oil from the engine passes on its way to the tank. Provision is made so that the oil may be by-passed when the temperature is low. The installation of the oil cooler must be very carefully considered from the point of view of drag and efficient cooling. The piping must be so arranged that the oil will not solidify and prevent proper circulation. A control of course must be fitted to operate the by-pass. An automatic oil cooler which maintains constant oil viscosity has recently been developed. Provision should be made for winter starting.

Wiring

The modern engine necessitates a considerable amount of wiring. These wires should be of the best quality and armoured. The cables should be carefully supported to avoid movement and should be kept as far away from the fuel lines and carburettor as possible. All wires leading back to the aeroplane should be removable at the firewall so that the engine may be removed as a unit without having numerous wires dangling from it.

The ignition cables and magnetos now supplied by the manufacturer are radio shielded in many cases. This also helps to protect them. Ignition switches should be within easy reach of the pilot and shall be off when pointing down.

Batteries should be in an accessible position so that they may receive proper attention.

Fire Protection

All transport aeroplanes must carry hand fire extinguishers. If the cabin is divided into separate compartments, then each compartment must have at least one extinguisher. One extinguisher must be within easy range of the pilot.

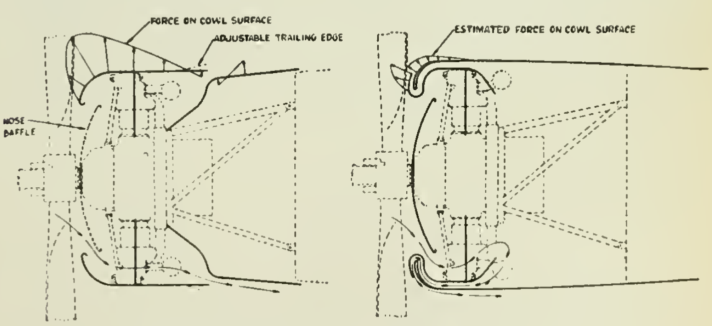

Fig. 13—Wright Reverse Flow Cowling.

While this is all that is required by the regulations, it is much safer to have a built-in extinguisher unit, piped to the various points where fire may be expected; particularly the engine and fuel system.

There are a number of types of extinguisher available. Probably the carbon dioxide snow apparatus is the most satisfactory. When other types are used it should be ascertained whether or not the fluid used will freeze in the temperatures apt to be encountered.

All fuel vents and drains must be carried well clear of the cowling.

The fuel lines must not pass within four inches of the exhaust pipe.

Except in the engine bay, the exhaust pipes may not pass through the fuselage.

INSTRUMENTS

A fire-proof bulkhead must be fitted between the engine and the fuselage or wings. Asbestos mill board $\frac{3}{32}$ in. thick between 24 gauge aluminum or duraluminum sheets satisfies the minimum requirements.

In addition to the conventional speed, fuel reserve and pressure, oil temperature and pressure, boost gauge, ammeter, air intake temperature and cylinder temperature instruments there are a number of instruments which have been developed which are of use to the pilot and should be fitted, particularly where the cost is not prohibitive.

An indicator is desirable to show when ice is forming in the carburettor. This instrument may of course be omitted when automatic de-icers or heater controls are fitted. An oil flow indicator should prove of value, for although the pressure gauge and thermometer are fitted it is possible that these will not tell the whole story.

An exhaust gas analyzer fitted to the tail-pipe gives the pilot a close check on the mixture control

A carbon monoxide indicator which will operate continuously and warn the pilot when the concentration reaches a dangerous figure.

SUMMARY

To summarize briefly the requirements of a good installation, the engine should be mounted as an easily removable unit which will function under all conditions of flight. All parts should be easily accessible for maintenance and care should be taken that as little vibration as possible is transmitted to the airframe.

57th Annual Meeting of the Society of Chemical Industry and 21st Annual Chemical Convention, Ottawa, June 20th-22nd.

More than usual importance attaches this year to the Annual Convention of the Canadian Chemical Association and the Canadian Institute of Chemistry. The meeting is held in conjunction with the Society of Chemical Industry of London, England, and a large delegation from overseas will land at Quebec on June 17th. There will be many distinguished members and visitors from abroad and from the United States.

The programme begins in Quebec and takes in Shawinigan Falls, Ottawa, Sudbury, Toronto, Hamilton, Niagara Falls and Montreal truly an ambitious undertaking. The principal sessions will take place in Ottawa, commencing with the presidential address of Viscount Leverhulme. Many excellent papers will be presented there, and the chief social events will also take place in that city. The president's reception and the annual dinner and dance at the Chateau Laurier are at the top of the list. At these functions the Engineering Institute will be represented by President J. B. Challies, who is also reading a paper on "Water Power and the Electro Chemical Industry" as part of the symposium on "Natural Resources of Canada and Their Development through Chemical Research."

The Convention comes to Montreal on June 28th to July 1st, when tours of industries and sightseeing, golf, luncheons, dinners, and a smoker make up an interesting looking programme.

The Engineer and the Law of Supply and Demand

F. P. Shearwood, M.E.I.C.,
Consulting Engineer, Dominion Bridge Company, Montreal

This report is published in The Engineering Journal in accordance with instructions issued by Council at the meeting held in Toronto April 22nd, 1938. Further reference to it wil lbe found on the editorial page.

Having been appointed by the Council of The Engineering Institute at the meeting held November 16th, 1937, to report on "The Present Supply and Demand for Technically Trained Engineers," I found on investigation that the subject covers so extensive a range of different branches of employment, and is of such vast importance, as to make anything approaching a complete survey of the subject a task entailing not only great expense but a tremendous volume of work. In addition to these considerations, it is evident that the rapidity of change in all engineering fields might render the report antiquated as soon as it could be published. This present report, therefore, is a superficial review of the matter as it appears to one whose record is a long experience in one branch of industry. Industry is one of the most fertile fields of future employment for young engineers.

Such a report, to be of any benefit, should be a provisional guide for young students, indicating the probable opportunities for them when they have graduated from the university, and also a suggestive guide to the professors, of the type and extent of study which will be of most service to these students in procuring employment, and for the eventual attainment of their success. Assuming that our universities, at present, are obliged to play the part of technical and business colleges and that the majority of their graduates follow an engineering course to fit them for financial success, it should be kept in mind that most of them require remunerative work as soon as possible after graduation. Also it has often happened that when a student entered college in prosperous times he planned his training as he and his advisors saw the future judged by the then existing conditions. These conditions were apt to change, and often did change, by the time the student graduated, and they have at times changed very significantly and suddenly. There is always a probability that many of the scientific processes of manufacturing construction will also change, thereby throwing much of the scientifically trained employment into channels very different from those current when the student matriculated. The man may then find on graduation that he has been cast ashore in lean years, having specialized in the wrong course.

The question arises too as to whether the general training is for the few who will eventually advance to the higher positions or whether it aims at fitting the great majority to earn a living immediately on graduation. It must, in this connection, be realized that the number of leading professional engineering positions is not large and is not nearly adequate for the number of graduates in engineering who complete their education every year in our colleges. In fact, there are not nearly enough berths of a truly professional nature in all classes of engineering to meet the increasing demands for them. If therefore, the supply of engineering graduates is not diminished in the future, is it not desirable that the college training should fit them to engage in allied lines of work, where their education in engineering would be of great advantage to their prospective employers? To indicate just what some of these allied lines are, and what courses are best suited to preparation for them, is therefore the objective of this report.

A great number of investigations, questionnaires, and inquiries have been made from time to time by various groups of engineers, but they have nearly all dealt with past history, and have been answered from a financial point of view, and dealt for the most part with the question of past and present earnings, salaries, and remuneration. It is the question of the future opportunities that engineers are required to think about at present, and how future engineers may be prepared for them in the most efficient way.

Perhaps our universities are trying to combine the objectives of the university and the business institutions. The university aims at educating a man irrespective of, or at least not primarily with respect to commercial returns, while the business college enables a man to understand the commercial affairs of his community, and to carry on the business by which he earns financial remuneration for his support. It would also enable him to superintend or direct the trade of engineering works.

Such, theoretically, are the functions of the training schools, but practically speaking it is of course of paramount importance that the graduate in engineering should find employment as soon as possible after completing his course, not necessarily or, even primarily for the sake of earning a living wage, but so that he may have an opportunity of applying his recently acquired knowledge while it is fresh in his mind; and also it is desirable that he should utilize the engineering data and reasoning with which it has been the object of his college to furnish him. It is very necessary that he should have an opportunity during the most receptive years of his life to practise some of what he has learned theoretically—viz. the years which follow his graduation.

Engineering, purely, as a separate profession, is vanishing rapidly from view, but it is expanding very greatly as allied with other professions, as a contributor to all that is scientific in commerce, and as a necessity in trade. As a consequence of this trend of engineering toward the allied employments, the training colleges must realize the fact that engineering is largely connected with commercial business, and that nearly all business and commerce is at its root primarily derived from engineering principles of an immense and varied type which are constantly touching our everyday life with a peculiar importance. We find evidence of and readily recognize the fact that an increasing proportion of engineering graduates must find their life occupation in this semi-engineering calling and employment. What this employment is to be and what training will best fit the engineering student for it, is the objective we are really seeking. A very superficial forecast of some of the prospects of employment for the young graduate is here suggested as a guide for the future, but as already implied it must of necessity be curtailed and inadequate in its information:—

1. *Industrial.* Such positions as shop superintendent, foreman, shop inspector, plant engineer and many others, have been, and perhaps still are looked upon by some as only to be filled suitably by mere mechanics. But most of these positions, indeed practically all of them, can, by the application of scientific principles, be made into engineering positions, and in this way increase their efficiency so greatly as to warrant a much higher remuneration than is earned by the majority of engineers engaged along the old professional lines. In these cases a graduate of any of our universities would be required to attain a certain

degree of practical skill, either in his long summer vacations or as a postgraduate training. Work in the shop for a certain period is almost imperative in such a course. These berths can be made the stepping stones to the very highest positions in the plants, provided the candidate has the cultural and social qualities required.

2. *Contracting.* Contracting, which has already become an engineering business (profession?) in the large corporations, and to a certain extent in the smaller firms, practically all partakes of the nature of engineering, even if in a simple method and to a modest extent. For this reason it is desirable that contracting undertakings should be directed by men with engineering knowledge and training. The labouring men who are to be directed in such work are constantly becoming more intelligent and it is less necessary now to do the driving by the old rough methods which were so common in former times. It is becoming more and more customary to recognize that the positions of superintendent, foreman, etc., can be often better filled by educated engineers than by skilled forceful and vigorous artisans.

3. *Sales Engineer.* We come now to the very modern but necessary member of the industrial plant, the sales engineer. His work represents a line of employment of recent birth, and there is every reason that it should act an important part in the future as a result of the rapid, intensive and, scientific development of the modern products of industry. The development has made this office requisite and necessary to the sale of products of the modern plant. Very many engineering products must have special engineering qualities and the engineering designs as well as scientific advice must be supplied by the producer when the product is to be marketed. Here again engineering knowledge is greatly in demand by the producers, and investigation shows that this line of employment is growing very rapidly. It is likely that it will continue to increase since the average products of all industries tend to become engineering specialities.

