MONTREAL, QUE.

# THE ENGINEERING JOURNAL

## INDEX

VOLUME XXVIII—JANUARY TO DECEMBER 1945

### AUTHOR—TITLE

	Page		Page
Aircraft Performance Testing and Reduction by the "iw" Method, J. J. Green and F. S. Nowlan.....	758	Annual General and Professional Meeting, Fifty-Ninth—	
Americans Honour Canadian Engineers.....	106	Programme.....	34
Anderson, R. J., Flame-Priming Steel Surfaces for Painting.....	707	Report of the Meeting.....	161
Anti-Malaria Drainage in Trinidad, G. A. Campbell....	695	Said at the Meeting.....	171
Application of Soil Mechanics to the Design and Maintenance of Prairie Highways, G. B. Williams.....	285	Annual General and Professional Meeting, Sixtieth....	784, 791
Discussion.....	297	<i>Branch News—</i>	
Atomic Bomb and Canada's Contribution to It; Uranium Fission Plant.....	581	New Branch is Born—and Christened (Sarnia)....	647
Atomic Power, B. W. Sargent.....	752	Border Cities..... 53, 126, 330, 407, 535, 733	
Autumn Reverie, John Simmons Watt.....	38	Calgary..... 330, 801	
Bain, Jas. T., Principles Involved in a Modern Concept of Airline Operation.....	342	Edmonton..... 54, 200, 480, 801	
Discussion.....	346	Halifax..... 54, 200, 407	
Battle of the Scientists, C. F. Goodeve.....	568	Hamilton..... 54, 126, 200, 259, 330, 480, 535, 734	
British Engineering Education and Training, A. P. M. Fleming.....	234	Lakehead..... 55, 126, 259, 536	
Broek, Van den, J. A., Column Formula for Materials of Variable Modulus.....	772	Lethbridge..... 127, 260, 408, 802	
Evaluation of Aeroplane Metals.....	424	London..... 55, 127, 408, 536, 736	
Cabana, L. P., Pollution Hazards in a Water Supply System.....	576	Montreal..... 55, 127, 201, 331, 412, 734, 802	
Cadenhead, A. F. G., Need of Research in Canada....	147	Niagara Peninsula..... 57, 332, 413, 736, 803	
Cameron, J. C., Union Security Clauses in Canadian Collective Labour Agreements.....	456	Ottawa..... 57, 202, 262, 332, 414, 481, 674, 736	
Campbell, G. A. Anti-Malaria Drainage in Trinidad....	695	Peterborough..... 58, 128, 262, 536, 736	
Canada's New Voice, J. Alphonse Ouimet.....	440	Quebec..... 58, 202, 674, 737	
Canada's Pulp and Paper Industry, R. L. Weldon....	448	Saguenay..... 481, 537, 601, 737, 803	
Canadian Engineers' Contribution to Victory, A. G. L. McNaughton.....	713	Saint John..... 204, 263	
Canadian Engineers' Part in the War, A. G. L. McNaughton.....	236	St. Maurice Valley..... 540	
Canadian Scientist Revisits Canada.....	467	Sarnia..... 803	
Canadian Universal Trestle.....	498	Saskatchewan..... 58, 128, 204	
Carrière, J. P., Semi-Permanent Bridge Construction by Canadian Army in the European Theatre of Operations.....	614	Sault Ste. Marie..... 58, 205	
Cochrane, H. G., Unique Opportunity for Industry....	471	Toronto..... 60, 128, 205, 263, 333	
Coller, S. Gordon, Oil for Defence and Attack.....	515	Vancouver..... 60, 264, 414, 482, 537, 675	
Correspondence..... 40, 112, 179, 246, 527, 595, 662, 790		Winnipeg..... 60, 130, 264, 414, 482, 676, 805	
Diamond Drills and Well Drills on the Raft Lake Canals at Steep Rock, C. H. Hopper.....	18	Branch Report.....	91
Diesel-Electrics in Industry and Transportation, I. I. Sylvester.....	570	<i>Committee Reports, 1944—</i>	
Diversion of Seine River at Steep Rock, A. W. F. McQueen and C. N. Simpson.....	10	Board of Examiners and Education.....	82
Dyment, John T., Engineering Selection of an Airline Aeroplane.....	348	Canadian Lumbermen's Association Prize.....	90
Discussion.....	361	Committee on Deterioration of Concrete Structures.....	89
Ecole Polytechnique's New Dean.....	650	Committee on Employment Conditions.....	86
Employment Service. 66, 135, 212, 272, 339, 418, 493, 548, 607, 682, 745, 810,		Committee on Engineering Features of Civil Defence.....	88
Engineer and the Community, John S. Galbraith.....	74	Committee on Industrial Relations.....	82
Engineer in Administration, C. R. Young.....	232	Committee on Prairie Water Problems.....	83
Engineering for Veterans.....	586	Committee on Professional Interests.....	89
<i>Engineering Institute of Canada—</i>		Committee on the Engineer in the Active Services... ..	88
A. S. M. E. —E. I. C. Joint Meetings.....	590, 642	Committee on the Engineer in the Civil Service.....	83
Admissions and Transfers, Proposed Changes.....	317	Committee on the Training and Welfare of the Young Engineer.....	85
		Duggan Medal and Prize Committee.....	90
		Employment Service.....	81
		Finance Committee.....	84
		Gzowski Medal Committee.....	90
		Julian C. Smith Medal.....	90
		Kieffer Medal Committee.....	90
		Legislative Committee.....	81
		Leonard Medal Committee.....	90
		Library and House Committee.....	82
		Nominating Committee.....	83
		Papers Committee.....	89
		Plummer Medal Committee.....	90
		Publications Committee.....	81
		Ross Medal Committee.....	90
		Students' and Juniors' Prizes.....	90
		Treasurer's Report.....	84
		Committee on Professional Interests.....	391

	Page		Page
<i>Council—</i>		Idle Engineers.....	588
Meetings.....	45, 113, 179, 248, 321, 398, 471, 665, 726, 792	Importance of Design in a Tax Structure, Stuart S. Garson.....	156
Report for the year 1944.....	79	Inductive Co-ordination Aspects of Mercury Arc Rectifier Installations, D. J. McDonald.....	68
Elections and Transfers.....	46, 119, 186, 252, 324, 403, 474, 669, 729, 795	Industrial News.....	340, 420, 496, 610, 685, 748
Examinations.....	719	International Engineering Congress, 1946.....	792
Fees, Change in Student Fees.....	38	Iron Ore Loading Docks at Port Arthur, J. M. Fleming.....	26
<i>Financial Statement—</i>		Jacobsen, E. R.,—	
Branches.....	94	New York Letter.....	593
Institute.....	84	Washington Letter.....	39, 111, 178, 245, 320, 394, 468, 528
Sir John Kennedy Medal.....	646	Japanese Paper Balloons, R. W. McKay.....	568
<i>Membership—</i>		Kelly, E. G., Post-War Plans for Rural Electrification in Alberta.....	227
Increase.....	36	Discussion.....	230
Branches.....	94	Laffoon, C. M., Water-Wheel Generators.....	556
Need for Technical Institutes in our Educational System; Brief Submitted to the Royal Commission on Education (Ontario).....	641	Lamoureux, Paul E., Recent Developments in the Field of Materials and Processes.....	378
<i>Officers—</i>		Discussions.....	386
Newly Elected—Biographies.....	191	Lexier, H. L., Metallurgy and Machine Design.....	300
Nominees for 1946.....	663	Library Notes.....	61, 131, 206, 266, 334, 415, 486, 542, 602, 677, 738, 805
Preliminary Notice.....	64, 133, 206, 269, 337, 490, 545, 605, 679, 742, 807	Lighthouses and Depth Charges.....	32
<i>President—</i>		Lynn, H. R., Fog Dispersal from Airstrips.....	634
Honours for the President.....	393	McDonald, D. J., Inductive Co-ordination Aspects of Mercury Arc Rectifier Installations.....	68
Visit to Maritimes.....	315	MacDonald, J. W., and J. T. Farmer, 12,500 Kilowatt Steam-Electric Station of Nova Scotia Light and Power Company Limited.....	620
Visit to Ontario and Quebec.....	459	McHenry, M. J., Rural Electrification.....	703
President's Message.....	139	McKay, R. W., Japanese Paper Balloons.....	563
<i>Prizes—</i>		McMulkin, F. J., Welding and Fabrication of Canadian Light Armour.....	141
Engineering Institute of Canada Prize Awards, 1945.....	474	McNaughton, A. G. L., Canadian Engineers' Contribution to Victory.....	713
Institute Prize Winners.....	196	Canadian Engineers' Part in the War.....	236
Sir John Kennedy Medal.....	646	McQueen, A. W. F., and C. N. Simpson, Diversion of Seine River at Steep Rock.....	10
New Prizes.....	108	Madill, J. T., Field Decay Characteristics of Large Hydro-Electric Generators.....	778
Rules Governing Award of Institute Prizes.....	43	Manufacture of Propellers for 18" Torpedoes, J. S. Walsh.....	505
Committee on Rehabilitation—Reports.....	239, 315, 392, 463, 523, 643, 745	Meek, Victor, Engineering Investigation of the Water Resources of the Columbia River Basin.....	585
Voluntary Assessment.....	36	Metallurgy and Machine Design, H. L. Lexier.....	300
Engineering Investigation of the Water Resources of the Columbia River Basin, Victor Meek.....	585	National Housing Administration. Community Planning Division, Outline of the Preliminary Steps in Community Planning.....	516
Engineering Selection of an Airline Aeroplane, J. T. Dyment.....	348	Need for Technical Institutes in our Educational System; Brief Submitted to the Royal Commission of Education (Ontario).....	641
Discussion.....	361	Need of Research in Canada, A. F. G. Cadenhead.....	147
Engineers' Council for Professional Development Annual Meeting.....	720	Nowlan, F. S., and J. J. Green, Aircraft Performance Testing and Reduction by the "iw" Method.....	758
Reading List for Junior Engineers.....	483	<i>Obituaries—</i>	
Engineers' Proposed Programme of Control for German Industry.....	661	Acres, Henry Girdlestone.....	673
Eon, L. Guy, Radar as an Aid to Air Navigation and Meteorology.....	690	Arkley, Lorne McKenzie.....	329
Etkin, Bernard, Turning in a Wind.....	160	Bennett, Charles Samuel.....	800
Evaluation of Aeroplane Metals, J. A. Van den Broek.....	424	Bennett, Harry Frederick.....	189
Farm Electrification; A New Science, J. W. Tomlinson... Discussion.....	214, 220	Bone, Peter Turner.....	800
Farmer, John T. and J. W. MacDonald, 12,500 Kilowatt Steam-Electric Station of Nova Scotia Light and Power Company Limited.....	620	Bowman, Frederick Allison.....	800
Field Decay Characteristics of Large Hydro-Electric Generators, J. T. Madill.....	778	Brandt, 2nd Lieutenant René Edmond.....	258
Finnie, Richard, Post-War Engineering Opportunities in Alaska and the Canadian Sub-Arctic.....	453	Brown, George Laing.....	533
Fisher, Sidney T., Radio for Over-Land Long-Distance Telephone Service.....	305	Brown, Harry Cleophas.....	258
Flame-Priming Steel Surfaces for Painting, R. J. Anderson.....	707	Browne, Major George Alleyne.....	674
Fleming, A. P. M., British Engineering Education and Training.....	234	Burchell, Herbert Charles.....	406
Fleming, J. M., Iron Ore Loading Dock at Port Arthur... Fog Dispersal from Airstrips, H. R. Lynn.....	26, 634	Collet, Aimé.....	733
Frampton, A. H., Power Supply in the Steep Rock Mining Area.....	150	Corbett, Flying Officer Bruce Sherwood.....	329
Future Aspects of Radio and Communication in Air Transportation, S. S. Stevens.....	364	Crompton, Arthur.....	407
Discussion.....	375	Dodge, George Blanchard.....	733
Galbraith, John S., Engineer and the Community.....	74	Fisher, Seymour Jost.....	125
Garson, Stuart S., Importance of Design in a Tax Structure.....	156	Fitzgerald, George G.....	534
Goodeve, C. F., Battle of the Scientists.....	568	Gilchrist, James Macdonald.....	258
Green, J. J., and F. S. Nowlan, Aircraft Performance Testing and Reduction by the "iw" Method.....	758	Gnaedinger, Frederick Theodore.....	534
Hopper, C. H., Diamond Drills and Well Drills on the Raft Lake Canals at Steep Rock.....	18	Hazen, Hugh T.....	406
		Heustis, Harry Ernest.....	258
		Kelsch, Raymond Stirling.....	257
		Lea, Richard Smith.....	799
		Lovelace, Edgar Sydney Montgomery.....	479

Page	Page		
McKenzie, James Edgar.....	406	Recent Developments in the Field of Materials and Processes, Paul E. Lamoureux.....	378
MacLeod, George Roderick.....	599	Discussion.....	386
Meldrum, William.....	800	Registration in Engineering at Canadian Universities.....	785
Mellor, Alfred Ayre.....	600	Rehabilitation and Employment Service... 66, 135, 212, 272, 339	339
Mills, Alfred Arthur.....	407	418, 493, 548, 607, 682, 745, 810	810
Morley, Edward Henry.....	406	Rural Electrification, M. J. McHenry.....	703
Morrison, Major Duncan Seward.....	190	Samuel, W., Steep Rock Iron Mines—Discovery and Development.....	4
Norrie, James Paul.....	733	Sargent, B. W., Atomic Power.....	752
Pottle, Walter Reginald.....	479	Semi-Permanent Bridge Construction by Canadian Army in the European Theatre of Operations, J. P. Carrière.....	614
Prideaux, Lieutenant Norman Llewellyn.....	534	Simpson, C. N., and A. W. F. McQueen, Diversion of Seine River at Steep Rock.....	10
Reilly, Francis Bell.....	53	Soil Mechanics as Applied to the P. F. R. A. Problems with Special Reference to the Proposed St. Mary Dam, Robert Peterson.....	274
Roche, Robert Selwyn.....	125	Discussion.....	285
Ross, Cecil Middleton.....	53	Spence, George, Post-War Projects for the Prairies....	76
Rostron, John Robert.....	258	Steep Rock Iron Mines—Discovery and Development, W. Samuel.....	4
Ryckman, John Hamilton.....	407	Stevens, S. S., Future Aspects of Radio and Communication in Air Transportation.....	364
Sargent, Charles Daniel.....	800	Discussion.....	375
Scott, Charles F.....	39	Sylvester, I. I., Diesel-Electrics in Industry and Transportation.....	570
Seabury, George Tilley.....	478	Taber, H. E., Wartime Equipment Responsibility of the Royal Canadian Corps of Signals.....	510
Segre, Beresford Henry.....	53	Text for C. E. D. (Committee for Economic Development).....	788
Strong, Robert Ambrose.....	600	Tomlinson, J. W., Farm Electrification—A New Science. Discussion.....	214
Surveyor, Joseph Bernard Edouard Fabre.....	601	Turning in a Wind, Bernard Etkin.....	160
Taylor, Alfred James Towle.....	600	12,500 Kilowatt Steam-Electric Station of Nova Scotia Light and Power Company Limited, J. T. Farmer and J. W. MacDonald.....	620
Thorne, Carl Busch.....	532	Unification of Engineering Standards, Ottawa Conference.....	657
Turner Bone, Peter.....	800	Unification of Screw Threads, Hugh P. Vowles.....	633
Tyrrrell, James Williams.....	190	Union Security Clauses in Canadian Collective Labour Agreements, J. C. Cameron.....	456
Walker, Andrew.....	600	Van den Broek, J. A., Column Formula for Materials of Variable Modulus.....	772
Westman, Alfred Adolf Julius.....	534	Evaluation of Aeroplane Metals.....	424
Westman, LeRoy Egerton.....	533	Vowles, Hugh P., Unification of Screw Threads.....	633
Wilcox, Percy Lawrence.....	801	Wages for Professional Workers.....	787
Williams, Group Captain David Gabb.....	258	Walsh, J. S., Manufacture of Propellers for 18" Torpedoes.....	505
Oil, John Simmons Watt.....	725	Wartime Bureau of Technical Personnel. Monthly Bulletin..... 241, 526, 656	656
Oil for Defence and Attack, S. Gordon Coller.....	515	Wartime Equipment Responsibility of the Royal Canadian Corps of Signals, H. E. Taber.....	510
"Operation Pluto"; The Story of the Channel Pipeline..	389	Washington Letter..... 39, 111, 178, 245, 320, 394, 468, 528	528
Quimet, J. Alphonse, Canada's New Voice.....	440	Water-Wheel Generators, C. M. Laffoon.....	556
Outline of the Preliminary Steps in Community Planning, National Housing Administration. Community Planning Division.....	516	Watt, John Simmons, Autumn Reverie.....	38
Personals..... 51, 123, 187, 253, 326, 405, 477	477	Oil.....	725
529, 596, 670, 730, 798	798	Welding and Fabrication of Canadian Light Armour, F. J. McMulkin.....	141
Peterson, Robert, Soil Mechanics as Applied to P. F. R. A. Problems with Special Reference to the Proposed St. Mary Dam.....	274	Weldon, R. L., Canada's Pulp and Paper Industry—Past and Future.....	448
Discussion.....	285	What is an Engineer?.....	718
Pollution Hazards in a Water Supply System, L. P. Cabana.....	576	Williams, G. B., Application of Soil Mechanics to the Design and Maintenance of Prairie Highways.....	289
Polytechnique Maintains its Lead.....	784	Discussion.....	297
Post-War Engineering Opportunities in Alaska and the Canadian Sub-Arctic, Richard Finnie.....	453		
Post-War Plans for Rural Electrification in Alberta, E. G. Kelly.....	227		
Discussion.....	230		
Post-War Projects for the Prairies, George Spence....	76		
Power Supply in the Steep Rock Mining Area, A. H. Frampton.....	150		
Principles Involved in a Modern Concept of Airline Operation, Jas. T. Bain.....	342		
Discussion.....	346		
R. C. E. M. E. Officers—Engineers or Tradesmen?....	587		
Radar as an Aid to Air Navigation and Meteorology, L. Guy Eon.....	690		
Radio for Over-Land Long-Distance Telephone Service, Sidney T. Fisher.....	305		
Reading List for Junior Engineers, E. C. P. D. Junior Committee on Professional Training.....	483		

## S U B J E C T

Aerial Transportation	Evaluation of Aeroplane Metals, J. A. Van den Broek.....	424
Future Aspects of Radio and Communication in Air Transportation, S. S. Stevens.....	Recent Developments in the Field of Materials and Processes, Paul E. Lamoureux.....	378
Discussion.....	Discussion.....	386
Principles Involved in a Modern Concept of Airline Operation, James T. Bain.....	Air Navigation	
Discussion.....	Radar as an Aid to Air Navigation and Meteorology, L. Guy Eon.....	690
Aerodynamics	Airlines	
Turning in a Wind, Bernard Etkin.....	Engineering Selection of an Airline Aeroplane, John T. Dymant.....	348
Aeroplanes	Discussion.....	361
Aircraft Performance Testing and Reduction by "iw" Method, J. J. Green and F. S. Nowlan.....	Principles Involved in a Modern Concept of Airline Operation, James T. Bain.....	342
Engineering Selection of an Airline Aeroplane, John T. Dymant.....	Discussion.....	346
Discussion.....

### COVER PICTURE

The Raft Lake canals are part of the extensive Seine River diversion scheme carried out by Steep Rock Iron Mines Limited to enable them to pump Steep Rock lake dry and mine the otherwise inaccessible high grade iron ore bodies in the lake bottom.

The cut for the west canal, shown in the cover picture, was carried out by a method employing diamond drills and a pilot tunnel.

Price 50 cents a copy, \$3.00 a year: in Canada, British Possessions, United States and Mexico. \$4.50 a year in Foreign Countries. To Members and Affiliates, 25 cents a copy, \$2.00 a year. —Entered at the Post Office, Montreal, as Second Class Matter.

THE INSTITUTE as a body is not responsible either for the statements made or for the opinions expressed in the following pages.

# STEEP ROCK IRON MINES

## Discovery and Development

W. SAMUEL

Chief Engineer, Steep Rock Iron Mines Limited, Toronto, Ont.

Paper to be delivered at the Fifty-Ninth Annual Meeting of The Engineering Institute of Canada, in Winnipeg, Man., on February 7th, 1915.

The iron bearing ranges of the Lake Superior district lie to the south and to the west of Lake Superior (Fig. 1). First iron ore was discovered in 1845 on what is now the Marquette range, Michigan. Shortly afterwards, ore was found on the Menominee and Gogebic ranges of Michigan and the Vermillion range of Minnesota. The Mesabi and the Cuyuna ranges of Minnesota were discovered in 1893 and 1912 respectively. From these discoveries developed the huge ore mining and transportation system of today, whereby an annual average of about 50,000,000 tons of ore increasing to 90,000,000 tons during war years has been mined and shipped by rail to Lake Superior ports and from here by lake boats to ports on Lakes Michigan, Erie and Ontario for transfer to the blast furnaces of east-central United States and Canada.

To the west of Lake Superior, the boundary between Canada and the United States passes about 25 miles north of the Vermillion range and about 60 miles north of the Mesabi range. It is natural therefore, that for the past 60 to 80 years, much attention has been paid to the possible presence of comparable iron ranges in Ontario, north of the Minnesota boundary.

In 1882, an Indian found a deposit of magnetite east of Sapawe lake, about 10 miles east of Steep Rock lake and locations were taken up by the McKellar brothers

of Fort William. In 1905, the property was taken over by the Atikokan Iron Company Limited who erected a roaster and small blast furnace at Port Arthur. This plant operated from 1909 to 1911, but the pig iron produced was too high in sulphur and the operation was abandoned.

In the 1800's the main travel route from Lake Superior to western Canada passed close to, if not through Steep Rock lake, and one often wonders if some of the voyageurs did not take east with them occasional specimens of float iron ore picked up from the shores of the lake. However, the earliest record of the iron ore possibilities of Steep Rock lake is a note in the margin of a Geological Survey of Canada map of the Rainy River area by Messrs. Smith and McInnes, published in 1897 and which reads as follows:

"An iron bearing horizon with hematite of good quality appears to be generally covered by the waters of the lake."

Numerous pieces of high grade iron ore float or boulders from the size of gravel to over five tons in weight are distributed along the south shore of Steep Rock lake and in the country for about four miles to the south of the lake. While no float has been found along the north shore and to the north of the lake, this

Fig. 1.

Fig. 2.

indicated that the iron orebody, or orebodies, occupied part of the bed of the lake itself.

Since 1900, considerable sums have been spent without success in the search for the source of the float to the south of Steep Rock lake. In the winter of 1926, Jules Cross of Port Arthur became interested and made a magnetic survey with a dip needle of the middle arm of Steep Rock lake which showed two areas of low magnetic attraction, somewhat similar to the attraction caused by some deposits of hematite ore with a small magnetite content on the Lake Superior ranges. Cross tried to interest various people and in the fall of 1937 brought the proposition to Joseph Errington. They agreed to join as equal partners in the search for the source of the float ore.

#### EXPLORATION

In January of 1938, a diamond drill was set up on the ice of the middle bay of Steep Rock lake (Fig. 2.) at the centre of the northern zone of magnetic attraction but failed to reach bedrock after passing through 160 ft. of water and 160 ft. of clay-silt. The drill was then moved to the centre of magnetic attraction of the southern zone and two holes were put down into bedrock after passing through 90 ft. of water and 50 ft. of clay-silt and gravel. These holes showed that bedrock consisted

of a greenstone which carried numerous grains of magnetite but in no sense an iron ore, eliminating the magnetic location theory.

The geologist who was in charge of the diamond drilling at that time noted that the two drill holes exploring the south magnetic zone passed through a thick layer of sand and gravel before entering bedrock and that this sand and gravel contained numerous grains and fragments of hematite. As a result of this observation, it was decided to drill a series of holes up the middle arm of the lake noting the amount of hematite in the gravel immediately above bedrock, until a point was reached where no hematite was found in the gravel. From here it was deduced that the orebody lay to the south, since glacial ice movement in this country is from north to south.

The drill was moved northward to the centre of the north magnetic attraction zone and hole No. 5 showed bedrock to be magnetite in greenstone, thus confirming the results of exploration of the south magnetic zone. The gravel, however, carried very numerous pieces of hematite, suggesting that an orebody lay a short distance to the north. The drill was moved northward 500 ft. and hole No. 6 showed bedrock at this point to be high grade hematite. Seven more holes at 100-ft. intervals on a north and south line were put down

before it was necessary to move the drill from the ice. Of these seven holes, six showed clean hematite ore and one limestone.

Several angle diamond drill holes were put down from the shores of the lake to cut the "A" and "B" orebodies. Of these, one showed ore toward the west end of the "A" orebody at a depth of 1100 ft. below bedrock and three on the "B" orebody between 300 and 600 ft. below the bedrock, but owing to the position of the orebodies in the lake and the steepness of the shores, long, costly holes were required so the method was abandoned in favour of drilling vertical holes from the lake ice.

Two methods of drilling from the lake ice were used in the exploration of the ore deposits at Steep Rock, namely, "scout drilling" and "churn drilling" (Fig. 3.). In scout drilling as the name suggests, a light casing was washed to bedrock as quickly as possible and just sufficient diamond drilling done to obtain a sample of bedrock material. In churn drilling, larger casings were washed to bedrock, and the hole continued by chopping for 300 to 400 ft. into bedrock when in ore. The action of the chopping bit was such that in most of the work the steel casing slipped down the hole within six inches of the bottom as the hole advanced. On occasions when the casing would not sink of its own accord, it was raised a short distance and a five-foot length of 50 per cent Polar dynamite cased and sealed in a rubber tube was lowered to the bottom of the hole and fired electrically. This chambered the hole sufficiently to allow the casing to be lowered to the bottom of the hole. Diamond drill equipment was used in this churn drilling and on the rare occasions when the ore was too hard to chop, diamond drilling was resorted to.

Core recovery was poor in the scout drilling but it quickly indicated the extent of the orebodies. In churn drilling, the chippings were collected in large sludge boxes and were sampled and analysed at five-foot intervals. Since the steel casing was brought to within six inches of the bottom of the hole at the end of each five-foot run and the hole washed out, sampling results were very reliable and satisfactory. Including water and clay in both cases, a total of 110,900 ft. of diamond drilling and 27,800 ft. of churn drilling were completed in the exploration of the orebodies.

During the winters of 1938-1939 and 1939-1940, the "A," "B" and "C" orebodies were explored by scout drilling. The geophysical studies carried out by Dr. Brant of the University of Toronto\* were of great assistance in the layout of this work. Churn drilling mainly on the "B" orebody was carried out in the winters of 1940-1941 and 1941-1942. A shaft was sunk in 1939 and a cross-cut driven about 400 ft. below the lake bed

\* See *Engineering Journal*, Nov. 1940, p. 464.

Fig. 3.

toward the "A" orebody. On nearing the orebody, several diamond drill holes were put out which showed the orebody to extend to more than 1,000 ft. below bedrock at the deepest point explored; these holes cut water bearing seams in and near the orebody which indicated that it would probably be troublesome to attempt to mine ore from underground workings at shallow depths without removing the lake water above; at the same time, exploration showed that by removing the lake water, ore would be available for cheaper open pit mining.

Geological mapping of the country around the lake and the exploration described above showed the rocks of the country to the north and east of Steep Rock lake to be granites with small outcrops of limestone along parts of the lake shore (see Fig. 2), while to the south and west they were volcanic greenstones. The lake bed itself in the parts explored is underlain by limestones, in places altered to dolomite and the first members of the volcanic rocks.

The "A," "B" and "C" orebodies lie in the brecciated contact zone between the limestone and the volcanic rocks. The hematite has completely replaced the original rocks forming massive high grade orebodies, dipping about 80 deg. to the west. In composition the ore lies about midway between a hematite and a limonite or  $Fe_2 O_3 \cdot \frac{3}{4} H_2O$  and all impurities are not over five per cent.

The "A" orebody has an indicated length of 3,200 ft., with possible extension at the south end and width from 175 to 300 ft.; it has been closely explored at shallow depths and partially explored to depths of over 1,000 ft. below bedrock.

The "B" orebody has an indicated length of 4,500 ft. with possible extensions at both ends and width from 125 to 250 ft.; for half of its length it has been closely explored to 400 ft. below bedrock.

The "C" orebody has had very little exploration as yet and neither the length nor the width are known, but an orebody with a length of over 1,100 ft. and width of over 200 ft. is indicated.

The company's consulting engineers estimate that there are some 31,000,000 tons of proven and probable ore in the "A" and "B" orebodies. This quantity of ore is limited only by the amount of exploration work done to the present, and the author's personal opinion is that the mine will ultimately produce many times the 31,000,000 tons of ore estimated above, since the estimates take into account ore for only a comparatively short distance into bedrock, whereas the orebodies have an almost vertical dip and there is no reason why they should not persist to depths now attained in mining iron ore on the Vermillion range and in mining gold and nickel-copper ores in the Canadian shield. The "C" orebody is not included in the ore estimate because of the small amount of work done on it as yet. Geological conditions and the presence of float suggest that other orebodies as yet undiscovered lie beneath the bed of Steep Rock lake.

Exploration by churn drilling has been almost completely confined to the "B" orebody as this orebody is most easily opened up, and the analysis given below is the average for the estimated 14,000,000 tons of standard ore of the "B" orebody. Work to the present suggests that the "A" orebody is slightly higher in grade.

AVERAGE VALUE OF "B" OREBODY  
(Dried Ore)

Iron . . . . .	60.48%	} Analysis of composite sample
Phosphorus . . . . .	0.023	
Silica . . . . .	3.40	
Sulphur . . . . .	0.043	
*Loss by ignition . . . . .	8.61	
Manganese . . . . .	0.15	
Alumina . . . . .	0.66	
Lime . . . . .	0.11

Cobalt . . . . .	0.022	

\*Water of crystallization.

Iron ores as shipped contain varying amounts of moisture and payment is made on the "natural iron" content of the ore, that is including this moisture.

Steep Rock expects to ship four grades of ore of the following approximate compositions.

<i>Lump Ore</i> . . . . .	Size 4" to 10"
Iron . . . . .	61% (Dried Analysis)
Phosphorus . . . . .	.025
Silica . . . . .	3.5
Moisture under 4% . . . . .	Natural Iron 58.5%
<i>Intermediate Ore</i> . . . . .	Size 1" to 4"
Iron . . . . .	61% (Dried Analysis)
Phosphorus . . . . .	.025
Silica . . . . .	3.5
Moisture under 4% . . . . .	Iron Natural 58.5%
<i>No. 1—Fine Ore</i> . . . . .	Size Minus 1"
Iron . . . . .	60% (Dried Analysis)
Phosphorus . . . . .	.025
Silica . . . . .	4.0
Moisture 8% . . . . .	Iron Natural 55.2%
<i>No. 2—Fine Ore</i> . . . . .	Size Minus 1"
Iron . . . . .	57.5% (Dried Analysis)
Phosphorus . . . . .	.03
Silica . . . . .	8.0%
Moisture 10% . . . . .	Iron Natural 51.8%

It is difficult to estimate closely into what proportions the ore will be divided in mining, but it is expected that the quantities of the four grades will be as follows:

Lump Ore . . . . .	20%
Intermediate Ore . . . . .	30%
No. 1 Fine Ore . . . . .	30%
No. 2 Fine Ore . . . . .	20%

VALUE OF STEEP ROCK ORE IN THE STEEL INDUSTRY

The iron ranges producing more than 90 per cent of the ores from the Lake Superior district have been in operation for between fifty and one hundred years. It is understandable therefore, that as the direct shipping ores of the ranges approach exhaustion, lower grade ores are being and will be mined. These lower grade ores have as their main feature a lowering of the iron content and an increase in the silica content to such an extent that concentration of various sorts is becoming increasingly prevalent. Best blast furnace practice calls for an ore charge with a silica content of 7 per cent in order that there will be sufficient slag to clean the metal of impurities. Steep Rock's No. 1 Fine Ore with its very low silica content will therefore be in demand to mix with cheap high silica ores to make a desirable blast furnace feed. The texture of the ore is also desirable, and its phosphorus content is also much below the maximum allowed for the classification of Old Range Bessemer Ore (the highest classification and most valuable standard ore in the iron ore business).

Open hearth furnaces, in which pig iron is converted into steel, use considerable amounts of lump and intermediate ore. In this operation the low silica and phosphorus content and the lumpy nature of these sizes of Steep Rock ore make it very desirable, as tests have shown that the time required to complete a charge in the open hearth furnace when Steep Rock Intermediate ore is charged, is considerably less than when other charge ores are used, thus increasing the capacity of the furnace. Also, it is likely that when Steep Rock Intermediate ore is used in a charge, the amount of ore can be increased and the amount of scrap iron reduced, thus decreasing the cost of steel production. For many years there has been a considerable shortage of good charge and feed ore in the American and Canadian steel industry.

**Pumping installation, showing connection to shore and flexible couplings. Lake down 15 ft. when picture taken; now down 135 ft.**

The Canadian steel industry is small in comparison to the size of the country and its population, probably because it has been dependent on foreign sources for almost all of its ore, but with the opening up of large potential reserves at Steep Rock lake it is likely that the next generation will see a considerable expansion in the Canadian steel industry and its associated heavy industries, particularly in centres where ore and coal can be cheaply brought together at points where low cost hydro-electric power is available.

#### THE DIVERSION OF THE SEINE RIVER

The company decided that it was necessary at first to lower and finally remove the water from the eastern portion of Steep Rock lake, in order to make large quantities of ore available for cheap open pit mining, and later to make safe underground mining possible. Much study was given to the problems presented by this decision, as the Seine river which drains an area of over 1,800 sq. mi. passed through the lake. Marmion lake, immediately above Steep Rock lake had been dammed and raised as a storage lake with an area of about 32 sq. mi., and there was a fall of 100 ft. with a power plant between Marmion lake and Steep Rock lake, and other power plants on the Seine river between Steep Rock lake and Rainy lake.

It was found to be impossible economically to divert the Seine river from the eastern portion of Steep Rock lake and still leave the power plant intact, so arrangements were made with the owners of the plant and the government of the province of Ontario through the Hydro-Electric Power Commission for a power line to be built from Port Arthur to Steep Rock, a distance of about 130 mi., to supply power from the Lake Nipigon system of the Commission for pumping and mine operation and to replace power then generated at the plant at the head of Steep Rock lake.

A feasible route for the diversion of the Seine river away from the eastern portion of Steep Rock lake was found which required the raising of the spillways at the power plant, the excavation of two rock cuts called the

Raft Lake cuts about 10 mi. north of Steep Rock lake connecting Marmion to Raft lake and Raft lake to Finlayson lake, the construction of a spillway and control gates in the bed of Raft lake, the lowering of Finlayson lake which was done by breaking a rock tunnel through into the lake bottom, the excavation of an earth and rock cut through a terminal moraine at the south end of Finlayson lake called the Esker cut, and the clearing of a channel from the Esker cut to the west arm of Steep Rock lake.

The diversion work described above was done in 1943 and two coffer-dams were built at the narrows between the west arm and middle arm of Steep Rock lake which were later strengthened into permanent dams. In December, 1943, the power plant was shut down and all flow between Marmion lake and the eastern portion of Steep Rock lake was sealed off. The coffer-dams were completed and the Seine river passed through its new diversion route. This isolated the eastern portion of Steep Rock lake and pumping was commenced.

#### PUMPING LAKE WATER

Detailed surveys and soundings were made of the eastern portion of Steep Rock lake and from these it was estimated that this portion of the lake held some 118,000,000,000 U.S. gallons of water, but that by pumping 70,000,000,000 U.S. gallons the lake water would be lowered sufficiently to permit commencement of overburden removal and mining of ore on the "B" orebody. To remove the lake water, it was necessary to start pumping against almost no head and end against a total head of about 200 ft.

Pumping equipment consisted of fourteen 30-in. suction, 24-in. discharge, centrifugal pumps with specially designed impellers so that they were reasonably efficient at low heads as well as efficient at their designed head of 98 ft. Twelve pumps were driven by 500 hp. squirrel cage induction motors and two by wound rotor motors. Seven steel barges were constructed and two pumps were installed on each barge in such a way that the lake was lowered about 80 ft. by the pumps operating in parallel. At this depth, the two pumps on each barge were connected in series and so were capable of pumping against a total head of over 200 ft.

At depths up to 55 ft., each pump had a capacity of over 23,000 U.S. gallons per minute, or a total capacity of 322,000 gallons per minute (717 cu. ft. per sec.); at the designed head of 98 ft. each pump had a capacity of 18,000 U. S. gallons per minute or a total capacity of 252,000 gallons per minute (561 cu. ft. per sec.); at a total head of 200 ft. the pumps would have a total capacity of 126,000 gallons per minute (280 cu. ft. per sec.).

The eastern portion of Steep Rock lake had a length of about ten miles, a surface area of about four square miles and it was estimated that the surface should fall at an average rate of a little over six inches a day. Pump operation was very satisfactory in every way and the lake surface fell a little faster than the estimated rate. No inflow other than that from the residual

drainage area around the lake was anticipated as the lake lay in a rock basin. This judgment has proved correct and an average inflow of under 10,000 U. S. gallons per minute only must be handled.

#### OVERBURDEN REMOVAL AND PREPARATION FOR PRODUCTION

The "B" orebody lies around and close to the south end of the headland that divides the east arm from the middle arm of Steel Rock lake; its outcrop slopes with the bordering rocks downward into the lake bottom as shown in Fig. 3, and the depth of overburden in the part to be first mined, varies from a minimum of about 25 ft. to a maximum of about 100 ft. It was difficult to properly judge the composition of the overburden before the lake water was removed, but samples taken in drilling showed it to be a clay-silt, with sand and gravel on bedrock. It was appreciated that it might be difficult to place mechanical equipment on this water-logged ground so it was decided to break down the overburden with monitors or hydraulic jets and collect the resulting slurry in a sump or pond in which floated a barge with a dredge pump to pump the disintegrated overburden to disposal points in the lake bottom. Water for the monitors is supplied by one of our pump barges, which was moved into the east arm of the lake last spring for this purpose. The suction dredge is equipped with a 15-in. harbour type dredge pump capable of pumping to a total head of 180 ft. and of passing gravel and boulders up to ten inches in diameter. This pump is driven by a 750 h.p. wound rotor motor with special speed controls. A three-drum hoist is installed to raise and lower the suction head and to move the dredge in the pond or sump. The monitors and dredge began operation early in July and the dredge has been lowered 40 ft. into the overburden removing considerably more than 100,000 cu. yd. of clay silt monthly. When gravel and boulders show up monitor operation is stopped and clean-up of bedrock is done by dragline, shovels, trucks and bulldozers.

Pit equipment consists of:—

- 3—2½ cu. yd. Diesel shovels.
- 1—1-cu. yd. Diesel shovel.
- 11—15-ton heavy duty ore trucks.
- 6—4-ton dump trucks.
- 4—tractors and bulldozers.
- 6—well (churn) drills 6-in. bit,

together with electric drive compressor and rock drills.

To properly prepare the ore for shipment, a crusher and screening plant was erected at the west side of the middle arm on the Canadian National Railway's spur. In this plant, ore is dumped from the trucks into a bin, and passed by a Ross feeder over a grizzly with bars set ten inches apart. The undersize passes to a 36-in. belt conveyor, oversize is crushed in a 48-in. by 60-in. jaw crusher, joins the grizzly undersize and is elevated by

Two pumps set up on the centre line of a barge—picture shows pumping in parallel—when pumping in series, the suction of No. 2 pump was eliminated and No. 1 pump's discharge was connected through to the intake of No. 2.

conveyor to the top of the railway loading bin, where the ore is passed over a heavy duty 6 by 12 ft. double deck shaking screen and divided into three sizes 4 to 10 in., 1 to 4 in. and minus 1 in., which fall into three loading pockets.

Empty, bottom dump ore cars are stored by the railway company to the north of the loading terminal; from here they are passed by gravity on a 1½ per cent compensated grade through the terminal where they are loaded and on the full storage yards.

An ore haul road was constructed in the early summer from the crusher plant and loading terminal a distance of 7,000 ft. to the pit which had been opened up on the highest point of the "B" orebody. By the middle of October, this pit was of sufficient size to show that the character of the orebody was in every way up to expectations and it was possible to send two boat loads of ore to eastern furnaces. At this time a slide of bank material came on the ore bench and held up operations for the few remaining weeks of the shipping season.

The company plans to move as much clay-silt hydraulically as possible this winter, assisted by dragline operation and to open up and place on a stockpile near the crusher plant a considerable tonnage of ore, so that there will be a good reserve of mined ore available at the start of the shipping season towards anticipated production for 1945 of over 1,000,000 tons of ore.

The Canadian National Railways built the spur line from the division yards at Atikokan to the loading terminal, a distance of about three miles. Ore trains will be made up and taken to Neebing, just outside of Fort William, where the cars will be sorted to grade the ore and taken to the ore dock at Port Arthur, through which the ore will pass to the holds of the ore boats of the Great Lakes and so into the normal stream of iron ore from the Lake Superior district to eastern Canadian and American furnaces.

# DIVERSION OF SEINE RIVER AT STEEP ROCK

A. W. F. McQUEEN, M.E.I.C.,  
Hydraulic Engineer,

H. G. Acres and Company, Consulting Engineers, Niagara Falls, Canada

C. N. SIMPSON, Jr., E.I.C.,  
Assistant Engineer,

Paper to be presented at the Fifty-Ninth Annual Meeting of The Engineering Institute of Canada,  
at Winnipeg, Man., on February 7th, 1945

Quite early in the engineering investigations at Steep Rock it became apparent that the rich iron ore deposits lying beneath the lake could not be reached by ordinary underground mining methods. The only practicable alternative was to divert the Seine river from its course through Steep Rock lake, pump the lake dry, and strip the overburden from its bed, so that the ore could be mined by open-pit methods. This scheme, therefore, was adopted. Its magnitude and the difficulties that might accompany such an operation can, perhaps, be realized by a study of the map of the region shown herein as Fig. 1.

From this map it will be seen that the main source of supply for Steep Rock lake is the Seine river, all other direct drainage being very small in amount by comparison. Prior to its diversion, the Seine river flowed through Marmion lake, dropped over Steep Rock falls into Steep Rock lake, thence through the three arms of the lake in succession to its outlet at the head of Tracy rapids. The feasibility of making the diversion and unwatering was based upon geological assurance that the bottom and sides of the basin of Steep Rock lake were entirely composed of tight, pre-cambrian rocks and that, such being the case, no material flow of water had access to the lake from underground sources. This meant that, after diversion, the water to be disposed of by pumping comprised only the residual water content of the lake itself, and the comparatively negligible surface run-off from the area immediately adjacent to its shores.

As mentioned above, Steep Rock lake consists of three main reaches or arms known respectively as the Eastern, Middle, and Western arms and, as an initial development, it was decided to unwater only the Eastern and Middle arms covering an area of about four square miles.

The problem of isolating the Middle and Eastern arms to allow unwatering was simplified by the existence of a narrow and comparatively shallow section between the Middle and Western arms known as the Narrows. This topographical feature allowed bulkhead dams of moderate dimensions to be designed, and constructed at this point. On the other hand, this problem was considerably complicated by the Moose Lake power development at Steep Rock falls between Marmion and Steep Rock lakes, since any scheme of diversion required the abandonment of this plant and the securing and delivering of a satisfactory supply of replacement power. The difficulties and expense attendant upon this phase of the scheme, and also upon retaining to the Power Company its use of Marmion lake as seasonal and yearly storage for power plants further downstream were, however, partly offset by the fact that the power dam, spillway, and headworks could be used, with but minor alterations, to close the inlet to Steep Rock lake.

After making extensive explorations and surveys, the most economical and practical route for the diversion of the Seine river was found to be from Marmion lake to the west by a heavy rock cut to Raft lake, through Raft lake and into Finlayson lake by another large rock cut; then, through the esker at the south end of

Finlayson lake by means of another huge cut, from the outlet of which the diverted water would flow into the lowlying and swampy area to the south; and finally, into the west arm of Steep Rock lake at Wagita bay, through a low spot in the intervening rock ridge.

It was required that provision be made in the diversion scheme, if possible, to facilitate the unwatering of the Western arm of Steep Rock lake should the discovery of ore under it make such a step advisable at some time in the future. For this reason, the lower portion of a small bulkhead dam near Wagita bay was included in the programme. This will function for the time being as a free overflow spillway. Diversion of the Seine river away from the Western arm of Steep Rock lake could then be accomplished later by making two minor rock cuts to the south of the swamp area, completing the bulkhead at Wagita bay to its full height, and constructing a new bulkhead to close the present outlet of Steep Rock lake. If the Wagita Bay dam is completed, the water impounded behind it will flood the swamp area previously mentioned and the diverted Seine river will continue on its course through the two small rock cuts and then by an existing watercourse to rejoin its present channel at the foot of Tracy rapids.

Fig. 1—Map of Steep Rock Lake Area.

Fig. 2—Inflow and rainfall at Marmion lake during the storm of September 15th to October 8th, inclusive, 1941.

The basic hydraulic requirements for any diversion scheme at Steep Rock lake were two in number. It must, first of all, have sufficient capacity to pass all floods which otherwise might cause Marmion lake to overflow the existing power dam and inundate mining operations in Steep Rock lake. Secondly, it must allow the Ontario and Minnesota Power Company, owners of the Calm lake and the Sturgeon Falls hydro-electric plants further downstream, the same regulation of storage on Marmion lake as they had enjoyed prior to the construction of the diversion. Therefore, in addition to providing a new route of adequate capacity for the Seine river, a combined control dam and spillway located at or near the new outlet of Marmion lake was an essential and important element of the diversion waterway.

#### FLOOD POSSIBILITIES

The Seine river rises some fifty to sixty miles to the northwest of Port Arthur and Fort William, flows in a generally westerly direction through rough territory, and finally empties into Rainy lake, a cross-country distance of approximately 130 miles. At the inlet of Steep Rock lake its drainage area is about 1,810 sq. mi. The discharge of the river at this point has been measured in connection with the operation of the Moose Lake power plant, and according to these records, the average inflow to Marmion lake is about 1,040 cu. ft. per sec. with a maximum average daily inflow of 13,230 cu. ft. per sec. These figures represent an average run-off of 0.58 cu. ft. per sec. per sq. mi. and a maximum run-off of 7.3 cu. ft. per sec. per sq. mi. of drainage area.

The question of fixing an upper limit to the flow for which the diversion was to be designed, presented a problem of great difficulty and of more than usual importance. On the one hand, the size of the various cuts and, consequently, the cost of the diversion would be almost directly proportional to the magnitude of the adopted figure while, on the other hand, if the diversion were so limited in capacity that the run-off at any time overtopped the holding structures at the Moose Lake power plant and flooded the mine, Steep Rock Iron Mines Limited, the mining company, would suffer great loss both of material and of production.

The period of record referred to above, unfortunately, from the viewpoint of flood investigation, did not commence until 1927 so that figures for only 16 years were

available at the time the engineering studies for the diversion were made. Their use as an aid in estimating the magnitude of possible large floods is accordingly definitely limited. This feature of the record, however, is partly discounted by the following circumstance. The maximum measured run-off at Marmion lake of 13,230 cu. ft. per sec. occurred on September 27th, 1941, following unusually heavy, prolonged, and widespread rainfall. The rainfall as measured at the Moose Lake plant is given in Table I and from this it will be seen that from the commencement of the storm on September 16th to its end on September 27th, a total of 8.03 inches was recorded for this 12-day period, while up to September 24th, three days before the maximum run-off occurred, a total of 7.13 inches was recorded. The really phenomenal fall, however, was the 4.62 inches of September 20th and 21st. Despite this extraordinary precipitation, the run-off was not excessive. For the ten-day period of heaviest flow into Marmion lake, the run-off represented, on the average, only 0.24 inches of precipitation daily on the entire drainage area or only 31 per cent of the precipitation as recorded at the Moose Lake power plant. The highest average daily run-off of 13,230 cu. ft. per sec. similarly represents only 0.27 inches of precipitation on the drainage area. These data illustrate the remarkable retarding effect on run-off caused by the numerous lakes, muskegs, and river courses of the drainage area, for even such an abnormal rainfall as that described. The graphical representation of rainfall and run-off given by Fig. 2 depicts this point in an even more striking manner than the figures given above.

As a further aid to judgment in arriving at a design figure for the maximum flow in the diversion, flood flow data for other watersheds in the district were examined. These data are illustrated graphically on Fig. 3. They include all measuring stations from Mine Centre on the west to Kaministiquia on the east. The maximum recorded flow at four of these ten stations occurred following the storm of late September 1941. These are shown by a special symbol on the figure, and it will be noted that the envelope curve for all points is defined by the points for three of these four stations.

Fig. 3—Unit flood flows for drainage areas surrounding Steep Rock lake.

Following a study of the various points outlined above, it seemed reasonable to design the diversion so that it could pass 15,000 cu. ft. per sec. without overtopping the flashboards and bulkheads at Moose lake. As an additional protection to mining operations, an earth safety dam is planned for construction in the intake channel of the Moose Lake plant. This dam will have a crest at elevation 1,375 which will allow the diversion to carry 25,000 cu. ft. per sec. (13.9 cu. ft. per sec. run-off per sq. mi. of drainage area) with Marmion lake at a maximum elevation of 1,370.0.

The crest of the bulkhead portions of the dam at the Moose Lake plant, namely, elevation 1,367, fixed the maximum flood stage of Marmion lake, since it was undesirable to add to the height of these structures. The crest of the spillway is four feet lower, i.e.—elevation 1,363. Therefore, the scheme required that this be raised to elevation 1,367 by means of flashboards so designed that they could be readily removed, should mining operations be abandoned and the Moose Lake plant put into operation again.

The layout of the Moose Lake plant is such that the minimum practical operating level for Marmion lake is elevation 1,345. This low level had been reached during the lifetime of the plant and it therefore established the volume of storage for which the diversion scheme must provide. The retention of the Moose Lake power dam, without increase in height, meant that the normal maximum operating level of Marmion lake would remain unchanged. These two facts therefore fixed one important element of the diversion, namely, that it must carry the minimum regulated flow required by the power plants on the lower reaches of the river, with Marmion lake at elevation 1,345.

The maximum regulated level of Marmion lake is elevation 1,363, while the normal level of Steep Rock lake is elevation 1,263. There is thus available a fall of 100 ft. for the 10.4 miles of diversion. This total length of 10.4 mi. is comprised of one mile of earth and rock cuts, 5.8 mi. of lake, and 3.6 mi. of new river channel.

Of the total 100 ft. of fall between the two lakes, only 34 ft. is actually available for producing flow in the various channels. This is due to the fact that the minimum practical elevation for the crest of the initial portion of the Wagita Bay dam is 1,325 and to pass flood flows over this crest required yet another eight feet (See Fig. 4).

Preliminary studies and calculations indicated that both the flood flows and the low-water flows could be carried through the diversion route without the necessity for excavation in either Raft or Finlayson lake. Moreover, since the general elevation of the swampy area to the south of the esker ridge is well below the initial crest of the Wagita Bay dam, it was possible to produce the necessary waterway through this area simply by clearing a strip through the undergrowth and timber. It was clear, also, that while the quantities of rock to be taken out from the two Raft lake cuts and of earth and rock from the esker cut were large, they

Fig. 4—Water surface profiles along the diversion.

Fig. 5—Raft lake east cut looking east from the control works.

were by no means excessive. These circumstances, therefore, not only eliminated any difficult and expensive swamp work but concentrated all excavation at three large cuts, where the material was relatively easy to take out and where disposal areas were close at hand and readily accessible. These features were a very attractive part of the adopted scheme since they contributed directly to shortening the construction period as well as to lowering the actual excavation costs.

Before making the detail hydraulic computations for the diversion, it was necessary to assign values for the friction coefficients to be used and also to determine, if possible, the location of the hydraulic controls. For a project being constructed on a rush schedule under wartime conditions, it is evident that the supervising engineer cannot maintain the same close control over construction methods and equipment as is possible on a normal peacetime job. Anticipating, therefore, that the sides and bottom of the rock cuts might be quite rough and indented, a friction coefficient of  $n = .045$  was selected for all surfaces excavated in solid rock. It was felt that this figure would provide a fair margin of safety and yet not be unduly pessimistic. For the heavy rip-rap lining on the wetted perimeter of the earth portions of the esker cut, a friction coefficient of  $n = .045$  was also adopted.

At the outset, it was obvious that the spillway and sluices at the outlet of Marmion lake would form a hydraulic control, as also would the Wagita Bay spillway. On the other hand, superficial examination and preliminary figures did not disclose whether or not the esker cut would form an intermediate control, and it was not until some considerable study had been given to this problem that the matter was finally determined.

As will be seen from Fig. 4, the profile of the water surface at the lower end of the esker cut is very sharply curved while at the upper end it is quite flat. This results from the fact that the elevation of the invert of the cut was determined,

within close limits, by the general slope of the diversion profile and that it was important to keep this elevation as high as possible in order to avoid excessive excavation. The effect of this was to produce a channel relatively shallow in proportion to its width and therefore hydraulically inefficient. This feature, combined with the high friction of the bottom and sides, produced a water surface profile having marked "drop-down" characteristics unusual in artificial channels.

This was a fortunate circumstance, as related to the general hydraulic problem of head loss determination. As mentioned above, the waterway from the outlet of the esker cut to the Wagita Bay spillway was nothing more than a right-of-way cleared through timber

and underbrush. The friction co-efficients for such an unusual channel are not known with any degree of accuracy and hence it was impossible to calculate the losses in this stretch with any great precision. However, due to the shape of the profile through the esker cut, this was a matter of no importance because this lack of precision would have but very little effect on the level of the water surface at the entrance to the cut. If the losses in the stretch in question were sufficiently low, the esker cut would form a hydraulic control and the water level in it and at all points upstream would be unaffected by the flow downstream. With increasing losses, the control disappears and it is evident that the water surface profile in the cut moves downstream. Because of the sharp curvature of the profile at the downstream end, this lateral shift is comparatively small for quite wide variations in the losses in the cleared channel. On the other hand, the small lateral shift produces but very little change in the water surface elevation at the upstream end of the cut since the profile

Fig. 6—Raft lake west cut looking east; the control works can be seen in the background.

Fig. 7—The Marmion lake “plug” just before blasting.

here is quite flat. In other words, it was possible to determine the overall hydraulic losses from the upstream end of the esker cut to the Wagita Bay spillway with reasonable accuracy, even though the water level at intermediate points, as calculated, might be only quite approximate.

According to these studies, backwater from the Wagita Bay dam extends up to the downstream side of the spillway at Raft lake for all flows below about 22,000 cu. ft. per sec. For flows larger than this amount, this spillway becomes submerged and the level of Marmion lake is then influenced by the hydraulic characteristics of the entire diversion route.

It was originally planned to construct the spillway and control dam at the Marmion end of the Marmion-Raft cut. While this was the logical place for such a structure, this location involved either extensive cofferdamming or the drawing-down of Marmion lake to levels which would allow construction in the dry. Neither of these alternatives was very attractive; the former required considerable expenditure of materials and labour, while the latter entailed loss of storage and power. Consequently, the mining company would be under the necessity of supplying replacement power at an early date in the construction schedule. Accordingly, various other possible sites for the combined spillway and control dam were studied, but it was not until mid-summer of 1943 that a final decision was made. By that time, the pumping out of Raft lake had disclosed the existence of a reef of ledge rock near the end of the Marmion-Raft cut, so located that the required structures could be easily constructed on it with a minimum amount of materials and labour. Owing to the necessity of maintaining the elevation of

Marmion lake within the range of levels previously described, the adoption of this site as against one at the outlet of Marmion lake, carried with it the necessity for accepting a very small, but nevertheless permanent, loss in diversion capacity. It was considered, however, that the advantages of the new site, from the viewpoint of constructional facility, far outweighed this factor and, accordingly, it was adopted.

#### MAIN DIVERSION WORKS

##### RAFT LAKE CONTROL DAM

The Raft Lake control works consist of a concrete gravity spillway section 820 ft. long, with crest at elevation 1,363 to conform with the existing structure at Steep Rock falls, three regulating sluiceways each 10 ft. wide with sills at elevation 1,340, and one log sluice 10 ft. wide with sill at elevation 1,352. The three regulating sluiceways and the log sluice are closed with timber stop-logs, handled by a spud-type, gasoline engine powered hoist operated from a reinforced concrete deck which spans the sluiceway openings. This deck is set at elevation 1,372, well above high flood levels, and allows access to the hoist at all

times. While the location of the spillway provided a minimum of construction difficulties, it did introduce one design complication. Much of the spillway is less than five feet high, its forebay is small, and an unduly large section would have been required to resist a thrust resulting from expansion of an ice sheet against it. Therefore, a one-on-two batter was provided on the upstream face for five feet below the crest to reduce this possible ice pressure. On sections more than five feet high, maximum ice pressure, taken as 10,000 lb. per lin. ft., was assumed to act at elevation 1,358. Even with these provisions, a much heavier cross section than is usual was required.

##### WATERWAYS

Both of the Raft Lake cuts are located in soft, schisted green stone. The overburden is scanty, so that of the

Fig. 8—Raft lake east cut; wedge-shaped wave approaching the Raft lake spillway after blasting the Marmion lake “plug”.

Fig. 9—Raft lake control works and spillway.

total of slightly over 500,000 cu. yd. of excavation required at these two points, rock accounted for nearly 96 per cent. The section adopted for these cuts is rectangular in shape, 100 ft. wide, with the invert on a level grade at elevation 1,340. For the east channel, this meant a maximum depth of cut of about 60 ft., while for the west channel the maximum depth is about 90 ft.

The esker at the south end of Finlayson lake rises to a maximum elevation of 1,475 and is about 1,500 ft. wide at the base, measuring from the lake on the north to the swamp on its south side. In order to pass the required amount of water at low stages in Marmion lake, it was necessary to set the invert of the channel at elevation 1,338. The maximum depth of cut was therefore 137 ft. Side slopes in earth were made 1 on 2, and the net bottom width of the earth section 180 ft.

The material above elevation 1,350 is a poorly graded sand and gravel mixture. Below this there occurs a fine sand, with such uniformly sized particles that it becomes "quick" when thoroughly wet. To prevent this material from being washed out, the cut was located to take advantage of sub-surface rock contours so that at least the inlet would be in non-erodible material and excavated rock was used to line the wetted perimeter of the remainder of the cut. This lining was carried up to elevation 1,354, the maximum water surface elevation at the assumed highest flows. To reduce excavation, the rock cut at the inlet was made 160 ft. wide with walls practically vertical.

In accordance with the basic design for the diversion, as outlined above, and also to provide suitable facilities for logging operations, a channel 300 ft. wide was cleared through the timber and underbrush in the swamp area between Wagita bay and the esker cut.

At the depression in the rock ridge through which the swamp drains into Wagita bay two dams were required, one about 500 ft. long with a maximum height of 14 ft., and

the other about 700 ft. long with a maximum height of 30 ft.

The former of these is an earth dam, and was built to its full height, i.e., with crest at elevation 1,343. The top width is 10 ft., the upstream slope 1 on 3, and the downstream slope 1 on  $2\frac{1}{2}$ . A cut-off is formed by a single row of Wakefield sheet piling. The longer dam is a standard, concrete, gravity-type bulkhead with a sluiceway to be closed by timber stop-logs. To allow the diverted river to flow into Wagita bay, a 100-ft. length of the bulkhead was built to elevation 1,325 only, to form a free overflow whenever the water rises above this height. The length and height of this section were fixed by the dual requirement of preventing flooding of near-by mining claims and of maintaining a low holding contour to the south.

To facilitate future completion of this bulkhead section, the sill of the sluiceway was placed at elevation 1,315, and the piers and approach bulkhead section built to full height. The sluice will pass all low water flows up to and including the average flow of the river, with the upstream water surface at elevation 1,325 or lower. Thus the structure can be completed during any future low water season without the necessity of unwatering.

#### THE NARROWS BULKHEADS

At the South Narrows bulkhead site, ledge rock outcrops at the southerly end only, the remainder of the foundation consisting of ledge rock overlaid with soft clay to a maximum depth of 18 ft. At the deepest point of the Narrows, the dam has a height of 60 ft., which makes it an outstanding structure of its type.

Where the foundation consists of exposed ledge, ordinary rock-filled timber cribs were used, with a blanket of suitable material deposited to form a seal at the upstream toe. For the remainder of the bulkhead, two parallel rows of steel sheet piling, spaced 30 ft. apart, were driven through the overburden to bed rock. One row of  $1\frac{1}{2}$  in. rods and turn-buckles, five feet below the top of the piling and spaced at intervals of five feet

Fig. 10—Earth excavation in progress at the esker cut.

Fig. 11—Esker cut nearing completion.

tie the two rows of sheet piling together, and double channels bolted to the piling act as wales. The space between the two rows of sheet piling was filled with gravel. Rock fill was placed against both the upstream and downstream faces of the bulkhead. This somewhat unusual design was selected because a minimum amount of steel was required—an important consideration in wartime. At the same time, it made full and effective use of the natural materials which the site abundantly provided.

The North Narrows bulkhead, only 30 ft. high at the maximum section consists of a gravel fill central portion flanked by rock fills. A single row of steel sheet piling driven through the gravel core forms a cut-off.

#### CONSTRUCTION SCHEDULE

It was late in the winter of 1942-43 before the project had advanced to the stage where a general contract could be let. The goal set was the shipping of ore before the close of navigation in the fall of 1944. Such an accelerated programme meant that Steep Rock Lake must be sealed off and the diversion completed by mid-December 1943, to allow time for unwatering Steep Rock lake and for stripping the ore body. Despite the huge quantities of material to be excavated, this date of mid-December was actually met and pumping of Steep Rock lake commenced on December 15th, 1943.

Work got under way in the first part of April 1943, with the driving of a tunnel 350 ft. long by 10 by 12 ft. in cross-section under the esker to drain Finlayson lake. At the same time, excavation of the esker cut itself was commenced.

Construction of the initial stage of the Wagita Bay dam started in mid-May 1943. Obviously, it was necessary to complete this operation before the tunnel was holed through and water from Finlayson lake passed on to Steep Rock lake.

The two Raft lake cuts involved the excavation and disposal of over 500,000 cu. yd. of rock. Within the short time allowed by the schedule, this could only be done by working simultaneously from four faces. Since the volume of Raft lake down to the grade of the cuts was only 600 million gallons, this water was pumped out as an initial operation at this point. This allowed excavation from the Raft lake end of the two cuts to be done in the dry and proceed against a full working face. As explained above, it was required that Marmion lake be maintained at its normal elevation until the diversion

was completed. It was therefore decided to follow a procedure at this point which had been successful twice before under similar circumstances. This called for leaving a rock barrier between the cut and Marmion lake, which barrier would be blown out as a final operation, with any loose rock not removed by the blast, excavated thereafter in the wet. It was therefore necessary to ramp down about 30 ft. at this point before a full working face could be developed. After the bulk of the water from Finlayson lake had been drained, it was possible to start a fourth face at the Finlayson lake end of the west cut. It was necessary to leave only a small barrier or "plug" here.

#### SPECIAL CONSTRUCTION FEATURES

Construction methods and procedures were governed almost entirely by the time limitations which the construction schedule imposed. At Raft lake, standard well-drilling methods, using seven-inch holes spaced 20 ft. on centres and drilled five feet below final grade, were employed on the east cut while a diamond drilling method new to construction was used on the west cut. Here a shaft was sunk on the centre line at each end of the cut, and a drift seven feet square established between them with its invert three feet below grade. Vertical  $1\frac{1}{2}$  in. holes spaced ten feet on centres, in rows six feet apart, were drilled from the surface to within two feet of the top of the drift. Horizontal holes, at three feet centres, were drilled from the drift to the walls of the cut. These assured a level floor for mucking. The cut was advanced in 12-ft. slices, two rows of vertical holes and four horizontal holes being fired simultaneously. Views of typical surfaces produced by these two methods of excavation are shown in Figs. 5 and 6. The well-drilled cut has uneven, shattered walls, with about 15 per cent overbreak, whereas the diamond-drilled cut has extremely smooth walls and the overbreak amounted to only two per cent.

Before the diversion, Finlayson lake stood at elevation 1,396 and drained northward and eastward into Marmion lake. As part of the programme, therefore, it was necessary to lower this lake to about elevation 1,345, which would be its normal elevation after the diversion. Under ordinary procedure, the emptying of this lake would have been accomplished by making use of the esker cut after the latter had been completed. Because of unavoidable delays in getting construction

Fig. 12—Completed esker cut looking south.

Wagita Bay dam.

under way, the engineers of the mining company decided to try an alternative scheme which, if successful, would shorten, by several months, the time to complete the diversion itself.

This involved excavating a tunnel, 10 by 12 ft. in cross-section and 1,350 ft. long in the rock underlying the esker. The starting point was an outcrop on the southerly side of the esker and the tunnel was driven northward until a point under the lake bottom was reached. Here a shaft was stoped out until only a very few feet of rock was left. This latter was heavily loaded in the hope that the blast from the charge would clear a hole through the 21 feet of overburden which existed at this spot. Previously, two large sumps had been excavated in the tunnel, one near the foot of the shaft and the other near the outlet, to catch any large pieces of rock not thrown clear by the blast and so prevent them from blocking the tunnel. The operation was entirely successful, flow starting immediately after the charge was fired. Despite the heavy shot only a moderate "boil" appeared on the surface of the lake, which at this point was 36 ft. deep.

It was computed that flow through the tunnel, at the start, would be about 2,300 cu. ft. per sec. and that the level of Finlayson lake would drop about six inches per day. Actually the rate of flow was higher than this and the lake dropped about seven and one-half inches per day. In anticipation that control of the tunnel flow might be required, stop-log checks were formed in the rock near the outlet.

The drainage tunnel under the esker enabled Finlayson lake to be lowered almost to its final normal level. The "plug" left at the west end was therefore

small and easily blasted. At the east end it was quite different. Here, a wall of solid rock over 30 ft. high and containing about 7,000 cu. yd. was of necessity left for the final break-through. The blowing of this "plug" was a very spectacular affair.

The South Narrows bulkhead was completed in one operation. At the smaller North Narrows bulkhead, an opening was left at the centre sufficiently large to pass the flow from the Moose Lake power plant.

At the beginning of October, the sluices at the Moose Lake dam were opened and Marmion lake drawn down sufficiently to allow placing the flashboards on the spillway. After this was done, the dam and power house intake were closed, the plant was shut down, the North Narrows bulkhead completed, and pumping started on December 15, 1943, as previously noted. The diversion itself was put into operation on January 26, 1944, the power plants downstream being supplied

in the interval with water from Finlayson lake and from the Steep Rock lake pumps. Figure 7 shows the Marmion "plug" before blasting, Fig. 8, the first wedge-shaped wave approaching the Raft lake control works. Figure 9 shows water flowing over the control works and spillway shortly after the blowing of the Marmion "plug".

The drainage tunnel at the esker passed the flow of the Seine river until the completion of the cut on April 26, 1944. Figures 10 and 11 show this cut under construction, and Fig. 12 the completed job.

Table II is a summary of total quantities of rock and earth excavated for the diversion. The bulk of this work was done between April and December 1943, a period of only nine months, and was entirely completed by April 1944.

# DIAMOND DRILLS AND WELL DRILLS ON THE RAFT LAKE CANALS AT STEEP ROCK

C. H. HOPPER, M.E.I.C.  
Consulting Mining Engineer, Boyles Bros. Drilling Co. Ltd., Vancouver, B.C.

Paper to be presented at the Fifty-Ninth Annual General and Professional Meeting of The Engineering Institute of Canada, in Winnipeg, Man., on February 7th, 1945

The Raft Lake canals are part of the extensive Seine River diversion scheme (Fig. 1) carried out by Steep Rock Iron Mines Limited to enable them to pump Steep Rock Lake dry and mine the otherwise inaccessible high grade iron ore bodies known to exist in the lake bottom. The two canals have similar dimensions and they are in the same formation. The central section of the east cut was broken by well drill blasting supplemented by jackhammers and the central section of the west cut was broken by a method employing diamond drills and a pilot tunnel. Thus the physical setup was excellent for comparison of the two methods and many interesting differences were brought out during the course of the work which the author will endeavour to state fully in this paper.

All the work at Raft lake and the bulk of the other work at Esker cut, various dams, camps, and road construction was contracted to C. A. Pitts General Contractor Limited, under a very exacting time schedule. As far as the work at Raft Lake was concerned, the general contractor found that he had insufficient well drilling equipment to undertake both cuts at the same time and therefore, with the sanction of Steep Rock, he let a sub-contract for the drilling and blasting of the deep central section of the west cut to Boyles Bros. Drilling (Eastern) Limited who had suggested a diamond drilling method adapted from the underground method employed by several large Canadian mining companies.

## GENERAL CONDITIONS

Raft lake occupied a rock basin, about a quarter of a mile in diameter and 80 ft. deep, located in the centre of the  $\frac{3}{4}$  mile rib of rock between Finlayson lake on the west and the Seine river (Marmion lake) on the east. In the spring of 1943, it was accessible only by water as it was situated in an undeveloped section of pre-cambrian rock and muskeg, 16 miles north of Atikokan, Ontario (A station on the Canadian National Railway 142 miles west of Port Arthur). It was evident that only light drilling and stripping equipment could be moved in over the water route and this was done in May. The heavy trucks and shovels could not be placed on the job until a road had been constructed and that was not possible before August. As it turned out, blasting and excavation of the west cut could not have commenced before August because excavation was entirely dependent upon the dewatering of Raft lake and also upon the water level of Finlayson lake, neither of which were low enough before August to permit the establishment of ramps and starting faces at the ends. For this reason the hole spacing and method had to be chosen without trial on both cuts and most of the drilling was completed before blasting could begin.

The cuts on both sides of Raft lake were in solid greenstone or pillow lava with a distinct vertical slaty cleavage. One dike of harder diorite 50 ft. wide formed a high ridge on the west cut but all the rock may be considered good drilling for all classes of equipment. The rock surface was smooth and solid owing to glaciation but it was very hummocky on the west cut. The tops of the hummocks were bare rock somewhat

decomposed to a depth of 4 or 5 ft. and the depressions were usually filled with hardpan, clay and muskeg to a depth of from 4 to 15 ft. Such potholes had to be excavated by dragline and by hand labour before the rock below could be drilled off.

The construction of access roads and ramps to four faces was a big job as was the lake pumping, stripping, and the preliminary work in establishing the four faces squared up to sufficient height to warrant either the well drill or diamond drill method. For the purpose of this paper, all these things will be considered as done, and detailed description will be confined to the central sections of the two cuts; but because the diamond drilling of blastholes is new to construction work and because this is the first cut to employ a diamond drilling method exclusively, a full description of the west cut will be given. Description of the well drill cut, on the other hand, will be brief as it followed methods that have been familiar to construction men throughout the country for many years.

## THE EAST OR WELL DRILL CUT

### GENERAL

The east cut was relatively flat on top with some shallow areas of muskeg and clay that had to be removed by dragline because they would not support

Fig. 1.

Fig. 2—The "Diamond Drill" Canal.

Fig. 3—The "Well Drill" Canal.

equipment. The east toe was submerged under Marmion lake and had to be left as a natural dam until it was blown out on completion of the job, but the relation of Marmion lake to grade was such that a face could be started by ramping down from just above water level until grade was reached and a light  $\frac{3}{4}$ -yd. shovel and two trucks were brought in on a scow to get this face started. A start could not be made on the Raft Lake No. 2 toe until the middle of August when Raft lake was almost down to grade and the well drill blasting was not under way there until September 1st.

During April and May 1943, Camp 5 was established on the east side of Raft lake to accommodate 250 men and was furnished with a bit sharpening shop for both well drills and jackhammers. The six well drill rigs, compressors, gas and oil and the pumps and pipe for dewatering Raft lake were all moved in at this time under very difficult tractor hauling conditions on the mile of muskeg road between the dock at Finlayson lake and the camp. The starting up cost of the well drilling was therefore quite high.

#### CHURN OR WELL DRILLING

Once the well drilling was under way it became a self-contained operation not subject to delays from outside sources. Drilling on the central section of the east cut started on May 26th and continued until September 10th during which 16,558 ft. of 7-in. hole was put down to an average depth of 58 ft. at an average rate of 16 ft. per ten-hour drill shift. The Keystone No. 26 Model 51 drills were all self propelled and crawler mounted and each valued at about \$10,000 when new.

In well drilling operation, a heavy steel stem with a large chopping bit on the end, the whole thing weighing about a ton, is lifted and dropped in the hole on about a 30-in. stroke. The face of the bit is forged to a special design to clear cuttings and to maintain the gauge of the hole and is tempered and heat treated to withstand

considerable abuse. The bits averaged about 12 ft. each sharpening and were taken to and from the job by a small service tractor pulling a stone boat. The drill rig is heavy and some side hill setups were difficult as a firm solid base had to be built up. A crew of two men tended each machine and would expect to drill from 10 to 30 ft. in a ten-hour shift for which one or two bits would be required.

#### BLASTING

Spacing and burden were both about 20 ft. and all holes were drilled 5 ft. below grade. Once a face was established it was not carried at right angles to the direction of the cut but rather at a skew to suit the direction of the vertical cleavage of the rock which made an angle of 60 deg. with the centre-line. (Cleavage N. 42° E., cut N. 78° W.). The corner holes on the tight side were left each time for the following shot. Seventy-five per cent polar foreite gelatin in 6 by 15 in. cartridges was loaded throughout and detonated with instantaneous electric blasting caps. The charge was not decked as it was found necessary to load a solid column to within 20 ft. of the top using a primary factor of 1.25 lb. per cu. yd. The holes were then filled with sand stemming. A one row shot would yield from 4,000 to 5,000 cu. yd. of broken rock in a loose wedge-shaped pile 25 ft. high near the face and tapering to nothing about 150 ft. away.

As the operation progressed it became evident that, although the rock was relatively easy to break, the bottom was very tight due to the formation being more or less slaty and standing on end,—and often failed to break to grade. This was a serious handicap because of the restricted working space and the demand for speed. Had there been other working faces there might have been time to drill snake holes in the face or do the necessary jackhammer trimming without holding up the mucking. As it was, a number of situations developed that caused delays to production and considerable secondary work.

Overbreak of 20.8 per cent at the walls was average for well drill blasting of this nature although payment was made for overbreak up to 12 per cent only. The walls themselves were rough, embayed and badly cracked in places, necessitating a substantial amount of scaling and jackhammer trimming.

The heavy loading of the holes together with the easy cleaving nature of the rock caused some backbreak although that in itself was no handicap, but sometimes wide cracks opened up 20 or 30 ft. behind the row blasted causing offset holes and difficult loading. On several occasions, cracks up to 12 inches in width opened right along the row of holes behind the shot and if this row happened to be cased through overburden, parts of the holes might be filled and be difficult to clean and load.

The muck pile was a characteristic well drill product. In other words there was a considerable range in size from dust to large blocks in a big loose pile with the larger pieces usually resting on top where they could be readily blockholed. As the work progressed, more jackhammers and compressors were added and fragmentation was improved by "blockholing in the main shot." In other words the spaces between all the well drill holes were drilled off by jackhammers to a depth of 18 ft. on a 6 by 8 ft. pattern. This is considered to be secondary work in this paper.

#### SHOVELLING AND HAULING

The material was loaded by  $2\frac{1}{2}$  and  $1\frac{1}{2}$  cu. yd. Northwest diesel shovels into 15-ton Euclid trucks and was hauled an average distance of about 800 ft.

up ramps at both ends so that all the material was elevated a vertical distance of about 30 ft. The dumps were built out into Marmion lake and Raft lake and were kept in condition by bulldozers which were also used to clean up the scattered muck on the floor immediately after each blast. During part of the operation two shovels were used at one face, and sometimes at both faces, without much difficulty as the skew of the face and the overbreak gave a clear width of 120 ft. for swinging the shovels.

Production per shovel shift was poor especially during August when several lengthy idle periods were occasioned by the jackhammer work necessary on the floor of the cut after several shots had failed to break to grade. Even on the basis of actual operating time, production seldom exceeded a rate of 800 cu. yd. per ten-hour shift and, although this may be partially explained by the facts that the equipment was not as new nor the operators quite as skillful as those employed in the west cut, it was also due in some measure to the blockholing of big muck and the necessity of working around occasional big pieces buried in the pile.

### THE WEST OR "DIAMOND DRILL" CUT

#### GENERAL

The surface of the west cut was more rugged than that of the east cut as it consisted of a series of rounded rock hummocks with muskeg potholes between them which were sometimes 15 ft. in depth. The excavation of the muck from these potholes was a costly job for the light dragline equipment that could be brought in via the water route, and when they were cleaned out it became evident that a lot of staging would be required for drilling on the many steep side hills. For instance, the highest hump, where the cut depth was to be 90 ft., dropped off 40 ft. on both sides with slopes of 45 to 60 deg. (Figs. 4 and 5).

The toes on both the Raft Lake and Finlayson Lake ends were entirely submerged to cut depths of 56 and 58 ft. respectively when the job started in May. The east toe was blasted on August 15th and the first shot on the central section August 26th. The west toe was blasted on September 5th, but the first shot on the central section was not fired until October 15th because of a series of blasting, ramp and water seepage difficulties unrelated to work on the central section. The east and west faces were known as No. 3 and No. 4 respectively.

Finlayson lake became clear of ice on May 11th and immediately six gasoline powered diamond drill outfits were moved by scow and tractor to the site of the cut. A tent was erected for temporary accommodation of the men prior to construction of Camp 6, and a 12 by 26 ft. storage and repair shop was established near the work. Drilling commenced on May 19th and continued until October 24th, during which 171,253 ft. of 1½ in. (E) hole was completed on the central section at an average rate of 112 ft. a ten-hour drill shift. Ten Boyles Bros. Model BBS—1 diamond drills powered with air-cooled Wisconsin gasoline engines were employed during the first two months but when compressed air was made available in July, a change was made to Boyles Bros. J V underground type drills. The gasoline drill is valued at about \$1,425 and has a hoist and cable with which to pull itself about on long moves. The J. V is valued at about \$1,000, has no hoist but is very light and easily moved.

#### THE SUB-CONTRACT

The diamond drilling and blasting on the west cut was done for 75c a cubic yard on a fixed price sub-

Fig. 4—Muskeg pothole and highest hump.

Fig. 5—Same view as above showing drills and staging.

contract basis by Boyles Bros. Drilling (Eastern) Ltd. for C. A. Pitts General Contractor Limited under the following contract terms.

In general, the work was to be carried out according to the terms of the pre-existing agreement between the general contractor and Steep Rock Iron Mines Limited based on the completion date, October 31st, 1944. The cut was to be 100 ft. wide with vertical side walls although overbreak up to 12 per cent beyond these limits was to be allowed and paid for.

The subcontractor agreed to drill off, blast and break approximately 245,000 cu. yd. of rock from the proposed canal and perform such secondary drilling or blasting as was required to render the rock muck to a size that could be economically and efficiently loaded by the shovels (2½ cu. yd.) into the trucks (15 ton) that were available for the work, but normally no one piece of rock was to be of a greater size than 40 cu. ft. The work was to be under the direction of the general superintendent of the general contractor and was to be planned to suit the progress schedules established from time to time.

The general contractor agreed to furnish camps, board and transportation on the same basis as was provided for and charged to their own employees. He also agreed to supply compressed air and water under pressure to the drill sites for operation of the drills, squared timber for staging, stripping of overburden from the rock surface, lights at night, transportation of men and equipment to and from the railhead at Atikokan and the necessary underground openings required by the method adopted.

It was understood that the diamond drilling yardage contract would apply only after the toes on both ends had been excavated by the general contractor to vertical faces more than 40 ft. in height.

Fig. 7—General view of surface drilling.

Fig. 8—Same view as above after excavation started.

holes  $1\frac{1}{2}$ -in. pipe collars were set a foot or two into solid rock. On sidehills where setups might be as much as 15 ft. above the rock, long pipes were set to help reduce vibration in the string of drill rods.

As two or three moves were commonly made in a shift, it was not convenient to have any shelter over the drills and during wet weather the crew wore rubber overalls, coats and sou'wester hats. It must be remarked that such an operation would be slowed up considerably by winter weather because heated shelters would have to be made as well as provision for coil stoves to keep the water supply line from freezing.

The underground portion of the drilling was carried out under much better operating conditions than those mentioned in the preceding paragraphs. Each setup was identical with the one before it, and consisted simply of a 6-ft. mine bar set vertically in the centre of the tunnel to which the J.V. air drill was clamped. There was no need for timber staging, eyebolt holes or casing, the labour requirement was very much reduced in comparison, and the crew was sheltered from variable weather conditions. These advantages were reflected in the fact that the total cost of underground drilling was roughly 20c per ft. less than the surface drilling. The only important problem that developed underground was due to inadequate or broken pumping equipment as the tunnel, being 2 to 3 ft. below cut grade, acted as a sump and would be flooded after a heavy rain. Normal drainage into the shaft sump was from 50 to 100 gal. per min.

The bulk of the drilling was carried out with a non-coring concave type blasthole bit set with about 300 diamond borts having a total weight of about 6 karats valued at \$4.00 per karat. Average per bit was 62 ft., average per ten-hour drill shift was 112 ft. and per manshift 50 ft. Some exceptionally high drill shifts were reported and the record on surface was 212 ft. and underground 237 ft. The emphasis on this job was

on footage, encouraged by a footage bonus, although this tended toward a considerably poorer bit performance and consequent diamond cost than would be expected on a similar job not rushed. Vibration was the chief problem encountered in the drilling and it was not eliminated throughout the job. At any depth after 30 ft. the rods might start to slap from side to side in the hole, sometimes violently enough to stall the machine, and although all varieties of rod grease, gear dope, cable dressing and axle grease were used on the rods in an effort to reduce vibration none had a lasting effect. A possible remedy might have been the use of special heavy blasthole rods of a diameter more closely approaching full hole size but delivery of such tubing could not be expected during the life of the job and therefore a trial was not possible.

#### BLASTING

The main features of the method were the use of small diameter, extra long holes widely spaced and the establishment of a pilot tunnel or drilling drift through the centre of the cut  $2\frac{1}{2}$  ft. below grade from which horizontal holes were drilled to the walls. In other words the widely spaced vertical holes would break to the wide free face but not to bottom and in order to avoid springing long holes and to ensure breaking perfectly to grade, closely spaced lifters were employed. The lifters had to be drilled from a tunnel as there was only a 100-ft. width of face and mucking had to be continuous there. Had there been more working face it might have been economic to have used standard lifters in the face drilled with jackhammers or a wagon drill.

The layout was as shown in Fig. 6. The spacing of 10 ft. and burden of 6 ft. were established by experience at various mines and proved satisfactory for this ground but, as most of the cut was drilled off before blasting could begin, it must be recognized that good fortune played a major part. Holes were placed at 3-ft. intervals along the boundary rows until blasting results proved they were unnecessary in this ground. The boundary rows were drilled one foot outside the theoretical limit to allow for a possible deviation inward of some of the holes because the specifications called for a cut 100 ft. in width at the bottom.

From a blasting standpoint it is preferable to blast one complete 6-ft. slice at a time from a given face, and this is commonly done in mine work, but one row shooting would throw down too small a muck pile for a good shovelling and loading schedule and therefore a two row shot was adopted. A two row shot would place from 2,500 to 4,000 cu. yd. of broken rock in front of the shovel every blast, depending upon the height of the face. The two rows of vertical surface holes at 6-ft. burden and four rows of horizontal underground holes

Fig. 9—General view of west cut looking across Raft Lake.

Fig. 10.—Face of west cut immediately before a blast.

Fig. 11.—Face of west cut immediately after a blast.

at 3-ft. burden, a total of 45 holes, were fired instantaneously with a 3A blasting machine and No. 8 electric blasting caps. Polar forcite gelatin 75 per cent in  $1\frac{1}{4}$  by 8 in. cartridges was used throughout because of its concentrated strength and shattering action.

The effect of the blast was to kick off the face and shatter it without any lifting to cause overbreak or backbreak. The broken rock would fall into a pile about 30 ft. high 20 ft. out from the centre of the face and slope off to the sides and to grade about 100 ft. from the face. The little rock that was thrown beyond the 100-ft. line was quickly cleared up with a bulldozer. Little secondary breaking was necessary and was confined to sandblasting. The walls and face were commonly clear of loose rock requiring scaling, except along the top edge, as there was a marked tendency to break cleanly from hole to hole in a straight row and often the powder burn mark of every face and wall hole could be seen from top to bottom. The horizontal holes invariably broke to grade and made a level mucking floor across the central section. However, in one bottom corner out of four, small toes would be left about 12 ft. high and 6 ft. out from the wall. These proved worrisome at first but to prevent delays they were usually ignored and the cut advanced leaving the toe along the wall until a convenient time permitted the whole thing to be cleaned up. Very little time was involved in this clean

up work as it became apparent that the bootlegged horizontal holes were easy to find, clean out and reblast. Thus it will be seen that the need for a jackhammer crew was practically eliminated on this portion of the cut.

After a shot was fired a seven-man crew would start preparing the next one. The tops of the holes would be tested with an 18-ft. loading stick to determine if they were clear. Generally if any shifting had taken place it would be at flat weathered joints a few feet below the top in the front row of holes. If displacement was slight, an E chopping bit on X-ray rods was used with hand wrenches to clear it, but if the ground had shifted too much for that, the tops of such holes were loaded ready to be blasted at the same time as the sandblasting of the muckpile. A four-man surface crew would then proceed with the blowing out of the clear holes and a three-man crew would go underground to blow out and load as many holes as they could behind the muckpile. Generally, most of the holes were clear although four or five might require the use of the chopping bit. If they required to have their tops blasted off the resulting muck was shovelled over the edge until the collars were relocated on a flat bench a few feet below the top. The men wore safety belts for work of this nature.

The surface holes were then loaded by dropping one cartridge of dynamite at a time, listening to make sure that it

went to the bottom, and tamping every ten cartridges with a multiple loading stick made in 5-ft. sections which were first bored and slotted and then threaded on a sash cord. The front row was loaded with a solid column of dynamite to about 3 ft. from the top and the primer was placed second cartridge from the top. The back row was loaded solid to 10 ft. from the top and then alternately with 12-in. wood spacers and cartridges of dynamite to 3 ft. from the top with the primer placed second cartridge from the top of the solid loading. The spacers were used to keep backbreak and shifting to a minimum. All the holes were then filled to the top with sand stemming.

The underground holes gave comparatively little trouble. A bulkhead was used to prevent the muck from falling back into the tunnel and to prevent the shovel from pushing more in. While the shovel was mucking, the three men would clean and load about 10 of the 16 holes solidly to about 5 ft. from the collar, placing the primer second cartridge from the collar and filling the rest of the hole with clay stemming wrapped in paper. The shovel would advance first in the centre of the face to clear the tunnel and the loading crew could then hand muck the bottom, move back the bulkhead and clean and load the front holes while the shovel was cleaning the corners. In this way the shot was commonly

loaded, connected and ready to fire as soon as the shovel finished mucking.

#### SHOVELLING AND HAULING

The average haul of 800 ft. and the building of the dumps at both ends to an elevation of 20 to 50 ft. above grade was practically identical to the set-up on the east cut. 2½-cu. yd. No. 80 D North-west shovels did the bulk of the work and one shovel operating in a face proved much more efficient than two shovels. Three and sometimes four 15-ton Euclid trucks were provided to dispose of the muck from each shovel and these did excellent work especially in hauling full loads up the very steep (20 per cent) ramp at the west end.

The muck pile was usually well broken. A few shots required no secondary breaking at all but, on the average, about 250 lb. of 75 per cent forcite was employed in sandblasting each two row shot. However, as the shovel worked in close to the face it often happened that sections of ground had broken into flat slabs which nested together vertically and caused some bucking of the shovel.

The capacity of one shovel adequately supplied with trucks was close to 1,000 cu. yd. per ten-hour shift and this was often reached. By reference to the table of comparative data it will be seen that the shovel production per shift for the best month including all lost time was 901 cu. yd. on the west cut and 662 cu. yd. on the east cut. Similarly the overall average of 770 cu. yd. per shift on the west cut compares with 570 cu. yd. on the east cut. This marked difference in mucking efficiency together with the big difference in overbreak yardage combine to make the speed greater and cost of excavation less by the diamond drilling method than by the well drilling method. For example, a calculation of the mucking shifts that would be required to excavate the west cut by each method is as follows:

(a) By well drill method:

$$\frac{201,914}{570} \times \frac{120.8}{100} = 428 \text{ shifts}$$

(b) By diamond drill method:

$$\frac{201,914}{770} \times \frac{104}{100} = 273 \text{ shifts}$$

In other words the rate of operation in this case may be said to be 36 per cent faster for the diamond drill method or 57 per cent slower for the well drill method. It would appear reasonable that such a big difference in speed would be reflected in overhead charges as well as in rentals of equipment and other direct operating costs. The differences in this instance, however, are probably greater than would be expected on other jobs of a similar nature.

The above high speed on the west cut is explained by the fact that, during the excavation of the 210,000 cu. yd. central section, delays were relatively infrequent, particularly during August, September and October on No. 3 face. In the final six weeks, after No. 4 face had been opened up and the weather became severe, more serious delays were occasioned by rain storms, blizzards, and water seepage. An analysis of the major delays is as follows:

Fig. 12—West canal completed; Finlayson Lake in the background.

<i>Nature of Delay</i>	<i>Lost Shovel Hours</i>
Shifted holes.....	9
Backbreak on a hummock.....	7
Snow blizzard, no loading.....	10
Passing through clay filled depressions.....	34
Elimination of toes.....	38
Experiment with 3 row shot at shaft.....	17
Heavy rainstorms and broken pumps..	80
Shovel breakdowns and repairs.....	75
	<u>270</u>

The major delays above account for 10 per cent of possible operating time. Other factors influencing shovel efficiency were shortage of trucks, absence of bulldozer from dump or during cleanup of a shot, moving in and out for both primary and secondary blasting, large blocks buried in the muck pile and the skill of the shovel operators.

#### SAFETY

No injuries of a permanent nature were suffered by the crew during the course of the work. The seven short term compensation accidents consisted of a bruised elbow when cranking an engine, two dislocated knees from falls, burns due to friction when clothing caught in a machine, burns about face from a flash in the carbide storage house, a wrenched back from lifting and a finger cut on a sharp edge of rock.

#### CONCLUSIONS

The diamond drilling method compares favourably with the well drilling method in speed of operation, in resulting condition of the canal and in cost at the Raft Lake cuts at Steep Rock.

The rate of advance through a cut was appreciably greater with the diamond drilling method because of the absence of overbreak yardage to be handled, relative elimination of delays for toe and floor trimming to grade, and better floor and muckpile for shovelling. The combined advantage in speed at Raft lake, on a basis of footage or equivalent cut completed, was approximately 36 per cent. A closer spacing of the well drill pattern would undoubtedly have reduced this big difference in speed and might reduce it to as little as 17 per cent which is the advantage in overbreak only.

The condition of the completed canals is markedly in favour of the diamond drilling method as the walls of the water channel are straight from one end of the cut to the other and roughness can only be measured in

inches whereas, in the well drill cut, embayments up to 10 ft. in depth are commonplace and reduce the hydraulic properties or capacity of the channel through the development of eddy currents. Good walls are a characteristic result of the diamond drilling method as no special pains need be taken with the blasting and this feature may prove useful to hydraulic engineers in special instances to eliminate a tedious job of careful blasting or an expensive concrete wall.

The cost basis that best expresses the ultimate cost of a canal is total cost per cu. yd. within the specified limits (i.e., per pay yard) and not total cost per cu. yd. broken. In this manner, overbreak is shown in its true light as a costly thing (although on a purely rock breaking job, overbreak may be an advantage and then the cost per cu. yd. broken would be used). In the case of the Raft Lake cuts, the total cost per cu. yd. within the limits has been estimated to have been 10 per cent higher on the well drill section. Unfortunately, details of cost cannot be published, but it is interesting to note that only 3 per cent of all direct charges for breaking on the diamond drill cut were for secondary work compared with 30 per cent on the well drill cut. The other important differences in the cost column are that the diamond drill method required major expenditures for shafts and tunnel, compressed air and water supply, and the well drill method required a bit sharpening shop and double the amount of explosives per cu. yd.

The theoretical principle that creates the above favourable picture for the diamond drilling method is scientific distribution of powder in many long holes of

smooth bore. Each stick of powder may be said to have its appointed task and no other, whereas in the well drill method, the heavy concentrated charge required to shear off to grade is entirely too heavy for breaking only and its force is wasted in the heaving effect that produces a shaken condition of the walls and resulting backbreak and overbreak.

The conclusions herein expressed apply only to rock conditions similar to those at the Raft Lake canals. Diamond drilling methods are not applicable to a great many formations or conditions where the well drills would find no trouble at all. On the other hand the diamond drills have such unique advantages for certain special rock breaking problems that an expanding future for them in construction work can be foreseen. Generally speaking, the ground should be solid and relatively free from open cracks, badly fractured areas, or a tendency for any part of the walls of the holes to cave. Bouldery overburden may prevent drilling from surface but the possibility of drilling entirely from underground might prove economic as that would eliminate work in the overburden altogether. When it is borne in mind that holes may be drilled to any practical depth at any angle—flat, up or down, it is evident that a diamond drilling layout could be made for any size or shape of cut. For example, a highway cut 200 ft. long and 25 ft. deep might be drilled off with nearly horizontal holes from setups at grade at each end. The method employed at Steep Rock would show up to best advantage on a face 200 ft. wide and 100 ft. high but its use would not be competitive where the depth was less than 40 ft.

# IRON ORE LOADING DOCK AT PORT ARTHUR

J. M. FLEMING, M.E.I.C.

*President, C. D. Howe Company Limited, Consulting Engineers, Port Arthur, Ont.*

Paper to be presented at the Fifty-Ninth Annual Professional Meeting of The Engineering Institute of Canada, in Winnipeg, Man., on February 7th, 1945

The development of the Steep Rock iron mining project includes, as an important part, the means of transporting the ore from the loading point at the mine to the market at the lower lake terminals. Very early in the development, the Canadian National Railways serving the mining area at Atikokan were asked to consider the transportation problems involved, determine the facilities required, and establish the rates to be paid for such facilities.

In general, the facilities required included a spur track connecting the mine loading point with the main line at Atikokan, a distance of about four miles and including the yard tracks at the loading point for the storage of empty and loaded ore cars; providing ore cars of special design and sufficient quantity to handle the expected volume; improvement to main line track between Atikokan and Port Arthur, a distance of 140 miles; and providing ore loading facilities at the Lakehead sufficient for the rapid transfer of iron ore from cars to ore carriers for shipment down the Great Lakes to the lower lake ore terminals. After considerable discussion and study, arrangements were completed between the Steep Rock Iron Mines Co. Ltd. and the Canadian National Railways, with assistance in financing from the Federal Government, to proceed with the building of the transportation facilities required and preliminary work on the planning was commenced in the fall of 1942.

## GENERAL REQUIREMENTS

A survey of the ore and other material loading docks in operation on the Great Lakes was made to discover the possibilities of the various docks for this particular application. The high level pocket type ore loading dock is used almost exclusively in United States lake ports for loading iron ore from railway cars to boats and is a development from the very early days of the movement of iron ore from the Mesabi range in Minnesota through Duluth and Superior. However, another type of loading dock using belt conveyors has been developed in recent years for loading iron ore, limestone and other coarse materials and this type was thoroughly investigated and considered for the Port Arthur dock.

The annual volume of shipments from the Steep Rock Mine is expected to reach two million tons during the season of navigation of 200 days. This amounts to one average ore carrier load of 10,000 tons per day during the season. Because of weather conditions causing delay in navigation and other conditions of traffic it would be quite possible to have three ore carriers arrive for loads during one day; also some grades of ore must be stored for a time until a full boat-load is available. It is not desirable or economical to store any great amount of ore in railway cars and it was, therefore, assumed that a minimum ore storage at the dock of 30,000 tons should be provided. The average loading time on American iron ore pocket docks is about two hours for a 10,000 ton cargo. Actually, record shipments of about 17,000 tons have been loaded out to one carrier in twenty minutes. The Port Arthur dock, therefore, should have a reasonably rapid loading rate in order that cargo arrangements for

shipments can be made at favourable rates in competition with the American iron ore ports. Steep Rock iron ore is fairly heavy and is expected to run from 135 to 150 lb. per cu. ft. as shipped and will be abrasive, particularly the larger size lump grades. The ore will be graded into three sizes up to nine inch and will also be graded according to analysis. It is expected that at least six grades will be shipped at first and, as development of the mine proceeds, more grades will be marketed. To provide uniform grading of a cargo of iron ore each carload will be sampled at the mine and graded while the cars are in transit to the Lakehead. These cars will then be placed at the dock in accordance with the grades to provide an average sample in the five or six cars emptied into each bin. When the bins are loaded into the ore carrier, further mixing of different bins will be made through each hatchway in the boat to ensure a good average sample in the whole cargo.

In general, therefore, the dock facilities to be provided should conform to the following conditions:

- (a) To handle an annual volume of 2,000,000 long tons of iron ore with provision for future expansion if required
- (b) To provide storage of a minimum of 30,000 long tons of iron ore ready for loading to boats exclusive of storage in cars
- (c) To provide facilities for mixing the ore as graded when unloaded from cars into bins and from the bins into a boat
- (d) To provide rapid loading of boats consistent with present American practice.

The high level pocket type iron ore dock in use at American lake ports meets all these conditions fully but because of the cost of this type of dock, particularly when the railway approach is such a large factor, it was necessary to make comparisons of the capital and operating cost for such a dock with other types to determine whether the high level pocket type would be justified for this application.

## COMPARISON OF TYPES OF DOCKS

Preliminary designs and estimates were prepared on several selected sites for two main types of docks, one a high level type similar to American practice, the other a mechanical dock. The mechanical dock considered contemplated the use of belt conveyors for unloading the iron ore from cars to stock pile bins built on the ground and removing same from the bins with belt conveyors in tunnels to loading points at the mooring dock. The arrangement had the same storage capacity in the bins of 30,000 tons and the delivery to boats at two points at a maximum rate of 4,800 tons per hour. It was estimated that five hours would be the maximum loading time for a 10,000 ton cargo, the average rate of loading being much less than the maximum due to the shifting of conveyor mechanisms and the moving of the boat as each hatch was loaded.

After these studies were completed the general result obtained showed that a mechanical dock complete with railway connections would cost about 70 per cent of the cost of the high level pocket type complete with high level railway connection. The estimates for operating cost showed a marked difference, the mechanical dock

Fig. 1—Map showing location of approach spur track and ore dock.

being  $2\frac{1}{2}$  times greater than the pocket type. The pocket type being entirely a gravity method, there is very little wear and tear in equipment whereas the mechanical dock has a great amount of costly equipment requiring frequent replacements. There are some serious difficulties in the layout and operation of a mechanical dock, and two of the main ones are the large amount of shore property required for stock pile bins particularly if future expansion is to be provided, and a serious operating difficulty is the loss of time in loading a boat if mechanical breakdown occurs. This would happen much more often in the mechanical dock than in the pocket dock. The results of the investigation showed that if a volume of over 1,000,000 tons per year was shipped the overall cost was in favour of the high level pocket type dock.

All railway trackage in the Lakehead area is at a low level, usually a few feet above Lake Superior. The high level approach to a pocket dock would be required to

reach a height of about 80 ft. above lake level. Where main line and yard trackage is at a comparatively low level and there is no high ground present close to harbour area, the cost of a high level railway approach is a considerable factor and this operates to the disadvantage of the high level type dock in comparative estimates with other types where a low level trackage throughout is used. There is no question in American practice that the high level pocket dock is entirely satisfactory and more economical than any other type for volume shipments of iron ore and the single factor at the Lakehead of the high cost of railway approach to the dock made it necessary to carefully study comparative estimates in the two types to be sure that the proper decision was made.

#### CHOICE OF SITE

Various sites were considered in the harbours of Port Arthur and Fort William before a selection was made.

The site question was included in the comparative estimates made in the two types of dock to determine the most economical type of dock and site. The general requirements of a suitable site included the following:

- (a) Reasonably good foundation conditions must be obtained to permit use of bearing piles as the load per sq. ft. of dock structure is about  $2\frac{1}{2}$  tons.
- (b) The site should have good access to C.N.R. trackage and yards to provide good operating approach facilities
- (c) Proper navigation conditions to and from the site through the harbour should be available
- (d) The site should have future expansion possibilities both as to the dock for increased storage of ore and loading facilities and railway connections for increased traffic
- (e) The site should have access to both sides of the dock for berthing the boats

Existing traffic on the railway, particularly in the movement of grain traffic was taken into account in order that new traffic problems could be avoided as far as possible when iron ore shipments in volume were going on at the same time as maximum grain shipments. It was considered essential that loading of boats should be done on both sides of the ore loading dock to permit quick dispatch at times when boat traffic tie-ups occur and to handle larger volumes in the future if required. In the case of the high level pocket type dock the one-sided type has never been built and it is much more costly per ton of storage capacity than the two-sided dock. All sites considered, therefore, were limited to those which provided berthing of boats on both sides.

The preliminary surveys and investigation were completed and decision was made by the railway company in December 1943, to proceed with the high level pocket type ore dock with high level approach spur track on a site in the south harbour of Port Arthur. Figure 1 shows a map of the area with the location and profile of the approach spur track and the location of the ore dock in the south harbour area illustrated thereon. This site met all conditions required very well. Solid rock to support bearing piles was located 35 to 40 ft. below water level. The depth of water on the site was from one to six feet and the material over the rock was lake bottom silt with gravel seams making the dredging of slips alongside the dock quite practical. The railway connection could be made without interference with existing railway facilities and traffic and also without disturbing any built-up area in the city as practically all street crossings could be made overhead and very few buildings were present on the right-of-way. Navigation to the dock site through the south entrance of the harbour breakwater is excellent and ore carriers will be able to

berth at the dock without assistance from tugs. Any probable future expansion can be made on this site to both the dock and the railway approach without interfering with ore shipments on the completed dock.

### STRUCTURAL DETAILS

The Port Arthur iron ore loading dock now under construction is similar to latest practice on the Great Lakes in the American iron ports. It is being constructed almost entirely of reinforced concrete containing 100 pockets, 50 on each side, with a total working capacity of 30,000 long tons of iron ore. Figures 2 and 3 illustrate the general features of the pocket dock section.

The pocket structure has a length of 600 ft. and an over-all width of 64 ft. 8 in. and a height of 82 ft. 6 in. from mean low water to the base of rail on the dock. The mooring dock extends 200 ft. inshore and 54 ft. outshore from the pocket section making an over-all mooring length of dock of 854 ft. The pockets are 12 ft. centres to register with the usual 24 ft. spacing of hatches on the ore carriers and the special ore cars are 24 ft. centres coupled to register at every other pocket for unloading. Each pocket will contain 300 long tons of iron ore being filled by five or six carloads. Figure 4 shows the designed section of one pocket and the sequence of filling same from the cars overhead. A working model of the pocket, ore car, chute, and cross-section of the ore carrier was built to a scale of  $\frac{1}{2}$  in. to the foot and  $\frac{1}{2}$  in. crushed stone was used for experiments in filling the pocket and unloading same through the hatches of the ore carrier. This was done to check experimentally the design work in determining over-all dimensions of the dock required and to establish the proper pocket dimensions for loading under all conditions. The maximum capacity of the ore cars being delivered is 1,000 cu. ft. or 65.5 short tons. If heavy ore is shipped the contents of the car will be about 825 cu.

Fig. 2—Typical plans and elevations of ore dock.

Fig. 3—Typical cross-section of ore dock.

ft. In the design, illustration cars of 950 cu. ft. capacity were used which is near the maximum condition. This experimental work done on the scale model was checked with results of surveys made by American railroads in actual pockets on their docks and the experiments agreed fairly well with the full scale survey. The model was useful also in determining the proper position of the hinge pins on the ore chutes above lake level to load the full cross-section of the ore carrier without too much trimming operation.

The pocket structure is 59 ft. wide face to face of side walls and is divided into 50 pairs of bins by transverse walls 12 ft. centres and 16 in. thick making the inside width of bins 10 ft. 8 in. lengthwise of the dock. The bins have a depth of 37 ft. at the outside and 5½ ft. at the centreline of dock where adjacent bins are separated by a 12 in. wall. The bottom has a slope of 47½ deg. from the horizontal and the slab thickness increases from 14 in. at the top to 20 in. at the bottom. This variation provides for increase in load from the top to the bottom, and a maximum allowance of two inches extra thickness at the top tapering to zero at the bottom is made to provide for wear on the concrete bottom slab. Most of this wear is beneath the inside track when the first carload emptied strikes this slab. The balance of the carloads fall on ore but do not affect the slab. The movement of the ore to the boats does not create as much wear as the unloading of this first car. Intersections of all walls and slabs are filleted to facilitate the flow of ore and provide for corner stresses. The cross walls are stayed at the top midway between the railway tracks by a concrete beam which acts both as a tie and a strut. The whole bin structure is monolithic for lengths of 120 ft. between the expansion joints.

The railway approach is single track and switches to four tracks at the inshore end of the pocket section,

each track on the dock having room for twenty-five car loads of ore. The rails of the four tracks on the dock are carried on I-beams set on bearing plates on the transverse walls. The space between the rails is entirely free of bracing to permit the passage of ore from the cars to the pockets, all bracing being done between the tracks and on the outside machinery deck. The deck structure is made of similar I-beams and channels spanning crosswise to support the concrete dock slabs and hoist machinery.

The live and dead loads of the bin structures are supported on reinforced concrete bents in the planes of the transverse walls, these bents consisting of two columns 9 ft. wide by 2 ft. 9 in. thick, spaced 40 ft. 8 in. on centres so that each column of the pair is located substantially under the centroid of its respective bin load. The columns are braced across at the bottom of the pockets and longitudinally near their middle height by reinforced concrete struts. In the middle of each section and at both ends of the dock a 16 in. thick wall between columns provides tower bays for longitudinal bracing.

At the base of columns a pedestal footing is provided, combined with the mooring dock walls, to distribute the loads over the reinforced concrete mattress. Because of the wide spacing of the columns, the mattress is divided into two longitudinal sections tied together at intervals with cross slabs. These mattresses and slabs are all 2 ft. thick, poured directly on the filled site which was graded 2 in. below the pile cut-off at low water level.

The pocket section is divided into five sections of 120 ft. each and the four expansion joints of these sections are located at the face of transverse walls. The slabs and walls of the expansion pocket are formed into grooves made of steel plates and angles anchored in the face of the adjacent transverse wall. All metal surfaces in these expansion joints are coated with warm tallow when erected in the forms. An expansion of 1 in. is allowed. A complete separation between sections is made at each joint right through to the mattress level and a 1 in. filler of paraplasic was used at all joints not protected by steel plates, to prevent ore dust from getting into the expansion space.

#### FOUNDATIONS

The foundation consists of timber piling driven to refusal on solid rock and cut off at mean low water level, the area being filled with sand dredged from alongside the dock to the mattress grade. Along each side and at the ends the entire dock area is enclosed with a 10 in. Wakefield timber sheet pile wall. These sheet piles are 34 ft. in length, cut off one foot above mean low water and bolted at the top with two timber wales and a 12 in. steel channel. Tie rods 1½ in. diameter at 6 ft. centres are placed across the full width of the dock to tie back the revetment. The whole top of the revetment and tierods are encased in the concrete mattress and dock walls. Batter piles are driven at 6 ft. centres along each side to give additional stability to the foundation section. After completion of this revetment dredging operations were carried out on both sides.

#### MECHANICAL EQUIPMENT

The equipment on the dock consists of a pocket gate, ore chute, and electric hoist for operation of the gate and chute on each ore pocket. The ore is discharged from the pockets through openings 7 ft. wide and 5 ft. 4 in. high in a vertical direction, or 3 ft. high normal to the bottom slab. This opening is provided in a steel gate frame set in place in the forms when the concrete is

Fig. 4—Ore pocket filling section.

poured, and on its lower portion, on the outside, a steel plate frame is connected to enclose the gate mechanism and for attaching the hinge pins of the ore chute. The gate is 7 ft. wide and 4 ft. high, made of steel plates, channels and angles, operating vertically and guided by means of two pins attached to the top of the gate and running in slots at the side frames. The bottom of the gate is held in the closed position with a forged U-shaped bar resting on two dogs on the sides of the frame. For opening the gate these dogs are released by a lever mechanism at the top deck, allowing the bottom of the gate to swing outward and releasing the ore. The gate is then raised by a small drum on the hoist machine until it is clear of the ore stream. To close the gate it is raised to the top position by the hoist and the dogs are reset by the lever mechanism at the top deck. The gate is then lowered by its own weight and the U-shaped bar engaged by the dogs forces the gate back into the closed position. If any one is still running, the down movement of the ore at the opening tends to assist the closing of the gate.

Below the gate an ore chute 36 ft. long, 7 ft. wide at the top and 4 ft. 10 in. wide at the bottom, is attached to the gate frames by means of two hinge pins. This chute is made of steel plate stiffened by angles and channels, the plates being curved at the side corners and carefully made flat to prevent excessive wear near supports.

On the lower side of the chute near the outer end, two steel rails are attached to prevent damage to the chute should it strike the hatch combing of a boat or other obstruction.

The chute is lifted and lowered by means of a steel bail attached to the sides of the chute and connected to the hoist drum by a  $\frac{3}{8}$  in. thick by  $5\frac{1}{2}$  in. wide steel ribbon cable. This cable is provided with special sockets at each end and winds on the drum in line, the increasing diameter of the wound cable compensating for the change in load as the chute is elevated to the

housed position clear of moving boats. The chute is lowered by gravity controlled by a brake drum on the hoist.

The hoist machine is mounted on a machinery deck on the operating floor of the dock. There is a hoist machine for each pocket and ten machines are driven from one lineshaft driven by a 25 hp. motor through a gear speed reduction. The hoist machine has two drums, one for the chute and the other for the gate. Each drum has a separate friction clutch to pick up the load and a separate brake band for lowering the load by gravity. In operation, the lineshaft runs all the time loading is going on in the ten pockets involved and the operator handles each machine individually with simple foot pedal and lever controls. Any number of chutes or gates can be operated at one time, depending on the number of operators required to handle the loading. Usually, two men can do this work for each boat and only one operator will be working at a time in each section of ten pockets.

### SERVICES

Complete access by means of stairways, ladders and walkways, is obtained to the gates and chutes from the top operating deck. Poke holes are provided in the top deck to permit operators to poke down sticky ore which does not run freely from the pockets. Wooden poles up to 36 ft. in length, provided with metal chisel points, are used for this work. It is expected that Steep Rock ore will be free running and give little trouble at the dock during loading operations.

Lighting for night operation is provided over the whole dock and portion of the railway bridge where switching takes place. On the top deck, this is done by installing strings of five lights between steel poles at intervals, lighting up the whole deck area. There are lights also inside the pockets and along the walkways. On the railway bridge, lights are located on wooden poles at the sides of the trestle. Flood lighting of the track area is not used to avoid glare interfering with the train crew switching operation, and all lights in this area are directed downward. Navigation lights and dock lights at intervals are provided to light up the whole length of the mooring dock on each side.

At the outer end of the pocket section, a three bent timber trestle, four tracks wide, is provided to allow sufficient track room for full use of the end pockets. The outer end of the pocket section is designed to permit construction of additional pocket sections in the future and this trestle section would be rebuilt further out. Stairways from the ground level for access to the operating deck are located at each end of the pocket section in the timber trestle. At the top of the inshore stairs, office accommodation and a welfare room for workmen is provided at the side of the approach trestle.

Electrical power for the operation of the dock will be delivered to an outdoor substation at 2,300 volts, located on the shore at the inner end of the north slip. The substation will transform this power to 550 volts for distribution to the ten motors operating the hoist machines and to lighting transformers located throughout the dock to suit the lighting distribution at 110 220 volts.

### RAILWAY CONNECTION

The railway approach to the dock is approximately  $2\frac{1}{2}$  miles in length and has a single track dividing to four tracks at the dock. The approach track leaves the C.N.R. main line immediately north of the McIntyre River crossing and follows ground levels for a mile to

the dock yard tracks located alongside the approach track and connected to it at each end. This yard is about one-half mile in length and is also level grade. At the northerly end of the yard, about one mile from the dock, the approach spur rises on a maximum grade of 1.75 per cent. The first section to Memorial avenue is on fill. Memorial avenue, the main automobile highway, has an overhead crossing of steel plate girder deck span with a minimum clearance above the highway of 14 ft. Between Memorial avenue and the Fort William road the approach is carried on standard timber trestle of framed bents resting on cedar piling. The next 550 ft. is carried on steel viaduct of towers and plate girder deck spans. This section crosses the street railway track, the Fort William highway, the main lines of the C.P.R. and C.N.R. and the yard tracks of the C.N.R. The balance of the approach, 2,500 ft. in length, is carried on standard timber trestle, reaching a height of 80 ft. above the ground. The last 1,000 ft. of the approach is on a level grade to permit switching of ore cars on to the pocket section without the excessive use of air brakes.

The ore trains from Atikokan will be received at the main yard of the C.N.R. at Neebing, west of Fort William, and the ore cars will be classified there in a hump yard, in the proper order according to grade in which they will be placed on the dock. The usual switch engine transfer will be made from the Neebing yard to the ore dock yard alongside the approach. At this point, a Diesel-electric switch engine will take the loaded cars up the grade to the dock for unloading and return the empty cars from the dock to the yard. This Diesel-electric switch engine will be able to handle up to a maximum of 25 loaded cars at a time on the approach grade. The regular steam switch engine will return the empty cars to the Neebing yard where empty car trains will be made up for return to Atikokan. The use of a Diesel-electric switch engine on the dock approach was decided upon to lessen the fire hazard to the timber trestle section and also on account of the high tractive effort of this type of switch engine for short periods of operation compared to the steam switch engines in general use at the Lakehead.

#### CONSTRUCTION

Construction of the ore dock was started in April 1944, with the foundation contractor moving on the site to drive the foundation piling and revetment required and also to grade the dock site in preparation for pouring the concrete mattress and footings. Piling and timber for this work was ordered in advance of the start of construction and this foundation work was completed in about four months time. 4,700 timber foundation piles were driven and about 2,000 lin. ft. of timber revetment placed in this contract. One scow pile driver and one swing pile driver were used, both with drop hammer equipment. All piling was jetted and driven to refusal.

The superstructure contractor moved on the site about the 1st of June 1944, and actual pouring of mattress concrete was started on August 4th. There is about

Fig. 5—View of construction progress at end of November, 1944.

19,000 cu. yd. of concrete to be placed on the whole work and, at the date of the progress photograph shown in Fig. 5, about 9,000 cu. yd. had been placed up to the top of the columns. The concrete forms, made of lumber, were made up in the yard as much as possible, hauled to the site and erected with caterpillar cranes. As there is a good deal of repetition of sections on this work, the same forms are being used two or three times. Concrete aggregates are produced from Lake Superior sand and gravel dredged from the lake bottom pits and brought to the site on scows. The contractor has set up a screening plant for separation of the gravel into fine and coarse aggregates. This separated material and sand is weighed in batches below bins and taken to the mixing plant in trucks where cement and water are added. A Rex Paver concrete mixer—one cubic yard capacity—is used for the mixing of concrete and is located on a ramp to permit discharge of the mixed concrete to a pump machine. All concrete is delivered to the work by a Rex Pumperete machine through an 8-in. pipe line at a rate of 25 to 33 cu. yd. per hour.

Because of the late start in the season making it necessary to carry out concrete operations in winter weather, full provision has been made to heat all materials for the concrete and also to house the mixing plant and the upper portion of the dock structure. This will permit full protection for the workmen during the forming period, and heating of the concrete after it is poured. Concrete aggregate stock piles have been established during the navigation season from the screened gravel and sand to permit construction of the work during the winter months until further aggregate can be delivered by scows in the spring. It is intended to carry out sufficient concrete work this winter to permit completion of at least one-half of the pocket section of the dock and all of the approach trackage, ready for operation at the opening of navigation next April. The balance of the work will be done in the spring for completion of the whole project during the early summer of 1945.

Dredging of two slips, one on each side of the dock, was completed in November. These slips are dredged to 25 ft. depth below mean low water for a width of 150 ft. from the dock face. On the south side, the new

slip is adjacent to an existing slip at the Reliance elevator, making a basin 275 ft. in width between the faces of the elevator dock and the ore dock. The dredging was carried out mainly by the suction dredge *Primrose*, having a 23-in. suction cutter and a 20-in. discharge pipe line. Material from this dredging was used to fill the low area near the C.N.R. main yard about 4,000 ft. distant from the dock. The dipper dredge *Excelsior* completed portions of the work where the material was too hard for the suction dredge or where obstructions were present. This material was dumped in the open lake with scows. The total dredging done was about 300,000 cu. yd.

#### CONTRACTS AND COST

The contract work for the ore dock and approach is being done by Tomlinson Brothers Ltd., of Toronto and Port Arthur, in three sections, covering approach

filling, the trestle and viaduct, and the ore dock section. The foundations for the ore dock were carried out by the Thunder Bay Harbour Improvements Ltd., of Port Arthur, in advance of the superstructure contract. The dredging contract, arranged by the Dominion Department of Public Works, was done by the Canadian Dredge & Dock Company. The design and supervision of the entire project is being done by the Canadian National Railways Engineering Department, with the exception of the ore dock section which is being handled by C. D. Howe Company Limited, of Port Arthur, on a consulting basis with the railway company.

The cost of the project is expected to be about \$2,500,000. This includes the dock and approach at Port Arthur and the spur from Atikokan to the mine. Other expenditures are being made by the railway company for ore cars and such main line track improvements as may be required.

## LIGHTHOUSES AND DEPTH CHARGES

The "man in the street" knows what a vital part in winning this war has been the destruction of the enemy's submarines, but possibly he is not aware of the contribution made by the Federal Department of Transport in this regard. Admittedly, the connection between the two is not quite obvious, and yet is there not a subtle association between Aids to Navigation and the destruction of such a deadly menace?

People who regard the various departments of our government merely as so many agencies for the expenditures of public moneys doubtless will be interested to hear of a Dominion Government department which has successfully entered the manufacture of munitions on a large scale, while still carrying on its regular functions and technical developments.

With the Honourable J. E. Michaud as Minister, and Commander C. P. Edwards, M.E.I.C., as Deputy Minister, Marine Services operate under the directorate of J. G. Macphail, M.E.I.C. A division of Marine Services is known as The Aids to Navigation Branch, with H. V. Anderson, M.E.I.C., as Chief, and it is through his initiative and enterprise that a unique development in engineering production has taken place in an entirely departmental organization.

When a German submarine is sent to the bottom by depth charges discharged from Canadian or British fighting ships, and even mercantile marine of all Allied nations other than the United States of America, the workers at the Dominion Lighthouse Depot, situated on the peaceful banks of our St. Lawrence river at Prescott, Ontario, are entitled to take satisfaction.

Since 1941 they have been making a substantial contribution to the defeat of the enemy under the sea. This is the only factory in the British Empire, outside of the British Isles, engaged in such work, and in fact there is no factory, even in the United Kingdom, with an output of these vital pieces comparable with that of the Federal workshops at Prescott.

The transition from the peaceful occupation of manufacturing lighthouse apparatus, such as revolving mech-

anisms for optics, reflectors, burners, fog horns, buoys and buoy lighting equipment, to the manufacture in mass production of these important naval stores, has proved to be a very heavy task. This was made especially involved as it was necessary to do so without in any way impairing the Canadian Marine Service of aids to navigation, so well carried on by the Department of Transport. Lighthouses, beacons and buoys continue to help the mariner wherever they can be operated without aid to the enemy.

In the summer of 1940, the Dominion Lighthouse Depot shops were enlisted to manufacture bombing targets for the R.C.A.F. Later, snow-drags for runways were supplied also to the R.C.A.F.

Mr. Anderson, Chief of Aids to Navigation, through his enquiries, having as an objective the increased usefulness of facilities available, early in 1941 learned that the Department of Munitions and Supply were having difficulty in placing a Canadian contract for 10,000 pistols and primer mechanisms, complete with casings, for the weapon known as a "depth charge". Negotiations were opened with the Bomb Division, Department of Munitions and Supply, from which there developed a contract requiring the Department of Transport to deliver these vital parts of the depth charge at the rate of 2,000 per month.

H. V. Anderson, M.E.I.C.

Explosion of depth charge at sea.

Pistols and primers are far from being simple devices. They are operated on a hydrostatic-time principle and must have considerable selective operating depth to insure effectiveness in varying depths of water where the submarine may lurk on its deadly mission. When a pattern of depth charges is being laid down around a submerged U-boat, in many cases the charges are thus arranged to fire at varying depths, and so find their mark. In this connection a unique development in the process of manufacture has been introduced, and this method was greatly praised by the Admiralty officials following this project.

With no previous experience of such work, more than 600 men and women have made the Dominion Lighthouse Depot at Prescott a bee hive of industry, much admired by industrialists who have visited the plant.

Workers recruited from country places in the vicinity of Prescott have been trained, and practically no physically fit men of military age are now employed. It was found necessary to establish a plant school to introduce these unskilled workers to the mystery of micrometers and the intricacies of precision lathes. This was accomplished through the assistance of the Provincial Department of Labour which met the expense of a qualified teacher. At the commencement of activities to manufacture munitions of war, there were only about 35 workers at the Prescott depot; now there are approximately 650, of whom 150 are women and girls, operating two ten-hour shifts, which at peak loads have been working seven days a week.

A very high standard of efficiency is maintained throughout the whole organization, and all workers seem to be imbued with the importance of the work being performed. This efficiency is reflected in the exceptionally low costs of handling materials, particularly in

buildings almost fifty years old, and has been specially commented upon by a New York company's report on the standard of efficiency obtaining. All prevailing wage scales and salaries were approved by the War Labour Board, and the government has extended to the personnel the privileges of six days' leave with pay per annum under certain conditions of service.

In conjunction with Prescott's part in the U-boat war, the Dominion Lighthouse Depot has developed a large wood-working section producing several kinds of heavy transportation cases for torpedoes and other munitions. High officials of the British Admiralty Technical Mission have, on several occasions, expressed their appreciation of the quantity of work performed, and the very high standard of workmanship maintained.

Over 2,500 tons of non-ferrous metals have been used in production; more than 120 tons being cast in the depot's own brass foundry. Included in the metal used has been substantially more than 175 miles of extruded brass bar, 450 tons of stainless steel, and the amount of lumber consumed is well in excess of 600 miles foot board measure.

Without publishing the actual output of depth-charge pistols and primers, it can be said that some months ago the total had exceeded 150,000, with a monthly output reaching as high as 9,000, and in monetary value, the total output is well in excess of \$6,000,000. It should be added that practically all contracts for war work at the Dominion Lighthouse Depot have been secured by tender, in open competition, and at these prices very substantial surpluses are being built up, to be refunded at the conclusion of all contracts.

Healthy working conditions in the shops have helped to promote production. A cafeteria is operated under the auspices of the plant by an elected committee. Profits accruing from this cafeteria enterprise revert to the recreational association who carry on activities in swimming, softball and tennis during the summer, and skating, curling and skiing in the winter. A dormitory has also been established in conjunction with the Merchant Seamen Marine School, this dormitory housing from forty to fifty men. There is always a waiting list for same.

Altogether the war work of the Dominion Lighthouse Depot at Prescott is highly creditable to the government, whose policy of making the best possible use of every workshop, every machine and every available worker to contribute to Canada's part in winning the war is being well carried out by the Department, under the responsible Minister of Transport, the Honourable Joseph Michaud.

# FIFTY-NINTH ANNUAL GENERAL

## WINNIPEG - ROYAL

WEDNESDAY, THURSDAY and FRIDAY

F. V. SEIBERT  
General Chairman

T. H. KIRBY  
Vice-Chairman

W. P. BRERETON  
Chairman of the Reception Committee

J. T. DYMONT  
Chairman of Transportation and  
Excursion Committee

H. L. BRIGGS  
Chairman of the Finance Committee

### WEDNESDAY, FEBRUARY 7th

- 9.00 a.m.—Registration.
- 9.30 a.m.—Annual General Business Meeting of the Institute.
- 11.15 a.m.—**Steep Rock Iron Mines—Discovery and Development**, by Watkin Samuel, Chief Engineer, Steep Rock Iron Mines, Toronto.
- 12.30 p.m.—Luncheon—Speaker: John S. Galbraith, M.E.I.C., Head of the Community Planning Division, National Housing Administration, Ottawa—**The Engineer and the Community**.
- 2.15 p.m.—**Diversion of the Seine River at Steep Rock**, by A. W. F. McQueen, M.E.I.C., Hydraulic Engineer, and C. N. Simpson, Jr.E.I.C., Assistant Engineer, H. G. Acres & Co., Consulting Engineers, Niagara Falls, Ont.

**Diamond Drills and Well Drills on the Raft Lake Canals at Steep Rock**, by C. H. Hopper, M.E.I.C., Consulting Mining Engineer, Boyles Bros. Drilling Co., Limited, Vancouver, B.C.

**Iron Ore Loading Dock at Port Arthur**, by J. Murray Fleming,

M.E.I.C., President, C. D. Howe Co., Limited, Port Arthur, Ont.

5.30 p.m.—Special Convocation of the University of Manitoba to confer honorary degree upon de Gaspé Beaubien, president of the Institute.

6.30 p.m.—Dinner tendered by the City of Winnipeg to the delegates at the meeting.

8.30 p.m.—**Post-war Plans for Rural Electrification in Alberta**, by E. G. Kelly, Superintendent of Construction, Canadian Utilities Limited, Calgary, Alberta.

**Farm Electrification—A New Science**, by I. W. Tomlinson, Assistant General Superintendent, Manitoba Power Commission, Winnipeg, Man.

Discussion by representatives of Canadian power companies and Government organizations.

### THURSDAY, FEBRUARY 8th

- 9.30 a.m.—**Soil Mechanics as Applied to P.F.R.A. Problems with Special Reference to the Proposed St. Mary Dam**, by R. Peterson, Jr. E.I.C., Soil Mechanics Engineer, P.F.R.A., Department of Agriculture of Canada, Saskatoon, Sask.

# AND PROFESSIONAL MEETING

## ALEXANDRA HOTEL

FEBRUARY 7th, 8th and 9th, 1945

**Application of Soil Mechanics to the Design and Maintenance of Prairie Highways**, by G. B. Williams, Department of Public Works of Manitoba, Winnipeg.

12.30 p.m.—Luncheon—Speaker: George Spence, Director of Rehabilitation, Department of Agriculture of Canada, Regina, Sask.—**Post-war Projects for the Prairies.**

2.15 p.m.—**Principles Involved in a Modern Concept of Airline Operations**, by J. T. Bain, Superintendent of Engineering and Maintenance, Trans-Canada Air Lines, Winnipeg.

**The Engineering Development of an Airline Aircraft**, by J. T. Dymont, M.E.I.C., Engineering Superintendent, Trans-Canada Air Lines, Winnipeg.

**The Future of Radio Communications in Commercial Air Transportation**, by S. S. Stevens, Superintendent of Communications and Electronic Development, Trans-Canada Air Lines, Winnipeg.

**New Developments in the Field of Materials and Processes**, by P. E. Lamoureux, Materials and Processes Engineer, Trans-Canada Air Lines, Winnipeg.

7.30 p.m.—Annual Banquet—Speaker: Honourable Stuart S. Garson, K.C.

10.30 p.m.—Dance.

### FRIDAY, FEBRUARY 9th

9.30 a.m.—Visit to Stevenson Airport and Shops of Trans-Canada Airlines.

2.30 p.m.—Visit to University of Manitoba, Fort Garry Campus, including tour of Engineering Building. Tea will be served by the University of Manitoba Engineering Society.

### LADIES' PROGRAMME

Ladies are invited to all functions on the general programme. In addition, special entertainment is being arranged for them.

Through the courtesy of the Engineers' Wives Association of Winnipeg, a ladies' tea will be held from 3.00 to 4.30 p.m., Wednesday, February 7th, at the University Women's Club (Complimentary to visiting ladies).

The Ladies' Committee of the Annual Meeting is arranging a special feature for Thursday, February 8th, at 2.30 p.m., in the form of visits to interesting places, which the ladies have called "Wanderings".

D. M. STEPHENS  
Chairman of the Papers Committee

R. A. SARA  
Chairman of the Publicity Committee

C. V. ANTENBRING  
Chairman of the Registration and Information Committee

A. E. MACDONALD  
Chairman of Ladies' Committee

W. D. HURST  
Chairman, Hotel Arrangements, Luncheons, Banquet and Dance Committee

# From Month to Month

## GREETINGS TO THE INSTITUTE

Each year a great many Christmas and New Year's greetings come to the Institute. One of the pleasantest experiences of the year for the general secretary is to receive these good wishes on behalf of the Institute. The messages come from members, sister societies, officials of government, institutions of learning and business organizations in many parts of the world.

The sum of this goodwill cannot be added up to a numerical figure but it is none the less an impressive manifestation of the place of the Institute in Canadian affairs. It is an indication of the important part the Institute has played in the past and is an encouragement to expand its usefulness in the future.

It is not reasonably possible to acknowledge all messages, or to return individually the good wishes, but to all those who have been kind enough to send greetings, may this be taken as an acknowledgment and an expression of appreciation.

## PROFESSIONAL WORKERS AND COLLECTIVE BARGAINING

The group of societies which has become known as the "Committee of Fourteen" met again in Ottawa on December 20th to re-survey the situation in the light of an invitation to appear before the National Wartime Labour Relations Board on January 9th. A similar invitation had been sent to a large number of organizations and individuals, including professional societies and trade unions.

Some time ago, the sub-committee appointed for the purpose presented a draft of the proposed new order-in-council to the Minister of Labour. The purpose of this order-in-council is to make possible to the professional worker a basis for collective bargaining whereby he would be in control of his own negotiations. Subsequently, the Minister informed the sub-committee that he had referred the proposal to the Wartime Labour Relations Board for a report. This explains the invitation referred to in the previous paragraph.

The sub-committee has prepared a brief for presentation to the Board, which was approved by the major group at the December meeting. In order that members of the Institute may be kept fully informed, the brief is reproduced in full on page 49.

By way of a news report to our members, in Ontario there has been established through the assistance of the Association of Professional Engineers, a group referred to as the Federation of Employee-Professional Engineers and Assistants for purposes of collective bargaining. The *Journal's* information is to the effect that only engineers who are members of the provincial association are eligible for membership in the Federation. It appears as possible that this restriction will cause other groups of professional workers to set up their own bargaining agencies thereby further complicating and confusing an already complicated and confused situation. Nevertheless, the Ontario Association is to be congratulated on its enterprise, and everyone will hope that wide success will attend its efforts.

In Quebec, under the leadership of the Corporation of Professional Engineers, progress has been made towards setting up a group similar to that in Ontario, but with this distinctive difference. It is proposed that

## News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

the Quebec group will not be restricted to one society but that it shall be a co-operative organization representing all qualified organizations that desire to be included. At the time of writing, this organization has not been completed, but it is well advanced.

## VOLUNTARY ASSESSMENT

Each Corporate Member and Junior of the Institute will have received with his annual account for fees a special message from the Finance Committee relative to a voluntary assessment for purposes of rehabilitation of members in the services. There is little to be added to the Committee's message, but it is hoped that the proposal will be well received.

This decision was not made hastily. The subject has been before the Committee and Council for over a year, and the problem has been examined from every angle. The only alternative to the assessment seemed to be an increase in fees. Because of necessary by-law changes which would take from one to two years to become effective, the assessment method was chosen instead.

The need of a special service, co-ordinated with other services, to members returning to civil life is already present. Every day, Headquarters receives a number of enquiries in person or by mail from those who want assistance. The present staff is not adequate to render the detailed service that will be necessary, and the Institute must not be found wanting. It is believed that all members at home will realize the Institute's responsibilities in these matters.

## INCREASE IN MEMBERSHIP

It is always interesting at the year's end to check up on the total of membership. For many years now there has been a steady increase, and the end of 1944 sees the Institute well on the way to reaching seven thousand members.

The largest society in the United States now has about twenty thousand members. Sometimes we get a better perspective of our own affairs when we look at them in comparison with others.

Comparing the above figure on a population basis with the membership of the large American societies, we find the Institute's membership much greater than that of any other similar organization. A society in the United States with the same percentage of the population would have a membership of about eighty thousand.

In the last two or three years there has been an encouraging upswing in the number of applications for membership received from students. This reached a new level in 1944 when approximately five hundred students were admitted. This is specially gratifying in view of the disturbed conditions at the universities brought about by the war.

This trend is an indication that there is work to be done by the Institute for the student. Those branches that are situated in a university city have special opportunities to aid in the development of the future engineers. The increase in numbers of Junior Sections

is a sign that the branches are aware of these opportunities.

For several years, the Ecole Polytechnique in Montreal has given the Institute outstanding support. In 1944, 249 students out of a total enrolment of 330 were members. In the last three months of the year, 150 applications were received through the efforts of Léo Scharry and J. P. Laviolette, the Ecole representatives in the Junior Section of the Montreal Branch.

There has also been a considerable increase in activity at the Universities of British Columbia, New Brunswick, Mount Allison and Queen's.

Increased membership brings increased responsibilities to branch executives and to headquarters. At headquarters this development is producing a most noticeable effect in a greatly increased volume of work. If this trend continues, at the present rate, the time is not far distant when substantial changes will be necessary, both in staff and quarters. Again referring to the admirable sister societies in the United States, on a comparable basis, the Institute staff should be more than twice as large as it is now.

These are matters of concern to council and to the membership, which will require consideration and study shortly—if not immediately.

### THE REMUNERATION OF THE ENGINEER

Elsewhere in this number of the *Journal* are letters from members complaining of the remuneration received by the engineer. It is interesting to see this activity in the thinking of the young engineer, and the *Journal* is pleased to publish such letters (even though a trifle long). Each contributor has left many holes in his argument, and there is the temptation to shoot through them, but the letters are sincere and must be taken as such.

Usually when an engineer speaks of the remuneration of the profession he is speaking of himself. This is only natural. If he is inadequately paid he thinks the whole profession is, and if he is well paid he is likely to forget that many others are not. On the whole, however, it is probable that the profession of engineering is paid as well as any other profession. Some time ago, a survey was made in the United States which showed that engineering was the best paid of all professions. This is hard to believe but it is submitted as evidence which should be kept in mind when speaking of such things.

One correspondent states that prospective engineers should be told that all they will get out of engineering is an income no better than that of a small storekeeper, etc. He goes on to say that "a few lucky ones through influence or heritage" are able to do better. That is an unfortunate statement not very complimentary to thousands of engineers. How will this correspondent feel if some day he finds himself with a better income than "a small storekeeper"?

Again the letter writer may be considered by many to over-exaggerate in his reference to the employment methods of those engaging engineers. Many will doubt that the job goes to the lowest bidder and not "the one best fitted for it."

Criticism of these letters is not intended as a contradiction of the case they make for better salaries. There is much room for improvement, but there may be more effective means of bringing it to pass than by the specific proposals contained in the letters.

It is doubtful if there is any single factor that does more injury to engineers' incomes and professional status than the pittance usually offered by governments—municipal, provincial and federal. Perhaps in this field the job does go to "the lowest bidder," not to

"the one best fitted for it." The salary scale is so low that no one would take the place if he could get employment elsewhere. As long as such outstanding employers as governments persist in paying wages that starve a man both physically and mentally, there can be no hope for an upsurge in professional recognition for the engineers across Canada.

Perhaps as the correspondents state, engineering organizations can do something to help. For years the Institute has been battering the doors of government that are shut on progress in this direction, but so far no impression seems to have been made. The mountain of indifference is still unmoved.

One tragic feature that is uppermost in all the recent discussions in collective bargaining is that government employees are excluded from such legislation. If ever any group of engineers needed a union it is those in the service of cities, provinces and the Dominion.

### MINING INSTITUTE ACHIEVES UNIQUE SUCCESS

The usefulness of a national technical society in affairs of national importance was clearly demonstrated by the Canadian Institute of Mining and Metallurgy at its recent Annual Western Meeting in Vancouver, when its president invited to the meeting the Ministers of Mines or the Minister of Natural Resources of each of the provinces in which minerals are mined. Out of eight such ministers, six were able to be present.

It was arranged that the ministers would meet privately, prepare their own agenda, and conduct their own discussions. Eventually they released the following statement:

"For the purpose of assisting in every way possible the development and production of the minerals of Canada in the best interests of the nation, and of establishing a basis of agreement on the problems affecting the mining industry, six of the eight Ministers of Mines of Canada took advantage of the western meeting of the Canadian Institute of Mining and Metallurgy to hold several conferences.

"The first of these was convened by A. A. MacKay, president of the Institute, the second by Hon. E. C. Carson, Minister of Mines of British Columbia, and subsequent conferences followed. The ministers attending were: Hon. E. C. Carson, British Columbia; Hon. N. E. Tanner, Alberta; Hon. J. S. McDiarmid, Manitoba; Hon. Leslie M. Frost, Ontario; Hon. Jonathan Robinson, Quebec; and Hon. L. D. Currie, Nova Scotia. The Ministers of Mines of Saskatchewan and New Brunswick were unavoidably absent.

"An agenda was tentatively drawn, which will receive careful study and will be the subject of further joint conferences between now and the Annual Meeting of the Institute at Quebec next April, when it is expected that a joint agreement will be reached by all the ministers.

"The ministers attending were highly pleased with the meetings and expressed the feeling that much could be accomplished in other fields by ministers of all departments of the provincial and federal governments getting together, so that a common understanding could be reached on all the problems and matters that concern the nation, and so that the cause of Canadian unity in all its aspects will be advanced.

"Some of the matters discussed were measures to achieve conformity, where desirable, in mining legislation and security laws, wider cooperation of all de-

partments of mines across Canada, problems of taxation, conservation and development of the industry from a national as well as from a provincial viewpoint. The ministers expressed keen concern over the vital question of Canadian unity and Canada's future contribution to civilization, and felt that the initial steps taken at their meetings would help to promote that desirable end".

An extension of the work done on the above subjects will be arranged for by the establishing of provincial committees to study them. These committees will be coordinated by a central committee under the chairmanship of the Minister of Mines of Ontario. The work of the provincial committees will be the basis of further joint conferences which may culminate in another conference at the time of the annual meeting of the Mining Institute in Quebec next April.

The conception of the idea and its successful achievement are a tribute to the officers of the Mining Institute. It is doubtful if such a conference has ever been arranged before by any organization other than a government agency.

Is there not in this the seed of an idea applicable to other fields as well? As the meeting at Vancouver suggested, it is possible "that much could be accomplished in other fields by ministers of all departments of the provincial and federal governments getting together." The good example of the Mining Institute might well be followed by the Engineering Institute with other ministries. Such action would be one means of complimenting the Mining Institute on its progressiveness and its interest in the national welfare.

#### AUTUMN REVERIE

*It will be autumn home,  
Clear, cool nights and lazy days.  
The smell of leaves burning,  
A big, soft moon through yellow haze.  
No shifting sands and heat.  
It will be autumn home  
And from the hill and wood  
The trees will blaze defiantly  
Bright as a chieftain's hood  
Rich wines and native gold.  
It will be autumn home.  
The waning sun soon dies.  
From a thicket on a country road  
A flash of colour where the pheasant's rise  
Sets the hunter's heart aflame.  
It will be autumn home.  
Along an old, familiar street  
Generous maples spread their gold  
So soon to vanish under careless feet  
And turn to dust.  
It will be autumn home.  
But here, the seasons go  
Not marked by colours bold  
For one can scarcely know  
When spring is here,  
Or summer slips away.*

JOHN SIMMONS WATT, Jr., E.I.C.

Bahrein Island, Persian Gulf, 1944.

#### CHANGE IN STUDENT FEES

Beginning in January, 1945, Student members will all receive *The Engineering Journal*, the same as other members. This is in accordance with the change in by-laws proposed in 1943 and approved early in 1944. Up to now, Students have had the option of taking or not

taking the *Journal*. Council has felt that the Institute could render a greater service to this group if all received the monthly publication.

There is a change in fees also whereby the annual contribution becomes \$3.00, less the usual one dollar discount for prompt payment. This should work no hardship on anyone, but should go a long way towards binding the future members of the profession to the Institute and to each other.

A proposal to inaugurate a special Student and Junior section in the *Journal* was approved some time ago by the Publication Committee, and it is hoped this innovation may appear shortly. There is considerable organization work to be done to secure a steady and adequate supply of suitable material, and it is not planned to start the section until these details have all been arranged satisfactorily.

#### LECTURES IN MATHEMATICS AND SOIL MECHANICS

##### Junior Section of Montreal Branch Sponsors Series

It is some time since a branch has inaugurated a series of lectures for the benefit of members, and it is even longer since such action has been taken by a junior section—all of which is preliminary to commenting on the action of the Junior Section of the Montreal Branch in announcing a course on Elementary Calculus and Differential Equations, as well as a course on Soil Mechanics.

The mathematics series consists of twenty lectures given by Dr. G. C. Mark and Dr. P. R. Wallace of the National Research Council in Montreal. Both instructors have a sound working knowledge of the application of mathematical methods to the solution of engineering problems. Emphasis will be placed on the practical application, it being assumed that those attending have an undergraduate training in the subject.

The series starts on January 10th in the reading room of headquarters, and will continue on Wednesday each week from 8.00 to 9.30 p.m. The whole course costs \$12.00 per person.

The course on Soil Mechanics starts in February. Laboratory exercises in testing (at Ecole Polytechnique) will be included in the twenty sessions.

The fundamental physical and mechanical properties of soil will be reviewed with a view of preparing for further study. The solution of practical problems will also be considered.

The course will be given by Jacques Hurtubise, assistant-professor of Civil Engineering at Ecole Polytechnique and Guillaume Piette, Soils Engineer with the Department of Highways of the Province of Quebec. Both Mr. Hurtubise and Mr. Piette have done post graduate work in Soil Mechanics, the former at Massachusetts Institute of Technology and the latter at the University of Michigan.

All inquiries should be addressed to R. A. Frigon, Junior E.I.C., secretary, 125 Pagnuelo Avenue, Outremont, Montreal 8, or Dominion Engineering Company Limited, WA. 2701, not later than January 29.

The news of this project will be interesting to members in all parts of Canada. It is a sign of the activities in the junior section and of the enterprise of its officers. It is along these lines that the Institute should be able to do a lot for the profession. If this innovation is successful, why not extend it to other branches and to other subjects? Wouldn't this be a good means for promoting the cultural material—the

humanities about which so much is heard these days as an ingredient lacking in the usual course of engineering study? Public speaking also could very well be developed by such classes. The field of prospect is very large, and there are real opportunities in this direction for an expansion of the usefulness of the Institute.

The juniors of the Montreal Branch are to be congratulated on their enterprise. Members everywhere will wish them success.

(American Institute of Elec. Engr.)  
Dr. Charles F. Scott

### AN APOSTLE OF PROFESSIONAL IDEALS GONE

*Not all members of the Institute had the privilege of knowing the late Dr. C. F. Scott but all those who did will not forget him. He was present at the annual meeting of the Institute in Montreal in 1942.*

*Because of his contributions to the past and future of engineering in North America the Journal presents herewith a eulogy written by one of our members who knew him well.—Ed.*

Few men have so impressed their professional colleagues and associates with apostolic zeal in the promotion of professional ideals as did the late Dr. Charles F. Scott, who passed away in New York City on December 17th at the age of 80 years.

Graduating from Ohio State University in 1884, he became associated with the Westinghouse Electric and Manufacturing Company in Pittsburgh from 1888 until 1911, for years as its chief electrical engineer. He then joined the staff of Yale University as Professor of Electrical Engineering, serving continuously in that capacity with great distinction until his retirement in 1932.

Dr. Scott was a past president of the American Institute of Electrical Engineers, the Engineers' Society of Western Pennsylvania, and the Society for the Promotion of Engineering Education. He was the recipient of the Edison Medal of the American Institute of Electrical Engineers and the much-prized Lamme Medal of the Society for the Promotion of Engineering Education. Several universities conferred honorary doctorates upon him.

Since the foundation of the Engineers' Council for Professional Development in 1932, into which The Engineering Institute of Canada was admitted in 1940, Dr. Scott followed with keen interest the efforts of the new organization to enhance the professional status of the engineer. While his active participation in its work was more particularly channelled through the Committee on Professional Recognition, of which he was

chairman from 1938 to 1944, his enthusiasm ranged over the whole field of the Council's activities. Those who served with him on the Council or its committees will long remember his ardor in the advocacy of any measures that he thought sound. He was a missionary charged with a burning gospel in which he believed so implicitly and expounded so forcefully as to enlist the support and enthusiasm of many others.

Dr Scott was a genial and attractive figure, honoured for his wholesome enthusiasms, and a warm and constant personal friend of those Canadians who in one way or another have served on ECPD. Much of the expanding and widening appreciation of the worth and dignity of the engineering profession on this continent is due to him. C.R. Y.

### WASHINGTON LETTER

President Roosevelt's Seventeenth Report to Congress on Lend-Lease Operations contains quite a lot of previously restricted news of considerable interest to engineers dealing largely with the logistics of the European campaign. The report makes quite clear the paramount role which is being played by the engineer and the technicians in mechanized war. Almost one-third of Great Britain's total building labour forces has been employed in the immense amount of new construction involved in airfields, camps, supply and repair depots and other installations in Great Britain necessary for the mounting of the European offensive. There is little doubt that a very large share of the credit for the success of the Normandy landings belongs to the two "synthetic harbours". While much has recently been written regarding this engineering feat and while the installations were featured in a recent issue of the *Journal*, the following statistics are sufficiently arresting to be repeated for the record. The three main elements of the harbours in addition to the outer breakwater of some sixty old grounded ships, were the inner breakwater of reinforced concrete caissons weighing up to 6,000 tons each and towed across the Channel—the huge steel floats moored in deep water—and the floating steel piers some hundreds of feet long which rose and fell with the tide. The programme called for two complete harbours on open beaches, each to have a capacity equal to the port of Dover. The programme involved 100,000 tons of steel and 600,000 tons of concrete, and a labour force of 50,000 men were employed in many different places in Britain in building and assembling the equipment. In twelve days the harbours were moved across the channel and put in operation. This involved a movement of over one million tons of material and half a million tons of doomed vessels that were sunk as block ships. British engineers had begun experimental work over two years ago and American scientists and engineers had joined in the work.

Some day it will be possible to write another great engineering chapter with respect to the repairing or substituting of destroyed bridges in France. There was hardly a bridge left on the whole route north from Marseilles. Virtually every bridge across the Seine between Normandy and Paris was out. Thousands of bridges in key spots all over France had been destroyed. In most instances it was the British designed Bailey bridge which came to the rescue, carrying loads some times in excess of seventy tons. The British have also extended the principles of the Bailey bridge to a unit railroad bridge.

Another item which has interested me was the decisive importance in the operations in North Africa, and recently in Normandy, of an efficient five-gallon gasoline

can. These came to be known by the Eighth Army in Africa as "Jerrie-cans" and they figured largely in Rommel's early successes. The British did not have a gasoline can as good nor did they have them in the quantities required. Some of the "Jerrie-cans" were captured and sent back to England and a large programme of manufacture initiated. After El Alamein, the Eighth Army had enough "Jerrie-cans" to drive 1,500 miles across the desert all the way to Tunisia. The British programme was doubled in recent months and before D-Day many millions of these cans were ready to take the gas to Patton's and Hodge's tanks. They are designed with air pockets which allow them to float when filled and they can, therefore, be dropped from airplanes into rivers and streams and dumped off ships and barges. They are tough enough to be thrown off trucks in motion without bursting. They are designed with flush surfaces. Cargo planes, combat planes, trucks of every size, jeeps, armoured cars—anything on wheels—rushed "Jerrie-cans" of gasoline to the front lines.

Another interesting development has been the use of waste paper, pressed and treated according to a formula first developed by British technicians, to produce a 108-gallon paper gasoline tank which can be thrown away when empty. This extra gasoline carrying capacity has made all the difference in enabling aircraft to strike deeper into the heart of Germany and to afford heavy bombers increased long range fighter protection.

Turning for a moment to the campaign in the Pacific, tribute is paid by the President to Australia and New Zealand for their very extensive contribution in food and equipment on reverse Lend-Lease and the report mentions specifically the 36-million-dollar programme undertaken by Australia and New Zealand for the supply of landing craft, barges, tug boats, and other craft essential to the prosecution of an amphibious campaign over thousands of miles of ocean. When General MacArthur moved into the Phillipines, nearly ten thousand of these craft had already been delivered under reverse Lend-Lease.

The President also enlarges on the great benefits which have accrued to the free interchange of technical and scientific information between the United States and the British Empire in what he calls the "joint stock pile of brains" Radar, the jet propulsion plane, rocket projectiles and the liquid cooled Merlin airplane engine are among the examples of British initiated developments which have gone forward as the result of the pooling of the joint experience and skill of both sides.

If the logistics of modern war present a challenge to engineers, the physical reconstruction and rehabilitation necessitated by the devastation of war will present an equally complex problem. Little by little the stories are coming out of Europe of what is involved in terms of social unrest and dislocation in the destruction of utilities, transportation, power developments, factories, etc. A British observer recently returned from Europe has emphasized the difficulty of achieving any kind of political or social stability in many of the countries of Europe in their present state of dislocation. One of the difficult aspects of the situation is the fact that the Germans did maintain to a considerable degree the functioning of facilities and manufacture in occupied countries. Where necessary, food and raw materials were exported from Germany proper. In the process of taking over previously occupied countries, transportation systems have been ruined and public utilities destroyed and the exigencies of war prevents our supplying vitally needed imports in anything like the quantities that it was possible for Germany to supply under

comparatively normal operational conditions. In Greece for instance, railways have virtually ceased to exist. There were literally only a few usable locomotives in Greece and something less than 100 available freight cars. In the central part of Italy at present liberated, only 10 to 20 per cent of the normal production of electric power is still available and this is largely required for such essential purposes as operating services in Rome, the pumps on the Pontine marshes and the army repairing and service depots. It is impossible to understand the political significance of many of the developments and trends in Europe unless they are seen against this background and a satisfactory settlement will not be possible until the logistics of rehabilitation have been developed to a point where they compare with the logistics of destruction.

I have had two particularly interesting interviews in the last little while in connection with the visit of an Australian senator. One was with Mr. John L. Lewis. Australia also has a coal mining problem. Another of Australia's problems is the necessity for developing power and irrigation and it was in this connection that we called on Mr. Ickes, Secretary of the Interior, who gave us information, reports and data on the vast series of irrigation projects being planned for the Western States by the Bureau of Reclamation.

The President's Seventeenth Report referred to above deals largely with Reverse Lend-Lease. It was timed to appear simultaneously with the British White Paper entitled "Second Report on Mutual Aid" and the further British White Paper entitled "Statistics Relating to the War Effort of the United Kingdom". The British White Papers, supplemented by the President's Report, depict the tremendous effort of the United Kingdom in details which it has hitherto been impossible to publicize. These are important documents and should be widely read. Mr. Leonard W. Brockington aptly remarked that the British White Papers would not only astound our enemies, but they would silence our critics.

E. R. JACOBSEN, M.E.I.C.

Washington, D.C., December 22nd, 1944.

## CORRESPONDENCE

The Editor,  
*The Engineering Journal*,  
Town of Mount Royal, Que.,  
November 22nd, 1944.

Dear Sir:—

I wish to compliment you on publishing "Nutrition in Relation to Efficiency" in the current issue of the *Journal*. Many times in the past I have intended to write to you to say that in my opinion the general tenor of the *Journal* is too technical. Engineers have often been criticized for not taking a more active part in civic and governmental affairs, for being narrow-minded, for acting like glorified mechanics. I feel that our *Journal* reflects that attitude of mind in moving in a small world of its own. Perusal of medical, legal and even mining institute publications seems to indicate a much wider range of interests. Book reviews of historical essays, poetry (such as Major Diespecker's "Prayer for Victory"), editorials on major developments in the war and in government policy are frequently seen in such publications.

I hope that you will publish many more articles which take note of the trend of the times and which deal with subjects not strictly within the engineer's province.

I trust that you will find this note constructive rather than critical.

Sincerely,

(Signed) Murray V. MacDonald, M.E.I.C.

## Suggestions for Improving Professional Status

No. 7 Leslie Apartments,  
Griffith Street, Welland, Ontario.  
December 18th, 1944.

The Editor, *The Engineering Journal*.

Dear Sir:

The letter by Mr. G. L. T. Ellis in the December issue of *The Engineering Journal* gives a clear picture of the status of the engineering profession to-day.

Many engineers feel the same as he does. We read such letters and articles from time to time, wholeheartedly endorse them, commend the writer and wish someone would take action but no one does so we drift along in our present state.

If engineering is ever to be recognized as a profession the engineer must wake up. There must be a definite line of demarcation between the engineer and non-engineer, a line which cannot be crossed unless the individual has acquired necessary qualifications. Until this line of demarcation is drawn, engineering will continue to be made up of a heterogeneous assembly from designing engineer to blue-print boy and rodman all being referred to as engineers.

The subject of the officers of the R.C.E.M.E. Corps caused long controversy and we became very indignant over some of the personnel chosen but how could we expect the army to distinguish between the engineer and non-engineer when the engineering profession itself makes no distinction. The doctor would not join the army as a captain if he must compete in civilian life with the hospital orderly and first-aid man.

The engineer keeps his profession at its present low status by endorsing non-engineers for membership in engineering societies. We cannot hope to improve our prestige until these engineers show some pride in their profession and cease this practice. Then we have the affiliate, a non-engineer who wishes transfer to membership, and endorsed by engineers is accepted. The engineering profession will never rise above its present level unless the engineer develops pride in his calling and becomes less lenient.

Thus far this letter has been one discussing the status of the engineering profession and such discussion is useless unless workable remedies are suggested and steps taken to carry them to a successful end.

Every engineer must play his part in improving the status of the profession and he can do so by practising the following suggestions:

- (1) That every graduate engineer hang his degree in a conspicuous place in his office for the public to see.
- (2) That he cease to criticize his fellow engineer before non-engineers.
- (3) That he conduct himself in his work so he will not invite criticism.
- (4) That his work no matter how menial be given technical importance by himself and his fellow engineers.

Two suggestions I would like to offer to engineering societies are:

- (1) That they organize within themselves a body composed of engineers who have acquired or "organized a body of higher learning". That this body adopt and practise a code of ethics and that they wear an insignia whereby they shall be known.
- (2) That the standards for membership be raised to admit only those who have acquired an "organized body of higher learning".

The employer engineer occupies a position in this scheme and without his co-operation the task may seem impossible but I am sure he will assist as it means raising the prestige of his own profession. He can do more toward improving the status of the engineering profession than the schools of engineering and engineering societies because both the graduate engineer and non-engineer must seek employment from him and if he employs graduate engineers to do engineering work and makes a distinction between engineers and non-engineers the status of the engineering profession will be improved.

Let us refer to the address by Robert E. Doherty, "The Engineering Profession To-Morrow" appearing in the August issue of *The Engineering Journal*. It would be well if we read this address again and started practising the idea set forth but if we are to realize this renaissance we must take action to-day because to-morrow never comes.

Yours very truly,

(Signed) W. D. BROWNLEE, M.E.I.C.

## The Engineer's Salary—a Disgrace?

December 15th, 1944

The Editor, *The Engineering Journal*.

Dear Sir:—

I have read with great interest the letter written by G. L. T. Ellis, Jr., E.I.C., which was published in the November issue of the *Journal*.

As he suggests, the trend seems to be for older engineers to take advantage of the young ones. This situation is also found in industry. Engineers have been, and are now, very much exploited by industry. The majority of us work for a salary which is a disgrace when compared to the remuneration of other professional bodies.

When a young graduate gets out of college and applies for a position, he is told by either an older professional engineer or by an industrialist that he lacks experience and therefore he cannot be paid much more than \$125 or \$150 per month. In the majority of cases, having obtained his engineering education at the cost of great sacrifice, he is faced with necessity and must accept the offer. He is told that if he works hard he will be promoted and obtain substantial increases in salary.

Let us now look at the course of events from then on. A few years later, having secured with great difficulty a few increases in salary, he is now approaching the \$200 per month mark. Thinking that he is now starting to reap the benefits of his engineering education and is on the road to success he generally gets married. Time marches on. Five years or so out of college we see him with family responsibilities and with a salary that seems perpetually frozen at \$225 to \$250 per month. At this stage, if he economizes, all he can afford is to rent a modest apartment and to drive a low-priced car.

Seeing that his income is all taken up he soon realizes that something must be done about it. Two alternatives present themselves. The first is to request an increase in salary and the second is to change his position. So he approaches his superior and the answer is almost invariably an emphatic "no" with all the well-known excuses, he must wait for a promotion, he must give the job a chance, business conditions are such that an increase cannot be granted, he has a steady job under pleasant working conditions and that is worth something, it is better to have a small regular income than a large irregular one, etc. Soon he gets fed up and starts looking for another job.

He is told by his prospective employer that as he is starting in the new firm he cannot have a good salary, the reason being that it would not be fair to the boys ahead of him. Please note that this time, since the lack of experience reason cannot be given, some other excuse to keep the salary down must be found and this is the favorite one. Again he must accept a starting salary of \$225 to \$250 per month, accompanied by still more promises of security and a bright future. A few years later he is able, generally speaking, to obtain \$300 per month and this amount in terms of engineers' salaries is indeed astronomical. From then on, if he is lucky, he will get \$400 per month before he dies at the age of 60 or so years.

This, Mr. Editor, is a true picture of the financial progress of an engineer throughout life in this country. It is indeed pathetic. If the young engineering students were told these facts, no doubt many of them would quit right away. They should be told that all that can be expected out of engineering from a monetary viewpoint is an income no better than that of a small storekeeper, a wood and coal merchant, a travelling salesman or a good tinsmith. It is true that a few lucky ones, through influence or heritage, are able to better the figures given by a considerable margin but they do not amount to more than 10% of the total.

I believe this situation is caused by the fact that far too many students are admitted to engineering courses. The medical faculties everywhere restrict the number of students in the first year and the same should be done for engineering. There are 36,000 engineers in this country and industrialists know it. Every time an advertisement appears for one engineering position the number of replies averages 25. Therefore, they know that engineers are plentiful and take advantage of that fact by keeping the salaries down. The position does not necessarily go to the one best fitted for it but to the lowest bidder. If the supply of engineers was kept a little short of the demand as is the case with the medical profession, remunerations would increase substantially and working and living conditions would improve, thus making it worthwhile to practise engineering as a profession. How can the engineer live like a professional man and have influence in the community if he has not the income to do so?

Of course, industrialists may try to combat this situation by importing engineers from foreign lands. This can be taken care of by strictly enforcing the law that nobody can practise engineering or be hired in an engineering capacity unless he is a member (not an associate member or other misleading terms) of an officially recognized professional body. Positions that embody engineering work should be listed and nobody should be employed in those positions unless he is properly qualified according to law. The medical profession and the licensed electricians do it, why don't we? I can see only one reason for this and that is the apathy of our various associations. Unless we stand up and fight for our rights nobody can be expected to do it for us.

For another thing the engineer talks too much. He gives free of charge technical information which cost him money to learn. Doctors do not talk for nothing, they talk only when they are paid to do it in their office, why can't engineers do likewise? Technical information should be circulated freely amongst members of the profession but should not be spread outside for poachers to take advantage of it. These poachers, half-trained and incompetent persons, fill around 5,000 jobs in this country, jobs that should be filled by thoroughly trained and competent engineers.

These poachers are a menace to the engineering profession, yet many call themselves engineers, and are the cause of low salaries. They are a menace to the profession and should be got rid of by the most drastic means. They can be likened to the barnacles that cling to the hull of a ship.

Until the engineering societies are ready to use drastic means to raise the level of the engineer to that of a truly professional body there can be no hope of improvement. If nothing else is done it is the duty of the Institute, and on this I am in full agreement with Mr. Ellis, to inform all prospective students that they are intending to take a course which will give them little in the way of decent remuneration.

The following steps are therefore recommended to improve the situation:

1. Restrict the number of students admitted to first year engineering.
2. Close the profession to those who are not properly trained.
3. Stop disseminating technical information right and left free of charge.
4. Get rid of the poachers.
5. Strictly enforce existing laws like the medical profession.

Yours truly,

(Signed) F. DUGAL, Jr., E.I.C.,  
Mechanical Engineer.

### Architects vs. Engineers

December 1st, 1944.

L. Austin Wright, Esq., General Secretary,  
The Engineering Institute of Canada,  
2050 Mansfield Street, Montreal.

Dear Sir:—

The distressing law suit between the architects and the engineers is still before the courts. As you know, there will be a small amount of rebuttal testimony and the legal arguments to be heard on December 19th. As you also know, this case has dragged through its legal course ever since mid-April 1942. There has been a tremendous amount of repeated preparation and discussion for the hearing, and it should be well known to the profession generally, that their rights have been fought for by a committee representing the Institute as well as the Corporation of Professional Engineers. I can vouch that these men, all of whom are members of the Institute, have worked throughout, with the same interest as though the case were their own.

In a somewhat different way, but in no less degree of sincerity of interest, the same should be said for those witnesses whose assistance was so necessary. All of those who agreed to help and went through the work of preparation were not heard, due to legal technicalities.

But, regardless of the general feeling that this case was an attack on our profession, I cannot help but realize the fact that I have been in the embarrassing position of having to defend myself. I do not find it easy to express adequately my appreciation of the efforts of busy men who have spent many days (weeks in several instances) in assisting me to defend my business. Also to the many others who have offered their assistance and shown their interest by telephoning or writing to find out how the case was progressing. To all of these, as well as to yourself and the Council of the Institute, I can only say "Thanks."

Yours very truly,

(Signed) BRIAN R. PERRY, M.E.I.C.

# RULES GOVERNING AWARD OF INSTITUTE PRIZES

## THE SIR JOHN KENNEDY MEDAL

A medal, called the "Sir John Kennedy Medal," was established in 1927, to be awarded under the following rules in commemoration of the great services rendered to the development of Canada, to engineering science and to the profession by the late Sir John Kennedy, past-president of The Engineering Institute of Canada.

- (1) The medal shall be awarded by the council of the Institute, at intervals of not less than two years, but only when the occasion warrants, as a recognition of outstanding merit in the profession or of noteworthy contribution to the science of engineering or to the benefit of the Institute.
- (2) As a guide in making the award, the council of the Institute shall take into consideration the life, activities and standing in the community and profession of the late Sir John Kennedy.
- (3) Awards shall be limited to corporate members.
- (4) At the beginning of the year of award, all members of Council shall be asked for their recommendations, supported by reasons, for the award of the medal, which must be submitted to council not later than May first. The council of the Institute shall then give consideration to the recommendations, but will not necessarily adopt any of them. If, in the opinion of the council, no corporate member of the Institute thus recommended is of sufficient merit or distinction, no award shall be made.
- (5) The award shall be decided by letter ballot of the council in a form to be prescribed by the council. The ballot shall be mailed to each member of the council and shall state the date of the council meeting at which it is proposed to canvass the ballot, which shall not be less than twenty days after the issue of the ballot. Unless at least twenty-five votes are cast there shall be no award. There shall be no award if more than two negative votes are cast.
- (6) Announcement of an award shall be made in *The Engineering Journal* and at the annual meeting, and, if possible, the presentation shall take place at that meeting.

## THE JULIAN C. SMITH MEDAL

This medal was founded in 1939 by a group of senior members to perpetuate the name of the late past-president of the Institute. It is awarded for "achievement in the development of Canada." The inaugural awards—eleven in number—were made in 1940 and 1941, but subsequent awards are limited to not more than two each year.

The general secretary shall ask each past-president and each vice-president of the Institute for nominations, which shall be submitted to a committee of three consisting of the president and two members of Council appointed by him. This committee may select not more than two names from the nominations, which name or names shall be submitted by open letter ballot to all councillors not later than October first of each year. At least twenty days shall elapse before the ballot is closed. Unless at least twenty-five votes are cast there shall be no award. There shall be no award if more than two negative votes are cast.

It is possible that some special occasion—a centenary celebration or the like—may arise when it would evidently be desirable to award more than two Julian C. Smith medals. In such a case departure from the prescribed limit may be permitted, but only if authorized by a formal resolution of Council, stating the special reasons for the action.

## DUGGAN MEDAL AND PRIZE

A prize of a medal and cash to a combined value of approximately one hundred dollars was established in 1935, to be given each year from the proceeds of a donation by Past-President G. H. Duggan, D.Sc., LL.D., M.E.I.C., for the purpose of encouraging the development of the branches of engineering in which he practised.

The prize will be awarded for the best paper presented to the Institute in accordance with the following rules:

- (1) Competition shall be open to all members of the Institute.
- (2) The papers shall be presented to the Institute either at the regular meeting of a branch or at a professional meet-

ing of the Institute, or directly to Headquarters. They shall not have been presented previously to any other body or meeting.

- (3) Papers to be eligible for this competition shall deal with subjects concerning the use of metals for structural or mechanical purposes. Without limiting the generality of the foregoing, it is suggested that the following topics come within this category, viz.: the economic and theoretical elements of design, fabrication, machinery, transporting, erecting, the investigation of problems or failures, methods of overcoming difficulties, new methods of design or manufacturing, the recording of tests, and other features that add to engineering knowledge.
- (4) Papers shall be the bona fide production of the author and proper credit shall be given for any assistance received from other parties, partners or reports. The relation of the author to the work shall be clearly stated. Papers shall be compiled and arranged with proper regard to literary value and shall constitute worthy contributions to the records of the engineering profession.

In judging the competition consideration will be given to the personal knowledge and appreciation of the problems and processes involved and the joint application of theoretical and practical considerations to the execution of the subject which are displayed on the part of the author.

- (5) The papers shall be judged by a committee of three corporate members, eminent in the corresponding branch of the profession, appointed for the purpose by council as required.
- (6) The award shall be made only when a paper of sufficient merit is presented. The prize year shall be from July 1st to June 30th and papers must be presented to Headquarters of the Institute by the 30th day of June.
- (7) The prize shall be awarded at the annual meeting.

## THE GZOWSKI MEDAL

A gold medal, called "The Gzowski Medal," is provided from the fund established in 1889 by Col. Sir Casimir Gzowski, A.D.C., K.C.M.G., late past-president of the Institute, and will be awarded according to the following rules for papers presented to the Institute.

- (1) Competition for the medal shall be open only to those who belong to the Institute.
- (2) The award of medals shall not be made oftener than once a year, the medal year shall be the year ended June last previous to the annual meeting at which the award is to be made.
- (3) The papers entered for competition shall be judged by a committee of five, to be called the Gzowski Medal Committee, which shall be appointed by the council as soon after the annual meeting of the Institute as practicable. Members and Honorary Members only shall be eligible to act on this committee.
- (4) Papers to be eligible for competition must be the bona fide production of those who contribute them, and must not have been previously made public, nor contributed to any other society in whole or in part.
- (5) The medal shall be awarded for the best paper of the medal year, provided such paper shall be adjudged of sufficient merit as a *contribution to the literature of the profession* but not otherwise.
- (6) In the event of the committee not considering a paper in any one year of sufficient merit, no award shall be made; but in the following year or years, it shall be in the power of the committee to award the accumulated medals to the authors of different papers which may be deemed of sufficient merit.
- (7) The medal shall be suitably engraved by the Institute, and shall be handed to the successful authors at the annual meeting, or be given to them as soon afterwards as possible.

### THE LEONARD MEDAL

A gold medal, called "The Leonard Medal," is provided from the annual proceeds of a fund established in 1917 by the late Lieut.-Col. R. W. Leonard, and will be awarded in accordance with the following rules for papers on mining subjects presented either to The Canadian Institute of Mining and Metallurgy or to The Engineering Institute of Canada.

- (1) Competition for the medal shall be open to those who belong to The Canadian Institute of Mining and Metallurgy or to The Engineering Institute of Canada.
- (2) Award shall be made not oftener than once a year, and the medal year shall be the year ended June last previous to the year in which the award is made.
- (3) The medal shall be presented at annual meetings of The Engineering Institute of Canada.
- (4) A committee of five shall judge the papers entered for competition, all of whom shall be members both of The Canadian Institute of Mining and Metallurgy and The Engineering Institute of Canada, this committee to be appointed by the council of The Engineering Institute of Canada.
- (5) All papers presented shall be the work of the author or authors and must not have been previously made public, except as part of the literature of The Canadian Institute of Mining and Metallurgy or The Engineering Institute of Canada.
- (6) Should the committee not consider the papers presented in any one year of sufficient merit, no award shall be made, but in the following year, or years, the committee shall have power to award the accumulated medals or to award a second prize in the nature of a silver medal, or a third prize of books to be selected by the committee.
- (7) The medal shall be suitably engraved, containing the name of The Engineering Institute of Canada, and the words, "The Leonard Medal" together with the adopted design, and on the reverse side the name of the recipient, the date and any other inscription that may be decided upon by the committee.

### THE PLUMMER MEDAL

A gold medal, called "The Plummer Medal," is provided from the annual proceeds of a fund established in 1917 by J. H. Plummer, D.C.L., and will be awarded according to the following rules for papers on chemical and metallurgical subjects presented to the Institute.

- (1) Competition for the medal shall be open to those who belong to The Engineering Institute of Canada, and to non-members if their papers have been contributed to the Institute and presented at an Institute or Branch meeting.
- (2) Award shall be made not oftener than once a year, and the medal year shall be the year ended June last previous to the year in which the award is made.
- (3) The medal shall be presented at annual meetings of The Engineering Institute of Canada.
- (4) A committee of five shall judge the papers entered for competition, all of whom shall be members of The Engineering Institute of Canada, and shall be appointed by the council of the Institute.
- (5) All papers presented shall be the work of the author or authors and must not have previously been made public, except as part of the literature of The Engineering Institute of Canada.
- (6) Should the committee not consider the papers presented in any one year of sufficient merit, no award shall be made, but in the following year, or years, the committee shall have the power to award the accumulated medals or to award a second prize in the nature of a silver medal, or a third prize of books to be selected by the committee.
- (7) The medal shall be suitably engraved, containing the name of The Engineering Institute of Canada, and the words, "The Plummer Medal," together with the adopted design, and on the reverse side the name of the recipient, the date and any other inscription that may be decided upon by the committee.

### THE T. C. KEEFER MEDAL

This medal was established by Council in 1942 to perpetuate the name of the first president of the Institute.

It is awarded for papers presented to the Institute during the

year on *civil engineering subjects*, "civil" being used in the limited sense to indicate structural, surveying and construction work generally.

### THE R. A. ROSS MEDAL

This medal was established by Council in 1942 to perpetuate the name of a past president of the Institute distinguished for work in the electrical branch of engineering.

It is awarded for papers presented to the Institute during the year on *electrical engineering subjects*.

### THE CANADIAN LUMBERMEN'S ASSOCIATION PRIZE

A prize of \$100.00 will be awarded by the Canadian Lumbermen's Association for the best paper presented in any year on the use of lumber or timber in construction; or on the use of wood, including wood waste, in the manufacture of useful products; or on the development of methods of treating wood to make it more resistive to destruction from decay, insects, marine organisms or fire; or in such other related subjects in wood utilization as may later be designed.

The following rules shall govern in the competition:

- (1) The competition shall be open to all members of the Institute and to any bona fide resident of Canada.
- (2) An award shall be made only if, in the opinion of the examiners, a paper has been presented for publication in the *Journal of the Engineering Institute of Canada* and/or in *Timber of Canada* of sufficient merit to justify the award.
- (3) The award shall not be made oftener than once a year, and the prize year shall be from July 1st to June 30th.
- (4) The award shall be made at the Annual Meeting of the Engineering Institute of Canada.
- (5) A committee of five shall judge the papers entered for competition, all of whom shall be members of the Engineering Institute of Canada.
- (6) All papers presented shall be the work of the author or authors and must not have been previously made public except as part of the literature of the Engineering Institute of Canada, or of the Canadian Lumbermen's Association. Proper credit shall be given in the papers for any assistance obtained from other parties or from other reports.
- (7) Should the Committee not consider the papers presented in any one year of sufficient merit to justify a prize, no award shall be made, but in the following year or years the Committee shall have power to award accumulated prizes if papers of sufficient merit to justify prizes are presented.
- (8) In the case of two or more authors presenting a paper, the amount of the prize shall be divided equally among such authors.
- (9) For the first year the award shall be made for the best paper on the structural application of timber and/or plywood as for example—
  - (1) Laminated structural wood members.
  - (2) Composite wood and plywood structural members.
  - (3) New ideas in the design of structural timber units.Special consideration will be given to papers dealing with the application of low grade material to structural uses. (Approved by E.I.C. Council, June, 1944.)

### PRIZES TO STUDENTS AND JUNIORS

- (1) Five prizes may be awarded annually for the best papers presented by Students or Juniors of the Institute in the vice-presidential zones of the Institute, as follows:—

The H. N. Ruttan Prize,—  
in Zone A—The four western provinces.

The John Galbraith Prize,—  
in Zone B—The province of Ontario.

The Phelps Johnson Prize,—  
for an English Student or Junior in Zone C—The province of Quebec.

The Ernest Marceau Prize,—  
for a French Student or Junior in Zone C—The province of Quebec.

- (2) Awards shall only be made if, in the opinion of the examiners for a zone, a paper of sufficient merit has been presented to a branch in that particular zone.
- (3) The winner of a prize shall be required to specify such technical books or instruments as he may desire to the total value of approximately twenty-five dollars when suitably bound and printed or engraved, as the case may be.
- (4) The award of prizes shall be for the year ending June thirtieth. On that date, each branch secretary shall forward to the examiners for his particular zone all papers presented to his branch by Students and Juniors during the prize year, regardless of whether they have been read before the branch or not.
- (5) The prizes shall be awarded only to those who are in good standing as Students or Juniors of the Institute of June thirtieth following the presentation of the paper.
- (6) The papers must be the bona fide production of those contributing them and must not have been previously made public or contributed to any other society in whole or in part. It is to be understood, however, that a paper which has won or been considered for a branch prize is nevertheless eligible for the Institute Prize. No paper shall be considered for more than one of the five prizes.
- (7) The examiners for each zone shall consist of the vice-president of that zone and two councillors resident in the zone, appointed by council. In the case of Zone C, two groups of examiners shall be appointed under the two vice-presidents, one for the English award and one for the French award. The awards shall be reported to the annual meeting of the Institute next following the prize year, and the prizes presented as soon thereafter as is reasonably possible.

## MEETING OF COUNCIL

A meeting of the Council of the Institute was held at Headquarters on Saturday, November 25th, 1944, at nine-thirty a.m.

*Present:* President deGaspé Beaubien in the chair; Vice-President C. K. McLeod; Councillors J. E. Armstrong, R. S. Eadie, E. V. Gage, R. E. Hertz, J. A. Lalonde, P. E. Poitras, H. J. Ward; Treasurer R. E. Chadwick, Secretary Emeritus R. J. Durley, and General Secretary L. Austin Wright.

*Legal Action by Architects Against an Engineer*—The general secretary reported that recently he had had an interview with Mr. Brian Perry in which Mr. Perry had informed him that the evidence in the case of the Province of Quebec Association of Architects *vs.* Brian Perry was now all in and that the argument of counsel would be heard on December 19th. Mr. Perry had indicated that his lawyers were satisfied that they had been able to get into the evidence all the facts that had a direct bearing on the legal aspects of the case and were confident that a favourable decision would be obtained.

Mr. Gage inquired as to the distribution of legal costs of the case, and in a general discussion which followed it was agreed that the case was in the interests of the entire profession as well as Mr. Perry. Mr. Chadwick thought that no matter how the case was decided a move should be made to maintain the position in the construction field which had always been occupied by engineers.

It was pointed out by Mr. Armstrong that although it was indicated that the Institute should assist with the finances, it would be necessary for Council to get permission for such expenditure from the annual meeting. It was therefore moved by Mr. Chadwick, seconded by Mr. Eadie, and approved unanimously, that a resolution along these lines be presented to the annual meeting.