4. *Business and Commerce.* All business is connected with the trading of material, or of work produced which is, or should be scientifically directed; and therefore engineering knowledge is not only of great value in most of the occupations in business but it is especially useful in the management of all big commercial enterprises. There are many graduates who are endowed with a commercial turn of mind or who are not suited to the intensive concentration of strictly professional engineering questions who should, and do, find their best prospects in commerce connected with engineering trade.

In this connection it is possible that much can be done to improve the prospects of employment for engineering graduates, by showing those who are in charge of small and medium sized plants (which are to be found in nearly all classes of industry) the advantage to be gained by employing men with engineering training. If such employers would offer the young graduates opportunities of applying their technical knowledge it would be of great benefit. It would help solve the problems of many employers and also the question of finding technical work for the unemployed engineers.

5. *Research.* The candidates and appointments for employment along the line of research will undoubtedly be multiplied as science delves deeper and deeper into the unknown. Each discovery leads inevitably to more discoveries and points to previously unsuspected principles of truth. To some natures this seeking after new discoveries will provide the very greatest gratification, satisfaction and pleasure in the daily occupation of a never-ending pursuit. The enjoyment of the research worker in such efforts toward new discoveries means far more to him than any colossal financial returns.

6. *Consulting Engineering* is probably the aim of many young men when they enter college, but under existing conditions a conservative estimate of the future would indicate that very few graduates can hope to find enough private practice to enable them eventually to earn a livelihood. It is regretted that our Provincial Associations of Professional Engineers have not done more to encourage and preserve for the competent independent professional engineer the work of general designing and of the supervision of engineering works and projects. If all engineering projects could be legally controlled by licensed engineers, the community would be in a much safer condition and would undoubtedly be better served than it is at present. Under existing conditions and for the sake of the reputation of professional engineering, only the exceptionally clever graduate who is prepared to spend many years acquiring post graduate experience, should contemplate engaging in consulting engineering practice.

7. *Chemical, Electrical, Municipal, and Mining Engineering*, and employment with the railways, and big corporations with highly organized scientific departments are not here touched upon, since they should be reviewed by those very conversant with the openings for employment along their own particular line. These positions too, require greater specialization than the occupations already considered.

It is very difficult to forecast the course which the complete college training in any province should aim at. There is, however, one question which is specially important to us in Canada, viz. should all our colleges, situated as they are in such different environments, specialize on the peculiar requirements of their own districts, or should they all offer courses which are essentially the same and so fit the majority of their graduates to take up work which may force them to leave their own province or possibly to emigrate from the Dominion when the time comes for them to seek employment?

There are of course many occupations, other than those mentioned, which can be filled by graduate engineers with great advantage to their employer, but to try to give a full and useful account or advice about them, without a thorough and exhaustive investigation would be extremely dangerous. The salient fact regarding the future engineer's employment is that owing to our changing conditions only the few can hope to be assured of precisely the employment that they contemplated when they entered on their college course, but it can be recognized that the application of scientific engineering is widening and that general engineering is intruding itself into almost every sphere of modern life. The study of it in any form cannot fail to advance the prospects and success of those who are sincere in their effort to earn a livelihood by engineering, and who are willing to apply their technical knowledge to any type of commercial venture.

Are You Looking for a Job?

Advice to the Young Engineer

C. R. Armstrong

General Employment and Safety Supervisor, Bell Telephone Company of Canada, Montreal.

An address delivered before the Junior Section of the Montreal Branch of The Engineering Institute of Canada, January 17th, 1938.

It is my understanding that the Junior Section of The Engineering Institute has been studying the problem of the individual's adjustment from graduation to a place in industry. Your attention has been directed, I am informed, to the proportionately large number of engineers who have accepted positions believed to be suitable and after some experience have found it expedient to change their associations and try again. Time has been wasted, years have gone that might have been used to better advantage in another field, and suitable adjustment becomes more and more difficult to attain.

Worse than this by far is the condition of that unknown number who, perhaps after more than one trial, find themselves compelled by economic necessity and the weight of home responsibilities to carry on amid uncongenial associations, with remuneration far below their considered worth, with uninteresting and monotonous work, and with an outlook for the future that holds slim possibilities for any real improvement. In dealing with any phase of the problem of individual maladjustment in industry, you are tackling one of the most serious and vital situations of to-day, considered from the broad social standpoint.

Latest research in industrial relations is showing conclusively that the present unrest is traceable as much or more to individual maladjustments as to the economic factors of earnings and working conditions. The worker who is unhappy about his daily work or who hates his boss tends to dwell upon his unhappiness and readily decides to blame the whole miserable situation upon the corporation which hires his efforts, but not his interest. This is the state of mind upon which the propaganda of the professional agitator flourishes. This is the sentiment which, when fanned into the flame of action, may burst our present industrial organization wide open, if something is not done about it.

No one is much concerned about the effect of the professional agitator upon the engineering mind. But, if the same reaction is prevalent among the graduates of universities as with industrial employment, there is small hope for a counteracting leadership to throw its influence on the side of the stability and orderly progress which are essential for economic and social well-being. This is what is meant when I say that I consider you are engaged upon one of the most important social problems of the day—the proper adjustment of the graduate engineer to economic and industrial life. If, by assisting in this discussion on the initial interview, I can contribute something to your broader study I will consider it a privilege to have had the opportunity.

Before leaving that point, however, it might be well to point out there is no justification for becoming unduly pessimistic. In my experience and yours, we have met many who, in their daily associations, appear to be reasonably "happy about the whole thing." There is reason to believe they are in the majority even though they may not be heard from persistently. It is with the others we are concerned—those who graduate with engineering degrees into wholly unsatisfactory positions in industrial life. Why has this happened and what can be done to prevent it in the future or at least to substantially reduce the frequency? More particularly we are concerned with the initial employment interview—where has it failed and what can be done about it?

It is not my intention to deal with ideals—things as we may conceive they should be. More can be gained by dealing with facts even when these may seem to be hard and unsympathetic, considering it is a wholly human relationship that is under review. The situation we will try to describe is the meeting between the recent graduate of an engineering school and the representative of an industrial organization.

The young engineer is leaving behind his academic career with its peculiar interests and worries, to plunge into a completely different environment. He is usually young, keen, inexperienced and anxious to get started. He is delighted that the long grind of studies and preparation is over and he looks upon this next step as an adventure. He looks forward to his future success—seldom considering the possibility of failure.

From my experience, I would say that by far the greatest number of recent graduates are sensible, level-headed young men free from the conceit which is usually attributed to them. It is their inexperience rather than their conceit that creates most of the difficulties of the first interview.

They are quite indefinite in what they ask for. They are indefinite because they have not more than a hazy conception of what there is to ask for. They want a job, of course. Almost invariably they want a job with the possibilities of success. What kind of a job and what they mean by success are points to which they have seldom, if ever, given a great deal of attention. It is doubtful if they always have the necessary knowledge to weigh the relative merits of different jobs as they relate to their own interests and capabilities. This point I will bring up again later.

The representative of the industrial concern may carry any one of many titles: employment manager, superintendent, chief engineer. His position makes little difference to his purpose in the interview—his experience and outlook may make a great deal of difference to his conduct during the interview. No matter what his title may be he is acting in the capacity of representative of the concern that hires him. It is his business to protect their interests and their interests are invariably financial. If he employs an engineer he commits his company to the expenditure of money. A return for that expenditure is demanded. The better the return, the better the job that has been done. To put it plainly, the interviewer approaches the interview from the standpoint of a business transaction. Those he represents need a commodity—are ready to pay a reasonable price provided the commodity is up to the required standard. Otherwise, he cannot be interested.

The situation is quite similar to that of the salesman and the purchasing agent. The young engineer is the salesman and the interviewer the purchaser. The product is the engineer's present and potential capabilities. The interviewer's decision will be based upon his opinion of the relation of these capabilities, as he sees them, to the needs of his enterprise. Are they or are they not the best that can be procured for the amount of the purchase price?

That is something the interviewer has to decide. It does not, however, close the deal. At some stage in the interview, if it is to be carried through to a successful conclusion, the scene shifts and the applicant takes his place as the purchaser. From his standpoint it is not an impersonal product he is considering, it is, or can be presumed to be, his entire future economic life. Does he want to close the deal? Now the interviewer becomes the salesman. He has to sell his proposition to the desirable applicant. The applicant has a free choice to close or not to close and just as much time and effort is required to determine if the job suits the applicant as to decide if the applicant suits the job. In the long run it is probably the more important consideration.

The graduate who accepts a job without first finding out all he can about it and its possibilities is either a fool or an ignoramus. The employment man who declines to give as fair and accurate a picture as circumstances permit, will and should fail to bring into his organization any but the most desperate those who feel pressed to accept any form of employment for the time being and take a chance.

When I say the scene shifts I do not mean there is a definite point in the interview when the trend of the conversation undergoes a sudden change. The well-conducted interview is an exchange of facts and ideas from beginning to end. The applicant is endeavouring to supply the interviewer with facts about himself and to secure from the interviewer facts about the job and the organization. The interviewer, if he understands the first principles of his job, will be just as honest and sincere in his efforts to give as to receive facts and impressions. This process of exchange carries on right through the interview, sometimes one phase predominating and sometimes the other.

I am at this point, in fact all through this discussion, thinking of industry in terms of large corporations. Supposing the graduate accepts a position upon graduation which turns out to be absolutely unsuitable. He seeks employment elsewhere. Let us assume he retains his job while seeking another. He explains his position to the interviewer who immediately becomes suspicious. It is astonishing, the confidence one large corporation has in the fairness and wisdom of another. If he is dissatisfied there, he will be dissatisfied here, is the first reasoning of the employment man. In the interests of his firm he is immediately on guard. Let us assume the young engineer resigns, and starts out to seek employment again. The first question he faces is "Why did you quit?". The implications are obvious.

The task of the recent graduate in the employment interview is a sinecure when compared with that of the graduate of two or three years employment. The latter must be unusually impressive to break through the initial defence of the interviewer, have an exceptionally reasonable story to explain his desire for a change, or apply to a firm which is acutely in need of new employees of his standing. In the last instance it is the applicant's turn to be on guard and ask the question "why?"

This should not be taken to mean that once employment in one company is accepted the individual is condemned to work there all his life. There are means of gaining employment other than the cold unintroduced application at the employment office. It is, however, wise to point out to your friends who will graduate, the importance of getting correctly placed in the first instance. Later adjustments do present peculiar difficulties and these difficulties are steadily growing with the increase in importance, from the standpoint of employment, of the large corporation. Experience is dictating this employment policy. In many instances this opinion of the employment man has been borne out by experience. The probability is that the man who seeks to shift jobs often is shiftless. It is unfortunate that the poorly-adjusted man of high capabilities suffers through the standard set by the average.