## PRIZES TO UNIVERSITY STUDENTS

In 1930 Council established eleven cash prizes of twenty-five dollars each for competition among students of Canadian engineering schools, in the year prior to the graduating year. Awards are now made annually to the following institutions:

University of Alberta  
University of British Columbia  
Ecole Polytechnique, Montreal  
Laval University, Quebec  
University of Manitoba  
McGill University  
University of New Brunswick  
Nova Scotia Technical College  
Queen's University  
Royal Military College  
University of Saskatchewan  
University of Toronto.

It is the desire of council that the method of their award shall be determined by the appropriate authority in each school or university, so that a prize may be given to the student in any department of engineering who has proved himself most deserving, not only in connection with his college work, but also as judged by his activities in the student engineering organization, if any, or in the local branch of a recognized engineering society.

It is not necessary for the recipient to belong to the Institute, and in this respect the prizes are quite distinct from those offered to Students and Juniors of the Institute, or from the prizes which are offered by a number of our branches to the Students attached to them.

It is felt that the establishment of these prizes not only aids deserving students, but assists in developing their interest in engineering societies' work, and in the resulting acquirement and interchange of professional knowledge.

*Employment Conditions (Collective Bargaining)*—Mr. Hertz, chairman of the Committee on Employment Conditions, gave a detailed report of the activities up to date. He pointed out that a draft order for new legislation which would cover collective bargaining for professional workers had been prepared and accepted by the fourteen societies, and since had been presented by the committee of three to the Minister of Labour. They were now waiting for some decision or instructions from the minister. He also referred to two meetings which had been called by Mr. C. C. Lindsay, president of the Corporation of Professional Engineers of Quebec, in Montreal, to establish a co-operative organization to administer collective bargaining legislation for the professions in Quebec, and he asked Mr. Poitras to give the meeting further details of these developments.

Mr. Poitras referred to the two meetings called by Mr. Lindsay, stating that a sub-committee had been established to study the procedure that would be required for a bargaining agency within the province. The committee had thought that a procedure should be followed similar to that taken by the Ontario Association which had established a Federation of Employee-Professional Engineers and Assistants and was prepared to operate under the existing Order 1003.

He reported that a meeting of the committee was to take place that afternoon at which the constitution would be studied. He said that representatives of the Institute on the committee (selected by Mr. Hertz from his committee) had been asked to get authorization from the Council of the Institute to accept the constitution and also to request a loan as an aid towards the setting up of the organization. It was expected that the loan would be repaid as soon as the revenue from the federation had been established. He reported that the Corporation of Professional Engineers of Quebec had already indicated that it was prepared to make a loan for that purpose. Some question was raised as to

whether or not the Council had the power to use Institute funds in this way without submitting the proposal to an annual meeting.

Mr. Hartz agreed that it was wise to be ready to take action but he wondered whether or not the new federation could do anything until a decision was made as to whether or not the new order would be passed. Mr. Poitras explained that it was proposed that the federation would operate under the existing Order 1003 for the present and until the new order was in force.

The president observed that as this was an extremely important step, and so far-reaching in its implications, he thought Council should have an opinion from the Institute's Committee on Employment Conditions.

After further discussion it was agreed that the urgency of the situation did not require an immediate decision but that Council should have a report from the Committee on Employment Conditions before taking action. This was moved, seconded, and agreed upon unanimously.

It was agreed further that if an emergency development required a decision before the next meeting of Council the chairman of the Institute's committee could notify the president who would call a special meeting for that purpose.

*Rehabilitation of Members in the Armed Forces*—Mr. Lalonde was strongly of the opinion that the Institute could not neglect its duty in this matter. He thought no other organization could give the members the same service as the Institute, because of the Institute's special interest in its members. The president suggested that the search for the right person should go ahead without determining at the moment where he would be located. Mr. Armstrong thought a much better job could be done by handling the Institute rehabilitation from a central office rather than attempting to do it through each individual branch.

Finally, it was agreed to continue the proposal and to establish the office in Montreal at least for the time being, and that consideration should still be given to the advantages of conducting this operation from some other location.

*New Engineering Organization*—The general secretary presented a report from J. B. Stirling, chairman of the Institute's Committee on Professional Interests, who, because of illness, was unable to be present. The report acknowledged the decision of Council made at Edmonton, to the effect that the proposal for a new engineering organization be referred to the Committee on Professional Interests with the suggestion that the committee consult the four provincial professional associations with which the Institute has agreements, in order to reach a decision that would be in accordance with the wishes of those bodies.

Mr. Stirling reported that he had discussed the matter with the local members of his committee and that negotiations were under way for having a full meeting of the committee, including out-of-town members, within a very short period of time.

*Financial Statement*: The financial statement to the end of October was presented, and it was noted with satisfaction that the revenue from fees and Journal was materially ahead of last year; expenditures, though somewhat increased, were still within reasonable limits.

*President's Western Tour*: The president gave a brief outline of his visit to the western branches which began at Sault Ste. Marie and finished at Victoria. In addition to the regular branch meetings, meetings were held at Atikokan (Steep Rock Iron Mines), Trail and Kelowna. He reported that the affairs of the Institute seemed to

be in a very thriving condition. The reception which had been accorded his party in every centre was an indication of the esteem in which the Institute was held. He thought there was no other way in which a person could see what an integral part of the fabric of Canada the Institute was, except by visiting all the branches. He commented particularly on the dinner meeting which had been arranged by a few members of the Institute in Trail. At this meeting there were one hundred and seventy persons in attendance. He also referred to the day spent with Mr. Lorne A. Campbell, M.E.I.C., vice-president and general manager of the West Kootenay Power and Light Company, making inspections of several power developments of the company. He then outlined the itinerary from Victoria back to Montreal, which included for himself and Madame Beaubien a visit to the Grand Coulee Dam, the Boulder Dam, and also Los Angeles and San Francisco.

The president also expressed his appreciation to Mr. Hartz for accompanying him through his entire tour of the provinces, both east and west, and also to Vice-President Brereton of Winnipeg who had travelled with him from Winnipeg to Edmonton.

Mr. Hartz agreed with the president on the educational value of such a trip. He thought it would be a wonderful thing for the Institute and for the individuals if all councillors could get the real picture of the Institute that is afforded only this way.

*Council Minutes to Committee Chairmen*: The general secretary pointed out the desirability of sending copies of the minutes of Council meetings to the chairmen of Institute committees. Very often discussions took place, or decisions were reached, which would be of interest to certain committee chairmen. It was unanimously agreed that this should be done.

## ELECTIONS AND TRANSFERS

### Members

A number of applications were considered, and the following elections and transfers were effected:

**Bickell**, William Albert, B.A.Sc. (Univ. of B.C.) and M.Sc. (McGill Univ.), Capt., R.C.E., Dir. of Works and Constrn., N.D.H.Q., Ottawa, Ont.

**Cock**, Cecil James, B.A.Sc. (Chem.), (Univ. of B.C.), Capt., R.C.E., 2nd-in-Command, 6th (Reserve) Field Coy., Vancouver, B.C.

**Godin**, Camille Rene, B.A.Sc., C.E. (Ecole Polytechnique), asst. professor of maths., Ecole Polytechnique, Montreal.

**Hall**, Per, B.Sc. (Civil), (Royal Tech. Coll., Copenhagen), asst. project engr., Aluminum Co. of Canada, Ltd., Montreal.

**Jarmain**, Edwin Roper, B.A.Sc. (Univ. of Toronto), engr., Kelco Engrg. Ltd., and proprietor, Forest City Laundry, London, Ont.

**Ketchum**, Verne, B.Sc. (Michigan State College), chief engr., Timber Structures Inc., New York, N.Y.

\***Krassov**, Chas., B.Sc. (Civil and Chem. Eng.), Tri-State Coll. of Engrg., mech. engr. dept., Ford Motor Co. of Canada, Ltd., Windsor, Ont.

**Mokrzycki**, Gustav Andrew, Dip. in Mech. Engrg. (Inst. of Tech., Lwow), Dip. in Aero. Engrg. (E.S.N.A.), research engr., Consolidated Vultee Aircraft Corp., San Diego, Cal.

**Muir**, William Gordon, B.Sc. (Mining Eng.), (N.S. Tech. Coll.), plant engr., St. Maurice Chemicals, Ltd., Shawinigan Falls, Que.

**Perrin**, James Vincent, Ph.B. (Civil), (Sheffield Scientific School), woods mgr., Brown Corp., Quebec, Que.

**Range**, George Neil, B.Sc. (Arch.), (Royal Tech. Coll., Copenhagen), Military Foreman of Works, Camp Engr. Officer, A-4, C.A.T.C., Brandon, Man.

**Richardson**, Frank Cockburn, B.A.Sc. (Chem. and Met. Eng.), (Univ. of Toronto), met. engr., genl. tech. dept., Aluminum Co. of Canada, Montreal.

**Roddick**, James Oliver, B.A.Sc. (Univ. of Toronto), pres. and genl. mgr., Russell Construction Co. Ltd., Toronto, Ont.

**Worley**, Harold Gordon, B.Sc. (Univ. of Toronto), asst. project engr., Canadian Industries Ltd., Montreal.

\*Has passed Institute examinations.

- \***Ainlay**, Arthur, tech. asst. engr., Inspection Board of U.K. and Canada, Montreal.  
**Dewar**, Geoffrey Plummer, B.A.Sc. (Univ. of Toronto), Directing Staff Officer (G.S.O.II), Cdn. War Staff Course, R.M.C., Kingston, Ont.  
**Dewar**, Peter Stewart, B.A.Sc. (Mech.), (Univ. of Toronto), mech. engr., foundry divn., Ford Motor Co. of Canada, Ltd., Windsor, Ont.  
**Fox**, James Clarence, B.A.Sc. (Univ. of Toronto), engr.-in-charge, stress analysis group, deHavilland Aircraft of Canada, Ltd., Toronto, Ont.  
**Wallingford**, Vivian Miles, B.A.Sc. (Civil), (Univ. of Toronto), wartime surveys engr., grade II, Geodetic Service of Canada, Dept. of Mines and Resources, Ottawa, Ont.  
 \*Has passed Institute examinations.

## Affiliates

- Emery**, Charles Arthur, instructor, Chatham Vocational School, Chatham, Ont.  
**Wilson**, Alexander, mgr., Pumps & Softeners, Ltd., London, Ont.

*Transferred from the class of Junior to that of Member*

- Brews**, Robert William, B.Sc. (Elec.), (Univ. of Alberta), inspecting officer, fuse divn., Inspection Board of U.K. and Canada, Ottawa, Ont.  
**Furanna**, Anthony Lewis, B.Sc. (Elec.), (Queen's Univ.), engr., instrument divn., Sparton of Canada, London, Ont.  
**Northover**, Arthur Clinton, B.A.Sc. (Civil), (Univ. of Toronto), structl. engr., Canadian General Electric Co. Ltd., Peterborough, Ont.

*Transferred from the class of Student to that of Member*

- Richard**, Adrien, B.A.Sc., C.E. (Ecole Polytechnique), engr., Mongeau & Robert Co. Ltd., Montreal.  
**Roy**, Maurice, B.Sc. (Civil), (Queen's Univ.), Major, Dominion Arsenal, St. Malo, Que.  
**Smith**, Norman Janson Winder, B.Eng. (McGill Univ.), Lieut.-Col., R.C.E., C.R.E., 2nd Cdn. Inf. Divn., Cdn. Army Overseas.  
**White**, William Barr, B.Sc. (C.E.), (Univ. of Man.), Capt., R.C.E., Camp Engr., No. 133 I.C., Lethbridge, Alta.

*Transferred from the class of Student to that of Junior*

- Anglin**, Thomas Gill, B.Eng. (Mech. and Indus.), (McGill Univ.), tech. asst. to L.H. & P. dept., supt., D.I.L., Nitro, Que.  
**Bousquet**, Paul, B.A.Sc., C.E. (Ecole Polytechnique), tech. translator, General Staff, N.D.H.Q., Ottawa, Ont.  
**Brien**, François, B.A.Sc., C.E. (Ecole Polytechnique), elec. engr., Canadian Fairbanks-Morse Co. Ltd., Shelburne, N.S.  
**Cuthbertson**, Robert Shedden, B.Sc. (Mech.), (Queen's Univ.), junior engr., Northern Electric Co., Montreal.  
**Duffy**, Frank H., B.Sc. (Elec.), (Univ. of N.B.), asst. meter and relay engr., Aluminum Co. of Canada, Ltd., Shipshaw, Que.  
**Garrett**, Richard Hudson, B.Eng. (McGill Univ.), F/O, R.C.A.F., Victoria, B.C.  
**Hamilton**, John C., B.Sc. (Queen's Univ.), shift supervisor, Cdn. Resins & Chemicals, Shawinigan Falls, Que.  
**Hébert**, Guy, B.A.Sc., C.E. (Ecole Polytechnique), soil engr., Dept. of Roads, Quebec, Montreal.  
**Lamarque**, Marcel, B.A.Sc., C.E. (Ecole Polytechnique), engr., marine divn., Cdn. Fairbanks-Morse Co. Ltd., Shelburne, N.S.  
**Lavigne**, Bernard, B.A.Sc., C.E. (Ecole Polytechnique), F/L, Aero. Engr., R.C.A.F., Montreal.  
**Macdonald**, Ian Malcolm, B.Eng. (N.S. Tech. Coll.), mech. engr., Cdn. Westinghouse Co. Ltd., Hamilton, Ont.  
**Mackay**, William Ronald, B.Eng. (McGill Univ.), engr., commercial and distribution dept., Shawinigan Water & Power Co. Three Rivers, Que.  
**Manuel**, Oliver Hemphill, B.Sc. (Civil), (Univ. of N.B.), Lieut. (S.B.) (E), R.C.N.V.R., Mtee. Officer, R.C.N. Armament Depot, Dartmouth and Bedford Magazine, Dartmouth, N.S.  
**Ouellette**, Robert Pascal, B.Eng. (McGill Univ.), asst. engr., United Shipyards Ltd., Montreal.  
**Phillips**, Ronald Edward, B.Sc. (Elec.), (Univ. of Alta.), Elect. Lieut., R.C.N.V.R., instructor, electl. artificers course, Univ. of Alberta, Edmonton, Alta.  
**St. Laurent**, Aurèle, (Ecole Polytechnique), mining and smelting divn., International Nickel Co. of Canada, Copper Cliff, Ont.  
**Saunders**, William Allison Baxter, B.Sc. (C.E.), (Univ. of N.B.), P/O, Flying Instructor, No. 15 S.F.T.S., Claresholm, Alta.  
**Smith**, Paul M., B.A.Sc. (C.E.), (Ecole Polytechnique), engr., Marine Industries, Ltd., Sorel, Que.  
**Willis**, Lloyd Everett, B.Sc. (Civil), (Univ. of Alberta), sapper, R.C.E., Debart, N.S.

- Scarlett**, Irvine Canfield, B.Eng. (McGill Univ.), 2nd/Lt., R.C.E.M.E., A-36, C.R.T.C., Barriefield, Ont.

*Students at Ecole Polytechnique*

- Amiot**, Jean-Marie, 1836 Valois, Montreal.  
**Arbic**, Pierre-Paul, No. 2, 3rd Ave., St. Eustache, Que.  
**Archambault**, Joseph Bernard, 4248 Fabre, Montreal.  
**Barette**, Joseph A. Raymond, 5389 Brodeur, N.D.G., Montreal.

# BRIEF ON COLLECTIVE BARGAINING

Presented to the Wartime Labour Relations Board by the "Fourteen Societies" on January 9th, 1945

1. On April 12 last a committee representing some 14 organizations of professional engineers and scientists appeared before you and requested that such workers be excluded from the operation of P.C. 1003 at least until they had been given an opportunity of considering the effect of this law on their position in national life. They had not been consulted in the drafting of the law. You were good enough to order that such workers be excluded from the operation of the order for a period of at least six months. Pursuant to your letter of November 29, 1944, we present herein the collated views of the professional scientific workers of Canada.

2. Following our meeting with you, the Committee requested each of the organizations to inform its own members of the problems and considerations involved in this new law and to request them to indicate their individual wishes in the matter. There are some 40,000 workers in this group. The several organizations did a very good job in the matter of informing their members as to the considerations involved. The results were collected by means of individual ballots by some of the organizations and by branch meetings held across the country by other of the organizations. In gross the results indicated substantial unanimity on the part of such workers in favour of compulsory collective bargaining for professional scientific workers but by an agency of their own choosing and constituted by professional people. As illustrative of the vote, the following figures may be quoted:

92% were in favour of collective bargaining under a new Order in Council relating specifically to this group of persons.

Only 1% indicated a preference for trade unions as their bargaining agents.

3. The new order was drafted and the undersigned Committee was instructed to present it to the Government. A copy of the order which we presented to the Honourable Humphrey Mitchell, Minister of Labour, on November 8 is attached hereto.

4. The essential features of this order, which distinguish it from P.C. 1003 are:

(a) "Employee" is defined as a person employed in his capacity as a professional worker and excludes persons employed in any other capacity distinct from their professional or scientific training.

(b) "Professional Worker" is defined so as to describe the types of employees to be covered.

It includes three groups as follows:

(i) Members of the provincial professional registering bodies, and those in training for registration.

(ii) Members of national technical societies formed for the purpose of promoting the advancement of knowledge in the various scientific professions.

(iii) Those who hold degrees in several stated branches of science, or who are taking courses leading to such degrees, in or from universities or colleges recognized by the Board.

(c) It seeks to include professional employees of the Dominion Government.

(d) References to "trade unions" have been replaced by the term "employees' organizations" as descriptive of the collective bargaining group.

(e) It is proposed that a National Board (smaller than the present Board, and more directly representative of professional workers and their employers) and

Provincial Boards constituted on the same principle, be set up to administer the proposed order. It is assumed that the Dominion and the provinces will make similar arrangements as under P.C. 1003 as to the body (and its personnel) to administer the order in each province and as to the classes of matters within the general jurisdiction of the National Board which are to be administered by the provincial body.

5. The following reasons are advanced in support of the proposed order:

(a) By virtue of their professional and scientific training, such employees are as distinctly distinguishable from the general body of employees as are employees belonging to a craft-union; they also possess a community of interests not shared by the generality of employees.

(b) By the nature of their work they are differentiated from the generality of employees. The duty of professional workers as defined in the proposed Order possesses the following characteristics:

(i) It is predominantly intellectual and varied in character as opposed to routine mental, manual, mechanical or physical work.

(ii) It requires the consistent exercise of discretion and judgment in its performance.

(iii) It is of such character that the output produced cannot be standardized in relation to a given period of time.

(iv) It requires knowledge of an advanced type in a field of science or learning customarily acquired by a prolonged course of specialized intellectual instruction and study, as distinguished from a general academic education and from an apprenticeship, and from training in the performance of routine mental, manual, or physical processes.

(v) It is predominantly original and creative in character, as opposed to work which can be performed by a person endowed with general manual or intellectual ability and training.

(c) It is hard to fit these employees into an Order designed for employees generally and built largely around the conventional trade unions. The Board which is to regulate collective bargaining by such employees should be directly representative of such workers and of employers of such workers. The present Board is representative of employers and workers as a whole.

(d) Professional scientific workers usually occupy a functional position which is between labour and management. Their function has primarily to do with the advising on, the reporting on, the designing of, the supervising of the construction of various projects and research, as well as the operation of various processes and the like. In performing these functions they are restricted to the use of established formulae, rules and procedures by which the facts surrounding the project in hand are measured quantitatively. They have no opinion on the project until the facts are so established. This constitutes the basic principle of the training they receive as students usually at considerable cost to the country. In the national interest nothing should be permitted to hamper efficient utilization in research and industry of that skill.

To place professional scientific workers performing such functions in a group with management or labour for bargaining purposes, would tend to reduce the efficiency with which they can perform their major function, because of the new loyalty which they would have to assume in relation to the group to which they are associated.

It is quite natural for the individual to develop loyalty to an association of which he forms a part. It is apparent that, if such workers found that they could not exhibit loyalty to the group and at the same time efficiently perform their professional function, their social position in the group would be unhealthy. The effect on creative or productive capacity of the group would be bad, to the detriment of all. If a few professional scientific workers join in an association with a large number of other workers who are not hampered by the necessity for factually analyzing the project in hand, it seems clear that they will be forced to follow the will of the majority, even if that should be contrary to the scientific facts to which they are committed.

We suggest that this is an important factual consideration which should not be valued lightly in the improvement of employment relations.

- (e) We believe that professional scientific workers acting as independent units in industry in the matter of collective bargaining will be able to do much to promote improved relationships between labour and management.
- (f) We are sure best results can be achieved by operating under a separate order since the effort will be free from the prejudices which have developed, not unnaturally, in the procedures followed by trade unions and management.
- (g) We realize that difficulties will arise by the provision of the separate procedure, but we believe they will be fewer and the benefits greater to both labour and management.
- (h) Professional workers are now organized in associations and societies throughout Canada for the purpose of disseminating technical and scientific information, establishing standards of practice, controlling the practice of the professions and disciplining their members. They have prepared and they enforce codes of ethics applicable to professional workers. All of these activities have for their object the rendering of competent and adequate technical services which are absolutely essential to the welfare, safety and health of the public. These services are distinct from those rendered by the generality of employees, and distinguish professional workers as having a community of interests which will be jeopardized if they are included in the operations of an order, with other employees.

If the professions are to serve the public as they should and as they desire to do, they may with propriety ask the Government to recognize them as a distinct element in the community as Labour is now recognized, to accord them equivalent status and privileges, and to do nothing which will jeopardize the unity of the professions. Indeed we believe our group would be negligent in its duty to the betterment of human relationships if we did not strongly urge this point of view.

- (i) The Dominion Government has already recognized the validity of the principle involved by enacting a code of wartime manpower controls for professional engineers and scientists different from that applying to employees in general, and by placing

the administration of these controls under the Wartime Bureau of Technical Personnel, a body set up at the request of our national scientific organizations, under the direction of the Honourable Humphrey Mitchell, Minister of Labour. The benefits accruing therefrom have been acclaimed widely by all who know the facts.

That is to say, the Government has acknowledged by a special law that professional workers, because of their training and experience, form a distinct class different from the generality of employees. By placing the operation of the Bureau in the hands of professional persons, through the medium of its administrative officers and Advisory Board, the Government has acknowledged the competency of professional workers to deal with problems in the field of their special work.

The postwar period will present problems as formidable as those now facing us. They will include many more than collective bargaining. Their solution will require the concentrated and combined efforts of all those competent and willing to attack them. Professional workers' contribution to their solution will be based upon the capacity which their training and experience has given them. To be effective, it must not be impeded by diversifying their efforts and submerging them in groups not familiar with their methods.

- (j) The practice of professional engineering is controlled by law in each of the provinces. Under such laws a professional engineer may be denied the right to practise his profession. In this respect, too, the position of such professional workers differs from that of members of a trade union.
- (k) The proposed Order is an adaptation of P.C. 1003 to the specific case of professional and scientific workers. No change of the basic principle or machinery is involved.

6. The hope for improvement in such relations in fields of employment lies in the greater exercise by individuals of the sense of responsibility to others in accomplishing a desired object. Responsibility for the discharge of loyalty to a group must not be placed, by law, in opposition to responsibility for recognizing and pursuing the course dictated by the facts involved in the project in hand. Professional scientific workers have an ingrained sense of responsibility to their job: to define the best way the project can be carried out successfully.

7. It is of interest here to quote a statement made at a recent meeting of the American Chemical Society by Mr. Bernard M. Baruch, one of the outstanding leaders in the United States in organizing production in both this and the last war:

"A trained scientific researcher thinks only of the subject he has before him; not of any ideology, not of himself, not of his publicity, not of what anybody thinks of him or his associates, not of another job—but only of one thing—what do the facts justify? How helpful it would be if we could have more trained minds to see errors, to pass judgment and guide action before it is too late.

"It is hoped that in the future, even in the fields of economic, political and social matters, national and international, more of these trained scientific minds, those experienced searchers after facts, truths and realities, will be asked to help solve them."

No reflection on trade unions is implied or intended; the proposal merely reflects the fact that trade unions being differently constituted need not be invoked as

agencies of collective bargaining by professional workers who are organized on the different principle of professional training.

No great loss can accrue to trade union membership, as such unions have seldom brought professional workers into union ranks as such; on the contrary it is in accordance with the spirit of P.C. 1003 that the professional workers should be free, if so minded, to select non-union agencies or to avoid agencies altogether and choose individual representatives directly.

It is of as much interest to labour as a class as it is to management as a class to have an independent body to advise on the practical possibilities of a given proposal.

9. We understand the Honourable Minister of Labour is awaiting your views before dealing with our request. In the interest of the purpose for which P.C. 1003 was enacted we strongly urge that you recommend it.

Respectfully submitted on behalf of Professional Engineers and Scientists by their officially appointed Committee.

R. E. HEARTZ.  
W. P. DOBSON.  
A. E. MACRAE.

## Personals

Relatives and friends of members in the active forces are invited to inform the Institute of news items, such as locations, promotions, transfers, etc., which would be of interest to other members of the Institute and which should be entered on the member's personal record kept at Headquarters. These would form a basis of personal items in the *Journal*.

A. Peebles

**Archibald Peebles, M.E.I.C.**, has been elected chairman of the Vancouver Branch of the Institute. Mr. Peebles was born at Glasgow, Scotland, in 1904. He was educated in Vancouver receiving his B.A.Sc. in civil engineering from the University of British Columbia in 1929 and his B.A. degree in 1934.

He was employed as draughtsman on construction work with various firms among which were Stuart Cameron & Co., John S. Metcalf Company, and Powell River Company. From 1929 to 1931 he worked as structural draughtsman and checker for the Dominion Bridge Company, Vancouver. He has been with the Department of Civil Engineering, University of British Columbia since 1931 when he started as instructor.

## News of the Personal Activities of members of the Institute

**Lieut.-Col. W. E. Phillips, M.E.I.C.**, has recently been appointed by the Ontario Government a governor of the University of Toronto, filling the vacancy caused by the death of F. Gordon Osler. He is head of Research Enterprises Limited, president of Duplate Canada Limited, W. E. Phillips Company Limited, Fibreglass Canada Limited, Duplate Tool and Die Limited, as well as director of the Royal Bank of Canada, Massey-Harris Company, Trusts and Guarantee Company Limited and Steep Rock Iron Mines, Limited.

Col. Phillips was born in Toronto and educated at Upper Canada College and at the University of Toronto where he received his B.A.Sc. in 1914. During the First Great War he served with the Leinster Regiment and later with the Royal Warwickshire Regiment. He was awarded the M.C. and D.S.O., and was mentioned twice in despatches, becoming a lieutenant-colonel while still under twenty-six years of age.

In 1919 Col. Phillips was loaned to the French for special work in Poland and on returning to Canada established the Phillips Glass Company in Oshawa. By the time the present war broke out he had acquired considerable knowledge and experience in glass manufacture. In 1940 when the Department of Munitions and Supply decided to organize a company for the manufacture of optical glass and optical instruments in Canada, Col. Phillips was chosen to head the company, known as Research Enterprises Limited. Recently the government appointed him a director of Turbo Research, a Crown company, which will manufacture the jet propulsion plane in Canada.

**Major-General Christopher Vokes, C.B.E., D.S.O., M.E.I.C.**, commander of the Canadian First Division in Italy, has been made an Officer of the Legion of Honour and awarded the Croix de Guerre with palm by the French Government "in recognition of gallant and distinguished services in the cause of the Allies".

**Harvey Doane**, M.E.I.C., has been appointed manager of the recently formed Halifax Public Utilities Commission, Halifax, N.S. He was previously employed by the Standard Paving Maritime Limited at Halifax.

**A. W. K. Billings**, M.E.I.C., has succeeded the late Sir Herbert Couzens in the presidency of Canada's largest external industrial undertaking, the Brazilian Traction, Light & Power Co. For the past 23 years vice-president of Brazilian Traction and its several operating subsidiaries, Mr. Billings spends most of his time in Rio de Janeiro and Sao Paulo, where he and his company have played an important part in facilitating the industrial development of Brazil and that country's impressive industrial contribution to the United Nations' war effort.

**Yvon Cousineau**, M.E.I.C., of the Aluminum Company of Canada, Limited, at Arvida, Que., has been appointed secretary of the Arvida Aluminum Uses Committee. The Arvida Aluminum Uses Committee has been created to promote new industrial uses for aluminum by working them out in the plant at Arvida. Recent progress overseas has somewhat curtailed the production of this material which has played such an important role in the war. The Aluminum Company has foreseen such curtailment and is working to develop new uses for aluminum to absorb its post-war production.

**Captain A. O. Barrie**, M.E.I.C., is on active service with the Royal West African Frontier Force, previous to which he had been serving with the Gold Coast Light Battery in Kenya, Somaliland, Abyssinia, Gambia, the Gold Coast and Nigeria.

**R. W. McColough**, M.E.I.C., has resigned his positions as Director of Construction, Department of Munitions and Supply, Ottawa, and Deputy Minister, Department of Highways and Public Works, Province of Nova Scotia. He is now vice-president of Dufferin Paving and Crushed Stone Limited at Toronto, Ont.

**Constructor-Lieutenant John Middleton**, M.E.I.C., has joined the Royal Canadian Naval Volunteer Reserve. He has been assistant engineer with the Department of National Defence, Naval Service Headquarters, at Ottawa, Ont.

**John Frisch**, M.E.I.C., has recently resigned his position with the Canadian Celanese Limited and has joined the Marathon Paper Mills of Canada Limited, Marathon, Ont., in the capacity of mechanical superintendent.

**Lyle McCoy**, M.E.I.C., has been recently promoted to general manager of Canadian Car and Foundry Company Limited, Montreal, Que. Last spring he was elected vice-president of the company. He has been with the firm since 1916.

**W. A. Dawson**, M.E.I.C., has recently been appointed chief master mechanic of the deHavilland Aircraft of Canada Limited at Toronto, Ont. He was formerly associated with the Ordnance Division of the Otis-Fensom Elevator Co. Limited at Hamilton, Ont.

**William Watkins Downie**, M.E.I.C., has resigned his position as buildings engineer with the Maritime Telegraph & Telephone Company Limited at Halifax. He has recently been appointed buildings engineer with the Board of School Commissioners for the City of Halifax.

**Squadron Leader Kenneth Y. Lochhead**, M.E.I.C., has recently been promoted from the rank of flight lieutenant and is now in charge of engineering development work on trainer type airplanes at R.C.A.F. Headquarters, Ottawa, Ont.

**V. W. Dick**

Secretary, Annual Meeting Committee, Winnipeg

**Weston E. Weatherbie**, M.E.I.C., who has been employed with the Aluminum Company of Canada at Shipshaw, Que., has accepted a position as yard foreman with the Bathurst Power & Paper Company, Bathurst, N.B.

**Allan D. Nickerson**, M.E.I.C., a former chairman of the Halifax Branch of the Institute, has resigned his position as transmission engineer with the Maritime Telegraph & Telephone Company Limited at Halifax, N.S. He is now with the Bell Telephone Company of Canada at Montreal, Que.

**Rosaire Saintonge**, M.E.I.C., of the Consolidated Paper Corporation, has been transferred from the Port Alfred mill where he was assistant division engineer to the woodlands department at Grand'Mère, Que., as woodlands logging engineer.

**Joseph D. Kline, Jr.**, E.I.C., formerly with the Pickering works of Defence Industries Limited, is now employed as designing engineer with the newly formed Halifax Public Utilities Commission, Halifax, N.S.

**Flying Officer Graham R. Treggett, Jr.**, E.I.C., has recently been promoted from the rank of pilot-officer and has been posted overseas.

**E. L. Miller, Jr.**, E.I.C., is now with the Jamaica Bauxite Company at Manderville, Jamaica, B.W.I.

**W. S. Raynor, Jr.**, E.I.C., of Canadian Car & Foundry Company Limited, has been transferred from Amherst, N.S., to the St. Laurent plant at Montreal, Que., as executive engineer.

**J. N. McCarey, Jr.**, E.I.C., is now employed as engineer with the Canadian International Paper Company at Hawkesbury, Ont. He was formerly with the Stephens Adamson Manufacturing Company of Canada Limited, Belleville, Ont.

**Melvin Lee Zirul**, Jr., E.I.C., is at present with the Powell River Company, Powell River, B.C.

**Ralph T. Morgan, Jr.**, E.I.C., who has been with the Canadian International Paper Company at Three Rivers, Que., is now with the New Brunswick International Paper Company at Dalhousie, N.B.

**G. E. P. Eastwood**, S.E.I.C., who has been engaged in geological mapping with the Geological Survey of Canada, is now employed in the research department of the Hudson Bay Mining and Smelting Company at Flin Flon, Man.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**Francis Bell Reilly**, M.E.I.C., died on November 22nd, 1944, at his home in Regina, Sask. Born at Wardsville, Ont., on May 17th, 1874, he received his education there and in Regina.

For a number of years after moving west, Mr. Reilly taught school in the Wolseley and Regina districts. In 1909 he joined the architect firm of Reilly, Dawson and Reilly and was in charge of different architectural undertakings as well as assisting in general survey work. He had joint responsibility in preparing plans and superintending buildings such as Westman Chambers, Regina, and Central and Elmwood Schools, Swift Current, and various other structures throughout the province. In 1934 he became a partner in the firm of Reilly and Crowther.

Mr. Reilly was associated with the Regina library board for 27 years, being chairman from 1923 until he retired in 1943. A prominent Mason for many years, Mr. Reilly was grand master of the Masonic Lodge of Saskatchewan in 1932-33 and was provincial prior and grand constable of the Grand Priory of Canada.

Mr. Reilly joined the Institute as an Associate Member in 1918 becoming a Member in 1940. He was made a Life Member in 1943.

**Cecil Middleton Ross**, M.E.I.C., died on November 29th, 1944, at the Western division of the Montreal General Hospital after a short illness. Born at Scotstown, Que., on January 13th, 1886, he received his education at Ottawa Collegiate and at McGill University from where he graduated in 1908 with a B.Sc. in mining.

For the two years following graduation Mr. Ross worked as assayer-engineer with the Crown Reserve Mining Company in Ontario after which he did survey-

ing and contracting in British Columbia. From 1914-1919 he served with the Royal Canadian Engineers overseas ending his service with the rank of captain. After the war Mr. Ross worked in the mining department of the Manitoba Bridge & Iron Works at Winnipeg for one year when he was engaged as engineer in charge of the "Core Wall" Twin Falls development of the Abitibi Paper Company for the contractors Morrow and Beatty. In 1920 Mr. Ross joined the Mathews Conveyer Co. Limited, Montreal, as district engineer for the designing, selling and installing of Conveyer systems in the province of Quebec. He remained with this company until the time of his death. His mining activities were well known across the Dominion and included the C.N.R. tunnel under Mount Royal.

Mr. Ross joined the Institute as a Member in June, 1944.

**Beresford Henry Segre**, M.E.I.C., a survey engineer with the Mines and Resources Department for many years, died in Ottawa on November 15th, 1944. Born in Jamaica, B.W.I., on February 19th, 1886, he received his B.A.Sc. degree at the University of Toronto in 1913.

After graduation Mr. Segre entered the service of the Dominion government as chief of party on Dominion Land Surveys, and in 1915 he enlisted in the First Great War. He served overseas with the Royal Engineers as a lieutenant being Works Officer R.E. at Baku, Russia. In 1920 he returned to work for the government and two years later left Ottawa to conduct the survey of the Mackenzie River, N.W.T., shortly after the discovery of oil at Norman Wells. Commencing at Norman Wells he continued to the Arctic coast and wintered at Aklavik, then a mere settlement, continuing the delta survey the following summer. He had been with the Department of Mines and Resources for 24 years.

Mr. Segre joined the Institute as Associate Member in 1921 becoming a Member in 1940.

## News of the Branches

### BORDER CITIES BRANCH

W. R. STICKNEY, M.E.I.C. - *Secretary-Treasurer*  
G. W. LUSBY, M.E.I.C. - *Branch News Editor*

The regular monthly meeting of the Border Cities Branch was held at the Prince Edward Hotel on October 20th, with J. B. Dowler, chairman of the Branch, presiding.

The speaker of the evening was Mr. George Long, historian for the Bell Telephone Company of Canada, whose subject was **Giving Wings to Words—To-day and To-morrow.**

Mr. Long stressed the importance of communications in modern warfare and stated that the early battles of this war were lost because of inadequate communication systems. Since then great strides have been made in developing and perfecting special telephone equipment to meet the requirements of the armed services with the result that over 2,000 patents on telephone equipment alone have been made in the last three years.

The modern battleship requires as many phones as a city of 10,000 people and the B-29 super fortress bomber carries over 2,000 lbs. of radio equipment.

One of the recent developments in radio equipment is an electrical anti-aircraft locator. This automatically calculates the speed of the plane, its elevation, drift, makes allowances for wind and will bring down an

### Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

enemy plane with one shell where formerly 17,000 were required.

New transmitters were developed which in the laboratory were the most efficient possible but in actual practice they picked up too many undesirable sounds. Finally these difficulties were overcome and now the standard telephone transmitter is the receiver which was developed in peacetime as an aid to the deaf. This is made possible by a new metal called permalloy that has very little residual magnetism and reduced the size of the magnet required in the receiver and transmitter. It has also reduced the size of conductance coils in telephone work and in two years this item alone has saved the Bell Telephone Company over \$200,000,000.

Mr. Long brought with him a very interesting display of actual pieces of equipment for demonstration purposes.

\* \* \* \* \*

The monthly meeting was held at the Prince Edward Hotel on November 17th with J. B. Dowler, chairman of the Branch, presiding.

The speaker of the evening was Major G. G. M. Carr-Harris, Deputy Assistant-Director, (Tanks and M.T.), Inspection Board of United Kingdom and Canada, who presented a very interesting paper entitled **The Combustion Turbine**.

### EDMONTON BRANCH

G. H. MILLIGAN, A.M.I.E.I.C. - *Secretary-Treasurer*

A most interesting address was heard at the meeting of the Edmonton Branch on November 14th, at which Mr. D. D. Morris, general manager of Alberta Nitrogen Products Limited, Calgary, spoke.

Mr. Morris' subject was **The Operations of the Alberta Nitrogen Products** and, in an address amply illustrated with charts, he pointed out many interesting features in connection with the manufacture of ammonia, noticeable among which was the high compression of the gases necessary in this process. Mr. Morris pointed out that in the production of ammonia the first stage is a compression of 1,700 pounds which eventually is increased to 5,000 pounds in the final stage. The speaker mentioned that at present whereas the plant is shipping ammonia to various explosive plants in Canada, their chief output is that of ammonium nitrate as fertilizer which, due to present war conditions, occupies a position of highest priority.

Among the problems encountered was corrosion of water cooling pipes due to the presence of iron eating bacteria in the Bow River water due to the fact that the Nitrogen Plant intake is below the sewage disposal of the City of Calgary. This was overcome by chlorination, but inasmuch as the water consumption is something in the order of 400 second feet the consumption of chlorine is exceedingly heavy. Another problem mentioned by Mr. Morris was the pulsation caused on the power system of the supply company by virtue of the compressors operating at certain loadings. It was suggested that the addition of fly wheels to the motors would possibly correct this condition.

The speaker was suitably thanked by W. Porteous of the University of Alberta.

The meeting was under the chairmanship of B. W. Pitfield.

### HALIFAX BRANCH

S. W. GRAY, M.E.I.C. - *Secretary-Treasurer*  
C. D. MARTIN, M.E.I.C. - *Branch News Editor*

The regular monthly dinner meeting was held at the Nova Scotian Hotel on Thursday, November 23rd. Chairman G. J. Currie presided.

Following dinner Mr. Currie opened the meeting by introducing J. B. Hayes, manager of the Nova Scotia Light and Power Company, Limited, who gave some of the highlights of the subject of the evening, the subject being **The New 12,500 Kilowatt Steam-Electric Station** recently completed in Halifax by the above mentioned company.

Mr. Currie then introduced John T. Farmer, mechanical engineer of the Montreal Engineering Company, Limited, and J. W. MacDonald, of the Nova Scotia Light and Power Company, Limited, who was the resident engineer during the construction of this new plant.

With the aid of lantern slides Mr. Farmer showed comprehensive graphs which gave evidence of the necessity of increased capacity. Mr. Farmer's talk presented a very complete picture of all the various aspects of the design and construction of the plant.

Mr. MacDonald then carried on with the slides which showed the main stages of construction from commence-

ment to completion. In his comments covering these slides Mr. MacDonald gave most interesting information, as well as mentioning the difficulties encountered.

It is a fine tribute to the engineers working on this project that the actual figures confirmed the expected performance of the boiler and turbine units, and further that one pound of coal will produce one kilowatt hour, which is a record in Canada.

The guests, 135 in all, including several senior students of the Nova Scotia Technical who were guests of the Branch, were presented with a copy of the paper covering the details of the station.

The meeting was then formally closed and those present adjourned to the new station for a tour of inspection. The crowd was divided into small groups, each under the guidance of one of the company's engineers. This added greatly to the success of the inspection, which incidentally was the first inspection of this type to be made through this station.

We are in no small way indebted to the Nova Scotia Light and Power Company, Limited, for a very successful meeting, and all efforts in this respect are greatly appreciated.

### HAMILTON BRANCH

W. E. BROWN, M.E.I.C. - *Secretary-Treasurer*  
L. C. SENTANCE, M.E.I.C. - *Branch News Editor*

Thursday, November 16th, was the occasion of a gathering of 180 members of the Hamilton Branch and their guests at a Ladies' Night dinner meeting; H. A. Cooch, branch chairman, presided.

The speaker of the evening was Dr. Samuel G. Hibben, Director of Applied Lighting, Lamp Division, Westinghouse Electric and Manufacturing Company. Dr. Hibben, who has spent many years in a constant search for new kinds and applications of light and who has lectured on lighting subjects throughout the United States, Canada, England, France and Holland, chose for his subject, **How Illuminants Are Born**.

Dr. Hibben outlined the potentialities of visible and invisible light of various wave-lengths and traced the developments which had resulted in utilization of more and more of the spectrum above and below those wave-lengths which produce direct response in the human eye—visible light.

The phenomenon of luminescence first received the attention of scientists, and the development of synthetic "phosphors" ultimately resulted in the present fluorescent light. Dr. Hibben demonstrated several new types of fluorescent lamps, of which many variations in size and form will be available to the public after the present conflict.

Ultra violet light is even now playing an important part in the war effort—such as providing for aircraft perfect instrument illumination which is invisible to hostile craft. Prospecting by means of "black light" has led to important discoveries of calcium tungstate ores.

Discussing the almost unlimited possibilities of the post-war field of illumination Dr. Hibben effectively demonstrated numerous innovations such as heat lamps, emitting visible and invisible rays which will add greatly to the comfort and health of future populace. Heat lamps for cooking in which the entire energy output of the lamp is converted into heat in the food itself were shown to be entirely practical when Dr. Hibben expertly cooked an egg and several rashers of bacon.

New steam lamps properly controlled will provide an automatic means of humidifying homes.

Homes of the future will have easily varied colour

schemes, changes being made merely by turning on lamps of the desired colour combination. Wall papers, curtains, drapes, table linen, when properly treated, will exhibit certain patterns under the influence of white light and will glow with rich colour and pattern under excitation of ultra violet light.

In his talk Dr. Hibben made use of much equipment in actual demonstrations of the many astonishing types of illuminants which will be available in the future.

Dr. Hibben was introduced to the assemblage by G. F. Mudgett, Manager of the Illumination Division, Canadian Westinghouse Co., and was thanked by N. Eager, vice-chairman of the Branch.

#### LAKEHEAD BRANCH

J. I. CARMICHAEL, M.E.I.C. - *Secretary-Treasurer*  
R. B. CHANDLER, M.E.I.C. - *Branch News Editor*

At a dinner meeting on Friday evening November 10th 1944, some 40 members of the Lakehead Branch were addressed by Mr. A. H. Frampton, assistant chief electrical engineer of the Hydro-Electric Power Commission of Ontario.

Mr. Frampton spoke on **The Steep Rock Iron Mine—Its General Features and Power Supply**. The address which was illustrated by excellent slides was followed by the showing of a coloured motion picture depicting the programme of development work undertaken at Steep Rock Mine, including the diversion works carried out to de-water the lake overlying the ore bodies.

The address was most interesting and well received. S. T. McCavour, chairman of the Lakehead Branch, presided at the dinner and introduced the speaker. W. L. Bird and L. B. Hulko expressed the thanks of the meeting to Mr. Frampton.

#### LONDON BRANCH

A. L. FURANNA, M.E.I.C. - *Secretary-Treasurer*  
G. N. SCROGGIE, M.E.I.C. - *Branch News Editor*

**Flood Control in the Muskingum Conservancy District of Ohio** was the subject of the address by W. R. Smith, Middlesex County engineer, at the December meeting of the London Branch on December 13th. Mr. Smith was one of a party chosen by the Department of Planning and Development of Ontario to visit the Muskingum District to learn of their practices in developing methods of flood control in that area, having in mind the need for similar projects in certain river valleys in the province.

The speaker pointed out the geological similarity between the Muskingum and the Thames River districts by the use of coloured slides, aerial views and maps. He stressed the proper use of land by contour plowing, terracing, strip cropping and reforestation, as well as by control dams, as being essential in any successful conservation scheme. Sodded slopes, alfalfa crops and mixed or deciduous trees, rather than coniferous, were better aids in reducing runoff.

The amount of runoff and top soil erosion has been accurately measured in the Muskingum District, and Mr. Smith gave statistics showing the alarming loss of top soil and the steady lowering of the water table where improper farming methods were in use.

If fifty picked farmers were given the opportunity of visiting this Ohio conservancy district to learn the practices and methods of land use in that area, they could see for themselves the great benefit by these proper practices and on their return to their own farms each would be able to produce object lessons for their

neighbours and by this means conservation in any Canadian river valley area would start at once.

In thanking Mr. Smith for his paper, W. G. Ure commended the provincial department for their selection of Mr. Smith as a member of this group as he will be able to bring to engineers generally the results of his studies, and the London Branch feels honoured in being represented.

#### MONTREAL BRANCH

L. A. DUCHASTEL, M.E.I.C. - *Secretary-Treasurer*  
H. H. SCHWARTZ, J.E.I.C. - *Branch News Editor*

On Thursday, November 2nd, the Montreal Branch listened to a talk by Mr. E. R. Complin, industrial relations manager for C.I.L and D.I.L. C. A. Peachey was chairman of the meeting.

Mr. Complin graduated in civil engineering from the University of Toronto in 1926 and since then has devoted most of his time to personnel work. His subject **Industrial Relations—Human Engineering** was therefore approached from two angles, that of the engineer and that of the personnel worker.

To-day the problem of labour has come to the fore as one of the most important problems of management. Inasmuch as during the postwar period the selling price of the product will be fixed while raw materials, overhead and other manufacturing costs will be raised, it will be necessary to cut labour costs.

This can be done in either of two ways: (a) by cutting wages, a course certain to cause strife and unrest in the country, or (b) by increasing the productivity of labour. If course (b) is followed it may even be possible to increase wage rates still further, rather than decrease them.

In order to increase the productivity of labour, it is essential to realize that the workingman is a human being, with human wants, desires and needs. It is a good administrator who recognizes these facts and properly applies them. Administration is the art of getting the right people to do the right thing at the right time.

Mr. Complin pointed out that the engineer dealt as much with humans as with inert materials, and that both were amenable to scientific laws. The engineer's training should fit him to handle both with equal facility.

On Thursday, November 16th, Mr. Jean Asselin, a graduate of Ecole Polytechnique and city manager of Three Rivers, addressed the Montreal Section on **The City Manager Plan**, discussing the aims and necessities of a city manager. Raymond Matte was chairman of the meeting.

One of the principal advantages of the city manager plan is the unification of authority and responsibility. The city manager is entrusted with the carrying out of all legislation passed by the city council. He must prepare plans, co-ordinate and supervise the work of all municipal departments.

An important point is that the city manager is responsible to council and since the council is itself responsible to the voters there is little danger of dictatorship by the manager. However, since the manager has the authority necessary for the carrying out of his orders, it is not possible to "pass the buck" when something must be done.

One comment by Mr. Asselin aroused a great deal of discussion. He stated that 30% of the city managers are engineers. The question was then immediately raised

as to the reason why the city managers are not all engineers and whether this would not prove a fruitful field for the engineering profession. Mr. Asselin replied that undoubtedly the engineer could and would do a good job as a city manager, but that more was required than technical ability only. The city manager must be able to co-ordinate many people's activities. He must be able to withstand pressure from many and varied political groups and still make decisions based upon mature judgment. This is the reason why city managers in the larger cities are lawyers, financiers, etc. In the smaller communities where finances are limited the positions of city manager and chief engineer are frequently combined.

The city manager plan is occasionally opposed by organized politicians, since it tends to shear from them a large amount of their patronage. From the citizen's viewpoint, this is all to the good since what the citizen demands is efficient and honest government. Experience has shown that a city manager fulfils these requirements very well.

Reported by ELI. L. ILOVITCH, S.E.I.C.

On November 23rd the members of the Montreal Branch were shown sound films on the manufacture of ball bearings. The films were produced by the New Departure Bearing Company. Mr. H. Little, vice-president and sales manager of R & M Bearings, Montreal, was the guest speaker.

The audience was shown how carefully the steel was made so that a perfectly uniform product was given to the consumer. The different steps in the rolling of the steel were described. The steel was annealed before being fed into the ball forging machine which cuts off a pre-determined length of steel rod and wedges it between cup-shaped dies so that an almost perfect sphere is formed. The balls are then rough ground to leave just enough material for hardening and grinding. It was shown that the movement of the ball grinding machine can be compared to that of a man rolling a clay ball between the palms of the hands. After grinding, polishing and lapping the balls are tumbled with leather into wood tumbling barrels. They are then gauged and grouped into sizes to within 1/10,000 of an inch and assembled in the finished bearing.

Both inner and outer races are hot forged from round bar stock. This forging operation tends to form the steel into a more compact texture which is advantageous in bearing races. The end of the bar is heated and then upset, after which the bar is pierced so that very little material is wasted. The races are rough turned on their inside and outside diameters and they are also faced, leaving enough material for hardening and grinding.

An oscillating grinding head forms the actual ball tracks and makes it unnecessary to have a true ball radius on the grinding wheel. Automatic gauges guide the cutting wheel so that the proper final dimensions are kept. Frequent and careful inspection and cleaning is carried out so that the final product is as nearly perfect as it is mechanically possible to produce.

Another film by the same company showed the care that is taken to keep the bearings clean at every stage of inspection and packaging. Air-conditioned work-rooms, clothes made of synthetic fibres that are lint-free, and no human handling of the balls or races were some of the reasons why bearings reach us in such good condition. The audience was asked to exercise a reasonable amount of care in handling and installing the bearings to keep the excellent service that was built into them.

"One battleship requires 2,200 telephones—enough to serve a city of 10,000 people," declared George L. Long, historian of The Bell Telephone Company of Canada, speaking on **Giving Wings to Words—To-day and To-morrow** at the meeting of the Montreal Branch on November 30th.

Illustrating the immense quantities of signals supplies needed overseas, Mr. Long also pointed out that the cost of radio-telephone and radar equipment carried by 2,000 bombers is greater than the cost of all broadcasting stations in the United States.

The speaker also demonstrated the properties of certain crystals which are used to control the frequencies of radio transmitters in tanks. During a battle, he said, hundreds of messages may be radioed back and forth, yet none interferes with any other, because each is kept in its own channel by means of these crystals.

Some tanks have as many as 80 crystals in their radios. By pushing a button, a tank commander can switch from one channel to another, talk to other tanks, call for artillery support, hear warnings from aircraft overhead, or check with headquarters for further orders.

One manufacturing company alone, Mr. Long revealed, delivered eight million crystals to the armed forces last year at a cost one-twentieth that of crystals produced before the war.

Discussing the electrical gun director developed by telephone engineers, Mr. Long said only 24 per cent of the robot bombs, which travel between 350 and 400 miles per hour, get past the gun batteries equipped with electrical directors.

"The most significant development in this war over the previous conflicts was the ease of communications," the Bell Telephone Company historian said. He explained how the wireless telephone has changed the form of air fighting and made possible the success of the United Nations air power.

"Men like Group Captain E. A. Macnab and Wing Commander Gibson, V.C., have declared that they have as much control over their squadrons in the air now as did the cavalry officers over their cavalry units," Mr. Long said. "It is possible to talk to one or all planes in the squadron while in the air as well as talk to the commander at the home base."

He quoted a statement of an Allied general, that modern army, without field radio and telephone communications, would be confused and helpless, and he said that during the first 21 days of the invasion of Italy, signal corps units installed a total of more than 5,300 miles of assault telephone wire, field wire and cable—an average of over 240 miles of line laid a day.

Demonstrations were given of Canadian and German army field telephones and of the R.C.A.F. and United States Army Air Force microphone to show the efficiency of these instruments and it was stated that equipment used by our men was second to none.

To show how this efficiency has been attained, Mr. Long demonstrated the sensitivity of special metal alloys being used in the equipment as well as the power of the most modern magneto.

He also demonstrated an electronic tube photo-electric cell by having it pick up speech and music which was transmitted on a beam of light. The modern application of this in wartime is the transmission and reception of radio pictures which appear in the newspapers a few hours after they have been taken on the fighting fronts.

"Many developments for war purposes become useful to mankind in peacetime," Mr. Long said, predicting great benefits when the scientific knowledge gained in

this war is put into peacetime pursuits. However, he dispelled the idea that Utopia could be brought automatically after the war and warned against too much optimism in this regards.

\* \* \* \* \*

On Thursday evening, December 7th, 1944, the members of the Montreal Branch spent a different kind of evening at the Institute. Four Engineering students were the speakers, two from McGill and two from the Ecole Polytechnique, Montreal. There were cash prizes given for the best and second best papers. K. G. Cameron, C. E. Gelinis, and L. H. Burpee were the judges.

The first prize was won by Denis Noiseux, S.E.I.C., 5th year Ecole Polytechnique, for his paper on the **Analysis of True Unit Stress of Copper**. He showed how it was possible, without any special equipment, to find the true unit stress in the metal. By stressing a test specimen to destruction, measuring the diameter of the neck at the break by micrometer, and then applying his formula, he was able to solve his problem. These results were checked several times and were found to be correct.

The second prize was taken by Louis A. Dion, S.E.I.C., 4th year Ecole Polytechnique, for his paper on the **Design of an Explosion-Proof Concrete Wall**. Mr. Dion had spent a summer or two working for the C.I.L. plant, Brownsburg, Que., where he had opportunities to help in the design of several powder manufacturing buildings. His paper mentioned some of the problems involved and also showed a novel way of placing reinforcing steel in the concrete structure. The building he discussed had a hinge-type roof so that any explosion might be deflected upwards and so lessen the resultant damage.

G. H. Y. Slader, S.E.I.C., 4th year Mechanical Engineering, McGill, read a paper on **The Development of Power at Back River**. P. J. Robinson, S.E.I.C., 3rd year Mechanical Engineering, McGill, gave an interesting paper on **The Realization of a Dream**. He told how over a period of five or six years there was built and equipped a laboratory in a 10' x 10' concrete building near his home. It has an electrical, a biological, and a chemical department with the added feature of a reflecting telescope on the roof for the study of astronomy.

All the speakers were given a free Student Membership for the coming year. K. G. Cameron presented the prizes to the winners.

William D. Fleming, S.E.I.C., was in the chair during the speeches and the discussion which followed.

\* \* \* \* \*

On Thursday evening, December 14th, Mr. C. M. Lafoon of the Westinghouse Electric and Manufacturing Co. presented a paper on the **Development of Waterwheel Generators** to the Montreal Branch.

In tracing the development of these machines he told the meeting that the construction of large dams and waterwheel generators was largely due to the efforts of government agencies although private enterprise played a considerable role. A number of generator units were under construction in the U.S.A. when the war broke out, and these have since been completed, but new projects have been deferred until after victory. The new projects, he believed, would be the development of the Missouri river valley in the United States and the St. Lawrence river valley in Canada.

In his paper he mentioned some of the difficulties

encountered in the operation of waterwheel turbines and generators, and spoke of the work that is being done to overcome them. The problems of the thrust bearings are now undergoing extensive investigation and a full report on the subject is expected to be published in the spring. Corona, he said, has been greatly reduced by the use of conducting varnishes in quantities so limited that short circuiting does not occur. The demand for high temperature insulation is being met by the use of fibre glass and a new series of plastic resins based on the silicon oxygen chains instead of the usual carbon chains. Laminations are now being made of cobalt steels resulting in higher efficiencies.

A lively discussion followed the meeting. The chairman was McNeely DuBose.

### NIAGARA PENINSULA BRANCH

J. H. INGS, M.E.I.C. - - Secretary-Treasurer  
J. L. McDougall, M.E.I.C. - Branch News Editor

The second of the season's meetings of the Niagara Branch was held in St. Catharines at the Leonard Hotel on November 16th. The dinner meeting, the usual custom of the Branch, was especially well attended and Chairman W. D. Bracken welcomed some 60 members from the surrounding districts of Niagara Falls, Welland, and Port Colborne.

J. H. Ings introduced the speaker of the evening, Mr. A. H. Frampton, assistant chief electrical engineer with the Hydro-Electric Power Commission, who chose as his subject **The Steep Rock Iron Mine—Its General Features and Power Supply**. From his firsthand experience in following the development in recent years, his remarks added much to what has already appeared in papers which have been printed from time to time in the *Journal* about this important and unusual development.

Besides the photographs used to illustrate his talk, the coloured movies were of special interest as these, combined to give a visible idea of the size of the undertaking that has now been completed and has made possible the ore shipments to date.

Mr. Frampton remarked that as far back as 1891 large ore deposits were thought to exist under the deep 15 mile long lake. In connection with the above scheme the Hydro has now supplied the power to make possible the development of the Steep Rock Iron Mine. This power supply to this area was a problem in itself and was clearly shown, involving the tie-in and operation to a line of some 400 miles in length from widely dispersed available sources.

At the close of the lecture, H. E. Barnett expressed the appreciation of the members present and thanked Mr. Frampton for his most informative talk.

### OTTAWA BRANCH

A. A. SWINNERTON, M.E.I.C. - Secretary-Treasurer  
R. C. PURSER, M.E.I.C. - - - Branch News Editor

On November 7th, 1944, Past-President K. M. Cameron, Branch Chairman W. L. Saunders and Secretary-Treasurer A. A. Swinnerton called on Mrs. G. J. Desbarats and, expressing regrets that it had not been possible to present the Julian C. Smith medal to Mr. Desbarats in person, asked her to accept it as a token of the esteem in which her late husband had been held by his fellow engineers. She replied suitably and gave some interesting reminiscences of Mr. Desbarats' official life.

## PETERBOROUGH BRANCH

ERIC WHITELEY, Jr. E.I.C. - *Secretary-Treasurer*  
J. F. OSBORN, Jr. E.I.C. - *Branch News Editor*

**Wrought Copper and Its Alloys** was the subject of a paper by Mr. G. S. Mallett, technical supervisor of the Anaconda American Brass Company, at the meeting of the Branch on November 2nd. Mr. Mallett's firm is the only one engaged in the manufacture of wrought copper alloys in Canada and he is, therefore, in an exceptionally good position to know this product as it is related to Canadian industry.

Since it occurs in metallic form copper was one of the first metals to be worked and its history extends back several thousand years. Native copper frequently contained other elements which imparted properties similar to modern alloys.

By far the largest use of copper is in the electrical industry which requires a pure electrolytically refined product. Other applications take advantage of the corrosion resistance and workability of copper and its alloys. The principle alloying elements used singly or in combination are zinc, tin, nickel, lead, aluminum, silicon, manganese, cadmium, beryllium, selenium and tellurium. The various categories—brasses, bronzes and specific alloys—were described and identified with their more common characteristics. For most purposes the alloys are cast in cakes and bars from which form they are rolled, extruded and drawn into sheets, bars, tubes, etc.

Much material is now bought to specifications, some covering chemical composition and some physical properties. It is not practicable to expect to buy finished material to conform rigorously to both of these but it is possible to manufacture closely to one or the other. In connection with specifications it should be borne in mind that most of them cover minimum acceptable standards and may be below standard commercial

time substitutes were discussed with respect to advantages and deficiencies. Mr. Mallett is of the opinion that, as far as the copper industry is concerned, in most cases revert to pre-war alloys as soon as a full range of elements is available. Following a lively question period a vote of thanks was moved by W. T. Fanjoy on behalf of those present.

## QUEBEC BRANCH

STUSTAVE ST. JACQUES, M.E.I.C. - *Secretary-Treasurer*  
LEO ROY, M.E.I.C. - *Branch News Editor*

December 4, 1944, Mr. Huet Massue, statistical manager of The Shawinigan Water & Power Company addressed the members of the Quebec Branch at the meeting of the Faculty of Sciences of Laval University.

Complementing his talk with splendid coloured slides, Mr. Massue spoke on **The Population of Quebec and its Place in the Economy of Canada**. The subject dealt with the distribution of the population, its growth, age, origin, birthplace, language, urbanization, education, health and occupation.

From the many conclusions derived, the following were the most outstanding:

1. Because of the fact that the population of Quebec is increasing more rapidly than that of other parts of Canada, the importance of Quebec in the Canadian scene is growing and it becomes a duty for Quebec to contribute in the widest possible measure to the progress and development of Canada.

2. The particular characteristics of the large majority of the population of Quebec and its birthright obtained

from two centuries of residence in America, results in the fact that it cannot always look upon the problems facing Canada in the same light as do the other citizens of the country.

4. The fact that some 2,000,000 Quebecers of French origin do not speak English creates a problem in itself and prevents them to view many questions in their true national aspect. The same applies however to other parts of Canada where few Canadians speak French (3% in B.C., about 6% in the Prairies and less than 10% in Ontario). If there were more bilingualists of English origin it would help the situation considerably. They would be so many more apostles of good understanding and mutual comprehension.

5. Needless to repeat here, the urbanization of Quebec has created a most dangerous artificial situation. Let it be remembered that before the depression which preceded the present conflict, 240,000 or 28.5% of the population of Montreal was on relief and that, even in 1939, immediately before the war there were still 160,000 persons in the urban centers of Quebec depending on state relief for their living.

7. Each year in Quebec, more young men join the ranks of the army of workers than anywhere else in Canada. This adds to the seriousness of the employment problem. It is a fact that, so far the trend has favoured the industrialisation of the region of the Great Lakes to the detriment of other parts of Canada. The same phenomena has taken place in the United States to the detriment of the eastern part of the country.

8. Facts also indicate that industry in Quebec is altogether different from that of Ontario and that because of its particular nature, it cannot permit the salaries and wages paid in Ontario.

9. If the employment problem is to be helped and wages and salaries increased in Quebec, foreign capital will have to be attracted and more remunerative industries developed. It must also be remembered that no efforts must be spared to transform into peacetime enterprises the industries developed during the war.

## SASKATCHEWAN BRANCH

STEWART YOUNG, M.E.I.C. - *Secretary-Treasurer*

The Saskatchewan Branch met jointly at dinner with the Association of Professional Engineers in the Kitchener Hotel, Regina, at 6.30 p.m. on Friday evening November 17, 1944. Thirty members and guests were in attendance. The branch chairman, J. McD. Patton, presided.

Immediately following the dinner the Convenor of the Committee on Professional Interests made an interim verbal report particularly on data collected in respect of salaries of engineers.

W. P. Cheney, having recently been in Winnipeg, conveyed the greetings of the Winnipeg Branch and delivered an invitation from that Branch to attend the forthcoming annual meeting of the Engineering Institute of Canada, to be held in Winnipeg next February. Mr. Cheney then introduced the guest speaker, E. F. Holliday, Secretary, Educational Committee, Canadian Legion War Services, Inc.

Taking as the subject of his address **Education in the Services**, Mr. Holliday reminded his audience that the purpose of education is to discipline the mind rather than to fill it with information. The objective of the Legion is threefold:

1. To assist in building and sustaining morale;
2. To help make better fighting men;
3. To assist in the discharge and rehabilitation of the fighting forces.

All departments of education in Canada had assisted the Legion in devising a course of education that would be acceptable anywhere in Canada. Instruction may be by correspondence and the examination standings granted are accepted for credit in each province. The Committee also provides a library service of non-fiction and technical books. Over one thousand students are enrolled in Saskatchewan.

A hearty vote of thanks was tendered the speaker on motion of H. R. MacKenzie.

Mr. J. G. Schaeffer, convenor of the Committee on Collective Bargaining, reported the progress made to date. He advised that the recent legislation in Saskatchewan appeared to exclude Professional Engineers and that, to be covered, it was the opinion of his committee that special legislation would be necessary. For guidance in this direction the committee awaited information on a proposed order complementary to P.C. 1003 of the Dominion Government.

Following discussions on certain by-law amendments raising the Association annual fees, Messrs. W. B. Ramsay and C. W. Doody introduced a resolution, which carried unanimously, that:

"The executive take such action as may be necessary with the proper authorities to obtain income tax deductions on account of Association annual fees". In this connection it was noted that the members of the Ontario Teacher's Federation, according to the October 1944 Bulletin, had been granted tax deductions on account of annual fees.

### SAULT STE. MARIE BRANCH

T. F. RAHILLY, Jr., E.I.C. - *Secretary-Treasurer*

A general meeting of the Branch was held in the Windsor Hotel on May 26th 1944. The speaker was F. J. McDiarmid, mechanical engineer of the Algoma Steel Corporation Limited, who spoke on the stationary steam plant recently built by his company.

This plant consists of three Foster-Wheeler boilers each having a rating of 100,000 lb. of steam per hour at 400 p.s.i. when fired with blast furnace gas. Two of the boilers are equipped to fire pulverized coal. In addition to the usual auxiliaries, this plant has two turbo generators for supplying the electric power required by the plant and for reducing the steam pressure from 400 p.s.i. to 150 p.s.i. for general steel plant service. There is also a large water treating plant using both the hot process and Zeolite Systems for treating the feed water.

After a brief discussion of the equipment, construction and operation of the plant, the meeting adjourned and proceeded to the boiler plant for an inspection of its facilities.

Mr. McDiarmid had the assistance of Mr. G. A. Edwards, chief steam engineer of Algoma Steel, in conducting the visitors through the plant and in answering their many questions concerning its operation.

A general meeting was held in the Windsor Hotel on August 25th, 1944. Mr. A. E. K. Bunnell of the Department of Planning and Development of the Ontario Government, was the speaker his topic being **Post-War Planning** with emphasis placed on Civic Projects.

Mr. Bunnell stated that his department was formed for the purpose of co-ordinating the activities of various departments of the Ontario Government in the conservation of the natural resources of the province and of assisting in the rehabilitation of Ontario men to civil life. It also plans to assist municipalities in their rela-

tionships with the Ontario Government with regard to post war projects.

If there is a let-down after war, the higher levels of government working in conjunction with the municipalities must step in with construction. It was felt that plans must be prepared now to give assistance. This would promote sound rather than hasty planning.

City boundaries are artificial. Planning must go beyond the boundaries, city and township being a social entity.

In Sault Ste. Marie, the city owns most of the buildable property. Before disposing of this property, a plan should be made showing present uses of land and the location of lands which might be required for city use. A contour plan should also be made as a base for street, sewer and drainage studies.

Zoning of the city should be done. With zoning, housing loans may run for thirty years; without zoning, the loans run for twenty years.

Which streets are to be traffic arteries should be determined. Local and through traffic should not mix. The Trans-Canada highway passing through here would present a real problem. The best locale for a tunnel or bridge crossing the St. Mary's river should be studied for connections to roads to the north and east.

Post-war parking problems should now be faced. There will be more cars in the future than in the past. Certain streets should be widened so that traffic gravitates to them, every street being no longer a traffic street.

The Sault has a sewerage problem in storm and waste sewers. The more sprawl permitted a city, the worse the problem and the higher the cost. City property should not be sold in areas where there are no roads and sewers, while these facilities are available in other areas not yet built up. There are 4,000 to 5,000 parcels of land available in this city, sufficient for 16,000 people.

Alderman McQuarrie, chairman of the Post-War Planning Committee for Sault Ste. Marie, introduced the speaker. At the conclusion of the address the thanks of the meeting were conveyed to Mr. Bunnell by J. L. Lang and A. E. Pickering. A. M. Wilson, chairman, presided at the meeting.

Present at the meeting were representatives of the City Council, Lions Club, Rotary Club and the Board of Trade.

A general meeting of the Branch was held in the Windsor Hotel on Oct. 10th 1944, the occasion of the president's annual visit. Sixteen members were present.

Following the dinner, Chairman A. M. Wilson called on John Lang to introduce President de Gaspé Beaubien and General Secretary L. Austin Wright.

Mr. Beaubien addressed the meeting on **The Engineer's Place in Society**. K. G. Ross replied to the president's address.

The chairman then called upon Dr. L. Austin Wright, general secretary, who reviewed Institute business and gave an account of Headquarters custodianship of Institute affairs.

Attention of the meeting was drawn to the Annual Meeting at Winnipeg on Feb. 7th and 8th. It was stated that most of the papers would be on Western subjects, the suggestion being made that the Steep Rock Iron Mines and Ore Dock would make a good topic for papers.

The chairman conveyed the thanks of the meeting to Mr. Beaubien and Dr. Wright for their visit to the Branch.

Prior to the meeting, Mr. Beaubien and Dr. Wright spent part of the afternoon visiting the plant of the Algoma Steel Corporation Ltd., on the invitation of C. Stenbol, chief engineer.

## TORONTO BRANCH

S. H. DE JONG, M.E.I.C. - *Secretary-Treasurer*  
G. L. WHITE, A.M.E.I.C. - *Branch News Editor*

The Toronto Branch heard an interesting address on **Mechanization of Woodland Operations** at its meeting on November 16th at Hart House, University of Toronto. The speaker at this joint meeting with the Canadian Society of Forest Engineers was J. W. McNutt of Kimberly-Clark Corporation, Neenah, Wis.

The speaker made brief reference to mechanized operations on the Pacific Coast, the character of which is determined principally by the terrain and the size of timber to be handled. The principal cable systems used are (1) the ground snaking; (2) the high lead system; and (3) the aerial tram system.

The introduction of the track type tractor was probably the most important single step in mechanization of woodlands operation and came about 1904. The tractor permits selective logging where desired although it is more generally believed that the clean cut system is best.

Probably the most spectacular progress in mechanization, particularly in the application of power-driven saws, has taken place in the southern pine forests of the United States. The extensive mechanization in this area has been speeded by shortage of manpower, but is dependent in no small measure upon the relatively even ground for the conduct of operations. Other contributing factors are firm footing, little underbrush, relatively uniform weather, and the existence of networks of permanent roads throughout the area.

Woodlands operations may be divided into four main classifications: (1) Cutting; (2) Skidding; (3) Hauling; (4) Driving. Most pulpwood operations in Eastern Canada involve all four divisions. From the viewpoint of cutting pulpwood, difficulties are encountered in Eastern Canada in the application of the power saw because much of the best pulp timber is in swamp areas. Progress along this line may be made with the introduction of lighter saws which will aid greatly if they measure up to advance claims. Power saws are usually two-man equipments operated by gasoline engines, compressed air, or electricity. With compressed air or electricity one man is required for every two saws to keep the cable or hose clear. Saws are circular, chain or reciprocating with the chain seeming most likely to succeed.

Advances in skidding operations have been slow with hand work and teams are still largely employed in Eastern Canada. Considerable advances have been made in the mechanization of hauling, whether to water or the main haul to the mill. Trucks have made the big difference in hauling, with tractor hauling going out of vogue. Under driving, one must consider stream driving and towing. Principal advances in mechanization have been in the design of power boats for towing operations.

The speaker showed a very interesting film of mechanized operations in southern pine forests in the United States. This film illustrated the application of various types of power saws to felling and cutting up of trees and also the use of movable units for cutting up of lengths and hoisting them into trucks. This latter type of operation employs the power saws for felling and the tractors for hauling the trees to the cut-up and loading units.

### JUNIOR SECTION

A general meeting of the Junior Section was held in the Debates Room, Hart House, on Tuesday, December 4th. The speaker was Mr. C. H. Millard, president

of the United Steel Workers of Canada, member of Executive of the Canadian Congress of Labour and C.C.F. Member of Provincial Parliament for West York, Ont., who spoke on **Labour's Post-War Outlook**. Mr. Millard quoted many prominent and informed persons who stated that in their opinion the cycle of prosperity, depression and war was an inherent component of our civilization. He stated that Labour will take definite steps in an attempt to alleviate this cycle and he outlined the twenty-nine point programme.

He stressed the fact that engineers, as a part of the group between management and labour, must ally themselves with either group and so get off the fence which he said is getting sharper and more uncomfortable all the time.

A lively discussion followed and although all sixty present did not see eye to eye with all Mr. Millard's statements they were very thought provoking and gave a clear picture of Labour's ideas.

## VANCOUVER BRANCH

J. G. D'AOUST, M.E.I.C. - *Secretary-Treasurer*  
P. B. STROYAN, M.E.I.C. - *Branch News Editor*

The annual dinner and business meeting of the Vancouver Branch was held in the Hotel Georgia on Saturday, November 18th. T. V. Berry, chairman, presided over the meeting which was attended by about 65 guests and members.

The business session of the meeting opened with the acceptance of the minutes of the last annual meeting and the presentation of the financial statements by Secretary P. B. Stroyan.

Chairman T. V. Berry then presented his report for the past year. A number of interesting meetings were held outstanding among which were the Ladies' Night at which C. E. Webb was speaker, and Student's Night conducted by members of the Student Chapter of the University of B.C. Three papers were read by students on this occasion.

An annual prize was established by W. N. Kelly for the student turning in the best machine shop examination project at the University of British Columbia. First winner of this prize was W. McFarlane Walker, fourth year Engineering student, who was among the guests present and who was introduced to the members by Mr. Kelly.

The slate of officers for the following year was presented by the nominating committee and elected by acclamation. Election of a nominating committee for the following year completed the business of the evening.

Lieutenant Black, R.C.N.V.R., guest speaker of the evening then addressed the members giving them a very colourful and witty description of his experiences during service with the Royal Navy on convoy duty in the Mediterranean area. The various types of vessels on which he sailed were described and Lieutenant Black related many humorous incidents of his term in the service. The speaker was thanked on behalf of the members by Col. W. G. Swan.

A few words by the chairman elect, Professor A. Peebles of the Dept. of Civil Engineering, University of B.C. concluded a most enjoyable evening.

## WINNIPEG BRANCH

T. E. STOREY, M.E.I.C. - *Secretary-Treasurer*  
V. W. DICK, M.E.I.C. - *Branch News Editor*

At an evening meeting at the University of Manitoba on Broadway, on November 2nd, a coloured sound film on plastics **The Formica Story** was shown. The manu-

facture and varied uses of laminated plastics was illustrated, and the method of manufacture for whatever purpose they are intended to be put was shown. Their lightness, hardness, adaptability to a wide range of uses, and their possibilities for decorative furniture or interior furnishings and other attributes were well illustrated. A large number turned out to take advantage of this interesting film.

\* \* \*

**Town Planning** was the subject of an address at the joint general meeting of the Winnipeg Branch of the Institute and the Manitoba Association of Professional Engineers, held at the University of Manitoba, Broadway, on December 7th, under the chairmanship of C. P. Haltalin, branch vice-chairman.

F. S. Adamson, assistant city engineer, introduced the speaker, Lawrence J. Green, B.Sc. Arch. M.R.A.I.C., who advised that not only engineers and architects, but also sociologists, economists, and others have contributed to town planning knowledge.

Mr. Green traced the planning of towns from the medieval type behind its protecting walls and the colonial type around its "common", to the modern version of "main street" built around the cross-road on the through highway.

The necessity of planning was brought out by an examination of a central district in the city, a "blighted" area due to many non-conforming uses of the property in its area.

It was pointed out that "blight" was the greatest single factor in the high cost of housing. It destroys property values by rendering buildings and whole dis-

tricts undesirable, while the buildings and services are yet structurally capable of fulfilling the uses for which they were intended.

The high cost of blighted districts was presented in figures quoted from City Health Department reports, resulting from adult crime, juvenile delinquency, disease and death. City planning shows how to control and eliminate blight, and to stabilize property values and the tax roll.

Planning is essential for the welfare and well ordered growth of any modern city, as it provides a framework on which to build. The cost of such planning will be more than paid for by the saving in property values, which would otherwise be destroyed by the spread of blight.

Mr. Green then outlined the needs of a modern city in regard to traffic, airfields, protected neighbourhoods, business districts, parks and the other vital necessities of a well planned community. He pointed out that Winnipeg was fortunate in having a Metropolitan Town Planning Committee and a City of Winnipeg Town Planning Commission, both working together under a joint executive committee, with a Town Planning Consultant. Personnel was being gathered for the planning office, and the necessary data was now being gathered for the commencement of a city plan, which will make for better living and working conditions and a more beautiful community for the citizens of Winnipeg.

Considerable discussion followed, those taking part being: C. V. Antenbring, Prof. G. H. Herriot, R. H. Avent, W. D. Hurst, and others.

The discussion period was closed by C. V. Antenbring who moved a vote of thanks to the speaker.

## Library Notes

### BOOK REVIEW

THE ROMANCE OF MINING

by T. A. Rickard. The Macmillan Co. of Canada Ltd., Toronto, 1944. 450 pp.

Reviewed by G. W. WADDINGTON, M.E.I.C.

Here is a story of mining that will be enjoyed by people in all walks of life. It deals with ordinary people, yet the incidents are far removed from everyday life. They have the charm of the unexpected; they incite our wonder; they appeal to our imagination. With the prospector, we share a series of strange and unusual experiences as we are drawn ever onward toward the pot of gold at the foot of the rainbow. Here is true romance—the antithesis of commonplace.

As a contribution to the history of mining, this book also has considerable merit, especially when we reflect that accuracy in such matters is not easy to attain. The discoverers of mines and those connected with their early development are not always careful in their statements. After the lapse of a few years the essential facts become clouded with fabrications amid which the truth is hard to find. The discoverer of an ore deposit that becomes famous as a mine usually will endeavour to ignore the accidental elements in his good fortune, and impute his success to quasi-scientific knowledge such as will serve to glorify his sagacity. A picturesque yarn is preferred to a vivid statement of fact. In this work Dr. Rickard has sorted out the true from the fictitious, and has provided us with an authentic account that is stranger than fiction.

The prospector, who is the forerunner or advance guard of the industrial army of mining, is mentioned in the records of the expeditions sent by the Pharaohs from Egypt to the peninsula of Sinai. In this arid region overlooking the Red Sea there have been found memorial stones bearing engraved records of mining expeditions sent there about 3,000 B.C. A later inscription records the tribulations of a certain prospector named Harurre, about 1830 B.C.: "The desert was hot as a furnace, the hilltop seemed on fire, and the vein of ore was exhausted". Down through the ages, how many prospectors and mining engineers have found themselves in a similar predicament!

### Book notes, Additions to the Library of The Engineering Institute, Reviews of New Books and Publications

The first mining adventure of which we have any written record is that of Jason and his comrades, who sailed from Greece to the gold diggings in Colchis (now Georgia) on the southwestern slope of the Caucasus where this range of mountains approaches the waters of the Black Sea. Their ship was the Argo, due to which the adventurers have become known as the Argonauts. The Golden Fleece was a sheep's fleece, used to recover fine particles of gold from river sand.

The latter half of the nineteenth century was marked by an intensive and successful search for minerals, the immediate consequence of which was to incite a world-wide migration of enterprising men, an enormous expansion of international trade, and the spread of scientific industry to the waste places of the earth. The event that started these movements was the discovery of gold in California in January, 1848. At that time California belonged to Mexico. On February 2 of the same year the United States annexed California, New Mexico, Arizona, Nevada, Utah and portions of Colorado and Wyoming, paying only \$15,000,000. for this enormous territory. Gold equivalent to three times the amount of this payment was produced in California in 1849, the year following the signing of the treaty. Within two years of the discovery 100,000 men had arrived in California from the eastern part of the United States. Gold was discovered in Australia in 1851. Within a year of the discovery 369,000 emigrants from Great Britain had arrived in Australia.

Other interesting episodes in this entertaining book include the Silver of Laurium, Frobisher's Quest, the adventures of Cortés and Pizarro in the sixteenth century, the story of the diamonds of Kimberley, the mineral development in the western United States, and the gold discoveries in Witwatersrand, the Yukon territory and New Guinea. Into these chapters are interwoven the careers of many notable men whose names are familiar to everyone.

## ADDITIONS TO THE LIBRARY

### TECHNICAL BOOKS

#### Occupational Accident Prevention:

Harry H. Judson and James M. Brown. N.Y., John Wiley and Sons, 1944. 5½ x 8½ in. \$2.75.

#### Flexible Shaft Handbook:

2nd edition. N.Y., The S. S. White Dental Mfg. Co., Industrial Division, 1944. 5½ x 8½ in.

#### Science in a Tavern:

Essays and diversions on science in the making. Charles S. Slichter. The University of Wisconsin Press, Madison, Wis., c. 1940. 5¾ x 8¾ in.

#### American Men of Science:

A biographical directory. 7th edition. The Science Press, Pa., 1944.

#### Metallurgical Experiments:

(Non-ferrous metals, iron and steel). F. Johnson. London, Paul Elek (Publishers) Ltd., 1944. 5¼ x 8¼ in. 5 sh.

#### The A B C of Physics:

Jerome S. Meyer. Toronto, Longmans Green and Co., 1944. 5½ x 8 in. \$4.50 (Canadian price).

#### Canadian Standards Association:

Z92-1943: Recommended practice of industrial lighting. Z90-1943: Part 1 and 2, Guide for quality control and control chart method of analyzing data. American War Standard, approved May 1941 by the American Standards Association and adopted as a CESA standard March 16th, 1943. Part 3, Control chart method of controlling quality during production. American War Standard, approved April 1942 by the American Standards Association and adopted as a CESA standard March 16th, 1943.

#### TRANSACTIONS, PROCEEDING

#### North East Coast Institution of Engineers and Shipbuilders:

Transactions vol. 60, 1943-1944. Newcastle Upon Tyne, 1944.

#### The Society of Naval Architects and Marine Engineers:

Transactions vol. 51, 1943. N.Y., The Society, 1944.

#### REPORTS

#### Queen's University—Dept. of Industrial Relations:

Bulletin no. 9: The closed shop—a study of the methods used by unions to attain security. October, 1944.

#### U.S.—War Manpower Commission:

Informational manual on industrial job evaluation systems. Washington, Government Printing Office, 1943.

#### Carnegie Corporation of New York:

Annual report for the year ended September 30, 1944.

#### National Research Council of Canada:

Twenty-sixth annual report for the year 1942-1943.

#### Canada—Dept. of Labour:

Thirty-third annual report on labour organization in Canada. Ottawa, King's printer, 1944.

#### Toronto Harbour Commissioners:

Annual report for the year 1943.

#### U.S.—National Research Council—Highway Research Board:

Wartime Road Problems No. 9: Recommended practice for treatment of icy pavements.

#### Ontario—Dept. of Mines:

Fiftieth annual report being vol. 50, part 6, 1941.

#### American Institute of Mining and Metallurgical Engineers—Technical Publication:

No. 1543: Replacement hematite deposits, Steep Rock Lake, Ontario by Hugh M. Roberts and M. W. Bartley.

#### U.S.—Bureau of Mines—Technical Paper:

No. 659: Analyses of Pennsylvania anthracite coals.—No. 663: The flow of coal-ash slag on furnace walls.—No. 666: Bureau of mines research on the hydrogenation and liquefaction of coal and lignite.

#### U.S.—Bureau of Mines—Miners' Circular:

No. 45: Explanation and justification of tentative inspection standards for bituminous-coal mines and lignite mines.

#### U.S.—Bureau of Standards—Building Materials and Structures Report:

BMS102: Painting steel.

### The Electrochemical Society—Preprints:

No. 86-24: Continuous concentration of electrolytic caustic soda.—No. 86-23: Mineralogy of the manganese oxides.—No. 86-25: Silver alloy brazing with induction heating.—No. 86-24: The fabrication of magnesium alloys.—No. 86-27: Induction heating in radio tube manufacture.—No. 86-28: Film in chromium electroplate.—No. 86-29: X-ray and electron microscope evaluation of carbon blacks.

### BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet all of these books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

### AIRPORT ENGINEERING

By H. O. Sharp, G. R. Shaw and J. A. Dunlop. John Wiley & Sons, New York; Chapman & Hall, London, 1944. 150 pp., illus., diags., charts, tables, 11¼ x 8½ in, cloth, \$5.00.

This undergraduate textbook presents concisely the problems that confront the airport builder. After a brief discussion of airport size and site, planning and preliminary surveys are considered. Problems of grading, drainage, soil stabilization, and paving are then treated. Finally, lighting, buildings, and construction and maintenance equipment are presented.

### AMATEUR TELESCOPE MAKING

Edited by A. G. Ingalls and others. 497 pp., \$4.00.

### AMATEUR TELESCOPE MAKING ADVANCED, a sequel to "Amateur Telescope Making."

Edited by A. G. Ingalls. 650 pp., \$5.00.

Munn and Co., New York, 1943-1944. illus., diags., charts, tables, 8 x 5¾ in., cloth.

A comprehensive, detailed account of the parts and operations necessary for the construction of telescopes is presented in this two-volume set. Volume I discusses types, lenses, mirrors, mountings, drives, etc., and provides some 200 pages of practical information on a large number of technical details. Volume II offers a more advanced description of the finer work needed to produce superior instruments, and also covers the practical aspects of observing. There is a twenty-page annotated bibliography in the first volume.

### (The) ASHLEY BOOK OF KNOTS (Mariners Museum Publication No. 13)

By C. W. Ashley. Doubleday, Doran & Co., Garden City, New York, 1944. 620 pp., illus., diags., 11½ x 8¼ in., cloth, \$7.50.

This comprehensive work is encyclopedic in character. Not only is a tremendous variety of knots described and illustrated but general and specific historical information is also included, and exact procedures for the tying or forming process are given in many cases where a diagram is insufficient. Sailors' knots predominate, but many other occupations are covered, as well as fancy knots and braiding, tricks and puzzles. Technical distinctions among the various classes of knots, hitches, bends, splices, etc., are carefully explained, and a bibliography and glossary are appended.

### BULLDOZERS COME FIRST, the story of U.S. War Construction in Foreign Lands

By W. G. Bowman, H. W. Richardson, N. A. Bowers, E. J. Cleary and A. N. Carter. McGraw-Hill Book Co., New York and London, 1944. 278 pp., illus., maps, 9 x 5¾ in., cloth, \$2.75.

An interesting series of articles describing the work of American engineers overseas during the present war, as seen by war-correspondent editors of the Engineering News-Record, in which the articles first appeared. Great Britain, North Africa, the Middle East, Alaska, the Aleutians, the Pacific ocean areas, South America and Central America were visited.

### COMFORTIZATION OF AIRCRAFT

By A. A. Arnheim. Pitman Publishing Corp., New York and Chicago, 1944. 347 pp., illus., diags., charts, tables, 9¼ x 6 in., cloth, \$7.50.

Looking to the future, designers and others associated with the airplane industry and air transport are concerned with passenger comfort and conveyance. The author has assembled technical data, calculations, information and illustrations useful in eliminating discomforts inherent to flying. He outlines the various important phases, and gives a detailed analysis of air supply, heat supply, soundproofing, seating, berthing, catering, etc. Procedures and methods are included for incorporating, specifying, selecting and servicing comfort equipment.

## CUMULATIVE INDEX for Volumes I, II, III, IV, V and VI of The CHEMICAL FORMULARY

By H. Bennett. Chemical Publishing Co., Brooklyn, N.Y., 1944. 164 pp., 8 $\frac{3}{4}$  x 5 $\frac{1}{2}$  in., cloth, \$4.00.

Owners of the Chemical Formulary will welcome this index, which covers all the formulas and recipes included in the six volumes of that work. The index is alphabetic, with cross-references.