The interviewer, it has been said, looks upon the interview as a business deal. The applicant can do nothing to alter this and is well advised to realize its truth and equip himself as well as he can for the situation into which he is entering. The intelligent interviewer is not concentrating upon recruiting or selecting the best man. That term is much too abstract. In the first place if one attempted to define the "best man" he would run into many difficulties. Obviously the best for one situation may not be the best for another. The interviewer, then, is trying to select a man from among those available who is most suitable for the position that is or may be available. The interview becomes a process of attempting to fit the characteristics of the man into the characteristics of the position and observing the nature of the result. The decision of the interviewer will be based not so much upon his opinion of such generalities as the all-round abilities of the applicant, as upon the mental picture he forms of the applicant in the job.

It can be assumed the interviewer knows a good deal about the position to be filled; if he doesn't he should not be interviewing. With this knowledge he can, or should, be able to describe in general terms the type of man he needs. During the interview he is trying to discover if the qualities that go to make up this type predominate in the applicant. It is now time to become analytical. What is there in each job that calls for peculiar traits in the individual? What are the personal characteristics that make one man more suitable than another for a particular situation? I am not going to attempt to describe in detail industrial jobs that are open to graduate engineers. It is easier and I believe more profitable to generalize. Let me explain.

An addition may be called for by the chief engineer for what he looks upon as his technical section. The immediate job is mostly assisting in work of an experimental nature. The future is industrial research. This technical section will, in all probability, be a group set apart from the general activity of running the business. Budgets and estimates, sales variations and production schedules will never become a part of the duties. The day-by-day occupations will resemble more the scientific research laboratory than the hurly-burly of industrial management. Speedy judgments will not be called for. Patience to carry through month by month, trial and error experimentation is an absolute essential. That type of mind that revels in mathematical formulae but does not require the stimulation of social contacts to keep up interest and enthusiasm; the man who chooses the laboratory in preference to the football field; the potential scientist in contrast to the potential man of business, will fill the bill. There are a few right jobs for the scientific student in industry but there are thousands of wrong ones. There are some industries that can use his services to good advantage, but there are many that cannot.

There is another type of engineer whose work is rather difficult to describe. Let us call him the methods engineer. His position calls for the same type of patience, the same ability to keep going month after month on hope without immediate tangible results. To capably fill this position one must have all the attributes of the student. He studies operating methods, methods of doing the work in the plant and the operation of machines. He tries to find improvements. But he must do more than discover improvements, and it is this that inclines me to separate his job from the first class. He must have, or be able to develop, the ability to put over his ideas to practical men such as plant managers and superintendents. He must think in terms of the student and talk and write in the language of the craftsman. Many of his duties can be carried out only with the co-operation of the operating staff. Usually he is called upon to put his suggestions into writing in a form that will not be misunderstood by practical people. He will have to take his place in that great modern industrial institution, the conference. If you like, he is the industrial, literary scientist. I think you will agree that a considerable number of graduates, even from among the so-called outstanding men, fail to qualify. No useful purpose would be served in going on to describe other variations of the technical engineer.

Next in order I would refer to what has been called the operating engineer. He is the man who lays out or plans the job, usually in relation to some form of construction. He is not much concerned with research. He learns all about the accepted methods and standards of the work of his concern and prepares the plans from which the field or plant forces do their work. He sets the detailed rules to be followed. This type of work calls for a set of abilities and interests different from those that bring success in the more speculative jobs. It is work for the doer, the man who gets satisfaction out of direct accomplishment, in psychological terms, the extrovert.

The job of the sales engineer calls for a man with a make-up almost the opposite of that of the research engineer. It has been said that the successful salesman is born not made. However that may be, the adult individual who has had born in him, or who has acquired, a nervous or too modest response to strangers finds it impossible to develop the particular poise of the successful salesman.

So far we have been considering those positions in industry that carry the title of engineer. I know there may be differences of opinion at this point but from my experience I will say frankly that, if engineering graduates will insist upon looking upon themselves solely as professional men and will undertake only those jobs labelled engineering, they will, by thus limiting their future to the one relatively narrow field, seriously miss some of the brightest opportunities of the future.

The industrial scientist has his place, and an important one. But the greatest need is for well trained and capable men in the field of Industrial Management. The large and growing corporations need and will continue to need, probably more than anything else, men capable of handling the intensely difficult tasks of industrial leadership—trained men, big men, men who can visualize the significance of things as they fit into the larger pattern. Men of normal intelligence can be trained to do accurate and painstaking work. They may be trained to direct others to do detailed work efficiently. But when this average man is assigned a position of higher rank and greater responsibility he finds it impossible to grasp the essentials of the broader situation and before long is floundering in difficulties. The hardest positions to fill are those requiring broad executive ability and the peculiar characteristics of leadership. The field of industrial leadership offers the greatest opportunities for those capable of shouldering that responsibility.

The chief engineer is not chosen for his engineering ability. He is often far behind in technical skill and knowledge. He is chosen for the same reason that any other executive is chosen, because he has definite administrative powers. He can see and appreciate the broad picture of company purpose and activity, and can co-ordinate the work of his own department to serve the broader needs. The technical expert of all levels must, by the nature of things, be subordinate to the executive head. We should, therefore, include in our classification of job possibilities those that give, or lead to, the experience necessary for executive leadership.

If I am ever asked to advise a young graduate of known ability and promise, I will without question suggest he get into the business or operating end of the business and let his success be dependent upon his demonstrated ability and not upon his academic degree. This will sound like old-fashioned advice. Like many other things that are old-fashioned its truth is again coming to be fully appreciated.

I have dealt at considerable length with these points because in so doing I have, I think, described a good deal of what is in the back of the mind of the interviewer. His assignment is not merely to hire a man for a job. It is to bring into his peculiar organization a man with the peculiar qualities that will become an asset to the business and, coincident with that, provide the man with reasonable prospects for a successful career. And by successful career I mean, as will be discussed later, one that makes use of his predominant personal characteristics as they are and as they are likely to become.

Turning to the other side, what can the applicant do to aid in carrying the interview through to a satisfactory conclusion without unnecessary delay? The answer is quite simple.

The first and most important step should take place some time before the date of the interview. It is an honest self-appraisal, if possible with the aid of a friend in whom the applicant has confidence. This somewhat painful process should not be directed by the general question "How good am I?". It will take years of experience to answer that. It should lead up to answers to two important questions: (1) What am I best fitted for? and (2) What do I like? It should not be impossible to come to a reasonably intelligent judgment from a review of recent college experience. The student has spent years labouring over such subjects as mathematics, mechanics, economics and accounting in some form, and has had experimental and mechanical experience in the laboratory. Which of these have been hardest to get interested in? In which have the results been poorest? Which, if any, have been reasonably easy but tiresome? Which have become progressively more interesting the more deeply they have been investigated?

Then there is the other side, class and college social and athletic activities. Have they been uninteresting, or participated in no more than necessary? Is associating with other people tiresome? Perhaps an honest review will indicate to the graduating student that he did pretty well in these things and found real enjoyment, or that he had been elected to office frequently and enjoyed it.

This self appraisal does not call for a psychological examination in technical terms. It is not scientific treatment that will get the best results at this stage; it calls for the application of some good horse sense. Surely anyone with enough grey matter to go through to a university degree, and clever enough to fool a host of professors into believing he has mastered a score of subjects, is capable of looking back over the events of the past four or five years and appreciating their significance in relation to himself. If he can't do that let him apply for a pick and shovel job and find his proper level.

If applicants could learn to do all this in preparation they would earn the eternal gratitude of all interviewers. I suppose I have asked hundreds of times "What kind of a job do you want?" Hundreds of times I have been rewarded with the answer "Some place where I will have a chance to get ahead." Who doesn't? Then begins the long digging process of question and half answer. 'What subjects did you find most interesting? Why? What have you done in addition to going to college? How did you find this and what did you think of that? Eventually, if both parties have enough patience, the applicant will tell something of himself, what he has been good for and what he has been interested in, and a mutual decision will be reached that the job the interviewer has in mind is not suitable. A great deal of time has been wasted because the applicant was not prepared.

But now, suppose the applicant has reviewed his past activities as suggested, and, after the preliminaries necessary to form the contact with the interviewer, tells his story plainly and simply. He is acting as a rising young business man should, he is putting his cards on the table and explaining the uses to which he believes his product can be put. That is the way any business deal should start.

Now the interviewer has his chance. He can explain the conditions of employment in his concern, and in general terms the nature of the duties of the job he has in mind and the nature of the work to which the first position may lead. By this time all the cards are on the table and it is a relatively simple process to determine if the qualifications of one party fit the needs of the other. A satisfactory conclusion can be reached because two supposedly intelligent people have before them the data for the solution of their problem.

Much is being said and written about the technique of the interview and the science of interviewing. I do not propose to deal at any length with this because it applies chiefly to the interviewer. The applicant, in my opinion, needs no technique, in fact is better off without one. His policy consists first of all in deciding what he wants and why he wants it. If he clearly and naturally explains this to the interviewer he has done his share.

I do not think the interview should be looked upon as a psychological examination probing into degrees of intellect, memory, imagination, social adjustments, etc. It can't be. Such examinations take a great deal of time and no industry is, so far as I know, equipped with a personnel capable of conducting them. The interviewer looks upon the applicant as a behaving entity and not as a synthesis of functions. He forms certain impressions of the individual from what he is told and how it is told. He is looking for a man of business and will be impressed by the applicant who conducts himself throughout the interview as if he were one. I feel, therefore, we are not missing much in passing over lightly the technique of interviewing as it applies to adult graduate applicants. If we were dealing with interviewing of a different kind, interviewing, for example, those already employed endeavouring to uncover true mental attitudes in connection with the relation of workers to their conditions of employment, it would be a totally different matter.

It was mentioned earlier that the normal applicant has not given much thought to the meaning of the success he says he is seeking. In most cases he is thinking somewhat hazily of his future earning power. If he were to define minimum success he would probably begin speaking of so many thousands of dollars per year. From one standpoint this is not so unwise for one starting on an industrial career with the advantages of a college training. Nearly all the important positions in the larger corporations command salaries of considerable size. But the question I would like to raise is this: Is each man who fails to rise to the level of such important posts, a failure? I hope not.

For each one who climbs to a position of power and earnings measured in the tens of thousands of dollars there are some thousands of others who do not get there. But our whole background from the cradle to college graduation is permeated with the thought that success in such extreme terms is available for those who apply themselves. I heard recently of an American couple living in Montreal who returned to the United States for the birth of their first child. Quite seriously they called our attention to the clause in the constitution which requires that the President of the United States must be born within the boundaries of that country. Incidentally it was a girl. That is, after all, but an exaggeration of the attitude of a host of parents. Their child will have opportunities denied them. With these he will climb to a position of wealth and power. These opportunities become a terrible responsibility. Driven into the growing child is the slogan "strive to succeed;" "work to get on top." Anything else will be failure. Hope beclouding judgment, capabilities are imagined that are not there. The fall is hard, the disillusionment is great, because the aim has been unreasonably high. Application and some luck will bring success but not in the sense referred to. There is but one president and one chief engineer of importance for each several thousand workers. If everyone is a candidate many must be defeated.