### (The) DYNAMICS OF TIME STUDY

By R. Presgrave. University of Toronto Press, distributed by Ambassador Books Ltd., 12 Richmond St. East, Toronto 1, Canada, 1944. 211 pp., diags., tables, 9 $\frac{1}{4}$  x 6 in., cloth, \$3.50.

The author analyzes the essential principles to which sound time study technique must conform in order to function effectively. He points out many elements which are unnecessary or are actual drawbacks in time study work. The primary design of the book is to help those now engaged in time study to assess their present methods, to modify them out of reason rather than out of experience and so to use them with greater confidence.

### GENERAL METEOROLOGY, published formerly under the title, "Synoptic and Aeronautical Meteorology"

By H. R. Byers. McGraw-Hill Book Co., New York and London, 1944. 645 pp., illus., diags., charts, maps, tables, 9 x 5 $\frac{1}{2}$  in., cloth, \$5.00.

This book is designed as a general text embodying the fundamentals as well as the modern development in synoptic meteorology, including recent advances in the field such as: isentropic analysis, new forecasting uses of upper-air pressure charts, etc. The last five chapters of the book cover material of particular importance in aeronautics. An appendix contains practical aids for the student and meteorologist.

### MANUAL OF MACHINE SHOP PRACTICE

By O. Benedict, Jr. McGraw-Hill Book Co., New York and London, 1944. 249 pp., illus., diags., charts, tables, 7 $\frac{1}{2}$  x 4 $\frac{3}{4}$  in., fabrikoid, \$1.75.

The main part of this small book is devoted to such aspects of machine shop practice as cutting speeds and times, screw thread production, the spiral head for milling machines, tolerances and allowances, precision measuring devices, press tools and machine tool analysis. Ten illustrative experiments for various operations are included, and a considerable amount of technical data is provided in an appendix.

### NOTES ON HELICOPTER DESIGN THEORY

By A. A. Nikolsky. Princeton University Press, Princeton, N.J., 1944. 228 pp., diags., charts, tables, 9 x 6 in., paper, \$3.00.

This volume presents a series of lectures given at Princeton University in the spring of 1944 to a group of engineers representing the Army and Navy air forces and various aircraft manufacturers. The treatment is theoretical and mathematical and, of necessity, tentative, as theory in this field is still in an unstable state.

### PADDLE-WHEEL DAYS IN CALIFORNIA

By J. MacMullen. Stanford University Press, Stanford University, Calif., 1944. 157 pp., illus., woodcuts, tables, 10 $\frac{1}{4}$  x 7 in., cloth, \$3.00.

The first steamboat came to California in 1847. For the next ninety years steamboats were an important part of the transportation system of the state. The story of the rise and fall of steamboating is told, with many anecdotes and pictures of famous boats.

### PAPER AND PAPERBOARD

Characteristics, Nomenclature, and Significance of Tests. October, 1944, sponsored by A.S.T.M. Committee D-6 on Paper and Paper Products, American Society for Testing Materials, 260 So. Broad St., Philadelphia, 1944. 108 pp., illus., charts, tables, 9 x 6 in., paper, \$1.50.

The four parts of this report cover respectively: general considerations and the nature of paper properties; the action of water on paper and its significance; definition of terms, nomenclature, and properties of various classes of paper and paper-

board; and a discussion of commonly used tests applied to paper and paperboards and their significance. A complete list of A.S.T.M. and TAPPI test methods is included.

### PLASTICS STOCK MOLDS

Catalog of Stock Molded Parts, Extrusions and Laminates; compiled by Stock Mold Department of MODERN PLASTICS Magazine, 122 East 42nd St., New York, 1944. 168 pp., illus., 10 x 8 in., cardboard spiral binding, \$5.00.

Nearly 1,600 current stock injection and compression molds for plastics are illustrated in this Catalog, classified under twenty-two headings according to type of product. By reference to a list of item numbers the company owning any mold may be found. This revised edition also provides the same service for some 200 standardized extruded cross-sections and laminated sheets, rods and tubes.

### PROCEDURES FOR TESTING SOILS, Nomenclature and Definitions, Standard Methods, Suggested Methods, September 1944

American Society for Testing Materials, 260 S. Broad St., Philadelphia 2, Pa. 200 pp., illus., diags., charts, tables, 9 x 6 in., paper, \$2.25.

This publication brings together in convenient form various methods of testing soils now in current use. In addition to thirteen methods already adopted by the Society there are also 38 suggested methods representing test procedures, comment and criticism on which are invited. The test procedures fall into five categories; indicator tests; compaction and consolidation tests; strength tests; tests for soil-cement; and tests for soil-bituminous mixtures.

### STEAMBOATS COME TRUE, American Inventors in Action

By J. T. Flexner. The Viking Press, New York, 1944. 406 pp., illus., diags., 8 $\frac{1}{2}$  x 5 $\frac{1}{2}$  in., cloth, \$3.50.

An interesting, well written account of the early history of the steamboat. The stories of Fitch, Fulton and Rumsey are told. Fitch's life is described with some fullness, and the reasons for his failure explained. Fulton is given credit as the "inventor," the man who finally won the race. There is a good bibliography.

### TERNARY SYSTEMS, Introduction to the Theory of Three Component Systems

By G. Masing, translated by B. A. Rogers. Reinhold Publishing Corp., New York, 1944. 173 pp., diags., tables, 9 $\frac{1}{4}$  x 6 in., cloth, \$4.50.

This translation from the German presents a thorough exposition of the fundamental theory underlying ternary systems. Special care has been taken with reference to the difficulties which the beginner meets, and only the simpler structural cases have been described. The methods used for investigating such systems receive little attention as they are so similar to those used for binary systems. Some of the more important industrial alloys have been particularly discussed in the last three chapters.

### (The) UNIVERSE AROUND US

By Sir J. Jeans. 4th ed. rev. and reset. University Press, Cambridge, England; Macmillan Co., New York, 1944. 297 pp., illus., diags., charts, table, 8 $\frac{1}{2}$  x 5 $\frac{1}{2}$  in., cloth, \$3.75.

This book contains a brief account, written in simple language, of the methods and results of modern astronomical research, both observational and theoretical. Special attention has been given to problems of cosmogony and evolution and to the general structure of the universe. This fourth edition has been largely rewritten in the light of recent advances, such as the application of the physics of atomic nuclei to various stellar phenomena.

### YOUR SERVANT THE MOLECULE

By W. S. Landis. The Macmillan Co., New York, 1944. 239 pp., illus., diags., tables, 8 $\frac{1}{2}$  x 5 $\frac{1}{2}$  in., cloth, \$2.75.

The majority of the chapters in this book for the layman deal with the chemical background of everyday necessities such as food, shelter, clothing, soaps, drugs, petroleum products, etc. Other chapters discuss in simple language organic chemistry, colloids, chemical research, and the history and nomenclature of the chemical art.

# PRELIMINARY NOTICE

of Applications for Admission and for Transfer

FOR ADMISSION

December 27, 1944.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described at the February meeting.

L. AUSTIN WRIGHT, General Secretary.

\*The professional requirements are as follows:—

**A Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupillage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

**A Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examination of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

**A Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; or he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

**An Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

**BARKER—FREDERICK GEORGE**, of Arvida, Que. Born at Montreal, Que., Nov. 6th, 1917. Educ.: B.Eng. (Chem. Eng.), McGill Univ., 1939; 1939-40, Shell Oil Co. of Canada, Ltd.; 1940 to date, with the Aluminum Co. of Canada, Ltd., & at present, fluoride plant supervisor i/c aluminum fluoride & cryolite production, Arvida, Que.

References: A. C. Johnston, P. E. Radley, E. Brown, D. D. Reeve, B. E. Bauman.

**BARRATT—PHILIP S.**, of 204 Kootenay Ave., Tadanac, B.C. Born at Marlowe Green, England, April 18th, 1907. Educ.: B.A.Sc. (Civil), Univ. of B.C., 1932; 1929 (summer), engr. dept., City of Vancouver; 1930 (summer), P.G.E. Resources Survey; 1932-33, drfsmn. & later surveyor, Pioneer Gold Mines, Ltd., Bridge River; 1933-35, asst., Langley & Warren, Vancouver, also (5 mos.) i/c survey for hydro-elec. power plant & installn. of dam & pipe line 3 miles long at Hedley, B.C. under supervsn. of W. R. Bonnycastle, M.E.I.C., 1935-40, mine surveyor & later asst. mine engr., Kelowna Exploration Co. Ltd.; 1940 (8 mos.) preparation of plans for pulp mill at Port Alberni, Bloedel, Stewart & Welch Co. Ltd.; 1940 to date, engr. drfsmn., constrn. dept., Consolidated Mining & Smelting Co. of Canada Ltd., Trail, B.C.

References: S. C. Montgomery, G. H. Bancroft, A. C. Ridgers, C. E. Marlatt, T. W. Lazenby.

**COTE—J. F. RAOUL**, of Montreal, Que. Born at Pointe aux Outardes, Que., Sept. 7th, 1907. Educ.: 1928-34, surveying, mapping & civil engr., I.C.S.; With the Ontario Paper Co. Ltd., as follows: 1925-29, chainman, levelman & instrum. man, 1929-32, asst. chief engr., Outardes Falls, 1932-33, forestry engr., Shelter Bay, Que.; 1935-37, field engr., 1938-39, surveying; 1939-40, field engr., constrn., Foundation Co. of Canada; 1940-41, field engr., Ontario Paper Co. Ltd.; 1941, surveying, C.P.R.; 1941-43, field engr., dredging, etc., Beauharnois Light, Heat & Power Co.; 1943 to date, instr., aircraft layout & tooling engr., Canadian Car & Foundry Co. Ltd., Montreal. (Asks for admission as an affiliate).

References: C. G. Kingsmill, B. K. Boulton, P. G. Gautbier, A. Babin, L. C. Nesham, R. Lord.

**CUNNINGHAM—JOHN**, of Vancouver, B.C. Born at Uddingston, Scotland, Oct. 3rd, 1889. Educ.: 1908-11, Glasgow & West of Scotland Tech. Coll.; 1905-10, ap'tice civil engr. & 1910-11, junior asst. engr., district engr., County of Lanark, Scotland; 1911-14, asst. res. engr., water & sewerage scheme & later res. engr., Manaos, Brazil; 1914, engr., Sao Paulo Land Co. Ltd., town planning & land development; 1914-19, army service, Royal Engrs.; 1919-24, engr., Sao Paulo Land Co. Ltd., Santos, Brazil; 1927-44, field engr., various undertakings & from 1937, supt., i/c large defence projects, Northern Construction Co. & J. W. Stewart Ltd.; At present, mgr., North Western Dredging Co. Ltd., Vancouver, B.C.

# Employment Service Bureau

## NOTICE

Technical personnel should not reply to any of the advertisements for situations vacant unless—

1. They are registered with the Wartime Bureau of Technical Personnel.
2. Their services are available.

A person's services are considered available only if he is—

- (a) unemployed;
- (b) engaged in work other than of an engineering or scientific nature;
- (c) has given notice as of a definite date; or
- (d) has permission from his present employer to negotiate for work elsewhere while still in the service of that employer.

Applicants will help to expedite negotiations by stating in their application whether or not they have complied with the above regulations.

## SITUATIONS VACANT

GRADUATE CIVIL OR MECHANICAL ENGINEER wanted. See page 38 of the advertising section.

SURVEYOR wanted for Lands and Surveys Department of Trinidad Government. See page 41 of the advertising section.

SALES ENGINEERS—large manufacturer of air handling ventilating and air conditioning equipment requires sales engineers with good technical background for industrial and contractor sales. Position would be permanent and on a salary basis. Applicants should give age, nationality, education, training and experience. Apply to Box No. 2877-V.

GRADUATE MECHANICAL ENGINEER about thirty for a permanent position with a well-established, growing concern engineering and manufacturing conveying equipment in their own plant. A working knowledge of mechanics and light structural steel, with the aptitude for applying same, along with the desire to learn the conveying business from the ground up is essential. Apply to Box No. 2878-V.

CONSTRUCTION SUPERINTENDENT, qualified engineer required by a large public utility company in Canada, who will take full supervisory responsibility for construction of substations of large capacity and who will also act as liaison between the company's engineering staff and the contractor. Applicants must have thorough experience in similar work. Applications in first instance should contain full personal and professional history. Apply to Box No. 2869-V.

ELECTRICAL ENGINEERS, graduates, required by a large public utility company in Canada as follows:

(a) One who is thoroughly experienced in the design of sub-stations of large capacity, making system studies, preparing cost estimates and writing specifications.

(b) One as Protection Engineer, who has thorough knowledge of modern relay equipment and its application, along with allied subjects.

Applications in first instance should contain full personal and professional history. Apply to Box No. 2870-V.

DRAUGHTSMEN AND ENGINEERS, Mechanical, electrical and concrete draughtsmen and designers wanted by pulp and paper company. Apply to Box No. 2890-V.

## INDUSTRIAL ENGINEER

### Senior Staff Man For Consulting Company

At least 10 years' industrial experience with following work: Time Study, production control, planning, stores, inventory and material control, factory cost accounting, industrial relations. Minimum age, 35.

University graduation essential. Applicants without above requirements not considered.

Apply by letter only to Stevenson & Kellogg, Ltd., Room 970, Sun Life Building, Montreal.

Do not apply unless your services are available under Regulations P.C. 246, Part 3, Jan., 1943, administered by the Wartime Bureau of Technical Personnel.

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

## DRAUGHTSMEN WANTED

Experienced structural draughtsman for central Ontario. State experience and salary expected. Apply to Box No. 2897-V.

Experienced reinforcing estimator and draughtsman who can take off, price and detail reinforcing for central Ontario firm. State experience and salary expected. Apply to Box No. 2898-V.

## SITUATIONS WANTED

ADMINISTRATIVE ENGINEER, Civil, M.E.I.C., R.P.E. (Ont.) Toronto graduate, age 31, married. Structural supervision experience including design, maintenance, estimates, preparation of reports and specifications; administration of construction. Qualified to prepare and develop municipal and industrial plans and layouts. Available immediately. Would consider foreign assignment. Apply to Box No. 2466-W.

CIVIL AND ELECTRICAL ENGINEER, M.E.I.C., age 37, married, eight years' experience in public utility field, transmission lines, distribution systems, power sales, estimating, inspection, rates, electricity and gas. Seeks responsible position with public utility or similar organization. Registered with W.B.T.P. Available December 1st, 1944. Apply to Box No. 2469-W.

ENGINEER, B.Sc. (civil and mechanical), A.M.I.C.E., M.E.I.C., age 39, married, with eighteen years' experience in civil, mechanical, structural and chemical engineering field covering design and construction of filtration plants, industrial buildings, structural steelwork and chemical plants. Recently returned from wartime chemical plant design, construction, operation and management in Australia. Accustomed to technical development of industrial processes, supervision of operations and executive responsibility. Ready for new appointment requiring engineering qualifications combined with executive ability. Interested in permanent position with progressive chemical or industrial concern or with firm of engineers planning development. Ontario location preferred but not essential. Services are available under regulation P.C. 246, part 3, administered by W.B.T.P. Apply to Box No. 2470-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., R.P.E. (Ont.) 35 years of age, 10 years' general contracting experience; 6 years sales engineering and executive experience with manufacturer of construction materials. At present holding commission in R.C.A.F. Works and Buildings branch, desires contacts in construction field for employment in near future. Apply to Box No. 2471-W.

## FOR SALE

The following used engineering and scientific instruments:  
Tachmeter, Dr. Horn's system 80—3200 r.p.m.  
12" sextant with silver scale. Complete with telescopes and wooden case.  
Fuller spiral slide rule in wooden case.  
Keuffel and Esser Polar planimeter with 6½" tracer arm with wooden case.  
Price rotating vane water current meter in wooden case.  
Seven-day recording thermograph.  
Lufkin 50' steel measuring tape graduated in feet and inches.  
Lufkin 100' steel measuring tape graduated on one side in links and on the other in feet and inches.  
Bronze plumb bob.  
Set 34 Vulcanite railroad curves in wooden case.  
Brass cross staff head in leather case.  
Flexible transit rod in metal container.  
Chesterman (English) 100' steel measuring tape graduated on one side in links and on the other in feet and inches.  
Canvas pack sack.  
These may be inspected in Montreal; for further information, please write Box No. 55-S.

# THE FAITH OF THE ENGINEER

formulated by the  
Engineers' Council  
for  
Professional Development

Prepared for distribution  
at the 59th Annual General and Professional Meeting  
of The Engineering Institute of Canada,  
at Winnipeg, Manitoba, February 7, 8 & 9, 1945.

**NOTE**—This has been designed and printed so that it may be framed by those who so desire.  
The Formulation of the Faith may be detached and mounted on the back of the frame.

#### COVER PICTURE

A Sherman tank broke down near the battle front in Italy. It was taken to an Advanced Workshop Detachment of the Royal Canadian Electrical and Mechanical Engineers. In a few minutes these specialists found a faulty clutch. They went to work immediately, under fire from enemy guns. The repair crew was compelled to "take cover" from enemy gun fire twice. In a few hours they had the satisfaction of seeing the Sherman join in the battle.

# INDUCTIVE CO-ORDINATION ASPECTS OF MERCURY ARC RECTIFIER INSTALLATIONS

D. J. McDONALD, M.E.I.C.  
The Bell Telephone Company of Canada, Montreal, Que.

Paper delivered before a joint meeting of the Montreal Branch of The Engineering Institute of Canada and the American Institute of Electrical Engineers on December 16th, 1943.

This paper deals with the effects of mercury arc rectifiers on the co-ordination of power supply lines and communication lines. The subject has been treated at length in technical papers and publications, some of which are listed in the appended bibliography; the purpose here is to review the overall problem and to discuss its more important aspects.

As an introduction to the main subject, a brief summary will be given of the co-ordination problem. Noise induction<sup>①</sup> is the part of the problem of special interest and the remarks will be confined to it.

Noise induced from power supply circuits into circuits used for transmission of speech or music is caused by the harmonic frequency voltages and currents present in the power system wave shape. The interfering effect of a foreign voltage on a telephone circuit depends on its frequency. The interfering effect increases with frequency up to a certain value and then decreases. The voltage induced in a telephone circuit by a given amount of voltage or current on a power supply circuit depends on the frequency, the mutual relation or coupling being directly proportional to frequency. When considering the effect of harmonics present on the power circuits; it is necessary to give due weight to both factors. The term "inductive influence" is used in speaking about them. The inductive influence of a power system voltage or current wave shape is measured in terms of "Telephone Influence Factor"<sup>②</sup> abbreviated "T.I.F.", which factor takes into account both the variation of interfering effect with frequency and the variation of coupling with frequency. Figure 1 shows two T.I.F. curves, one marked 1935 and the other tentative 1941.<sup>③</sup> The shape of the curve depends, of necessity, on the characteristics of the telephone instruments in use and the change from the 1935 curve to the 1941 curve reflects the changes which have been made in improving telephone instruments. The 1941 curve is just coming into use now and the majority of the investigations made in recent years have been based on the 1935 T.I.F. weighting curve.

The co-ordination problem introduced by mercury arc rectifiers appears on both the D.C. and the A.C. circuits connected to them. The D.C. problem was the first one to be encountered and it will be treated first here. Incidentally, it is of interest that the problem was first encountered in Montreal and that the control measures applied on that installation are still generally used. The discussion, which follows, of effects on both the D.C. and A.C. systems applies specifically to poly-phase rectifiers of the common mercury cathode type. It also applies in general to single anode rectifiers of the mercury cathode type operating either in glass bulbs or metal tanks.

## EFFECTS ON DIRECT CURRENT SYSTEMS

The common cathode mercury arc rectifier is usually built with 6 or 12 phases. Figure 2-A is a schematic diagram of one of the common methods of operating a six-phase rectifier. Figure 2-B shows the wave shape of the D.C. voltage at no load and Figure 2-C shows it

under load. The voltage consists of a D.C. component with a ripple superimposed on it. The ripple can be analysed into a series of harmonic frequencies. Table I shows the harmonic voltages expressed as percentages of the average D.C. voltage.<sup>④</sup> The frequencies shown are for a 60-cycle system. The first column of percentages shows theoretical values calculated for no load and the other column shows ranges of values which have been measured in certain cases. Only a limited number of measurements are represented and values outside this range may be expected.

TABLE I  
HARMONIC VOLTAGES ON DIRECT CURRENT OUTPUT OF  
6-PHASE, 60 CYCLE RECTIFIER

Order of Harmonic	Frequency of Harmonic	Percentage Ratio of Effective Harmonic Voltage to Average Direct-Current Voltage	
		No Load (Theoretical)	Measured Under Load
6	360	4.04	4.5 to 5.95
12	720	0.98	1.26 " 1.37
18	1080	0.44	0.53 " 0.90
24	1440	0.25	0.61 " 0.72
30	1800	0.16	0.40 " 0.80
36	2160	0.11	0.43 " 0.62
42	2520	0.08	0.41 " 0.44
48	2880	0.06	0.35 " 0.36

It will be noted that the harmonic frequencies are 360 cycles and multiples thereof, namely 360, 720, 1080, 1440, etc. The series of harmonics is represented by  $(ps)$  where  $p$  is the number of phases and  $s$  is any whole number. The magnitudes of the harmonics decrease with increasing frequency.

With a higher number of phases, for example 12 phases, for an ideal installation, the harmonics present would be 720 cycles and its multiples. In practice it is found that all the harmonics present with a 6-phase group are present but 360 cycles, 1080 cycles, etc., are reduced in magnitude, the reduction depending on the characteristics of the installation.

Filtering equipment has proved to be generally the most satisfactory method of controlling the harmonics impressed on the D.C. system.<sup>⑤</sup> Figure 3 is a schematic diagram of the equipment. It consists of a reactor in

Fig. 1—Comparison of tentative 1941 T.I.F. weighting and T.I.F. weighting adopted in 1935.

FIG. 2-A SCHEMATIC CIRCUIT DIAGRAM

FIG. 2-B OUTPUT VOLTAGE WAVE-SHAPE - NO LOAD

FIG. 2-C OUTPUT VOLTAGE WAVE-SHAPE UNDER LOAD

Fig. 2—Six-phase mercury arc rectifier.

series with the circuit and a number of tuned shunts connected across the system on the load side of the reactor. A tuned shunt is required for each of the harmonics which is to be suppressed. The usual experience is that if shunts are provided for 3 or 4 frequencies, they will also reduce to some extent all the higher frequencies present. The design of the filtering equipment depends of course on the characteristics of the particular case. It is generally quite practicable to make it such that the voltage T.I.F on the D.C. system is comparable to the values found on systems supplied by rotating machines.

The problem of co-ordination with the D.C. system arises usually only where rectifiers are used to supply traction circuits, either street railways or other electrified railways. In most other cases the D.C. circuits are confined to the immediate vicinity of the load and are short, and it is possible to avoid communication circuit exposures to them.

EFFECTS ON ALTERNATING CURRENT SYSTEMS

It is a characteristic of a mercury arc rectifier that harmonics are present in the load current taken from the A.C. circuit even though they are not present in the generated voltage applied to the supply system.<sup>(5),(6),(7)</sup> To assist in obtaining some idea of what happens, consider an ideal case in which the A.C. voltage is a pure sine wave and the impedance of the A.C. supply circuit and of the rectifier transformer are negligibly low. Referring to Figure 4-A, the wave form  $I_A$  shows the current in one phase of the 3-phase circuit supplying a 6-phase rectifier.<sup>(9)</sup> Wave form  $I_B$  is the same quantity for a 6-phase rectifier with a different connection of the primary of the rectifier transformer. One primary is star and the other is delta. The wave shapes depart markedly from a sine wave.

Analysis of the wave shape of  $I_A$  or  $I_B$  shows that

it consists of a series of harmonics represented by  $(ps \pm 1)$  where  $p$  is the number of phases and  $s$  is any whole number.<sup>(9)</sup> For a 6-phase rectifier, the frequencies are the odd non-triple harmonics and for a 60-cycle system they are 300 and 420, 660 and 780, 1020 and 1140, etc. The magnitude of the  $n$ th harmonic is  $1/n$  times the magnitude of the fundamental frequency current. The currents are identical in each phase of the 3-phase supply circuit so the harmonics introduced are balanced components.

The distortion of the voltage wave shape depends on the impedance at harmonic frequencies looking back into the power system. A simplified view of what occurs may be obtained by considering the rectifier as a generator of high internal impedance which feeds back into the power supply system. Figure 5 is a schematic diagram which demonstrates the action.<sup>(6)</sup> Since the rectifier load is a balanced 3-phase load and the effects are alike for each phase, the diagram shows the circuit for only one phase to neutral.

Examination of the diagram helps in understanding a number of conclusions which have been reached as a result of measurements on rectifier installations.  $E_n$  is the harmonic voltage produced by the rectifier and it acts on a circuit consisting of the internal resistance of the rectifier  $R_o$  in series with  $Z_{in}$ , the impedance of the rectifier transformer, and  $Z_{sn}$ , the impedance looking back into the supply system.

- (1) The harmonic currents increase with increasing load on the rectifiers. This corresponds to a reduction of  $R_o$ , the rectifier internal resistance, as the load increases.
- (2) For a particular rectifier, the harmonic currents depend on the total impedance in the circuit, namely, on the rectifier load, and the impedances of the rectifier transformer and of the supply system.
- (3) The harmonic voltages appearing on the supply system depend on the harmonic currents flowing and also on the system impedance  $Z_{sn}$ . The voltage is directly proportional to  $Z_{sn}$  for a particular value of current. Any arrangement of the power system which reduces the impedance looking back into it from the rectifier will usually reduce the voltage wave shape distortion. Conversely, an increase in the system impedance will increase the effects.
- (4) The larger the rating of the rectifier is, the lower will be its internal resistance and the impedances of the rectifier transformer and supply system. Hence the harmonic currents increase with the load rating of the rectifier.

RELATIONS BETWEEN SHUNT CONSTANTS ASSUMING 60 CYCLE SUPPLY SYSTEM

$$2\pi(360)L_6 = \frac{1}{2\pi(360)C_6}$$

$$2\pi(720)L_{12} = \frac{1}{2\pi(720)C_{12}}$$

$$2\pi(1080)L_{18} = \frac{1}{2\pi(1080)C_{18}}$$

Fig. 3—Filter for 6-phase mercury arc rectifier—Schematic circuit diagram.

The harmonic voltage,  $E_n$ , produced by the rectifier depends on a number of factors. An important one is the amount of phase control used to vary the D.C. voltage and the load taken by the rectifier. For small values of phase control, the change is not great but, beyond a few per cent, the harmonic currents increase rapidly with increasing phase control. There is also evidence that the wave shape distortion depends on the nature of the D.C. load supplied by the rectifier.

#### MULTI-PHASE OPERATION<sup>⑧,⑨</sup>

In the early investigations of the effects of rectifiers on A.C. power system wave shape, it was found that the distortion was less for 12-phase operation than for 6-phase. Figure 4-A shows two 6-phase rectifiers arranged for 12-phase operation by using a star-connected primary for one of the rectifier transformers and a delta-connected primary for the other.<sup>⑨</sup> As mentioned previously, wave forms  $I_A$  and  $I_B$  show the wave shape of the currents in one phase of the 3-phase circuit supplying each 6-phase rectifier.  $I_C$  is the current to the 12-phase group and is the sum of  $I_A$  and  $I_B$ . Wave form  $I_C$  shows its wave shape and it is seen to approach a sine wave more closely than either  $I_A$  or  $I_B$ .

In a polyphase rectifier, each anode fires once during each cycle of the applied voltage and they are arranged symmetrically so that the time intervals between the firing of successive anodes are equal. For a rectifier with  $p$  phases, the phase interval between anodes which fire successively is  $360/p$  deg.

In a 6-phase rectifier, the phase interval between the firing of successive anodes is 60 deg. and in a 12-phase

rectifier it is 30 deg. If a number of 6-phase units are associated in such a manner that the phase interval between the firing of successive anodes is decreased, it is equivalent to increasing the number of phases. For example, 15 deg. between successive anodes corresponds to 24-phase operation, 12 deg. to 30-phase operation, 10 deg. to 36-phase operation, etc.

For ideal conditions the harmonics produced in the A.C. system would be the series  $(ps \pm 1)$  where  $p$  is the equivalent number of phases and  $s$  is any whole number. For 30-phase operation, the lowest harmonics would be the 29th and 31st, corresponding to frequencies of 1740 and 1860 cycles on a 60-cycle system. Table II shows, for such theoretical conditions, the harmonics which would be present for different numbers of rectifier phases.<sup>⑨</sup> The magnitudes of the harmonic currents are shown in per cent of the fundamental frequency current. The table is made up for a 60-cycle system. On a 25-cycle system, the harmonics and the percentages would be the same but the frequencies would be lower in proportion to the fundamental frequency. In practice, the harmonics which are shown as suppressed are only partially suppressed, the amount depending on the characteristics of the installation and the manner in which the rectifiers are operated.

A number of methods may be used for obtaining multi-phase operation. In general the individual rectifiers, if multi anode, or groups of rectifiers if single anode units are used, are 6-phase. Two common methods of obtaining 12-phase operation are shown in Figure 4.<sup>⑨</sup> Figure 4-A shows the use of star and delta primaries on the rectifier transformers to obtain the

30 deg. phase displacement. Figure 4-B shows the use of 2 sets of 6-phase zig-zag secondary windings on the rectifier transformer. The zig-zag connection provides a 15-deg. phase displacement and one set is connected to advance the anode voltages 15 deg. while the other set retards 15 deg, thereby providing a 30-deg. displacement between the two sets.

Phase displacement in 3-phase circuits may be made readily by means of phase shifting transformers as shown schematically in Figure 6. The supply circuit is connected to terminals A, B and C and the load circuit to terminals A', B' and C'. The vector diagram indicates how the secondary voltages are shifted with respect to the primary. The transformer can be designed to provide phase shift of any value up to 120 deg. By interchanging the supply and load connections, it can be made either plus or minus.

Figure 7 shows two methods of using phase shifting transformers to obtain 36-phase operation with six 6-phase units. The first method employs phase shifting transformers to do all the phase shifting. All the rectifier transformers are alike. It will be noted that as much as +25 deg. is required in one phase shifting transformer and -25 deg. in another. The second method employs phase shifting transformers in association with delta and star primaries on the rectifier transformers. In this way it is possible to limit the maximum shift, to be provided by phase shifting transformers, to 10 deg.

It was stated above that the harmonics which are shown as suppressed with ideal multi-phase operation

are only partially suppressed in an actual case. To obtain the maximum amount of suppression, the following requirements should be observed.

All units comprising the multi-phase group should be identical and should be carrying the same load. If phase control is used, it should be substantially the same for all units.

The impedance of the rectifier transformer plus that of the phase shifting transformers, if used, should be identical for each 6- or 12-phase unit. If phase shifting transformers are not needed for some of the units, reactors of equal impedance may need to be substituted.

The phase shifting transformers or other devices used should provide exactly the phase displacement required. Even a small departure at the fundamental frequency will be large when referred to the higher harmonic frequencies.

In some installations, suppression ratios of as high as 80 to 1 have been obtained for the harmonics below about the 19th. For the higher frequencies it is not possible to do so well and ratios of the order of 5 to 1 are more common.

If one or more 6-phase units of a multiphase group are shut down, balanced multi-phase operation is no longer obtained. The magnitude of the effects on power system wave shape may be deduced by looking at the condition as follows. Assume a perfectly balanced multi-phase group of  $p$  phases in which all harmonics below  $(p \pm 1)$  are suppressed. If one 6-phase unit is shut down, the harmonics appearing on the system apart from the  $(p \pm 1)$  harmonics correspond to those which would

Fig. 4—Twelve-phase rectifier arrangements—Schematic circuits and wave forms.

$E_n$  = Harmonic voltage produced by the rectifier.  
 $R_o$  = Rectifier internal resistance  
 $n$  = Order of harmonic.  
 $Z_{cn}$  = Rectifier transformer reactance at the  $n$ th harmonic.  
 $Z_{sn}$  = Phase to neutral system impedance external to the rectifier transformer at the  $n$ th harmonic.  
 $V_n$  = Harmonic phase to neutral line voltage due to the rectifier.  
 $I_n$  = Harmonic line current due to the rectifier.

Fig. 5—Schematic diagram showing harmonics in supply circuit to rectifier (phase-to-neutral equivalent circuit).

exist if this 6-phase unit were operating alone and carrying its normal load.

As the number of phases in a multi-phase group is increased, the benefits obtained are limited by the above factors. With a large number of units, it is more difficult to maintain all the conditions required to obtain the results which are theoretically possible.

#### CHARACTERISTICS OF POWER SUPPLY SYSTEMS

Considerable attention has been given to the manner in which the characteristics of the rectifiers affect the magnitude of the harmonics produced. The characteristics of the power system are also important in determining the wave shape distortion, particularly at a distance from the rectifier load. The impedances of items of power equipment such as generators, transformers, etc., increase proportionally to frequency and are largely inductive reactances over the frequency range of interest. The impedances presented by transmission lines may be either inductive or capacitive reactance and may vary from one to the other over the frequency range. It will be seen, therefore, that if the power supply system is extensive the impedance looking back into it from the rectifier will be a very complex function of frequency.<sup>10</sup> The wave shape distortion which a rectifier would cause in these circumstances would differ markedly from what it would be if the system impedance were uniform over the frequency range or varied in a simple manner with frequency.

#### OTHER CONTROL MEASURES

Other means of controlling the wave shape distortion are feasible in certain situations. If exposures of communication circuits exist only in some parts of the power system, it may be possible to operate the system in such a manner that the wave shape distortion does not extend to that part or is reduced to such an extent that it is no longer troublesome. Usually there are disadvantages to following a plan which hampers the flexibility of the power system and this means may not be looked upon with favour as a permanent solution. It may be very helpful, however, in the interval pending the application of permanent measures.

There are situations in which the use of frequency selective devices or filters in the power supply system are the best solution. Such devices may be shunt capacitors, series reactors or any combination of such items. Cases where these devices might apply are as follows. With well balanced multi-phase operation the lowest unsuppressed harmonics are sometimes the chief components of the T.I.F. Selective devices for these two frequencies will improve the wave shape greatly without being unduly costly.

Cases occur in which the characteristics of the power system are such that resonance occurs at a harmonic frequency and the magnitude of that frequency is increased out of proportion to the others. Filters to take out the one frequency will make marked improvements. A factor to be considered in connection with filters is that in some instances they may be associated with the part of the power system where they are needed and hence their current and voltage rating will usually be lower than would be required if they were installed at the rectifier.

#### DISCUSSION

All rectifier installations do not introduce co-ordination problems. However, when problems do arise they may be serious and widespread. The effects may be manifest over a large part of a power network or they may appear in any part of it. In some cases they appear in remote parts of the system without causing trouble in the vicinity of the rectifier. If the equipment is already operating, co-ordinative measures are apt to be costly and difficult to install, and communication services will be adversely affected in the meantime. To forestall such occurrences it is desirable that all parties concerned in rectifier installations should co-operate to investigate the possible effects on co-ordination with communication circuits at the earliest opportunity.

Information on a number of methods of estimating the harmonic voltages and currents produced by rectifiers has been published.<sup>5,6,7</sup> They include calculations involving characteristics of the rectifiers and the impedance of the power supply system at harmonic frequencies. It is necessary to make simplifying assumptions to facilitate calculation, and a very close check between actual and estimated results cannot be expected. Experience does indicate, however, that the

Fig. 6—Phase-shifting transformer—Schematic and vector diagrams.

Fig. 7—Two methods of providing 36-phase operation with 6-phase units and phase shifting transformers.

methods are useful as a basis of judgment regarding the extent and seriousness of wave shape distortion.

For many years before the war there was extensive growth in power systems, particularly in distribution lines, and communication circuit exposures were being created on a large scale. During the same period, the wave shape of the power systems was being improved gradually and this was one factor in making it possible to co-ordinate the two types of circuits without incurring excessive costs specifically for that purpose. The advent of large mercury arc rectifier installations has threatened to reverse the trend and is a challenge to the utilities involved.

About 1938, a large mercury arc rectifier installation was put in operation in the United States and excessive noise induction was caused on communication circuits over an extensive area. Development work, in which the manufacturer and the purchaser of the rectifiers and the communication company participated, led to the practical application of multi-phase operation as a means of controlling wave shape distortion. Since that time, there has been extremely rapid growth in the installed capacity of mercury arc rectifiers in connection with electro-chemical and electro-metallurgical industries. In Eastern Canada alone, mercury arc rectifiers now total more than a million kilowatts. Multi-phase operation has been used widely and has prevented what would otherwise have been widespread co-ordination problems. The types of loads mentioned above are well suited to multi-phase operation since it is possible to operate large groups of rectifiers in parallel on both the D.C. and A.C. sides and the loads are substantially constant throughout the day. These conditions cannot be looked for in all the applications which will be made when rectifiers are available to fill all demands.

As regards the future, new problems can be expected in connection with rectifiers and other types of electronic devices. In addition to use in traction systems and in the electro-chemical and electro-metallurgical industries, rectifiers have been used widely as a source of D.C. for high power radio stations. It is expected that, in the future, they will be used wherever conversion from A.C. to D.C. is required, for example, to supply large D.C. motors in steel mills and similar industries. Direct current transmission of power has been under development for many years. When it comes into general use, it will involve both rectifiers and inverters, and wave shape distortion may appear on the A.C. systems at each end and on the D.C. link. A similar situation will be introduced by electronic type frequency changers used either to supply higher frequency power for industrial purposes or to interconnect power systems of different frequencies.

We do not know the solutions to all these problems or even the precise nature they will take. What can be stated definitely however, is that they can be solved and that the best solutions will be obtained if all parties concerned co-operate wholeheartedly to that end.

# THE ENGINEER AND THE COMMUNITY

JOHN S. GALBRAITH, M.E.I.C.

*Head of Community Planning Division, National Housing Administration, Ottawa, Ont.*

An address delivered at the Fifty-Ninth Annual General Professional Meeting of The Engineering Institute of Canada, at Winnipeg, Man., on February 7th, 1945.

Nearly every profession but that of engineering is closely associated with the family life of a community — my doctor, my lawyer, my dentist are all every-day expressions; and it is commonplace to hear a housewife say my butcher, my baker — even my ice-man — but who ever heard the engineer referred to in these possessive, intimate terms by all the members of a family? It is not because the family does not need his services, but rather because the average family does not know the engineer or understand how he may be of assistance to it. I believe the ordinary citizen looks upon the engineer as a mystery-man — a stranger — a romantic figure who lives apart in a different world. This attitude may have had its origin in the days when the frontiers were far from home, in "the wild and woolly West". Now that the frontiers are the urban and rural communities themselves, now that the frontiers are on our very door steps, the engineer who builds frontiers of every description, must introduce himself and make friends with Mr. and Mrs. Jack Canuck and help those friends to get the sort of communities they want and need.

What kind of community design do people want? Why do they need the services of the engineer? Both these questions will be answered by understanding how the engineer thinks and works. The engineer's training, experience and practice are centred on what is known as functional design. To understand what this means, let one examine a radio, a steam engine, an electric motor, an automobile or another structure symbolizing mechanical progress. The designer of the motor car did not begin by making a spark plug or a pneumatic tire, nor a hand brake. He started by knowing what he wanted to achieve, then he went to work to devise ways and means of accomplishing it. In other words, he first had a well defined aim, next he made an overall plan for the kind of vehicle which would be needed to accomplish this aim, he then applied scientific principles to the design of the whole machine and each of its parts, so that when fitted together each part would serve the rest and the whole machine each part; that is what functional design means. It is the way the engineer thinks and works. It is the way the overall and individual structures of a community should be designed and built. It is the reason why the engineer is the key man in community planning.

Slums, traffic congestion, crowded cities have made Canadians land conscious. They say Canada is a vast country. We possess all kinds of transportation means, provincial governments have constructed great networks of highways to distribute people. Why concentrate so many people in one centre? Why have big cities? Why make narrow lots which pack houses together in tight monotonous rows? Canadians all over Canada want to know the answers to these questions — that is why they are interested in community planning. They know that planning shapes the community, the neighbourhood, the lot, and they also know that the shape of the lot shapes the house which plays so important a role in shaping the lives of the family

which dwells in it. That is what makes the planner the family engineer.

In my view, cities are suffering more from the *lack of understanding how to plan* than from the *lack of planning effort*. Unsuccessful planning efforts, in my opinion, are due to failure to recognize the scope of community planning, to failure to plan the various elements that condition the physical structure of a community, to failure to plan these elements so that they will serve each other and work in harmony to produce the necessary overall physical structure. The main elements which condition the physical structure of a community include the economic base of a community, the municipal tax structure, the system of municipal assessment, the functional land-use plan, the zoning regulations, and last but not least "the rural base" upon which a community depends for its supply of food. In my view, realistic planning is impossible until appropriate measures are introduced to make land-use flexible and fluid.

Under the present system of municipal assessment, assessed values govern the use of land, not functional design. The first step in community planning is to devise a system of assessment which permits functional design to determine the use of land. Municipal post-war projects conditioned on the present assessment system, not functional design, are, in my opinion doomed to ultimate failure. Take for example a "traffic artery project" planned to relieve congestion; its costs will be recapitalized in higher assessments, higher assessments will develop higher rentals, higher rentals call for higher intensities in the use of land, the more intensive use of land creates further congestion, which in turn demands new and costly measures to relieve it. A rising spiral of cause and effect is thus set in motion. In consequence of project planning, our large cities are gradually becoming monstrosities not fit for human habitation.

We have promised men and women in uniform and overalls that a fresh start will be made at the end of the war. The fulfilment of this promise calls for action and for technical leadership which visualizes the community as a whole, which envisages the overall picture, not a miscellaneous lot of projects. We need leaders with engineering training, who design their entire structures as units; there is no lack of specialists; National Housing legislation is ready. It is predicated on a solid foundation. The Federal Government is responsible to all the people of Canada for moneys advanced to finance housing. In order to protect investments and borrowers alike, the National Housing Act makes adequate community planning and appropriate zoning regulations conditions for long-term housing loans.

Under the British North America Act, the provincial governments enjoy the privilege of enacting municipal legislation. Consequently, the provinces are responsible for enacting legislation necessary for proper planning. The Engineering Institute of Canada and its branches can do much to educate the public and in other ways

help provincial administrations with such tasks. With respect to handling the politicians and general public, it may be said that the engineer has accustomed himself to think in terms of straight lines — the shortest distance between two points — and that he is not always understood by others. Although straight line thinking is right to the point, it is not always possible to get prompt action along these lines; Ruskin may have "had something" as the boys says, when he said "there is nothing more monotonous than a straight line" and Mae West may have "said something" when she defined a curved line as "the loveliest distance between two points". Perhaps a mixture of these ideas would help the engineer, the politicians and the public to a better, all round understanding.

It may take time to recondition the present assessment system; however, in the meantime, the slum clearance provisions of the National Housing legislation make functional design attainable now and a fresh start possible when the war ends, providing municipalities have their plans ready. By providing a large sum of money for outright grants to municipalities, the high assessments on lands now occupied by slum dwellings may be deflated. These areas may be remodelled in accordance with modern design. As they abut upon congested commercial districts, this congestion may be relieved by a re-orientation and widening of the street system in the slum areas, without incurring the ordinary huge expenditures for street widenings. By introducing appropriate zoning regulations and by providing open spaces in the crowded business sections, the daytime population may be more uniformly distributed and the average densities reduced. Legislative measures which provide that suburban subdivisions be divided into rural and not into city lots will protect the close-in rural communities against haphazard intrusion of deficit urbanization.

The engineer may comfort those who are frustrated by the idea of land control by telling them that he places controls on all the machines he makes, and that when these controls fail to function, the machine either stops or runs wild; or the engineer may tell them that when the Great Engineer of the universe made His working drawings for the human form, He equipped the human organism with glands to control and limit the size and shape of the body and its limbs. The Creator also equipped mankind with power to think. Our armed forces are again saving democracy; as freedom entails responsibility, the engineer may also suggest that it is our democratic responsibility and duty to intelligently control the development of our communities.

Manifestly the specialist is not the man to direct in the field of community planning. Our cities are what they are today, largely because the development of municipalities has been departmentalized into special divisions. No clearly defined idea exists as to what the overall picture should be. Most municipalities lack an administrative department to make designs and plans for the overall development. Years of this kind of growth have resulted in an accumulation of evils of all sorts. The economic base of a community has been allowed to grow up on the idea of bigness; in fact our generation has had a mania for bigness: big cities, big business, big wars, big shots; this generation is now turning its attention from bigness to quality. People now speak of better cities, better business, a better world, in which there

will be no war, and the only big man left is the one who serves.

A better city may mean less industry and commerce. It may mean a redistribution of industry within the region. It may mean replacing unsuitable industry and commerce by enterprise which "plugs" the gaps and rounds out a programme for maximum employment. Research shows that municipal costs increase with increasing concentrations of population, that larger concentrations mean higher municipal taxes, smaller living quarters and less agreeable surroundings. Research also shows that a large percentage of the area of an urban municipality is deficit area. Consequently, any enterprise unable to support the maintenance of the deficit area it creates will prejudice the whole community. Such enterprise should be located elsewhere where it can help to fill out the industrial structure. If living conditions and maximum employment are made the planning objectives to be achieved, the community's economic base will be conditioned to meet these needs.

Besides knowing what provisions should be included in a comprehensive programme of planning legislation, the planner must have a grasp of the principles involved in all branches of applied science and know how to collect information on a host of other subjects. He should be able to use such information wisely. Because buildings of every description represent certain concentrations of population, the planner employs the principles of statics. He distributes the land loading according to functional arrangement. Functional design makes public services and utilities subservient to the needs of the people. Project planning does the reverse. It subordinates the distribution of population to public services and utilities.

The layman may like to know that public libraries are well supplied with literature on the subject of community planning but, as ever, the most trustworthy authority to follow is none other than "Dame Nature" herself. Her works answer the community planner's every question, her plans are comprehensive and total, her designs are functional, her organization for planning is permanent, her planning is constituted as a continuing process in order to meet changing conditions. She limits the height of forests, she shows mankind that stunted growth and death are the penalties for overcrowding. Nature rebuilds her blighted and burnt-out areas, her highways; the watercourses follow the easiest gradients; her rains cleanse the air; the sun purifies the waters; she paints the landscapes in gorgeous colours; each year she drapes and dresses her structures in new foliage; nothing is permitted to grow shabby. The engineer works with Dame Nature—he understands her language. Therefore, he is the man who ought to be able to make cities as simple, as efficient, as functional and as beautiful as Nature herself.

Finally, I take it that we are gathered here for the purpose of deciding how we can best serve society in its work of building a better world. I may be prejudiced, but I know of no other medium which can do more to help the people of this country than community planning. Canadians grow up in communities, they spend their lives in them. Development of national resources in the provincial and national communities is designed to converge on the local municipalities, both rural and urban. Therefore, let us make

*(Continued on page 78)*

# POST-WAR PROJECTS FOR THE PRAIRIES

GEORGE SPENCE

*Director, Prairie Farm Rehabilitation Administration, Regina, Sask.*

An address delivered at the Fifty-Ninth Annual General Professional Meeting of The Engineering Institute of Canada, at Winnipeg, Man., on February 8th, 1945.

It is important that we should try to visualize and do everything within our power to meet a situation which will come upon the country like an avalanche immediately after the war. The government will be faced with an insistent demand for the demobilization of the fighting forces; a demand which no government, however constituted, will be able to resist. Overnight the problem of reconstruction and rehabilitation will be upon us. It will be then, if ever, that the need will be most urgent to get large peace time enterprises under way.

## FAR-REACHING PROJECTS NEEDED

It will be then, too, that the country will turn to the engineer. Governments, all governments, will want to know what the engineer has to offer. The problem will not be confined to the returned men only, there are also the tens of thousands of war workers who will be thrown out of employment. The situation cannot be met by half measures. Small projects around town, however numerous, will be entirely inadequate. Jobs for the sake of jobs will not solve the problem. Something will have to be done in a big way.

An act of Parliament cannot, by itself, ensure freedom from want. The high standard of living to which we have become accustomed can only be maintained when the man power of the nation is fully and gainfully employed in constructive enterprises. Enterprises must be planned that are designed to stimulate the national economy. If this is done, forces will be released that will set the wheels of industry rolling forward on the high road of greater national achievement. It has been said before: in time of war, prepare for peace. We must prepare for D Day on the home front. This great task offers a challenge to us all and to no one more than to the engineer. We must not flag or fail in this great task that is just ahead. We must not! we will not let our fighting men down!

The economy of this country is predominantly agricultural. It follows, therefore, that measures designed for the rehabilitation of agriculture will automatically strengthen the whole national economy and create the conditions requisite for greater national growth and well-being. In this, the engineer working in conjunction with the agriculturist has a major part to play and nowhere more so than on the broad, open face of the western prairies, where the hazards of farming, from one cause and another, are so great. While we regret the circumstance—a national emergency owing to the great drought of the thirties—which made the step necessary, I think it is right to say that we are fortunate in having an organization in operation which is experienced in rehabilitation work; an organization competent to take on a much greater job, if and when the green light is given. At this point, a word on the range of our organization's activities might not be out of place.

## P.F.R.A. ACTIVITIES

The Prairie Farm Rehabilitation Act was passed in the spring of 1935 and now applies to an area of 122,737,000 acres in the three prairie provinces. The

programme of the administration was just getting well under way when the war intervened and, in common with other peace organizations, the administration had to adjust its programme to wartime conditions. Fortunately, and notwithstanding reduced appropriations and other handicaps, no important activity of the administration has had to be discontinued.

In arranging the programme to meet the conditions imposed by the war, first consideration had to be given to projects which required only a minimum of labour and materials. Projects in which large quantities of steel and other scarce war materials were required are being held in abeyance. By following this policy, the administration has carried out, even during the war years, a reasonable programme of construction and, what is equally important, has maintained an organization geared to undertake projects, however large, if suddenly called upon to do so. In furtherance of this policy too, surveys, investigations and studies, of one kind and another are being conducted. These investigations are not confined only to the engineering feasibility of a project, but include agricultural and economic studies as well. These economic studies ensure, among other things, that public money is not being wasted on half-baked, unsound or visionary enterprises. The great bulk of P.F.R.A. work is not particularly spectacular. The work can best be described as ordinary, everyday "spade work" in a field which offers almost unlimited scope for expansion if an "all out" effort is put forth for the rehabilitation of agriculture on a national scale.

As I have already indicated, P.F.R.A. was primarily formed as a measure to meet an emergency created by extensive drought conditions over a large section of the prairie provinces during the thirties. Happily, for the time being at least, that emergency has passed but other circumstances remain and the administration finds itself dealing more and more with problems created by factors of an enduring and permanent nature such as climatic variability and soil conditions with consequent hazards and limitations to agricultural production. This condition is certainly not confined to the so-called drought area, or for that matter, to the prairie provinces only. Doubtless it was such considerations that weighed with the Parliamentary Committee on Reconstruction and Re-establishment when they recommended that the Act be made applicable to "all of Canada".

Expressed in general terms, the main activities of the P.F.R.A. have to do with measures for the conservation and utilization of surface or run-off water, and the reclamation of submarginal lands, together with the rehabilitation of settlers situated on these lands.

## SCOPE OF ITS WORK

The work is classified under three main divisions:

1. Cultural.
2. Land Utilization.
3. Water Development.

The cultural work can be shortly stated as embodying farming practices and systems of agriculture best

sued to climatic and soil conditions in particular regions and includes, of course, a great deal of research and experimentation.

The land utilization work is based on soil surveys supplemented with economic studies in a given locality. As these soil studies are the scientific basis for proper land use and therefore indispensable in planning a rehabilitation programme for agriculture, this work can and should be greatly expanded.

The third division of the work, water development, is the subject with which we are more particularly concerned in this paper. It is now a well recognized fact that low and variable rainfall rather than lack of soil fertility (except in definitely submarginal areas) is the limiting factor in crop production on the open plains. It is good economy and sound public policy, therefore, to conserve by every feasible means, our precious water resources so limited on the prairies, yet so essential to national prosperity and well-being. The prairie farmer is forever waging a constant and relentless battle against the recurring ravages of droughts, for which irrigation is the only permanent solution—water is liquid gold on these prairies!

True, only a very small portion of our agricultural land in the low rainfall area can be commanded by the ditch. The situation is not without hope, however. Fortunately, the rivers and streams bisect the country in a way that favours the low rainfall area. Fortunately too, feasible sites for dams and reservoirs are found at strategic points where large areas of suitable and good land can be brought under irrigation. The policy is to take advantage of this natural situation. Consequently, large dams and reservoirs have already been constructed on the Frenchman, Souris and Qu'Appelle rivers, on Swift Current creek and on other streams and water courses. Suitable reservoir and dam sites have been located on the main rivers which, when fully developed, will bring hundreds of thousands of acres of new land under irrigation. These projects, totalling approximately \$30,000,000, have all been fully investigated and are now ready for immediate construction as post-war projects. Other projects are being investigated, which if found feasible, will add another \$70,000,000, making an estimated grand total of well over \$100,000,000. All these projects are within the present P.F.R.A. area.

It is well to point out here that the initial expenditures on the construction of the main works of these irrigation projects is only a part, usually the smaller part, of the ultimate development. The opportunities, therefore, which the development of irrigation opens up for permanent and gainful employment cannot be too strongly stressed. This employment factor, beginning with the construction of the primary works, carries progressively through all stages of development, building up in the process a new economy based on intensified farming, particularly on the production of specialty crops, sugar beets, canning crops and the like. In this connection, perhaps I cannot do better than quote from the report of the St. Mary and Milk Rivers Water Development Committee, This committee which made a special study of the present irrigation development in the province of Alberta, says on page 53 of its report under the sub-heading "Industrial Development":

"The industrial development resulting from irrigation is contributing very substantially to the general welfare of southern Alberta and to the country as a whole. Two sugar factories for processing sugar beets, and two factories for the canning of a wide assortment of products from irrigated lands, and, in addition, seed cleaning plants, alfalfa meal mills, commercial apiaries, and other enterprises attendant directly or

indirectly on irrigation and increased trade have been established in the area.

"Were it not for irrigation, the city of Lethbridge would depend entirely on coal mining, ranching and wheat growing for its trade, and would not have achieved, as reported, the distinction of having the highest retail trade per capita in Canada during one or more of the depression years when relief in various forms was being distributed in large sections of the prairie provinces".

#### SOME TYPICAL PROJECTS

Much as engineers desire precise information on projects as such, time will permit only a brief reference to one or two which may be taken as typical of the aims and objects sought.

#### ST. MARY AND MILK RIVERS WATER DEVELOPMENT

Of the larger projects, perhaps the best known because of its international aspects, is the "St. Mary and Milk Rivers Water Development Project". The nature and benefits of this project involve the construction of a storage dam on the St. Mary river a few miles northeast of Cardston, Alberta, together with numerous other reservoirs, certain river diversions and canals to carry water across southern Alberta to within a few miles of the city of Medicine Hat. This project, if and when constructed, will make possible full use of Canada's share of the water of the St. Mary river—an international stream. The full development of this project will bring under the ditch 345,000 acres of land now either unproductive or only in very limited production under dry farming practices or in pasture. The estimated cost of the project is \$15,000,000 and, during construction of the works, 1,000 men will be employed steadily for five years. This is, of course, exclusive of the indirect labour required for the preparation of material and supplies.

#### RED DEER RIVER DIVERSION

Another project I might mention is "The Red Deer River Diversion" which is part of the North Saskatchewan River Project or better known as the William Pearce Stockwatering Scheme. Details of this large scheme I believe, which had originally as its objective the irrigation of approximately 1,400,000 acres, are already in the records of this Institute. The project as it now stands, after five years of continuous investigation and study by P.F.R.A. engineers, has been much reduced from the original scheme. The project now recommended involves the construction of a dam on the Red Deer river approximately thirty miles east of the city of Red Deer, Alberta, and a canal to Hamilton and Kirkpatrick lakes just south of the town of Coronation, Alberta. From these lakes, water will be carried through natural channels to the drought areas of east-central Alberta and central-western Saskatchewan. The estimated cost of the project is \$6,750,000. Labour required in the construction of the works will be 1,500 men steadily for eighteen months. Again this does not include the indirect labour required in the preparation of materials, nor that required in servicing the purchasing power of the men and their families while employed on the work. The chief benefits of the project will be:

(1) Opportunities for settlement, permanent homes and means of livelihood for 7,500 families in a section of western Canada from which over 90 per cent of the original settlers were forced out by drought; it can, therefore, resettle an area now practically depopulated; the area will support between 30,000 and 40,000 people.

(2) It will provide irrigation for approximately

500,000 acres of land suitable for irrigation. This land is not now in production and is, for the most part, publicly owned. In addition to the lands which can be irrigated, it will give a constant flow to 610 miles of dry creek channels traversing an area containing 12 million acres of range lands and will materially increase the livestock carrying capacity of such lands. The project will also rehabilitate 24 urban communities now practically depopulated from years of drought.

#### A BOON TO NATIONAL ECONOMY

It will be apparent that a post-war programme such as I have indicated, should not be regarded in the narrow sense of a "works programme" only. We like to think and speak of it in broader and more comprehensive terms, preferably in terms of reconstruction and rehabilitation, for in its wider aspects, that is what it is. Apart altogether from the advantage of creating

immediate employment, other and more permanent benefits will accrue, not only to the individual but to the state as well, benefits far in excess of the amount of money spent on the initial construction of the works.

It is hard to visualize the revolutionary effect on western agriculture which the full development of our water resources for irrigation would bring about. If we have vision, enterprise and courage, nothing can stop us!

In conclusion: I have been able to deal with only one P.F.R.A. activity and only lightly on that. The "overall" programme is much more comprehensive. It is designed not only to overcome unfavourable conditions of soil and climatic variability but also to give leadership in conservation practices and the application of scientific principles to proper land use. The future is bright along a new horizon—the horizon of new opportunity.

---

## THE ENGINEER AND THE COMMUNITY

*(Continued from page 75)*

the rural and urban communities living monuments to those who have suffered and died that Canada might live.

Engineers may do this by helping the people in each community to clarify their ideas about the kind of community they want. Engineers can show the results which will follow if they do this, that or the other. By planning the whole community before its parts, the engineer can make man the master of his environment. Project planning by itself will make man a slave

to his environment. The Engineering Institute of Canada can help university authorities to establish courses in this all-embracing subject. It may assist legislators to design the proper legislative tools necessary to shape the physical structure of a community. The Institute can assist the planning movement throughout this country by promoting a Community Planning Institute of Canada.

The engineer can lead the family and community to victory in peace!

---

## DEFENDANT'S FACTUM

*(Continued from page 100)*

the case of a church it would appear at once that the engineering problems only arose out of the nature of the material the architects wished to employ in the construction of the building or out of the shape or form they desired to give to the building.

If the construction of this machine shop is examined, it will be seen that all the features are in the engineering category, and these features do not arise from the nature of the materials to be used in the construction of the building, or from the form that might be desired to give to the building, but arise from the nature of the works to be housed in the building. In other words, the building is made to conform to the operation of the machines housed therein. The design of a church is governed to a very great extent by the appearance desired to be given to the structure. A church is to a great extent a monument.

Our seventh contention is that the evidence supports the proposition that the Harrington Tool & Die Shop was a mechanical work. All the Defendant's experts classified the building as a mechanical work, and there has been no evidence to the contrary. Witnesses for the

Plaintiff have testified that they could have prepared the plans and specifications for the Harrington building—it is quite possible, but absolutely immaterial. The issue is not whether architects have the capacity and ability to design and specify a machine shop of this kind, but whether the work done by the Defendant is, or forms part of a mechanical or other engineering work.

No doubt it is for the Court to decide whether it is a mechanical or other engineering work, but seeing the members of the Plaintiff Association have not denied and the Defendant experts have testified that it is both engineering and mechanical, we submit with respect, that the uncontradicted opinion of experts is entitled to the Court's consideration.

MONTREAL, January 5th, 1945.

# REPORT OF THE COUNCIL FOR THE YEAR 1944

## Together with Committee and Branch Reports

The annual report of Council is the sum of the reports of committees plus certain "vital statistics" prepared by Headquarters. Words on paper cannot transmit the hopes and ambitions, the successes and the failures, the efforts and the results of a year's work in an organization like the Institute. The authors of committee reports follow conventional lines, thereby concealing from the casual reader much of the effort made and some of the success attained. Consequently this report is largely just a cataloguing of the eventful year of 1944, nevertheless in justice to the committees and in the interest of the profession, each member should read the report. Only in this way can one get a picture of the Institute in action. When it is realized that approximately five hundred members are serving on committees, the value of these reports becomes apparent.

There is no better manifestation of an engineer's loyalty to his profession and his society than his service on committees. The Institute has been more than ordinarily fortunate in these things. Leading engineers in many places have given freely of their time and effort to serve the Institute, particularly in the position of chairmen of committees. Council is very grateful to every one of them.

Again the membership total has reached a new level—6,717 is where it stands at the end of the year. An encouraging sign is that a large portion of the increase has come from student applications. There are now over 1,800 students in the Institute. This figure, along with that of 800 Juniors, indicates that the Institute is remaining young in spite of its years.

Compared on a population basis, the new membership is equivalent to 80,000 members in an American society. The largest professional engineering organization in that country has approximately 20,000 members.

An examination of the reports of the Finance Committee and of the Treasurer indicate that finances are in good shape. The year has been finished with an increased surplus, as compared to previous years, even though increased activities have added to expenses.

*Presidential Visits to Branches:* Once again it has been possible for a president to visit every branch of the Institute and every university but one where engineering is taught. This is no small accomplishment, and again attests to the sacrifices made by leading engineers in support of the Institute. Presidency makes great demands upon its incumbent. In 1944, the president attended over fifty meetings, at which he was either the chairman or the special speaker. He has travelled about 200,000 miles to carry out his duties. These figures give some indication of the size of the task, but it is not so easy to find a measure that will describe the great good done for branches and for the profession by these visits.

*Council Meetings:* During the year the policy of holding regional meetings in various parts of Canada was continued. Six meetings out of the twelve took place outside of Montreal, at Edmonton, Toronto, Ottawa, Kingston, Quebec, and Halifax. The average

attendance at the twelve meetings was fourteen, and out of forty-eight councillors, forty attended at least one meeting and represented twenty-two out of the twenty-five branches.

*Annual Meeting at Quebec:* In the history of the Institute, few meetings have been as successful as the one held in 1944. With a registration of almost 900, it was the second largest meeting ever held. In addition to the large registration, there were many other outstanding features. The local committee arranged and carried out a programme full of intricate detail, and established such standards of hospitality that the membership will look forward to visiting Quebec again at the earliest possible date.

*Work of Committees:* The year saw unusual activity on the part of many committees, as can be seen from the following reports. Outstanding in the field was the work of the Committee on Employment Conditions, established early in the year to advise the Institute membership on the very important subject of collective bargaining. New committees were established late in the year on Statistical Control of Quality in Production, and on Soil Tests. No report from either of these committees is included in council's report, as the work of organization was completed only at the year's end. It is likely that both committees will be heard from frequently during 1945.

*Cooperative Agreements:* An event of great significance occurred late in the year, when the ballot submitted to their membership by the Corporation of Professional Engineers of Quebec and by the Engineering Institute relative to a cooperative agreement, was approved by both organizations. This is a great step forward in practical cooperation. It is planned that the signing ceremony will take place early in January.

*Engineers' Council for Professional Development:* The important work which is being carried out by this organization was advanced materially in the last twelve months. Considerable progress was made on further tests of aptitude and measurement in relation to students and prospective students in engineering. An informative and helpful report was also prepared by the committees dealing with Technical Institutes. The Engineering Institute has continued to take a very active part in all these deliberations, and has shared with the other seven organizations in the expansion of the work previously undertaken and of new subjects added to the programme.

*The Engineering Journal:* Throughout the year, the *Journal* suffered from restrictions placed by the War-time Prices & Trade Board with regard to the supply of paper. Many changes had to be made by way of reducing the total amount of paper consumed, but in spite of this handicap, the total number of pages printed was not affected seriously, although in certain numbers this reduction was quite noticeable. A feature of the year, as far as the *Journal* was concerned, was the publication of the Shipshaw numbers in May.

In the future some amelioration of the restrictions

has been arranged so that additional paper will be available in 1945 to take care of the expansion in membership due to the greater student activity and the cooperative agreement in the province of Quebec. In this way it is hoped that in the coming year the *Journal* can be restored to something like its previous character.

*New Horizons:* As the membership approaches 7,000 and as new activities are constantly being brought to the attention of Council, it apparent that the Institute has reached a new stage in its development. There are great opportunities to render a greater and an improved service to the profession and to the public served by the profession. To take full advantage of these opportunities will require changes from previous procedures. Principal among these may be a change in annual fees. At the last council meeting of the year, the Finance Committee was instructed to examine this problem and to report to the annual meeting of Council in Winnipeg in the month of February. To make a change of this kind it will be necessary to have by-law amendments, and therefore, if decided upon, could not be made effective before 1947. In the meantime, Council has asked Corporate Members and Juniors for voluntary contributions in order to establish a fund whereby one member may be assigned full time to the task of assisting members in uniform at the time of their demobilization. The notation regarding this voluntary assessment will be found on all the 1945 accounts.

#### MEMBERS ON ACTIVE SERVICE

It is difficult to present the story of members participating in the services. The field of activity is so far-flung, and the pressure of matters of greater importance so urgent that Headquarters gets little more than an outline of what is being done.

The records show that eleven hundred members are in uniform but the division between overseas and in Canada is impossible to make. The situation is changing constantly so that the figures, if they were obtainable, would not mean much. Likewise with casualties, promotions and decorations, it is almost impossible to assemble the complete story as it might apply at any one time.

Certain it is, that members are making a substantial contribution in all parts of the world, and it is hoped that eventually the whole story may be presented through the medium of the *Journal*. In the meantime Council wishes to express to all members in uniform its appreciation of the efforts and the sacrifices they are making and the honour they are bringing to their profession.

To date there are four hundred and twenty-three members serving overseas, made up as follows:—

Members .....	113
Juniors .....	98
Students .....	208
Affiliates .....	4
	—
	423
	—

#### ROLL OF THE INSTITUTE

The membership of all classifications now totals 6,717, which again is a record. New names added for the year 1944 amounted to 779, but deaths, resigna-

tions and removals reduce the net figure to a gain of 644.

During the year, 760 candidates were elected to various grades of membership. These were classified as follows: Honorary Members, 2; Members, 182; Juniors, 52; Students, 518; Affiliates, 6. The elections for the previous year totalled 546. Nineteen reinstatements were effected, and 12 life memberships were granted.

Transfers from one grade to another were as follows: Junior to Member, 37; Student to Member, 23; Affiliate to Member, 1; Student to Junior, 102, a total of 163.

The names of those elected or transferred are published in the *Journal* each month immediately following their election.

#### REMOVALS FROM THE ROLL

There have been removed from the roll during the year for non-payment of fees and by resignation, 40 Members; 9 Juniors; 23 Students, and 9 Affiliates, a total of 81.

#### DECEASED MEMBERS

During the year 1944 the deaths of fifty-four members of the Institute have been reported as follows:—

#### HONORARY MEMBER

Desbarats, Georges Joseph

#### MEMBERS

Atwood, William Stephen  
 Blanchard, Aubrey B.  
 Bogart, John Laurence Haslett  
 Braden, Norman Short

Respectfully submitted on behalf of the Council,

DE GASPÉ BEAUBIEN, M.E.I.C., *President*  
 L. AUSTIN WRIGHT, M.E.I.C., *General Secretary*

**PUBLICATION COMMITTEE**

During the course of the year, your committee's principal problem has been to publish all the papers and discussions that were available and at the same time keep within the allotment of paper. This meant, in many cases, rather drastic editing of the copy.

The steps taken early in the year were insufficient to meet the administrative requirements, with the result that in August we were advised that a further reduction must be made immediately in order to cut down the overdraft.

To do this, the following changes in the makeup of the *Journal* were made—

- (1) The list of the officers of the Institute and of the members of committees, and of the executives of the branches, will be published every three months instead of every month.
- (2) The advertisers' classified directory and the pages of industrial news have been eliminated.
- (3) The weight of paper in the front advertising section will be reduced as soon as the printer's present stock of the heavier paper is used.

Your committee has discussed a suggestion that the *Journal* should be sent to the officers' messes of engineering units overseas. To date, a feasible method of carrying this out has not been evolved. The matter is being given further consideration.

The committee has before it proposals for other changes which will improve the publication, but cannot authorize them until certain additional editorial and reportorial facilities are available. It is believed that there are unusual opportunities now to make the *Journal* more useful to the profession, and the committee hopes that these can be taken advantage of before long.

Your committee approved the publication of a

second edition of the booklet "The Profession of Engineering in Canada," as revised by the Committee on the Training and Welfare of the Young Engineer.

The committee believes that the May issue of the *Journal* which contained all the papers on Shipshaw was particularly valuable to all engineers. It acknowledges its indebtedness to the authors and to Aluminum Company of Canada for their combined efforts, which made this number possible.

Respectfully submitted,

R. S. EADIE, M.E.I.C., *Chairman.*

**LEGISLATION COMMITTEE**

The year 1944 was noteworthy as far as legislation affecting the profession was concerned, although none of it dealt directly with the legislation of the Institute.

There were two far-reaching developments. (a) Proposals for collective bargaining legislation for professional workers; and (b) action taken by the Province of Quebec Association of Architects against Bryan R. Perry, M.E.I.C., for having made plans of an industrial building.

Because of the widespread implications of the collective bargaining issue, a special committee was established by Council under the chairmanship of R. E. Hartz, and the subject will be covered thoroughly in the report of that committee. The action of the architects has been reported from time to time in the *Journal* and as no judgment has been handed down at this date there is no additional news to report.

Respectfully submitted,

P. E. POITRAS, M.E.I.C.,  
*Chairman.*

**EMPLOYMENT SERVICE**

In spite of increasing Institute activities at Headquarters, it has been possible to maintain the Employment Service to the extent required by calls from employers and from members.

The return to civil life, which has begun from at least one of the armed services, caused a sudden revival of activity in the last four months of the year and has demonstrated the necessity for a reorganization of these facilities. Many calls have also been received in recent weeks from employers who are considering reorganizing their staffs for peacetime production.

The fact that both members and employers have come to the Institute in this connection would indicate that they expect it to perform a function supplementary to the work undertaken by the Government in this field. Council's decision to add another person to the staff, whose sole duties will be the rehabilitation of members from the services and from war industry, is an indication that the Institute will meet its responsibility. It should result in a more efficient operation of the Employment Service than is possible with the present facilities.

Last summer, the Director of Personnel of UNRRA (United Nations Relief and Rehabilitation Administration) came to the Institute for assistance in recruiting technical personnel from Canada for work in liberated countries of Europe. The vacancies were advertised in the *Journal* and 110 applications were handled through Headquarters. Some of the applicants were interviewed in Canada by officials from

Washington. Recent information received at the Institute indicates that there is at present a lull in the activities of UNRRA's personnel department, as a result of the military situation in Europe. However it is expected that recruiting may be resumed in the course of the next few months.

The following table gives comparative figures of the work done in the Employment Service Bureau, in addition to the special assignment carried out for UNRRA:

	1943	1944
Members registered for employment....	59	72
Non-members registered for employment	46	43
Number of members advertising for a position .....	21	28
Replies received from employers.....	30	40
Vacant positions registered .....	113	195
Vacancies advertised in the <i>Journal</i> ....	36	38
Replies received to advertised positions..	93	80
Personnel records forwarded to prospective employers.....	13	16
Men notified of vacancies.....	91	181
Placements definitely known.....	19	22

Respectfully submitted,

LOUIS TRUDEL, M.E.I.C., *Assistant General Secretary.*

### LIBRARY AND HOUSE COMMITTEE

Your committee has authorized very little expenditure at Headquarters this year, as the building was found to be in good repair. Because of the need of more space, the assistant general secretary moved his office upstairs to what was formerly the committee room. It was necessary to redecorate and to relight the room for the purpose.

The increase in membership in all branches and the general increase in activities due partly to the war have increased the work of the staff, and have added to the congestion at Headquarters. The committee commends the work of the staff and compliments its members on their loyalty and support.

It is with regret that we announce the resignation of Miss Elizabeth Power who, for three years, has so capably filled the post of librarian. In her place, Mrs. Lawrence Short, a graduate of the McGill Library School, assumed these duties on January 1st, 1945.

The statistics customarily reported to indicate the extent to which members use the library are as follows:

#### LIBRARY

Books for review .....	67
Books presented .....	20
Proc. and Trans.....	23
Reports .....	257
Books reviewed.....	3
Requests for information .....	2,717
By phone .....	1,268
By letters.....	1,070
In person.....	379
Books and periodicals loaned..	936
Photostats .....	12 blueprints
20 orders.....	189 negatives
Bibliographies prepared.....	24

The use of the library has been increased, principally by the student members. With the purchase of new books which are expected to arrive at the beginning

of the year, it should be used to an even greater extent. Revision of the library arrangement has been started which will allow more space for expansion.

The new books and the rearrangement are made possible by the \$200.00 granted annually by the Finance Committee for this purpose.

It is urged that members interested in the library make suggestions for its improvement and recommend suitable technical books for its expansion.

The committee wishes to remind members outside Montreal that these facilities are available to them also, on the same basis as members in Montreal, the only difference being that out of town members are asked to pay postage charges. All that is required is that a cheque for five dollars be sent along with the request. This cheque will be returned when the book arrives back at Headquarters.

Respectfully submitted,

E. V. GAGE, M.E.I.C., *Chairman.*

### BOARD OF EXAMINERS AND EDUCATION

Your Board of Examiners and Education for the year 1944 has had prepared and read the following examination papers with the results as indicated:

SCHEDULE C—	Number of Candidates	Number Passing
<i>Electrical Engineering—</i>		
III. A. General Paper.....	2	0
III. B. Utilization of Electric Power.....	2	0
<i>Structural Engineering—</i>		
VII. A. General Paper.....	1	1
<i>Chemical Engineering—</i>		
I. A. General Paper.....	1	1
I. B. Water Softening.....	1	1
SCHDEULE B—		
I. Elementary Physics and Mechanics.....	5	3
II. A. Strength and Elasticity of Materials....	6	2

The Board recommends that the schedule of examinations and the rules and regulations applying thereto be reviewed with the object of improving them and of bringing them up to date.

Respectfully submitted,

R. A. SPENCER, M.E.I.C., *Chairman.*

### COMMITTEE ON INDUSTRIAL RELATIONS

Since the last annual meeting the Committee on Industrial Relations has held three meetings, on 2nd June, 23rd June and 6th December.

The committee has continued its activities in arranging for papers to be prepared for publication in the *Journal*, and, below is a complete list together with date of publication:

The Significance of Industrial Relations, by E. A. Alleut and J. A. Coote—Oct. 1942.

A Scientific Approach to the Problem of Employee Relations, by Prof. M. S. Viteles—March 1943.

The Role of the Industrial Relations Executive in Company Management, by Bryce M. Stewart—March 1943.

Trends in Industrial Relations, by Prof. J. C. Cameron—December 1943.

Some Observations on Benefit Plans for Canadian Workers, by M. A. Mackenzie and N. E. Sheppard—January 1944.

Job Evaluation, by D. W. Weed—February 1944.

Social Security Planning in the English-speaking World, by Maurice Stack—March 1944.

Effective Foremanship, by D. D. Pannabaker—May 1944.

Nutrition in Relation to Efficiency, by Dr. K. E. Dowd—November 1944.

Paper in regard to R.C.A.F. Rehabilitation Schemes, by Group Captain S. N. F. Chant—December 1944.

All papers submitted for publication have now appeared in the *Journal* or are in print, and the committee is informed that they have been well received.

During the current year, the position of engineers under Order-in-Council 1003 has been under considerable discussion, and the committee submitted to Council a memorandum of its views in this matter.

The committee has continued to study and discuss the question of retraining and rehabilitation of men returning to industry from the Armed Forces. One meeting of the committee was attended by Group Captain Chant, Deputy Director, Personnel Direction and Research, R.C.A.F., and the information given to the committee by Group Captain Chant in connection with rehabilitation work in the Air Force was later, at the request of the committee, put by them in the form of an article for publication in the *Journal*. The study of different aspects of this question is continuing actively.

In view of the appointment of a special committee of the Institute on employment conditions, the Committee on Industrial Relations is not at present taking further action in regard to its collective bargaining studies, but it has arranged to be kept in close touch with the work performed by the Committee on Employment Conditions.

Respectfully submitted,  
WILLS MACLACHLAN, M.E.I.C.,  
*Chairman.*

### COMMITTEE ON PRAIRIE WATER PROBLEMS

A meeting of the Prairie Water Problems Committee of The Engineering Institute of Canada, under the chairmanship of G. A. Gaherty, was held in the Palliser Hotel, Calgary, on October 24th, 1944. Those present were Messrs.:

- |                    |                |
|--------------------|----------------|
| de Gaspé Beaubien  | D. W. Hays     |
| G. A. Gaherty      | G. N. Houston  |
| P. M. Sauder       | P. J. Jennings |
| S. G. Porter       | T. D. Stanley  |
| A. Griffin         | L. A. Wright   |
| L. C. Charlesworth |                |

As this was the first meeting of the committee for some time, discussion of a future course of action took place. It was felt that as regards suggested projects in addition to the St. Mary's project, this committee should not push one as against another, but should be ready to advise the Dominion Government in such a manner that the development of irrigation would be on a sound engineering basis.

The question of expanding existing systems instead of developing new projects was discussed. As there were several projects which could be brought into production within a year after the war, it was felt that they should be brought to the attention of the Government as they would fill a need for immediate employment on the construction, and would bring land into production at once to be used for settlement by returned soldiers and by industrial workers who wished to return to farming. Some discussion took place as to the ability of the average soldier farmer to handle irrigated land.

Ways and means of bringing the Institute's views before the Government were discussed at some length, and it was suggested by Mr. Gaherty that a western sub-committee should be formed, this sub-committee to study the questions on the ground and to prepare the necessary data and reports for the eastern members to present to the Government at the opportune moment. This was agreed to and P. M. Sauder was appointed chairman of the sub-committee and T. D. Stanley, secretary.

The appointment of engineers to positions on the P.F.R.A. was also brought up and Mr. Austin Wright told what had been done by the Institute with the Government in this regard.

Respectfully submitted,  
G. A. GAHERTY, M.E.I.C.,  
*Chairman.*

### COMMITTEE ON THE ENGINEER IN THE CIVIL SERVICE

This committee was continued during 1944 with a "watching brief". The main work was accomplished in 1943, and the only activity during 1944 was a conference with the Civil Service Commission in order to present to that body the further views of our committee relative to salaries of technical men in the Civil Service. The Civil Service Commission gave Mr. Westman and the chairman of this committee a good hearing, and after laying before the Commission our views we were assured that the Commission would take them into consideration in the forthcoming report which was to be presented to the Treasury Board. What the results of this report will be we do not know, but it would appear that the continued interest of the committee and its readiness to offer suggestions as well as criticisms has had some effect upon the department.

Respectfully submitted,  
N. B. MACROSTIE, M.E.I.C., *Chairman.*

## TREASURER'S REPORT

The audited statements of assets and liabilities and of revenue and expenditure for the year ended December 31st, 1944, are submitted herewith and, as may be seen, the Institute has had, from the financial standpoint, a most successful year.

The securities in the Institute's investment funds, totalling \$12,366.39 for the account of Special Funds and \$32,064.66 for the account of General Funds, have been checked and found in order.

The statement shows an increase in revenue from Membership Fees of \$2,564.27 or of approximately 7 per cent as compared with the previous year and an increase in revenue from publications of \$6,707.24 or of approximately 21 per cent. On the other hand, total expenditures, exclusive of an item of \$5,000.00 transferred to Contingent Reserve, show an increase of but \$3,930.13

or of less than 5 $\frac{3}{4}$  per cent. The showing undoubtedly reflects great credit on the Institute's General Secretary and his staff.

During the year the Institute has purchased and has taken delivery of \$5,000.00 Dominion of Canada 7th Victory Loan bonds against which it has borrowed a like amount with the expectation that the loan will be repaid as the annual membership fees are paid for the year 1945.

Respectfully submitted,

R. E. CHADWICK, M.E.I.C.,  
*Treasurer.*

### FINANCE COMMITTEE

Your Finance Committee is pleased to report a satisfactory year for the Institute, but would stress that certain conditions of a temporary nature have increased our surplus.

## COMPARATIVE STATEMENT OF REVENUE AND EXPENDITURE

				\$ 9,269.42    \$ 7,651.12
			<b>REBATES TO BRANCHES .....</b>	\$6,840.61    \$ 6,712.40
			<b>TRANSFER TO CONTINGENT RESERVE .....</b>	5,000.00      —
			<b>TOTAL EXPENDITURES .....</b>	\$76,763.93    \$67,833.80
			<b>SURPLUS FOR YEAR .....</b>	3,022.46      2,601.44
<b>TOTAL REVENUE FOR YEAR .....</b>	\$79,786.39	\$70,435.24		\$79,786.39    \$70,435.24

Our main sources of revenue are, of course, membership fees and advertising from the *Journal*. Both of these, you will note, have increased materially. On the other hand, the cost of printing the *Journal* is abnormally low because of the ceiling price, and it is entirely probable that this situation will not last much longer. In addition to this, Headquarters is very much understaffed due to the increase in membership and activities, so that our expenditure for salaries is likely to be greater in 1945.

Your committee has set aside \$5,000. for contingencies, and we feel that this is very low in view of special expenses which are now foreseen and which may be incurred in the near future.

The special funds, including the Past Presidents' fund, have been consolidated to facilitate accounting. I might say that this has been done on the strong

recommendation of our auditors. We are also pleased to report that the Past Presidents' fund has been augmented during the past year and a further fund established by one of the past presidents for the annual presentation of a copy of "Pioneers of Science" to the retiring president.

Respectfully submitted,

C. K. McLEOD, M.E.I.C.,  
Chairman.

### COMMITTEE ON THE TRAINING AND WELFARE OF THE YOUNG ENGINEER

The Committee on the Training and Welfare of the Young Engineer asks leave to make its sixth annual report.

### AUDIT CERTIFICATE

We have audited the books and vouchers of The Engineering Institute of Canada for the year ended 31st December, 1944, and have received all the information we required. We have verified the Cash in Banks and the Investment Securities and the revenue therefrom. In our opinion the Statement of Assets and Liabilities and Statement of Revenue and Expenditure for 1944, as attached, are properly drawn up so as to exhibit a true and correct view of the Institute's affairs as at 31st December, 1944 and of its operations for the year ended that date, according to the best of our information and the explanations given to us and as shown by the books.

(Sgd.) RITCHIE BROWN & Co.,

Chartered Accountants.

MONTREAL, 22ND JANUARY, 1945.

neering in Canada," made it necessary that a second edition should be prepared. The booklet was revised and thirteen thousand copies of the second edition were printed at a cost of \$387.33. The initial distribution has been completed and includes 3,530 copies to the universities, and 3,000 copies to approximately 1,200 high schools in all nine provinces. Requests have come in for additional copies.

#### BRANCH STUDENT GUIDANCE COMMITTEES

These committees have been active during the year and the number of counsellors has increased to a present total of about 130. The student guidance programme of the Institute is dependent on the energy and co-operation of these men. Your committee takes this opportunity to thank them for their continued assistance.

#### THE CANADIAN COMMITTEE FOR STUDENT GUIDANCE IN SCIENCE AND ENGINEERING

The previously reported joint Student Guidance Committee of the E.I.C., the C.I.M.M. and the C.I.C. was re-convened in Ottawa on September 26th and a new committee, to be known as The Canadian Committee for Student Guidance in Science and Engineering, was formed with the following members: John R. Kirkconnell, secretary, representing the C.I.M.M.; Bernard Collitt, representing the C.I.C.; and Harry F. Bennett, chairman, representing the E.I.C.

This committee has been approved by the three Institutes; the E.I.C. by resolution of the Council on October 21st, 1944. The student counsellors named separately by each body across Canada automatically became part of the new committee, and these, numbering about 600, were circularized by a bulletin issue during October. A copy of the second edition of the E.I.C. booklet was sent to each counsellor. The letter accompanying this bulletin contained the following paragraph:

"It is not intended that counselling by your committee should supersede the work which may now be carried on in your locality. We do emphasize co-operation with local groups, universities, and other educational authorities. Our objective is to direct the proper students to the courses in which they probably will be most successful. Suggestions as to methods, reports of experience, etc., are contained in the accompanying Bulletin No. 1. Further bulletins will be issued periodically so that finally no student anticipating a career in science or engineering will find it necessary to enter upon his professional education without first being advised by an experienced counsellor."

Bulletin No. 1 went rather exhaustively into the present activities and future programmes. It is expected that further bulletins will be issued as information becomes available to the central committee.

#### CO-OPERATION WITH THE ARMED FORCES

The Student Counsellors of the Institute and of the joint committee are ready to act as consultants to all demobilized members of the Armed Forces who are interested in further training for the profession of engineering. This counselling has begun and your committee has found it a very pleasant duty.

The District Rehabilitation Boards of the Department of Veteran's Affairs have been directed to contact all our Student Guidance Committees throughout Canada for "counsel and advice particularly when dealing with applicants for training in the engineering profession. These men will also be in a position to give advice in connection with industrial requirements and the opportunities for training on the job."

Your committee urges each branch to study the needs in its area so that these men will have the advice they will be seeking at a time when it is needed.

#### RECOMMENDATIONS

(1) That each branch executive be asked to study this report and to urge its Student Guidance Committee to extend its activities so that every part of the branch district is represented in this work.

(2) That the organization of joint counselling committees, as urged by Bulletin No. 1 of the joint committee, be hastened so that the fields of science and engineering may be covered fully.

(3) That each member of the Institute should give some thought to student guidance, especially those who are in small communities away from the branch centres, so that students and demobilized service men may have local contacts to assist them in their choice of a profession.

Respectfully submitted,

HARRY F. BENNETT, M.E.I.C.,  
*Chairman.*

#### COMMITTEE ON EMPLOYMENT CONDITIONS

The Committee on Employment Conditions was set up by the president on May 5th, 1944 because of the implications to the profession of collective bargaining legislation as determined by the then recently promulgated Order in Council P.C. 1003. It was instructed to study the question of employment conditions and to make such recommendations to Council as it deemed necessary in the best interests of the profession.

The members are: Messrs. P. N. Gross, G. N. Martin, B. J. McColl, A. D. Ross, J. D. Sylvester, I. R. Tait, and the chairman.

#### BRIEF AND QUESTIONNAIRE

A brief entitled "The Engineer and Collective Bargaining" dated July 10th, 1944 and a questionnaire whereby each member could express a complete opinion on the subject were mailed to all members of the Institute. Replies were received from 2,550 members. Many of the members in the armed forces could not be contacted in sufficient time to reply within the time limit. More than 800 special comments were returned with the questionnaire.

#### RESULT OF QUESTIONNAIRE

The outstanding feature of the replies was the uniformity of opinion expressed. In the three age groups selected, namely under thirty, thirty to forty and over forty, there was little difference in opinion. The senior engineers with broad experience expressed themselves similarly to those under thirty with limited experience. There was a definite desire on the part of the older men, themselves not affected by bargaining legislation, to assist in improving the economic status of the young engineer.

Ninety-two per cent of those who returned the questionnaire expressed themselves in favour of collective bargaining by means of a new order (or by amendment to P.C. 1003). As an example of the uniformity of opinion on this question the lowest percentage in favour for any province was 90 and the highest 95. Engineers under thirty years of age were 96% in favour, those from thirty to forty were 94% in favour while those over forty years of age were 90% in favour.

If a new order (or an amendment to P.C. 1003)

cannot be obtained, 65% wanted total exclusion from P.C. 1003. On this question the young engineers were 67% in favour of exclusion, the intermediate age group 66% in favour and the senior engineers 64% in favour.

As to the kind of bargaining agency, 90% were in favour of employees' organizations for engineers only, with interlocking of bargaining units by an engineers' group. Less than 1% favoured trade unions as a bargaining agency. If included within a bargaining order 87% expressed themselves as willing to support it morally and financially.

Other interesting information obtained is that 70% of these replying are members of a professional association or corporation.

#### SPECIAL MEETINGS

Members of the committee have addressed twenty-one branches of the Engineering Institute, attended all meetings at Ottawa of what has become known as the "Committee of Fourteen" and in addition have attended numerous special meetings with other committees and influential groups and persons in various parts of Canada.

#### OTTAWA MEETINGS

A meeting was held in Ottawa on August 15th for the purpose of reporting the results of the canvass of the membership of the various engineering organizations on collective bargaining, and to decide on a course of action.

The following organizations (whose representatives are now generally referred to as the Committee of Fourteen) were represented at this meeting.

The Engineering Institute of Canada  
The Canadian Institute of Mining and Metallurgy  
Canadian Institute of Chemistry  
The Royal Architectural Institute of Canada  
Canadian Society of Forest Engineers  
The Canadian Institute of Surveying  
The Dominion Council of Professional Engineers  
The Association of Professional Engineers of the Province of Ontario  
Corporation of Professional Engineers of Quebec  
The Association of Professional Engineers of Nova Scotia  
Association of Professional Chemists of Quebec  
American Institute of Electrical Engineers (Canadian Section)  
The Institute of Radio Engineers (Canadian Section)  
Junior Graduate Engineers Association of Ottawa  
It was agreed unanimously at this meeting:

1. "That this group request the Dominion Government, through the Minister of Labour, to grant professional workers separate legislation for collective bargaining".

2. "That a sub-committee consisting of

Messrs. O. N. Brown—Can. Institute of Mining & Metallurgy  
A. J. Hazelgrove—Royal Architectural Institute of Canada  
Leon Lortie—Can. Institute of Chemistry  
W. P. Dobson—Dominion Council  
R. E. Hartz—Engineering Institute of Canada

proceed immediately to draft special legislation for presentation to the Committee of Fourteen at the earliest possible date."

The sub-committee held its first meeting on August 15th and a further meeting on the following day. Mr. Vincent McDonald who had previously been with the legal section of the Department of Labour at Ottawa and was well versed in the many details necessary for legislation of this type was engaged as legal draftsman. Following several meetings the sub-committee presented a proposed draft at a meeting of the Committee of Fourteen at Ottawa on October 3rd. The draft was approved with certain amendments and a committee of three consisting of Messrs. A. E. MacRae, Ottawa, W. P. Dobson, Toronto, and R. E. Hartz, Montreal, was instructed to present the revised draft legislation to the Minister of Labour and also to arrange for the continuance of exclusion from P.C. 1003 pending a final presentation.

The amended legislation was presented to the Minister on November 8th and he advised the Committee of Three on November 11th that the Wartime Labour Relations Board intended to hold some special meetings in connection with the matter in January, preliminary to making a report to himself.

On the advice of the Committee of Three the Committee of Fourteen, with eighteen organizations represented, reassembled in Ottawa on December 20th to discuss the situation again and to approve the brief prepared for presentation to the Wartime Labour Relations Board.

#### OTTAWA HEARING

On January 9th the Committee of Three presented the brief to the Wartime Labour Relations Board at a public hearing held in the Railway Room of the House of Commons on behalf of twenty organizations of Engineers and Scientists.

The organizations officially represented by the committee were the fourteen organizations above mentioned, less the Association of Professional Engineers of Ontario, and plus seven more who asked the committee to represent them, namely:

The Professional Institute of the Civil Service of Canada  
The Illuminating Engineering Society  
Ontario Association of Architects  
Association of Professional Engineers of Saskatchewan  
The Association of Professional Engineers of the Province of Manitoba  
Association of Professional Engineers of Alberta  
The Association of Professional Engineers of the Province of New Brunswick

Briefs were submitted by the Association of Professional Engineers of Ontario, the Federation of Employee Professional Engineers and Assistants of Ontario; the National Conference of Canadian Universities and the Canadian Association of Scientific Workers. Briefs and statements were also presented by the Trades Unions.

The proposal for new legislation was opposed by the Canadian Congress of Labour, the Trades and Labour Congress and the Association of Technical Employees. The Canadian Catholic Federation of Labour was not unfavourable to our proposal. The Canadian Manufacturers Association favoured exclusion as the best

solution. The National Conference of Canadian Universities recorded its conviction that any application of P.C. 1003 "to include members of university staffs would violate the principles upon which universities as free associations of scholars are founded." The Ontario Association and Federation supported the proposal.

#### PRESENT SITUATION

It is expected that the Board will make a recommendation to the Minister in about a month. The Committee cannot predict the course of subsequent events but it is in almost daily touch with the situation and will continue to take all possible action in furthering the interests of the profession.

#### FURTHER INFORMATION

Additional information on the subject of this report has already appeared in the columns of the *Journal*. The brief to the Wartime Labour Relations Board appeared in the January issue and a summary of the discussion and rebuttal will be published in the February number. Copies of the proposed new order were sent to all branches, and the essential features of it are also included in the brief which has been published as stated.

#### ACKNOWLEDGMENTS

Mr. A. E. MacRae was the able chairman of the Ottawa meetings and presented the brief to the Wartime Labour Relations Board very competently indeed. Mr. W. P. Dobson contributed generously of his time, his wisdom and his influence throughout all the many discussions and consultations in different cities, and Mr. L. A. Wright gave immense assistance in his capable performance of the onerous duties of Secretary to the Committee of Fourteen.

The chairman of the Institute Committee on Employment Conditions feels that his committee members have well earned the thanks of the Institute. They have worked arduously, travelled extensively, and have shown a live sense of their responsibility for finding the best practical solution of a difficult problem. Mr. L. Austin Wright acted as secretary of this committee too, and was able with his wide connections to obtain many valuable data from a number of various sources, and generously accommodated himself to the many requirements of the committee. Mr. Louis Trudel likewise gave generously of his time, and the assistance of his services and the support and co-operation of the headquarters staff are gratefully acknowledged.

Respectfully submitted,

R. E. HEARTZ, M.E.I.C., *Chairman*

#### COMMITTEE ON THE ENGINEER IN THE ACTIVE SERVICES

The immediate objective of the Committee on the Engineer in the Active Services was to improve the position of the engineers in the Royal Canadian Ordnance Corps. There, the technically trained officers dealing with the mechanical engineering side of ordnance were definitely at a disadvantage in regard to rank and rates of promotion with those on the stores side.

After studying the matter, the committee advocated the formation of a corps in the Canadian service analogous to the Royal Electrical and Mechanical

Engineers in the British Army. It also advocated recognition of professional standing in the form of increased pay and rank as has been the practice in the R.E.M.E. and in the Canadian forces in the R.C.A.M.C.

These ideas were presented to the officials concerned and careful consideration of them was promised. At the same time it was indicated that a reform of some sort was being contemplated.

After some months passed and no change was apparent, an interview was sought and obtained with the Minister of National Defence on March 13th last. Later the same day the representatives were received by the Master General of the Ordnance where it was learned that the formation of the R.C.E.M.E. was then well along and that an official announcement was pending, which later was given to *The Engineering Journal*.

After some weeks, certain questions arose regarding the use of non-professional officers in professional positions which formed the basis of editorials in the *Journal*, and letters were sent to the Master General of the Ordnance out of which a conference was arranged between the president and the M.G.O. where the various points were discussed.

It is now felt that the position of the trained engineer officer in the R.C.E.M.E. is definitely improved over that in the R.C.O.C. and the various difficulties inevitable on the formation of a new corps gradually will be worked out.

The questions of professional pay and rank are so involved with army structure and precedent that action on them at present cannot reasonably be expected. However, it is hoped that having our proposals on record will be helpful in any reorganization that takes place later.

The Institute, in pressing for the formation of the new corps, has aided progress in army organization.

There is no measure by which one may gauge the amount of influence that the Institute's interest in this subject exerted on the department's change in policy, but unquestionably it has brought to the attention of government departments and officials the fact that there is a large body of well informed public opinion in the membership of professional societies.

In conclusion, this committee wishes to draw to the attention of the President and Council the fact that the lion's share of the work — if a lion does work — of the committee was done by the general secretary, without whose industry, sagacity and perspicuity little would have been accomplished. This committee is very grateful for his help.

Respectfully submitted,

D. S. ELLIS, M.E.I.C., *Chairman*.

#### COMMITTEE ON ENGINEERING FEATURES OF CIVIL DEFENCE

The final paragraph of this committee's report for 1943 reads as follows:

"Because of improvement in the war situation, and because the special assignments to this committee have been substantially fulfilled, this committee is now less active than heretofore. It is endeavouring however, to maintain its organization, including that of the branch committees, so as to permit of promptly taking up further assignments should that become necessary."

During 1944, due to continuing improvement in the war situation and consequently to lack of any essential work which this committee might undertake, it has been entirely quiescent. Present prospects are that this condition will not change.

The organization of this committee has been maintained to the extent only that it has not been dismissed. Attempts have been made to discover means of maintaining lively interest in matters pertaining to engineering features of civil defence, but even the most promising of these was abortive.

As the conditions under which your committee was appointed have changed and the purposes for which it was appointed have either been fulfilled or become unnecessary, your committee recommends that it be dismissed.

JOHN E. ARMSTRONG, M.E.I.C.,  
*Chairman.*

## COMMITTEE ON PROFESSIONAL INTERESTS

There has been ample evidence that during 1944 the co-operative agreements pursuant to By-law 78 between the Institute and the Associations in the provinces of Saskatchewan, Nova Scotia, New Brunswick and Alberta are all operating to the satisfaction of all concerned.

In December, the terms of a co-operative agreement between the Institute and the Corporation of Professional Engineers of Quebec was submitted to a vote, and approved by both parties. The corporate members of the Institute resident in the province of Quebec voted 697 for and 96 against; the members of the Corporation voted 765 for and 344 against. It is a matter of congratulation that the traditionally friendly relationship between the Institute and the Corporation will now be formalized.

With regard to the relations between the Institute and sister engineering societies—Canadian, British and American, there has been little definitive progress during the year in effecting co-operative agreements pursuant to By-Law 82. Revision of the agreement between The American Society of Mechanical Engineers and the Institute, signed in Toronto on October 1st 1943, is still under discussion with officers of the Ontario Section of the Society. Informal exploratory discussions are still under way between the chairmen of the Committee on Professional Interests and of the special committee appointed by the president of the American Institute of Electrical Engineers in 1943 to consider ways and means for promoting closer relations between the two societies. While discussions with other sister societies are in the preliminary stage only, they are very promising.

Mention should be made of an invitation to participate in a meeting in London, England, on August 28th, to discuss the possibility and advisability of establishing an international federation of engineering institutions and societies. The Institute was represented at the meeting by W. O. Maclaren, M.E.I.C., of the Ministry of Works. The latest word received on this project is that a provisional organization committee was appointed to survey the situation in order to discover if there was enough interest on the part of existing engineering organizations to justify the contemplated federation.

At the request of Council, the committee has given careful consideration during the year to several proposals emanating from members of other engineering societies for some all-embracing organization that could

speak for all branches of the engineering and certain other professions in Canada. There has been complete unanimity among the members of the committee, in their inability to recommend any of the proposals. An attempt, however, is being made to evolve, for the consideration of Council, a set of principles which will set out very plainly the policy and the programme of the Institute with regard to co-operation among the members in Canada of Canadian, British and American engineering societies.

Dr. Challies having requested relief from the responsibilities of chairman of the Committee on Professional Interests, the undersigned has, at the urgent request of the president and with the approval of the Council, accepted this duty. At the same time, the committee had been reorganized to make it geographically representative. It is now constituted as follows:

Col. W. G. Swan . . . . . Vancouver, B.C.  
James A. Vance . . . . . Woodstock, Ont.  
G. J. Currie . . . . . Halifax, N.S.  
Dr. J. B. Challies . . . . . Montreal, Que.  
G. A. Gaherty . . . . . Montreal, Que.  
J. E. Armstrong . . . . . Montreal, Que.  
Dean A. Circe . . . . . Montreal, Que.  
J. B. Stirling . . . . . Montreal, Que.

Respectfully submitted,

J. B. STIRLING, M.E.I.C., *Chairman.*

## PAPERS COMMITTEE

The Papers Committee reports a rather inactive year. A special film for branch circulation showing the activities of engineers in the active services was ordered from the Public Relations Office of the Department of National Defence, but it was found to be quite unsuitable for the purpose. Further efforts to secure a suitable film have been of no avail, although the committee still feels that the right material is in Canada if only it could be edited and put together into one or more reels.

The Committee notes that branches have secured papers of a high standard covering a wide range of subjects. It believes that an increased appropriation for expenses, including speakers for branch meetings, would be very helpful, particularly to the smaller branches, but appreciates the difficulty of securing such funds out of present revenues.

The general secretary and Headquarters staff have been of great assistance, particularly by keeping branches informed of additions to the film library.

Respectfully submitted,

L. F. GRANT, M.E.I.C., *Chairman.*

## COMMITTEE ON DETERIORATION OF CONCRETE STRUCTURES

The committee has no report to make for this year. It has purposely been inactive feeling that, while there is plenty of work for it to do, it would be desirable to wait until more favourable times when its members could give it proper attention.

I have discussed this with several of its members who concur in this view and I think are prepared, when the war in Europe is over, to undertake the programme of work which we have had in mind for some time.

Respectfully submitted,

R. B. YOUNG, M.E.I.C.,  
*Chairman.*

## KEEFER MEDAL COMMITTEE

The Keefe Medal Committee consisting of Messrs. R. L. Hearn, A. C. D. Blanchard and E. P. Muntz unanimously recommends that the first award of this medal should be made to M. V. Sauer, M.E.I.C., for his paper entitled "St. Lawrence River Control and Remedial Dams — Soulanges Section". This paper was presented before the Montreal Branch on October 7, 1943, and was published in *The Engineering Journal* in December, 1943.

Thirteen papers in all have been reviewed before arriving at the above recommendation.

As chairman of the committee, I wish to record my appreciation of the cooperation given by Messrs. Hearn and Blanchard which has resulted in the unanimous opinion given above within two weeks of the assignment being given to the committee.

I presume that this report terminates the work of this committee and I therefore presume that the committee may be dissolved.

Respectfully submitted,

E. P. MUNTZ, M.E.I.C., *Chairman.*

## ROSS MEDAL COMMITTEE

Your committee, which has been appointed to adjudicate the papers on electrical subjects presented to the Institute during the season 1943 to 1944, has for examination the following papers:

- (1) Electrical Systems in Military Explosive Plants, presented January 20, 1944, by J. R. Auld, M.E.I.C.
- (2) Electrical Equipment at Shipshaw, presented March 9, 1944, by R. A. H. Hayes, M.E.I.C.

Both papers dealt in a descriptive form with installations of plant and equipment with which the authors were associated as part of an organization charged with the work of designing and engineering the respective projects.

The decision of your committee therefore rested on the value and extent of engineering information presented and on the appropriate selection and inclusion of items of engineering interest.

On this basis, the committee unanimously recommends the award to R. A. H. Hayes for his paper on "The Electrical Equipment at Shipshaw".

Respectfully submitted,

E. V. LEIPOLDT, M.E.I.C., *Chairman.*

## PLUMMER MEDAL COMMITTEE

It is the unanimous opinion of the members of your committee that the Plummer Medal for 1944 should be awarded to Wilfred Gallay for his paper "Plastics in Engineering" as published in the February, 1944, issue of the *Journal*.

Respectfully submitted,

PAUL E. GAGNON, M.E.I.C., *Chairman.*

## LEONARD MEDAL COMMITTEE

Your committee is of the opinion that the Leonard Medal for 1944 should be awarded to J. E. Gill and P. E. Auger for their paper "Zinc Deposits in the Federal Area" as published in the December, 1943, issue of *The Canadian Mining and Metallurgical Bulletin*.

Respectfully submitted,

F. V. SEIBERT, M.E.I.C., *Chairman.*

## JULIAN C. SMITH MEDAL

Carrying out the instructions pertaining to the award of the Julian C. Smith Medal for 1944, the special committee consisting of Past-Presidents C. J. Mackenzie, C. R. Young and myself, has made a selection of two names, which have been submitted by letter ballot to all councillors.

As a result, Julian C. Smith Medals for 1944 are being awarded to:

Edward Phillips Fetherstonhaugh, Lieut. Col., M.C., B.Sc., Dean of the Faculty of Engineering and Architecture, University of Manitoba, Winnipeg, Manitoba.

John Armistead Wilson, Director of Air Services, Department of Transport, Ottawa, Ontario.

Respectfully submitted,

DE GASPÉ BEAUBIEN, M.E.I.C., *Chairman*

## STUDENTS' AND JUNIORS' PRIZES

The reports of the examiners appointed in the various zones to judge the papers submitted for the prizes for Students and Juniors of the Institute were submitted to Council at its meeting on December 16th 1944, and the following awards were made:

John Galbraith Prize (Province of Ontario), to A. A. Hershfield, S.E.I.C., for his paper "Plywood: A Structural Material for Aircraft."

Ernest Marceau Prize (Province of Quebec—French), to André Leclerc, S.E.I.C., for his paper "Influence de la vitesse d'essai sur la résistance".

Martin Murphy Prize (Maritime Provinces), to J. L. Belyea, S.E.I.C., for his paper "The Cathode Ray Oscillograph and its Applications in Industry."

## GZOWSKI MEDAL COMMITTEE

It is the unanimous recommendation of your committee that the Gzowski Medal for the year 1944 be awarded to Walter Griesbach, M.E.I.C., for his paper "Construction of Shipshaw No. 2 Power Development" as published in the April 1944 issue of the *Journal*.

Respectfully submitted,

T. H. JENKINS, M.E.I.C., *Chairman.*

## DUGGAN MEDAL AND PRIZE COMMITTEE

Your committee has examined carefully the papers presented to the Institute during the prize year and is of the opinion that none of them is of sufficient merit to justify an award of the Duggan Medal and Prize.

Respectfully submitted,

W. J. W. REID, M.E.I.C., *Chairman.*

## CANADIAN LUMBERMEN'S ASSOCIATION PRIZE

Your Committee has considered the papers eligible for the Canadian Lumbermen's Association Prize during the prize year and recommends that the first award of this prize be made to Professor C. F. Morrison of the University of Toronto for his paper "Modern Timber Engineering" which appeared in the October 1943 issue of *The Engineering Journal*.

Respectfully submitted,

JOHN L. LANG, M.E.I.C., *Chairman.*

# Abstracts of Reports from Branches

## BORDER CITIES BRANCH

The Executive Committee held nine meetings during the year for the transaction of branch business.

Nine Branch meetings were held during the year including the annual meeting and the visit of our president, Mr. de Gaspé Beaubien. Information about these meetings is as follows, attendance being shown in brackets:

- Jan. 14—**Your Fire Department**, by Clarence J. DeFields, chief of the Windsor Fire Department. (24.)
- Feb. 18—**Infra-Red Applications in Industry**, by P. Thompson, illumination manager of Toronto District, Northern Electric Company, Limited. (35.)
- Mar. 17—**Erection of the Rainbow Bridge**, by E. L. Durkee, resident engineer for the Bethlehem Steel Company. (62.)
- Apr. 14—**The Ogoki Diversion**, by J. R. Montague, assistant hydraulic engineer, Hydro-Electric Power Commission of Ontario. (51.)
- May 20—**Description of the Polymer Steam and Power Plant**, by F. F. Walsh, combustion engineer, St. Clair Processing Corporation. This paper was presented at Sarnia. (101.)
- June 14—Special meeting on the occasion of the president's visit. The president, Mr. de Gaspé Beaubien, spoke on **Canada's Industrial Effort as It Affects the Engineer**. Dr. L. A. Wright, general secretary of the Institute spoke on matters affecting the general membership and Mr. R. E. Hartz spoke on **Collective Bargaining for Engineers**. (60.)
- Oct. 20—**Giving Wings to Words—To-day and To-morrow**, by George Long, historian of the Bell Telephone Company of Canada—illustrated by demonstration of equipment. (38.)
- Nov. 17—**Engineering in National Defence—The Combustion Turbine**, by Major G. G. M. Carr-Harris, Deputy Assistant Director of Tanks and Military Trucks, Inspection Board of United Kingdom and Canada. (44.)
- Dec. 8—Annual meeting and election of officers. A paper on **Magnesium Aircraft Wheels** was given by J. G. Hoba, assistant chief engineer, Kelsey Wheel Company Limited. (26.)

## CALGARY BRANCH

During the year the Branch Executive met seven times.

The following report covers the activities of the Branch for the year 1944:

- Jan. 13—**History of Exploration in the Canadian Rockies**, by Dr. H. H. Beach. (52.)
- Jan. 27—**The Electronic Microscope**, by C. K. Chisholm. (65.)
- Feb. 10—**Waterworks Systems of Alberta and Some of Their Attendant Problems**, by D. B. Menzies. (52.)
- Feb. 24—**The Alaska Highway**, by Major General W. W. Foster. (124.)
- Mar. 11—Annual Meeting, followed by Dinner. (42.)
- Mar. 23—**The Operations of the Alberta Nitrogen Products Co.**, by D. D. Morris. (68.)
- Oct. 24—Dinner Meeting, followed by President's Address. (148.)
- Nov. 2—**Coal and Coal Mining**, by H. Wilton Clarke. (61.)
- Nov. 16—**Air Transportation**, by J. Moar. (34.)

## CAPE BRETON BRANCH

On April 26th President de Gaspé Beaubien visited the Branch. He was accompanied by General Secretary L. A. Wright and Councillor R. E. Hartz. The presidential party had luncheon with the officers of the branch and other prominent engineers at the Cove. In the afternoon a trip was made through the rolling mills and that evening there was a dinner meeting which combined the annual meeting of the branch and the reception to the president. The dinner started under the chairmanship of J. A. MacLeod, the retiring chairman,

## Note—For Membership and Financial Statements see pages 94 and 95

who handed over during the course of the programme to M. F. Cossitt, the new chairman of the branch.

The following morning the party was taken to visit some of the power plants of the Dominion Steel & Coal Company, returning at noon to have luncheon with the officers of the branch. In the afternoon the party divided, some visiting the naval base and others taking in points of interest having to do with National Defence.

## EDMONTON BRANCH

During the year the Branch held eight general meetings and, in addition, two meetings were held in conjunction with other societies. The following is a summary of our regular meetings with attendances shown in brackets. All of these meetings were preceded by an informal dinner.

- Jan. 6—**Water Resources Systems of Alberta with Some of Their Attendant Problems**, by D. B. Menzies, Provincial Sanitary Engineer. (47.)
- Jan. 25—Film on **The Electron Microscope**—R.C.A. Victor, by K. C. Chisholm of the staff of the R.C.A. Victor Company. Members of the Association of the Professional Engineers of Alberta, Canadian Institute of Mining and Metallurgy, and the Academy of Medicine were among those invited. (150.)
- Mar. 7—**Military Strategy in the Northwest**, by Major General W. W. Foster, C.M.G., D.S.O., V.D. (80.)
- Apr. 5—This was the discussion of a memorandum by Dean Young of the University of Toronto re the **Establishment of Institutes of Technology**. Paper read by Dean R. S. L. Wilson, University of Alberta, and general discussion followed. (31.)
- May 9—**Air Transportation**, by J. Moar, head of Planning and Production Department of Aircraft Repair Limited. (34.)
- Oct. 20—Banquet in honour of President de Gaspé Beaubien and party. Addresses by Mr. Beaubien, Mr. R. A. Hartz, and Dr. L. Austin Wright. (117.)
- Nov. 14—**The Operations of the Alberta Nitrogen Products Co.**, Calgary, by D. D. Morris, general manager of the Alberta Nitrogen Products. (36.)
- Dec. 2—Joint meeting with Association of Professional Engineers and Canadian Institute of Mining and Metallurgy. The dinner was followed by an address by G. M. Blackstock, Chairman of the Board of Public Utility Commissioners. (69.)

## HALIFAX BRANCH

During the year meetings were held as follows:

- Jan. 20—Combined annual banquet at Nova Scotian Hotel. (232.)
- Feb. 24—W. S. Wilson, chief engineer, Dominion Steel and Coal Corporation, spoke on **The History, Operation, Development and Post-War Plans** of the above company. (72.)
- Mar. 23—Dr. N. W. McLeod, Imperial Oil Company, Toronto spoke on **The Place of Soil Engineering in Post-War Highway Construction**. (82.)
- Apr. 21—The Branch was host to President De Gaspé Beaubien and his party consisting of G. L. Dickson, R. E. Hartz and L. Austin Wright, general secretary. There were also present as guests of the Branch, Premier A. S. MacMillan, Air Vice-Marshal G. O. Johnson, Rear Admiral L. W. Murray, Commander D. W. Piers and J. E. Lloyd, Mayor of Halifax. (150.)
- Oct. 19—Captain Berton E. Robinson, associate editor of the Halifax Chronicle, addressed the meeting on the subject, **The Gateway of the North**. On the completion of this talk, William Stairs, Son & Morrow showed a sound film on the **Construction of the Alaskan Highway**. (105.)

Nov. 23—John T. Farmer, M.E.I.C., mechanical engineer of the Montreal Engineering Company, Limited, and J. W. MacDonald of the Nova Scotia Light and Power Company, Limited, addressed the meeting and showed slides of the new 12,500 kilowatt Steam Electric Station construction in Halifax for the Nova Scotia Light and Power Company, Limited. The meeting also had a conducted tour through the new plant. (135.)

### HAMILTON BRANCH

The Branch has had a very active year. Very excellent work has been done by the Students' Papers and Prize Committee under the chairmanship of E. G. Wyckoff with A. R. Hannaford and A. H. Wingfield as members. Another committee with C. H. Hutton as chairman and T. S. Glover has headed up the Branch activities with regard to Collective Bargaining. A third committee with T. S. Glover as Chairman and A. H. Wingfield has represented the Branch in the Institute's work in Ontario with regard to the formation of Technical Institutes.

The Branch wishes to record in this report our thanks to Chancellor Gilmour for the continued use of the facilities of McMaster University.

The Executive Committee of the Hamilton Branch held eight meetings during the year with an average attendance of eight members.

During the year the Branch held the following meetings with the attendance figures as given in the brackets:

- Jan. 7—The Annual Meeting and Dinner was held in the Scottish Rite Club, the guest speaker being Wing-Commander T. R. Loudon, who spoke on the subject, **Aviation, Past, Present and Future.** (100.)
- Feb. 17—**Stone Canyon and Oil for War**, two colour films with sound, by the Barrett Company Ltd., of Montreal, with discussion by D. McLaren of the same Company. (85.)
- Mar. 23—Students' Night. **The Economical Use of Power Hack Saw Blades**, by J. C. Buchanan, S.E.I.C., and **Electronics as Applied to Spot Welding**, by K. R. Knights, S.E.I.C. Atlas Steels Limited presented their film, **Vision Fulfilled.** (48.)
- Apr. 14—Annual joint meeting with the Toronto Section, A.I.E.E. The subject was **Future Power Opportunities**, by A. C. Monteith, manager of Industry Engineering, Westinghouse Electric and Manufacturing Company, East Pittsburgh, Pa., U.S.A. (190.)
- May 11—**The Engineering History of Shipshaw**, by McNeely DuBose, vice-president of the Aluminum Company of Canada, Limited. (120.)
- June 12—A special dinner meeting was held to honour President de Gaspé Beaubien, C.B.E., who gave a very delightful talk on the affairs of the Institute and of the engineer. Also present were R. E. Heartz, chairman of the Institute's Committee on Employment Conditions, who outlined the work of his Committee with reference to P.C. 1003 and Collective Bargaining; and Dr. L. Austin Wright, general secretary, who drew attention to the efforts of the Institute to obtain adequate recognition for the engineer in the Armed Services. (86.)
- July 3—Special Meeting on **Collective Bargaining.** The discussion was lead by C. H. Hutton, and T. S. Glover. (46.)
- Sept. 28—**Progress of Science in Criminal Investigation**, by V. A. M. Kemp, Assistant Commissioner and Director of Criminal Investigation, Royal Canadian Mounted Police, Ottawa. (75.)
- Oct. 17—Joint meeting with the American Institute of Electrical Engineers, Hamilton Subsection. **The Decew Falls Development—Past and Present**, by Dr. Otto Holden, chief hydraulic engineer of the Hydro-Electric Power Commission of Ontario. (115.)
- Nov. 16—Ladies' Night. The Branch entertained the ladies at a very successful dinner meeting at the Scottish Rite Club. The speaker was Dr. Samuel G. Hibben, Director of Applied Lighting, Lamp Division, Westinghouse Electric and Manufacturing Company Ltd., East Pittsburgh, U.S.A., whose subject was **How Illuminants Are Born.** (180.)
- Dec. 14—**The Welding and Fabrication of Canadian Light Armour**, by F. J. McMulkin, Ontario Research Foundation, Toronto.

### KINGSTON BRANCH

During the year the following meetings were held by the Branch:

- Jan. 11—**Evolution of the Steam Engine**, by Prof. D. M. Jemmett, head of Electrical Engineering Dept., Queen's University.
- Jan. 26—**Plastics**, by V. T. Griffiths, plastics engineer, Canadian General Electric Co. Ltd.
- Feb. 8—**Nylon in War and Peace**, by C. J. Warrington, development manager, Nylon Division, Canadian Industries Limited.
- Feb. 22—Student Night. **Engineering Uses of Some Unknown Metals**, by A. R. Bader (1st prize); **Fire Protection in a Small Factory**, by C. E. Leon (2nd prize); **Industrial and Economic Aspects of Plastics**, by K. Rothchild (2nd prize).
- Mar. 7—**Town Planning and the Future of Kingston**, a symposium; public meeting. A. S. Mathers, Toronto; W. Cecil Cole, Kingston; Prof. R. A. Low, Kingston.
- Apr. 25—Annual Meeting, with films: **Tested by Underwriters Laboratories, The Failure of the Tacoma Narrows Bridge, and Wings Over the North.**
- Sept. 16—Dinner meeting, Catarqui Golf Club, Kingston. Visiting members of Council and their wives entertained by the Branch.
- Oct. 18—**The Magic of Electric Welding**, by P. H. Take, welding engineer, Canadian General Electric Co.
- Nov. 1—Brig. J. Melville, M.C., E.D., Chairman, The Canadian Pensions Commission: **Plans for the Rehabilitation of Our Armed Forces.** A public meeting.
- Nov. 15—**The Engineering History of Shipshaw**, by McNeely DuBose, vice-president, Aluminum Company of Canada. An open meeting.
- Dec. 6—Student Night. **Alloys, the Backbone of Chemical Engineering**, by A. Bader (1st prize); **Concrete Inspection**, by R. McKnight (2nd prize).

### LAKEHEAD BRANCH

The Branch held the following meetings during the year:

- Jan. 19—Fort William. **Television and Frequency Modulation**, accompanied by coloured sound films, by J. Murie, branch manager, Canadian General Electric Company. (31.)
- Feb. 22—Port Arthur. Annual dance, Prince Arthur Hotel. (130.)
- Mar. 22—Fort William. Visit to Canadian Car and Foundry Company Plant after short descriptive talks by members of the Plant personnel, A. D. Norton, P. H. Spence, J. I. Carmichael, Canadian Car and Foundry Company. (46.)
- Apr. 12—Port Arthur. **Powder Metallurgy**, accompanied by sound film, by J. Murie, branch manager, C.G.E. (22.)
- May 10—Port Arthur. Visit to Port Arthur Shipbuilding Company, after descriptive talks relative to Aircraft Department and shipyards by O. M. Gunderson and H. Walton. (60.)
- June 16—Port Arthur. Annual Meeting and election of officers. (33.)
- Oct. 12—Port Arthur. Special meeting on the occasion of the visit of President de Gaspé Beaubien and General Secretary L. A. Wright. (27.)
- Oct. 13—Atikokan, Ontario. Branch Visit to Steep Rock Iron Mines. M. S. Fotheringham, manager, Steep Rock Iron Mines. (40.)
- Nov. 10—Fort William. **Steep Rock Iron Mine—Its General Features and Power Supply**, accompanied by coloured motion pictures and slides, by A. H. Framp-ton, assistant chief electrical engineer, Hydro-Electric Power Commission of Ontario. (36.)
- Dec. 15—Port Arthur. **Post-war Reconstruction**, by Honourable C. D. Howe, Department of Munitions and Supply. (50.)
- Town Planning**, by J. Murchison.

### LETHBRIDGE BRANCH

The Branch held the following meetings during the year:

- Jan. 14—A corporate members meeting was held dealing mainly with the election of officers and proposals for the year's activities.
- Mar. 23—A regular meeting was held in the Y.M.C.A. The speaker was Mr. L. Jacobson and his subject was **The Wheat Stem Saw Fly.**

- Mar. 25—The annual combined meeting of the Lethbridge Branch of the Engineering Institute of Canada and the Professional Engineers of Alberta was held in the Marquis Hotel. The guest speaker was Lt. Leckie of the U.S. Engineering Division, Edmonton, and his subject was **The Finishing of the Alaska Highway**. (62.)
- Apr. 21—A regular meeting was held for the purpose of discussing Dean Young's paper on the **Establishment of Technical Institutes in Canada for the Returning Servicemen**.
- June 2—A regular meeting was held to further discuss Dean Young's paper and draw up resolutions to be sent to the proper authorities.
- Oct. 27—A special meeting was called on the occasion of the President's annual visit. The guest speaker was President de Gaspé Beaubien and he dealt with **Engineer's Contributions to Canada's War Effort**.
- Nov. 24—The guest speaker was D. F. Hamelin who gave a paper entitled **Development of Sub-Surface Water in Alberta—A Post-war Project**.
- Dec. 15—**Ecological Engineering**, accompanied by a movie entitled **The Big Marsh Lives Again**, by T. C. Main.

### LONDON BRANCH

During the year, the Executive held 6 business meetings, and 10 regular and special meetings.

- Jan. 12—Annual meeting and election of officers. **Ducks Unlimited**, by Geo. N. Fansett.
- Feb. 16—Sound Colour films **Oil for War** and **Stone Canyon**, by D. McLaren, engineer of the Barrett Co. Ltd.
- Mar. 8—General discussion on branch activities.
- May 17—**Town Planning in London**, by R. W. Garrett, city engineer, London.
- June 13—Special dinner meeting for the president, Mr. de Gaspé Beaubien.
- Sept. 29—Open discussion on **Thames River Valley Development** led by R. W. Smith, and **Technical Institutes** explained by H. F. Bennett.
- Oct. 25—Open discussion on **Collective Bargaining**.
- Nov. 22—Open discussion on Revision of Branch By-laws.
- Dec. 13—Report on the **Muskingum Conservancy District**, by W. R. Smith, county engineer.

### MONTREAL BRANCH

The Executive Committee held nine regular meetings during the year. The Annual Meeting of the Branch was held on January 27th, at which time the President of the Institute, Mr. K. M. Cameron, paid his official visit and addressed the members. Special meetings of the Branch were called on July 20th to discuss **Collective Bargaining** and the **Engineer** and on October 26th to elect the Branch Nominating Committee.

The programme of meetings continued to be excellent and the average attendance of 139 compared to 140 last year indicates no falling off of interest. The social evening held on February 24th proved to be more popular than ever as it was noted that the attendance increased by 50 over the preceding year.

Without doubt, the most outstanding achievement of the year was the successful conclusion of the work undertaken three years ago by the Branch Committee on Provincial Professional Interests. As everyone knows, the Proposed Agreement between the Engineering Institute and the Corporation of Professional Engineers of Quebec has been accepted by the vote of the membership of both parties. Great credit is due to the untiring efforts of Mr. J. A. Lalonde, to the members of his committee and others who so willingly helped.

Following is the list of meetings held during the year, with attendance shown in brackets:

- Jan. 13—**The Manouan and Passe Dangereuse Water Storage Developments**, by F. L. Lawton. (160.)
- Jan. 19—**Electric Systems in Military Explosive Plants**, by J. R. Auld. (80.)
- Jan. 27—Annual Meeting of the Branch. (80.)

- Feb. 3—**Some Wartime Applications of Refrigeration**, by Dr. W. H. Cook. (80.)
- Feb. 10—**Everyday Electronics**, by John Mills. (160.)
- Feb. 17—**Future Products for the Chemical Industry**, by H. H. Lank. (150.)
- Feb. 24—Annual Social Evening. (250.)
- Mar. 2—**Construction of Shipshaw Development**, by Walter Griesbach. (225.)
- Mar. 9—**Electrical Equipment at Shipshaw**, by R. A. H. Hayes. (130.)
- Mar. 16—**Highway Expenditure vs Highway Investment**, by J. O. Martineau. (60.)
- Mar. 23—**Intercepting Sewers in Quebec City**, by J. G. Chenevert. (55.)
- Mar. 30—**Network Radio Operation**, by Dr. Augustin Frigon. (130.)
- Apr. 5—**Canadian Engineering Standards Association**, by Col. W. R. McCaffrey and W. J. Cale. (60.)
- Apr. 13—**New Materials of Engineering with Special Reference to Gas Turbines**, by F. Nagler. (130.)
- Apr. 20—**Design of Large A.C. Generators with Specific Reference to Accessibility for Inspection and Repair**, by H. R. Sills. (100.)
- Apr. 27—**Meteorological Services for Utility Systems**, by A. E. Davison. (100.)
- July 20—Special Meeting to discuss **Collective Bargaining and the Engineer**. (250.)
- Oct. 5—Opening Night; films. (285.)
- Oct. 12—**Methods and Practical Value of Soil Classification**, by Dr. Karl Terzaghi. (180.)
- Oct. 21—Visit to United Shipyards (Bickerdike Basin). (200.)
- Oct. 28—Visit to Shipyards (Bickerdike Basin). (125.)
- Oct. 26—**Field Decay Characteristics of Large Hydro-Electric Generators**, by J. T. Madill. (80.)
- Nov. 2—**Industrial Relations—Human Engineering**, by E. R. Complin. (175.)
- Nov. 9—**The Burning of Solid Fuels**, by Otto de Lorenzi. (185.)
- Nov. 16—**The City Manager Plan**, by Jean Asselin. (80.)
- Nov. 23—**Ball-Bearings**, by H. Little. (150.)
- Nov. 30—**Giving Wings to Words To-day and To-morrow**, by George L. Long. (130.)
- Dec. 7—Annual Student Night. (155.)
- Dec. 14—**Development of Water Wheel A.C. Generators**, by C. M. Laffoon, (85.)

### JUNIOR SECTION

While the presentation of papers was still one of the main activities of the Junior Section, great strides were made this year towards increased usefulness to the young engineer. The widespread interest in collective bargaining (with its special importance to the younger engineer) and other aspects of engineering as a profession brought about the formation of a committee on the welfare of the young engineer. The purpose of this committee is to foster discussion groups which will eventually form the basis of open forums.

The phenomenal expansion of Canadian industry has been accompanied by an increased need for technical knowledge which, in some instances, is of advanced character. To assist those who might be interested in perfecting their knowledge of any particular engineering subject, a committee on the development of the young engineer has been formed. This committee has made a survey of existing evening study facilities in the region. A questionnaire has been sent out to the membership in order to ascertain their needs. Acting on the replies to the questionnaire, courses were organized in calculus, engineering materials, and soil mechanics.

A third committee was named to study means of increasing the interest of the students in the activities of the section. Visits to both Ecole Polytechnique and McGill University are scheduled for early in the new year. This will give students of both universities the opportunity to increase their "professional" association.

A discussion group on Electronics, meeting fortnightly, has been sponsored jointly with the Institute of Radio Engineers.

The following is a list of Junior Section meetings:

- Feb. 28—Annual Meeting. Mr. de Gaspé Beaubien spoke on **The Engineer in the Community**.
- Mar. 20—Open forum on activities of the section. Dr. L. Austin Wright addressed the members and a sound film was presented.
- Mar. 27—Visit to Canadian Vickers Ltd., Aircraft Division, Cartierville. (250.)
- Apr. 17—**Quality Control at Canadian Propellers Ltd.**, by Maurice Conklin, and **Modern Trends in Mechanical Engineering**, by Raymond A. Frigon.
- July 27—**The Young Engineer and Collective Bargaining**, by R. E. Heartz.
- Oct. 3—Opening Meeting. C. C. Lindsay, Chairman of the Montreal Branch, addressed the members. Albert Clément, chairman of the Junior Section Committee on the Welfare of the Young Engineer, spoke on **Collective Bargaining**, and Raymond A. Frigon, Provisional Chairman of the Junior Section Committee on the Development of the Young Engineer, spoke on **Educational Facilities for Recent Graduates**.
- Nov. 13—Film Night.
- Dec. 7—Annual Student Night. **The Development of Power at Back River**, by G. H. Y. Slader (McGill); **Analysis of True Unit Stress of Copper**, by Denis Noiseux (Polytechnique); **The Realization of a Dream**, by P. J. Robinson (McGill); **Design of an Explosion-Proof Concrete Wall**, by Louis A. Dion (Polytechnique). (155.)

### MONCTON BRANCH

The Executive Committee held seven meetings. Ten meetings of the Branch were held as follows:

- Feb. 22—A dinner meeting was held in the Brunswick Hotel. H. Franklin Ryan, Canadian General Electric Co., gave an address on **Electronics**.
- Mar. 28—A meeting was held in the city hall, when a series of technicolor films, dealing with concrete highway construction, were shown.
- Mar. 30—A combined meeting of Moncton Branch and the Engineering Society of Mount Allison was held in the Science Building of the University. Films on concrete highway construction were shown.
- Apr. 17—A dinner meeting was held in the Y.M.C.A. in honour of the President of The Engineering Institute of Canada, Mr. de Gaspé Beaubien.
- May 11—A meeting was held in the city hall for the purpose of nominating branch officers for the year 1944-45.
- May 29—Annual meeting.
- July 24—A. D. Ross, a member of the Institute Committee on Employment Conditions, led a discussion on **Collective Bargaining for Engineers**.
- Oct. 12—The executives of the Moncton Branch of the Engineering Institute of Canada, the Moncton Board of Trade, the Junior Chamber of Commerce, together with members of the City Council met in the City Hall. J. S. Galbraith of the National Housing Administration delivered an illustrated address on **Community Planning**.
- Dec. 4—A meeting was held in the city hall. Two films were shown, the first dealing with photo-flash photography, and the second with the manufacture of electric light bulbs.
- Dec. 5—A joint meeting of Moncton Branch and the Engineering Society of Mount Allison was held at the University at Sackville. Films on photo-flash photography and electric light bulb manufacture were shown.

### NIAGARA PENINSULA BRANCH

The branch executive held one electoral and six business meetings during the year.

The programme committee arranged for and conducted the following general professional meetings:

- Jan. 20—Dinner meeting held at the Leonard Hotel, St. Catharines. The speaker was Dr. H. G. Acres, who gave an illustrated lecture on **A General Description of the Shipshaw Development**.
- Feb. 24—Dinner meeting at the General Brock Hotel, Niagara Falls. The guest speaker was J. D. Willis, of the Canadian General Electric Company, who gave a

lecture on **Electronics in Industry**, and also presented a movie on **Sightseeing at Home**.

- Mar. 23—Joint dinner meeting with the Niagara Falls, N.Y., section of the American Institute of Electrical Engineers. The dinner was held at the General Brock Hotel, Niagara Falls, Ont., and the speaker was E. W. Henderson, of the English Electric Co., who addressed the meeting on **The Application of Synchronous Condensers for Effective Control of Circuits Affected by Arc Furnaces**.
- Apr. 27—Dinner meeting and ladies' night, held at the Leonard Hotel, St. Catharines. The evening speaker was R. W. Emery, who gave an illustrated talk on **Impressions of Trinidad and British Guiana**. Many samples of native work and woods were displayed.
- June 15—Branch annual dinner meeting, held at the Park Restaurant, Niagara Falls, through the courtesy of the Victoria Park Commission. The president, Mr. de Gaspé Beaubien, the general secretary, Dr. L. Austin Wright, and Mr. R. E. Heartz, all of Montreal, were our guests and addressed the meeting on professional and E.I.C. affairs.
- July 28—Special dinner meeting held at the Leonard Hotel, St. Catharines, to discuss **Collective Bargaining**. The meeting was first addressed by Messrs. C. G. Moon, J. W. Brooks, and W. D. Brownlee, who spoke on three different aspects of the subject. The meeting was then thrown open for extended discussion.
- Oct. 26—Dinner meeting held at the General Brock Hotel, Niagara Falls. Guest speaker was O. G. Moffat, of the Canadian Westinghouse Company. The subject of the meeting was **Air Sanitation**, with particular reference to the use of the Precipitron.
- Nov. 16—Dinner meeting held at the Leonard Hotel, St. Catharines. The speaker was A. H. Frampton, of the Hydro-Electric Commission of Ontario, who spoke on the development and construction of **The Steep Rock Iron Mine**.

### OTTAWA BRANCH

The following meetings were held during the year, the attendance being shown in brackets:

- Jan. 13—Annual evening meeting, auditorium, National Research Council. Showing of two films, **The Banff-Jasper Highway** and **The Story of Canadian Pine**. (80.)
- Feb. 3—Luncheon meeting, Chateau Laurier. **Reconstruction and Re-Establishment**, by Hon. Gray Turgeon, M.P. (133.)
- Feb. 24—Evening meeting, auditorium, National Research Council. **Electricity in Modern Warfare**, by G. E. Bourne, General Electric Company. (75.)
- Mar. 9—Luncheon meeting, Chateau Laurier. Sound colour film, **Oil for War**, courtesy of the Barrett Co., Montreal. (132.)
- Apr. 17—Joint evening meeting with the Illuminating Engineering Society, auditorium, National Museum. **The Engineer Looks Ahead**, by M. J. McHenry. (80.)
- May 4—Evening meeting, auditorium, National Research Council. Sound colour film, **The Manufacture of Laminated Plastics**, courtesy of Arnold Banfield and Company, Toronto. (90.)
- Oct. 12—Luncheon meeting, Chateau Laurier. Assistant Commissioner V. A. M. Kemp, R.C.M.P., spoke on **The Application of Science to Criminal Investigation**. (110.)
- Nov. 9—Luncheon meeting, Chateau Laurier. Sound colour films, **Construction of Trans-Canada Highway**, courtesy of the Ontario Department of Highways, with commentary supplied by the chairman. (110.)

### PETERBOROUGH BRANCH

The following meetings were held during the year, with attendance shown in brackets:

- Jan. 13—**Reaction Type Hydraulic Turbine Design**, by C. G. Southmayd of Canadian Allis Chalmers Co. (39.)
- Feb. 5—Social Evening (Ladies Night).
- Feb. 17—**Nylon in War and Peace**, by C. J. Warrington of Canadian Industries Ltd. (36.)
- Mar. 2—**Technique of Testing High Voltage Bushings**, by G. W. N. Fitzgerald of H.E.P.C. of Ontario. (22.)
- Mar. 16—Junior and Student Night. **Design and Manufacture of Alnico Magnets**, by D. L. Cole; **Cosmic Rays**, by G. M. Nixon. (37.)

- Mar. 30—**Blue Reels Turning**, by M. J. Aykroyd, Bell Telephone Company. (44.)  
 May 16—Annual business meeting.  
 June 24—Annual picnic.  
 Sept. 14—**Big Inch Pipe Line**, by D. McLaren of The Barrett Company. (62.)  
 Sept. 21—Joint Meeting with Association of Professional Engineers of Ontario. **Collective Bargaining**, by T. M. Medland. (45.)  
 Nov. 2—**The Wrought Copper Alloys**, by G. S. Mallett of Anaconda American Brass Ltd. (30.)  
 Dec. 6—Annual Dinner. President de Gaspé Beaubien was guest speaker. (63.)

## QUEBEC BRANCH

The executive committee held six meetings with an average attendance of eight members. The programme of activities was as follows, attendance being given in brackets:

- Jan. 24—**Controlled Illumination for Perfection and Comfort**, by H. John Ward. (86.)  
 Feb. 28—**Oil for War and Stone Canyon**—films. (40.)  
 Mar. 6—Forum: Proposed agreement between the C.I.P.Q. and the E.I.C. (60.)  
 Mar. 13—**Projets d'après-guerre dans l'Industrie Electrique**, by Léo Roy, Quebec Power Co. (40.)  
 May 8—Annual Meeting of the branch. **La Physique Moderne et ses Applications**, by Dr. Franco Rasetti. (65.)  
 July 24—**The Engineer and Collective Bargaining**, by Gerald Martin. (30.)  
 Aug. 28—Annual golf tournament. (75.)  
 Nov. 6—**Rayons Cosmiques**, by Dr. Franco Rasetti. (53.)  
 Nov. 13—**The Magic of the Spectrum**, by Marcel Laflamme, Canadian General Electric Co. (133.)  
 Dec. 4—**Ressources Humaines du Québec**, by Huet Massue, Shawinigan Water & Power Co. (51.)  
 Dec. 18—S.H. le maire de Québec, Monsieur Lucien Borne, on **Projets d'après-guerre pour la Cité de Québec**.

## SAGUENAY BRANCH

During the year a total of 18 general meetings were held as follows:

- Jan. 19—**Lubrication**, by F. Moody, manager, industrial sales department, Imperial Oil Co. Ltd., Montreal, Que. Two films: **The Inside Story of Lubric; The Portland-Montreal Pipe Line**.  
 Feb. 3—**The Manouan and Passe Dangereuse Water Storage Developments**, by F. L. Lawton, Aluminum Company of Canada, Ltd., Montreal, Que.  
 Feb. 16—**Developments of Steam Production at Arvida**, illustrated with slides, by M. G. Saunders, Aluminum Company of Canada, Ltd., Arvida, Que.  
 Feb. 23—**Plastics**, by A. E. Byrne, manager, Plastic section supply department, Canadian General Electric Company, Toronto, Ont.  
 Mar. 1—**The Engineering History of the Shipshaw**, by McNeely DuBose, vice-president, Aluminum Company of Canada, Ltd., Arvida, Que.  
 Mar. 8—**The Combustion Turbine**, by A. Leuthold, chief engineer, Swiss Electric Company of Canada, Ltd., Montreal, Que.  
 Apr. 12—**A Description of the Electrical Equipment at Shipshaw**, by R. A. H. Hayes, acting chief engineer, Aluminum Laboratories Ltd., Montreal, Que.  
 Apr. 19—**Some Aspects of Automatic Control**, by W. F. Steinkamp, assistant sales manager, Brown Instrument Div. Minneapolis-Honeywell Regulator Co. Ltd., Montreal, Que.  
 May 10—**Geology and the Effect of Water**, by W. C. Gussow, Aluminum Company of Canada, Ltd., Shipshaw, Que.  
 June 14—**The Engineer and His Profession**, by P. E. Poitras, The Steel Company of Canada, Ltd.  
 June 23—**Welding in Industrial Maintenance**, by H. Thomasson, metallurgical engineer, Canadian Westinghouse Company, Ltd., Hamilton, Ont.  
 July 2—**Collective Bargaining**. J. N. Martin, Dominion Bridge Company, Montreal, Que., led the meeting. (Special meeting to discuss the different aspects of collective bargaining as it may affect the engineer.)

- Aug. 3—Dinner meeting held in the Saguenay Inn Grill, for the purpose of meeting the Institute president, Mr. de Gaspé Beaubien, and the general secretary, Dr. L. Austin Wright.  
 Sept. 13—**General Considerations Governing the Use of Aluminum**, by G. R. Black, general technical dept., Aluminum Company of Canada, Ltd., Montreal, Que.  
 Sept. 28—**Oil for War**, a film depicting **The Big Inch** through courtesy of the Barrett Company, Montreal, Que.  
 Oct. 25—**Concrete at Shipshaw**, by W. F. Campbell, Roberval & Saguenay Railway Company, Arvida, Que., formerly concrete engineer, Aluminum Company of Canada, Ltd., Shipshaw, Que.  
 Nov. 21—**Proposed Agreement Between the Engineering Institute of Canada and the Corporation of the Professional Engineers of Quebec**. A special meeting called to discuss the various points of the above agreement. The discussion was led by J. Crawford, of Shawinigan Water & Power Co., Montreal, in the absence of J. A. Lalonde, of Montreal, Que.  
 Dec. 18—**Economics and the Post-war Application Thereof**, by A. L. Simcox, of Price Brothers & Company, Ltd., paper division, Kenogami, Que.

## SAINT JOHN BRANCH

The executive held eight meetings with an average attendance of seven members. The executive gave special attention to the revision of the Branch by-laws.

Two special meetings of the Branch, were arranged and five regular meetings as listed below with the attendance of the meetings given in brackets:

- Jan. 26—Annual joint dinner with the Association of Professional Engineers of the Province of New Brunswick. Mr. G. H. Prince, Deputy Minister of the Department of Lands & Mines, addressed the members on **The Natural Resources of the Province**. (54.)  
 Feb. 24—The Atlas Steel Corp. film, **A Vision Fulfilled**, was shown at a dinner meeting. (18.)  
 Mar. 17—Dr. N. A. MacKenzie, President of the University of New Brunswick, addressed the Branch on **Canada and the Post-war World**. (43.)  
 Apr. 18—Dinner, held in honour of Mr. de Gaspé Beaubien, President of the Institute. (46.)  
 July 17—Spécial meeting to hear an interim report by the general secretary, Dr. Austin L. Wright, on **Collective Bargaining**.  
 Sept. 14—Special meeting at which J. S. Galbraith, National Housing Administration, Ottawa, addressed the members on **Community Planning**.  
 Dec. 5—Address by Dr. Milton F. Gregg, V.C., president of the University of New Brunswick, on **The Engineer in Canadian Army and Problems Arising with Engineering Courses at the University**. (35.)

## ST. MAURICE VALLEY BRANCH

Following is a list of the meetings which were held during the year, with the attendance as shown in brackets:

- June 22—Dinner and annual meeting, with the installation of new officers, at the Cascade Inn, Shawinigan Falls. R. E. Heartz was the guest speaker and his topic for the evening was **Collective Bargaining and the Engineer**. (76.)  
 July 25—A meeting was held at which G. H. Martin led a forum on the subject of **Collective Bargaining**. The meeting was held at the Cascade Inn in Shawinigan Falls under the chairmanship of R. Dorion. (27.)  
 Aug. 15—Joint meeting with the Shawinigan Falls Chemical Association, under the direction of our branch chairman. W. M. Gifford of the Aluminum Company of Canada spoke on **Aluminum—Past, Present and Future**. Special films were shown on the manufacture of aluminum goods. (140.)  
 Sept. 27—Meeting of the members of the executive.  
 Dec. 12—Dinner and meeting at the Cascade Inn, Shawinigan Falls, to welcome President de Gaspé Beaubien and his party. During the afternoon, a visit was made to the Cellophane Plant of the Canadian Industries Ltd., by the president and his party, accompanied by branch officers. (48.)

## SASKATCHEWAN BRANCH

All meetings were held jointly with the Association of Professional Engineers, the average attendance being 46. The respective programmes were as follows:

- Jan. 21—Regular meeting, addressed by K. G. Chisholm, B.E., on **The Electron Microscope**.
- Feb. 18—Annual meeting, addressed by Rev. Harry Joyce, on **People I Have Met**.
- Mar. 24—Regular meeting, **Forest Conservation in Canada**, by Robson Black, President, Canadian Forestry Association.
- Oct. 18—Regular meeting, addressed by President de Gaspé Beaubien, on **Institute Affairs**.
- Nov. 17—Regular meeting, **Education in the Services**, by E. F. Holliday, Secretary, Educational Committee, Canadian Legion War Services, Inc.
- Dec. 18—Regular meeting, addressed by Hon. J. H. Brockelbank, Minister of Municipal Affairs, on **Municipal Affairs**.

## SAULT STE. MARIE BRANCH

The executive committee of the Branch met three times during the year. Seven dinner meetings were held with an average attendance of 26 members and guests. The programmes were as follows:

- Jan. 21—**Archaeology as an Engineer's Hobby**, by R. H. Merrill, post engineer, U.S. Army War Dept., Fort Brady, Sault Ste. Marie, Mich.
- Feb. 25—**Structures in Steel**, by W. H. M. Laughlin, chief designing engineer, Ontario Division, Dominion Bridge Co. Ltd., Toronto.
- Mar. 31—**Electronics in Industry**, by Mr. Becker, sales engineer, Canadian General Electric Co. Ltd.

## TORONTO BRANCH

The executive held fifteen meetings with an average attendance of nine.

Regular meetings of the Branch are listed below, with the attendance given in brackets:

- Jan. 7—Ladies Night. Joint meeting with the Junior Section. (172.)
- Jan. 20—**Launching Ten Thousand Ton Cargo Vessels**, by P. G. A. Brault. (41.)
- Jan. 26—**Engineering Features of the Toronto City Plan**, by S. R. Frost, N. D. Wilson, A. E. K. Bunnell, and A. S. Mathers. Visit to the Exhibition of the City Planning Board, Toronto. (140.)
- Feb. 3—Dinner meeting, **The Ogoki Diversion**, by O. Holden. (86.)
- Feb. 5—Joint meeting with the Royal Canadian Institute, **How Shall We Use Our Natural Resources**, by Dr. R. C. Wallace.
- Feb. 17—Student Night. Joint meeting with the Junior Section and the University of Toronto Engineering Society, **Flood Control**, by D. H. Perkins; **Magnesium as an Aircraft Component**, by J. H. Ward; **Fluid Drives**, by E. M. Peacock; **Glass as a Structural Material**, by H. D. McNiven; **Air Jet Propulsion**, by J. Ward. (85.)
- Mar. 2—Joint meeting with the American Institute of Electrical Engineers, **Design Features of the Shipshaw Development**, by Dr. H. G. Acres. (250.)
- Mar. 16—**The Clarkson Oil Refinery**, by R. L. Rude. **Oil for War** (colour film). (91.)
- Apr. 1—Annual meeting.
- Oct. 5—**Transportation Subways**, by Charles E. De Leuw. (105.)
- Oct. 19—**Trades Training**, by Col. W. H. Bonus, G. M. Gore and J. M. Piggot. (45.)
- Oct. 24—Joint meeting with the American Society of Mechanical Engineers, **Rockets, Gas Turbines and Jet Propulsion**, by Dr. Lionel S. Marks. (600.)
- Nov. 16—Joint meeting with the Canadian Society of Forest Engineers, **Mechanization of Woodlands Operations**, by J. W. McNutt. (98.)
- Nov. 30—Joint meeting with the Institute of Radio Engineers, **Radio for Over Land Long-Distance Telephone Service**, by S. T. Fisher. (105.)
- Dec. 7—Dinner meeting, **Canada's Nitrogen Industry**, by S. R. Frost. (40.)

## VANCOUVER BRANCH

The Branch held the following meetings during the year:

- Jan. 17—**Fishway Problems in B.C. and Neighbouring Streams**, by John McHugh.
- Feb. 3—**The Electron Microscope**, by K. G. Chisholm.
- Feb. 23—Student Night. Chairman: V. L. Mosher. **The Aluminium Industry**, by Alan M. Eyre; **Lofting and Template Making for Airplane Parts**, by H. B. R. Graves; **Soil Stabilization**, by R. Scarisbrick.
- Mar. 24—Meeting with ladies at Stanley Park pavilion. **The Romance of the North Country**, by C. E. Webb.
- Apr. 3—Joint meeting with A.I.E.E. **Industrial Application of the Science of Metals**, by Frank Forward.
- Apr. 24—**The Uses of Glass; Industrial, Structural and Ornamental**, by Dr. Gilbert Hooley.
- May 26—**Power Development of the Skagit River by the City of Seattle**, by E. R. Hoffman.
- Oct. 4—**Hell's Gate Fish Ladders**, by Milo Bell.
- Nov. 3—Dinner meeting, **Institute Affairs: De Gaspé Beaubien, L. Austin Wright and R. E. Hertz**.
- Nov. 3—Tea for Ladies at Shaughnessy Golf Course.

## VICTORIA BRANCH

During the year there were four meetings of the executive committee and five general meetings of the branch. The branch meetings may be summarized as follows:

- Jan. 15—Lecture meeting, **Flying Control and Air-Sea Rescue Work** by Squadron Leader R. M. Donaldson and Flight Lieutenant G. H. Lee. This meeting was held under the joint auspices of the Oak Bay A. R. P. organization and the Victoria Branch, E.I.C. In addition the air cadets of the greater Victoria High School were in attendance. There were a total of about 500 people present. The talk was accompanied by a film entitled **Prepare for Ditching**.
- Feb. 1—Lecture meeting, **Into Unseen Worlds**, by K. G. Chisholm, sales engineer of R.C.A. Victor of Winnipeg, Man. The talk was illustrated by a film entitled **Into Unseen Worlds** and by slides. Attendance was 60.
- Aug. 2—General discussion meeting, **Collective bargaining and the Engineer**. This meeting was held in the Oak Bay municipal hall to discuss the subject of collective bargaining. Attendance was 12.
- Nov. 5—General meeting. This meeting was called to hear President de Gaspé Beaubien, General Secretary L. A. Wright, and Mr. Hertz, chairman of the Institute Committee on Employment Conditions.
- Nov. 6—President's visit. A dinner meeting was held at the Empress hotel in honour of the visit of the presidential party. About 55 members and their ladies were present. Mr. Beaubien gave a very inspiring address concerning the place of the engineer in the Canadian scene.

## WINNIPEG BRANCH

The following Branch meetings were held during the year:

- Jan. 6—Dr. J. Ansel Anderson, chief chemist, Board of Grain Commissioners for Canada, Winnipeg, spoke on **Engineering Aspects of Agricultural Development**.
- Jan. 10—Dinner in honour of W. P. Brereton, retiring city engineer.
- Feb. 3—Annual meeting of the Branch. Following the business of the meeting, two films were shown—**A Modern Aladdin's Lamp and Mining Above Ground**.
- Mar. 2—K. G. Chisholm, R.C.A. Victor Co. Ltd., spoke on **The Electron Microscope**.
- Apr. 6—F/L N. M. Fowler, R.C.A.F., gave an address on **The Application of Aerial Photography to Survey Work**.
- Sept. 28—G. R. Pritchard, Canadian General Electric Co., spoke on **The Magic of the Spectrum, or Illumination**.
- Oct. 17—On this day the Branch was honoured to have as guests, President de Gaspé Beaubien, L. Austin Wright, general secretary, and R. E. Hertz, councillor, at a luncheon meeting held in the Hudson's Bay Co. dining room.
- Dec. 7—Lawrence J. Green gave an interesting address on **Town Planning**.

# DEFENDANT'S FACTUM

## Argument of Attorney for Engineer

District of Montreal No. 209929: Superior Court: The Province of Quebec Association of Architects,  
Plaintiff vs. Brian R. Perry, Defendant.

The case of the architects' association versus the engineer is so interesting and the judgment so serious to the profession and so far reaching that the complete text of the argument for the defence is reproduced herewith. By reading this, one can understand why the defendant expected a favourable decision, and why it has been decided to appeal the case. Unfortunately the written argument presented by the attorney for the plaintiff was approximately ten times as long as this argument of the defendant and therefore is too long to be reproduced.

Additional reference to the case and the judgment is made in the Month to Month section of this issue.—*Ed.*

The Plaintiff Association complains that the Defendant has acted as an Architect "inasmuch as for remuneration he prepared and furnished sketches, drawings, plans and measurements, gave counsel and advice, and prepared and furnished specifications, called for tenders and arranged contracts for, and for remuneration supervised the construction of a building for and the property of Harrington Tool & Die Co. Limited at Lachine."

The Defendant answers that he is a member in good standing of the Corporation of Professional Engineers of Quebec, and was such at all the times mentioned in the complaint, and that the acts complained of form part of the activities of a Civil Engineer as defined by statute.

The Plaintiff Association was incorporated by 54 Victoria, Chapter 59, assented to on the 30th day of December 1890. This Act and the amendments thereto, prior to the amendment of 1929 reserved nothing to the members but the exclusive right to use the name or title "registered Architect" or "Architect."

It was only by the amendment 19, George V, Chapter 67, assented to on the 4th of April 1929, that the paragraph set out in the second allegation of Plaintiff's declaration was added. At the same time and by the same amendment act which added the said paragraph recited in Plaintiff's declaration, a further paragraph was added which reads: "Nothing in this section shall be interpreted as affecting in any manner whatsoever the rights and privileges conferred by law upon the members of the Corporation of Professional Engineers of Quebec." Both of these amended sections now appear as part of section 12 of Chapter 272 of the Revised Statutes of Quebec 1941.

Members of the Corporation of Professional Engineers of Quebec were granted by 61 Victoria, Chapter 32 (Que.) assented to the 15th of January 1898, the exclusive right to use the title of "Civil Engineer," and to act and practise as Civil Engineers within the meaning of the first section of the Act, Sub-paragraph (d) of which reads:

"The expression 'civil engineer' means any one who acts or practises as an engineer in advising on, in making measurements for, or in laying out, designing or supervising the construction of railways, metallic bridges, wooden bridges, the cost of which exceeds six hundred dollars, public highways, requiring engineering knowledge and experience, roads, canals, harbours, river improvements, light houses, and hydraulic, municipal, electrical, mechanical, or other engineering works, not including government colonization roads or

ordinary roads in rural municipalities; but it is not deemed to apply to a mere skilled artisan or workman."

This section is now sub-section 4 of section 2 of Chapter 270 of the Revised Statutes of Quebec 1941, and for the purpose of this argument is exactly the same as originally enacted.

It was held in the case of Association des Architectes de la Province de Québec vs. Ruddick, 59 K.B. page 72, that an action under the Architects' Act to recover a fine is a penal action, and that the statute in that respect is a penal statute, because it imposes a penalty or punishment, and as such it must be restrictively construed in favour of the person charged with the offence.

Our first submission is that the rights given to Engineers by the Statute of 1898 were not disturbed or interfered with to the slightest extent by any amendment to the Architects' Act.

Any burden of proof that may at the outset have rested upon the Defendant was removed and placed upon the Plaintiff so soon as the Defendant proved his membership in the Corporation of Engineers, and that buildings formed part of the activities enumerated in sub-section 4.

The Defendant proved both of those points, and was assisted in respect to the second point by the declaration made on behalf of the Plaintiff that it did not intend to contest same. Thereupon and thereafter the burden rested upon the Plaintiff to establish that the building in question in this lawsuit did not form part of the enumerated engineers' activities.

The Plaintiff, instead of attempting to make such proof or to contradict the evidence offered by the Defendant, confined its efforts to an attempt to prove the capacity of architects to make plans and specifications for the building in question.

Our second contention is that irrespective of where the burden of proof lies, that the defendant has conclusively established that he has not gone outside the sphere of activities exclusively falling within the province of Engineers.

We respectfully submit that what the Defendant did, will be found to fall within the expression "mechanical or other engineering works." A machine shop is surely a mechanical works. It is full of mechanical machines and it can hardly be anything other than a mechanical work, and a machine shop ordinarily does not consist of machines only, there must be some sort of a building and usually the building is more than a single storey.

It is essential that the building be designed and laid out for the efficient working of the machines to be operated in it. It is not necessary that the designer of the building be a designer of the machines in order that the work be a mechanical one. The illustration offered at the argument, we submit, stands good—one engineer may design and lay out a power house and another engineer may design and lay out the dam, while a third or several other engineers may design the machinery. All are part or parcel of the same work. In the same way a machine shop building is part and parcel of the machine shop. The machinery in the

machine shop is no less unique to the machine shop than is the machinery in the power plant. Certain of the equipment that was much framed into the Harrington building, for example the tempering or heat treatment equipment as the power equipment in a power plant. It is true that the machine shop is not complete without a building. A building is not an accessory to a machine shop, it is, we submit, fundamental. To operate, the machines must be housed.

Our third contention is that the machine shop in question had to be particularly constructed for the proper functioning of the machines to be operated therein, because to operate the Harrington machines at all satisfactorily, they had to be subject to a minimum of vibration and a minimum of temperature change. These were engineering problems as well as mechanical problems, they were problems that had to be determined in advance of, and before the building could be detailed, and they controlled also the design of the building.

In support of our contention we wish to cite from the evidence of Mr. James M. Robertson commencing at the bottom of page 108 and continuing onto page 109.

Q. On what do you base your opinion that it is engineering work ?

A. The designer of a project of this kind must when he takes on the job, first study the problem that is set before him: that is, he has to consider the material which is to be manufactured, the degree of precision which is to be attained, the various factors which may be unfavourable and may work against his producing such precision work at the rate that is asked for as well as the favourable conditions; and out of all these studies he must evolve a design which will in his opinion take care of all these problems to the maximum extent. That is all done before he starts to make any drawings at all; that is the engineering study; that is the main backbone of the whole thing. After all of those factors are determined, the putting of those determined factors into a physical entity such as a building is a small matter. That is nothing; anybody can do it. But anybody cannot do that first thing.

A question arose at the oral argument, whether a mechanical work to fall within sub-section 4 must also be an engineering work.

The answer to this question, we submit, is that upon the true construction of the sub-section, mechanical works are declared to be engineering works. In this respect we submit that the French version of sub-section 4 is clearer than the English version. The English version reads:

"Hydraulic, electrical, mechanical, municipal or other engineering works."

Whereas the French version reads:

"Travaux hydrauliques, électriques, mécaniques, municipaux et autres travaux d'ingénieur."

Our fourth contention is that the argument put forward by Counsel for Plaintiff to the effect that architects have the exclusive right to prepare plans and specifications for buildings, and engineers the exclusive right in respect of engineering works is subject to some modification, seeing that it was conceded at the trial and at the argument that "works" includes buildings.

The contention then should read, "architects have the exclusive right to make plans and specifications to construct or remodel buildings, except such buildings as are comprised in the "works," in respect to which Engineers have been given exclusive jurisdiction.

With this modification the contention that Architects may make plans and specifications for buildings and

Engineers may construct works is not decisive of the issue. Again Engineers are not limited to construction, they may lay out and design. It is not necessary that they construct. The word "construction" used in sub-section 4 applies only to the word "supervise."

Our fifth contention is that it is unnecessary for the decision in this case to reconcile the provisions of the Architects' Act with those of the Engineers' Act, because the rights given to the Architects were made subsidiary to the rights given to the Engineers. Now, if it should be that the new rights given to the architects in 1929 are illusory, the position of Architects was not made any worse than it was before the amendment.

Having said that, we may add that we do not contend that the Architects' rights are illusory, they have the sole right to make plans and specifications to construct or remodel buildings, except such buildings as the Engineers have the sole right to lay out and design, and this, we submit, means that the architects' exclusive right applies to all buildings not forming part of one or other of the activities enumerated in said sub-section 4. But, however that may be, the point we submit is that the rights granted to Engineers in 1898 are not cut down in the slightest degree by the rights granted to the Architects in 1929.

Our sixth contention is that as all the features in this particular job belong to the engineering class, and the end to be achieved was a mechanical one, it follows that the ensemble belongs to the mechanical and engineering classes. If each feature of the work is examined separately, it will be found to be an engineering feature. For instance the supports and columns, beams, floors and roof were of reinforced concrete. Now, the overwhelming testimony in this case is that reinforced concrete for structural purposes is designed by engineers. The plumbing and heating is also an engineering job.

In the Jetté case, Jetté was charged with having made plans for a heating system and thereby having contravened with the provisions of the Engineers' Act. The first Court and the Court of Appeals exonerated Jetté on the ground that he came within the exception contained in subsection 4, as he was a mere skilled artisan or workman. In that case, it was said that Architects are rarely experts in heating. The evidence, therefore, must have agreed with the evidence made in the present case. Electricity was required for power and lighting; elevators were also required. Both these jobs were engineering jobs.

We remind the Court that Mr. Payne, who was the architect in charge of the construction of the Sun Life Building, testified that engineers designed and specified for the foundation of that building, the structure, the electricity for power and lighting, the plumbing and heating, the roof, the elevators and the power plant, and when asked what was left for the architects, he said "The finishing."

Messrs. Pitts and Perrault alone testified that they designed and specified for the above items. Both these gentlemen had engineering training. In rebuttal the Defendant proved that even Mr. Pitts applied to an Engineer to design and specify for the dome of a church, and that in at least two cases, Mr. Perrault had the design and specifications for structural reinforced concrete made by an Engineer. The buildings were the Rockland Garage and the Crescent Building. It has been urged against this argument, that if a church can be constructed of reinforced concrete, it would become an engineering work. Our reply to that is, it may be necessary to look at the work as a whole, and not at one or two features only of it, and if this were done in

# From Month to Month

## ROUND ONE GOES TO THE ARCHITECTS !

According to the Honourable Mr. Justice O. S. Tyndale of the Superior Court, Montreal, "in general only a member of the Plaintiff Association can legally furnish for remuneration plans or specifications to construct or remodel a building", the "plaintiff association" being the Province of Quebec Association of Architects which some time ago took action against an engineer for making plans to construct a certain machine shop in the province of Quebec. Accordingly, Mr. Tyndale found the defendant guilty of having violated the architects' Act.

This revealing decision was handed down on January 26th, 1945. It will come as a shock to engineers throughout Canada who believe that since the development of the industrial age, industrial buildings were the work of the engineer. Many hundreds of engineers and employers may well look back on the era of crime which this judgment establishes for them, and look forward to the "arrangements" they will have to make in the future to continue the sane and well established policy of having industrial buildings designed by engineers.

This interpretation of the Acts of the engineers and the architects in the province, if it is allowed to stand, will have a seriously detrimental effect upon the practice of engineering. The judgment not only finds the engineer guilty of having contravened the architects' Act on this particular building, but denies him the right to design any building "such as the one in question in this case." As no other building will be identical, it is evident that this phrase will be considered by the architects' association as encouragement to take legal action on a wide range of structures, including almost anything that could be considered a building.

It is a disturbing thought to an engineer that if argument such as that put forward in this case by the architects convinces the court that an engineer may not design a shop for making precision tools, it may well be used to prove that he may not design buildings for power development, a pulp and paper plant, a concentrator, and so on. To an engineer, all of these buildings, as well as a machine shop, have always been distinctly his field. The basic engineering understanding and requirements as applied to the building itself which determined its layout and design details, are probably far more precise and technical in this instance than in most instances; therefore, if the technical aspects are not clear enough for a court in this case, they would hardly be in any other. Are we then to face a period in which, for example, pulp and paper mills will become the work of architects?

### THE DEFENCE

Elsewhere in this *Journal* is the argument or "factum" as prepared for the Court by the attorneys for the engineer. A perusal of this will make clear to the reader the sound basis upon which the defence was conducted, but will confuse and confound him when he considers the judgment. It will also bring a realization of the desirability, if not the necessity, of appealing the case and of revising the Act. If in the face of such sound reasoning an engineer may still be denied the right to continue to design industrial buildings it is apparent that in the public interest something must be done. The *Journal* is informed that already notice of appeal has been filed.

## News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

### THE COURT'S DIFFICULTY

There is no denying that the case was a difficult one. The judge stated that the admissions of the various facts, with the Plaintiff's early formal proof, constituted a "prima facie" case for the architects. Doubtless he made a sincere and valiant effort to understand the complexities of a technical field in which he was probably a stranger, so that he might make a fair and legally sound decision. Nevertheless, there are points in his judgment which do not make sense to an engineer.

In the first place the judge threw out all the evidence that was taken over several days, and states "The problem must therefore be solved by a comparison of the two texts in the light of the ordinary canons of interpretation and the argument of counsel." The defendant's plea rested entirely on the claim that the building in question was "a mechanical engineering works" as mentioned in the engineers' Act. To prove this, several expert witnesses were called so that the judge would have the necessary information before him, but this evidence was thrown out.

The judgment clearly infers that there is a restricted class of buildings that can be considered as "engineering works"; but if expert testimony is not admissible to prove that a building is in that class, how can this or any other defendant even attempt to prove his case?

Again the judgment finally develops a new meaning for the word "works", (the word used in the Quebec Engineers' Act) which is difficult to accept. In this writer's opinion it cannot be substantiated by reference books or by custom and yet on that unique interpretation the whole adverse decision is based. Although granting that "works" are the clear and legitimate field of the engineers, the judge finds unsuitable all explanations or definitions of that word other than his own. He quotes one dictionary as defining works as "an architectural or an engineering structure, edifice" but he fails to consider that definition in his decision, or to recognize the overlapping fields of the two professions so clearly indicated in that definition, and so well known in the construction industry. He goes on to say "It is obvious that some of the specific items mentioned in Section 2 (of the Engineers' Act. Ed.) comprise a building of some sort as an accessory; but none of them, except 'lighthouses', could in the opinion of the undersigned, be considered 'in se' as 'buildings'." From there on he decides that any buildings envisaged in the word "works" must be *accessory* only, and the judgment denies the defendant's plea that this machine shop is a "mechanical works," because it was not merely an accessory to a larger project.

It goes further, for the judge in his "conclusions" establishes the necessity for the engineer designing a building to be "concerned" in the construction of the entire "work" of which his building is an accessory. Imagine making it a legal requirement that the highly skilled specialist engineer designing a turbine or a generator must be similarly skilled in the equally specialized engineering requirements of building design before he can interest himself or specify in any way the building to protect his "works"; or conversely it infers that the engineer, to be legally entitled to design the

building, must also design the mechanical or electrical equipment that goes in it; i.e., he must be responsible for the whole "works."

As an example, reference was made to the building over the turbines and generators of an hydro-electric power development, which it was admitted would be the work of an engineer because it was "accessory only." To make such a statement is to say that one's heart or one's stomach is accessory only. It doesn't make sense. The power house building is just as essential to the power project as any other part, and the turbines and generators couldn't operate without it, and there wouldn't be any power. To accept such an interpretation of "works" is to shut out the engineers from a field of endeavour which has always been theirs. The "lack of clarity and precision" which the judge finds in the Acts is not dispelled by such interpretations. It is the well known intention that lies behind this suit that such work should be designed as in the past by engineers but must be carried out over the signature of an architect. In this way engineering would cease to be a profession.

#### ARCHITECTS AND INDUSTRIAL BUILDINGS

No doubt architects have handled many industrial or manufacturing buildings, and with profit to themselves. It is well known that in many of these cases, half or more of the building design work is done by engineers, and much of it is made available through the supply trade without cost to the architect. It is paid for by the owner as part of the building cost but is not supplied by the architect who is paid for the job. Under such a profitable and satisfactory arrangement from the architects' point of view, the owner's interest in an unbiased, economical and adequate design for those parts of the building may tend to disappear even if the technical ability to properly check such engineering design actually exists.

Obviously, one of the main points stressed and reiterated by the defense was not considered by the judge to be serious; that the engineering work in any project of this kind starts and continues on many and major considerations that establish the requirements, and finally concludes with a building; the building itself is minimized, not because it is an accessory, but because its design and detailing are almost automatic after the "engineering" fundamentals and requirements have been worked out. In this case, the owner, a particularly skilled, competent and well informed manufacturer, called as a witness by the architects for formal proofs, testified that he didn't know the size of the building, even closely, the floor loadings or the heating system. "I left those things to the engineer; that's what I hired him for." On the other hand, architects testified, claimed in their plea, and their attorney insisted in his written argument, that when industrial buildings are handled by architects, they depend on the owner to supply such details!

Much was made by plaintiff's attorney of two points, and the fundamental absurdness of the conclusions apparently was not appreciated by the court. It was contended, first, that as the plant in question could be emptied of its machinery and still remain a building, and be used for a variety of purposes, there was nothing special about its design. The answer to this is that churches, due to a simple shift in urban growth, have often been used as warehouses and stores. They cease to be churches even though they were so designed! In Canada, to-day, the government is remodelling two large ocean-going ships to be used as rest and recreation centres for troops. Does ship-

building thereby become a building architect's job, just because some day some one may decide to tie a ship to a dock and use it for an hotel? Even light-houses, which the court admits are an engineering work, are converted to residences from time to time. Should they therefore be considered an architect's work? Such conclusions would be absurd!

The second point was: In considering the question of vibration on which there was extended argument and discussion, due to its technical quality, plaintiff's counsel seriously contended that an engineer's ability to understand and arrange and dispose weight to counteract vibration was not only equalled but was far surpassed by the architect responsible for the Sun Life Building because it was bigger and immeasurably heavier. Adequacy and economy of design, which is the essence of engineering, was stressed in reply but was not appreciated by the court.

#### AMENDMENTS TO ARCHITECTS' ACT

If an engineer may be allowed to have an opinion on a purely legal point, it would seem that the centre of the dispute in Quebec is the restrictive clause in the architects' Act which clearly retains to the engineer any rights he had prior to that Act. The engineers' Act, passed in 1920, describes engineering in exactly the same words used in the old Civil Engineers' Act of 1898. Plaintiff's written argument mis-states that "In 1890 the Architects were secured in their rights as the planners of buildings". The significant paragraph of their Act was granted only in 1929. There, for the first time, is there any mention whatever of buildings. And in the same amending paragraph is the exception or saving clause in favour of engineers which reads, "Nothing in this section shall be interpreted as affecting in any manner whatsoever the rights and privileges conferred by law upon the members of the Corporation of Professional Engineers of Quebec". The judge properly states the first fact but omits reference to the second. Neither does he face the fact that these two related clauses are the only two significant changes made in that Act at that time. Surely a saving clause in such context should not be ignored but should be given ample consideration before elimination in a judgment well recognized as a test case.

#### PROFESSIONAL ETHICS AND CONDUCT

To show the ethical level at which the architects' case was handled, the *Journal* quotes a few extracts from the written argument as presented to the judge by attorney for the plaintiff:

"The plea is shameful and invidious—a condemnation of an entire profession, without exception, by a man wholly unqualified either to belong to it or to criticize it."

"Let the consulting engineer, like Perry, specializing in concrete or in electrical work, or other specialty, stay in his field as a consultant—let him wait until he is consulted by the architect or others."

"If a few engineers and big contracting firms can get the contract on their own terms, draw the plans and specifications, furnish some semblance of architectural service, and do the work in their own way, without the co-ordinating and integrating planning and supervision of an architect, the intent of the statute is flouted. The fees and the work of architects go to engineers and contractors, and the architect is ignored."

"Even an engineer, so verbosely sure of himself as Mr. Perry, or so interested as Mr. Chadwick, Mr.

McCrory or Mr. Stirling, would do well as witnesses under oath to keep on the persuasive side of the ridiculous." (Whatever that means.—Ed.)

The *Journal* has maintained from the beginning that the whole business was a useless and disgraceful exhibition. These quotations seem to offer no reason to change that opinion.

#### OTHER INTERESTING QUOTATIONS

The following additional excerpts from the plaintiff's argument may come as a surprise to engineers and to owners of buildings:

"It is recognized that the architect is master, that he must exercise his judgment over the work done by engineers."

"Section 12 of the Architects' Act grants architects a monopoly in respect of 'buildings'."

"And, as was fully proved, architects have to deal with the placing, spacing, laying out and powering of machines in industrial, utility and processing buildings of many kinds, in planning and specifying them for the functional purposes of their owners."

It is unlikely that future developments made necessary by this decision will add any lustre to either profession, but it can be proven readily that the engineers' organizations have made attempts early and often to settle this dispute privately. The architects' association declined to negotiate outside of the courts, and so we come to to-day's situation, which may well be a long way from the end.

Because of the many architects in Quebec who do not support the action of the Association, the *Journal* regrets the necessity of attacking the judgment and the tactics of the Association. It is unfortunate that the whole profession has to suffer for the acts of what the *Journal* understands is a small group, but the engineers must defend themselves and their obligations to the public.

#### REHABILITATION OF MEMBERS

On the employment page of this issue is an advertisement stating that the Institute desires to secure the full time services of a member to take charge of the programme for assisting members in uniform at the time of their demobilization. This addition to the staff has been authorized by Council after long consideration, and after consultation with many persons interested in post war planning.

Council believes that returning members are entitled to every assistance that the Institute can provide. It is emphasized that it is not intended to have the service overlap or conflict with any existing service such as the Wartime Bureau of Technical Personnel, but rather to augment and amplify the recognized usefulness of such organizations to the members.

There will be another task also for the employment service of the Institute. This is related to the transfer of engineers from war industry to peace industry. Many members will be in this shuffle and additional assistance will certainly be required, if the Institute is to meet its obligations.

Members who are interested in work of this kind and in this opportunity are invited to communicate with Headquarters just as quickly as possible. The position is open now and the demand for the service is increasing.

#### "THE FAITH OF AN ENGINEER"

With this issue of the *Journal*, members will have received a copy of "The Faith of an Engineer." It is not the purpose of these lines to refer specifically to the Faith, as that has been well done on the leaflet itself, but rather to make acknowledgment of the Institute's indebtedness to the donors, the five past-presidents who have been privileged to represent the Institute on the Engineers' Council for Professional Development.

This gesture of support of the ethics of the profession will be of substantial assistance in developing and sustaining the professional mentality which is so essential to all professions. Members will join the officers of the Institute in thanking the past-presidents who have made this message available to the membership and to friends of the Institute.

#### RUSSIAN ENGINEERS VISIT INSTITUTE

Five Soviet construction engineers visited Headquarters on January 23rd. Their mission in Canada was to study winter construction methods, and their call at the Institute was to secure additional advice on persons and places that should be seen.

Heading the delegation was P. P. Novojilov, a member of the Purchasing Commission of the Soviet Union in the United States, and chairman of the standing technical committee on Industrial Rehabilitation. Other members of the group were I. Onufriev, recipient of the coveted Red Star, A. Khraskovsky, Y. Alikhanov and S. Levin.

All five gentlemen had seen recent service with the Russian forces, and wore service ribbons. It is doubtful if their average age exceeded thirty-five. They explained that they had seen some very interesting construction projects, although in many instances the work was completed before their visit. One member of the Institute, who conducted them over part of their tour in Montreal, said that they were particularly interested in concrete, and were quite surprised at the quantities produced by concrete plants on large projects. In Russia, their production per mixer was much lower.

From Montreal the group went to Toronto for a similar inspection but returned to Montreal the following week for an additional two days, after which they entrained for New York.

#### C.S.A. WELDING STANDARDS

The Institute's representative on the C.S.A. Committee, C. R. Whittemore, has submitted the following progress report on this subject:

I wish to report that a meeting of the Sectional Committee on Welding Standards was held at the Royal York on Friday, January 26th.

At this meeting it was agreed to bring up to date the Code S47T-1938—Tentative Welding Qualification Code for Fabricators, Contractors, Supervisors and Welders and S48T-1938—Metallic Arc Welding Electrodes for Iron and Steel.

Codes S59-1940—Metallic Arc Welding (Buildings and Bridges) and W-91 Proposed Specification—Welding of Mechanical Details are to be combined into one specification.

This work is to proceed without undue delay and it was the opinion of all Members that this action would bring about full acceptance of welding in building fabrication.

## COLLECTIVE BARGAINING PROBLEM REACHES NEW STAGE

There is no definite progress to report on this subject since it was last commented upon in the *Journal*, but there has been some action about which the membership should be informed.

On January 9th, the Wartime Labour Relations Board (National) held an open hearing in Ottawa relative to the request of engineers and other professional workers for a separate order-in-council to establish and control collective bargaining for themselves. The previously appointed sub-committee of Messrs. MacRae, Dobson, and Hertz, spoke for the fourteen societies, and presented the brief which has been printed in the January issue of *The Engineering Journal*. The president and the general secretary were present as observers.

The hearing lasted all day, and the greater portion of it was taken up by certain organizations that were in opposition to the engineers' proposal. These included four well-established trade union groups and one recently established small group of professional workers. It would be unfortunate if this latter group's support of the trade unions' protest should have given the impression that the professional workers were divided in their opinions. However, their speaker admitted he represented but a few persons, and a study of their brief indicates that they had missed entirely the main points of the issue.

The experience of sitting through the hearing was a bit of an education. It provided a picture of democracy at work. Every one was heard, usually at great length, but without interruption, even though in many instances the observations were entirely irrelevant. Four speakers in opposition each consumed from a half hour to over an hour arguing points which were never an issue. In the vernacular, they seemed to be "shadow boxing".

Apparently the impression was abroad that the fourteen societies were going to base their case on the interpretation of the words "engaged in a confidential capacity" as written into the present order No. 1003. Each of the four opposition speakers laboured the point that professional workers should not be denied the privilege of collective bargaining by being classed as working in "a confidential capacity". However, no plea for exclusion on this basis was made by the committee, either verbally or in the brief.