The man who fails to land a job big enough to challenge his ability and hold his interest is unfortunate. The man who is grasping and gasping in a position for which he is not fitted is even more to be pitied. Much of the maladjustment of which we spoke is not a maladjustment between the man and his work at all. It is a maladjustment between the man as he is and as he has come to think of himself. His work is often quite suitable from every standpoint save that of his own foolish hopes and ambitions.

My final suggestions to the applicant approaching the employment interview are quite simple.

1. Avoid, as well as you can, over anxiety and self-consciousness. If you are the right man for the job the interviewer is as much in need of you as you are of his job. If not, it is better for both to find it out at once. Failure to land a job is not failure in the broader sense.
2. Try to forget it is yourself who is the object of the bargain.
3. Come with a well prepared description of what you have and have not been able to do.
4. Be prepared to judge the kind of thing that will appeal to you and will in all probability hold your interest.
5. Tell your story frankly and openly.
6. Demand equal frankness in return. Beware of the interviewer who oversells the advantages of the job and of his firm. You have just as much right to study him as he you. Stay with it until you are satisfied you have the facts.
7. Do not be discouraged with failure to sign up on the first attempt. You will have probably 30 to 40 years to work. A few weeks' effort spent in making as sure as you can that you are starting right on that long journey is not so serious a matter after all.

And I would like to add this. Approach the first interview with as much as possible of the carefree attitude of an adventurer rather than with that horrible grim determination to forge ahead at all costs. Find the type of work you are sure you will like, aim for congenial surroundings, start out with the idea that work itself, even in dark modern industry, can be a pleasure, and let the future take care of itself.

DISCUSSION ON

Canadian Steam-Electric Power Plants

Paper by C. A. Robb, M.E.I.C.[1] presented before the General Professional Meeting of The Engineering Institute of Canada, at London, Ontario, on February 2nd, 1938, and published in The Engineering Journal, March 1938.

Johnstone Wright[2]

Data and a brief commentary on the development and performance of Central Power Stations in Britain follows:

Power Station Design Features, etc.

Under the national scheme the retention of small capacity stations located adjacent to the load centres, peak load stations, and the reconstruction of old stations, are all governed by careful investigation into the question of policy and economics of generation and/or transmission.

With regard to the range of fuel and variation of furnaces designed to burn any available fuel or mixtures of fuel in this country, only a few cases of solid and gaseous mixtures are in use, and comprise pulverized coal and/or blast or coke oven gas.

On the other hand the geological structure of the British coal fields results in the volatile content of the coal varying from 5 per cent to 35 per cent within a range of a few miles. As a consequence, many firing equipments and furnaces must be so designed as to operate under widely varying volatile constituents. On the pulverized fuel firing equipments wide ranges in the proportions of primary, secondary, and tertiary air supply are necessary, whilst on stoker equipment of either the retort or chain grate types, a similar wide range must be made in the proportions of the primary and "over fire" air quantities.

Industrial Aspects

The use of by-product steam for generation purposes produced in either refuse destructors or by the burning of the final surplus of blast and/or coke oven gas at steelworks (after supplying the metallurgical heating requirements at works) is only undertaken after careful investigation into all the commercial factors of the case. It would appear that the value of such steam is represented by the incremental operating costs of steam production in a base load station, because these supplies are, in general, of an intermittent nature.

Interchange of energy is a feature in conjunction with certain steelworks electricity supply contracts providing the proportion between electricity imports and electricity exports has a commercially economic value. The maximum price paid for steelworks electricity exports is again fixed by the incremental cost of electricity production at the base load generating stations.

Diesel engines as a factor of power development influence the economic competitive tariff according as they are used (*a*) for electricity generation or (*b*) for direct mechanical drives. In case (*b*) the public utility company has to take into account that only the difference between the capital charges attributable to the engine drive and electric drive is available.

Electric boilers for use in conjunction with space heating apparatus are in frequent use, but to the best of my knowledge no such boilers are ever used for power steam production.

Design Cycles

During the earlier years of trading under the national scheme, a standardized cycle of 650 lb. g. 850 deg. F. with regenerative feed heating in four or five stages to 340 deg. F. to 350 deg. F. has been adopted. The station heat consumptions are established at a low level and when viewed in conjunction with the initial cost per kilowatt installed and the simple operating layout, commercially justify the cycle adopted.

At the North-Eastern Electric Supply Company's Dunston power station, a combined re-heating and regenerative cycle was adopted in conjunction with the same initial and terminal conditions.

The North Metropolitan Electric Supply Company have nearing completion a 53,000 kw. capacity plant, operating on a 2,000 lb. g. 950 deg. F. re-heating and regenerative cycle.

The London Power Company are also extending the Battersea station with a 100,000 kw. capacity plant designed to operate on a 1,400 lb. g. 965 deg. F. straight regenerative cycle. The 85,000 kw. low pressure section will also be capable of operating on the existing boiler plant designed for 600 lb. g. 350 deg. F. feed. This scheme should be commercially very successful, as it allows of the maximum output being installed on the site, and also of a maximum flexibility between new and existing plant.

Operating Data and Factors

Usually the spinning reserve in any area is limited to a maximum of 15 per cent. On the other hand the plant in individual stations might be run at from 85 per cent to the M.C.R. load depending on the local conditions in that area.

Superposed Plants

The commercial operating conditions under the national scheme have to date not been conducive to the wide application of superposed plants. Investigation has established that, in general, superposed plant must be justified on a commercial rather than on a heat consumption basis.

Steam Generating Plant—Trend of Design

Before proceeding with any remarks regarding the trend of design, it is considered necessary, first, to establish that the standard designs of 650 lb. boiler plant have proved extremely flexible. When fitted with either pulverized or retort firing equipment, these boilers have demonstrated that they may be loaded or unloaded at the rate of 20 per cent per min. without interfering with the natural circulation.

It would appear that the trend in boiler design to meet the ever increasing pressures, may be broadly divided into two sections: (*a*) the continued use of natural circulation and (*b*) the adoption of forced circulation systems.

(*a*) Natural Circulation Types

The adoption of a high head design where the cross drum is located at a high elevation relative to the furnace and convection tubes in a straight tube boiler design. In addition to improving the natural circulation, the design provides a very straight path for the gases, which should materially improve the availability factor in service.

An alternative design known as the Cantieny boiler embodies a special circulating system. Intermediate headers are provided to separate out the steam bubbles generated in the furnace water screens. Further, the water is fed to the furnace screens throughout the whole length of the main boiler drum.

(*b*) Forced Circulation Types

(i) The Loeffler system, which is designed for approximately 2,000 lb. operating conditions, employs a steam circulating pump which drives saturated

[1] Professor of Mechanical Engineering, University of Alberta, Edmonton, Alta.

[2] Chief Engineer, Central Electricity Board, London, England.

steam through the tubes forming the furnace walls (i.e. a radiant superheater) and the convective superheater located in the first pass of the boiler proper.

(ii) The Lamont system where the water from the main drum is forced through the water walls of the furnace by means of a separate circulating pump. The London Power Company have installed the largest boiler in the world of this type in their Deptford West power station extensions, for a duty of 400,000 lb. per hr.

(iii) The Velox boiler where the water is circulated at high speed through evaporator tubes forming the water wall of a combustion chamber. This boiler has to date been developed to be suitable for firing with any liquid or gaseous fuel, and the company are making intensive research to its application with powdered fuel firing. Although to date no Velox boilers are installed in the power stations in Britain, solely on account of the high price of fuel, it has been successfully applied on the continent and in New Zealand in conjunction with water power development schemes. The boiler is capable of being raised from cold to full output in a period of 4-5 min.

Manufacture

Due to the continued research into the science of welding, manufacturers are prepared to offer welded drums for pressures up to, and in some cases over, 650 lb. per sq. in. pressure.

Louis Elliott[3]

The writer has been much interested in the author's paper on Canadian steam development, and feels that he has rendered a service to the American engineering fraternity, in summarizing conditions and current practice in Canada.

The amount of electrical energy generated by Canadian plants has been increasing rapidly, more than doubling during the last decade as compared with about one half that rate of growth in the United States—although in the latter country, generation trebled during preceding ten years. Canada shows an extraordinarily high average energy consumption—1,950 kw.h. per capita. This reflects low average energy rates and high industrial and residential use, as well as enterprise put into development of load. It would appear that in a number of districts, established rates favour residential consumers at the expense of other classes of business.

The author brings out the wide spread in cost of energy for residential service in Canada—varying from about 1 cent up to nearly 8 cents for the different regions. This wide range emphasizes the irrationality of any general "yardstick," for determining reasonableness of rates. Another question as to applying a "yardstick" arises from difference in incidence of taxation under various conditions: for instance, Professor Robb points out that for commercial stations, taxes in 1935 amounted to nearly 21 per cent of total expenses, whereas for municipal plants taxes accounted for only about 1 per cent of total expense.

Canada is magnificently endowed with water power resources, in many parts of its great territory, and future prosperity will doubtless be bound up with the utilization of this hydraulic power. It is not improbable that during the next few decades commercial and technical developments will demand tremendous blocks of electrical energy, for chemical and related industries. To fulfil such a demand, Canada will be most favourably situated.

With this in view, and considering also the occurrence and character of Canadian coals, it is probable that steam generation will continue to play a relatively minor part. Whereas in the United States steam power is much more important than hydro-electric, and new hydraulic plants will be developed more for peaking or relatively low-load-factor service, steam stations in Canada, in the sections with large water powers available, will probably continue to supply kilowatts rather than kilowatt-hours. The author cites a capacity factor in 1934, in Canada, equivalent to about 4,000 kw.h. per kva. of hydro-electric capacity, and about 1,300 kw.h. per kva. of steam installation.

The author points out that at the present time Canadian steam stations "do not occupy a favourable position on the basis of thermal efficiency." This condition is perhaps to be expected, as a very large proportion of total energy production in Canada has been by hydraulic plants, and highly efficient steam plants can seldom be justified for low capacity factors. In future situations demanding large thermal plants to carry base load, Canada will find it worth while to provide highly efficient steam capacity.

The author, by charts and in discussion, brings out in striking fashion the rapid increase in fixed charges per unit of output, as load factor drops. This is a condition which seldom receives the attention to which it is entitled.

Generous supplies of lignite are available in a number of districts in Canada. For high-moisture high-volatile fuel similar to the Canadian lignite, experience at Trinidad station of Texas Power and Light Company has proved that a pulverized coal plant can be made successful and economical. It is therefore to be expected that as larger steam plants are built in Canada, utilizing lignite as fuel, the pulverized coal method of burning will be adopted in a larger measure.

The author cites the advantages of "topping" extensions, which have been quite "fashionable" in the United States during the past two or three years. It is the usual experience that these superposed extensions, which are rather expensive per unit of capacity, are economic only when capacity factor of superposed and corresponding low-pressure units can be made very high. It is seldom that a "topping" extension can be justified by fuel saving alone.

Common practice in the United States, for a good-sized steam development, is to use 1,200 lb. (or higher pressure) 900 to 950 deg. F. for a superposed installation, and 850 lb. 900 deg. F. or 650 lb. 825 deg. F. for a condensing unit. For smaller plants and low-load-factor service, 400 lb. 750 deg. F. or lower steam pressures and temperatures are still used.

J. A. Powell[4]

The writer most heartily endorses the use of a load duration curve in studying the plant requirements and detail studies of the component equipment before actual design is begun on a plant to eradicate prejudices and pet theories.

On a growing system requiring additions from time to time there is no such thing as a fixed set of operating conditions. The new unit or plant always takes the primary load and other units or plants take their position in the system loading according to their respective fuel costs. A new addition may have a load factor of 75 to 80 per cent to start with yet later on in its life its load factor may drop to 10 to 25 per cent.

It is the writer's opinion that no plant can ever be discarded for reason of obsolescence. Boilers may have to be replaced due to age and poor efficiency, but these can be replaced by ones of higher pressures and the installation of a topping turbine, which gives the plant a new lease on life. If the load factor on the plant does not justify top-

[3] Consulting Mechanical Engineer, Ebasco Services Inc., New York.

[4] Vice-President, E. M. Gilbert Engineering Corporation, Reading, Pa.

ping, efficient new low pressure boilers may be added as a more economical step than building a new plant.

In some systems the primary unit may operate for 8,000 hr. per year, while peak and stand-by units may operate only from 500 to 600 hr. per year.

For these reasons the interest of the designing engineer should be cost per kw.h. including fixed charges, fuel, labour and maintenance and not B.t.u. per kw.h.

The attached duration curve was actually used in the study of a system in which 1,400 lb. pressure boilers and a 20,000 kw. topping turbine exhausting at 250 lb. was to be installed. This system had four plants utilizing pressures of 1,400, 350, 250 and 200 lb. gauge boiler pressure.

The installation of the 20,000 kw. topping unit in plant "B" was the most economical of several plans considered for providing additional power to this system and replacement of boiler equipment unfit for longer use.

System Plant Capacity—Hours Use and Generation

	Capacity kw.	Hours	Kw.h. annually
Station A	......	8,010	322,000,000
Station B			
Unit No. 2	30,000	8,000	148,000,000

			1,120,000,000

G. A. Gaffert[5]

This paper appears to be a very thorough and detailed presentation of the power situation in Canada involving considerable technical information on the performance of Canadian stations and an admirable comparison with stations in the United States and Great Britain. Unfortunately, the author has not chosen some of the really outstanding stations in the United States in making his comparisons on economy, and several stations such as the Port Washington, South Amboy, State Line and Richmond stations, would give a somewhat different picture. Also the English stations cited have higher steam pressure and temperature conditions and compare more nearly with the following American stations:

Station	Pressure and temperature	Average heat rate—1936
Edgewater	600—835 deg.	13,840
Trenton Channel	390—710 deg.	13,800
Michigan City	650—750 deg.	13,300
Richmond	400—670/800 deg.	13,300

It would seem that the Canadian plants have not taken full advantage of the extraction cycle in that only two heaters are used in the average plant and a maximum of three extraction heaters are used in one plant. It is our experience that when fuel is costly, i.e., 20c. per million B.t.u., three or even four extraction heaters are economically advisable, as it is possible to pay for these heaters in a relatively short time out of annual fuel savings.

The author's comment about the elimination of slag screens is not quite correct, as practically all of our large boilers still have slag screens for the definite purpose of preventing slag from entering the superheater sections or more remote parts of the boiler, which it would be rather difficult to clean by hand. Reference might particularly be made to furnaces at West End, Columbia, and Fisk stations, wherein slag screens play a very important part.

It also seems that where fuel transportation is high, a condition that prevails in Canada, more development work should be encouraged on the burning of local lignite deposits. Even though the boiler efficiencies obtainable would not be of the order obtained with bituminous coal, the lower fuel cost should, in the long run, produce lower power cost.

The author's comment about erosion of turbine blading is also rather interesting, for several American manufacturers are now resorting to Stelliting on turbine blading for the purpose of eliminating erosion on the last stages operating in the moisture zone.

The author notes that condensing surface has been reduced to a rather low figure of .562 sq. ft. per kw. This is a rather dangerous conclusion to reach, for although Canada is favoured by cold condensing water, many condensers located in warmer climates must use larger surfaces to attain higher vacuum. In other words, it is necessary to provide either greater surface or more circulating water to obtain equal vacuum with warmer water.

We also feel that there is a definite tendency toward a unit plant but the conditions of reliability for any one system have not yet approached a status where a one boiler, one turbine plant is generally accepted as being the logical line of future development.

[5] Mechanical Engineer, Sargent and Lundy Engineers, Chicago, Ill.

John M. Drabelle[6]

The author has made a very valuable contribution to the science and art of the steam power generation and as in the tabular data furnished a most convenient review of practices in reference to new steam power developments. Since the date on the Cedar Rapids station was originally furnished the equipment has gone into regular operation and while at this writing no tests have been made the following observations will be of interest.

No difficulty of any kind has been experienced with inner water wall which divides the main furnace into two separate furnaces. There seems to be a decided cooling effect from this wall and as a result very little slag has accumulated on the first row of tubes that look at the fire.

In respect to the water-cooled stoker no operating difficulties of any kind have developed, but certain changes have been made by the manufacturer, the American Engineering Company, in the pushers in order to get a more uniform distribution of coal over the active surface of the stoker. Over-fired air is now available as well as preheated air and smoke difficulties are being rapidly eliminated.

In respect to the turbine which is of the topping type, no difficulties whatsoever have been experienced with the unit. The pressure control which is of the bellows type and makes use of an orifice has given excellent control of the unit. No difficulty has been experienced in connection with any of the piping. This being low carbon moly steel.

The only difficulty that has been experienced has been with the boiler feed pumps which have caused some difficulty and have occasioned outages.

[6] Mechanical and Electrical Engineer, Iowa Electric Light and Power Company, Cedar Rapids, Iowa.

A. K. Spotton[7]

There is one point not mentioned in the paper relative to the utilization of small power plants using reciprocating engines exhausting into low pressure turbines. Some recent installations show that such combinations give high efficiency; in one British unit of this type, about 20,000 lb. steam per hr., 5.9 lb. per B.h.p.

Professor N. M. Hall, m.e.i.c.[8]

The author is to be complimented on his concise presentation of a mass of information on the state of power generation by steam in Great Britain, South Africa, United States and Canada.

The situation in Canada stands out in bold relief on account of the small size and generally poorer thermal performance.

The wide use of water-generated power has delayed the development of Canadian steam stations in the provinces blessed with abundant water power. But as the economical sites are developed, the steady increase in energy requirements will necessitate co-ordination with new fuel stations to pick off peak loads. This will be followed by their assuming more and more firm power. The author has outlined the trends in the design of such stations in the light of developments in less favoured countries.

The relatively good thermal performance of British and South African stations, raises the question as to whether their records are based on lower calorific values; which would give them an unduly favourable comparison with North American stations, where the gross value is used.

Although in many provinces coal prices are relatively high, this is somewhat offset by the lower weighted average temperature of circulating water. This however is of lesser importance with the increasing use of the regenerative cycle.

The recent development of high pressure boilers and low heat drop turbines exhausting into existing station headers, should find many applications in Canadian practice.

The broad bibliography and comprehensive tabulation of installed equipment and operating data, add greatly to the value of the paper. The absence of several provinces from this tabulation sharply indicates that they have been amongst those favoured by abundant and cheap hydraulic power.

S. R. Parker[9]

There has been a great amount of discussion on the proper methods of burning coal and the associated question of the proper design of the furnaces and grates for the most efficient use of the coal within contiguous and economical freight hauls from present or proposed plant sites.

While great improvements have been noted in the last 25 years in this connection, which have resulted in the cutting of coal used per kw.h. generated by more than one-half, the progress, when we take into account the great number of steam plants that we have, does not seem to be as great as it might have been. Actually, there are 250 steam-electric generating plants as compared with 316 which are driven by water turbines. This lack of progress is stressed by the author in his conclusions where he states that "thermal performance of Canadian steam-electric plants does not compare favourably with that of plants of comparable size in other countries." This aspect of the situation is worthy of very careful analysis and is a challenge to all Canadian engineers engaged in this phase of the work in view of the fact that the potential coal resources of Canada are great as compared with other sections of the world and generally speaking available water resources in the coal areas are reasonably distant from centres of population.

Wide variations, as far as burning characteristics are concerned, of the coal available are possibly a contributory factor to the poor results obtained and this would seem to reflect, to some extent, on the ability of the design engineers to provide the correct design features which are most suitable for the coal characteristics within contiguous and economical freight haul of the plant location. In fairness, however, it must be conceded that the design engineer has been severely handicapped in co-ordinating design to obtain the best efficiency results by not having available for his use observed data on combustion results taken by trained observers.

The main responsibility for this situation largely rests with the executives of the operating companies who have shown a tendency in the past to consider their steam power plants as units in which maximum efficiency and continuity of service were not compatible terms. It is hoped that the interest taken in these papers and the missionary work done by certain eminent engineers in this line of endeavour will result in steam power plants being considered as complex operating units where, by proper co-ordination of technical skill with manual dexterity and operating experience, continuous service and economical operation are both practical and possible. The situation has been aptly summarized by Prof. A. G. Christie in his paragraph on "Personnel of Boiler Plant" in his paper read before the American Institute of Mechanical Engineers in September, 1936 in which he states that:

> "Nowhere in the power plant has there been a greater change in the type of operator than in the boiler room. Turbine efficiency is largely fixed by the original design, but boiler room efficiency is only secured by constant vigilance. Hence highly trained, intelligent, alert men are needed for economical operation of this section of the plant in contrast to the strong-backed coal passers of former years."

A comparison of the operating, and particularly, supervising staff in Canada and in other countries, employed in the power industry will indicate that during the past 25 years Canada has not progressed to the same extent as other countries in recruiting and training staffs to secure the constant vigilance necessary to obtain the greatest efficiency from the equipment produced by the design engineer.

While holding no brief for the design engineer the writer considers that he is not in a position to produce the best design for the local conditions unless he has available operating data taken by trained observers to enable him to co-ordinate this with his theoretical knowledge in order to produce the best design to comply with reasonable operating conditions that have to be met.