The second point argued by the opposition was that the societies asking for the new legislation were not proper persons to appear before the Board or to attempt collective bargaining for professional workers, because in their membership they included employers as well as employees. The fact that the brief had pointed out and the chairman of the committee had emphasized specially, that it was not proposed that the societies should do collective bargaining, but that a new body made up only of employees was to be established for the purpose, seemed to be lost on the opposition. The brief reads:

"In particular we should say, with reference to the professional employees' bargaining agency, it is intended that it be composed only of employees who are functioning in a professional capacity. It is not intended that it should contain any person who is in fact in the position of an employer. Accordingly there is no difference between us and others who have raised a question on this point."

The continued harping on these two irrelevant points by those who opposed the application left one with the impression that there were no real arguments against it.

In fact, it is likely that unprejudiced listeners were convinced of the justice and right of the professional workers' case, as much by what the opposition said as by the brief itself.

The Canadian Manufacturers' Association presented a brief opposing the proposed legislation, but asking instead that professional workers be excluded permanently from the present order.

The Canadian Congress of Labour brief stated:

"Our position in this matter springs from principle, the principle that every man or woman who works for a livelihood in this country has an unqualified right, a right without reservation to have a voice in the determining of his or her mode of livelihood, to determine that by the accepted agency of collective bargaining."

As each society had obtained an overwhelming majority vote from its members favouring collective bargaining by other than a trade union, it would seem that they had already used their voice to determine their own bargaining agency. They had said clearly that they did not want a trade union. On the ballot less than 1% voted for bargaining by a trade union.

The lawyer speaking for the Association of Technical Employees (C.I.O.) opened with the statement "I represent some people who are most concerned with the issue before the Board." Subsequently in response to an enquiry from a Board member as to how many graduate engineers were members of the organization, the secretary replied, "I am sorry I cannot tell you that offhand." It would have been interesting to know how many of the "persons most concerned" were professional workers, as it might have given some light on the A.T.E.'s interest in the issue. Their argument, like the others, though more voluble, was almost entirely on "confidential capacity" and the presence of employers in the membership of the societies. It took twenty-one foolscap pages of the stenographer's notes to record it all!

The Trades and Labour Congress representative's argument was no more convincing but was more amusing. He did not think much of engineers and science workers. Among other things, he said, "We think the term 'professional' is an apt one to describe those who practise their theoretical training, but to describe them as professionals in the same sense as doctors and lawyers is fictitious and misleading," and "their position is analogous to other groups performing specialized services such as toolmaking." As an argument against separate legislation he said, "Any proposal to elevate individual technicians within a group to a snobbish and priestly caste, and to alienate them from their colleagues, is detrimental to morale and should be frowned upon."

The representative of the Canadian and Catholic Confederation of Labour stated:

"We are not prepared to deal with the federal code as far as it concerns professional employees. If they wish to be covered by the federal code, we have no objection. If they do not insist on that, we are not asking for it. We believe that the interested parties should deal with their own problems and if they offer a solution which they think is a good one, we are ready to support it."

Again it can be said that the day's experience was a bit of an education. If eventually engineers have to bargain collectively through, or in opposition to, trade unions, this day's exhibition should be very helpful, but as far as progress is concerned, "there is nothing to report".

*Seated (left to right)*—J. A. Lalonde, councillor E.I.C.; L. Austin Wright, general secretary E.I.C.; de Gaspé Beaubien, president E.I.C.; C. C. Lindsay, president C.P.E.Q. and chairman of Montreal Branch E.I.C.; A. D. Ross, secretary-treasurer C.P.E.Q.; P. E. Poitras, councillor C.P.E.Q. and councillor E.I.C. *Standing (left to right)*—Louis Trudel, assistant general secretary E.I.C.; J. E. Armstrong, councillor E.I.C.; R. E. Hartz, councillor E.I.C.; E. V. Gage, councillor E.I.C.; G. A. Gaherty, member E.I.C. Committee on Professional Interests; J. B. Stirling, chairman E.I.C. Committee on Professional Interests; Marc Boyer, special representative C.P.E.Q.; E. A. Ryan, councillor C.P.E.Q.; J. A. McCrory, councillor C.P.E.Q.

## FIFTH MILESTONE

The fifth milestone on the journey from individual effort to complete cooperation between professional engineering organizations in Canada was passed on Saturday, January 20th, when the officers of the Corporation of Professional Engineers of Quebec and The Engineering Institute of Canada signed the recently approved agreement for cooperation. This brings the Institute into direct alignment with five out of the eight provincial organizations. In a sixth province, Manitoba, a ballot was submitted successfully to the membership of both organizations some time ago but certain amendments necessary to the by-laws of the Association are still pending.

The signing officers of the Corporation were C. C. Lindsay, president, A. D. Ross, secretary-treasurer, with Paul E. Poitras and E. A. Ryan as witnesses. For the Institute, deGaspé Beaubien signed as president and L. Austin Wright as general secretary. J. A. Lalonde and J. B. Stirling were the witnesses. The ceremony took place at the headquarters of the Institute before officers, councillors and members of both organizations.

A point of great importance is that the privilege provided by the agreement relative to remission of entrance fees is available only to those who take advantage of it within ninety days of the effective date of the agreement. Thus, the privilege expires on March 31st, 1945. In order to remind members of the Institute in Quebec who are not members of the Corporation, a letter has gone out from the president urging that immediate action be taken. A similar communication has been circulated to members of the Corporation by its president, C. C. Lindsay.

The agreement provides that persons who were mem-

bers of either organization at the time of signing will not be required to pay the entrance fee of the other organization if they desire to become members of both, and others joining either body subsequent to the date of the agreement are given the same privilege.

The agreement is somewhat different from those entered into in Alberta, Saskatchewan, New Brunswick and Nova Scotia, due to conditions which apply only in the province of Quebec. For instance, the Quebec Corporation is the only provincial registration body that grants full membership to a person just graduated, regardless of his age or experience. This procedure is in line with that followed in medicine and law, but is quite different from that followed in engineering in the other seven provinces and also from the requirements for membership in the Institute. It has been made necessary by provincial conditions that do not exist in the other provinces:

A further feature is that a joint committee is to be established immediately to study the possibilities of developing an extensive cooperative programme beyond that already provided by the agreement. It is believed that Quebec presents unique opportunities for cooperation, and it will be the duty of the joint committee to develop and submit ideas on a continuing basis.

The completion of this fifth agreement will be a matter of gratification to engineers in Quebec as well as elsewhere, particularly to the groups in every province who have worked so long and arduously in the interests of cooperation within the profession. It remains for the engineers in Quebec to signify at the earliest date their desire to become joint members, thereby transmuting words into deeds.

## AMERICANS HONOUR CANADIAN ENGINEERS

At the recent annual meeting of the American Society of Civil Engineers, an honorary membership in the society was conferred on Arthur Surveyer, a past-president of the Institute. Dr. Surveyer was presented for the honour by Institute Past-President J. B. Challies who made the following citation:

Mr. President and Members of the American Society of Civil Engineers:

"It is a great privilege for me to present Dr. Arthur Surveyer for that outstanding and well-guarded distinction in the engineering profession—honorary membership in the American Society of Civil Engineers. In so recognizing a distinguished Canadian engineer, your Board has also paid a gracious and much appreciated compliment to the national engineering society of the Dominion, since Dr. Surveyer was president of The Engineering Institute of Canada in 1924 and 1925.

"Ever since its inception in 1887, the Institute has enjoyed and profited by close relations with the American Society of Civil Engineers; indeed, our first and founder president, the late Thomas Coltrin Keefer, became your president in 1887. In the interval you have emphasized, with great discernment, the good relations which exist between our two organizations. Twice you have called leading members of the Institute to your Board of Direction; thrice you have awarded honorary membership to one of our past-presidents. It is an interesting fact that by your action to day our three senior living past-presidents have their names included in your Roll of Honour.

"Dr. Surveyer's academic standing is well attested. A Bachelor of Arts of Laval in 1898; a Bachelor of Applied Science in Civil Engineering of the Ecole Polytechnique in 1902; a post-graduate of the Ecole Spéciale d'Industrie et des Mines du Hainault, Mons, Belgium; an Honorary Doctorate of Engineering of Rensselaer Polytechnic Institute in 1925 and an Honorary Doctorate of Laws at Montreal University in 1942.

"His professional attainment is such that a leading financial paper of Canada recently said a list of his clients reads like a 'Who's Who' of Canadian corporations.

"His public service includes membership during both War I and War II in the National Research Council; an active member for 25 years of the Corporation of his own Alma Mater; a founder and for many years a director of the Canadian Institute of International Affairs; a member of the Federal Government Committee on Reconstruction and presently chairman of the Committee on Post-War Planning of the Canadian Chamber of Commerce.

"Mr. President, this brief recital of his attainments will explain why a past-president of The Engineering Institute of Canada can with pride now ask you to present Dr. Arthur Surveyer with the official evidence of the distinctive honour that your Board of Direction has so fittingly awarded him."

The president of American Society of Civil Engineers, in conferring the honour, said, in part:

"Upon completion of his studies in Belgium, Surveyer returned home for a position with the Department of Public Works of Canada. (Montreal was and is home to Arthur Surveyer, for he was born there in 1878 and has maintained an office there for many years.) After several years of experience on design and construction, he established the firm of Arthur

Dr. A. Surveyer

Surveyer and Company. For 33 years this firm has designed and supervised many important engineering works and has specialized in investigations for banking firms, public utilities and industrial corporations.

"Among these assignments were the preliminary design and estimate for a 240,000-hp. development on the Ottawa River at Caribou; preliminary design and estimate for a 70-ton Kraft paper mill; plans for a 1,500,000-gal. reservoir of reinforced concrete for the Canadian Pacific Railway; design and supervision of the construction of a six-storey department store in Montreal for Dupuis Frères.

"Dr. Surveyer's ability as an impressive, serious, and mildly witty after-dinner speaker is well known. It was demonstrated at the Special Meeting of the Society held in Buffalo a number of years ago, when he responded for Canada to a toast to the engineering profession. When he finished, the whole company stood up and gave him a hearty reception.

"On a famous occasion in Toronto when engineers from all over the Dominion were gathered for what was termed a 'tribal shout' to celebrate the selection of an engineer as Chairman of the Ontario Hydro-Electric Power Commission, Dr. Surveyer stole the show, notwithstanding the fact that well-known speakers from other professions were present. Like all good speakers, he thinks his own efforts are terrible and he does his best to avoid special assignments, but once he takes one on he can be depended upon for an original, apt, timely, and appealing speech.

"One of Dr. Surveyer's principal interests in recent years has been the Canadian Institute of International Affairs, of which he was one of the founders and is to-day one of the directors. Perhaps there are few Canadians, outside of those who are giving full time in the diplomatic service and other fields of international affairs, who are better posted on international questions than he. At nearly every round-table discussion on these matters on either side of the boundary among semi-official and unofficial groups during the last ten years he has been one of the principal speakers.

"Dr. Surveyer has taken a very deep and continuous interest in the Ecole Polytechnique, the French-Canadian Engineering Faculty connected with Montreal University. The fact that graduates from this faculty are sought after, and are to-day occupying important positions, throughout industrial Quebec is due to a large extent to his leadership. In the Great War, Dr. Surveyer was asked by the Govern-

ment of Canada to help organize the National Research Council—a body of leading Canadian scientists from the principal universities, with two consulting engineers, one the late Dr. R. A. Ross, Past-President of The Engineering Institute of Canada, and the other Dr. Surveyer, also a Past-President of the Institute. Dr. Surveyer is still a member of the Research Council, which has been responsible for inspiring the solution to technical problems of tremendous import to Canada's war effort.

“Perhaps the best example of the difficulty of applying theory to practice is that to be found in Dr. Surveyer's outstanding ability to explain the theory of hooks and slices in golf, accompanied by his great difficulty in keeping his score below 100. Dr. Surveyer can expound learnedly upon the reasons for each of the six different kinds of slices, but he cannot explain why on the fairway in the course of a game he cannot keep from demonstrating each of these different kinds at least once. Notwithstanding his learned expertness on the theory of golf and his ability to expound his theory, he is a popular member of the Royal Montreal Golf Club, the oldest and the original golf organization on this continent, founded in 1872. All his English friends envy him his outstanding ability to use the King's English, both in speech and in writing, although at all times he is most retiring and unassertive.

“In addition to his engineering practice, Dr. Surveyer has served as director of the Shawinigan Water and Power Company, the Chromium Mining and Smelting Corporation Ltd., and the Holland-Canada Mortgage Bank. He also has been a Commissioner-Censor of Credit Foncier Franco-Canadien. He was a member of the Canadian Council for Industrial and Scientific Research from 1917 to 1924, of the Canadian Research Council from 1942 to date, and of the Canadian Advisory Committee on Reconstruction in 1943.

“Dr. Surveyer became a Member of the Society in 1924. He is also a member of The Engineering Institute of Canada, of which he was president in 1924 and 1925, being one of four men to hold this position for more than one year since the founding of the Institute in 1880. He is also a member of the Corporation of the Ecole Polytechnique de Montreal, the Corporation of Professional Engineers of Quebec, the American Economic Association, and the American Management Association. He is the representative of The Engineering Institute of Canada on the Council of the Engineers' Council for Professional Development, and is chairman of the Committee on Postwar Policies of the Canadian Chamber of Commerce.

“Thus it is an outstanding French-Canadian member of the profession who becomes an Honorary Member of the Society in the person of Dr. Surveyer.

## CHEMICAL INSTITUTE OF CANADA

The following progress report from the new Chemical Institute of Canada has been prepared for *The Engineering Journal* by the Interim Director of Information of the C.I.C. The *Journal* is pleased to bring these developments to the attention of its readers.—Ed.

The Chemical Institute of Canada has now successfully completed the first half-year of its existence. The Institute was founded in Toronto in June 1944, in answer to an overwhelming mandate on the part of Canadian chemists and those associated with Canadian

chemical industry. It is an amalgamation of the Canadian Chemical Association, the Canadian Institute of Chemistry, and the local sections of the Society of Chemical Industry. It will serve as a truly unified and national organization.

The past six months have been devoted chiefly to necessary work of organization on the part of the Interim Board of Directors. Much work remains to be done, but sufficient has been accomplished so that the Institute can offer a full complement of services to its members as of 1st January 1945. Accordingly it is now actively soliciting members.

A few highlights of the Directors' Report to Council follow. The appointment of Mr. H. W. Lea, Director of the Wartime Bureau of Technical Personnel, Ottawa, as General Manager and Secretary, with effect as of 1st October 1944, was confirmed. Mr. Lea has already busied himself with the affairs of the Institute, and has paid one official visit to the Maritime Provinces. Other visits to Local Sections across Canada will follow. The national headquarters of the Institute has been established temporarily in Toronto, but when circumstances permit, will be moved to Ottawa.

Mr. W. E. Pomeroy, Toronto, Director of Conferences, reported that the Directors had accepted on behalf of the Institute an invitation to hold the first Annual Conference at Quebec City in June. Mr. Pomeroy was chairman of a sub-committee, composed of Mr. D. C. Lloyd of Montreal and Dr. J. J. Rae of Toronto, which has drafted a Charter and By-laws. It is proposed to amend the Federal Charter of the Canadian Institute of Chemistry, granted in 1921. The By-laws, however, are entirely new. They are intended to perpetuate all the good features of the amalgamating organizations, and to add many new services. In particular the By-laws provide for two classes of members, professional and non-professional, both of equal status. Professional interests will be cared for by a standing Professional Affairs Committee of the Council. The Institute will function locally through Local Sections, Subject Divisions, and Student Chapters. Action in legislative matters is provided for by Provincial Branches. Elections will be held nationally and also through Electoral Districts. The first elections will be held this spring.

Plans are well advanced with a view to the establishment of a national Speakers Bureau and a number of Subject Divisions.

Dr. H. R. L. Streight, Montreal, Director of Business, has been organizing a membership campaign on a national scale. During the month of January ten thousand chemists or persons interested in chemistry across Canada will receive a brochure, outlining the history, objects and services of the Chemical Institute of Canada, and an application form. Fees have been set as low as possible, commensurate with rendering the many worthwhile services which have been planned. Interested persons are asked to write to Mr. H. W. Lea, General Manager and Secretary, Chemical Institute of Canada, Room 605, 137 Wellington St. West, Toronto, Ont.

Other members of the Board of Directors, without portfolio, all of whom have made invaluable contributions, are: Mr. A. F. G. Cadenhead, Shawinigan Falls, Chairman of the Interim Council; Dr. Paul E. Gagnon, Quebec, Treasurer; Dr. R. H. Clark, Vancouver, Dr. T. Thorvaldson, Saskatoon; Dr. R. K. Stratford, Sarnia; Dr. R. R. McLaughlin, Toronto; and Dr. C. C. Coffin, Halifax, Directors.

After the acceptance of the Directors' Report on the 16th, the Council of the Canadian Chemical Association, the Council of the Canadian Institute of Chemistry, and the Canadian Council of the Society of Chemical Industry, met separately on the 17th. The Canadian Chemical Association will be disbanded as soon as its financial affairs are put in order. The Canadian Institute of Chemistry will continue in being only so long as may be necessary to secure an amendment to its charter. The S.C.I. has formed a single Canadian Section and will cease all local activities.

### NEW PRIZES

Although authorized by Council in 1942 the Keefer and Ross Medals are awarded this year for the first time. With their inauguration, the Institute now has an award for the best paper in each branch of engineering.

THE KEEFER MEDAL is established in honour of T. C. Keefer, the first president of the Institute who, incidentally, had the unique experience of being president of the American Society of Civil Engineers in 1888, the year after he presided over the affairs of the Canadian society. It is awarded for the best paper on a civil engineering subject.

THE ROSS MEDAL commemorates the name of R. A. Ross, president of the Institute in 1920, who devoted a large portion of his time and energy in advancing the affairs of the Institute and the profession. He was an electrical engineer of great repute. The medal is awarded for the best paper on an electrical engineering subject.

The first winner of the Keefer Medal is Max V. Sauer, M.E.I.C., for his paper, "St. Lawrence River Control and Remedial Dams—Soulanges Section", and of the Ross Medal, R. A. H. Hayes, M.E.I.C., for his paper "Electrical Equipment at Shipshaw".

CANADIAN LUMBERMENS' ASSOCIATION PRIZE—Another prize awarded this year for the first time has been made possible by a contribution of \$100.00 each year from the Canadian Lumbermen's Association. The first winner is Carson F. Morrison, M.E.I.C., for his paper, "Modern Timber Engineering".

For the information of members, the balance of the list of prizes is given herewith:

THE SIR JOHN KENNEDY MEDAL—To commemorate the great services rendered to the development of Canada, to engineering science and to the profession by the late Sir John Kennedy, past-president of the Institute. "Awarded as a recognition of outstanding merit in the profession, or of noteworthy contribution to the science of engineering, or to the benefit of the Institute".

THE JULIAN C. SMITH MEDAL—Founded to perpetuate the name of the late past-president of the Institute—Awarded for "achievement in the development of Canada".

THE GZOWSKI MEDAL—Founded by Sir Casimir Gzowski, president in 1889-90-91. Awarded for the best paper of the year on any subject.

THE DUGGAN MEDAL AND PRIZE OF \$100.00—Founded by G. H. Duggan, president in 1916, for papers dealing with the use of metals in moulded or fabricated shape for structural or mechanical purposes.

THE LEONARD MEDAL—Founded by Lieut.-Col. R. W. Leonard, president in 1919, for the best paper on a mining subject presented either to the Canadian Institute of Mining and Metallurgy or to The Engineering Institute of Canada.

THE PLUMMER MEDAL—Founded by J. H. Plummer, D.C.L., for the best paper on chemical and metallurgical subjects. Open to members of the Institute, or non-members if the paper has been presented to an Institute or a Branch meeting.

PRIZES TO STUDENTS AND JUNIORS—Five prizes of books or instruments to the value of \$25.00 for the best papers presented by Students or Juniors in the vice-presidential zones of the Institute.

The H. N. Ruttan Prize (Western provinces)  
The John Galbraith Prize (The province of Ontario).  
The Phelps Johnson Prize (English) (The province of Quebec).  
The Ernest Marceau Prize (French) (The province of Quebec).  
The Martin Murphy Prize (The Maritime provinces).

PRIZES TO UNIVERSITY STUDENTS—Twelve cash prizes of \$25.00 each for competition among students of Canadian engineering schools, in the year prior to the graduating year. Awards are now made annually to the following institutions:

University of Alberta.  
University of British Columbia.  
Ecole Polytechnique, Montreal.  
Laval University, Quebec.  
University of Manitoba.  
McGill University.  
University of New Brunswick.  
Nova Scotia Technical College.  
Queen's University.  
Royal Military College.  
University of Saskatchewan.  
University of Toronto.

### UNRRA

So that members may be informed of the most recent situation with regard to personnel for the United Nations Rehabilitation Administration, the latest letter from the Director of Personnel is presented herewith.—(Ed.)

6 January, 1945.

"Mr. Louis Trudel,  
Assistant General Secretary,  
The Engineering Institute of Canada,  
Montreal, P.Q., Canada.

"Dear Mr. Trudel:

"We have recently prepared a list of Canadians now serving on the staff of UNRRA which I am forwarding to you for your information. You will note that we have approximately one hundred persons now on the staff, and I am happy to say that they are very high-grade people. I want to express our thanks to you for your assistance in helping us to find suitable persons.

"At the present time there is a lull in our recruitment because of the delay in European operations of UNRRA, but presently we shall be looking for persons for the displaced persons programme in Germany for such positions as assembly center director and deputy director, welfare workers, and administrative officers. I shall advise you more specifically when we have more information, and I bespeak your continued cooperation. May I extend to you the best wishes of the season.

"Yours sincerely,  
(Signed) JOSEPH P. HARRIS,  
Director of Personnel.

# DRAFT ORDER IN COUNCIL FOR REGULATION OF LABOUR RELATIONS OF PROFESSIONAL AND SCIENTIFIC WORKERS AND THEIR EMPLOYERS

At the request of the Committee on Employment Conditions, the Journal prints herewith the draft of legislation that has been proposed by the "Committee of Fourteen" and presented to the Minister of Labour. It was this draft that provided the basis for the recent appearance of the representatives of the "Committee of Fourteen" before the Wartime Labour Relations Board (National) in Ottawa. The brief presented to the Board on that occasion appeared in the January Journal.

There is still no indication of what will happen but with this draft and the brief before them, members will be in possession of the entire evidence as prepared by the committee, and will therefore be in a position to appraise the decision when it is made.—ED.

**NOTE:—This Draft Order-in-Council is an adaptation of P.C. 1003. It incorporates new provisions or amends Provisions in P.C. 1003 only so far as is necessary to make the principles, machinery, and language of latter applicable to professional and scientific workers as distinct from employees generally.**

In order to make clear what is new or altered in this draft, the numbering of the provisions in P.C. 1003 has been retained and specific reference is made as to each provision which is to be altered or retained and to new provisions to be inserted.

The Minister of Labour has the honour to report:

THAT the Wartime Labour Relations Regulations were passed to facilitate the negotiation of collective agreements, and the adjustment of differences between employers and employees, particularly in industries essential to the prosecution of the war;

THAT many employees are members of professional associations incorporated under the laws of Canada or of the provinces, or hold degrees in various branches of science from recognized Universities, and are employed in work of a professional or scientific nature;

THAT by reason of their professional or scientific training or of their membership in such professional associations such employees share common interests affecting their professional or scientific capacities rendering it desirable that they should be able to deal with an employer or group of employers as a unit distinct from other employees in the conduct of negotiations and the adjustment of differences in respect of the terms and conditions of their employment;

AND THAT it is advisable and conducive to the war-effort to make provision for the regulation of the labour relations of such professional and scientific workers and their employers on the same principles as, but separately from, those contained in the Wartime Labour Relations and to set up a separate Board to administer the same.

*N.B.—Above recitals are new.*

Accordingly the undersigned has the honour to recommend that His Excellency the Governor-General in Council may be pleased, under the authority of the War Measures Act, Chapter 206 of the Revised Statutes of Canada, 1927, to make the following Order:

## SHORT TITLE

### SECTIONS

1. These Regulations may be cited as the Wartime Labour Relations (*Professional Workers*) Regulations (*Change*).

## INTERPRETATION

2. (1) (a) *No change*.  
(b) "Board" means the Wartime Labour Relations (*Professional Workers*) Board;

(change).

- (c) *No change*. (d) *No change*. (e) *No change*.
- (f) "Employee" means the employee of an employer who is employed in his capacity as a professional worker as herein defined; but does not include a person who though a professional worker within the meaning of this Order is employed in an executive or other capacity distinct from his professional or scientific training. (*amended*).
- (g) "Employer" means any person, firm or corporation employing three or more employees and includes His Majesty in right of Canada and any board, commission or other body incorporated to act as agent of His Majesty in right of Canada; it does not include His Majesty in right of any Province, or any department, branch or agency of any provincial government or any municipal corporation, unless and to the extent that the Lieutenant-Governor in Council of the Province concerned by Order consents to the application thereto of this order. (*Amended*).
- (h) *No change*.
- (i) "Employees' organization" means an organization of employees *in whole or in part* formed to regulate relations between employers and employees, and includes a "professional association" as herein defined. (*Change*).
- (j) *No change*. (k) *No change*. (l) *No change*.
- (ll) "Professional association" means an association of a kind specified in clause (lll) of this sub-section. (*New*).
- (lll) "Professional worker" means an employee who
  - (i) is a member of an association incorporated by provincial law for the purpose of controlling the admission to, and regulating the practice of the professions of engineering, land surveying, architecture, of chemical, metallurgical, physical, geological, or biological science, or who is registered by such association as a candidate in training for admission thereto;
  - (ii) is a member of an association incorporated by Dominion law for the promotion and advancement of knowledge and standards of any of the professions aforesaid; or
  - (iii) holds a degree in engineering, chemistry, metallurgy, physics, geology, biology, architecture or other branch of science from an university or college recognized by the Board for the purpose of these Regulations, or who is taking a course leading to such a degree from an university or college so recognized. (*New*).

(m) *No change.* (n) *Delete.* (o) *No change.*  
(p) *No change.*

(2) *No change.*

#### APPLICATION

3. *No change.*

#### RIGHTS OF EMPLOYEES AND EMPLOYERS

4. *No change.*

#### CERTIFICATION OF BARGAINING REPRESENTATIVES

5. (1) *No change.*

(2) If the majority of the employees affected are members of one *employees' organization*, that organization, *if so requested by the majority of employees aforesaid*, may elect or appoint its officers or other persons as bargaining representatives on behalf of all the employees affected; for the purpose of this section an employee shall be deemed to be a member of the employees' organization if he has in writing requested that organization to elect or appoint bargaining representatives on his behalf. (*Amended*).

(3) Where more than one employer and their employees desire to negotiate a collective agreement, the employees of such employers may elect bargaining representatives by a majority vote of the employees affected of each employer, or, if the majority of the employees affected of each employer are members of one *employees organization*, that organization, *if so requested by the majority of employees as aforesaid*, may elect or appoint its officers or other persons as bargaining representatives on behalf of all the employees affected. (*Amended as shown in it lics*).

(4) Where the employees' organization referred to in sub-sections (2) and (3) hereof is a professional association of which the employer concerned is a member that employer shall not participate in any way in any proceedings of the association relating to the request of the employees affected that the association elect or appoint bargaining representatives on their behalf nor shall he act as such a bargaining representative. (*Substitute for present sub-section (4)*).

(5) *Delete.* 6. *No change.*

7. Upon such application the Board shall, by an examination of records, by a vote or otherwise, satisfy itself that an election or appointment of bargaining representatives was regularly and properly made, and in the case of an *employees' organization*, that the organization acted with the authority of the majority of the employees affected as prescribed by sub-section two of section five, and that the unit of employees concerned is one which is appropriate for collective bargaining; and if the Board is not so satisfied, it shall reject the application. (*Change in italics*).

8. *No change.* 9. *No change.*

#### NEGOTIATION OF COLLECTIVE AGREEMENT

10-14. *No change except deletion of words "trade union or" in Section 10 (3).*

#### DURATION AND RENEWAL OF AGREEMENTS

15-16. *No change in these sections as amended by P.C. 6893, Sept. 1, 1944.*

#### GRIEVANCE PROCEDURE

17-18. *No change.*

#### UNFAIR PRACTICES

19. (1) No employer shall dominate or interfere with the formation or administration of an employees' organization or contribute financial or other support to it; *provided that where the employees' organization concerned is a professional association to which the employer and some of his employees belong it shall be lawful for the employer to pay his membership fees to that association*; and also provided that an employer may permit an employee or representative of an employees' organization to confer with him during working hours or to attend to the business of the organization during working hours without deduction of time so occupied in the computation of the time worked for the employer and without deduction of wages in respect thereof. (*Amended as italicised and with deletion of reference to trade unions*).

(2) *No change.*

20. (1) and (2) *Delete reference to trade union.* (3) *Omit.*  
(4) *Delete "trade union"*.

#### STRIKES AND LOCK-OUTS

21. *No change.*

#### INFORMATION

22. *Delete references to trade union.*

#### ADMINISTRATION

#### WARTIME LABOUR RELATIONS (PROFESSIONAL WORKERS) BOARD

23. There shall be a Board which shall be known as the Wartime Labour Relations (Professional Workers) Board and shall consist of a chairman, and of four other members, two of whom shall be appointed as representative of professional workers and two as representative of employers of professional workers. (*Changed*).

24. *No change.*

25. (1) *The Board shall decide all questions necessary to the effective operation of this Order, whether the same have been raised by parties or otherwise and its decision thereon shall be final and conclusive for all purposes of this Order. In particular the Board shall decide the following questions:*

(a) Whether a person is an employer or employee or a *professional worker* or whether an organization or association is an employees' organization or employers' organization or *professional association*;

(b) The unit of employees appropriate for collective bargaining in a particular case;

(c) Whether an agreement is a collective agreement; and

(d) Whether an employer is, or certified bargaining representatives are, negotiating in good faith.

(*Revised as italicised and substituted for original section.*)

26. (1) The Board may, by order delegate to any person, board or association all or any part of its jurisdiction relating to any particular

matter or class of matters. (Revised as italicised.)

(2) No change.

27. No change. 28. No change.

#### CONCILIATION OFFICERS AND BOARDS

29-35. No change except deletion words "trade union or" in Section 31 (1).

#### GENERAL

36-37. No change.

#### ENFORCEMENT

38-46. Delete references to "trade union" in Sections 41 (2), 42 and 44 (2).

#### MISCELLANEOUS

47. No change.

48. (1) The Industrial Disputes Investigation Act, and the Order in Council made on the sixth day of June, nineteen hundred and forty-one (P.C. 4020) as amended, shall except as to matters pending when this Order comes into force, be of no effect while this Order is in force. (Revised). (Changed as italicised).

(2) Omit. (3) The Wartime Labour Relations Regulations, P.C. 1003, February 17, 1944, shall not apply to employers and employees covered by these Regulations. (Substituted for present sub-section).

49. No change.

#### SCHEDULE A

No change.

HUMPHREY MITCHELL,

Minister of Labour.

### WASHINGTON LETTER

#### TOO MUCH TOO SOON

The last month has seen much recasting of plans. On the supply and production side, the position has changed greatly. In some respects it looks as though the coming year may be as difficult from a supply point of view as any year so far. This is due to a number of factors. It is now necessary to plan for the continuance of a two-front war throughout 1945. Krug has announced the recasting of all War Production Board plans on the basis of the assumption that the war in Europe "will continue indefinitely". All Stage II talks are being filed away for the time being. The tempo of the war in both Europe and the Pacific is being stepped up and battle experience has shown that the consumption of material on both fronts has been higher than was anticipated. This has been particularly true with respect to ammunition, rockets and mortars. Several large new projects have been authorized. As an example, a two hundred million dollar plant for the production of mortars is being rushed to come into operation in August of this year. The Army expects to need an additional million men by the middle of the year. The main difficulties will be with manpower shortages although there will be instances where shortages of basic raw materials will also cause difficulties. The May-Bailey bill proposing a limited National Service Act is being debated in the House as this is written and strong letters have been written by the President, General Marshall, Admiral King and by the Undersecretaries of War and Navy. Another difficulty in the supply position arises from the fact that the civilian economy in this country has been relying on accumulated stocks which it was hoped would last until

some reconversion to civilian production could be effected. However, all thought of reconversion has now been shelved and Krug has warned that civilian industry is facing tighter restrictions. Rationing controls have been strengthened and their scope may have to be extended.

Another factor in the supply position is the necessity for maintaining the economies of occupied countries. This task also is proving by experience to be even more difficult than was anticipated. Mr. Richard K. Law, British Minister of State, left Washington within the last couple of days after having taken part in a series of confidential discussions on the economic problems arising out of the liberation of large parts of Europe. The problem is a particularly difficult one. It is sufficiently complicated by the necessary disruption of European economies set up during the German occupation and the unavoidable destruction of transportation and port facilities. One of the main problems, however, is a critical shortage in shipping.

A world-wide shortage in coal has also been the subject of a number of studies and War Mobilization Director Byrnes has recently called for a "brownout" and issued instructions for the curtailment of the use of power, light and heat. Heavy trucks and tires are also subjects of special study and concern, and upward revisions in production targets. In general, every attempt is being made to undo the damage and prevent the recurrence of the stampede of optimism of three months ago. No doubt there will be some leaning over backward, and the new Russian drive may drastically alter the picture, but the new watchword seems to be "too much too soon".

#### DIPLOMATIC DEVELOPMENTS

On the diplomatic front, developments have also moved forward rapidly. Mr. Stettinius' much discussed reorganization of the State Department is settling down to work. Within the last week, Secretary Stettinius has suggested periodic meetings of Foreign Secretaries of the principal United Nations. He has urged that the three big powers should band together to guarantee the peace and in this connection has come out in commendation of Republican Vandenberg's recent important speech. Vandenberg's speech has been widely acclaimed as an important step forward in American foreign policy. The speech moves out of the realm of theory and takes a stand against any principle of postponing important political decisions until the war's end. The speech aims at clearing up a lot of the present difficulties in respect to the so-called unilateral European arrangements at present made necessary by the lack of any settled policy respecting the guaranteeing of peace. It is felt in many quarters that Vandenberg's suggestion that the United States, the United Kingdom and Russia should move now to guarantee the demilitarization of Germany and Japan would go a long way toward clearing the general atmosphere, and a long way toward implementing Article XII which is one of the keystones of the Dumbarton Oaks proposal. Recent press reports predict that Stettinius will attend the forthcoming Three Power parley. As this is written Senator Connally, chairman of the Senate Foreign Relations Committee, is entering a proposal for an Interim United Nations Council and Democratic Senator Wheeler has entered the international lists with a number of suggestions of his own. The President has just announced, on the day after his inauguration, that ex-Vice President Wallace will take over from Jesse Jones as Secretary of Commerce. Meanwhile the furore caused by the London *Economist's*

article has died down and Mr. Churchill's latest speech has been well received.

### SCIENTIFIC WONDERS

On the engineering and scientific front it is becoming increasingly possible to release information which has previously been restricted. The superb work which is being done by Army engineers in temporary bridge work, both with bridges of the Bailey type and with new and highly developed pontoon-type bridges is beginning to appear in print and will constitute an interesting chapter in the art of bridge building. A recent article describes the fire resistant timber construction for the large U.S. Navy hangars with their 258-ft. span arches. The switching of equipment and material from the European theatre to the Pacific theatre has introduced a number of complicated problems of packaging, preservation and tropic proofing. These problems have called for ingenious solutions, sometimes even calling for the redesign of the equipment itself. Rockets and rocket ammunition is daily coming into greater prominence. Many manufacturing techniques such as the use of the rubber die, continuous injection moulding, the use of plastics, sub-zero treatment of steel, and many other techniques have been advanced by war-time necessities. Particularly marked have been the advances in rubber and synthetic rubber. The new Koroseal lends itself to many purposes. New smooth rubber for bearings has been developed. Oil resistant rubbers, rubber that will stand up to sub-zero temperatures, and a rubber which will carry electricity and eliminate the static hazard have been amongst the many problems solved by the industry.

Interesting also have been recent articles on the scientific choice of bombing objectives. The extremely thorough and painstaking air campaign against the German ball-bearing industry, calculated to affect the whole range of German war-time production, is a case in point. The concentration on the destruction of locomotives and the concentration on oil and gasoline refineries are also good examples.

Washington, D.C., E. R. JACOBSEN, M.E.I.C.  
January 21st, 1945.

### CORRESPONDENCE

#### Method for Drawing Approximate Ellipses

457 Elm Ave., Westmount, Que.  
January 8th, 1945.

The Editor,  
*The Engineering Journal*

Dear Sir:

During the past year, while engaged as a draughtsman on plans, tracings, etc., in connection with mine-sweeper vessels, the writer had occasion to draw a great number of small ellipses (manhole covers to fuel tanks, side and deck openings for anchor chains, etc.) and at first experienced some difficulty in doing this.

Text books, it is true, give graphical methods (using circular arcs) for drawing approximate ellipses and, while these do well enough when the drawing is of an appreciable size, they were found to be useless for small ovals (too much construction work on too small a space).

It was easier in fact to find by trial, arcs that would approach the required dimensions of the oval. This method, too, was not very satisfactory as it was hard to keep the junction points of the arcs from overlapping, and besides the many perforations made in the paper by the compass points were not desirable.

Under these circumstances, the writer worked out a

method (indicated below) which gave excellent results and which may or may not be known to others.

Letting  $a$  equal half the long diameter and  $b$  equal half the short diameter, then the radius for the small arcs is always  $\frac{a}{2}$ .

The radius  $R$  for the large arcs is given by

$$R = \frac{b^2}{2b - a}$$

As the dimensions  $b$  and  $a$  are usually in even feet or inches, the value for  $R$  can, in most cases, be found mentally in a few seconds. The rest is easy.

Fine pencil lines joining the centres as indicated are produced until they cut the small arcs at the points  $P'$ ,  $P''$ ,  $P'''$ ,  $P''''$ , and these points become the junctions of the small and large arcs.

It might be noted that the arcs have common tangents at these junction points, for the derivation of the formula giving  $R$  was based on this assumption.

Also to be noted, is that the formula is applicable in every instance. For example:

If  $a = b$ , then  $R = b$ , and the figure becomes a circle.

If  $b = \frac{3a}{4}$  or  $a = \frac{4b}{3}$ , then  $R = \frac{3b}{2}$ , and the centres for the large arcs lie midway between the points  $O$  and  $C$ , and  $O$  and  $D$ .

If  $b = \frac{2a}{3}$  or  $a = \frac{3b}{2}$ , then  $R = 2b$ , and the centres for the large arcs lie at the extremities of the short diameter.

If  $b = \frac{3a}{5}$  or  $a = \frac{5b}{3}$ , then  $R = 3b$ , and the centres fall outside the figure.

Finally, if  $b = \frac{a}{2}$  or  $a = 2b$ , then  $R$  becomes infinite and the oval has flattened out until the figure becomes two semi-circles of radius  $\frac{a}{2}$  joined by straight lines.

In the example shown, drawn to a scale of one inch to the foot,  $a$  was taken as 21 inches,  $b = 15$  inches,

therefore,  $R = \frac{15 \times 15}{(2 \times 15) - 21} = \frac{225}{9} = 25$  inches, and  $E$ ,  $F$ ,

$G$ , and  $H$  become the centres from which the arcs are struck.

When  $b$  is made  $\frac{2a}{3}$ , that is, when the centres for the large arcs lie at the extremities of the short diameter,

it will be found that the resulting figure approaches so closely to an ellipse of similar dimensions that it could, virtually, be almost superimposed upon it.

It would seem therefore that, in designing and building concrete arches, so far as symmetry and utility are concerned, such an oval might well be used in place of the true ellipse.

It is chiefly, however, in the hope that it might be of use to other draughtsmen that the method outlined above is now submitted.

Yours very truly,

*Signed* E. S. M. LOVELACE, M.E.I.C.

## MEETINGS OF COUNCIL

A meeting of the Council of the Institute was held at Headquarters on Saturday, December 16th, 1944, at nine thirty a.m.

*Present:* President deGaspé Beaubien (Montreal), in the chair; Vice-Presidents L. F. Grant (Kingston) and C. K. McLeod (Montreal); Councillors J. E. Armstrong, R. S. Eadie, E. V. Gage, R. E. Heartz, J. A. Lalonde and P. E. Poitras of Montreal, H. R. Sills (Peterborough), J. A. Vance (Woodstock), and W. S. Wilson (Toronto); Secretary Emeritus R. J. Durley, General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

There were also present by invitation—President-Designate, Dean E. P. Fetherstonhaugh, of Winnipeg; J. B. Stirling, chairman of the Institute's Committee on Professional Interests; S. R. Frost, chairman of the Toronto Branch, and G. J. Currie, immediate past-chairman of the Halifax Branch.

*Post-War Policy of the Institute* (Rehabilitation of members in the Active Services)—The general secretary requested, in view of certain communications from officers of some of the Ontario branches, that Council give further consideration to the previously determined proposal to place in Toronto a new member of the staff whose duty it would be to assist in the rehabilitation of the members in the active services. The letters were from councillors in the Toronto and Hamilton branches and in each instance suggested that it might not be the best policy to place such a man in Toronto.

The president called on Mr. Frost, as chairman of the Toronto Branch, for an expression of opinion. Mr. Frost explained that the Toronto executive realized that a member of the staff placed in Toronto could give considerable help to the Toronto Branch, all of which was badly needed, but they didn't want other branches of the Institute to think that this man was placed there at their instigation as under such circumstances the branch would be adversely criticized. He referred to the work that such a man might do in relationship to other placement agencies in the province. He thought care should be taken that there would be no duplication of effort.

Mr. Frost went on to say that it had been suggested that the man might be located at Headquarters but that he might spend considerable time in the Toronto area. Under these circumstances he thought Toronto would have no complaint to make and would be glad to support the Institute in such a policy.

Mr. Wilson said that at the executive meeting of the branch a suggestion had been made that the money might be spent to better advantage in other things, such as an increased rebate to the branches and further assistance to the junior sections. He also announced that the Toronto executive had contemplated collecting an additional \$2.00 per member in order to augment

the branch finances but that no decision had been made which could be reported to Council.

The president explained that he understood that in most instances the branches had accumulated reserves of funds under the present rebate system. He thought that any general increase in rebates would only increase these surpluses and might not actually increase the activities. He pointed out the increase in Institute activities that could be realized if there were a greater income for Headquarters.

Colonel Grant was of the opinion that the discussion involved two separate items (a) an employment agent for getting men out of the forces and out of wartime industry into peace time occupation. He thought that if such a man were employed exclusively on this work the membership would respond generously to the request for a voluntary assessment to assist in financing the additional expense, and (b) rebates to branches, which he thought should not be introduced at the present time, although as a member of the Kingston Branch he appreciated the limitation under which at least some of the branches were working. He thought that a man to handle rehabilitation work should be placed at Headquarters but that ample provision should be made for him to visit all parts of Canada where his services were required.

The president reviewed the subject and the discussion and summarized it by stating that the question before the meeting was whether or not it was still the wish of Council that such a man should be employed and that he should be placed at Headquarters, and that as a means of meeting at least part of such costs the corporate membership be assessed on a voluntary basis a minimum amount of \$2.00.

Mr. Vance stated that he was strongly in favour of employing such a man and that the membership at large should be given an opportunity to contribute.

Mr. McLeod moved that Council confirm its previous decision that a man be engaged for rehabilitation and that a voluntary assessment of \$2.00 be made on all corporate members. This was seconded by Mr. Poitras.

In the discussion which followed Mr. Gage suggested that it might be desirable to appoint two such representatives, one with headquarters in Toronto and one with headquarters in Montreal. Mr. Lalonde inquired as to the proportion of the total cost that would be obtained by the voluntary assessment, to which the president replied that there was no means of finding out except by trying, but that many individuals had indicated a desire to contribute to such a work even well beyond the minimum amount which had been agreed upon. Dean Fetherstonhaugh agreed that a request to the membership at large would meet with a good response and he thought that Council should proceed on that basis. The motion was put to the meeting and carried unanimously.

*Employment Conditions* (Collective Bargaining)—Mr. Heartz, chairman of the Committee on Employment Conditions, gave a complete statement of conditions as they exist at the present time, including a review, clause by clause, of the proposed new order in council. He explained in many cases the reasons for the inclusion of certain clauses in the order in relationship to the existing order 1003.

He brought Council up to date on all the recent developments, announcing that an invitation had been sent out by the National War Labour Board to a great many organizations, including technical societies and labour groups to appear before it on January 9th to discuss the professional worker in relation to the existing order.

He also announced that a meeting of the fourteen societies had been called for December 20th in Ottawa so that the situation could be resurveyed and the plans of the group revised if it were found desirable or necessary. The sub-committee of three, consisting of Messrs. MacRae, Dobson and himself would meet in Ottawa on December 19th in order to prepare the presentation of the case for the general meeting on the following day.

Mr. Hartz indicated that there would be opposition to the new order being issued and he wanted to draw the attention of Council to the fact that if the new order were refused eventually, his committee's only option was to ask for total exclusion from the present order 1003. He based this statement on the results of the Institute's questionnaire which showed that over eighty-five per cent wanted collective bargaining if it could be secured through a new order or a suitable amendment to the present order that would give the professions control of their own bargaining agencies. In the event of such order or amendment not being obtainable the Institute membership voted sixty-five per cent in favour of obtaining total exclusion from 1003.

He pointed out the possibility of confusion between policies of different organizations as indicated in the fact that at least one provincial association of professional engineers had already established a bargaining agency under the title of The Federation of Employee-Professional Engineers and Assistants, and apparently was prepared to bargain under the existing order. He pointed out also that three out of four provincial associations with which the Institute had agreements had used the Institute questionnaire in canvassing their members and had obtained the same results. Therefore it seemed that these three associations and the Institute had no alternative but to ask for total exclusion in the event of being unable to get the new order.

In view of this possible confusion he thought it was very important that all organizations should be represented in Ottawa on December 20th, particularly the provincial professional associations.

In conclusion, Mr. Hartz moved the adoption of his progress report, including in it the approval of the proposed new order. This was seconded by Mr. Vance and approved unanimously.

Mr. Hartz continued with a further report from his committee dealing with the request of Council that the committee consider the suggestion made at the last meeting that the Institute give financial support to the proposed new collective bargaining agency for the province of Quebec, and approval to the establishment and form of the organization. In reporting, Mr. Hartz divided his subject into two parts—(a) the constitution of the proposed federation, and (b) the question of financial assistance. He explained that consideration of the new developments in relationship to the proposed new federal order had given him and the committee so much work since the last meeting of Council that they had had insufficient time to deal properly with the reference from Council. Therefore, in relationship to item (b) he reported as follows:

"The Institute Committee on Employment Conditions recommends that Council offer encouragement and financial support in the establishment of a collective bargaining organization in each province if and when requested by appropriate groups, to administer the new proposed Order in Council as submitted by the fourteen societies to the Minister of Labour, it being understood—

"That the bargaining organization be made up of

and directed by representatives of all qualified organizations that wish to be included, and would bargain for all professional workers without regard to membership or lack of membership in any organization. In other words, a co-operative effort in which all qualified organizations would be closely affiliated, and all in accordance with agreement reached at Ottawa on August 15th and October 3rd, and with the terms of the proposed Order in Council.

"The committee is studying the constitution of the proposed Quebec Federation of Employee-Professional Workers but is unable to recommend to Council any action with regard to it at this time."

Mr. Poitras pointed out that he thought that there was some need of getting the new federation into action quickly as he had been informed that already a labour union was endeavouring to organize one of the large public utilities in Montreal and to include the engineers. He went on to explain the steps taken by the Corporation to bring together representatives of the various societies to form a federation similar to that which had been inaugurated by the Ontario Association of Professional Engineers. He further explained that the architects had expressed themselves as not being greatly interested because they were mostly self-employed. On the other hand the chemists wanted to bargain and would be glad to co-operate with other organizations in doing so.

Mr. Eadie asked Mr. Poitras if the public utility to which he had referred was being organized under Order 1003 or under the Quebec law. In response Mr. Poitras replied that it was under 1003. Mr. Eadie stated that he did not see how the engineers could be included inasmuch as they were excluded now from that order by a ruling of the Board.

Mr. Poitras said that he had had a report to the contrary and that the engineers' exclusion expired on October 12th. Mr. Hartz stated, at this point, that the Board had not withdrawn the exclusion on October 12th and that therefore engineers working in a professional capacity were still deemed to be working in a confidential capacity and therefore were excluded from the order.

Mr. Poitras explained that the Corporation believed it had a special responsibility in this matter and that it felt it a duty to assist in doing the best job possible. There was further discussion participated in by many councillors and eventually Mr. Eadie presented the following motion which was seconded by Mr. Sills and approved unanimously:

"In view of the discussion at today's Council meeting—and of the representations of Mr. Poitras as to the urgency of the matter, Council requests its Committee on Employment Conditions to consider the problem further at the earliest moment and report to the president and the Finance Committee, who are hereby authorized to take whatever action is deemed advisable."

*Rehabilitation of Members in the Armed Services*—The general secretary asked Council to consider the advisability of setting up a committee to settle matters of policy relative to the rehabilitation of members in the active services. He felt that this whole matter should not be left to Headquarters but that a committee representative of the three services and of industry should be established immediately.

Council agreed that such a committee should be established and authorized the president to select a chairman with power to name his own committee.

The general secretary announced that a letter, over the signature of the president, had been prepared and

also a questionnaire which it was proposed to send to every member of the Institute in uniform. This letter stated that the members in Canada wished to render a service to the men in uniform upon their rehabilitation, and asked the overseas members for certain information, as indicated on the questionnaire, which would be helpful in carrying out this work. It was proposed that the replies to these letters should be turned over to the committee for study and for determination as to policy.

*Community Planning*—The general secretary reminded Council that at the September meeting authority had been given to the president to select a chairman of a committee which would recommend to Council action which would be taken by the Institute to assist in developing the subject of community planning and the engineers' participation in it. Mr. Arthur Bunnell, of Wilson and Bunnell, Toronto, had been selected as chairman. Mr. Bunnell was now engaged as consultant on community planning by the Province of Ontario in its newly created Department of Planning and Development.

In response to the president's request, Mr. Bunnell had submitted the following proposal:

"I have recently had several conversations with various of my Toronto friends, some of whom are members of the Engineering Institute, some of the Town Planning Institute, some of the Royal Architectural Institute, and some just plain John Citizens, but all interested in planning.

"On Thursday last by invitation, I attended a meeting of the Council of the Royal Architectural Institute of Canada and exchanged ideas with them as to the re-establishment of the Town Planning Institute. We reached the following conclusions:

"1. That there was a great need in Canada for an organization to foster community, regional, provincial and national planning.

"2. That this could best be accomplished through an organization that admitted to membership, on an equal basis, all persons interested enough in the matter to join and that the members of the Engineering Institute of Canada and the Royal Architectural Institute of Canada, recognizing the need, should foster such an organization to the end that branches be established in all the larger centres across Canada.

"3. That both our organizations at the appropriate time, should convey to Mr. J. M. Kitchen, the Secretary of the Town Planning Institute, our deep appreciation for his having kept the charter alive through all its years of inactivity.

"That I should write to Mr. Kitchen, advise him of this meeting, the conclusions reached, and ask him if he would come with me and Mr. A. J. Hazelgrove, a member of the Council of the Royal Architectural Institute of Canada resident in Ottawa, and interview the appropriate officer in the Department of State with a view to ascertaining exactly what steps would have to be taken to revive the Institute and to amend its charter so as to provide for one class of membership only. As it stands, the Institute consists of honorary members, associate members, legal associate members, students and honorary associates.

"4. That contributions be sought from the Provincial and Federal Governments, all of whom at long last are displaying a tangible interest in planning, sufficient to enable the re-constituted institute to engage the services of an organizer with editorial ability to promote the formation of branches and to ensure the publication of a journal which would keep members informed not only of progress being made across Canada and in other countries, but would in addition

serve as a medium of exchange of members' views.

"5. That in any reorganization of the Institute it should, except for the financial aid referred to above, be entirely independent of any level of Government.

"Please accordingly let me hear from you at your early convenience as to whether or not you believe that the conclusions referred to above would be satisfactory to the Engineering Institute."

Council instructed the general secretary to advise Mr. Bunnell that it supported the proposal which he had made.

*New Engineering Organization*—With regard to the proposal for a new engineering organization, which had been referred by Council to the Committee on Professional Interests for consideration and report, Mr. Stirling, as chairman of that committee, presented the following letter to the president:

"At a meeting of the Committee on Professional Interests on December 15th, 1944, provisional approval was given to the attached draft of a proposed declaration of the principles and policy of the Council of the Engineering Institute with reference to its relations to sister societies having membership in Canada.

"As per instructions of Minute No. 3463 of the Edmonton meeting of Council on October 21st, 1944, the draft is being submitted to the presidents and secretaries of the associations having agreements with the Institute.

"In view of the importance of this draft the committee suggests that you, as president, refer it to each past-president and to each member of Council with a request that he transmit to Headquarters his comments thereon not later than Monday, January 29th. Such comments as are received by that date will be collated by the Committee on Professional Interests with a view to a submission for consideration at the plenary meeting of Council in Winnipeg on February 6th next, the day prior to the opening of the fifty-ninth annual general meeting."

In accordance with Mr. Stirling's request the draft declaration referred to in the letter will be submitted by the president to each member of Council and to each past-president.

*Co-operative Agreement in Quebec*—The general secretary presented the following report from the scrutineers appointed by Council to canvass the ballots on the proposed co-operative agreement between the Institute and the Corporation of Professional Engineers of Quebec:

*Ballot of Corporate Members:*

Total number of Ballots received . . . . .	836
In Arrears . . . . .	31
Invalid Ballots . . . . .	12
No . . . . .	96
Yes . . . . .	697
	— 836

*Ballot-Councillors:*

Total Ballots received . . . . .	38
Yes . . . . .	38

On the motion of Mr. Poitras, seconded by Mr. Eadie, it was unanimously resolved that the report be accepted, that the ballot papers be destroyed, and that the scrutineers be thanked for their services.

Through a letter from the president of the Corporation, it was noted that the Corporation had also recorded a favourable ballot, the details of which are as follows:

Total number of ballots received . . . . .	1168
Ballots in favour . . . . .	765

Ballots against . . . . .	344
Ballots rejected . . . . .	30
Ballots invalid . . . . .	29
— 1168	

In commenting on the very satisfactory results obtained, the president drew attention to the amount of work which Mr. Lalonde had done as chairman of the Institute's committee which had been working on this proposed agreement for over two years. On behalf of Council he thanked him most sincerely for his efforts.

On the motion of Mr. Hartz, seconded by Colonel Grant, the following resolution was passed unanimously:

"Council has noted with pleasure the results of the recent ballots on the proposed co-operative agreement between the Corporation of Professional Engineers of Quebec and the Institute, and it desires to record its appreciation of the efforts which have been put forward by Councillor J. A. Lalonde, who, for several years, has acted as chairman of the committee that has been fostering the proposal. Mr. Lalonde's efforts in bringing the subject so clearly before all the branches in the province, and his activity in obtaining a large return of ballots from Institute members, has been a great factor in producing the successful results. In acknowledging Mr. Lalonde's work Council feels that it is speaking, not only for its own membership, but for all engineers of the Province of Quebec.

"Council would be grateful to Mr. Lalonde if he would extend the Institute's appreciation to the members of his committee who assisted him in this project."

On the motion of Colonel Grant, seconded by Mr. McLeod, it was unanimously resolved that the president and the general secretary, or alternates appointed by the president, be authorized to sign the agreement between The Engineering Institute of Canada and the Corporation of Professional Engineers of Quebec.

The Council adjourned for lunch at one ten p.m., and reconvened at three o'clock with Vice-President L. F. Grant in the chair.

*Automatic Transfer of Students and Juniors*—Mr. Sills referred to a subject which the executive of the Peterborough Branch had brought to the attention of Council in 1943 relating to automatic transfer from Student to Junior. This proposal had been before Council previously and the general secretary had been asked to make a survey over the last five years in order to develop figures upon which a thorough study could be made. Mr. Sills had the general secretary's figures and now wished to bring the matter again to the attention of Council.

He explained that it was quite apparent that a great many persons delayed transferring to Junior until long after they had the qualifications. In this way the Institute was losing considerable revenue. His proposal was that Student members be transferred automatically at a certain specified period after graduation, without a transfer fee. Figures which he had developed showed that the increase in revenue from the earlier application of the Junior fee more than exceeded the loss of revenue from the cancellation of the transfer fee.

Mr. Sills pointed out, further, that his study revealed that applications for transfer from Student to Junior were almost never declined by Council. Therefore he felt that the transfer could be made without requiring a formal application for transfer with references, etc. He pointed out that the saving in work at Headquarters of following up delinquent Students would represent a considerable amount of money and would also relieve the Headquarters staff of a large volume of detail.

His proposal went on further to recommend that a

person be allowed to remain in the Junior classification as long as he wished, but that after a certain specified period of time the fee would be increased automatically to that of Member. For a Junior to be transferred to Member it would be necessary for him to make an application in accordance with the present by-laws.

Mr. Sills did not make any specific recommendation as to the periods of time involved in these changes but submitted for consideration a suggestion that a person would be automatically transferred from Student to Junior either in the second or third January after graduation. This would mean approximately one and a half or two and a half years. He suggested that the period for which the Junior fee would apply might be somewhere from six to eight years. In the case of members who entered the Institute as Juniors a maximum age limit would have to be applied at which time they would have the same increase in fee as would apply to Juniors who had been transferred from Student.

The chairman observed that this was a far-reaching proposal and would require changes in the by-laws. After some discussion, Mr. Hartz moved that the proposal be referred to the Membership Committee and that the thanks of Council be extended to Mr. Sills for his proposal. He also proposed that Mr. Sills' name be added to the Membership Committee. This was carried unanimously.

*Financial Statement*—It was noted that the financial statement to the end of November had been examined and approved by the Finance Committee. It showed a considerably improved situation over last year.

*Remission of Fees of Members in Combatant Areas*—On the recommendation of the Finance Committee it was unanimously resolved that the annual fees of members in combatant areas be remitted for 1945, in accordance with the policy which had been adopted since 1941.

*Institute Examinations*—On the recommendation of the Finance Committee and the chairman of the Board of Examiners, it was agreed that the whole procedure regarding Institute examinations should be reviewed, including the charges for examination, the basis of remunerating the persons who prepare and examine the papers and the invigilators. It was also suggested that the list of recommended textbooks be brought up to date.

*Alternative Proposal for Use of Institute Funds*—The Finance Committee had read a letter from Professor R. F. Legget in which six suggestions were made as to purposes for which he thought Institute funds might be used to better advantage than to establish an office in Toronto for some one to take charge of the rehabilitation of members in uniform. The committee felt, however, that it could not alter its previous recommendations to Council but thought Professor Legget's letter should be brought to the attention of Council so that the secretary could be instructed as to a reply. Each of the proposals was discussed and the secretary was instructed as to the reply.

*Increased Fees and Rebates*—As an outcome of consideration of Professor Legget's letter and of Councillor Wilson's earlier observations relative to increased rebates to branches, Council discussed at length the prospect of increasing the annual fee of the Institute. It would not be possible to increase rebates to branches with the present fee basis without greatly reducing the activities of Headquarters. Mr. Armstrong, as a member of the Finance Committee, stated that the annual surplus, averaged over a period of years, was not sufficient

to take care of increased rebates to branches and an increase of Headquarters activities.

Colonel Grant suggested that the Finance Committee might study this subject and make a report at a subsequent meeting.

On the motion of Mr. Hartz, seconded by Mr. Vance, it was agreed that the Finance Committee should endeavour to have a report on this subject ready for submission to the annual meeting of Council in Winnipeg on February 6th next.

*Engineer in the Active Services*—The general secretary reported that a letter had been sent for publication in *The Engineering Journal* by E. P. Muntz, M.E.I.C., in which the observation was made that in the present set-up at Ottawa in the Engineers' Corps there was no senior appointment available to engineers. The letter recommended that an engineer be appointed to the rank of Brigadier or Major-General who could act as a chief adviser on engineering matters, including personnel, to the Chief of General Staff. Such an appointment would place the engineers on a basis comparable to that established for the medical doctors. The general secretary explained that he was bringing the matter before Council so that consideration could be given to the desirability of transferring this matter to the Institute's Committee on the Engineer in the Active Services.

Colonel Grant stated that the general secretary had placed all the information before him the night previous, and that he had had some opportunity to familiarize himself with it. He thought that this afforded a further opportunity for the Institute to render a service to the profession. In view of the fact that the matter has been brought so forcibly to the Institute's attention he thought it would be a mistake not to follow up by means of the Institute's committee. He recommended, therefore, that it be referred to the committee and that the chairman, Dean D. S. Ellis, of Queen's, be asked to prepare a report for Council. On the motion of Mr. Eadie, seconded by Mr. Hartz, it was agreed that the subject be referred for further consideration to the president and the general secretary and that they be empowered to act on the recommendation of the committee.

*Hamilton Branch By-laws*—A letter was presented from the secretary of the Hamilton Branch asking Council's approval of a proposed amendment to the branch by-laws whereby the annual fee for a Branch Affiliate would be increased from \$3.00 to \$5.00. This is in accordance with a recommendation made some time ago by the Institute Membership Committee. On the motion of Mr. Vance, seconded by Mr. Armstrong, the proposed amendment to the branch by-laws was approved unanimously.

*Keefer and Ross Medals*—The general secretary reminded Council that in 1942 it was agreed that two new prizes should be created, one for papers on a civil engineering subject, to be known as the Keefer Medal in honour of the first president of the organization, and the other for an electrical paper, to be named the Ross Medal, in honour of Past-President R. A. Ross. He explained that these medals had never been awarded because of the difficulty of securing new dies. However, he recommended that awards be made this year even though the medals might not be available immediately. Council agreed to this unanimously, and the president was authorized to appoint two committees to make the selections.

*Medal Committee Reports*—The reports of the Gzowski, Leonard and Plummer Medal Committees were accepted, and awards were made as follows:

*Gzowski Medal*—To W. Griesbach, M.E.I.C., for his paper "Construction of Shipshaw Power Development."

*Leonard Medal*—To J. E. Gill and P. E. Auger for their paper "Zinc Deposits of the Federal Area."

*Plummer Medal*—To Wilfred Gallay for his paper "Plastics in Engineering."

The Leonard Medal Committee had suggested that as no award of that medal had been made last year, a second award should be made this year, and they had named a second paper. In view of the fact that two medals were required for the authors of the first paper, and as the proceeds from the fund would not warrant the awarding of two additional medals, Council decided to award two medals, one to each of the authors of the first paper as indicated above.

*Students and Juniors Prizes*—The reports of the examiners for the Students and Juniors Prizes were received, and awards were approved as follows:

*H. N. Ruttan Prize* (Western Provinces)—No award.

*John Galbraith Prize* (Province of Ontario) to A. Hershfield, S.E.I.C., for his paper "Plywood—A Structural Material for Aircraft."

*Phelps Johnson Prize* (Province of Quebec—English)—No award.

*Ernest Marceau Prize* (Province of Quebec—French) to Andre Leclerc, S.E.I.C., for his paper "Influence de la Vitesse d'essai sur la résistance."

*Martin Murphy Prize* (Maritime Provinces)—to J. L. Belyea, S.E.I.C., for his paper "The Cathode Ray Oscillograph and its Application in Industry."

The examiners for the Martin Murphy Prize strongly recommended a paper by F. W. Davidson, S.E.I.C., entitled "Principles of the Transformer," and Council agreed that this should be recorded in the minutes and that the president should write a letter of congratulation to Mr. Davidson.

*Job Evaluation*—Mr. Sills asked permission to bring up a subject about which Mr. G. R. Langley, of Peterborough, had written to the president early in the summer. It had to do with job evaluation for engineers. Mr. Langley has given a great deal of consideration to this subject and has prepared a synopsis of what he considers a reasonable job evaluation. In his opinion, before anything can be done in the way of collective bargaining, some basic value for jobs must be set up. This would have to be country-wide and would have to be done by some organization whose action would be authoritative. Mr. Sills had discussed the matter with Mr. Hartz, the chairman of the Institute's Committee on Employment Conditions.

Mr. Hartz stated that he had discussed this with an American firm of experts, considered to be outstanding on job evaluation and its related subjects. They admit that it is a very difficult problem, to which they have not yet found a satisfactory solution. While sympathetic to what Mr. Sills had said, Mr. Hartz did not think there was anything his committee could do at the present time.

Following some discussion, it was suggested that Mr. Langley and Mr. Sills might continue their study of this subject and submit some definite recommendations to Council. This was approved unanimously and the general secretary was directed to write Mr. Langley and ask if he would be willing to continue his investigation with this in view.

*Joint Finance Committee in New Brunswick*—It was noted that as the four members of the joint finance committee in New Brunswick had not selected a chairman within thirty days of their own appointment, in accordance with the terms of the co-operative agree-

ment, President Beaubien had named V. S. Chesnut, of Saint John, as chairman of the committee.

A meeting of the Council of the Institute was held at Headquarters on Saturday, January 13th, 1945, convening at nine thirty a.m.

*Present:* President deGaspé Beaubien in the chair; Vice-President C. K. McLeod; Councillors J. E. Armstrong, R. S. Eadie, E. V. Gage, P. E. Gagnon, R. E. Hartz, J. A. Lalonde, H. J. Ward and J. W. Ward; Treasurer R. E. Chadwick; Secretary Emeritus R. J. Durley, General Secretary L. Austin Wright and Assistant General Secretary Louis Trudel.

*Employment Conditions (Collective Bargaining)*—A letter dated January 9th, from Councillor P. E. Poitras, relative to the establishment of a collective bargaining agency in the province of Quebec was read to the Council. This letter reviewed some of the recent developments and concluded with the statement, "As a result the Quebec Federation of Employee-Professional Workers in Research and Applied Science is being organized."

Mr. Hartz reported that his committee had made a further study of the draft proposal for a collective bargaining agency in the province of Quebec and in accordance with the minutes of the last meeting of Council had reported to the president and the chairman of the Finance Committee. Though still unable to recommend the constitution, he reported that he had been in conversation with the chairman of the committee working on the proposal and he believed that it might be possible to have some modifications made that would meet the situation. He reported that further information had been received about the specific case which, at the last meeting of Council, was considered urgent, because of a reported attempt of a trade union to include engineers in a unit of heterogeneous employees which was being organized in Montreal, and he had found that the urgency had now been removed and that therefore in his opinion it was not necessary to rush the proposed organization.

He thought that it would be difficult to set up an organization or to prepare a constitution that would meet the needs until a final decision had been reached as to the form of the legislation under which engineers would have to bargain. Any constitution based on the existing order might be unsuitable for administration under the proposed new order, or any other arrangement decided upon by the Board.

Mr. Hartz then proceeded to report on the appearance made by the engineers before the Wartime Labour Relations Board (National) in Ottawa on January 9th. The fourteen societies were represented by the sub-committee which they had appointed, Messrs. MacRae, Dobson and Hartz, who presented a well prepared brief. He praised the presentation made by Mr. MacRae and expressed the opinion that the engineers handling their own case made a showing which did not suffer in comparison with that made by lawyers representing other groups.

He pointed out that there was opposition to the request for a new order. This came from the Canadian Congress of Labour (A.F. of L.), the Association of Technical Employees (C.I.O.), the Trades and Labour Congress of Canada, and the Canadian Association of Scientific Workers.

It was the opinion of the professional persons present at the sitting that the case put up by the opposition was weak. The trades union groups did not meet the specific statements made in the brief but resorted to references to democracy, class distinction, snobbery, and so on. The Association of Scientific Workers claimed

to represent a professional group made up of science workers numbering perhaps two hundred to two hundred and fifty.

The Ontario Association of Professional Engineers and its collective bargaining organization known as The Federation of Employee-Professional Engineers and Assistants, also presented short briefs, but these were quite in line with representations made by the sub-committee of three and therefore it was evident to the Board that the professional workers were presenting a united front.

Mr. Hartz went on to state that a brief was presented by the Canadian Manufacturers Association which opposed the engineers' request for a new order and asked instead that they be given total exclusion from the existing order. No brief was presented by the Canadian Chamber of Commerce although they had an observer present.

An interesting feature was that the representative of the Canadian and Catholic Federation of Labour was of the opinion that if the professional people wanted to handle their own collective bargaining provincially they should be given the right to do so.

Mr. Hartz pointed out that the Conference of Canadian Universities was represented by Dean J. J. O'Neill, of McGill, who reported that the universities had secured a telegraphic vote on the question and that they asked that the professional employees of the universities be excluded from collective bargaining legislation.

Mr. Hartz then went on to discuss the possibility of success in obtaining new legislation. He pointed out that the opposition carried considerable weight and that the Board might offer a compromise proposition. He thought the Board recognized the difficulty of the problem before it, both from the point of view of giving the engineers what they required and from satisfying the trade union groups.

Mr. Hartz then went on to explain the steps that have been inaugurated since the appearance before the Board to secure support for the new order which, at the moment, he did not think should be publicized too widely. He concluded by requesting that his remarks be taken as a progress report and approved. He had also requested that he be empowered to continue discussions with the other persons and organization that were interested in the formation of a collective bargaining agency in the province. He would also like to have the brief which was presented to the Board approved by Council.

It was moved by Mr. Armstrong that Mr. Hartz's report be approved and that Council give a vote of confidence to Mr. Hartz and his committee. This was seconded by Mr. McLeod and carried unanimously.

*Engineers and the Design of Buildings:* The Finance Committee reported that further thought had been given to the necessity of clarifying the Quebec provincial legislation so that in the future there could be no doubt as to the engineers' right to continue to design industrial buildings. In order to establish this fact, which doubtless would include revision of the legislation, the committee thought that the engineers should consider the creation of a special fund.

Mr. Chadwick was of the opinion that decision as to future policy should await the decision of the court on the case of Brian Perry and the Quebec Association of Architects. He agreed with the necessity of having the legislation clarified and pointed out that this might require a lot of work, and that it might need the full time services of some competent person for a consider-

able period of time. He recommended that after the court decision had been made a group of engineers should get together to formulate the future policy.

Mr. Armstrong agreed with the suggestion that the formulation of a policy should be deferred until the court decision was made. He pointed out that the Institute's interest was not restricted to the province of Quebec and that it would have to be concerned along with the provincial associations in other provinces where similar conflict between architects and engineers might develop.

Council gave unanimous approval to the Finance Committee's recommendation.

*Committee on Prairie Water Problems:* On the recommendation of the chairman of the committee, G. A. Gaherty, it was unanimously resolved that C. S. Clendenning and P. J. Jennings be appointed to the Committee on Prairie Water Problems.

*Canadian Standards Association:* A letter was read from the secretary of the Canadian Standards Association notifying Council that the term of office of its present representative on the Main Committee expires on March 31st, 1945, and asking for nominations for a representative for a further three year period. It was agreed that this matter should be brought before the next meeting of Council.

*Committee on Soil Mechanics or Soil Tests:* Mr. Chadwick reported that last fall the president had asked him to be chairman of a committee to carry out a certain task for Professor Terzaghi who was coming to Montreal to speak before the Montreal Branch. Dr. Terzaghi had asked for samples of certain clay found principally in the province of Quebec. He had arranged to have the samples secured and conveyed to Professor Terzaghi.

He now wished to point out to Council that there are many types of clay in Canada but that so far as he knew no scientific analysis had been made that would include them all. He knew that certain individuals in every province had a personal and practical knowledge of the local clay, but he thought an effort should be made to have them all classified in accordance with the new terminology developed under the heading of "Soil Mechanics". A national classification of this type, he believed, would be of considerable assistance to engineers inasmuch as a correct impression could be conveyed to engineers any place without the necessity of them seeing the clay deposits themselves. He pointed out the difficulty experienced by many persons making borings and test pits in recording their findings in such a way that they would be interpreted uniformly by all persons reading them.

He announced that he had suggested to Professor Legget of the University of Toronto that a course be established which might be attended by senior engineers in order to familiarize them with the subject of soil mechanics which had been developed in recent years. Professor Legget had approved of this suggestion and, as recently announced in the *Journ l*, arrangements had been made at the University of Toronto for this "refresher" course.

Mr. Chadwick recommended that the Institute set up a new committee or continue the temporary committee of which he had been chairman, so that the obtaining of the samples and the tests could be carried out on standard lines. He thought that the committee should include persons from each province whose companies, or who, individually, were specially interested in this subject. He believed there would be no difficulty in carrying out the work of the committee as long as

care was taken to choose the right representatives across the country.

The president gave approval to Mr. Chadwick's suggestion and recommended that Council authorize the continuance of the existing committee, perhaps changing the name to Committee on Soil Tests as recommended by Mr. Chadwick.

Mr. Armstrong approved the proposal that Mr. Chadwick continue with the chairmanship, and that he be empowered to select his own committee, and to prepare the terms of reference.

Mr. Chadwick suggested that he might endeavour to get a group of interested engineers together during the course of the annual meeting so that the organization work could be prepared in time for the gathering of samples in the early summer.

## ELECTIONS AND TRANSFERS

At the meeting of Council held on December 16th, 1944, the following elections and transfers were effected:

### Members

- Bach**, James R., B.Sc. (Elec.), (Univ. of Manitoba), mgr., instrument divn., Sparton of Canada, Ltd., London, Ont.  
**Bissett**, Ernest Eugène, B.Sc. (Mech.), (Univ. of Washington), consltg. engr., Vancouver, B.C.  
**Hueck**, Baron Boris de, B.Sc. (Polytechnic Institute of Riga, Russia), chief engr., Canadian Cottons Ltd., Cornwall, Ont.  
**Isbester**, James Emery, Capt., R.C.E., B.A.Sc. (Univ. of Toronto), Directorate of Works & Construction, National Defence Headquarters, Ottawa, Ont.  
**Laidrich**, Edward, Mech. Engr. (Ecole Polytechnique Federale Suisse, Zurich), engr., Pacific Mills Co. Ltd., Ocean Falls, B.C.  
**Leblanc**, Raymond Forté, B.A.Sc., M.E. (Ecole Polytechnique), B.Eng. & M.Eng. (McGill Univ.), M.Sc. (Univ. of Montreal), asst. prof. of mining engr., Ecole Polytechnique, Montreal.  
**McCuaig**, Donald Alexander, B.Sc. (Elec.), (Univ. of Manitoba), western district mgr., Ferranti Electric Ltd., Winnipeg, Man.  
**Morrison**, David, (Borough Polytechnical Inst., London), chief engr., Kipp-Kelly Ltd. & consltg. engr., Ogilvie Flour Mills Co., western divn., Winnipeg, Man.  
**Peck**, William Romaine, (Univ. of Toronto), chief dftsman., Ottawa Car and Aircraft Ltd., Ottawa, Ont.  
**Tallman**, Esley Gordon, B.Sc. (Civil), (Univ. of Sask.), design engr., Hydro-Electric Power Comm. of Ont., Toronto, Ont.  
**Turner**, William Elliott, B.A.Sc. (Univ. of Toronto), cost engr., Toronto Transportation Comm., Toronto, Ont.  
**Walsh**, John Stanley, B.Sc. (Brighton Tech. Coll.), Naval Ordnance Inspecting Officer, B.A.T.M., Montreal area.

### Juniors

- Heys**, Charles Horace, B.A.Sc. (Chem.), (Univ. of Toronto), mfg. engr., electronics divn., Northern Electric Co., Montreal.  
**Lefebvre**, Jean Jules, B.A.Sc., C.E. (Ecole Polytechnique), instructor, dept. of hydraulics, Ecole Polytechnique, Montreal.

### Affiliates

- O'Connor**, Patrick Arthur, Major, R.C.E., B.Sc. (F.), (Univ. of Toronto), District Engr. Officer, Military District No. 10, Winnipeg, Man.  
**Pickard**, Norman Stanley, Major, R.C.E. (Res.), (Manchester Coll. of Technology), constrn. engr., Dept. of Munitions & Supply, Montreal.

### Transferred from the class of Junior to that of Member

- Byers**, William Caryl, B.Sc. (Elec.) & B.Sc. (Civil), (Univ. of Manitoba), designing engr., C. D. Howe Co. Ltd., Port Arthur, Ont.  
**Kerry**, Frank George, B.Eng. (McGill Univ.), Engr. (E.S.S.A., Paris), mgr., development & engrg. dept., Canadian Liquid Air Co. Ltd., Montreal.  
**Motherwell**, James Shearer, Sqdn. Ldr., R.C.A.F., B.A.Sc. (Mech.), (Univ. of B.C.), Chief Engrg. Officer, No. 11 A.I. District, Montreal.

### Transferred from the class of Student to that of Member

- Gauthier**, Raymond Claude, B.Sc. (Civil), (Univ. of Manitoba), asst. designer (reinforced concrete), Dominion Bridge Co. Ltd., Winnipeg, Man.  
**Harland**, Robert Thompson, F/L., R.C.A.F., B.Sc. (Univ. of Manitoba), S.M. (M.I.T.), Radar Officer, R.C.A.F., Washington, D.C.  
**Mackinnon**, Donald Laughlin, U/T Pilot, R.C.A.F., B.Sc., M.Sc. (Civil), (Univ. of N.B.), No. 12 S.F.T.S., R.C.A.F., Brandon, Man.

**Roy**, Phil. B.Sc. (Queen's Univ.), plant engr., Canadian Locomotive Co. Ltd., Kingston, Ont.

**Swan**, Andrew Munro, Elect. Lieut., R.C.N.V.R., B.Sc. (Elec.), (Univ. of Manitoba), Elect. Officer, Torpedo School, Halifax, N.S.

*Transferred from the class of Affiliate to that of Member*

**Murray**, William John, Capt., R.C.E., (A-5), C.E.T.C., Petawawa Military Camp, Petawawa, Ont.

*Transferred from the class of Student to that of Junior*

**Bogle**, Roy Thomas, Major, R.C.E.M.E., B.A.Sc. (Mech.), (Univ. of B.C.), Elect. & Mech. Engr., Directorate of Mech. Engr., Ottawa, Ont.

**Browne**, Jack Wilkinson, B.Sc. (Elec.), (Univ. of Manitoba), asst. supt. of small arms ammunition group, D.I.L., Bouchard Works, Que.

**Buchanan**, James Charles, B.Sc. (Elec.), (Univ. of Sask.), tool engr., Hamilton, Ont.

**Coutts**, Erskine, B.Eng. (McGill Univ.), engr., Jas. Thom & Co. Ltd., genl. contractors, Montreal.

**Dansereau**, Joseph Hercule Rene, B.A.Sc., C.E. (Ecole Polytechnique). Navigation Instructor, R.C.A.F., Montreal.

**Davies**, Richard Llewelyn, B.Sc. (Civil), (Univ. of Alberta), res. engr., Dept. of Transport, Whitecourt, Alta.

**deVillers**, Raoul Albert, B.A.Sc., C.E. (Ecole Polytechnique), mech. engr., Canadian Marconi Company, Montreal.

**Drouin**, Jacques, B.A.Sc., C.E. (Ecole Polytechnique), oxy-cutters dept., Marine Industries, Ltd., Sorel, Que.

**Dunbar**, George G., B.Eng. (Chem.), (McGill Univ.), chemist, Imperial Oil Ltd., Dartmouth, N.S.

**Dunn**, Sydney Mewburn Secord, B.A.Sc. (Metallurgy), (Univ. of Toronto), supt. of quality control, D.I.L., Bouchard Works, Que.

**Farago**, William James, Lieut., R.C.E.M.E., B.Sc. (Mech.), (Univ. of Sask.), O.C., 119 L.A.D., R.C.E.M.E.

**Garrett**, Cyril, Elect. Lieut., R.C.N.V.R., B.Sc. (Univ. of Saskatchewan), Naval Research Establishment, H.M.C.S. Stadacona, Halifax, N.S.

**Glynn**, Walter S., B.A.Sc. (Univ. of Toronto), instructor in engrg. drawing, Univ. of Toronto, Toronto, Ont.

**Haakonsen**, Haakon, B.Sc. (Elec.), (Queen's Univ.), teacher of maths. & electricity, Shawinigan Technical Institute, Shawinigan Falls, Que.

**Hall**, William Francis, B.Sc. (Civil), (Univ. of Sask.), junior engr., P.F.R.A., Medicine Hat, Alta.

**Huot**, Joseph Adelard Marcel, F/L, R.C.A.F., B.A.Sc., C.E. (Ecole Polytechnique), Navigator & Navigation Instructor, R.C.A.F., St. Johns, Que.

**Keyfitz**, Irving M., B.Eng. (McGill Univ.), asst. to chief engr. & sales mgr., Canadian Propellers Ltd., Montreal.

**Kirk**, Jack Willis, B.Sc. (Civil), (Queen's Univ.), field engr., International Water Supply, London, Ont.

**Laberge**, Paul X., B.A.Sc., C.E. (Ecole Polytechnique), plant engr., Donohue Bros., La Malbaie, Que.

**Lecavalier**, Fernand, F/O, R.C.A.F., B.A.Sc., C.E. (Ecole Polytechnique), B.S., Aero Engrg., (M.I.T.), Engrg. Officer, R.C.A.F., Debort, N.S.

**Normandeau**, J. Gilles Laurent, B.A.Sc., C.E. (Ecole Polytechnique), shipbuilding engr., Marine Industries, Ltd., Sorel, Que.

**Palmquist**, David Ernest, Elect. Sub. Lieut., R.C.N.V.R., B.Sc. (Elec.), (Univ. of Manitoba), M.E.E. Dept., H.M.C.S. Scotian, Halifax, N.S.

**Peabody**, Gerald S., B.Sc. (Elec.), (Univ. of N.B.), service engr., Canadian Westinghouse Co., Montreal.

**Pratt**, James Crawford, Elect. Lieut., R.C.N.V.R., B.S. (Elec.), (Univ. of Manitoba), Elect. Officer, Naval Research Establishment, Halifax, N.S.

**Proulx**, Gilbert, B.A.Sc., C.E. (Ecole Polytechnique), asst. supt., Saguenay Electric Co., Chicoutimi, Que.

**Rolland**, Lucien Gilbert, B.A.Sc., C.E. (Ecole Polytechnique), plant engr., Rolland Paper Co. Ltd., Mont-Rolland, Que.

**Roue**, John Edward, Acting Elect. Lt. Cmdr., R.C.N.V.R., B.Eng. (Elec.), (N.S. Tech. Coll.), Chief Radio Engrg. Officer, R.C.N.V.R., H.M.C. Dockyard, St. John's, Nfld.

**St. Jacques**, Maurice, B.A.Sc., C.E. (Ecole Polytechnique), fractional horsepower motor engr., Cdn. General Elec. Co. Ltd., Peterborough, Ont.

**Scott**, Richard, B.A.Sc. (Elec.), (Univ. of Toronto), instructor in elec. engrg., Univ. of Toronto, Toronto.

**Skelton**, Eric Tudor, Lieut., R.C.E., B.Sc. (Civil), (Univ. of N.B.), Platoon & Section Cmdr., 27th Gen. Pioneer Coy., R.C.E., Montreal.

**Staniforth**, Harold F., F/L, R.C.A.F., B.Eng. (Mech.), (McGill Univ.), Aeronautical Engineer, R.C.A.F., Ste. Genevieve, Que.

**Stephenson**, Eric Paul, Major, R.C.E.M.E., B.Eng. (Elec.), (N.S. Tech. Coll.), Acting Major, Directorate of Mech. Engrg., Ottawa, Ont.

**Sutton**, Arthur Leslie, B.A.Sc. (Elec.), (Univ. of B.C.), application engr., English Electric Co. of Canada, St. Catharines, Ont.

**Tetreault**, Armand Jean, B.A.Sc., C.E. (Ecole Polytechnique), inspecting officer, Inspection Bd. of United Kingdom & Canada, Ottawa, Ont.

**Tetreault**, Jacques, B.A.Sc., C.E. (Ecole Polytechnique), designer, German & Milne, Naval Architects, Montreal.

**Waldron**, John Ross, Lieut., R.C.E.M.E., B.Sc. (Elec.), (Univ. of Manitoba), Elec. & Mech. Engr., (Radar) Army, No. 6 Coy., R.C.E.M.E., Sydney, N.S.

**Ward**, Kenneth Roy, Major, R.C.E.M.E., Grad. (R.M.C.), Kingston, Ont.

**Webster**, Geddes Murray, B.Eng. (McGill Univ.), foreman, operating dept., Nylon divn., C.I.L., Kingston, Ont.

**Wilson**, Murray Edgar, B.Sc. (Elec.), (Univ. of N.B.), elec. dftsmn., Atlantic Region, C.N.R., Moncton, N.B.

#### *Students Admitted*

**Bamford**, Alfred Basil, (Univ. of Manitoba), 459 Waverley St., Winnipeg, Man.

**Bourgault**, J. A. Gerard, Sorel Industries Ltd., Sorel, Que.

**Guard**, Donald E., (Univ. of Manitoba), 466 Beaverbrook St., Winnipeg, Man.

**Woolfrey**, George Raymond, (N.S. Tech. Coll.), Pine Hill Residence, Halifax, N.S.

#### *Students at Queen's University*

**Adams**, Garnet David, 196 University Ave., Kingston, Ont.

**Alexander**, Samuel James, 64 Regent St., Kingston, Ont.

**Bauman**, Desmond A., 75 Alfred St., Kingston, Ont.

**Beamish**, Vincent A., Merrickville, Ont.

**Bennett**, James Metcalfe, Campbellford, Ont.

**Birks**, William Robert, 343 Frontenac St., Kingston, Ont.

**Browning**, Douglas R. S., Cardinal, Ont.

**Campbell**, Donald Ross, 37 Pembroke St., Kingston, Ont.

**Conway**, John Maxwell, 382 Earl St., Kingston, Ont.

**Craig**, Donald Spence, Ridgetown, Ont.

**Creed**, Frank C., 2282 Lincoln Road, Walkerville, Ont.

**Darling**, Ralph Gifford, 303 University Ave., Kingston, Ont.

**Elliott**, S. H. Mackenzie, 30 Bruton St., Port Hope, Ont.

**Geddes**, Walter Robert, 14 Upper William St., Kingston, Ont.

**Gramoli**, Louizio, 329 Earl St., Kingston, Ont.

**Hanna**, John Newton, Supt.'s Residence, Ontario Hospital, Brockville, Ont.

**Harvey**, John Arthur, 34 Wellington St., Kingston, Ont.

**Hope**, Robert Leslie, 329 Earl St., Kingston, Ont.

**Horricks**, Robert, 530 River Road, Pembroke, Ont.

**Jarvis**, James Gordon, 164 Barrie St., Kingston, Ont.

**Lamont**, Donald Alexander, Morrisburg, Ont.

**Lee**, Edgar Robert, 629 Johnson St., Kingston, Ont.

**Lee**, Frank B., 136 Hawthorne Ave., Ottawa, Ont.

**Leon**, Clifford Ernest, 128 Union St., Kingston, Ont.

**Maguire**, Robert Adam, 75 L. Alfred St., Kingston, Ont.

**McKnight**, Russell Melvin, 19 Aberdeen Ave., Kingston, Ont.

**Moore**, Arthur Donald, 234 Earl St., Kingston, Ont.

**Moro**, Sylvano B., 73 Division St., Kingston, Ont.

**Nash**, Philip Townsend, 186 Frontenac St., Kingston, Ont.

**Ness**, Arthur Franklin, 374 Earl St., Kingston, Ont.

**Offer**, Leslie Douglas, 72 Princess Ave., Leamington, Ont.

**Payne**, Joseph Murray, 165 Division St., Kingston, Ont.

**Quance**, Richard Albert, 81 Clergy St. West, Kingston, Ont.

**Randall**, Norman, 623 Johnson St., Kingston, Ont.

**Richardson**, K. Grant, 28 Brighton Ave., Woodroffe, Ont.

**Robson**, James Albert, 382 Carl St., Kingston, Ont.

**Scott**, James Blair, 382 Earl St., Kingston, Ont.

**Secord**, Lloyd Calvin, 583 Johnson St., Kingston, Ont.

**Sheffield**, Harvey Clifton, Lyndhurst, Ont.

**Smoke**, Franklin G., 81 Clergy St. West, Kingston, Ont.

**Stewart**, Robert William, 329 Earl St., Kingston, Ont.

**Trewartha**, Frank E., 76 Division St., Kingston, Ont.

**Van Patter**, Douglas Macpherson, 374 Earl St., Kingston, Ont.

**Walker**, Edward Arthur, 295 Alfred St., Kingston, Ont.

**Walter**, Herman Karl, c/o Queen's Univ., Kingston, Ont.

**Whiteman**, Raymond Henry, 599 Helen St., Port Arthur, Ont.

**Wilson**, Hugh William, Alvinston, Ont.

**Woolsey**, Edgar Garnet, 311 Queen St., Kingston, Ont.

#### *Students at the University of British Columbia*

**Bakewell**, David Reginald, 3531 West 33rd Ave., Vancouver, B.C.

**Bayly**, Lemuel James, Williams Road, Chilliwack, B.C.

**Currie**, Robert Henderson, 7610 Cartier St., Vancouver, B.C.

**Dimock**, Arthur Clarence, Smithers, B.C.

**Ellis**, Gordon McLean, c/o Univ. of B.C., Vancouver, B.C.

**Gallaher**, Ernest Eugene, 25 E. 48th Ave., Vancouver, B.C.

**Golman**, Robert, 974 West 16th Ave., Vancouver, B.C.

**Heal**, Douglas Gordon, 3165 Capilano Road, North Vancouver, B.C.

**Kolbeins**, Henry, 584 West 16th Ave., Vancouver, B.C.  
**Lloyd**, William Ernest, Mt. Tolmie P.O., Victoria, B.C.  
**Munroe**, Lawrence Robertson, 4618 West 12th Ave., Vancouver, B.C.  
**O'Neil**, William James, 4198 Angus Drive, Vancouver, B.C.  
**Peatfield**, John H., 4624 West 10th Ave., Vancouver, B.C.  
**Robertson**, Edward Alistair, 984 West 20th Ave., Vancouver, B.C.  
**Teevan**, James T., 1785 West 12th Ave., Vancouver, B.C.