Due to the scattered nature of the plants and the varying conditions in almost every location with respect to coal characteristics and service requirements unless operating officials co-operate and supply the design engineer with accurate observed data, Canada cannot hope to approximate the thermal performance of comparable size plants in other countries. In other countries they have insisted for some considerable time on dividing their operating staff into skilled technicians and artisans. One group is responsible for obtaining maximum efficiencies from the equipment placed in their charge at lowest costs whereas the other group is required for its manual dexterity and experience in maintaining the equipment in first class operating condition.

It is very seldom that men who start in the second

[7] Advisory Engineer, Babcock-Wilcox & Goldie-McCulloch Limited, Galt, Ont.

[8] Professor of Mechanical Engineering, Department of Engineering, University of Manitoba, Winnipeg, Man.

[9] Engineer, Saskatchewan Power Commission, Regina, Sask.

category in a plant obtain promotion to the supervisory group unless they already have had, or later obtain, technical experience; until a similar policy is adopted in Canada our plants, with brilliant exceptions, are not likely to compare favourably with those in other countries even though the latest features of design are embodied in the original installation.

It is obvious that progressive modifications in design details must be continually tried and discarded or adopted, based on observed operating data and the theoretical development of the art, if plant extensions or new plants are to show progressive improvement in conformity with local conditions which govern.

The paper presented in June by Mr. Bull on "Experience in Burning Western Canadian Coals," brings out very forcibly results that can be obtained by application of scientifically observed results to the latest theoretical data on design to develop a plant to give minimum operating costs with maximum efficiencies and low capital investment.

When it is fully realized that coal burning is not a manual process but a scientific art and plants reinforce operating staffs with necessary technically trained men, one may expect to see:

(*a*) progressive development in the design features for the scientific burning of the various coals;
(*b*) improvement in overall station efficiencies;
(*c*) a material reduction in capital investment due to co-ordinated and scientific layouts.

R. S. Griffith[10]

In the author's paper in the first paragraph on page four, the remarks contained therein would stand clarification. A new condensing turbine rated at 7,500 kw. 3,600 r.p.m. complete with feed water heating evaporator and condensing equipment supplied with steam at 400 lb. g. 630 deg. total temperature, was placed into operation last April. A few months ago the topping turbine above referred to was placed into operation at the No. 3 power plant. You will doubtless agree that the paragraph referred to does not bring these facts out very clearly.

In view of the author's conclusions as stated on page 8, paragraph 6, the Dominion Steel and Coal Corporation have been requested to supply up-to-date figures regarding the performance of Seaboard Power Plant. There is no doubt that the B.t.u.'s per kilowatt hour in this plant have dropped considerably.

R. G. Edwards[11]

Although this paper does indeed give a history of development and performance, the canvas is so large that for specific information which would be of use to a designer or operator, one would have to go back to the source material.

In discussing the Regina and Edmonton additions, reasons for the choice of the particular units with supporting data would be invaluable.

Steam and power costs, while they are popularly supposed to rest upon a firm engineering and economic foundation, usually contain enough variables to make comparisons useless unless one is familiar with the conditions.

To use Regina as an illustration it is understood that this plant is an outstanding performer. What evidence is there to support this? Was the industrial use of back pressure steam considered? In a city like Regina, where an acute winter heating load exists, district steam heating and air conditioning should indicate a market for exhaust steam at moderate pressures.

With regard to the steam plant at Comeau Bay, a great deal of interest attaches to the combination boiler set up; while the figures given by the author for the fuel value of paper mill refuse are generally accepted, they do not have any real bearing on the situation. It is known in the paper industry that the moisture content of the bark for instance is only one factor. Realization of design figures will depend on the amount of screenings, sawdust and other refuse, and on whether the pulpwood has been in salt or brackish water for any length of time. Specific information on this one operation would be of immense value to members in the pulp and paper industry.

Fuel cost for the various stations are very pertinent figures. It would be interesting to know how the B.t.u. values were arrived at. By this the writer means where and how are the samples taken with respect to the stations in question, and what facilities are used for the analysis.

Minto, N.B., shows a cost of 15.19. This would lead one to believe that the Minto field has inducements to offer well designed plants using this fuel. There are two criticisms of this. Isn't there a doubt as to the available tonnage for steam raising purposes and what are the figures for plants using this fuel at a distance from the mines? At least one plant in Quebec has used this coal for test purposes and plants in New Brunswick were using this fuel on powdered coal installations prior to its use at Minto.

A. D. Harrison, m.e.i.c.[12]

The author's paper on Canada's steam-electric power plants deals very comprehensively with the subject giving mainly the results obtained from central generating stations. A similar summary of the results from by-product steam power plants as installed in the industrial field would be of interest.

Such are mainly associated with paper mills, sugar refineries and textile plants.

By the introduction of modern high pressure boilers this by-product power assumes worth while proportions and combined with the higher efficiency of such boilers remarkable savings can be shown in the cost of steam and power.

A recent installation for instance in a paper mill having a daily output of 500 tons is obtaining an average of 8,600 kw. in by-product power from steam or approximately 64,000,000 kw.h. per annum, which is higher than any central station output in Canada with the exception of the Seaboard plant at Glace Bay.

This by-product power is being obtained at a B.t.u. rate of less than 4,000 as against 19,000 B.t.u. per kw.h. realized at Seaboard.

G. C. Derry[13]

The writer wishes particularly to comment on the section headed "Fly-Ash Handling and Disposal."

The writer cannot agree with the efficiency of collection given for the cyclone type of collectors, unless the percentage of ash is given for each size of ash particle. There is no doubt that the cyclones will collect 70-90 per cent of the larger material, but I am afraid that I cannot agree with the statement that cyclones of newer design will collect "almost 100 per cent of all larger than 325 mesh." This should be broken down into collection efficiency for the various sizes of sieve.

One very interesting way of collecting the finer ash which results from the combustion of powdered coal is that of gas scrubbers. The Boston Edison Company have such an installation in their Kneeland Street central heating steam plant. These scrubbers have been used in connection with their three boilers. Each boiler has a capacity of about 250,000 lb. of steam.

[10] General Manager, Swiss Electric Company of Canada, Montreal.
[11] International Paper Company, Dalhousie, N.B.
[12] Engineer, Ontario Paper Company, Thorold, Ont.
[13] Vice-President, B. F. Sturtevant Company, Boston.

The scrubber consists of a cylindrical shell lined with corrosive proof brick, nozzles are located in a central manifold and the gas is caused to enter the shell tangentially and spiral upward where it is discharged to the fan.

The sludge is removed at the bottom of the cylinder into a rubber lined steel cone where it is syphoned off to receivers in the lower part of the power station.

Such a device has proved to be very efficient and tests show a recovery of 95-98 per cent of the fine ash, most of which will pass through a 325 mesh screen.

The fact that this station is located in the heart of a Boston business district, and has been operating for several years, without a complaint from the neighbouring buildings, shows that it has been a complete commercial success.

Another interesting device is that of a collecting system located inside of the inlet box of the fan. This serves to concentrate the ash in the outer periphery of such an inlet box where it is skimmed off into a collector. While this does not have the same high efficiency as the electric system or the scrubber, yet it has proved to be a very effective means of ash collection and relatively inexpensive.

The writer was impressed with the fact that in the Maritime Provinces they burn coal having a high ash content of 20 to 24 per cent. High ash is a distinct menace to the operation of induced draft fans. A few years ago when the pressures were low this high ash content did not play such an important part. Now that greater capacities are demanded from the boilers, and the fact that higher resistances are imposed upon the system by reason of air heaters, economizers, etc. it requires that the fans run at very much higher rotative speeds which consequently increase the erosion on the blades of the fans at tremendous rates.

This is entirely dependent upon the kind of coal used and the amount of ash resulting from its combustion. Anything in the nature of 20-24 per cent ash being handled by fans that are operating at tip speeds over 8,000 ft. per min. present a very difficult operating problem. There have been found cases where the fan blades have eroded through in less than one month. When coal of this character is used great care is taken in the selection of fans and this feature should be called particularly to the attention of the fan manufacturer so that it can be taken into consideration when the fans are selected.

F. E. M. Thrupp[14]

The author has indicated that dust catchers of the cyclone type are less costly but less efficient than electrostatic precipitators. The difference in the cost is considerable as an electrostatic precipitator normally costs more than one dollar per cubic foot of gases per minute, whereas the cyclone type costs less than one quarter of this figure. The advantage of electrostatic precipitators due to their lower draft loss can be considered to be offset by the complications due to the use of electricity at a very high voltage, but the high efficiency of the electrostatic precipitator is certainly a point in its favour where money is available for the attainment of freedom from the most minute particles of dust in the smoke.

Normally very fine particles, having a low settling velocity, are carried away such distances before reaching the ground that the concentration becomes negligible. It is only the particles larger than 325 mesh which cause a nuisance and practically all these, as stated by the author, can be separated out with a cyclone collector that is designed on aerodynamic principles.

John Blizard[15]

The author has presented some interesting tabulations which show the capacity and performance of steam-electric power plants. But whether he is justified in drawing the conclusion that Canadian power plants compare unfavourably with those of similar size in other countries is dubious.

For the most part the stations in the United States and in England are larger, and larger stations are able to employ more technical men both in planning and in operating the plant. If a power plant is to be efficient it must not only be properly designed but it must be operated by those who have a thorough knowledge of the heat balance and see that this balance is maintained at its peak throughout the year.

It is no simple matter to compare the performance of two plants. For example, two plants may have identical equipment, the same load factor and the same temperature in the cooling water. Yet one plant may have cooling water which rapidly causes the condenser tubes to foul and so materially reduce the vacuum and efficiency, while the other plant may have clean cooling water.

Even the load factors are insufficient criteria of the type of load. One plant, which is on a system with a good load factor, may not know when it will be called on to deliver power and have to operate two turbines with its boilers to be ready for the load, while another plant on the same load factor may be able to rely on receiving ample warning of an anticipated increase in load and so operate only on one turbine instead of two.

Should there be a call in Canada to design and install a power-plant of a size comparable to the larger plants now installed elsewhere, the most efficient and expensive plant may not necessarily be installed but the selection will no doubt fall upon one that serves its purpose with real economy.

The Author

The author wishes to express his appreciation for the contributions which have been made to the discussion by leading authorities in the field of steam power. These contributions are worthy of serious consideration by Canadian engineers who are responsible for the design and operation of steam-electric power plants and co-operation with neighbouring power systems.

Mr. Wright has presented a valuable commentary on present-day practice in Great Britain in regard to power station development, design features, and policy in dealing with industrial aspects, which will be appreciated by Canadian engineers. He refers, in the main, to superstations having a capacity in excess of 50,000 kw. However, experience has shown that the practice in the smaller stations follows the lead given by the developments in the larger stations.