*Students at McGill University*

**Boucley**, Roger P., 4314 Bourbonniere Ave., Montreal.  
**Dohan**, John Timmins, 327 Redfern Ave., Westmount.  
**Heuser**, Eric Richard, 4056 Melrose Ave., Notre Dame de Grace, Montreal.  
**Love**, Donald D., 1340 Regent Road, Town of Mount Royal, Que.

By virtue of the co-operative agreements between the Institute and the provincial associations of professional engineers, the following elections and transfers have become effective.

ALBERTA

*Transferred from the class of Student to that of Member*

**McKay**, William Gordon, B.Sc. (Civil), (Queen's Univ.), district engr., Department of Pensions and National Health, Edmonton, Alta.

*Transferred from the class of Student to that of Junior*

**Mitchell**, Maurice Stephen, B.Sc. (Civil), (Univ. of Alta.), instructor, dept. of civil engrg., (Univ. of Alta.), Edmonton, Alta.

SASKATCHEWAN

*Junior*

**Milne**, John Reid, B.Sc. (Civil), (Univ. of Sask.), junior engr., P.F.R.B., Dept. of Agriculture (Canada), Regina, Sask.

*Students*

**Anderson**, Cecil George, (Univ. of Sask.), 847 Temperance St., Saskatoon, Sask.  
**Dusel**, Frank Joseph, (Univ. of Sask.), Y.M.C.A., Saskatoon, Sask.  
**Graham**, Harry Marker, (Univ. of Sask.), 1125 Temperance St., Saskatoon, Sask.

*Transferred from the class of Student to that of Member*

**Vance**, Fenton Russell, B.Sc. (Elec.), (Univ. of Manitoba), traffic engr., Sask. Govt. Tels, Regina, Sask.

NOVA SCOTIA

*Members*

**Brown**, Edward Dow, B.Sc. (Elec.), (N.S.Tech.Coll.), plant supt., Canadian Industrial Minerals, Ltd., Walton, N.S.  
**Macdonald**, John Angus, elec. supt., Dominion Iron and Steel Corpn., Sydney, N.S.

*Transferred from the class of Junior to that of Member*

**Kline**, Joseph Douglas, B.Eng. (Civil), (N.S.Tech.Coll.), design supervisor, Halifax Public Utilities Commn., Halifax, N.S.

At the meeting of Council held on January 13th, 1945, the following elections and transfers were effected:

*Members*

**Blaylock**, Selwyn Gwilym, B.A.Sc. and LL.D. (McGill Univ.), and LL.D. (Univ. of Alberta), chairman and president, Consolidated Mining & Smelting Co. of Canada, Ltd., Trail, B.C.  
**Cadario**, Harry Paul, B.Sc. (Elec.), (Queen's Univ.), Major, D.M.E., N.D.H.Q., Ottawa, Ont.  
**Clarke**, Ross Eugene, B.Sc. (Civil), (Queen's Univ.), res. engr., Dept. of Transport, Air Services Airport Constrn., Kingston, Ont.  
**Colls**, Edward Arthur Geoffrey (Univ. of Sheffield), genl. supt., chem. and fertilizer dept., Consolidated Mining & Smelting Co. of Canada, Ltd., Trail, B.C.  
**Foss**, Leiv, C. E. (Royal Inst. of Tech., Trondhjem), design engr., Foundation Co. of Canada, Ltd., Montreal.  
**Hutchison**, William Leslie, B.Eng. (McGill Univ.), genl. supt., Hamilton Bridge Co. Ltd., Hamilton, Ont.  
**Lyman**, Stephen M., Diploma (R.M.C.), B.Eng. (McGill Univ.), asst. project engr., industrial engrg. section, C.I.L., Montreal.  
**Turcke**, Edmund Wolfgang John, C.E. (Swiss Federal Inst. of Tech., Zurich), structl. design engr., A. Surveyor & Co., Montreal.

*Juniors*

**Hewitt**, Harry Naylor, B.Sc. (Chem.), (Univ. of Alberta), asst. chief chemist, D.I.L. Bouchard Works.

**Staples**, William J., B.A.Sc. (Univ. of Toronto), mtce. engr., Aluminum Co. of Canada, Arvida, Que.  
**Tilbury**, Harry C., Sub. Licut. (E) (T), R.C.N.V.R., Hamilton, Ont.

*Affiliates*

**Hawkins**, Stuart Schofield, B.Sc. (Arch.), (McGill Univ.), Capt., R.C.E., Works Officer, M.D. 4, Montreal.  
**Willis**, W. Paul R., tech. sales representative, Canadian Genl. Electric Co. Ltd., London, Ont.

*Transferred from the class of Junior to that of Member*

**Giauque**, Louis Frederick, B.Eng. (Mech.), (Univ. of Sask.), foreman, screen bar dept., The B. Greening Wire Co. Ltd., Hamilton, Ont.

*Transferred from the class of Student to that of Member*

**Lafontaine**, Daniel Joseph, B.Sc. (Queen's Univ.), chief engr., Electric Tamper & Equipment Co. of Canada, Ltd., Montreal.

*Transferred from the class of Student to that of Junior*

**Courtright**, James Milton, B.Sc. (Civil), (Queen's Univ.), lubrication engr., Shell Oil Co. of Canada, Ltd., Toronto, Ont.  
**Etkin**, Bernard, B.A.Sc. (Univ. of Toronto), lecturer, Faculty of Applied Science, Univ. of Toronto, Toronto, Ont.  
**Griesbach**, Robert Johnston, B.Eng. (McGill Univ.), designing engr., Foundation Co. of Canada, Ltd., Montreal.  
**Harvie**, John Duncan, B.Sc. (Univ. of Man.), engr., Imperial Oil Ltd., Norman Wells, N.W.T.  
**Harvie**, Thomas Allan, Flt. Lieut., R.C.A.F., Overseas.  
**Kraft**, Robert William, B.Sc., M.Sc. (Queen's Univ.), chemist, Aluminum Co. of Canada, Ltd., Arvida, Que.  
**Latreille**, André, B.A.Sc., C.E. (Ecole Polytechnique), civil engr. and estimator, Atlas Constrn. Co. Ltd., Montreal.  
**Label**, Marcel, B.A.Sc., C.E. (Ecole Polytechnique), soils engr., Dept. of Roads, Quebec, Que.  
**MacBride**, James Malcolm, B.Sc. (Civil), (Univ. of N.B.), asst. engr., C.P.R., Montreal.

*Admitted as Students*

**Bishop**, Keith Clement (N.S. Tech. Coll.), 40 Brenton St., Halifax, N.S.  
**Cepella**, Otto Mario (McGill Univ.), 7959 de l'Epee Ave., Montreal.  
**Corbin**, Terrance Lewis, 2nd Lieut., R.C.E., B.Eng. (Civil), (N.S. Tech. Coll.), A-5, C.E.T.C., Officers' Mess, Petawawa, Ont.  
**Fainstat**, Michael M., 2nd Lieut., R.C.E.M.E., B.Eng. (McGill Univ.), Officers' Mess, A-21, C.O. & E.M.E.T.C., Barriefield, Ont.  
**Haskim**, Robert (McGill Univ.), 6960 Sherbrooke St. West, Montreal.  
**Jackson**, Robin Russell, B.Sc. (Elec.), (Univ. of Alberta), 489 King St., Peterborough, Ont.  
**Keeley**, Henry, B.Sc. (Mech.), (Univ. of Sask.), 334 George St., Peterborough, Ont.  
**Lee**, William U. (McGill Univ.), 1162 St. Urbain St., Montreal.  
**McKay**, Donald Edgar Anderson (McGill Univ.), 3473 University St., Montreal.  
**Norman**, Arthur W. (N.S. Tech. Coll.), 9 Tower Road, Halifax, N.S.  
**Petruchick**, John Charton (McGill Univ.), 3892 Colonial Ave., Montreal.  
**Verdier**, Henrik, Lieut. (SB) (E), R.C.N.V.R., H.M.C. Dockyard, Esquimalt, B.C.  
**Wood**, E. Oren (Univ. of Man.), Ladywood Apts., Winnipeg, Man.

By virtue of the co-operative agreements between the Institute and the provincial associations of professional engineers, the following elections and transfers have become effective:

SASKATCHEWAN

*Students*

**Brandlmayr**, John, Jr., 816 Ave. "J" South, Saskatoon, Sask.  
**Dickinson**, John Grant, 323-3rd Ave., North, Saskatoon, Sask.  
**Feldman**, David, 533-3rd Ave., North, Saskatoon, Sask.  
**Ludwig**, Roy Edward, 317-9th St., East, Saskatoon, Sask.  
**McIntyre**, Duncan, 1227 Elliott St., Saskatoon, Sask.  
**Mills**, Robert Vincent, 620-9th Ave., Saskatoon, Sask.  
**Reeder**, Wesley Foster, 1001-12th St., East, Saskatoon, Sask.  
**Rowbotham**, Brien Howard, 508 Sask. Crescent, Saskatoon, Sask.  
**Smith**, Thomas Rutherford, 503 Dufferin Ave., Saskatoon, Sask.  
**Snow**, Alfred Harold Grant, 862 Sask. Crescent, Saskatoon, Sask.  
**Topham**, Harvey Lawrence, St. Andrew's College, Saskatoon, Sask.

# EDWARD PHILLIPS FETHERSTONHAUGH

PRESIDENT OF THE ENGINEERING INSTITUTE OF CANADA, 1945

It is appropriate, that as this year's Annual General Meeting takes place in Winnipeg, the duties of president of the Institute should be taken up by a distinguished Winnipeg member who is also the Dean of Engineering and Architecture at the University of Manitoba. During his professorship, and particularly since his appointment as head of the Engineering Faculty, Dean Fetherstonhaugh has been a leading figure in the development of engineering education in the prairie provinces. He is in fact the seventh dean of an Engineering faculty to occupy the presidential chair of the Institute.

His teaching and administrative work at the University was interrupted from 1914 to 1919 by a period of active service as an engineer officer in France and Belgium. He was demobilized with the rank of Major, his services in the field having been recognized by an award of the Military Cross, and by mention in despatches.

Our new president is not a native of the west. He is one of the dwellers in Manitoba who have forsaken their homelands in the east, and have migrated to those wider horizons which exist west of the Great Lakes. It may be that some day scientific investigation will reveal the exact nature of the potent attractive force which these regions seem to exert on young men of talent in the east. Till then one can only speculate, and perhaps assign as a contributory cause the dry and invigorating nature of Winnipeg's winter climate. But there is no doubt as to the importance of the part which so many of these immigrants have taken in the cultural development of the lands of their adoption.

Edward Phillips Fetherstonhaugh was born in Montreal in 1879, receiving his education in the High School there, and at McGill University, where he graduated in 1899 with honours in Electrical Engineering.

For the next four years he was associated with Fetherstonhaugh and Co., patent solicitors, as manager of their Ottawa office. While in Ottawa he held a commission in the Ottawa Field Company, Royal Canadian Engineers, thus commencing the military career in which he was later to distinguish himself.

Returning to McGill for two sessions, first as a demonstrator and then as a lecturer, he pursued further studies in 1905 and 1906. Then, like his predecessor in the chair of the Institute, he received much of his early engineering experience in the Pittsburgh shops of the Westinghouse Electrical and Manufacturing Company, whose service he entered in 1907, coming to their Winnipeg office as electrical engineer.

In June, 1909, he was appointed to the newly established chair of Electrical Engineering at the University of Manitoba, undertaking the responsible task of equipping the laboratories and organizing the work of the Department. On the opening of hostilities in 1914 he was made a member of the University's Committee on Military Education and was active in the formation of a contingent of the Canadian Officers Training Corps at the University.

Proceeding overseas in 1915, he served with the Canadian Engineers in France and Belgium, first as a Lieutenant in the First Field Company, then for a few months as Adjutant of the 1st Divisional Engineers, and later as Field Engineer for Defences under the Chief Engineer of the Canadian Corps, with the rank of Major. After the Armistice, he made a defence reconnaissance with the Chief Engineer of the 2nd Army, dealing with the bridgehead areas at Cologne and Bonn.

After his return to Canada, he was appointed Dean of Engineering in 1921, when separate faculties of the University of Manitoba were organized. He subsequently became Dean of Engineering and Architecture. In 1923 he took over the command of the University of Manitoba C. O. T. C. and was promoted to the rank of Lieutenant-Colonel. He relinquished the command in 1929.

As a consulting engineer, Dean Fetherstonhaugh has made many reports, investigations, and plans for the Dominion and provincial governments, as well

as for municipalities and private concerns in western Canada. Among these activities may be mentioned his membership on a board of three engineers appointed in 1923 to report on the engineering and economic aspects of the Manitoba Power Commission's system, and his appointment in 1929 jointly by the City of Winnipeg and the Winnipeg Electric Company as chairman of a board of three members to study the problem of electrolysis and soil corrosion of underground water pipes. In this connection he attended a conference in 1937 at the Bureau of Standards, Washington, D.C., and presented a paper on underground corrosion.

Since 1937, he has been a member of the National Research Council of Canada, attending all its meetings and many meetings of its subcommittees. He has served on the Main Committee of the Canadian Engineering Standards Association since 1921, and also on its Electrical Sectional Committee and the Provincial Sub-Committee for Manitoba.

E. P. Fetherstonhaugh, M.C., B.Sc., M.E.I.C.

He has also served on a number of government and public boards and directorates, including the Advisory Board of the Royal Military College (1931 to 1935), and the Board of Trustees of the Winnipeg General Hospital (1923 to 1936). In the summer of 1941, he was Director of the Radio Technicians' Course given at the University of Manitoba for over two hundred members of the Royal Canadian Air Force.

He joined The Engineering Institute of Canada as a Student in 1899, becoming an Associate Member in 1908, and a Member in 1920. He was chairman of the Winnipeg Branch in 1921, and served on the Council from 1923 to 1925. He has been an Associate Member of the American Institute of Electrical

Engineers since 1909. He became a registered member of the Association of Professional Engineers of the Province of Manitoba at its formation.

As teacher and administrator Dean Fetherstonhaugh has won the esteem and confidence of the long series of students who have received their professional schooling under his direction. His acceptance of the new office brings to the presidency of the Institute a man of high professional standing, of whom the Province of Manitoba and its engineers of all branches may well be proud. His appointment will be heartily welcomed by all the members of the Institute who have been privileged to know him.

—R.J.D.

## Personals

Relatives and friends of members in the active forces are invited to inform the Institute of news items, such as locations, promotions, transfers, etc., which would be of interest to other members of the Institute and which should be entered on the member's personal record kept at Headquarters. These would form a basis of personal items in the *Journal*.

It will be a matter of interest to all members of the Institute to see the list of their fellow members who share in the recent King's Honour List. There are 16 persons included in the lists printed in the newspapers which we believe are complete.

The Institute joins with the other citizens of Canada in congratulating the following members for the honours which they have so well deserved.

### COMMANDER, ORDER OF THE BATH

**Air Vice-Marshal Alan Ferrier, M.C.**, former member of Air Council, Department of National Defence, Air Service, now member of Air Transport Board, Ottawa, Ont.

### OFFICER, ORDER OF THE BRITISH EMPIRE (O.B.E.)

**Commander K. S. MacLachlan, R.C.N.V.R.**, former Deputy Minister for Naval Services, Montreal, Que.  
**Col. W. G. Swan, D.S.O.**, Croix de Guerre, R.C.E., Vancouver, B.C.  
**Lieut.-Col. William D. Kirk, R.C.A.**, Montreal, Que.  
**Lieut.-Col. John M. Cape, R.C.A.**, Montreal, Que.  
**Group Capt. M. M. Hendrick, R.C.A.F.**, Toronto, Ont.

### MEMBER, ORDER OF THE BRITISH EMPIRE (M.B.E.)

**Major John D. Duncan, R.C.C.S.**, Toronto, Ont.  
**Major R. H. Wallace, R.C.A.**, Cardinal, Ont.  
**Major C. B. Bate, M.C., D.C.M., R.C.E.**, Quebec, Que.  
**Major L. D. McGee, R.C.O.C.**, Kitchener, Ont.  
**Sqd. Ldr. R. A. McLellan, R.C.A.F.**, Ottawa, Ont.  
**Capt. D. H. Forster, R.C.E.M.E.**, Sudbury, Ont.

### MENTIONED IN DISPATCHES

**Group Capt. Edward C. Luke, R.C.A.F.**, Vancouver, B.C.  
**Wing Commander J. L. Gray, R.C.A.F.**, Vancouver, B.C.  
**Sqd. Ldr. G. C. Brown, R.C.A.F.**, Montreal, Que.

### KING'S COMMENDATION FOR VALUABLE SERVICES IN THE AIR

**Sqd. Ldr. George Ross, R.C.A.F.**, Edmonton, Alta.

## News of the Personal Activities of members of the Institute

**Gordon D. Hulme, M.E.I.C.**

**Gordon D. Hulme, M.E.I.C.**, has been appointed manager of the Public Relations and Advertising Department of The Shawinigan Water and Power Company in Montreal. He was successively assistant to the superintendent of transmission lines and assistant manager, Department of Development.

**Gustave St. Jacques, M.E.I.C.**, has been appointed executive assistant to the Associate Transit Controller in the Department of Munitions and Supply. Mr. St. Jacques, who was formerly an engineer in the Public Service Board of the Province of Quebec at Quebec City, has now taken up residence in Montreal. Until his recent appointment he was secretary-treasurer of the Quebec Branch of the Institute.

**Lieut.-Col. A. B. Dove, R.C.E.**, of Montreal, Que., and **Lieut.-Col. John M. Cape, R.C.A.**, of Cartierville, Que., have been awarded the Canadian Efficiency Decoration as announced recently by the Department of National Defence.

**A. G. Graham, M.E.I.C.**, senior assistant engineer for the past three years in the Construction Engineering Branch, Western Air Command, R.C.A.F., Vancouver, B.C., has been released to take a position in Victoria, B.C., as supervisor of regional planning connected with the rehabilitation and reconstruction schemes of the Province of British Columbia. Before joining the

Western Air Command, he was city engineer of the City of Nanaimo, B.C., for 12 years.

**A. D. Ross, M.E.I.C.**, who has been with the Canadian Comstock Company Limited for eighteen years, the last thirteen as manager, has severed his connection with the firm to found his own business. The new firm will be known as A. D. Ross and Company, electrical engineers and contractors, with offices in Montreal. Mr. Ross holds the degree of Master of Science from the Massachusetts Institute of Technology and has had more than 20 years' experience in the electric contracting field.

**Capt. R. T. Hollies, M.E.I.C.**, has recently returned to Canada from the northwestern European front. He has been discharged from the Army and has resumed his duties as superintendent of Glenmore Water Supply for the City of Calgary.

**K. Winslow, M.E.I.C.**, of the Aluminum Company of Canada Ltd., has been transferred from Kingston, Ont., where he was plant engineer to the sales department in the Montreal office.

**John B. Stirling, M.E.I.C.**, is the newly elected chairman of the Montreal Branch of the Institute. Born at Dundas, Ont., Mr. Stirling graduated from Queen's University as a Bachelor of Arts in 1909 and as a Bachelor of Science in 1911. After graduating he worked on municipal construction projects and during the last war served with the Canadian Expeditionary Force overseas in the Royal Canadian Engineers. He had been associated with E. G. M. Cape and Company, engineers and contractors, for several years, first as a field engineer and then as a supervising engineer. In 1928 he became a partner in the firm and later was made vice-president in charge of operations. He had been connected with such construction projects as the Banting Institute in Toronto, docks and grain elevators at Saint John, N.B., and on Georgian Bay, and the Canadian Vickers plant in Montreal.

**W. H. Stuart, M.E.I.C.**, who joined the R.C.A.F. in 1940, has received his discharge and is now manager of the Halifax branch of War Assets Corporation. Before the war he was a construction contractor on government work in the national parks of Prince Edward Island and Cape Breton. From 1941 to 1944 Mr. Stuart was manager of the Stanley Flying Training School in Nova Scotia, which school was operated for the R.C.A.F. under the British Commonwealth Air Training Plan and which has been closed as a result of the curtailment of flying training.

**Frederick Alport, M.E.I.C.**, engineer with the Department of Public Works of Canada, who was loaned to the Department of National Defence in June 1940, returned to his former position recently. His first position in the Naval Service was that of liaison officer. Upon formation of the Works and Buildings branch he was appointed district engineer at Halifax, N.S., which position he held until the end of 1942. In 1943 he was consulting engineer to Naval Service at Ottawa and is still available to that Department in this capacity.

**Robert A. Logan, M.E.I.C.**, who had been serving as lieutenant-colonel in the United States Army, has been discharged due to permanent physical disability resulting from injuries received while on active service in the South Pacific.

**Lester McGillis, M.E.I.C.**

**Lester McGillis, M.E.I.C.**, has been appointed manager of the Industrial Development Department of The Shawinigan Water and Power Company. His headquarters will be in Montreal. He was formerly manager of the Beauharnois Division of the Commercial and Distribution Department of the company at Valleyfield, Que.

**J. E. A. Dugas, M.E.I.C.**, who has been employed by the R.C.A.F. for the past three years at No. 3 Training Command Headquarters, construction and engineering division, has returned to his former position as industrial engineer with the Quebec Hydro-Electric Commission at Montreal, Que.

**Jean Asselin, M.E.I.C.**, former city manager of the City of Three Rivers, Que., has been engaged by the Public Works Department of the City of Montreal, in connection with its post-war planning programme.

**Robert W. Ross, M.E.I.C.**, is now engineer, maintenance of way, with the Canadian National Railways (Western Division) at Winnipeg, Man.

**H. G. O'Leary, M.E.I.C.**, has retired from his position as superintendent with the Canadian National Railways at Fort William, Ont., after several years' service. He has been engaged in railway work since 1904 and has held the above position since 1927.

**R. R. Collard, C.B.E., M.E.I.C.**, who has been serving as Air Vice-Marshal, Director of Works and Buildings at R.C.A.F. Headquarters, Ottawa, is now with the Commonwealth Construction Company Limited at Winnipeg, Man.

**Gilbert H. Bancroft, M.E.I.C.**, who has been with the Consolidated Mining and Smelting Company of Canada Limited at Trail, B.C., has accepted the position of chief engineer with Engineering & Machinery Limited at Vancouver, B.C.

**Lawrence O. Cooper, M.E.I.C.**, has recently retired from the R.C.A.F. and has accepted the position of general superintendent of plant maintenance and construction with the Canadian Johns-Manville Company Limited, at Asbestos, Que.

**J. G. Lefrançois, M.E.I.C.**, is now employed with Vipond-Tolhurst Limited at Montreal as combustion engineer. He was formerly with Volcano Limited.

**J. L. Bieler, M.E.I.C.**, is now with Robert A. Rankin and Company, consulting industrial engineers at Montreal, Que. He was formerly employed in the engineering department of Williams and Wilson Limited at Montreal.

**George N. Scroggie**, M.E.I.C., junior engineer in the London District office of the Department of Public Works of Canada, has been promoted to the position of assistant engineer.

**Rodney Bruce**, M.E.I.C., of the Canadian Industries Limited, has recently been transferred from Brownsburg, Que., to the head office in Montreal.

**Alexander Wilson**, M.E.I.C., of the Canadian Comstock Company Limited, has been transferred from Toronto, Ont., to Montreal, Que.

**Albert E. Chard**, Jr., E.I.C., is at present employed as draughtsman with the Powell River Company at Powell River, B.C.

**Earl A. Russell**, Jr., E.I.C., of Defence Industries Limited, has been transferred from Nobel, Ont., to Chalk River, Ont.

**Allan Pollock**, Jr., E.I.C., is now employed on production development with the Office Specialties Company in Newmarket, Ont.

**C. N. King**, Jr., E.I.C., who has been serving overseas with the R.C.A.F. has been discharged and is returning to his former position in the engineering department of the Aluminum Company of Canada Limited at Montreal, Que.

**Harry E. G. Dupuy**, S.E.I.C., has recently been appointed manager of the Winnipeg Office of Babcock-Wilcox and Goldie-McCulloch, Limited. He was formerly service engineer and has been connected with the firm since 1938.

**Robert Boyd**, S.E.I.C., who has been employed by the Dominion Rubber Company Limited at St. Jerome, Que., has accepted a position as relay engineer with the Quebec Hydro-Electric Commission at Montreal.

**G. Robert Edwards**, S.E.I.C., has recently accepted a position with W. T. Brickenden & Associates, professional engineers, at Toronto, Ont.

**Yves Décarie**, S.E.I.C., formerly employed by Canadian Car & Foundry Limited at Longue Pointe, Que., is now in the Engineering Department of the City of Montreal.

**Gérard Lefebvre**, S.E.I.C., has been appointed superintendent of the Montreal extension of St. Jerome Branch of the Dominion Rubber Company Limited.

**H. K. Morris**, S.E.I.C., formerly a flight-lieutenant in the R.C.A.F., has returned to civilian life and is now employed by the Consolidated Paper Corporation Limited as an assistant in the Purchases and Stores Department at Montreal.

**Fernand Labrosse**, S.E.I.C., is at present employed by the Mathews Conveyor Co. Limited, at Port Hope, Ont.

**Kenneth R. Knights**, S.E.I.C., has enlisted in the R.C.E.M.E. and is at present training at Barriefield, Ont. He was formerly employed by Canadian Westinghouse Co. Limited in the capacity of home office service engineer in the Niagara district.

**Lionel Boulet**, S.E.I.C., is now employed by R.C.A. Victor in Montreal, Que. He graduated in electrical engineering at Laval University, Quebec, last spring.

## Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**Seymour Jost Fisher**, M.E.I.C., died at his home in Riverbend, Que., on December 18th, 1944. He was born at Musquodoboit Harbor, Nova Scotia, on July 6th, 1880.

After high school he worked for seven years as a machinist with the Robb Engineering Company at Amherst, N.S., before entering Mount Allison University where he studied mechanical engineering for two years and was in charge of the mechanical engineering course for one year. He then spent two years at McGill University, graduating in 1910 with honours and the British Association Medal.

The next six years were spent as sales and service engineer with Babcock-Wilcox, then two years with the Imperial Munitions Board at Ottawa during the first World War as assistant to the officer in charge of gauges and standards. For one year he was assistant mechanical superintendent of the Caron Brothers plant at Montreal, after which he was with the James Smart plant at Brockville, Ont., for two years as general superintendent.

Mr. Fisher entered the paper business in 1922 and spent more than four years with the E. B. Eddy Company at Hull, Que., as works and woods manager. For the next five years he was employed by the Lake St. John Power and Paper Company, first working on mill design and erection and later as operating manager of the company's mill at Dolbeau. In 1931 he was appointed general superintendent of the Riverbend mill of Price Brothers & Company Limited which position he held at the time of his death.

Mr. Fisher joined the Institute as an Associate Member in 1915, transferring to Member in 1919.

**Robert Selwyn Roche**, M.E.I.C., died suddenly at his home in Montreal, Que., on January 11th, 1945. Born in Auckland, New Zealand, on October 24th, 1893, he received his engineering education in that country.

From 1914 to 1919 he served in the engineering services of the New Zealand Expeditionary Force after which he went to the United States where he was for one year assistant engineer on the New York Water Power Investigation. In 1921 he became identified with petroleum development and in 1927 went to Tulsa, Oklahoma, where for the next fifteen years he was engaged in consulting practice on petroleum production engineering, design and construction of oil storage, pipe lines, etc.

From 1942 Mr. Roche was connected with the department of works and buildings, Naval Service Headquarters at Ottawa, Ont., as petroleum engineer in charge of design for naval fuel oil installations, until a month before his death when he had moved to Montreal as development engineer with Mainguys Limited.

Mr. Roche joined the Institute as a Member in 1944.

# News of the Branches

## BORDER CITIES BRANCH

W. R. STICKNEY, M.E.I.C. - *Secretary-Treasurer*  
G. W. LUSBY, M.E.I.C. - *Branch News Editor*

The regular monthly meeting and annual election of officers of the Border Cities Branch was held at the Prince Edward Hotel on December 8th, 1944, with J. B. Dowler, chairman of the Branch, presiding.

The speaker of the evening was J. G. Hoba, assistant chief engineer, Kelsey Wheel Company Limited, who gave a short talk on **Magnesium Aircraft Wheels**. Mr. Hoba stated that magnesium made its first appearance as a metal in 1832 when Sir Humphry Davy produced it by electrolysis of the chloride but it was not manufactured commercially until 1900.

During the last war the allies set up several plants for the production of magnesium which was, at that time, used chiefly for the production of flare shells. After the war some of these plants were closed because no extensive use for the metal could be found for civilian purposes.

The main sources of magnesium are sea water and such minerals as brucite, dolomite and magnesite. Brucite, which is the richest ore in magnesium, is found in Canada and Nevada.

The production of the metal, which is comparatively recent in the United States and Canada, amounts to about 365 million pounds in U.S. and 6½ million pounds in Canada. The characteristic affinity of the metal for oxygen limits its production to the electric furnace and the electrolytic process, the more outstanding of these being the Hansgrig Carbothermic Process and the Dow-Seawater process, respectively. In Canada, a process developed by Dr. Lloyd M. Pidgeon of the National Research Council, is used extensively.

The importance of magnesium lies in its extreme lightness. It is because of this characteristic that the metal is being adopted for airplane parts to a great extent, and particularly to the manufacture of airplane wheels. By the use of magnesium the weight of a wheel can be reduced 50% and at the same time retain the strength it had when it was made of aluminum. Because of the lightness of the metal, all wall dimensions are increased for casting purposes but machining is comparatively simple.

In conjunction with the description of various airplane wheels, the speaker entered into a discussion of the various brake constructions used on airplane wheels, the main features under consideration in the design of such brakes being the proper dissipation of heat due to friction and the magnitude of the "sweep", the full 360 deg. sweep having at last been attained by the use of an expander tube.

## HAMILTON BRANCH

W. E. BROWN, M.E.I.C. - *Secretary-Treasurer*  
L. C. SENTANCE, M.E.I.C. - *Branch News Editor*

On Thursday, December 14th, the regular monthly meeting of the Hamilton Branch was held in the Science Lecture Room, McMaster University. Twenty-five members and guests were in attendance. N. Eager, vice chairman, conducted the meeting.

H. G. Chambers introduced the speaker of the evening, F. J. McMulkin of the Ontario Research Foundation, whose subject was **The Welding and Fabrication of Canadian Light Armour**. Mr. McMulkin, in his capacity of metallurgist and welding engineer,

## Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

has been intimately connected with the manufacture of light armoured vehicles in Canada.

During the course of his talk Mr. McMulkin discussed the fundamental requirements of armoured vehicle construction, and outlined the production procedures developed to meet these requirements in the case of welded types. Numerous slides were utilized during the presentation of the paper. Mr. McMulkin answered questions on the subject at the conclusion of his talk.

The meeting adjourned at 9.30 p.m. for the customary refreshments.

## LAKEHEAD BRANCH

J. I. CARMICHAEL, M.E.I.C. - *Secretary-Treasurer*  
R. B. CHANDLER, M.E.I.C. - *Branch News Editor*

The December dinner meeting of the Lakehead Branch took the form of a joint session with the members of the Port Arthur Rehabilitation and Reconstruction Council in Port Arthur on December 15th, 1944.

S. T. McCavour, chairman of the Branch, welcomed the Honourable C. D. Howe, Minister of Munitions and Supply and Reconstruction, and the members of the local Reconstruction Council. He then turned the chair over to Alderman T. J. McAuliffe who spoke on the work of the Reconstruction Council of which he was chairman, and who called on Mr. Howe to address the meeting.

Mr. Howe gave a comprehensive review of the plans of his department for the immediate post-war period. He said that the first tasks were the conversion of industry to a peace-time footing, revival of Canadian export trade and the restoration of devastation of war. He advocated a "common sense" approach to reconstruction. The first duty should be an attempt to employ men and women in work similar to that in which they were employed. Consequently the government was making plans for reconversion of certain factories.

Outlining the form of his reconstruction department he said only a skeleton organization had been built but that branches were being added steadily. There was a deputy minister and several directors, including directors of development, research and housing.

A co-ordinator of public projects had also been appointed. One of his duties would be to list and place in sequence all public projects proposed by the Dominion, provincial and municipal governments. Regional committees would then be formed. There would be a co-ordinator of controls also as certain controls must be carried on to avoid inflation. Mr. Howe also referred to his earlier announcements about the appointment of a director of disposal of war assets and the establishment of a branch office of the department in Port Arthur.

Mr. Howe was thanked on behalf of the meeting by R. B. Chandler of the Lakehead Branch and M. J. McDonald of the Reconstruction Council.

Following Mr. Howe's address Mr. McCavour re-occupied the chair and introduced Mr. James Murchison, Fort William Town Planning Consultant and District Representative of the Ontario Department of

Town Planning. Mr. Murchison's address covered general town planning problems with specific mention of those relative to the Lakehead cities.

Mr. Murchison was thanked for his address by S. E. Flook.

### LETHBRIDGE BRANCH

T. O. NEUMAN, M.E.I.C. - *Secretary-Treasurer*  
A. G. DONALDSON, M.E.I.C. - *Branch News Editor*

A meeting of the Branch took place November 24th in the lecture rooms of the local Y.M.C.A. when D. L. Hamelin, water supply engineer for the Department of Transport delivered a very fine address entitled **Development of Underground Water in the Province of Alberta—a Post War Project**. The speaker gave many interesting facts and provided thoughts entirely new to many of those present.

On December 15th a meeting was held in the Marquis Hotel and consisted of a dinner meeting to which the ladies were invited. A. L. H. Somerville presided. The speaker of the evening was T. C. Main, general manager of Ducks Unlimited. His address was entitled **Ecological Engineering**.

Before starting on his paper Mr. Main made a few pointed remarks to engineers as a body stating that the engineer could contribute a great deal more to the progress of mankind if he would seek public office, or at least place his opinions before the public. He must become a leader rather than a follower.

Mr. Main opened his address by explaining that Ecological Engineering was "that branch of engineering devoted to wild life management." Ducks Unlimited was formed in 1938. It now numbers engineers, naturalists, ornithologists, etc. on its staff, all of whom are Canadians. Because drought is the greatest menace to the duck population, the chief work done by Mr. Main and his staff is to combat this. Many projects have been undertaken such as the building of dams, reservoirs, canals; the rerouting of streams and the further flooding of marsh lands. To date 135 of these projects have been completed with an equal number still to be undertaken. 1,200,000 acres of marsh lands and sloughs have been made safe nesting grounds; 200,000 acres of permanent surface water have been added to the prairie provinces. Incidental to the main object, fur trapping and cattle raising have been materially helped in areas near the projects. In the main object, handsome dividends have also been returned as proved by the increase in ducks from 35 millions in 1935 to 140 millions in 1944.

The address was illustrated by some excellent films,

### LONDON BRANCH

A. L. FURANNA, M.E.I.C. - *Secretary-Treasurer*  
G. N. SCROGGIE, M.E.I.C. - *Branch News Editor*

The London Branch held their annual meeting and dinner Wednesday evening, January 17th, at the C.P.R. Hotel, at which the new executive for the year took office.

This year the branch held a mail-ballot electing eight men to the executive, who in turn elected a chairman, vice-chairman, and secretary-treasurer from among themselves.

The results of the election were as follows: Chairman—H. G. Stead; Vice-Chairman—G. A. Cunningham; Secretary-Treasurer—A. L. Furanna; Executive—F. A. Bell, J. H. Johnson, H. A. McKay, G. N. Scroggie, and H. J. Simmons.

E. V. Buchanan introduced the speaker, Dr. R. C. Dearle, head of the Department of Physics at the University of Western Ontario. Dr. Dearle told the story of his own department during the years of this present war, and described the work especially with regard to radio detection or radar. He told of the training of university men, many of whom now hold important posts in the Armed Forces. He also told of the securing of financial backing for the training of technicians, the financial backing being given by the London Association for War Research.

Before closing, Dr. Dearle mentioned the tremendously important part radar played in the Battle of Britain, and told of some of its present uses by the Navy and Air Force, and of its possible future use in civil aviation.

Needless to say, the speaker did not divulge any military secrets, but there was so much he would like to have said and so much his very interested listeners would have liked to have asked him, that J. R. Bach, in thanking the speaker, expressed the hope that some day he would come back and speak to the Branch when he could give the inside story of radar.

Following the address, R. S. Charles, the retiring chairman, spoke briefly before turning the meeting over to the newly elected vice-chairman, G. A. Cunningham, who welcomed the new members of the Branch and urged them to attend all future meetings.

### MONTREAL BRANCH

L. A. DUCHASTEL, M.E.I.C. - *Secretary-Treasurer*  
H. H. SCHWARTZ, M.E.I.C. - *Branch News Editor*

On Thursday evening, January 11th, 1945, Dr. P. M. Haenni, Director of Research for the Aluminium Laboratories, presented a paper on **The Future of Aluminum** to the Montreal Branch. Dr. Haenni stated that the future for the aluminum industry looked very promising and outlined the steady rise in the demand for aluminum and aluminum alloy products since the beginning of this century. He pointed out that the qualities and physical properties were steadily improving, culminating in the new 75S alloy. On the other hand the price has, except for the World War I years, continually fallen until it is now at its lowest in history. In the past five years, many new techniques, such as continuous casting and extrusion, have been successfully applied in the processing and fabrication of these alloys.

The speaker stated that in the immediate post war period there would be a great demand for consumer goods, made entirely or largely of aluminum, and it is expected that the quantities of scrap now on hand will only partially fill these requirements. Because of the great technological advances and the drop in price, it is expected that these alloys will find increasing application in architecture, structures, transportation equipment and industrial machinery.

Dr. Haenni illustrated his lecture with graphs, tables and photographs of aluminum products. After a lively discussion R. N. Coke thanked the speaker. R. A. A. Hayes was the chairman of the evening.

\* \* \*

On Thursday evening, January 18th, 175 persons of the E.I.C. and A.I.E.E. Montreal branches met at a joint meeting at E.I.C. headquarters, where they enjoyed a talk on the amplidyne machine.

J. L. McKeever, general engineer of Canadian General Electric Co., Peterborough Works, who is in a

position to know about most recent developments in this field, was the speaker. He mentioned the use of the amplidyne machine for operation of aircraft gun-turrets. Among its industrial applications is the control of a flying shear for a hot-strip mill.

In conclusion, the speaker acknowledged the source of material for this paper as being the published work of many engineers of the General Electric Company. Chairman of the meeting was F. L. Lawton.

### PETERBOROUGH BRANCH

ERIC WHITELEY, Jr.E.I.C. - *Secretary-Treasurer*  
F. OSBORN, Jr.E.I.C. - *Branch News Editor*

This year marks the Twenty-Fifth Anniversary of the Peterborough Branch and the event was celebrated on Wednesday, December 6th, with a dinner at the Kawartha Club.

C. R. Whittemore, branch chairman, welcomed the guests of the evening including, in addition to the president and general secretary: Mayor James Hamilton, Rev. J. Sutcliffe, Past-President J. M. R. Fairbairn of Montreal, H. Morrow, C. E. Sisson of Toronto and Hugh Rose. Ross Dobbin was then asked to give a short history of the Branch. He recalled some of the better known figures who had been in the local organization and recounted a few of the outstanding activities, such as out of town inspection trips. In 1919 engineers of the city, who had previously organized an engineers' club, received a charter from The Engineering Institute of Canada and since that time the Institute has been the only active technical organization in the city.

Mayor Hamilton said a few words to the visitors on behalf of the City of Peterborough, at the same time taking the opportunity to commend the members on the contribution engineers are making to community life. A welcome from the Branch was voiced by Maurice St. Jacques, a native of Mr. Beaubien's home province. The president was introduced by G. R. Langley who, by way of diversion, revealed that a young lady of Peterborough returning to her native heath with her navy husband and two children, while travelling from Montreal on the same train had been assisted in her family cares by the presidential party and had found them "kindly old grandfathers."

The president, Mr. de Gaspé Beaubien, spoke gratefully of the honour bestowed upon one chosen for this office. He had just completed a tour of the branches and universities and was particularly moved by the unity of outlook displayed by engineers the country over. He intimated that if there were a few elements of disunity in the nation, there was certainly unity of thought and purpose amongst engineers. Mr. Beaubien pointed out that we should not be too concerned by impressions of friction gained from the newspapers which, after all, are tempted to print astonishing things to attract the readers. The ordinary things and the people who do not put on demonstrations are frequently overlooked. He had found that there were many things that all Canadians had in common. The president is himself a gracious person who has no small influence on better relations between those of his own racial extraction and Canadians of other background. The listeners were warned against the slackening of efficiency due to war weariness or over optimism, and it was asserted that our energy must be carried over to the post-war world.

Dr. L. Austin Wright, general secretary, reported briefly on measures taken during the year to cope with unusual conditions. In particular, a permanent official

is being considered to work on problems of veteran reestablishment and an active part has been taken in negotiations relating to collective bargaining. Dr. Wright was full of hope for a continuing increase in membership and an improved service to the members and the profession.

Prior to the dinner, Mr. Beaubien met the membership informally and inspected a display of old photographs of persons and events which had a place in the branch history. About 65 persons sat down to the meal which was enlivened by short interludes of group singing led by N. Finnie who accompanied on the guitar.

### SASKATCHEWAN BRANCH

STEWART YOUNG, M.E.I.C. - *Secretary-Treasurer*

The Saskatchewan Branch met jointly with the Association of Professional Engineers in the Kitchener Hotel, Regina, on Monday evening, December 18th. The attendance was 42. J. McD. Patton occupied the chair.

Hon. J. H. Brockelbank, Minister of Municipal Affairs, addressed the meeting on **Municipal Affairs**, dealing in particular with the proposed re-organization of Saskatchewan Rural Municipalities.

Outlining the work of his department Mr. Brockelbank emphasized the importance of local government, which, he said, was the foundation of democracy and should be preserved and strengthened in every way possible.

The re-organization of municipalities into larger units of administration was not a trend towards centralization as suggested in some quarters "but the exact opposite," stated the minister. He pointed out that any government that wanted greater centralization would take steps to weaken local self-government. The re-organization of the municipalities was designed to strengthen local self-government.

Mr. Brockelbank said he had received requests from six municipalities to appoint councillors because the electors had failed to nominate or elect a councillor to fill vacancies that would exist on the local councils after January 1st. The minister preferred not to make such appointments declaring that such vacancies should be filled by elections as provided for under legislation.

### TORONTO BRANCH

S. H. DE JONG, M.E.I.C. - *Secretary-Treasurer*  
G. L. WHITE, A.M.E.I.C. - *Branch News Editor*

"Without nitrogen war is impossible," so stated Stanley R. Frost, who was, previous to the war, sales director for North American Cyanamid Company, and at present is special assistant to the Controller of Chemicals, Department of Munitions and Supply, in an address before the Toronto Branch on December 7th. Mr. Frost noted that nitrogen is the basic element of all explosives and pointed out that Germany did not enter into the first World War until the development of the Haber process had made her virtually independent of outside nitrogen sources. Similarly before the present conflict, her nitrogen producing capacity had been greatly expanded.

Canada's nitrogen industry can be said to have started in 1908 through a small plant located at Niagara Falls engaged in producing cyanamid. By 1930 this plant was the largest in the world and was turning out cyanamid at the rate of 300,000 tons per year. The process of taking nitrogen out of the air and forming it into chemical compounds is usually called "nitrogen fixation" and at the cyanamid plant is performed as follows. Lime and coke are heated in an electric furnace

# PETERBOROUGH BRANCH CELEBRATES TWENTY-FIFTH ANNIVERSARY

(Left) From far end of table to near: H. A. Morrow, J. M. R. Fairbairn, G. R. Langley, de Gaspé Beaubien, C. R. Whittemore, L. A. Wright, Ross Dobbin, Mayor J. Hamilton.

(Right) View of tables: N. Finnie with guitar.

(Left) Left to right: G. R. Langley, de Gaspé Beaubien, H. R. Sills, C. R. Whittemore, L. A. Wright.

(Above) Back row, left to right: R. Dobbin, C. E. Sissou, G. R. Langley, B. L. Barns, Al. Dickieson, J. Barnes. Seated, left to right: W. M. Crothers, Hugh Rose, H. A. Morrow, Mayor Hamilton, T. E. Gilchrist. (Present first dinner 25 years ago.

(Left) Left to right: S. O. Shields, Ham, B. I. Burgess.

at a temperature of practically 4,000 deg. F., when calcium of the lime and carbon of the coke combine to give calcium carbide. This material when it is ground to a fine state actually burns in an atmosphere of nitrogen to give the calcium cyanamid  $\text{CaCN}_2$ . The nitrogen for this reaction is obtained by fractional liquefaction of air.

In 1941 when it appeared that England's synthetic nitrogen plants might be destroyed or impaired by bombing, allied high authorities agreed on the desirability of establishing in Canada adequate nitrogen capacity to be available during an emergency. Consequently there was built in Canada at Trail, B.C., Calgary, Alta., Welland, Ont., and at other places, plants which doubled Canada's previous synthetic nitrogen capacity and made it almost equal to that of the United States before that country entered the war. However, England's plants were not seriously affected and an apparent Allied surplus of nitrogen resulted. Investigations were immediately instigated to find increased uses for this unexpectedly available material.

In addition to explosives, one other large-scale use for nitrogen compounds is in agricultural fertilizers. In this respect ammonium nitrate is particularly desirable since nitrogen content is 35 per cent. Hence, in order to utilize the surplus nitrogen capacity in Canada, an intensive check was made for ways of employing ammonium nitrate as a fertilizer. Ammonium nitrate as a fertilizer material suffers from its peculiar property of absorbing moisture from the air and setting into a hard lump which is difficult to handle and, due to its low solubility, is not readily utilized by the plant.

These difficulties were finally overcome by Canadian scientists working in collaboration with the Canadian and United States Governments who developed the nitraprill process which consists of coating fine mesh ammonium nitrate with a thin layer of filter aid or other suitable dusting agent, thus rendering it free flowing. The available nitrogen is 32.5 per cent.

With Canadian nitrogen capacity far in excess of consumer demand for a number of years, the industry must look to exports for markets. As produced, however, the Canadian price is low, and Canada is in a reasonable position to face the future with some degree of confidence if advantage is taken of her favourable factors of erected plant, trained personnel and cheap raw materials.

\* \* \*

**Wartime Transport of Food** was the subject of the address by Dr. W. H. Cook, Director, Division of Applied Biology, National Research Council, Ottawa, before a meeting of the Toronto Branch on Thursday, January 18th, 1945.

In his address the speaker dealt particularly with refrigerated space for the shipping of meats and other perishable products to Great Britain. Under normal conditions standard refrigerated space in cargo vessels provides for transport of meats to Great Britain. A critical situation arose in 1941 due to sinkings and to slower operation of vessels in convoy. In this emergency very successful refrigeration space was improvised for transport of bacon to Great Britain. Requirements of this refrigerated space was the ability to maintain the bacon at temperatures somewhere in the vicinity of 35-40 deg. F. during transport.

In order to accomplish this improvisation of refrigerated space, special compact refrigeration units weighing three tons, were devised, which provided about five tons of refrigeration capacity. These units were

installed in such a way as to provide circulation of cold air around the outside of the bacon cargoes in the refrigerated hold. Special provision was made for rapid installation with little change in the ship. Results were excellent with the first cargo arriving in Great Britain with quality equal to bacon shipped in regular refrigerated space. The cargo air temperature in the hold was maintained at an average of approximately 40 deg. F.

The speaker described briefly subsequent experience which involved the application of the emergency refrigeration unit to holds in all positions in cargo vessels and the development of more efficient defrosting technique to increase the overall efficiency of the refrigeration unit.

Discussing Army feeding, Dr. Cook referred to the highly developed rations designed for individual cooking which provide operational food on which men may live for many days under the difficult feeding conditions of modern warfare. Dehydration has helped a great deal especially in reducing tinplate consumption, and also conserving shipping space.

Food problems in the Pacific theatre of war have been reduced considerably by the employment of obsolete vessels as refrigerator ships in that area.

#### JUNIOR SECTION

The Junior Section held a dinner meeting in Diana Sweets restaurant on Monday, January 8th at 6.30 p.m. with Ross Graydon as chairman.

The topic of the meeting, **Steps that are being taken to Consolidate and Elevate the Engineering Profession in Canada**, was discussed first by Major M. Barry Watson who spoke on the co-ordination activities of the Dominion Council of Professional Engineers of Canada.

Major Watson cited the progress that had been made in obtaining co-operative agreements between the Professional Associations and the E.I.C., four of the eight having voted for co-operative agreements—with two more provinces likely to form agreements in the near future. The small committee of the Dominion Council (one member from each association) is quite flexible, and since the members' travelling expenses are paid by the associations, the meetings can be said to be very representative and no one province is able to outvote the others.

Dean C. R. Young spoke on the Engineers' Council for Professional Development, of which the E.I.C. is a member. Dean Young stated that this body was studying problems such as student selection and guidance, professional training, professional recognition and engineering ethics. One concrete example of the work of this committee was the accrediting of engineering schools and courses.

In the business portion of the meeting, the action of the Council of the E.I.C. was criticized for deciding to employ an additional staff member to look after the rehabilitation of its members. It was felt that this was a duplication of effort—and should be left to the Wartime Bureau of Technical Personnel, which the E.I.C. helped to set up.

#### WINNIPEG BRANCH

T. E. STOREY, M.E.I.C. - - Secretary-Treasurer  
V. W. DICK, M.E.I.C. - - Branch News Editor

On Thursday, January 11, 1945, a joint general meeting of the Winnipeg Branch of the Institute and the Manitoba Association of Professional Engineers was

held in theatre "F" of the University of Manitoba, under the chairmanship of T. H. Kirby, branch chairman.

R. A. Sara, chairman of the committee in charge of publicity for the 59th Annual and Professional Meeting of the Institute to be held in Winnipeg on February 7th and 8th of this year, outlined the programme for this meeting. Mr. Sara made an appeal to the engineers of Manitoba to register in advance in order to leave the opening day free for the registration of the visiting engineers, who were expected from all parts of Canada and from the U.S.A. D. M. Stephens presented the report of the nominating committee of the Winnipeg Branch, giving a complete slate of officers and the executive committee for 1945, which was accepted without any further nominations.

The address for the evening was then presented by Dr. P. A. Macdonald, physicist with the Manitoba Cancer Institute, who spoke on the design and construction of high-voltage X-ray tubes, as used by the Cancer Institute. These machines represent a considerable advance over the conventional type of tube with its high-vacuum and tremendous weight of lead protection from the rays, which are necessary for the protection of the operators.

A new system of forming the filament type of emitter was described, which enabled a heavier filament to be

constructed for use at a lower vacuum, and a lower temperature range.

Various types of targets were detailed, and a new type of target designed at the Institute was described, which utilizes an extremely thin film of gold electroplated on a copper disc. Different ways of cooling the target were given, along with new methods that the Institute was working on, that would utilize the latent heat of evaporation to give greater cooling efficiency.

Dr. Macdonald pointed out that these machines were of great interest to engineers, as similar machines are used in the radiography of metals. A great deal of testing has been eliminated through X-ray examination of iron castings and welded metal. The denser the metal, the higher the voltage required, and machines using 2,000,000 volts are now at work in war industries.

Dr. Macdonald forecast a revolutionary method of producing X-rays, now in the laboratory stage, using low-voltage equipment with a circular method of controlling and increasing the speed of the electrons, to produce more rays with lower voltages and therefore much greater efficiencies.

The speaker had an interesting display of the parts of the machine described during his address, and after a discussion period the members present had the opportunity to examine these parts at close range. A vote of thanks was moved by Prof. N. M. Hall.

## Library Notes

### TECHNICAL BOOKS

#### How You Can Get a Better Job:

*Willard K. Lasher and Edward A. Richards. Chic., American Technical Society, 1945. 5¾ x 8½ in.*

#### Metallurgical Analysis by Means of the Spekker Photo—Electric Absorptiometer:

*F. W. Haywood and A. A. R. Wood. Lond., Adam Hilger, 1944. 6¾ x 9 in. 18s.*

#### Sheet Metal Theory and Practice:

*John C. Butler, N.Y., John Wiley and Sons, 1944. 8½ x 11½ in. \$3.00.*

#### What is Vocational Education?

*George H. Fern. Chic., American Technical Society, 1944. 5¾ x 6½ in.*

#### Wireless Receiving Devices:

*P. J. Risdon. Lond., Foulsham and Co. (n.d.) 3¾ x 5¾ in. 1s.*

### PROCEEDINGS, TRANSACTIONS, ETC.

#### Engineering Society of Buffalo, Inc.:

*Yearbook, 1944.*

### REPORTS

#### Canada—Department of Mines and Resources:

*Hydro-Electric Progress in Canada during 1944.*

#### Canada—Bureau of Northwest Territories and Yukon Affairs:

*Northwest Territories; administration, resources, development, 1944.*

#### Ohio State University—Engineering Experimental Station—Bulletin:

*No. 120; Weather headings in Ohio, by George W. Mindling.*

#### Ontario—Department of Mines:

*Review of Geophysical work carried out by the Ontario Department of Mines, 1937-1944, by A. A. Brant.*

#### United States—Bureau of Mines—Bulletins:

*No. 462; Coal-mine Accidents in the United States, 1942, by L. E. Geyer. No. 460; Diatomites of the Pacific Northwest as Filter-aids by K. G. Skinner and others.*

### Book notes, Additions to the Library of The Engineering Institute, Reviews of New Books and Publications

#### United States—Bureau of Mines—Technical Paper:

*No. 668; Low-temperature Carbonization of Alaskan Coals, by W. A. Selvig and others.*

#### United States—War Mobilization and Reconversion:

*First report to the President, the Senate, and the House of Representatives, 1945.*

### MONOGRAPHS AND PAMPHLETS, ETC.

#### Air Power:

*Aeronautical Chamber of Commerce of America, 1944.*

#### Air Power Can be Peace Power:

*G. W. Vaughan. Air Industries and Transport Association of Canada, 1944.*

#### Brief for Shipbuilding with Recommendations:

*By Canadian Shipbuilding and Ship Repairing Association, 1944.*

#### Economics of a Free Society; Declaration of American Business Policy:

*Reprinted from Fortune, October, 1944.*

#### Essentials of Metrology:

*C. H. Klawe. Toronto, Progress and Engineering Corporation, Ltd., 1944.  
T. D. Bulletin, No. 2.*

#### John Bracken Says:

*John Bracken. Toronto, Oxford University Press, 1944.*

#### International Business Conference, Rye, N.Y., November 10 to 18, 1944:

*Report. Reprinted from Industrial Canada, December, 1944.*

#### Limits and Fits:

*C. H. Klawe. Toronto, Progress and Engineering Corp., Ltd., 1944. T. D. Bulletin, No. 3.*

#### Manual of Industrial Radiography with Radium:

*Canadian Radium and Uranium Corporation, 1942.*

## Place of Canada in Post-War Organization:

Brooke Claxton. Reprinted from *Canadian Journal of Economics and Political Science*, v. 10, no. 4, November, 1944.

## This Housing Problem:

W. H. Bosley and H. E. Manning. Toronto, Bosley and Co., 1944.

## Wartime Controls:

Canada—Wartime Information Board, 1944.

## Wartime Industrial Transit Plan:

Canada—Department of Munition and Supply—Transit Control, 1944.

## BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet all of these books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

## ALLOY CAST IRONS

Reviewed, revised and published by the Alloy Cast Irons Committee, Gray Iron Division, American Foundrymen's Association, 222 West Adams St., Chicago 6, Illinois, 1944. 282 pp., illus., diags., charts, tables, 9¼ x 6 in., cloth, \$3.25.

The effects of alloys on cast iron, the alloys available for foundry use, the effect on physical properties, methods of adding them, the heat treatment of alloy cast irons, foundry practice and specific uses are discussed in this volume. The various chapters have useful bibliographies.

## ANYTHING A HORSE CAN DO, the Story of the Helicopter

By H. F. Gregory, introduction by I. Sikorsky. Reynal & Hitchcock, New York, 1944. 243 pp., illus., diags., 8¼ x 5½ in., cloth, \$3.00.

In any easy, informal way this book tells the story of helicopter development. The author traces its history, explains its principles and discusses its future. As an expert for the U.S. Army, the author has played a large part in the development of this plane and much of his story is the record of personal experience.

## BATTERY-ELECTRIC VEHICLES

By S. M. Hills. George Newnes, Ltd., Tower House, Southampton St., Strand, London, W.C.2, England, 1943. 206 pp., illus., diags., charts, tables, 9 x 6¼ in., cloth, 12s. 6d.

This book deals with all types of battery-operated electric vehicles and their accessories including light and heavy trucks, tractors, locomotives, buses, passenger cars, etc., Batteries, charging equipment and care and maintenance are discussed as well. The possible fields of use are pointed out, and British practice is thoroughly reviewed. There is a bibliography, but confined to British publications. This is the first book on the subject in twenty-five years.

## BROACHES AND BROACHING, First Edition.

Broaching Tool Institute, 74 Trinity Place, New York, 1944. 97 pp., illus., tables, 11 x 8 in., fabrikoid, \$3.00.

A brief historical sketch precedes a discussion of the advantages, applications and limitations of broaching. The later chapters give technical information on the types of broaches, design procedure, and current broaching practice. The subject of costs is briefly treated.

## CABLE CAR DAYS IN SAN FRANCISCO

By E. M. Kahn. Stanford University Press, Stanford University, California, 1944. 134 pp., illus., tables, 10¼ x 7 in., cloth, \$3.00.

This informal narrative covers the history of the cable car railroads in San Francisco from their beginning to the present day. The background of contemporary life in San Francisco is brought out by anecdote and description and is highlighted by the activities of the notable characters connected with the various enterprises. A large number of contemporary photographs illustrate the text.

## DIVING, CUTTING AND WELDING IN UNDERWATER SALVAGE OPERATIONS

By F. E. Thompson, Jr. Cornell Maritime Press, New York, 1944. 214 pp., illus., diags., tables, 7½ x 5 in., cloth, \$2.00.

This book is intended both as a text for men who are learning the work and as a practical manual for all those who are actively engaged in such operations. The material covers diving theory and practice under varying conditions, describes and demonstrates the use of all types of cutting and welding equipment for underwater work, and includes a section of useful data and definitions.

## EXPERIMENTAL STRESS ANALYSIS (Proceedings of the Society for Experimental Stress Analysis, Vol. 2, Number 1, held at the Hotel Statler, Boston, Mass., May 18, 19, 20, 1944)

Published and distributed by Addison-Wesley Press, Kendall Square Bldg., Cambridge 42, Mass. 225 pp., illus., diags., charts, tables, 11¼ x 8½ in., cloth, \$5.00.

This volume contains the papers presented at the 1944 spring meeting of the Society and symposium on residual stresses. Twenty-one papers are included, which discuss methods of measuring residual stresses and related topics.

## HENLEY'S TWENTIETH CENTURY BOOK OF FORMULAS, PROCESSES AND TRADE SECRETS

Edited by G. D. Hiscox, 1944; revised and enlarged edition by T. O. Sloane. Norman W. Henley Publishing Co., 17-19 West 45th St., New York, 1944. 865 pp., diags., tables, 8½ x 5½ in., cloth, \$4.00.

This well-known collection of recipes, formulas and processes has again been revised. New formulas have been added and new sections included on plastics and on photography. Old formulas have been replaced by better ones.

## INDUSTRIAL SUPERVISOR, a Training Guide for Improvement of Skill and Leadership

By J. M. Amise and T. C. Sutton. Ronald Press Co., New York, 1944. 243 pp., diags., tables, 8¼ x 5¼ in., cloth, \$3.00.

The beginning chapters discuss general supervisory responsibilities and the general qualifications of a supervisor. Succeeding chapters deal with the many specific responsibilities of the supervisor from a practical viewpoint, provide necessary technical information, and show how particular qualifications may be gained or improved. The book is intended for home study, industrial training departments or conference discussions by small groups.

## MECHANICAL INSTALLATIONS (Post-War Building Studies No. 9)

Compiled by the Institution of Mechanical Engineers and published by His Majesty's Stationery Office, London, 1944. 119 pp., diags., tables, 9½ x 6 in., paper, 2s. (Obtainable from British Library of Information, 30 Rockefeller Plaza, New York (\$0.60)).

The object of this series of British reports is to secure a comprehensive and coordinated review of building technique for the guidance of those who will be responsible for the direction and organization of building after the war. This present report on mechanical installations covers the following: lifts, hoists and escalators; cooking installations (except for homes); heating, ventilating and air-conditioning; wells, bore-holes and fire-fighting appliances; building power plants; and refrigerator equipment in buildings.

## METALLOGRAPHY AND HEAT-TREATMENT OF STEEL Ferrous Metallurgy, Vol. 3. (Mineral Industries Series).

By E. J. Teichert. 2 ed. McGraw-Hill Book Co., New York and London, 1944. 577 pp., illus., diags., charts, tables, 8½ x 5¼ in., cloth, \$5.00.

The text on ferrous metallurgy, of which this is the final volume, is intended especially for those employed in the steel industry who wish to acquire a working knowledge of fundamental principles. In this volume the physical metallurgy of the iron and steel alloys, metallography and heat treatment are considered. The work is well adapted for private study.

## MITTEILUNGEN AUS DEM INSTITUT FÜR BAUSTATIK AN DER EIDG. (Technischen Hochschule in Zürich, Mitteilung Nr. 14. Preisausschreiben der Culmann-Stiftung 1941/1942, Zusammenfassung der Preisarbeiten in Statik Massivbau Stalbau)

By E. Derron and others. A. G. Gebr. Leemann & Co., Zürich and Leipzig, 1944. 73 pp., diags., charts, tables, 9 x 6 in., paper.

In 1941 the Culmann Foundation offered prizes for the best papers on: 1. An analysis of the combined action of arch and superstructure in reinforced concrete bridges; 2. The influence of the percentage ratio of reinforcement of slabs and T-beams on the cost of reinforced concrete; 3. The establishment of the economic limit of the span of lattice girders and compound girders. The eight papers that received prizes are published in this pamphlet.

## STEAMBOATS COME TRUE, American Inventors in Action.

By J. T. Flexner. Viking Press, New York, 1944. 405 pp., illus., diags., 8½ x 5½ in., cloth, \$3.50.

Correction.—Published in Canada by the Macmillan Company of Canada, Toronto, \$4.50. For book note see January issue of the *Journal*. (Continued on page 134)

# PRELIMINARY NOTICE

FOR ADMISSION

## of Applications for Admission and for Transfer

January 29, 1945.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described at the March meeting.

L. AUSTIN WRIGHT, General Secretary.

\*The professional requirements are as follows:—

**A Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupillage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

**A Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examination of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

**A Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

**An Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

**ARCHIBALD**—JOHN ALEXANDER, Elect. Sub-Lieut., R.C.N.V.R., of Peterborough, Ont. Born at Peterborough, Ont., April 18th, 1915. Educ.: 1944, graduate of special electrical course at N.S. Tech. Coll., given to selected personnel in the Navy qualifying them for commissioned officer. (Course approved by Council as meeting requirements for Junior); 1936-39, ap'ticeship., and 1939-40, asst. foreman, Can. Genl. Electric Co.; 1940-44, elect. artificer, and at present, Elect. Sub-Lieut., R.C.N.V.R.

References: F. H. Sexton, G. H. Burchill, J. Deane, J. J. Smith, G. R. Langley.

**BERGER**—STEPHEN ETIENNE, of Toronto, Ont. Born at Pécs, Hungary, March 13th, 1900. Educ.: Civil Engr., Univ. of Berlin, 1923; 1924, asst. engr., i/c elevator tower constr., Pécs, Hungary; 1925-27, design of steel, reinforced concrete and timber structures, Kuhn and Schaim, Berlin; 1927-31, chief engr., structl. design section, Leiser B.M.b.H., Berlin; 1931-35, constg. engr.; 1935-40, chief engr. and efficiency expert, design, calculation and supervision of foundations and superstructures of industrial bldgs., etc., La Générale Sociéte Anonyme, Brussels; April, 1944, to date, designing engr., Hydro-Electric Power Comm. of Ontario, Toronto, Ont.

## LIBRARY NOTES (Continued from page 132)

### PLASTIC MOLDING AND PLANT MANAGEMENT

By D. A. Dearle. *Chemical Publishing Co., Brooklyn, New York, 1944. 196 pp., illus., charts, tables, 8 3/4 x 5 1/2 in., fabrikoid, \$3.50.*

Although books on plastics are numerous, not much has appeared on the actual problems that arise day by day in the molding plant. The present work is intended to assist the plant operator. The construction and maintenance of molds, methods of compression and injection molding, production problems, cost control and plant management are discussed in a practical way.

### PLASTICS IN THE WORLD OF TO-MORROW

By B. W. Leyson. *E. P. Dutton & Co., New York, 1944. 184 pp., illus., 8 3/4 x 5 1/2 in., cloth, \$2.50.*

A general survey of the subject, intended for non-technical readers, is provided in this book. The various plastics are described, their uses enumerated and future possibilities discussed.

### PRACTICAL COURSE IN HOROLOGY

By H. C. Kelly. *Manual Arts Press, Peoria, Illinois, 1944. 192 pp., diagrs., charts, tables, 7 3/4 x 5 in., cloth, \$2.75.*

Watch construction, repair and adjustment are treated in a clear manner in this textbook by an experienced watchmaker and teacher. The presentation is suitable for beginners.

### PRINCIPLES OF PHYSICS (Vol. 1, Mechanics, Heat and Sound)

By F. W. Sears. *Addison-Wesley Press, Cambridge 42, Mass., 1944. 526 pp., illus., diagrs., charts, tables, 9 1/4 x 6 in., cloth, \$5.00.*

This text is based on the first course in physics given at the Massachusetts Institute of Technology. It covers the subjects, mechanics, heat and sound, which form the first year of the two-year course, and is given to students who are concurrently given a course in analytical geometry and calculus. Throughout the emphasis is on physical principles, and the calculus is used freely. Numerous problems are provided.

### SIMPLIFIED TIME STUDY

By H. J. Myers. *Ronald Press Co., New York, 1944. 140 pp., illus., diagrs., charts, tables, 8 1/2 x 5 1/2 in., cloth, \$2.50.*

Intended especially for shop foremen, cost men and others who can use time studies to advantage, but to whom the results of elaborate, detailed studies are not available. Simple methods are described and basic principles are presented, with as few technicalities as possible.

### STATE TAXATION OF METALLIC DEPOSITS

By W. A. Roberts. *Harvard University Press, Cambridge, Mass., 1944. 400 pp., charts, tables, 9 x 6 in., cloth, \$4.50.*

Primarily a case study in public finance, this book deals with mine taxation over a broad period of time and with consideration of the underlying political and economic conditions. The author discusses debated principles of mine taxation, examines the aspects of mineral economics pertinent to the method of assessment and the weight of the tax, and shows the relation between the principles of taxation and the basic tenets of common law. A major part of the study is devoted to the political history of the important mining states.

### SYMPOSIUM ON PLASTICS, Philadelphia District Meeting, American Society for Testing Materials, February 22-23, 1944

*Published by American Society for Testing Materials, 260 S. Broad St., Philadelphia, 1944. 200 pp., illus., diagrs., charts, tables, 9 x 6 in., paper, \$1.75; cloth, \$2.00.*

Of the sixteen papers by authorities in the field presented in this publication, the first eight deal with such topics as the heat resistance of laminated plastics, diffusion of water through plastics, and the behavior of plastics under certain conditions and test methods. The rest of the papers are grouped together as a summary of properties, uses and salient features of the following families of plastics: phenolics, polystyrenes, urea and melamine, allyl, vinyl, cellulose, methacrylate and nylon plastics.

# Employment Service Bureau

## NOTICE

Technical personnel should not reply to any of the advertisements for situations vacant unless—

1. They are registered with the Wartime Bureau of Technical Personnel.
2. Their services are available.

A person's services are considered available only if he is—

- (a) unemployed;
- (b) engaged in work other than of an engineering or scientific nature;
- (c) has given notice as of a definite date; or
- (d) has permission from his present employer to negotiate for work elsewhere while still in the service of that employer.

Applicants will help to expedite negotiations by stating in their application whether or not they have complied with the above regulations.

## SITUATIONS VACANT

CIVIL ENGINEERS wanted. See page 42 of the advertising section.

GRADUATE CIVIL OR MECHANICAL ENGINEER wanted. See page 42 of the advertising section.

MECHANICAL ENGINEERS, recent graduates wanted. See pages 43 of the advertising section.

IRRIGATION ENGINEER wanted for Ceylon. See page 42 of the advertising section.

SALES ENGINEERS—large manufacturer of air handling ventilating and air conditioning equipment requires sales engineers with good technical background for industrial and contractor sales. Position would be permanent and on a salary basis. Applicants should give age, nationality, education, training and experience. Apply to Box No. 2877-V.

CONSTRUCTION SUPERINTENDENT, qualified engineer required by a large public utility company in Canada, who will take full supervisory responsibility for construction of substations of large capacity and who will also act as liaison between the company's engineering staff and the contractor. Applicants must have thorough experience in similar work. Applications in first instance should contain full personal and professional history. Apply to Box No. 2869-V.

ELECTRICAL ENGINEERS, graduates, required by a large public utility company in Canada as follows:

(a) One who is thoroughly experienced in the design of sub-stations of large capacity, making system studies, preparing cost estimates and writing specifications.

(b) One as Protection Engineer, who has thorough knowledge of modern relay equipment and its application, along with allied subjects.

Applications in first instance should contain full personal and professional history. Apply to Box No. 2870-V.

DRAUGHTSMEN AND ENGINEERS, Mechanical, electrical and concrete draughtsmen and designers wanted by pulp and paper company. Apply to Box No. 2890-V.

POST-WAR POSITION IN ENGLAND for an experienced executive with sales engineering background, preferably including export work, with a well-established, internationally-known firm of steel building products manufacturers. Senior position overseas. Desirable age limit 37-42 years. Position will require ability, tact, vision, enthusiasm and hard work. Present intention is to establish contact now with suitable applicant, although overseas move will not be made till war conditions permit. Some months of familiarization with future duties would be arranged for at a U.S.A. point. Apply to Box No. 2900-V.

## The Institute Requires

The full-time services of a member to take charge of the rehabilitation of members now in uniform; to operate the Institute's Employment Service Bureau on a permanent basis, and to assume such other duties as may develop from time to time.

It is desirable that candidates shall have had service in this war, or as an alternative, service in the last war. The position will require residency in Montreal and considerable travelling.

Make application by letter to the President of the Institute at 2050 Mansfield Street, Montreal 2, giving an outline of recent employment experience and date as to when available. All enquiries and applications will be treated as confidential. Salary will be based upon experience and other qualifications.

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

GRADUATE MECHANICAL ENGINEER for post-war position, age about 35 with production and executive experience required by internationally-known firm of manufacturers of steel building products, to act in senior plant position in U.S.A. Successful candidate must be adaptable, desirous of co-operating in development of new products and production of same, and preferably with some experience in handling labour. Present purpose is to establish contact with suitable applicant with a view to prompt action when regulations permit. Apply to Box No. 2901-V.

## SITUATIONS WANTED

MECHANICAL ENGINEER, J.E.I.C., J.A.S.H. & V.E., B.Sc. 1936. Age 30, married. British nationality; Canadian citizenship. Experience includes four years on design, test work and sales engineering with manufacturers of complete line of fans and air handling equipment, as well as domestic and commercial heating and air conditioning equipment; one year lecturer and demonstrator in mechanical engineering at leading Canadian University; two years engineer in charge of grey iron foundry in large metal industry; two years on industrial ventilation and dust control problems, including design, experimental and development work principally on gas and dust scrubbers. Ontario location preferred. At present employed and on military postponement, but services available under regulation PC 246 Part 3, administered by W.B.T.P. Apply to Box No. 1484-W.

ENGINEER, M.E.I.C., R.P.E. (Ont.) presently employed as assistant engineer and chief draughtsman. Desires new connection due to contemplated staff reduction in a war industry. Extensive experience in structural steel and plate fabrication, miscellaneous huilders' iron work and reinforced concrete as engineer and draughtsman, estimating and sales. Apply to Box No. 2208-W.

ADMINISTRATIVE ENGINEER, Civil, M.E.I.C., R.P.E. (Ont.) Toronto graduate, age 31, married. Structural supervision experience including design, maintenance, estimates, preparation of reports and specifications; administration of construction. Qualified to prepare and develop municipal and industrial plans and layouts. Available immediately. Would consider foreign assignment. Apply to Box No. 2466-W.

CIVIL AND ELECTRICAL ENGINEER, M.E.I.C., age 37, married, eight years' experience in public utility field, transmission lines, distribution systems, power sales, estimating, inspection, rates, electricity and gas. Seeks responsible position with public utility or similar organization. Registered with W.B.T.P. Available December 1st, 1944. Apply to Box No. 2469-W.

ENGINEER, B.Sc. (civil and mechanical), A.M.I.C.E., M.E.I.C., age 39, married, with eighteen years' experience in civil, mechanical, structural and chemical engineering field covering design and construction of filtration plants, industrial buildings, structural steelwork and chemical plants. Recently returned from wartime chemical plant design, construction, operation and management in Australia. Accustomed to technical development of industrial processes, supervision of operations and executive responsibility. Ready for new appointment requiring engineering qualifications combined with executive ability. Interested in permanent position with progressive chemical or industrial concern or with firm of engineers planning development. Ontario location preferred but not essential. Services are available under regulation P.C. 246, part 3, administered by W.B.T.P. Apply to Box No. 2470-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., R.P.E. (Ont.) 35 years of age, 10 years' general contracting experience; 6 years sales engineering and executive experience with manufacturer of construction materials. At present holding commission in R.C.A.F. Works and Buildings branch, desires contacts in construction field for employment in near future. Apply to Box No. 2471-W.

GRADUATE ENGINEER, M.E.I.C., R.P.E. (N.B.) with 30 years practical experience in design and construction of industrial plants, reinforced concrete, steel, timber, steam heating, water supply installation, sewerage, wharves and docking facilities, quantity and cost estimates. At present holding position of responsibility, seeks position of responsibility with industries which contemplate building or expanding. Apply to Box No. 2472-W.

RADIO ENGINEER, J.E.I.C., A.M.I.R.E., age 26, married, desires position with a radio manufacturer as a development or test engineer. Have four years experience in radio servicing, one year in general electrical (industrial) servicing, three years in teaching of radio theory and practice and one year as a technical superintendent of radio inspection. Registered with W.B.T.P. and am available immediately. Apply to Box No. 2473-W.

### BURLINGTON STEEL CHANGES

After spending more than three years with the Department of Munitions & Supply, Crossley W. Gale has returned to Burlington Steel Co. Ltd., as assistant sales manager.

Harlow W. Hinman has been appointed manager of tubing sales for Burlington Steel. In 1914 he established the Canadian Metal Products Ltd. at Guelph, a subsidiary of the Republic Steel Corporation. He operated this plant until 1931 when it was purchased by Burlington Steel, and Mr. Hinman joined the sales staff of the company.

Court A. Cline, who has been with the company since 1929, was appointed manager of reinforcing steel sales.

### PLASTICS

Canadian Celanese Ltd., Montreal, have for distribution a 12-page folder which has been designed to show some of the many applications of plastics to civilian goods and with a view to providing designers and others with opportunities for planning for the future. The various types of plastics are treated separately with illustrations showing typical products made from each. In addition, a table of the general properties of each type of plastics is furnished. The centre spread provides in summary an organized list of the company's plastics by forms and types, sizes, colour ranges and typical uses.

### C.G.E. APPOINTMENTS

H. M. Shockley was recently transferred from the apparatus sales department, head office of Canadian General Electric Co. Ltd., Toronto, to the Vancouver district office, where he will serve as central station engineer.

W. Alex. Williamson has returned to the apparatus sales department, head office of Canadian General Electric Co. Ltd., at Toronto, where he will specialize on switch-gear problems. During the past seven years he was sales engineer with the company at Trail, B.C.

### RECENT APPOINTMENT

Canadian Ohio Brass Co. Ltd. recently announced the appointment of R. R. Mills as district manager of the company's Niagara Falls and Toronto sales territories, with headquarters located in Niagara Falls, Ont. Mr. Mills was formerly transportation assistant of the Winnipeg Electric Company, with which organization he had been associated for the past fifteen years.

R. R. Mills

I. I. Sylvester

### TRANSPORTATION SPECIALIST

Canadian General Electric Company, Limited, recently announced the appointment of I. I. Sylvester as transportation specialist attached to their Montreal office. Mr. Sylvester, it is stated, will handle the company's traction equipment business with the railways, with industrial customers, and with urban transit properties in their Montreal sales district.

Mr. Sylvester was with the C.N.R. for twenty-six years, joining in 1918 as a special apprentice. In 1940 he was appointed inspector of diesel equipment in charge of all internal combustion power plants in locomotives, stationary plants and work equipment on all C.N.R. lines. In this capacity, and formerly as special engineer in charge of Diesel engines, he was identified with many significant achievements in railroad Diesel maintenance.

### CONDUIT MATERIALS

Canadian Johns-Manville Co. Ltd., Toronto, have issued a 44-page booklet, which constitutes a collation of technical data relating to the installation of conduit and ducts for electrical conductors in exposed and covered situations. The advantages and uses of the company's "Transite Conduit" and "Transite Korduct" are described in detail as are also the fittings and couplings recommended for use with these products. Considerable space is devoted to photographs and descriptions of typical installations including detailed engineering information.

### KELVINATOR APPOINTMENT

The Board of Directors of Kelvinator of Canada Limited recently announced the appointment of A. V. Phillips as vice-president in charge of engineering.

Mr. Phillips has been connected with the company since 1927. His first responsibilities were in connection with the development of commercial sales engineering and refrigeration applications. In 1930 he was made chief engineer and director of quality. Prior to his entry into the refrigeration business he spent some time in the motor car industry, having been connected with the Chevrolet Motor Company in the U.S. for several years.

### CONTROLS ENGLISH ELECTRIC

Announcement is made by Major James E. Hahn, D.S.O., M.C., president of John Inglis Co. Ltd., Toronto, of the acquisition by that company of a substantial stock interest and close mutual working arrangements with English Electric Co. of Canada Ltd., of St. Catharines, Ont.

"Both the Inglis company and the English Electric Co. have extensive immediate and post-war plans for supplying equipment to industry in Canada and abroad" said Major Hahn. "From an operational standpoint the products of the two companies dovetail in so nicely that it was felt a more complete and more satisfactory service could be given to manufacturers and producers through general working arrangements between the companies."

No change is intended in the individual operations or in the executive personnel of the two companies, nor in any agreements with associated companies.

### EXECUTIVE VICE-PRESIDENT

C. C. Thackray has been appointed executive vice-president of Dominion Rubber Co. Ltd., according to a recent announcement.

Mr. Thackray, who was born in Ottawa, joined Dominion Rubber in 1920 and has held many responsible executive positions in the company. He was made a director of the company in 1942.

### WINNIPEG OFFICE OPENED

Geo. W. Wolf, president of the United States Steel Export Company, has announced the appointment of William P. Walton as manager of the Company's Winnipeg office which is being reopened. Mr. Walton enjoys a broad background in the steel business, having represented the company as manager of its Sydney, Australia, office for many years.

### DECEASED

T. B. Fordham, president of the Leland Electric Co., died suddenly on December 17th in Dayton, Ohio.

Mr. Fordham was widely known throughout the continent as an industrial engineer. Besides being president of the Leland Electric Company, he held many important executive positions with other industrial corporations in Dayton. He was also chairman of the Board of Leland Electric Canada Limited.

T. B. Fordham

## A MESSAGE FROM THE PRESIDENT

“**N**O WISE MAN has a policy. A policy is the blackmail levied on the fool by the unforeseen. I am not the former and I do not believe in the latter.” So said the Viceroy of India, in one of Kipling’s “Plain Tales from the Hills.”

Like many other epigrammatic remarks, this is a rather clever over-statement of a fundamental truth. A policy is something that changes of necessity with changing circumstances. Certain broad principles may, however, be safely assumed as a policy for The Engineering Institute of Canada. The high ideals of the past must be sustained, the spirit of co-operation must be continued, and nothing that is in the interests of the members of the Institute must be considered unimportant.

There can be no let-up in the efforts that have been put forth in the past five years by the Institute as a body, and by its members individually in their engineering contributions towards the winning of the war. In spite of favourable news from the battlefield, this is a time to tighten our belts and to go into the last lap with unabated zeal and determination. We are faced by a skilled and relentless foe, and he will bring into this final stage of the battle all the clever and ingenious devices that his highly organized scientific and engineering staffs can invent and develop. By intensive and continuing research, development, manufacture and transportation, we must, as engineers, keep ahead of him in this gruesome race, until the last shot has been fired and Victory has been won. We can do it and, if we have a policy to lay down, let it be—“We will do it.”

But, in spite of our necessary preoccupation with the engineering problems of the war, it will be our duty to exercise all possible foresight and imagination in furthering plans already laid for the post-war period. Here again, the engineer has a notable part to play: in the development of post-war projects; in assisting returning engineers to adjust themselves into peacetime occupations; and in the training of those whose engineering education has been interrupted.

With its great prestige, its wide-spread membership, and its fine traditions, The Engineering Institute of Canada is well adapted to play a notable part in these spheres of war and peace, and I look forward with confidence to a busy and fruitful year for your Council and Committees.

You have conferred on me a high honour, by electing me to the Presidency of the Institute for the coming year. I deeply appreciate that honour, and I trust that I may be able to carry out to your satisfaction the accompanying responsibilities.

*President.*

# THE WELDING AND FABRICATION OF CANADIAN LIGHT ARMOUR

F. J. McMULKIN, Jr., E.I.C.,

Research Metallurgist, Ontario Research Foundation, Toronto, Ont.

Paper delivered before the Hamilton Branch of The Engineering Institute of Canada

On December 14th, 1944

## INTRODUCTION

The term "light armour" may be employed in two senses. It may refer to either the lighter thicknesses of armour plate or to the lightly armoured vehicles themselves, in which latter sense the term "light armour" is used by the newspapers. This article will deal with the welding of light armour in the first sense and the fabrication of the light armoured vehicle hull in the second sense.

In considering the problems relating to the welding and fabrication of light armour plate, it is necessary that we first review the developments in this field. The practice which existed in the manufacture of the pre-war armoured vehicles has in part served as a foundation for the present practices. At the beginning of the war there was little or no information on the welding of armour plate. The practices usual at that time involved the use of a bolted and riveted design.

## HISTORY

The first light armoured vehicles and, for that matter, the heavier type vehicles such as tanks, were constructed primarily with one or other of two types of armour, this armour being bolted or riveted on to a mild steel framework consisting of strips and angles. The armour used was either of the so-called face-hardened type or of what is known as a homo-hardened type. The first type is primarily a hardened plate of approximately 400 Brinell hardness, having one side carburized and hardened to approximately 600 Brinell, this hardened face being presented to the projectile attack. The second type, or homogeneous hardened type, is, as the name implies, an armour of uniform carbon content and hardness throughout its thickness, the Brinell hardness being about 450.

It is easy to visualize the difficulties which occurred in the machining and fabrication of these types of armour. Other difficulties were encountered in this type of construction, namely, the fact that the gaps between adjacent plates had to be held to very close limits in order to resist attack with solid core projectiles and to guard against molten lead splash from the ordinary ball type ammunition.

The objection to the use of welding at this period of armour vehicle construction was mainly due to the effect of the welding heat on the plate, which brought forth two problems. The first problem was that of avoiding cracks to which this high alloy type of armour plate was prone, due to its high hardenability. The second problem was presented by the softening effect of the welding heat in the adjacent parent plate zones which it was felt would tend to lessen their ballistic immunity.

## DESCRIPTION OF WELD ZONE

It seems desirable to mention the different zones which exist near any ferrous weld. Figure 1 shows a section through a single pass butt type joint in 12 mm. bullet proof armour plate which was made by an automatic electric arc welding process. Examination of the

figure will show that, progressing from the deposited metal to the parent plate structure, a number of complex heat affected zones are encountered in the weld adjacent armour plate. The first zone, adjacent to the deposited weld metal, is what is called the coarsened zone, the structure being relatively coarse due to the high heat (2,500 deg. F.) which this section of the parent metal has attained. This zone is also a hardened zone but, due to its proximity to the molten weld metal favouring slow cooling rates, it will not possess the maximum hardness encountered in the weld section. The next zone is called the hardened zone and, like the first, has been above the critical temperature, and it is here that the highest hardness is reached (in this type of armour plate up to 550 Brinell). The structures found in these first two zones in the case of armour plate weldments are mainly martensitic and thus inherently hard and brittle. It is the aim, if possible, to minimize the width and extent of these zones by the use of proper welding procedure and technique.

The next zone which is encountered is termed the softened zone or, in other words, the adjacent parent metal which has reached a temperature ranging from the critical temperature down to the maximum temperature which was reached in the drawing of the parent

Fig. 1—Weld section showing principal zones and hardness in adjacent armour plate.

plate during heat treatment. This zone in light armour plate weldments will show hardness as low as 290 Brinell and its extent must be minimized as much as possible in order that the ballistic properties of the weld zone may be maintained. The hardness graph in Fig. 1 shows the different hardness levels encountered in the different adjacent heat affected zones just described.

The above description of the weld zones is typical in part of all welds made on armour plate or, for that matter, any hardenable grade of steel, whether we are considering multiple pass manual arc welding or automatic single pass arc welding.

#### PROBLEMS ENCOUNTERED IN WELDING ARMOUR

While stating what is required of these armour weldments it will be well to study briefly the major difficulties encountered. In the making of a weld between two armour plates, the weld must meet a ballistic specification which is governed by the thickness of the plate being joined and the angle of projectile attack to which it will be subjected. The weld must also have sufficient structural strength to withstand the stresses which will be imposed in normal service. In the first case, sufficient excess weld metal build-up, weld soundness and weld hardness must be maintained to afford the same ballistic immunity as the thickness of the parent plate being joined. In the second case, it is necessary to ensure sound welds and maintain the desired physical properties of the weld and weld adjacent zones. In aiming to meet both these requirements, one of the main difficulties met with was that of preventing the formation and propagation of cracks in the heat affected parent plate zones just described.