Mr. Elliott has succeeded, with charming brevity, in bringing out the main facts of the paper. His comment, that "in future situations demanding large thermal plants to carry base load, Canada will find it worth while to provide highly efficient steam capacity" is significant. The argument would seem equally good when applied to extensions. New turbines are usually operated at a high capacity factor for the first few years and the older units are relegated to peak load service for which efficiency is of less importance than continuity of service. The prediction that "as larger steam plants are built in Canada, utilizing lignite as fuel, the pulverized coal method of burning will be adopted in larger measure" is well founded in view of the successful experience at the Trinidad and Moose Jaw stations. The manifold advantages of this method of firing have been too well established in recent years to require repetition.

Mr. Powell has adopted a happy phrase in the expression "to give the plant a new lease on life." The reference, of course, is to the application to low pressure plant of a topping turbine and when necessary, due to

[14] Manager for Canada, The Buell Combustion Co. Ltd., Hamilton, Ont.

[15] Consulting Engineer, Foster Wheeler Corporation, New York.

poor efficiency, replacement or reconstruction of old boilers. It has been stated that when the objective is a reliable supply of power at minimum cost, the dollar is always the denominator. The graphical representation of "Load Dispatching on System Duration Curve" provides a fine example of the precision, not too generally realized, with which such studies can be carried out.

Mr. Gaffert has raised a point in regard to comparative performance which the author is glad to clarify. As explained in the note at the bottom of page 9 (which refers to the British stations reported in Table I, page 13), the author's intention was to deal with stations having a capacity of 50,000 kw. and under as distinguished from the larger super stations. Thus, the data set out in graphical form in Fig. 1 is limited to stations of a size comparable with Canadian stations. It will be noted that five of the American stations selected in this class show a better thermal performance than those of other countries.

Mr. Drabelle has reported the successful application of two novel developments in steam-generating plant at Cedar Rapids—the inner water wall, which divides the main furnace into two separate furnaces; and a water-cooled underfeed stoker. Test results from these units will be awaited with interest.

Mr. Spotton has referred to the superposition of reciprocating engines which exhaust into low pressure turbines of small power plants. The application would presumably apply to units of 500 kw. or under, in which reciprocators may compete with turbines, and to low pressures, since even a small quantity of engine lubricant in the condensate presents difficulty in the operation of high pressure steam-generating plant.

Professor Hall's predictions with reference to the co-ordination of hydro with fuel stations are encouraging and augur a brighter future for steam-electric plants in Canada.

The author agrees with Mr. Parker that, when fuller advantage is taken of the present state of the art of station design and operation, improvement in overall station efficiencies may be expected.

The author is indebted to Mr. Griffith for clarification of the text in regard to the turbine units of the Dominion Steel and Coal Corporation. It has been stated that the reducing valve which serves the topping turbine is particularly quiet in operation.

Messrs. Edwards and Harrison have presented a number of interesting engineering problems from the pulp and paper industry which might well serve as a basis for a symposium on thermal problems in this industry. The heat rate of 4,000 B.t.u. per kw.h. for by-product power suggests useful possibilities. Fuel costs are calculated on the basis of heating value of the coal in B.t.u. per lb. and the average cost of coal per ton.

The comments of Messrs. Derry and Thrupp on "Fly-ash Handling and Disposal" provide a welcome addition to the discussion.

A hopeful avenue for improving the situation in Canada would be to encourage the bringing together, into a sort of Prime Movers Committee, of engineers who are concerned with the design of steam power plants to discuss matters among themselves with a view to exposing the operating troubles and generally to exchange ideas as is done successfully elsewhere. The position in Canada seems to be that engineers of municipal stations, commercial stations, and the pulp and paper mills, etc., get together, but in separate associations, and no one group in in a position to expose, by comparison, the whole picture. The proposal would facilitate the interchange of operating data, quicker acceptance of novel developments, impartial consideration of plans for interchange and mutual assistance in emergencies, and bring the thermal performance of our Canadian stations more in line with that of stations of comparable size in other countries.

Joint Dinner of the Councils of The Engineering Institute of Canada and the Association of Professional Engineers of the Province of Ontario Held at Toronto, April 22nd

Head Table, left to right, Prof. R. W. Angus, HON.M.E.I.C., Dr. A. Surveyer, M.E.I.C., Dr. A. H. Harkness, M.E.I.C., Brig.-Gen. C. H. Mitchell, M.E.I.C., J. B. Challies, M.E.I.C., E. P. Muntz, M.E.I.C. (chairman), Dr. J. M. R. Fairbairn, M.E.I.C., A. D. Campbell, M.E.I.C., Dr. O. O. Lefebvre, M.E.I.C.

THE ENGINEERING JOURNAL

THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

"To facilitate the acquirement and interchange of professional knowledge among its members, to promote their professional interests, to encourage original research, to develop and maintain high standards in the engineering profession and to enhance the usefulness of the profession to the public."

VOLUME XXI JUNE, 1938 No. 6

The Maritime Visit

The outstanding lesson learned by the delegation from Headquarters which recently had the privilege of conferring with the four most easterly branches of The Institute, is that there is an urgent need for some means of bringing Headquarters into closer and more continuous contact with the management committees of the branches. Theoretically, this should not be difficult because every branch has at least one representative on Council. Unfortunately, however, Council is so widespread, funds for transportation are so limited and distances so great, that the far-away branches are rarely able by personal contact to keep in intimate and immediate touch with Council business. While the situation can be greatly relieved by more detailed Minutes of Council discussions, and particularly by their wider dissemination, an annual visit of a party from Headquarters is perhaps the most acceptable means of meeting the growing demand from the branches for a greater "say" in the shaping of Institute policies and in the carrying out of Institute programmes.

The President and his party, which consisted of Vice-President McCrory, Councillor Newell and the new General Secretary, were surprised and delighted with the marked interest which the members of executive committees, and also the rank and file everywhere exhibited in all the matters which have been and are now being dealt with by Council. Well advised of this deep interest by his immediate predecessor Mr. Desbarats who, during his term of office conferred with practically every one of the 25 branches, President Challies has, wherever possible, acted as host at round-table luncheon conferences with branch officers, their committees and the senior local members of The Institute. At these conferences full opportunity has been afforded interested local members to discuss any matter of Institute business. Not only have these Maritime consultations been informative to the local members, but they have been very illuminating to the delegation from Headquarters. The General Secretary has found them an invaluable aid to a proper understanding of The Institute's problems, and perhaps what is of timely significance, they have indicated many possibilities for a more enhanced usefulness to the general membership, of the Headquarters secretariat.

The one matter which more than all others interested the members everywhere was the progress that is being made in establishing closer co-operation with the Provincial Professional Associations. It was therefore fortunate that the President was able to have with him the Chairman of the Council's Committee on Professional Interests. That Mr. Councillor Newell was able to speak reassuringly of the proposals for an early agreement under the new enabling By-law No. 76 in so many of the provinces gave great satisfaction everywhere.

No account of the Maritime pilgrimage would be complete without reference to the loyal support of the branch officers everywhere, to The Institute, their solicitous interest in the Secretary Emeritus, their encouragingly friendly attitude to the new General Secretary and their whole-hearted desire to do honour to the President and his party. Such experiences are an inspiration to all who are privileged to share them.

Supply and Demand

Attention is directed to a report published in this issue dealing with supply and demand in relationship to engineers. The report has been prepared for Council by Past-President F. P. Shearwood, and since its presentation has been the object of much discussion and favourable comment.

Council felt that the subject was of such importance and that the report was so clear and comprehensive in spite of its brevity, that further publicity should be given to it. Consequently by motion it was decided to place the report before the membership at large, through the medium of The Journal, and to bring it to the attention of universities, Ministers and Deputy Ministers of Education and such others as might be interested in the education and welfare of the young engineer, and to invite comments from all these sources. It is only right that leadership in such matters should come from The Engineering Institute of Canada, and it is hoped that our readers will give the report careful consideration. It deals with a subject that is vital to coming generations of engineers, and points a way which may lead to the solution of the problem of employment for the graduate.

Innovation

Something absolutely new in the affairs of The Institute occurred at the May meeting of Council. For the first time in the history of that body a woman was elected to corporate membership. The new member is Elizabeth Muriel Gregory MacGill, assistant engineer of one of Montreal's aircraft factories. Miss MacGill is a Bachelor of Applied Science of the University of Toronto, and a Master of Science in Engineering of the University of Michigan, and has done two years graduate study at the Massachusetts Institute of Technology towards her Doctorate. She is also an Associate Fellow of the Royal Aeronautical Society.

Her home is in Vancouver where her father is a well known lawyer, and her mother is Judge of the Juvenile Court, holder of an Honorary LL.D. of the University of British Columbia and a Bachelor of Music of the University of Toronto.

Recently Miss MacGill read a paper before the Ottawa Branch on "Simplified Performance Calculations for Aeroplanes," in which she showed by the use of logarithmic curves how to determine in simple manner the ceilings and high speed, climbing speed and the maximum rate of climb at any altitude for any aeroplane. We are informed that the paper reflected great credit on the author and made a definite contribution to the art of flying.

The Journal is pleased to make acknowledgment of Miss MacGill's election to Associate Membership, and to congratulate her on her high academic standing and her practical knowledge in this complicated field. We wish her great success in her future endeavours.

The President and Party's Visit to Sackville

Standing—F. Binns, A.M.E.I.C., C. F. Johns, Jr.E.I.C., H. W. Read, A.M.E.I.C., J. F. MacKenzie, A.M.E.I.C., L. A. Wright, A.M.E.I.C., G. T. Medforth, A.M.E.I.C., Prof. F. L. West, M.E.I.C. Seated—Dr. G. J. Trueman, J. B. Challies, M.E.I.C., Prof. H. W. McKiel, M.E.I.C., F. Newell, M.E.I.C.

Presidential Activities

The President accompanied by Vice-President J. A. McCrory, Councillor Fred Newell and the General Secretary has completed his visit to the Maritime branches. The itinerary included Halifax, Sydney, Sackville, Moncton and Saint John. The party left Montreal on April 29th and arrived back on May 7th, covering in all a distance of two thousand miles. A further reference to the journey will be found on the editorial page.

Some of the highlights are described briefly herewith:

Halifax:—

The unique banquet on April 30th at the Nova Scotian hotel, graced by the presence of ladies, and followed by after-dinner wit and oratory that would have done credit to Ottawa at its best;

The five-hour Maritime meeting of Council on May 1st, including the President's luncheon at which six Councillors and nine invited guests were present;

The delightful Sunday afternoon tea and reception of the President and Mrs. Challies at the Lord Nelson hotel, to which came many members of the Institute and of the Association of Professional Engineers of Nova Scotia and their ladies; also several distinguished guests including the Premier and Mrs. Angus MacDonald, the immediate past president of the Canadian Institute of Mining and Metallurgy, the Hon. Michael and Mrs. Dwyer. Approximately 125 people were in attendance.

Sydney:—

The very friendly informal gathering on the 3rd of the Sydney Branch members in the cozy library quarters which they share with the local members of the Canadian Institute of Mining and Metallurgy.

Sackville:—

The unexpected, but all the more enjoyable luncheon party at Sackville on the 4th, with former Vice-President and Mrs. McKiel and the local members of the Institute.

Moncton:—

The largely attended supper meeting of the Moncton Branch, followed by a frank and profitable discussion of Institute affairs.

Saint John:—

The enthusiastic and well attended annual business meeting of the Saint John Branch on the 5th, which concluded with a banquet and speeches from all the members of the Headquarters delegation; and

Finally, the President's luncheon at the Admiral Beatty hotel on the 6th for the President of the Dominion Council and the Saint John Executive Committee.

On May 13th the Niagara Peninsula Branch held its annual meeting at the General Brock hotel with the President as the guest of honour. The meeting took the form of a dinner function, general business being completed beforehand in order that plenty of time would be available for speeches and discussions.

The following members of the Executive were guests of the President at a luncheon round table conference at which the relationship of the Branch to Headquarters was thoroughly and satisfactorily discussed: L. C. McMurtry, A.M.E.I.C., Chairman; C. G. Moon, A.M.E.I.C., Chairman elect; Geo. E. Griffiths, A.M.E.I.C., Secretary-Treasurer; Councillor W. R. Manock, A.M.E.I.C., Councillor J. A. Vance, A.M.E.I.C., George H. Wood, A.M.E.I.C., Walter Jackson, M.E.I.C., C. G. Cline, A.M.E.I.C., W. D. Bracken, A.M.E.I.C.

The President and General Secretary attended the excellent annual dinner and meeting of the Toronto Branch held at the Military Institute on May 12th. There were many features that made this an unusually interesting gathering, such as the large attendance, the interest in the President's talk about the Institute, the presence of so many representatives of other branches, and the talk on Germany by Wilson Woodside. The out-of-town visitors were Vice-President E. V. Buchanan, Councillors Manock and Vance, Past Vice-President Dobbin, with W. T. Fanjoy, A.M.E.I.C., and A. L. Malby, Jr.E.I.C., secretary and chairman of the Peterborough Branch, and A. L. Killaly, A.M.E.I.C., W. J. W. Reid, M.E.I.C., and A. R. Hannaford, A.M.E.I.C., chairman and secretary respectively of the Hamilton Branch.

The branch executive and certain other prominent members of the Institute were guests of the President for luncheon at the University Club on the same day. Following are the names of those in attendance: A. U. Sanderson, A.M.E.I.C., C. E. Sisson, M.E.I.C., Brig.-Gen. C. H. Mitchell, M.E.I.C., Dr. T. H. Hogg, M.E.I.C., Dr. F. A. Gaby, M.E.I.C., Dr. A. H. Harkness, M.E.I.C., Professor Robert W. Angus, Hon.M.E.I.C., Professor C. R. Young, M.E.I.C., W. E. Bonn, M.E.I.C., Nicol MacNicol, M.E.I.C., W. S. Wilson, A.M.E.I.C., Dr. A. E. Berry, M.E.I.C., H. E. Brandon, A.M.E.I.C., J. J. Spence, A.M.E.I.C., and the General Secretary.

Result of the Ballot for Amendments Proposed to Sections 44 and 51 of the By-laws

We, the undersigned scrutineers, appointed to canvass the ballot for amendments proposed to Sections 44 and 51 of the Institute By-laws, beg to report as follows:

Total Ballots received		1,024
Unsigned Ballots	3	
Members in Arrears	14	
Spoiled Ballots	7	
Total	24

HUET MASSUE, M.E.I.C.,
M. BALLS, A.M.E.I.C.,
Scrutineers.

Meetings of Council

A meeting of Council was held in Toronto at the Royal York Hotel, on April 22nd, 1938, at two o'clock p.m., with President J. B. Challies in the chair, and sixteen other members of Council present. Four past-presidents and one honorary member were also in attendance by invitation of the President.

The Council noted with regret the sudden death of Dr. Adhemar Mailhiot, M.E.I.C., Dean of the Ecole Polytechnique, Montreal, and Registrar of the Association of Professional Engineers of Quebec. The following resolution was passed, and the Secretary was directed to send copies to Madame Mailhiot, the Ecole Polytechnique and the Corporation of Professional Engineers of Quebec:

> "The Council of The Engineering Institute of Canada, assembled in Toronto at a special meeting, on April 22nd, 1938, was shocked to hear of the sudden death of Dr. Adhemar Mailhiot, Dean of the Ecole Polytechnique of Montreal, and valued Member of The Institute. His wisdom, his broadmindedness and his ready helpfulness, have done much to endear him to his friends and associates and to advance the cause of the professional engineer, not only in Quebec but throughout Canada. His loss will be felt very keenly by the Ecole Polytechnique and by all others who were privileged to know him, but particularly by his family to whom the Council wishes to extend this expression of their profound and sincere sympathy."

Lieut.-Col. L. F. Grant, M.E.I.C., was appointed councillor representing the Kingston Branch, replacing J. E. Goodman, A.M.E.I.C., who had resigned.

Announcement was made that Vice-President E. V. Buchanan would attend the International Engineering Congress in Glasgow as The Institute's representative along with Major James MacGregor, D.S.O., M.E.I.C., of Glasgow. A paper on Gas Engineering, by John Keillor, of Vancouver, has been prepared, at the invitation of the Congress, for presentation.

It was decided to send Past-President Shearwood's report on the supply of and demand for technically trained men to public officials interested in the welfare and education of the young engineer.

The chairman of the Publication Committee reported on the committee's plan to revise The Journal. After discussion of several features, including Transactions, the matter was left with the committee for further action and consideration.

It was announced that Dr. Alfred Stansfield, M.E.I.C., had accepted the chairmanship of the Plummer Medal Committee, and had selected the following members to act with him: Messrs. J. R. Dunbar, M.E.I.C., C. K. McLeod, A.M.E.I.C., G. St. G. Sproule, M.E.I.C., and C. R. Whittemore, A.M.E.I.C.

A letter was read from G. A. Gaherty, M.E.I.C., chairman of the Committee on Western Water Problems, recommending the holding of a general professional meeting to discuss the economic utilization of the prairie water supply for increasing agricultural production, and making certain definite recommendations as to the conduct of this meeting. The President reported that he and Mr. Gaherty had visited Ottawa to discuss this matter with the Minister of Agriculture with the object of securing the co-operation of the Dominion technical officers for the meeting. It was reported that the Minister was very sympathetic to the suggestion and agreed to co-operate in any way that would assist in bringing about a betterment of conditions on the prairies. After considerable discussion, it was unanimously decided that this problem would be the main subject for discussion at the next annual general meeting at Ottawa, and that it would be left with the President, in consultation with Mr. Gaherty and the General Secretary, to arrange for the technical papers.

Council accepted with appreciation the invitation of the Managing Committee of the Ottawa Branch to hold the 1939 annual meeting in Ottawa at the end of January or the beginning of February.

Announcement was made of the results of the ballot for the proposed agreement in Nova Scotia which was practically unanimously approved.

The President explained the present status of negotiations between The Institute and the Association of Professional Engineers of Nova Scotia. After a good deal of discussion it was agreed that no further action should be taken by Council until after the special Maritime meeting of Council which was to take place in Halifax on the first of May.

Approval was given to the policy of Council in holding special meetings away from Headquarters whenever and wherever circumstances permitted. It was decided that the June meeting of Council would be held in Ottawa, the date to be determined later.

It was reported that the Canadian Chamber of Commerce had invited The Institute to appoint a representative to the Chamber's National Board of Directors. Mr. F. S. B. Heward was named for the balance of The Institute year.

Mr. McCrory reported on the financial statement to the end of March, calling attention to the fact that expenditures were running very close to the budgeted amounts.

Mr. McCrory also called attention to the small rebates that were received by some of the smaller branches, explaining that in such conditions the cost of some of the branch activities had been paid for out of the pockets of the officers. He recommended that some minimum amount should be set for such branches, irrespective of the number of their members. Council was very sympathetic, and decided to recommend the principle that there would be a minimum rebate of $100 a year, and that the Finance Committee should consider an additional rebate and the conditions which would be attached to it, if it were recommended.

Eight resignations were accepted; reinstatement was granted to one Student, who is also applying for transfer to Associate Member; Life Memberships were granted to four members who had been recommended by their branches; six special cases were considered, and decisions reached in accordance with their merits.

The President reported on the meeting of the Dominion Council of Professional Engineers that had been held in Montreal early in April, at which time he had had the opportunity of entertaining them at dinner. A very satisfactory round table discussion had followed, at which the subject of closer relationships between the Provincial Associations and The Institute was the theme.

The Secretary read a letter from Mr. Busfield relative to the library and employment services of The Institute. Such portions of this as were considered appropriate were allocated to the House Committee for their consideration, and the portion dealing with the employment service was left in the hands of Mr. Busfield and Mr. Heward for a further report.

Past-President Fairbairn and the General Secretary reported on their recent visit to the Secretaries of the Founder Societies in New York. Mr. Fairbairn recommended that close contact be maintained between these societies and the General Secretary, as such relationship would be greatly to the advantage of The Institute.

A report was presented from Professor Spencer, chairman of The Institute's Committee on Membership and Management. The Secretary was directed to send a copy to all members of Council with a request for comments, the report to be brought up again at the next regular meeting of Council.

New officers were noted for the Calgary and Saskatchewan branches.

A letter was read from Councillor A. J. Taunton of Winnipeg dealing with the method of electing applicants for admission and for transfer to a higher class of membership. After considerable discussion it was agreed that in future, when Council's decision differed from the recommendation of the branch, action would be deferred until the branch had been communicated with and requested to reconsider their decision in the light of full information.

The President reported on the joint dinner which was to follow the Council meeting between the Council of the Ontario Professional Association, and the Council of The Engineering Institute. The Council unanimously expressed appreciation of the arrangements, and recommended that family councils of this character should be held whenever and wherever practicable.

The following elections and transfers were considered and approved:

Elections		*Transfers*	
Member	1	Assoc. Member to Member	2
Assoc. Members	4	Junion to Assoc. Member	4
Juniors	6	Student to Junior	1
Students admitted	22		

One application for admission as Associate Member was approved, subject to the passing of The Institute's examinations. Two special cases were voted upon, and disposed of in accordance with their merits.

It was decided that the next regular meeting of Council would be held at Headquarters on Friday, May 20th, 1938.

The Council rose at six thirty p.m.

Maritime Meeting

A meeting of Council was held in Halifax, Nova Scotia, at the Lord Nelson Hotel, on May 1st, 1938, at ten fifteen a.m., with President J. B. Challies in the chair, and five other members of Council present. The chairmen of the Halifax and Cape Breton branches, the secretary of the Halifax Branch, together with other members of the Halifax executive and senior members of The Institute resident in Halifax were present by invitation.

The President explained that the purpose of a Council meeting in Halifax was to afford the four Maritime branches an opportunity to become well informed regarding the problems of The Institute, and the proposals for their solutions which committees of Council were considering.