Our present knowledge of crack formation is limited to a large but unrelated mass of information which has been gained by ourselves and many other observers. In order to fully understand the complexity of the problem, we will mention the main factors which are known to be important in the production or, inversely, the elimination of cracks. The two main types of variables may be classified under the heading of "external" factors and "internal" factors. The external factors are

those which it is possible to control directly and include plate composition, thickness and temperatures; the dimensions of the groove; the rigidity or external restraint of the joint; the composition, temperature and coating of the electrode; and the welding voltage, current and speed. The internal factors are those variables which we may class as not being directly under control and include the cooling rate of the weld zone; depth of weld metal penetration; thickness and contour of the weld bead; the stress distribution as governed by the external restraint; rates of speed of freezing and cooling; joint geometry; and the composition of the fused weld metal as governed by the dilution or per cent admixture of the deposited metal by the parent plate material. In addition, there are so-called inherent factors which are beyond experimental control and which are represented by the thermal diffusivity, physical properties, the range of temperature through which the weld zone passes, and the allotropic transformation of the steel.

It will be seen that many such variables must be dealt with in any investigation which aims to develop the best overall welding conditions. It should also be appreciated that elaborate and painstaking tests must be conducted in order to segregate and eliminate the causes, say, of weld cracking. In actual weld testing of mild steel weldments, it is generally necessary to perform only the usual physical tests. However, when one is dealing with high tensile type steels having latent high hardenabilities, it is also necessary to supplement the ordinary physical weld tests with a test or series of tests which will measure the tendency of a certain parent plate material or welding technique to produce cracks in the weldment. There are numerous tests of this type, in which the test specimen to be welded is held under restraint during and after the welding cycle. The number and complexity of these tests prevents their discussion in full. However, one such test, the R.D. Rigid Butt test, is shown in Fig. 2. It is possible in this test to vary conditions of restraint and cooling cycle while using different plate materials, welding rod types, and welding procedures or techniques. In other

Fig. 3—Three main types of weld section cracks—All samples etched with 3% nitric acid.

words, it is possible to vary the "external" and, to a degree, the "internal" factors in a test weld and study their effects.

Cracks which are encountered in armour plate welding are of three main types and are illustrated in Fig. 3: first, weld cracks, i.e., cracks in the weld metal; second, fusion zone cracks, or cracks occurring at the interface of the weld metal and the parent metal; and third, cracks occurring in the parent metal of the heat-affected adjacent zone. Fusion zone cracks are probably the most important and merit considerable attention. In these cases, fracture occurs within the very narrow region located at the welded edge of the armour plate without any direct relation to a particular microstructure or hardness pattern; this indicates that the distribution of internal stresses may be accountable for the crack formation. The coefficient of linear expansion is approximately 40 per cent greater in the case of the austenitic stainless weld metal normally used than in that of the parent armour plate which we are welding. After the joining of these two metals by means of welding, any decrease in temperature will result in the development of shear stresses at their junction or interface due to the restraint of contraction imposed upon the austenitic weld metal by the adjoining ferritic armour plate. This condition tends to favour the possibility of cracking which is already favoured by the adjacent brittle martensitic zone in the armour plate. This explains the tendency towards adjacent failure which is encountered in the ballistic testing of these welds and practically forbids the maintenance of 100 per cent ballistic immunity in the weld zone.

#### TYPES OF ARMOUR PLATE

In order to explain the difficulties encountered in the welding of the homo-hard armour, we will next consider its general properties. This armour plate is made from a steel containing a considerable quantity of alloy together with a medium carbon content. This results in a steel possessing a high hardenability. Briefly defined, the hardenability of a steel is that property which will allow it to harden throughout the section (thickness) being considered upon cooling to room temperature from above the critical temperature (1,500 deg. F.). In the heat treatment of steel this cooling is generally accomplished by quenching it in water or oil, whereas in welding, the weld zones heated above the critical temperature are quenched by the heat transfer effect occasioned by the mass effect of the parent plate. Hardenability is obtained by the addition of controlled percentages of carbon and hardening alloy elements to the steel. The percentage carbon content largely controls the maximum hardness level which may

be reached, by allowing the formation of hard carbide constituents, while alloy additions such as chromium, manganese and molybdenum slow up the structural transformation of the steel by depressing the critical cooling rate, i.e., the minimum cooling rate needed to induce full hardening.

High hardenability is needed to impart hardnesses ranging from 400 to 450 Brinell in this homo-hard type of plate. A plate of this hardness, while excellent against a small calibre attack with armour piercing projectiles, possesses the undesirable habit of shattering when over-matching attack with larger calibre projectiles is encountered. This is a feature which is common to German armour plate but is considered highly undesirable by Allied designers. The other undesirable feature, as mentioned above, which this armour plate possesses is that, due to the high inherent hardenability, the presence of extremely high hardnesses in weld adjacent zones makes for the propagation of weld cracks and cracks in the adjacent parent plate zone.

In order to allow for the total use of welding in the fabrication of an armoured hull, another type of armour was developed. This armour was to possess in addition the ability to withstand overmatching attack without shattering. This armour came to be known as machinable quality homogeneous armour and possessed a heat treated hardness of approximately 350 Brinell. Since the upper limit of practical machinability is approximately 400 Brinell, this hardness of armour allowed for mass production and manufacture on a comparatively economical basis when compared to the problems met with in trying to machine the earlier, harder types of armour used. Since a lower hardness was specified to give machinability, it was also possible to lower the percentage of alloying elements and in this way decrease the hardenability of this steel to the point where welding could be practised with fewer cracking difficulties in the weld and weld adjacent zones. It was found that it was possible to completely weld an armoured hull from this new type of armour plate, and the use of a mild steel framework with the accompanying use of rivets and bolts was eliminated. This resulted immediately in improvements in weight reduction, release of processing machines, added ballistic protection and saving in labour.

#### INITIAL CANADIAN WELDING DEVELOPMENT

It was at this stage of development that Canadian manufacturers were called upon to produce fighting vehicles using light armour (4-17 mm.). Since the United States had been doing no work of this kind, information was not available from this source. The only information which was obtainable from the United

Fig. 4—Note prebending induced in plate during welding of strip to edges of plate.

Kingdom was to the effect that it was possible to weld light homogeneous armour satisfactorily using stainless type electrodes, the process being that known as D.C. manual arc welding.

The property which makes the stainless type electrode suitable for the welding of armour plate is the ability of the weld metal to remain in the austenitic state on cooling, which austenitic state or structure possesses the necessary strength and, what is more important, ductility, to absorb the severe contractional stresses during cooling of the weld section. Since the tensile strength of the armour plate is over three times that of structural grade mild steel, it will be appreciated that a ductile weld metal is needed to absorb the expansional and contractional stresses induced by the welding heat.

Since it was of prime importance that the Canadian armoured car programme be started without delay, it was necessary to find a suitable type and make of stainless electrode and develop as soon as possible a satisfactory welding procedure and technique which would permit the fabrication of ballistically and structurally sound welded armour hulls. The only information available on the stainless electrode used was to the effect that three methods of welding were practised. The first method used the so-called 25-20 (25 per cent chrome—20 per cent nickel) type stainless electrode, but the difficulty we found was that, due to the low hardness (180 Brinell) of the weld deposit, it was impossible to maintain the ballistic properties of the weld zone. The second type of weld recommended was that in which all the passes in the vee were deposited with a 25-20 electrode and the crown bead, which was exposed to ballistic attack, was deposited with a hard-surfacing type electrode in order to resist projectile penetration. It was found that excessive cracking of this hard facing weld metal took place and this method was discarded. The third method of making a weld employed an 18-8 (18 per cent chrome-8 per cent nickel) type stainless electrode giving a harder weld deposit (210 Brinell) and after many experiments with welding procedures and welding techniques, it was found possible to produce ballistically and structurally satisfactory welds with the weld joint designs prescribed at that time.

After we had found out how to make satisfactory weldments with the 18-8 stainless type welding rod, studies were made of the factors relating to joint design from the point of view of increasing the overall physical

properties of the welds. It was found that in a butt type joint a 60 deg. vee angle represented the ideal. In the preparation of plate edges which formed a particular joint, the natural angle of the vee so formed was considered. Where the vee angle so formed did not fall below 50 deg., no plate edge preparation was carried out. It was found that a smaller vee angle than the above figure tended to produce unsound welds, while, on the other hand, if a vee angle of 60 deg. was exceeded, the greater area of soft weld metal so presented made for increased ballistic failures, while at the same time having a greater consumption of expensive weld material. In cases where the natural vee angle exceeds 60 deg., as in the case of the 90 deg. full open corner joint, there is no alternative but to use this type of joint design with adequate build-up of the crown bead.

Space does not allow us to describe in detail the many procedures and techniques which were developed to ensure satisfactory armour plate welds. It is sufficient to say that for the most part good mild steel welding techniques and procedures must be adhered to in the welding of armour plate. The main difference between the welding of these two types of steel is that, in the case of the armour plate welding, the welding heat and heat input into the adjacent zone must be maintained as low as possible. The reason for limiting this heat is to prevent excessively wide heat-affected zones in the parent plate and excessive admixture of the plate metal with the deposited weld metal, both of which conditions make for crack formation and ballistic failure.

#### ALLOY CONSERVATION

About this time in the development of Canadian armour plate welding, the alloy shortage was becoming increasingly severe. The stainless rod which we were using possessed a total of about 33 per cent alloy, these alloys being chromium, nickel, molybdenum and man-

Fig. 5—Hand-operated welding positioner used in positioning small sub-assembly weldments.

ganese. Considerable work was carried out to develop or discover a welding technique or type of welding electrode which would allow the joining of armour plate with a less expensive weld metal. It was found that insofar as ballistic requirements were concerned, it was possible to produce ballistically sound butt welds welded with mild steel electrodes. It was not, however, possible to ensure a production of crack-free weldments on a practical production basis when butt type or corner type joints were involved. It was, however, established that straight polarity mild steel electrodes of the AWS E6012 variety could be used satisfactorily in the welding of fillet and lap type joints with no danger of lowering the ballistic or structural requirements of the vehicle. It was also found practical to use mild steel electrodes when depositing the sealer bead or back bead on the stainless welded butt and corner type joints. The substitution effected in the use of mild steel in place of stainless electrodes was found possible to the extent of 35 per cent in the case of the two armoured cars being made at that time. Where effected, this substitution cut the cost of weld metal by 90 per cent, while at the same time conserving critical alloys.

The main precaution in regard to the use of mild steel rod was that, as in the case of the stainless, the penetration and welding current (heat) must be kept to the minimum compatible with the production of sound welds, in order that excessive dilution of the ductile deposited weld could be avoided. The use of mild steel welding on armour plate was limited for the most part to outside attachments and those inside attachments which allowed at least 8 inches of continuous welding. The reason for this was that the mild steel weld was not as capable of withstanding the impact of ball ammunition when the attack was on the opposite side of the plate from the weld. This is explained by the great difference in ductility of the two types of deposited weld metal, i.e., mild steel and stainless with 2-inch gauge length elongations of 20 per cent and 45 per cent respectively.

The next major step in connection with welding of armour plate was the development of the so-called ferritic type electrode. This electrode was of the so-called high tensile type and differed from the commercial grades in that it possessed a lime type coating such as that used on the stainless electrodes. The percentage of alloy was only about 3 per cent and a saving in cost of roughly 50 per cent resulted. This electrode was developed in the United States and had limited application to the welding of butt type and corner type joints. It was tried in Canada and, while not found suitable for these butt type joints, it did find some application to fillet welds in places where the use of mild steel was prohibited. A saving of 10 per cent in stainless electrode usage was made by the substitution of this ferritic electrode on one vehicle being welded at that time.

#### AUTOMATIC ARC WELDING

While manual arc welding of armour plate has proved to be the most advantageous type of welding to use in

many cases, the automatic type of welding, which is also known as the submerged melt type of welding, has also proved applicable to armour plate. The automatic type of welding has the advantage that in many cases the use of one welding pass may be substituted for three or four passes of hand welding, while at the same time employing an electrode travel speed upwards of 50 per cent higher than can be used by the manual method. Up to the time that armour plate welding was undertaken in Canada, no automatic welding of armour plate had been attempted anywhere. One Canadian company, however, took the big step of applying this process to one armoured vehicle which they were making. Since the rule of the day was to use an austenitic core wire in welding armour, the first vehicles produced by this welding method employed the stainless type of rod. It was soon found that unsound welds occurred when using this type of rod and that transverse weld cracking was encountered due to the high shrinkage stresses and also due to the embrittlement of the weld metal which took place. This embrittlement was due, in part, to the extremely deep penetration which is characteristic of this process and which results in upwards of 60 per cent dilution of the weld metal by the parent plate thus destroying the ductile nature of the intended austenitic weld metal. It was quite obvious that a ferritic or mild steel type of electrode was required and, after considerable experimentation, it was found that a mild steel core wire containing small additions of manganese and molybdenum made it possible to produce a weld which approached the physical properties of the parent armour plate.

The main considerations in this automatic type of welding are that the joint fit-up must be held to closely specified limits and that the welding procedure must be closely controlled to give the correct percentage of parent plate admixture and controlled cooling rates in the weld adjacent plate zones. It was found that exces-

Fig. 6—Large motor-operated positioner for handling major hull assemblies.

Fig. 7—Roll-over positioner used on production line.

sive admixture of the parent plate with the weld metal gave excessively hard welds, which though possessing particularly good ballistic resistance, tended to produce severe weld cracking due to the extremely low ductility factor. One advantage which the ferritic weld had was that, due to the co-efficient of expansion being approximately the same for the weld metal and the parent plate, the weldments gave extremely good ballistic results under impact with explosive or overmatching projectiles. It is not out of the way to say that Canada pioneered in the development of the submerged melt type welding of armour plate.

#### FABRICATION METHODS

Considerable difference exists between the working and fabrication of mild steel and armour plate, the latter material actually being a high tensile type of steel which has been heat treated to impart the necessary physical properties to enable it to withstand ballistic attack. When it is remembered that the structural grade of mild steel possesses a tensile strength averaging 65,000 lb. per sq. in. and a ductility, as measured by elongation, of about 35 per cent in a 2-in. gauge length as against the armour plate which possesses a tensile strength of approximately 180,000 lb. per sq. in. and a ductility of only 12 per cent, it will be realized that we are dealing with properties in the latter case which approach those of a spring steel.

After the flame cutting of plates which are designated for subsequent welding, it is necessary to employ a straightening operation so that flat plate surfaces and good weld-fit-ups can be obtained. In the welding of armour plate assemblies, as in the case of mild steel, considerable distortion and locked-up stresses are introduced into the weldment. When the initial fabrication was begun, it was soon realized that adequate clamping and holding of the assemblies to be welded was a primary prerequisite. This necessitated reinforced welding fixtures and extremely heavy clamps. Due to the high yield strength of the material, there was considerable difficulty in straightening assemblies after welding and, wherever possible and allowable, prebending of the assemblies during welding was used. Figure 4 shows one such jig in which a square door is present during welding of splash strips

around its edges. It was a case of considering every assembly as a separate problem and, by trial and error, construction of the jig was undertaken to produce a finished product containing the least possible amount of locked-up stresses and warpage.

In the manufacture of the jigs, two primary requirements had to be met. First of all, due to the shrinkage of assemblies after welding, it was necessary to allow for this in the jig so that the weldment could be freely removed after welding. It was also necessary, wherever possible, to allow for positioning of the assemblies so that flat or horizontal welding positions could be

used. The reason for this latter requirement was that, due to the shortage of good welding operators, the best welding conditions were required in order that quality welding could be maintained. There is also the other problem that the different operating characteristics of the stainless type electrode necessitated that, wherever possible, the trough or down-hand type of welding position should be allowed.

Hand-operated positioners such as shown in Fig. 5 were used to position the smaller welded sub-assemblies. Large assemblies were positioned by large motor-driven positioners working on the same principle as the smaller hand-operated ones. One such motor-driven positioner is shown in Fig. 6. Positioning on the production line was done in "roll-overs" such as shown in Fig. 7, in which the whole armour hull could be positioned around a horizontal axis.

In all phases of the straightening and fitting of assemblies, added difficulty was encountered due to the higher strength and springiness of the armour plate, and special tools and methods had to be developed to meet this problem. These problems were multiplied due to the close tolerances of fit between doors and door frames, etc., in order to afford adequate protection against lead splash.

#### OTHER PROBLEMS

One of the main difficulties which had to be met and which was always on hand was that of obtaining weld-

Canadian Mark 1 Reconnaissance Car.

ers for armour plate welding. Since in all other fields welding was becoming increasingly popular, a great strain was placed on the available welder capacity and, to counteract this, training schemes and welding schools had to be introduced. Hitherto it had always been claimed that it took years to produce a good welding operator and we found that this was, in a sense, correct. It was found possible, however, by the use of intensive instruction and a simplified training scheme to train a green man in a period of four weeks to a state of competence which would allow him to produce quality work on simple sub-assembly welding. Depending on their aptitude, it has been found possible to allow welding school graduates to work on major sub-assemblies three to six months after graduating from the welding school. It is perhaps of interest to mention that, at one time, 50 per cent of the welding school enrolment was composed of women, who, in some cases,

proved to be better than men in acquiring welding technique.

#### ACKNOWLEDGMENTS

The material for this paper has been taken, for the most part, from data and experiences which have been collected during the course of a research fellowship supported by the Hamilton Bridge Company, Hamilton, Ontario, on the problem of armour plate welding.

The author wishes to acknowledge the encouragement given him in this work by Mr. O.W. Ellis, Ontario Research Foundation, in whose department of the Foundation the laboratory work of the Hamilton Bridge Company fellowship on armour plate welding was conducted.

Acknowledgment is also made of the valuable work contributed by Dr. Gordon E. Willey who preceded the author in the initial stages of the fellowship.

The author is also indebted to the Hamilton Bridge Company for the photographs included in this paper.

## THE NEED OF RESEARCH IN CANADA

A. F. G. CADENHEAD, M.E.I.C.

*Director, Department of Chemical Development, Shawinigan Chemicals Limited, Shawinigan Falls, Que.*

An address delivered at the President's Dinner on the occasion of the Fifty-Ninth Annual General Meeting of The Engineering Institute of Canada in Winnipeg, Man., on February 6th, 1945

A year ago at the Annual Meeting in Quebec City, Dr. C. J. Mackenzie, now president of the National Research Council presented a paper which, in my opinion was of the greatest import, important because it dealt with one of the most fundamental and significant problems facing Canadians to-day: Research.

No apology is offered for the appearance of a few more remarks on the subject, in spite of the many excellent and thought-provoking contributions by eminently qualified writers on this theme. It is my wish to emphasize the situation, even though by repetition, in order to keep this vital subject in the public mind.

Of the many phases of research and the varied fields, such as the academic, the social, the economic, the engineering and the industrial, in which it is carried on, valid considerations preclude detailed treatment of the subject here, nor do they permit of anything but a casual reference to the overlapping of almost all of these areas. But there are certain aspects of the subject which do merit the sober consideration of all thinking Canadians. These, it is my intention, with your indulgence, to present briefly here.

It will be taken as axiomatic that because of the legitimate publicity now given to research, the day is past when any question is raised as to the need for industrial research or any other kind of research; and that these are commonly accepted as necessary items in the budgets of governments and government agencies, universities, and enlightened financial and industrial corporations.

#### PRESENT STATUS

The marked impetus given to scientific research throughout the world by the last war was not proportionately felt in Canada. With the exception of a few

Canadian companies whose contributions to the war resulted in research, in an effort to convert to civilian use certain processes and products born of the last war, Canadian industry and the engineering fraternity in general failed to be inoculated. From the national standpoint, the National Research Council came into being at this time.

Nor did conditions change markedly during the quarter century following the first world war. Apart from the contributions of university and government laboratories, Canadian industry, with a few notable exceptions, was existing on "technological blood-transfusions" from Great Britain and the United States. It is, therefore, of distinct interest to note the expansion of research in Canada, both in government and in industrial circles since the beginning of the present war in 1939.

#### COMPARATIVE NATIONAL EXPENDITURES ON RESEARCH

We are indebted to President Mackenzie for the following figures presented in his paper of a year ago—the paper which serves as the justification for the present effort. These figures show the estimated expenditures on research in Russia, the United States, Great Britain and Canada on a per capita basis and as a percentage of the national income. The year of estimate is also given.

Country	Year	Annual exp. on research in millions \$	Per capita expenditure \$	Percent of est'd national income
Russia.....	1934	300-500	1.80-3.00	0.8-1
United States...	1935	300	2.40	0.5-0.6
Great Britain...	1934	30	0.70	0.15
Canada.....	1938	2.4-3.3	0.22-0.29	0.06-0.08

Dr. Mackenzie stresses the fact that "it is impossible to obtain anything more than approximate figures as there are few official statistics available and, further, the word research is often used loosely to cover routine testing, plant control, and similar activities." Notwithstanding this and admitting the difficulties of correctly estimating the population of a country such as Russia, it is believed that the above figures, taken as they were from reliable sources represent at least the proper order of magnitude of the expenditures on what can be properly called scientific and industrial research in the countries shown. He continues "Even approximate figures for Germany, Japan, France and Italy are difficult to get for the corresponding periods, but it is safe to assume the expenditures in Germany approximate those of the United States, and that she is still leading in organized research." Of Japan, Bernal (*The Social Function of Science*, 1939) says: "Industrial and government laboratories and institutes in Japan are probably larger, better financed and organized in relation to the wealth of the community than in any other part of the world."

While comparisons are always odious, it will be healthy to consider somewhat further the significance of the above figures and it should be remembered that the ultimate value of research must be measured in terms of effectiveness and efficiency as well as in terms of total expenditure. It seems reasonable to assume that Russia, Germany, the United States and Japan were all devoting relatively large per capita amounts of their pre-war income to research; that Great Britain was far behind quantitatively although it is known that quality was very high; that France and Italy were well down in the scale in comparison to Britain; and that Canada, on any proportional basis either of population or of national income, was spending not more than one-eighth to one-tenth of the amounts spent by Russia and the United States, and probably not more than one-third of Great Britain's expenditure. Although Canada's population is one-tenth that of the United States, its total research expenditures were only one-hundredth; Great Britain's total expenditure was over ten times Canada's although its population is only four-fold.

Again may we quote Dr. Mackenzie: "While Canadian industry has, in the present war, an excellent record in war production and has shown skill and competence of a high order in manufacture, I think few would deny that if Canada had been cut off from the complete exchange of scientific and technical knowledge which was available from Great Britain and the United States, our contributions to this war would have been much as they were in the last one—superb front line fighting soldiers and the supply of simpler munitions such as shells and explosives—and our effectiveness as a self contained independent fighting nation would have co-related fairly well with our peace-time expenditure or research."

It may be further noted that while private industry in Great Britain in 1934 was responsible for about 33 per cent of the total national expenditure on research, the corresponding figure for Canada in 1938 is only 5 to 7 per cent. These figures provide ample scope for consideration by thinking Canadians as to what is to be Canada's position in the post-war picture as an independent nation, self-contained and something more than an exporter of raw materials to the outside world.

#### CANADA'S PRESENT CAPACITY FOR RESEARCH

And what is Canada's present capacity for research? Let us consider the raw materials required to

maintain an effective research programme in this country. First, and of fundamental importance, comes the research personnel. Since the beginning of the present war there has been, and there still is, a definite shortage of trained scientific workers in Canada.

The situation in the United States which has its exact parallel in Canada was presented by the late Thomas Midgley Jr., president of the American Chemical Society, on October 5th last in New York. Referring to the chemist's view of the future of industrial research, he stated that probably no other field holds more and varied promise for successful industrial research than chemistry; success for the investigator who may satisfy his curiosity about the unknown with a fair share of honour and wealth; success for industry (and when I say industry, I include the engineering profession, for the two are completely complementary) which may increase its payrolls, its output and its profits; and success for the public who will reap the benefits of better health, higher standards of living and a safer world in which to live.

As to the lack of properly trained personnel in chemical fields, he points out that the war has already eliminated three years of the normal supply of college graduates (in the United States), and if the upsurge of research takes place, which we all hope for, after the return of peace, we will find ourselves very short of professional chemists and chemical engineers. There will almost certainly be a decided rise in salaries as competitive industry again gets under way. This will not be bad for the chemists who are already in industrial work, but its repercussions on the educational situation may be quite disastrous. The universities are in no position to bid financially for the services of the younger men who are needed as instructors, later as assistants and associate professors, and later still as full professors and heads of departments.

Industry and the professions should take heed of this situation before it gets out of hand. By ample fellowships both in size and number they should encourage many young men to remain in educational work in order that their own full need can be met in the near future.

This shortage of scientific personnel in Canada has been somewhat ameliorated by the work of that branch of the Department of Labour known as the Wartime Bureau of Technical Personnel, a bureau created to administer the register of scientifically trained persons in the Dominion, and a special register, under Dr. Keyes, of those especially qualified to do research. This Bureau has the power, if necessary, to transfer, for the duration, scientists from non-essential to essential war work. The term 'technical personnel' is a misnomer and confusing. It had been better called the 'Bureau of Scientifically Trained Personnel', with a minimum registration requirement of graduation from a recognized university.

Figures released by this bureau give, on an annual basis, the number of scientifically trained graduates from all Canadian universities at the present time as 1,700. Of these about 300 to 350 are women with domestic sciences only to their credit. Of the whole group, approximately 1,200 are claimed on priority by the armed services, leaving 500 (including the women graduates) for other fields. Statistics show further that approximately 500 of the technical personnel of the Dominion either die, retire or become otherwise removed from the field, leaving an actual annual deficit to supply the demands of industry, even though engaged in war work. Hence the shortage.

Further there are only a limited number of Canadian

universities which offer strong postgraduate courses leading to the Ph.D. degree. This situation can scarcely be looked upon as a sound basis for an enlarged national research programme, especially in the chemical field. Actually, the shortage is more acute in the field of physics and of electrical and mechanical engineering. Again, and this is an old story, our better trained scientific men still migrate to the United States, attracted there by the much higher salaries paid even to recent graduates without engineering or industrial experience. This flow has been somewhat controlled by the W.B.T.P. but even so, many good men have been lost to Canadian industry and Canadian laboratories since the beginning of the war.

In the second place, a consideration of the special tools of modern research is indicated. These may be obtained, and their acquisition, maintenance and operation is a considerable factor in the research budget. The advent of these intricate tools requires specialists not only for their use, but also for their further improvement, development and the proper interpretation of their results. A number of examples might be chosen; the spectrograph for analytical work both qualitative and quantitative, X-ray and electron diffraction equipment for structural analysis, the infra-red spectrophotometer for the analysis of organic molecular structure, and the electron microscope. Any one of these can be set up and used in a routine way by a high grade technician, but to realize its full value and to fully exploit its possibilities in solving new problems requires research investigators of the highest calibre.

These and other considerations face us if we are to implement the will to have Canada maintain and improve her position in the post-war world. She is blessed with an abundance of the raw materials provided by nature, but it would be shortsighted policy indeed not to realize that these are exhaustible, and make no plans to supplement them by the utilization of wastes and the application of modern scientific knowledge to this end. To depend on these resources alone would be suicidal. And this seems to be the point at which a simple but pregnant question might be asked. What, during the year that has passed, has been done in Canada, or (to bring it closer to home) by the Engineering Institute, in the way of consideration of Dr. Mackenzie's splendid challenge to the Canadian government, Canadian industry and the scientific personnel of our Dominion?

Has the Institute met this challenge?

And finally, to end on a more optimistic note, and to answer the inevitable question "But what is the use of it all?" may we consider very briefly some of the present day results of past research and their implications?

#### THE RESULTS OF RESEARCH

This is well put in the words of Redmond and Mory<sup>1</sup>. "Are we appreciative of the benefits of electricity, that faithful servant that provides a light, a cooling breeze, or power for chilling cold as we decree? that toasts our bread, irons our clothes and runs the furnace that keeps us warm? That with the swiftness of light carries to the far ends of the earth our written and our spoken word. Then let us not forget Gilbert, Volta and those who came after, and more especially Faraday. It was none less than Gladstone who naively enquired of Faraday 'But after all, what use is it?' Then Faraday's rejoinder: 'Why Sir, there is every probability that you

will soon be able to tax it'." Considering the gross receipts from the distribution of electric current in Canada in 1944 the presumption is that to-day's public revenue from the outgrowth of Faraday's researches would have astonished Gladstone as much as it interests Mr. Ilsley.

"Do we take pleasure in the materials that add to beauty and comfort—the pleasing hues of raiment? It was Perkin who introduced to us the brilliant colors that lurk in coal tar awaiting the fairy wand of chemical research, and Woebler who removed the veil that hid from our eyes the limitless possibilities of organic synthesis." It was Bakeland and Redman who pioneered in the field of polymeric bodies—the 'synthetic resins' which delight the eye and the senses with everything from nylon to nirvana.

And most of all, is it not the beneficency of present day medicine, curative and preventive, of anaesthesia, and the miracles of modern surgery for which we are grateful? Let us not forget Pasteur and Lister, Koch and Ehrlich, nor the army of organized workers which to-day is intent on ridding us of our remaining scourges and adding to the span of life, and not for one generation alone is this creative work. While the physical structure of men are decaying, the facts he (the researcher) had learned are ever doing new service. Antitoxic devices will be increasing when locomotives are forgotten. Magnetic induction will work when the St. Lawrence river has ceased to flow.

"What shall we do, it has been asked, when there is no more research to apply? As great as is the need for continued effort in the application of existing knowledge, the old law of diminishing returns soon begins to take its toll unless new knowledge comes and removes the barrier to increasing returns. Our new *law of increasing returns* demands, if we would erect a superstructure of industrial and engineering application, that the foundation of progress, which is research in the realm of pure science, be strengthened and extended."

Industry was the first to apply the results of scientific research, but we as a nation will not reap the full benefits of research until our means to health, and our economic and social orders, also have received their full share of its benefits. As for economics and sociology, we are now doing as well as we know how. When the average man no longer pokes fun at fact-finding bodies—and no longer resents these when they are of government origin—we shall have taken a big step forward.

As for industry, our more progressive industries are endeavouring to maintain a consistent programme of research, but consistent sustained research has not yet acquired the status of an obligation of sound management in the minds of many of those in control of business finance. Too often research is looked upon as a luxury to be indulged during a period of large profits and to be discontinued or curtailed when dividends can no longer be fully maintained. Better to cancel fire insurance than to drop the only insurance against retrogression.

But we are awakening to the fact that the viewpoints and methods of research are applicable in ways we have been neglecting, and we begin to suspect that we shall continue such neglect at our peril. In our social institutions, in our government we are lagging behind. It would seem paramount to our general welfare that—without abating one whit our continuing support and development of scientific research—in other phases of our civilization, we proceed to catch up with material progress.

# POWER SUPPLY IN THE STEEP ROCK MINING AREA

A. H. FRAMPTON

*Assistant Chief Electrical Engineer, the Hydro-Electric Power Commission of Ontario, Toronto, Ont..*

Paper presented before the Niagara Peninsula Branch of The Engineering Institute of Canada on November 16th, 1944

Histories of the development of Canada's mineral resources virtually all bear one striking similarity. In the discovery, exploration and early development of our major mining areas electric power has not usually played any major role, but the ultimate development of producing properties has invariably gone hand-in-hand with an adequate supply of low-cost hydro-electric power.

In this particular, the development of the Steep Rock Iron Mine has been no exception. As is described in companion papers, exploration work was carried out, up to the mapping-out of the ore bodies and the development of a scheme of exposing these deposits for open-pit mining by the diversion of the Seine River and the pumping out of Steep Rock Lake, with little assistance from the electric utility industry.

However, this scheme of development, which may be said to be the only practical scheme in the light of the experience gained in the exploratory work, demanded the supply of nearly 20,000 horsepower; first—to replace the capacity of the Moose Lake generating station of the Ontario-Minnesota Pulp and Paper Company, which was to be closed down by the diversion of the Seine River, and second—to supply power for the initial pumping operations and the later actual mining operations. The planning and construction of these power supply facilities has been the responsibility of the Hydro-Electric Power Commission of Ontario, acting for and on behalf of the Province of Ontario, under the province's scheme of Northern Ontario development.

Power is supplied from the Thunder Bay system of the Hydro-Electric Power Commission of Ontario, being generated in its Nipigon River plants, Cameron Falls and Alexander Landing, transmitted approximately 70 miles over three 110,000-volt circuits to the Port Arthur transformer station, from which point a new 110,000-volt, twin wood-pole line has been constructed, approximately 120 miles westerly to an interconnecting switching and metering station at the Moose Lake generating station. The resulting interconnected system

arrangement is shown in outline in Fig. 1. It will be noted that there has been established a "back-bone" 110,000-volt transmission system extending from the Long Lac mining area on the east to Fort Frances on the west, a distance of nearly 400 miles, interconnecting hydro-electric generating resources totalling approximately 250,000 hp. These widespread facilities will unquestionably play a further part in the industrial future of the Lakehead district.

## COMMISSION'S THUNDER BAY SYSTEM

The Thunder Bay system is the outgrowth of one of the earliest undertakings of the Commission following its formation in 1906. While actually commencing its operations in southern Ontario, the Commission very shortly thereafter entered the field of power supply in the lakehead district. Initially, power was purchased from the local private company, the Kaministiquia Power Company. In 1918, the Commission commenced the construction of its own power development at Cameron Falls, on the Nipigon river, some 70 miles east of Port Arthur, two 12,500-hp. units forming the initial installation.

Power was first supplied to Port Arthur over a single-circuit, 110,000-volt wishbone-type wood-pole line in December 1920. Power was received at the Bare Point transformer station, near the easterly limits of the city of Port Arthur, where one bank of three 5,000-kva. transformers was first installed.

From this beginning, the Cameron Falls generating station has been expanded to include six generating units, of a total capacity of 72,000 hp., and the 54,000-hp. Alexander development, first placed in service in 1930, has been added to increase the total system generating capacity to approximately 126,000 hp. Installation of a fourth generating unit is now in progress at Alexander, which, when available this year, will raise the total generating capacity to approximately 148,000 hp.

The original single-circuit wood-pole line to Port Arthur has been augmented by a double-circuit steel

Fig. 1—Diagram showing power supply of Steep Rock area.

Fig. 2—Diagram illustrating the construction of the standard suspension structure.

tower line, so that three 110,000-volt circuits now extend from the generating stations to the receiving terminal at Port Arthur. In 1933, the system was extended to supply the gold mining areas which developed—first, in the vicinity of Beardmore, and then, in the Long Lac area. A 44,000-volt transmission line was originally constructed easterly from Cameron Falls to Long Lac, a distance of approximately 100 miles. This also was augmented in 1938, by the construction of a paralleling 110-kv. line and receiving transformer station.

The Port Arthur transformer station has been expanded to a capacity of 30,000 kva. and, in addition, a second transformer station provided at Fort William, of 18,000 kva. capacity. Furthermore, three large paper mill customers are supplied from the Port Arthur transformer station, directly at 110,000 volts.

The system peak load in December 1920 was approximately 10,000 hp. In November 1944, the system primary peak, including the power then being supplied under the Steep Rock contracts, reached 126,200 hp., a figure which compared to the normal system generating capacity of 126,000 hp. evidences the need for the fourth generating unit at Alexander. The average daily energy demand November 1944 approximated 2,000,000 kw. hours, representing a system daily load factor of virtually 90 per cent. The augmented controlled flow of the Nipigon river, created by the Ogoki diversion, is a major factor in supporting this unusually high average demand.

#### THE NEW STEEP ROCK 110,000-VOLT TRANSMISSION LINE

The new transmission line, constructed by the Commission to supply the power demands arising from the development of the Steep Rock property, is a single-circuit twin wood-pole line, extending from the 110,000-

volt bus at the Port Arthur transformer station, approximately 120 miles westerly, to a new interconnecting and metering station at the Moose Lake generating station. Its construction was commenced in the spring of 1943 and it was completed and placed into service on November 28th 1943, approximately six months after the erection of the first pole. The construction was carried out almost entirely by the Commission's Construction Department, who have been complimented by outside observers for the efficiency and dispatch with which the work was carried through, particularly in the face of those difficulties incidental to wartime construction.

War conditions have introduced a number of interesting features into the line design. The normal construction favoured for such a line would include twin fir-plank arms for crossarm construction, with the twin poles extending approximately five feet beyond the point of crossarm support for the ground cable location. Fir plank arms are not available in wartime and a single pressure-treated pine pole arm therefore has been substituted. Suitable timber for the

Fig. 3—Typical suspension structure—Steep Rock Line.

Fig. 4—Typical semi anchor structure—Steep Rock Line.

main supports also becomes more difficult to obtain as its length increases and the average length of the poles therefore has been reduced, by utilizing steel bayonet extensions for the ground cable supports.

The construction of the standard suspension structure is illustrated in Fig. 2. Pole lengths average 50 ft. The twin-pole spacing and also the phase spacing is 12 ft. The ruling span is 500 ft., at which span the maximum sag of the power conductors is 15 ft. The ground cables are supported at a distance of nine feet above the power conductors, resulting in a lightning shield angle of 30 deg. Because of the importance of this circuit, and in an effort to secure good lightning performance, two ground cables have been provided throughout. These are interconnected and grounded at each structure. Radial crowfoot counterpoises will be provided later at points of high footing resistance.

For approximately 100 miles of the line length, the power conductors are 312,000 c.m. A.C.S.R. In the westerly 20 miles, 211,600 c.m. copper has been used. This conductor material was removed from line sections in the Niagara system, where the redistribution of power in the 110,000-volt transmission network has been so altered by increasing deliveries from the Eastern 220,000-volt system that the conductivity could be spared and the purchase of new conductor thus avoided. Ground cables are  $\frac{1}{4}$  in., 160,000 lb. galvanized steel.

Insulators are standard, five-inch suspension units, seven in suspension and nine in strain positions.

Telephone communication is provided along the whole line route, though not, as is usual, on the power structures. The line parallels the Trans-Canada highway for approximately the first forty miles of its length and, in the majority of this section, the Commission has already rural service lines along the highway. In this distance, therefore, the telephone is largely on the rural power structures. From Shabaqua to near Atikokan, space has been leased on the telegraph structures of the Canadian National Telegraph Company on which the Commission's telephone is erected. From near Atikokan to the Moose Lake generating station the line is routed cross-country, paralleling the east arm of Steep Rock lake and, in this section, the telephone is on

separate structures on the power line right-of-way.

The fact that the line has been constructed so close to the C.N.R. that it has been possible to utilize its structures for the support of the Commission's telephone circuit has created an interesting problem in co-ordination. The railway provides the only means of access to the line in approximately 75 miles of its length, for its initial construction and for its future operation and patrol. Obviously, also, for economic reasons, the shortest possible line was required, so that all factors tended to establish a line location close to the railway right-of-way. By agreement with the railway company, a minimum separation of line and track of 1,000 ft. was established, except in places where the presence of lakes or other topographical features made it impossible to maintain such separation.

With this specification established, the line was first located by the use of aerial photographs and then surveyed and staked by field survey parties. On the basis of the final location, detailed mathematical studies indicated the severity of induced fault voltages in the communication circuits and pointed to the degree of protection required. It is of interest that these studies were very closely checked by the result of field tests made before placing the line into service and the protection provided has performed satisfactorily for all system disturbances so far sustained.

The construction of the line is illustrated in Figs. 3, 4 and 5 being respectively, photographs of a typical suspension structure, one of the types of semi-strain, angle structures and a section of the line paralleling the Shebandowan Road.

#### SYSTEM OF THE ONTARIO-MINNESOTA PULP AND PAPER COMPANY

The system of the Ontario-Minnesota Pulp and Paper Company consists of three hydroelectric generating stations on the Seine river, interconnected by, and delivering power into the company's paper mill at Fort Frances over a single-circuit 110,000-volt twin wood-pole line. The upriver plant is the Moose Lake station, consisting of two 6,000-kva., 6.6-kv., 60-cycle generating units. Downstream are the Calm Lake and Sturgeon Falls plants, consisting of two 5,500-kva. and two 4,500-kva. units respectively. The receiving station consists of one bank of three 10,000-kva. transformers, stepping down to a 6.6-kv. bus, to which is also connected the local generation at Fort Frances and which is extended across the river to the plant of the Minnesota-Ontario Paper Company at International Falls,

Fig. 5—General view of the new line paralleling the Shebandowan west of Shabaqua.

Fig. 6—The Moose Lake generating station.

where, in addition to local hydraulic generation, by-product steam-electric generators are also connected.

This system is operated almost entirely to supply the needs of the paper mills at Fort Frances and International Falls.

The normal controlled average flow of the Seine river is of the order of 1,200 cu. ft. per sec.; at times of above-average flow, the combined output of the three plants approximates 25,000 kw. As a result of the negotiations incidental to the Steep Rock development, it has been agreed that the long-time average capacity of the Moose Lake plant is 10,500 hp. at 85 per cent load factor and this is the amount of "replacement" power which is being delivered to the Ontario-Minnesota Company as compensation for the closing down of the plant. The Moose Lake generating station, seen from the tailrace, is illustrated in Fig. 6.

#### THE INTERCONNECTED SYSTEMS

The major problem in interconnecting the Commission's Thunder Bay system and the Seine River system of the Ontario-Minnesota Pulp and Paper Company is that associated with voltage control. The new Steep Rock line interconnects the receiving end of the former with the transmitting end of the latter. At the Port Arthur transformer station the normal bus voltage approximates 115 kv., while at the Moose Lake generating station the normal voltage is 117 kv. Over the interconnecting 120-mile line, power must be transmitted in amounts up to approximately 20,000 hp. This problem, and the associated problems of stability, fault currents and relay protection, emergency and abnormal operating conditions were studied on the a.c. network analyzer.

Voltage regulation problems have been largely solved by converting the two generating units in the Moose Lake plant into synchro-

nous condensers. The generator field poles have been replaced by new poles, in which starting windings are provided. An auto-transformer starting equipment has been installed, using a single magnetizing breaker and individual starting breakers. The transition from starting to running positions is completed by utilizing the Korndorfer principle.

The units thus converted have been found capable of delivering to the system approximately 4,500 lagging kvar. each, when operated over-excited as condensers. When operating under-excited, they will each draw approximately 3,500 lagging kvar. from the system, thus regulating the voltage at Moose Lake downwards during periods of light load or when paralleling the unloaded line from Port Arthur with the operating-system to Fort Frances. One calculation indicating the effectiveness of

the synchronous condenser control is illustrated in Figs. 7 and 8. Figure 7 is a schematic representation of the interconnected systems and Fig. 8 is the result of an alternating-current analyzer study based on an emergency low transmitting voltage at Port Arthur transformer station of 112.5 kv. (The figures in circles are bus voltages in kv.; the open figures in the various line sections and at the loads are kw. and the bracketed figures lagging kvars, both flowing in the direction of the arrows.) Note the output of the Moose Lake condensers of approximately 8,000 kvars maintaining the required 6.6 kv. at Fort Frances and approximately 7.0 kv. at the supply to Steep Rock.

With this degree of voltage control it will be possible, if necessary, to deliver 30,000 to 35,000 hp. to the Steep Rock mining area. Thus the Moose Lake generating station, closed down as a generating station, is playing a major part in the delivery of power which replaces its capacity, all but its hydraulic turbines

Fig. 7—Schematic diagram of the interconnected Thunder Bay and Seine River Systems.

Fig. 8—Schematic diagram illustrating power flow conditions in the interconnected Thunder Bay and Seine River systems.

actually performing an essential service in the new system arrangement.

The high-voltage switching arrangement at Moose Lake is essentially an extension of the 110-kv. station bus, on which extension the new line from Port Arthur is terminated and to which the original line from Fort Frances has been transferred. The new line is terminated only through an air break switch, but a new oil circuit breaker has been installed in the Fort Frances line. Thus faults in the Port Arthur line must be cleared on the far side of Moose Lake, interrupting the Steep Rock load, so that this load is not left on the Ontario-Minnesota Company system. Conversely, faults in the Fort Frances line are cleared on the new breaker, so that supply to the Steep Rock area is not affected. The interconnecting switching and metering station is illustrated in Fig. 9.

Relay protection is essentially double-distance range relaying of the impedance type. Metering and synchronizing is by means of 110-kv. equipment inserted in the Fort Frances line at Moose Lake. Synchronizing facilities are also provided at the Port Arthur terminal. Later the Ontario-Minnesota Company proposes to extend the metering indications by telemetering from Moose Lake to their system operator at Fort Frances.

#### SUPPLY TO THE STEEP ROCK IRON MINES

The existing equipment at the Moose Lake generating station has also been utilized to provide the means of supply to the Steep Rock mine. This supply is taken from the 6.6-kv. generator bus, transformed down through the main generating station transformers. Cable connections are run from this bus to a 6.6/44-kv., 8,000-kva.

step-up station immediately adjacent to the Commission's high-voltage switching station. The step-up station consists of four 2,000-kva., 3-phase transformers, all connected solidly in parallel. Oil-circuit breaker protection is provided on the low-voltage side, fuse protection on the 44-kv. line side.

Power was transmitted originally only to a single receiving transformer station at the site of the pumping operation—over a six mile single-circuit wood-pole line circling the south side of the lake. At the pumping site the stepdown transformation consisted of four 2,000 kva, three-phase, 44,000/2,300 volt transformers, connected in parallel on the high side but through oil circuit breakers to a 2,300 volt distribution board supplying the seven pump barges and the mine feeder.

This equipment was so arranged that each transformer and its associated section of the distribution board formed a unit. With the decrease of power required for pumping and the establishment of demands for the crusher plant and at other load centres, certain of these transformer and switching units have been moved to other locations, short supply taps being taken from the original 44 kv. line as required.

A general view of the site of the pumping plant including the receiving transformer station, as it existed just prior to the commencement of pumping operations shown in Fig. 10. The four 2,000 kva transformers are seen in the foreground, the small building immediately behind housing the switching equipment. Individual 2,300 volt feeders were run to each barge, being supported on the structure projecting above the barge housing.

#### PUMPING EQUIPMENT

The initial pumping station was located at the narrows between the main body and the westerly arm

Fig. 9—The interconnecting switching and metering station.

Fig. 10—Incomplete pumping station at the Narrows, Steep Rock Lake, November, 1943.

barges complete with their starting and control equipment. The piping connections were such that these pumps could be operated singly until the lake level had been reduced some 100 ft., after which they would be connected in series for pumping against the higher head.

The pumping plant was placed in operation early in December 1943 and, until the early spring of 1944, pumped an average of approximately 480,000,000 gals. per minute. By the early summer the site of the "B" ore body was uncovered, since which time the unwatering operations have continued as the conditions disclosed by the receding water levels have dictated.

#### CONCLUSION

The winter of 1944-45 finds the Steep Rock property standing on the threshold of commercial operation. All told nearly \$18,000,000

will have been spent, including the cost of power supply and the means of delivering ore into lake bottoms at Port Arthur, to bring the property to this state. In the future, the visionary can foresee the Steep Rock ore and low cost hydro-electric power available in this district combining to create in Canada an entirely new industrial development. Whether such will come to pass, time alone will tell, but time will not rob the story of Steep Rock of any of its romance nor the engineers who have brought it to its present stage of development of any of the satisfaction derived from a job well-done.

#### ACKNOWLEDGMENT

The author wishes to acknowledge the kindness of Steep Rock Iron Mines Limited in permitting the presentation of the data concerning its operations.

### ANNUAL FEES

Members are reminded that a reduction of one dollar is allowed on their annual fees if paid before March 31st of the current year. The date of mailing, as shown by the postmark on the envelope, is taken as the date of payment. This gives equal opportunity to all members wherever they are residing.

# THE IMPORTANCE OF DESIGN IN A TAX STRUCTURE

STUART S. GARSON, K.C.  
*Premier of the Province of Manitoba*

An address delivered at the Fifty-Ninth Annual Dinner of The Engineering Institute of Canada,  
at Winnipeg, Man., on February 8th, 1945

When I think of the frustration which engineers, whose emoluments as a profession are closely bound up with the working-out of our national policy, have suffered at the hands of politicians, my wonder is that you should admit me to your gathering at all. That you have actually consented to permit me as a politician to discuss these frustrations with you, is a piece of magnanimity upon your part, and for me a great and most unexpected honour.

The activities of your profession arise in large measure out of the investment of savings in enterprises which require for their creation engineering services. The decisions to invest are made on the basis of profits presently available, plus the prospect of future profits. Therefore, to an even greater extent, perhaps, than most other professions, you are interested in present prosperity, in the prospects of future prosperity, and in those public policies which will create and stabilize a condition of prosperity. To this end, few factors are more important to-day than taxation policy. There has been a very great change in this regard since 1867 when the British North America Act brought the Dominion of Canada into being.

## EVOLUTION OF TAXATION POLICIES IN CANADA

The British North America Act, 1867, was conceived in the political philosophy of *laissez faire*, that the less the government interfered in the business and industry, the better for the nation. The responsibilities of all governments were restricted by this philosophy. Consequently, prior to the turn of the century, the governments of Canada collected and spent a relatively small part of the national income. Under such conditions, a simple rule-of-thumb system of taxation was adequate for public needs, and created no serious inequities.

As conditions and our Canadian political ideas changed, however, the demands upon governments grew, and later multiplied. As more and more of the national income came to be raised and spent by the governments of Canada, it became necessary to develop a taxation system more exactly adjusted to ability to pay. It became even more necessary, and in recent years increasingly necessary, to consider the effects of tax policies upon the general prosperity of the nation. With the steady increase in the proportion of the national income which is collected by taxation and spent by governments in public services, there is an equally steady increase in the probability that unwise taxes will depress that income, whereas wise taxation and wise public expenditures may substantially increase it. Therefore, as compared with say 60 years ago, tax problems to-day are so different in degree as to be different in kind. Tax policies which were adequate 60 years ago or more, to-day would be disastrous. As the health of the Canadian economy comes to depend more and more upon public policy, we need efficiency in taxation more and more, and efficiency in taxation becomes more and more difficult to achieve.

Efficiency in taxation has been defined as "skill in collecting a given amount of revenue with the least possible burden upon the national income." When, under modern conditions, efficiency in taxation is so essential and so difficult to attain, we are most unwise

to tolerate legal impediments and habits of thought, which prevent us from achieving efficiency in taxation. Yet that is what we have been doing in Canada for decades. Let me explain briefly why this is so.

Generally speaking, the national income will be restricted if revenues are raised from taxes which increase the cost of production and of doing business. Most indirect taxes, like the sales tax for example, do this, for they raise the price of materials and supplies and increase costs all along the line. Obviously it is undesirable that taxation should eliminate either a firm or an industry, by destroying the margin of profit which keeps it going. That is what taxes which increase the costs of production tend to do. As such taxes are imposed, marginal firms which are just barely making ends meet, tend to disappear. When by the collection of what is relatively a small sum in taxes, a marginal firm is thrown out of production, the consequent loss of production or employment may be out of all proportion to the amount of public revenue which is involved. At the same time potential investors in new enterprises will be deterred from entering into industries in which costs have been raised by taxation, and consumption has been restricted by high prices due to taxation. When marginal firms disappear, and when potential investors are deterred from starting new enterprises, labour, capital and resources are all left unemployed or are thrown out of employment. The result is that the national income is correspondingly reduced, and incidentally, the engineering profession loses retainers which it might otherwise have had. Out of this diminished national income, larger tax revenues than before will have to be raised in order to meet the cost of maintaining the unemployed. If in raising these new revenues, the forms of taxes which are imposed are again levied upon costs, the vicious circle will be completed and a new vicious circle begun.

The alternative to taxes which increase business costs are taxes which fall upon net incomes and other surpluses. It is impossible to exaggerate the importance of reforms which would replace taxes upon costs, by taxes on surpluses. For it is largely by the avoidance of burdens upon marginal enterprises that a more sustained and stabilized employment of the nation's manpower and capital and natural resources can be achieved.

Yet with these principles plainly before us, Canada has continued to raise, from taxes which increase costs, a larger part of the total revenues of its government than are raised in other comparable countries from such taxes. As a result Canada has had before the present war began, one of the worst and most regressive tax structures in the world. Consider it as it stood in 1930, taking into account then all taxes in Canada, federal, provincial and municipal. 35 per cent came from customs duties, excise taxes, amusement taxes, public domain and miscellaneous taxes. Slightly over 25 per cent came from corporation taxes, gas taxes and sales taxes, etc. 33 per cent came from real estate, and we wondered why building languished. What percentage do you suppose came from taxes upon profits and surpluses, i.e. progressive taxes upon personal incomes and inheritances? Only 7 per cent. This 1930 tax structure

was exceedingly ill-balanced, but during the depression it was not corrected—it was aggravated. Almost three-fourths of the increases in federal taxes between 1930 and 1937 were produced by the sales tax—a tax which increased business costs. As a consequence, recovery from the depression was retarded by business-destroying consumption taxes, by employment-destroying real estate taxes and by economically harmful taxes upon corporations and business generally.

#### ALLOCATION OF TAXING POWERS

This lamentable state of affairs was not the result of the ignorance or perversity of politicians, nor of a mistaken policy which can be changed by them at will. It is the practically inevitable consequence of the present allocation of governmental responsibilities and taxing powers as between the Dominion and the provinces.

This allocation has remained unchanged since the sailingship days of 1867, when the Dominion of Canada was first created by the British North America Act. This Act and its amendments are our Canadian constitution. By it the functions of government were divided between the Dominion government upon the one hand, and the provinces upon the other. To the provinces were assigned the local functions of government, such as social services, the building of roads, provincial public works, education and municipalities. At that time these provincial functions could be discharged very cheaply. The provinces, therefore, were given the strictly limited taxing powers of direct taxation. At that time direct taxation was not used. It was too unpopular. It could not be concealed in the cost of living but was out in the open where it made the taxpayer conscious of its pressure upon him. Thus the idea was if the provinces were tempted to do their inexpensive work in an extravagant manner, the fact that such extravagance would involve them in the imposition of unpopular direct taxes would cause them to be prudent and thrifty.

To the Dominion were allocated the expensive national functions of government, such as the regulation of trade and commerce, banks and banking, customs tariffs, railways and canals, our money system and all matters of defence, including the pensions payable to the armed forces. The Dominion, having far more expensive functions of government to pay for, was given the right to impose any kind of tax, direct or indirect.

In law, provincial taxing powers were limited, Dominion taxing powers unlimited. In practice, Dominion taxing powers were limited in fact because the provincial powers were limited in law. This curious result arose from the Dominion's recognition that it should not invade the province's one field of taxation if it could avoid doing so.

Thus it was not until 50 years after Confederation, and three years after the beginning of the first world war that the Dominion, under the pressure of war needs, first invaded the provincial field of direct taxation with its War Income Tax measure of 1917. In spite of the moderation of his Federal tax levy, Sir Thomas White, in introducing it in the House of Commons, apologized for his action, saying: "The provinces and municipalities are confined to direct taxation, and I have not regarded it as expedient, except in cases of manifest public necessity, such as I believe exists at the present time, that the Dominion should invade the field to which the provinces are solely confined for the raising of their revenue."

The Dominion had completely refrained from invading

the provincial field from 1867 to 1917. The taxes which it then imposed in this field were commenced and have continued from that time until the beginning of the present war on a basis so moderate as not to embarrass the provinces in securing their own revenue needs from the field of direct taxation.

#### EFFICIENCY IN TAXATION DIFFICULT UNDER PRESENT CONSTITUTION

Now the difficulty is that this field of taxation to which the provinces are solely confined, namely the direct taxation of net incomes and surpluses, is the very field from which under modern conditions in a federal state such as Canada, the federal government should derive most of its revenues. The indirect taxes upon which the Dominion government has been relying to an inordinate extent in the past are those which are levied upon goods and services and transactions. Indirect taxes are passed on by those who pay them in the first instance, and thus finally come to rest upon, and are indirectly paid by, the consumer. Indirect taxes, therefore, generally speaking, are those which lead to an increase in the costs of production and of doing business. Direct taxes, generally speaking, are those which fall upon profits and other surpluses and on incomes in accordance with ability to pay.

It was largely because before the war the Dominion Government, instead of getting the bulk of its revenues from direct taxation upon net income and other surpluses, had been getting most of its revenues from indirect taxation which adds to the cost of production and of doing business, that our pre-war tax structure has been such an exceedingly ill-balanced one. There is no shadow of doubt that this tax structure greatly retarded our recovery during the depression. Moreover, the situation is becoming more and more aggravated with the passage of time. Both the functions of government and the costs of discharging them are increasing. For example the cost of discharging certain provincial functions of government, such as social services, road building, public works, education, have increased enormously since 1900, and will continue to increase. To meet these increased costs, the provinces have had to impose heavier and heavier direct taxes. The taxable resources of the various provinces vary greatly. Because some provinces are much less well-to-do than others, they must impose much higher provincial tax rates, in order to support provincial services which even approach equality with those of the richer provinces.

The Dominion as we have noted, although it has always had the power to impose direct taxation, could do so only by invading the one field which the provinces enjoy. Even when the Dominion does this, it finds it difficult to impose federal rates which will fit equitably into the widely varying tax rates of the different provinces. Thus the Dominion's invasion of the provincial field of taxation has widely different results in the different provinces, depending upon the level of the provincial rates of taxation in the same field. The difficulty of this problem and the importance of solving it will increase as the percentage of the national income which all governments of Canada spend increases. Just before the war our governmental expenditures in Canada were equal to about 30 per cent of the national income. As you know they had been growing steadily with the years. That growth has been greatly accelerated by the war. And while this war growth is of course temporary, there is not the slightest doubt that postwar governmental expenditures at all levels will absorb a considerably larger part of the national income

than did the expenditures of governments in Canada before this war.

"But," you may say, "surely postwar expenditures in Canada will not be as great as the war expenditures have been, and why is it that in spite of this unsolved tax problem, it has been possible for Canada to achieve the gigantic production records which she has made during the war?" The answer is that we solved this tax problem during the war. If we had not done so these production records would never have been made, and indeed the war effort itself would have been endangered.

How did we solve it? One of the recommendations of the Rowell-Sirois Commission was that the provinces should transfer to the Dominion the exclusive control over direct taxes upon personal and corporation incomes and inheritances, that is to say, direct taxes upon net income and surpluses. When the war came it was manifestly impossible for the Dominion Government to meet the unprecedented financial burdens of the present war out of federal indirect taxation, which would tend to increase the cost of production and of doing business, and thereby wreck our price ceiling and wage control policies, and gravely endanger the war effort. Therefore, in the early stages of this war, the Dominion entered into an agreement with the provinces under which they surrendered to the Dominion for the duration of the war and one year thereafter, the exclusive right of imposing direct taxes upon the incomes of individuals and corporations. For this surrender, the Dominion pays to the provinces the amount which they collected from these sources in the last full year before the agreement was made. In other words, what was achieved by this agreement was the temporary implementation of the most important recommendation of the Rowell-Sirois Commission.

#### REFORM ESSENTIAL TO POST-WAR PROSPERITY

Now I suggest that if we do not retain in effect the substance of this Dominion-Provincial taxation agreement after the war, either by extending it in some suitable form or by providing an adequate substitute, we have no more hope without it of achieving full employment in the post-war period than we had of having a successful war effort without such an agreement. I suggest that just as it was impossible to finance this war by federal indirect taxation which increased the cost of production and of doing business, it will be impossible for the Dominion to finance by indirect taxation its expenditures after the war upon greatly increased social services, such as family allowances and old age pensions, upon demobilization and pensions, upon carrying charges upon the war debt, upon floor prices for agricultural products, and upon the discharges of a substantial and continuing defence responsibility on land, on sea and in the air. These things have to be paid for, if not by indirect taxation upon the costs of production and doing business, then by direct taxation upon net incomes and surpluses.

The experience of the depression is excellent proof, if any were needed, that it is utter folly to expect to finance the Dominion's postwar responsibilities out of indirect taxes. Our experience of this war corroborates the experience of the depression by showing what can be done with a properly designed tax structure built around federal direct taxes upon net income and surpluses.

Let me emphasize here that I am not suggesting for a moment that after the war all indirect taxes should be abolished and that the present war income taxes should be increased. I think we can and should reduce

our total income tax collections from corporations and individuals by a considerable margin. But we would be making a most grievous error if we attempted again to obtain from indirect taxes which increase costs of production and business the percentage of the national revenue that we consistently obtained from this source before the war.

If after the war we get what we should get from direct taxation the Dominion will have to maintain at a level lower than our present war taxes, but substantially higher than its pre-war level, the federal taxes upon incomes and inheritances. True, there may be some shifts to encourage the investment of risk capital, and that sort of thing. But in the aggregate the amount of revenue which must be obtained from this source of direct taxation will be much greater than what the Dominion has ever collected in pre-war times. There is, therefore, no longer any possibility of the Dominion Government keeping down to low levels, as it did in the period between 1867 and 1939, its federal direct taxation, in order that the provinces may have this field largely to themselves.

*Hence when the present Dominion-Provincial taxation agreement expires, the provinces will get back—what? They will get back their constitutional right to impose provincial direct taxation. But what good will this right be to the provinces if they have to re-impose their provincial rates of direct taxation on top of federal direct taxes which are themselves at high levels?*

Let us remember that the provinces will need not the same revenues as before, but presumably more. To provide work for the very large number of men and women who will return to civilian employment from military service and war industries, Canada must have and must implement a national postwar programme. Large parts of this programme will be the sole responsibility of the provinces. For example, the larger part of the field of social services, the whole of the costly field of education, and the bulk of governmental public works, owing to the fact that the natural resources of the country belong to the provinces, are all responsibilities of the provinces, not of the Dominion. Even when the provinces had their field of direct taxation largely intact, it was insufficient for their purposes before the war. How can it be supposed that it will be sufficient for provincial purposes after the war, at a time when the Dominion has invaded the sole field of provincial taxation on a large scale?

Thus it is clear that, in some of the most vital and critical parts of our postwar activity, some of the provinces—probably a majority of them—will have the constitutional right to do things, but not the ability to pay for them, while the Dominion will be able to pay for them but will not have the constitutional right to do them. Those portions of this programme which are the provinces' responsibility and which they cannot pay for, the Dominion will not have the right to do; and the programme to that extent will simply fail of accomplishment. If the provinces are going to discharge these heavy postwar responsibilities they will need substantial revenues. If they have to secure these additional revenues by re-imposing their provincial rates of direct taxation, on top of high federal direct taxes, many of them, including Manitoba, will be placed in an impossible position. Before the war, ours were amongst the highest provincial rates of income and corporation taxes in Canada. To increase these rates and to superimpose them on top of high federal direct taxes is wholly unrealistic and out of the question.

Yet, except that postwar conditions will make it more critical than ever, there is nothing new in this

tax situation. For a quarter of a century at the very least, the dilemma of the Dominion Minister of Finance has been to choose between two bad alternatives. If he got his federal revenue from progressive direct taxation upon net incomes and surpluses, he had to invade the province's only field of taxation and run the risk of seriously impairing the finances of the more vulnerable provinces. If on the other hand he adopted the alternative course, he had to rely upon indirect taxes which increased the cost of production and of doing business throughout the country, and upon a policy, therefore, which was economically harmful to employment and to the national income.

As long as the provinces retain the field of direct taxation, given to them by the British North America Act, the Dominion Minister of Finance will be faced with the choice of either having a thoroughly unsound tax structure which will depress the national income and create unemployment, or of bankrupting some of the provinces.

As a result of this tax problem and other maladjustments in Dominion-provincial relations, Canada in 1937 had a crisis in public finance which resulted in the default of one province and the saving from default of others by interim federal grants, and the appointment of the Rowell-Sirois Commission. The responsibilities and expenditures of both federal and provincial governments were less in those days than they will be from this time on. It seems certain that the provincial needs which gave rise to the appointment of the Rowell-Sirois Commission will be substantially increased in the near future. These increased needs make imperative as an indispensable foundation for Canada's economy in the postwar, the reform of our Dominion-provincial relations. No part of our Dominion-provincial relations is in greater need of reform than the present allocation of taxing powers. Under the best of circumstances our Canadian tax structure is going to have a very heavy load to carry from this time on. Our pre-war tax struc-

ture was so poorly designed that it collapsed under a lesser load. One of the first tasks of a Dominion-provincial conference is to re-design our national tax structure in such a way as to make it capable of carrying the load which will inevitably be placed upon it.

#### ENGINEERS ARE DIRECTLY CONCERNED

If we fail in this task, the consequences will fall with greater or lesser severity upon every single Canadian, and upon no group more severely than upon the engineering profession. It is for this reason, and because you are such an important and powerful segment of public opinion in Canada that I entreat you to lend the great weight of your influence to the creation of a public opinion across this country which will make it impossible for any of its public men to oppose successfully this simple, basic and indispensable reform, of having the provinces turn over to the Dominion the exclusive right of imposing direct taxation upon net income and surpluses.

For the surrender of this exclusive right the provinces should receive from the Dominion compensatory payments which will enable them to provide for Canadians everywhere in Canada, average social, educational and governmental services without having to impose provincial taxation in excess of the Canadian average. This can be done in a manner which I have not the time to discuss in detail here, but which would preserve the financial responsibility of the provincial treasury. In this way each province in Canada would have its provincial autonomy intact. And it would be a real autonomy of legal powers plus financial capacity, instead of the illusory autonomy of legal powers minus financial capacity. The greatest advantage of such an arrangement, however, would be that it would provide a sound hope for avoiding large scale unemployment after the war. If we restore our pre-war tax structure in this country we shall not be able to indulge ourselves in such a hope.

### CORDUROY ROAD IN HOLLAND

Canadian engineers, aided by Dutch civilians, spread stone on a damaged road bed—Part of reconstructural road work made necessary by heavy traffic preceding the renewed Allied offensive on the Western front.

# TURNING IN A WIND

BERNARD ETKIN, Jr., E.I.C.

*Lecturer, Faculty of Applied Science and Engineering, University of Toronto*

**SUMMARY**—An analysis of the problem of an airplane turning in a wind is presented. The change in the kinetic energy of the machine referred to earth axes is shown to be caused by work done on the aircraft by the air. The change in groundspeed is computed from a consideration of the same force which does the work.

## WORK DONE IN EARTH SYSTEM

The change in kinetic energy of an aircraft turning in a wind has been the object of considerable discussion, particularly among pilots. The cause of a certain type of accident is sometimes erroneously ascribed to this source.<sup>1</sup>

When turning in a wind at a constant airspeed, the kinetic energy of an airplane, measured relative to axes moving with the air (subsequently called "moving axes"), remains constant. When the motion is referred to axes fixed on the earth (subsequently called "earth axes") however, the machine has more energy when flying downwind than it has flying upwind. The difference is

$$\Delta E = \frac{1}{2}m [(V+v)^2 - (V-v)^2] = 2mVv$$

where  $m$  = mass of airplane,

$V$  = airspeed,

$v$  = wind speed.

The resultant of all the forces acting on an airplane making a level turn at constant airspeed is the centripetal force—a component of the lift directed inwards. Considering first the motion relative to the moving axes, we obtain that the force is

$$C = \frac{mV^2}{r}$$

where  $r$  = instantaneous radius of turn.

This force is normal to the path and does no work in the moving system. In the system referred to earth axes, however, we observe that the force is not at right angles to the path and consequently does work. We proceed to compute the work done when the airplane turns 180 deg. from flying upwind. From the diagram we see that the rate of work is

$$\frac{dW}{dt} = \frac{mV^2}{r} V_1 \cos \phi$$

but  $V_1 \cos \phi = V_1 \sin \alpha = v \cos \theta$

whence  $\frac{dW}{dt} = \frac{mV^2}{r} v \cos \theta$

The angular velocity in the turn is

$$-\frac{d\theta}{dt} = \frac{V}{r}$$

hence  $\frac{dW}{dt} = -mVv \cos \theta \frac{d\theta}{dt}$

<sup>1</sup> Upwind versus Downwind Turns—Richard R. Bloss, *Aero-Digest*, Jan. 1941, p. 155.

and 
$$W = - \int_{\theta = \pi/2}^{-\pi/2} mVv \cos \theta d\theta = 2mVv$$

The gain in kinetic energy is thus seen to be the same as the work done on the airplane by the air.

## CHANGE IN GROUND SPEED

It is interesting to note that the change in groundspeed can also be calculated. The component of  $C$  acting in the direction of  $V_1$  is

$$F = \frac{mV^2}{r} \cos \phi$$

and the linear acceleration is

$$a = \frac{V^2}{r} \cos \phi = -\frac{d\theta}{dt} V \cos \phi$$

The total change in  $V_1$  is

$$\Delta V_1 = \int a dt = -V \int_{\theta = \pi/2}^{-\pi/2} \cos \phi d\theta$$

but  $\cos \phi = \frac{v}{V_1} \cos \theta$

and from the diagram

$$\begin{aligned} V_1 &= \sqrt{V^2 + v^2 - 2Vv \cos(\pi/2 - \theta)} \\ &= \sqrt{V^2 + v^2 - 2Vv \sin \theta} \end{aligned}$$

Hence

$$\begin{aligned} \Delta V_1 &= -Vv \int_{\pi/2}^{-\pi/2} \frac{\cos \theta d\theta}{(V^2 + v^2 - 2Vv \sin \theta)^{3/2}} \\ &= -Vv \left[ -\frac{1}{Vv} (V^2 + v^2 - 2Vv \sin \theta)^{3/2} \right]_{\pi/2}^{-\pi/2} \\ &= (V+v) - (V-v) \\ &= 2v \end{aligned}$$

# THE FIFTY-NINTH ANNUAL GENERAL MEETING

Convened at Headquarters, Montreal, on January 25th, 1945, and adjourned to the Royal Alexandra Hotel, Winnipeg, on Wednesday, February 7th, 1945

The Fifty-Ninth Annual General Meeting of The Engineering Institute of Canada was convened at Headquarters on Thursday, January 25th, 1945, at eight o'clock p.m., with President deGaspé Beaubien in the chair.

The general secretary having read the notice convening the meeting, the minutes of the Fifty-Eighth Annual General Meeting were submitted, and, on the motion of A. S. Rutherford, seconded by T. C. Price, were taken as read and confirmed.

## APPOINTMENT OF SCRUTINEERS

On the motion of Huet Massue, seconded by E. R. Smallhorn, Messrs. J. A. Lalonde, A. D. Ross, and G. E. Templeman were appointed scrutineers to canvass the officers' ballot and report the results.

There being no other formal business, it was resolved, on the motion of S. R. Banks, seconded by E. Nenniger, that the meeting do adjourn to reconvene at the Royal Alexandra Hotel, Winnipeg, at nine-thirty a.m., on the seventh day of February, nineteen hundred and forty-five.

## ADJOURNED GENERAL MEETING AT THE ROYAL ALEXANDRA HOTEL, WINNIPEG, MANITOBA

The adjourned meeting convened at nine thirty a.m., on Wednesday, February 7th, 1945, with President deGaspé Beaubien in the chair.

In welcoming the members, and in thanking them for coming such long distances to attend the meeting, Mr. Beaubien remarked that for a long time the Institute has discussed the possibility of holding an annual meeting in the west, but had been somewhat reluctant to do so because of the distance from the larger centres. The large attendance and great success of this meeting indicated that it could be done, and he expressed the hope that there would be many opportunities of returning to Winnipeg or other western cities.

## NOMINATING COMMITTEE—1945

The general secretary announced the membership of the Nominating Committee of the Institute for the year 1945 as follows:

Chairman: R. L. Dunsmore

<i>Branch</i>	<i>Representative</i>
Border Cities.....	C. G. R. Armstrong
Calgary.....	F. K. Beach
Cape Breton.....	M. R. Chappell
Edmonton.....	E. Nelson
Halifax.....	C. Scrymgeour
Hamilton.....	W. J. W. Reid
Kingston.....	D. C. Macpherson
Lakehead.....	H. G. O'Leary
Lethbridge.....	H. T. Miard
London.....	T. L. McManamna
Moncton.....	A. Gordon
Montreal.....	L. H. Burpee
Niagara Peninsula.....	J. H. Ings
Ottawa.....	L. M. Christmas
Peterborough.....	W. T. Fanjoy
Quebec.....	J. O. Martineau
Saguenay.....	N. F. McCaghey
Saint John.....	A. R. Crookshank
Saskatchewan.....	A. P. Linton

<i>Branch</i>	<i>Representative</i>
Sault Ste. Marie.....	R. A. Campbell
St. Maurice Valley.....	M. Eaton
Toronto.....	N. MacNicol
Vancouver.....	T. V. Berry
Victoria.....	S. H. Frame
Winnipeg.....	J. T. Dymant

## AWARD OF MEDALS AND PRIZES

The general secretary announced the awards of the various medals and prizes of the Institute as follows, stating that the formal presentation of these distinctions would be made at the annual dinner of the Institute the following evening:

*Gzowski Medal*—To W. Griesbach, M.E.I.C., Montreal, for his paper "Construction of Shipshaw Power Development".

*Leonard Medal*—To J. E. Gill, C.I.M.M., Montreal, and P. E. Auger, C.I.M.M., Quebec, for their joint paper "Zinc Deposits of the Federal Area".

*Plummer Medal*—To Dr. Wilfred Galloway, Ottawa, for his paper, "Plastics in Engineering".

*Keefer Medal*—To M. V. Sauer, M.E.I.C., Montreal, for his paper, "St. Lawrence River Control and Remedial Dams—Soulanges Section".

*Ross Medal*—To R. A. H. Hayes, M.E.I.C., Montreal, for his paper, "Electrical Equipment at Shipshaw".

*Canadian Lumbermen's Association Prize of \$100.00*—To C. F. Morrison, M.E.I.C., Toronto, for his paper "Modern Timber Engineering".

*Julian C. Smith Medals*—"For Achievement in the Development of Canada"—To Dean E. P. Fetherstonhaugh, M.E.I.C., Univ. of Manitoba, Winnipeg, and John A. Wilson, M.E.I.C., Director of Air Services, Department of Transport, Ottawa.

## STUDENTS' AND JUNIORS' PRIZES

(Books or Instruments to the value of \$25.00)

*John Galbraith Prize*—(Province of Ontario)—To A. Hershfield, S.E.I.C., for his paper "Plywood—A Structural Material for Aircraft".

*Ernest Marceau Prize*—(Province of Quebec—French)—To André Leclerc, S.E.I.C., for his paper "Influence de la Vitesse d'essai sur la résistance".

*Martin Murphy Prize*—(Maritime Provinces)—To J. L. Belyea, S.E.I.C., for his paper "The Cathode Ray Oscillograph and its application in Industry".

## REPORT OF COUNCIL, REPORT OF FINANCE COMMITTEE, FINANCIAL STATEMENT AND THE TREASURER'S REPORT

On the motion of F. C. Mechin, seconded by C. H. Fox, it was resolved that the report of Council for the year 1945, the report of the Finance Committee, the financial statement and the treasurer's report, as published in the February *Journal*, be accepted and approved.

## REPORTS OF COMMITTEES

On the motion of R. B. Chandler, seconded by S. H. deJong, it was resolved that the reports of the following committees be taken as read and accepted: Publication,

Legislation, Employment Service, Library and House, Board of Examiners and Education, Industrial Relations, Prairie Water Problems, Engineer in the Civil Service, the Young Engineer, Employment Conditions, Engineer in the Active Services, Engineering Features of Civil Defence, Professional Interests, Papers and the Deterioration of Concrete Structures.

#### BRANCH REPORTS

On the motion of G. H. Burbidge, seconded by J. H. Johnson, it was resolved that the reports of the various branches be taken as read and approved.

#### COMMUNITY PLANNING

The president announced that at the annual meeting of Council held on the previous day, considerable discussion had taken place on community planning, as a result of which it had been decided to present a resolution to the annual meeting.

In presenting the following resolution Mr. McLeod reminded the meeting that there had been in Canada a Town Planning Institute which, in recent years, had been quite inactive. Council felt that community planning should be revived but not on a purely professional basis, and that the Institute should support the movement in every way possible. He therefore had much pleasure in moving the following resolution:

THAT this session of the annual meeting of The Engineering Institute of Canada held in Winnipeg on February 7th, 1945, wishes to place itself on record as acknowledging the responsibility of the profession and the Institute in the vital subject of community planning. It recommends that the Council of the Institute establish immediately a committee to develop and administer a programme of activities whereby the Institute may make the maximum contribution to the solution of the many problems present in all parts of Canada. This programme should include encouragement and support of a planning Institute at the national level, development of interest in local problems by each branch, and publicity on a local and national basis that will inform the public as to what is in its best interest, and of the engineer's concern for its welfare.

This was seconded by P. E. Doncaster, and carried unanimously.

#### INCREASE IN FEES

C. K. McLeod, as chairman of the Finance Committee, informed the meeting that for some time the Finance Committee had been considering the advisability and the possibility of increasing Institute fees. The matter had been brought to Council several times by the Finance Committee and he believed that Council would favour a reasonable proposal. He stated that in comparison with other societies of a similar type, the Institute's fees were ridiculously low. He had examined some statistics with regard to similar organizations in the United States and he found that on a membership basis the Institute's staff should be more than twice as large as it is now, but he pointed out that the American societies' fees were substantially higher than those of the Institute.

He was of the opinion that there were many duties ahead for the Institute and that these could not be undertaken on the present volume of income. He did not think that the Institute's activities should be retarded or that future opportunities should be neglected because of lack of funds.

Mr. McLeod then referred to the decision of Council

to employ someone for the principal task of rehabilitation of members in the Armed Services and in wartime industry. He thought this was a very important work and was definitely an obligation of the Institute. He referred to the voluntary assessment that had been recommended by Council for 1945, and informed the meeting that the returns so far were excellent.

He also pointed out the great increase in the number of Students and Juniors in the Institute and recommended that the Institute should undertake additional services to this group. To do such a job properly a fair amount of money would need to be expended that could be derived only from an increase in fees.

The general secretary referred to the voluntary assessment returns which have been mentioned by Mr. McLeod and stated that so far less than one per cent of the members who had paid their fees had struck out the item with regard to the voluntary assessment. Over fifty per cent of the members had remitted an amount in excess of the minimum of \$2.00. Individual cheques had been received as high as \$100.00.

P. E. Doncaster, of Winnipeg, stated that any increase in fees should be such that it would not fall heavily on Junior members. In view of the increase in numbers of engineers applying for Junior classification he hoped that there would be no increase in fees that would retard the development. He thought that as these young people eventually become full Members it would be wisest to leave their fees as low as possible until they moved into the higher classification.

The general secretary stated that in the discussions up to the present time there had been no suggestion of increasing the burden on Students or Juniors and that, as a matter of fact, recent changes in the by-laws had actually reduced the annual fee for Students. He also drew attention to the fact that Council is now considering a proposal whereby Students would be transferred to the Junior classification with a transfer fee.

L. E. Westman, of Ottawa, agreed that the Institute would require funds in proportion to the work that it had to do. Referring specifically to the proposal to establish a department of rehabilitation he was of the opinion that in this field, as far as actually directing a man to work was concerned, the government, through its established machinery, would be in an excellent position to assist. He believed that the actual creation of opportunities for returned men was the field in which the Institute could be of greatest assistance. He thought that an expenditure of funds in this job-creating field was a duty of the Institute and other similar organizations. He pointed out that on the one hand there were certain things that the government could do, and then on the other hand there was the new collective bargaining situation facing the engineer, but that, in between, there was a creative field upon which attention should be focussed. He was heartily in accord with the expenditure of money on this creative work and he suggested that better results might be obtained if several organizations worked together to this end.

In response to Mr. Westman's observations, the general secretary stated that there was every intention of utilizing the government organizations and agencies as far as possible, and to eliminate duplication or overlapping of effort. The Institute realized that it had a duty to its members which it could not transfer to anyone else. He explained that already the Headquarters of the Institute is receiving many inquiries from persons who are expecting to leave the services shortly or whose employment with the wartime industry looks as though it were about to be terminated. All such persons were asking for advice and counsel and he felt

that the Institute was in a good position to meet these situations because of the support which it received from its members who were employers of engineers. From such sources the very best of information was available. He also explained that a special committee had been set up by Council to define policy and to direct the rehabilitation activity. Major-General Howard Kennedy, M.E.I.C., had accepted the chairmanship and was proposing to secure the co-operation of a Naval and Air Force officer and several industrialists. It was possible that this committee would have a representative in every branch of the Institute in order to give a thoroughly national service.

J. T. Rose, of Winnipeg, suggested that the branches should interest themselves in this rehabilitation programme and that they should encourage their members to become more active with social activities and with service clubs. He thought these fields offered opportunities for job creation.

#### ELECTION OF OFFICERS

The general secretary read the report of the scrutineers appointed to canvass the officers' ballot for the year 1945 as follows:

President: E. P. Fetherstonhaugh, Winnipeg, Manitoba

Vice-Presidents:

Zone A—Western Provinces, R. A. Spencer, Saskatoon

Zone B—Province of Ontario, C. E. Sisson, Toronto

Zone C—Province of Quebec, J. E. Armstrong, Montreal

Councillors:

Vancouver Branch.....	J. N. Finlayson
Edmonton Branch.....	C. W. Carry
Saskatchewan Branch.....	J. McD. Patton
Lakehead Branch.....	R. B. Chandler
Border Cities Branch.....	G. G. Henderson
London Branch.....	J. A. Vance
Toronto Branch.....	W. H. M. Laughlin
Ottawa Branch.....	W. L. Saunders
Kingston Branch.....	R. A. Low
Montreal Branch.....	R. C. Flitton
	C. C. Lindsay
St. Maurice Valley Branch.....	J. F. Wickenden
Saguenay Branch.....	A. Cunningham
Saint John branch.....	A. A. Turnbull
Halifax Branch.....	A. E. Flynn

On the motion of J. M. Fleming, seconded by L. Mackay, it was resolved that the report of the scrutineers be adopted, that a vote of thanks be tendered to them for their services in preparing the report, and that the ballot papers be destroyed. Mr. Beaubien announced that in accordance with the usual custom, the incoming president would take over at the end of the annual dinner the following evening.

#### RETIRING PRESIDENT'S ADDRESS

Mr. Beaubien stated that it was customary for the outgoing president to give his retiring address at this annual business meeting, but as he would be addressing the members again at the special convocation to be held that evening, he thought it would be wise to forego the address at this time. However, he wished to take advantage of this opportunity to tell the membership what a very pleasant and profitable experience it had been for him to be the Institute's representative during

the past year. Under prestige of the Institute he had visited all the Institute branches and all the universities from the Atlantic to the Pacific. He could think of no better way of obtaining information and an education in matters pertaining to the engineering profession. As president of the Institute he had been received all over the country by men who were au fait with all that is being done in the engineering field—men who have ideas of their own and who are not afraid to express them. He appreciated very much the reception which he had been accorded from coast to coast, and the splendid support which he had received from the membership at large. During the year, many members of the Institute had done an exceptional amount of work in the general interest, without any return, either personally or officially, except the satisfaction of having done something worthwhile for the profession. He had received good support not only from the membership but from the Headquarters staff, and to all who had received him and who had given such effective help, he extended a most sincere "thank you".

#### HARRY F. BENNETT

The president informed the meeting of the sudden death in London, Ontario, on January 31st, of Harry F. Bennett, chairman of the Institute's Committee on the Training and Welfare of the Young Engineer. He commented on the untiring efforts made by Mr. Bennett on behalf of the young engineer and of the organization which had been set up from coast to coast to supply counsel and advice to prospective students, parents and teachers with regard to the profession of engineering.

He stated that the benefits of the long term programme started six years ago were now beginning to be felt. He emphasized the great loss that this would be to this effort and to the Institute in general. He announced that Council had agreed to establish a prize for young men in honour of Mr. Bennett and the work he had accomplished.

#### VOTE OF THANKS TO RETIRING OFFICERS

On the motion of Past-President S. G. Porter, seconded by G. S. Roxburgh, it was unanimously resolved that a hearty vote of thanks be accorded to the retiring president and members of Council in appreciation of the work they have done for the Institute during the past year. In presenting the motion, Mr. Porter commented on the great amount of time and energy which Mr. Beaubien had given to the Institute during his excellent year of service.

#### VOTE OF THANKS TO THE WINNIPEG BRANCH

In proposing a vote of thanks to the Winnipeg Branch, Mr. Stirling noted that the president had already commented on the excellent arrangements which had been made. The members of the branch had shown an efficiency and an experience in the conduct of the meeting which had been exceeded in no other part of the country. All in all it had been a very fine exhibition of the hospitality for which western Canada was noted. Mr. Stirling took great pleasure in moving that a hearty vote of thanks be extended to the Winnipeg Branch of the Institute for their hospitality and activity in connection with the holding of the Fifty-Ninth Annual General Meeting. This was seconded by J. M. Patton and carried unanimously.

There being no further business, the meeting adjourned at eleven o'clock a.m.

## AT THE PRESIDENT'S DINNER

Head table: Vice-President Col. L. F. Grant, Kingston; Past-President S. G. Porter, Calgary; Guest Speaker A. F. G. Cadenhead; Shawinigan Falls, Que.; the host, de Gaspé Beaubien, Montreal; Past-President K. M. Cameron, Ottawa; not shown in the photo was Past-President C. J. Mackenzie, Ottawa.

Vice-President G. L. Dickson of Moncton, N.B., with Vice-President J. M. Fleming of Port Arthur, Ont.

Left to right: Dr. P. E. Gagnon, Quebec; Vice-President C. E. Sisson, Toronto; P. M. Sauder, Strathmore, Alta.; Arthur Jackson, Kingston; H. L. Briggs, Winnipeg; A. W. F. McQueen, Niagara Falls.

N. H. Eager, Hamilton; C. K. McLeod, Montreal; T. H. Kirby, E. V. Caton, Prof. N. M. Hall, all three from Winnipeg; J. G. Hall, Toronto.

Dean E. P. Fetherstonhaugh, Winnipeg; G. A. Gaherty, Montreal; Prof. E. O. Turner, Fredericton; E. P. Muntz, Montreal; W. L. Saunders, Ottawa.

Left to right: T. E. Storey, Winnipeg; S. H. deJong, Toronto; C. P. Haltalin and V. W. Dick, both of Winnipeg.

R. B. Chandler, Port Arthur; L. Austin Wright, Montreal; J. A. Vance, Woodstock, Ont.; R. S. Eadie, Montreal.

From left to right: F. V. Seibert, chairman of the Annual Meeting Committee, Winnipeg; C. W. Carry, Edmonton; Stewart Young, Regina; J. M. Patton, Regina; H. B. LeBourveau, Calgary, and J. W. MacDonald of Halifax.

From left to right: E. V. Gage, Montreal; H. E. Brandon, Toronto; E. B. Martin, Moncton; Alex. Love, Hamilton; Vice-President J. E. Armstrong, Montreal; Carl Stenbol, Sault Ste. Marie; H. J. Ward, Shawinigan Falls, Que.

## ANNUAL PROFESSIONAL MEETING

It grows increasingly difficult to give an adequate account of an annual meeting. Each year new heights are attained, both in quality and quantity, and the superlatives used in the account of the previous meeting are equally appropriate to the latest meeting. In this way such accounts tend to become but a repetition.

Certainly the meeting at Winnipeg did not reduce the acceleration of success that has been created. With an unusually full programme of unusually fine technical sessions, with social events of the most pleasing character, with a local committee of great capacity and foresight and withal an attendance of seven hundred and fifty, there was every reason to carry away the impression that no meeting could be more enjoyable, more profitable, or more completely successful.

When Winnipeg was first considered as a meeting place there were doubts and qualms in the minds of many. Was it too far away from the larger centres? Were there enough engineers there to establish a reasonable attendance? Could a programme of professional papers be set up that would appeal to a western audience and at the same time draw people from the east? How about transportation? Could the hotels meet the demand? And how about the weather? Fortunately these considerations were resolved into an affirmative decision, and another merit mark was added to the Institute's record of achievement.

To the Winnipeg committee and members goes the credit for everything. Within the memory of Institute officers, there was never a meeting where arrangements were so well and so fully prepared in advance. No detail was overlooked or neglected; no hitches or delays were allowed to occur. It was difficult to realize that the Institute had not met there for thirty-four years. The committee's work was done so well that one would think the meeting had been there every year. It is likely that not many years will be allowed to pass before Winnipeg is again sought out to act as host.

There is no need to go into the details of the programme. It has been published in the *Journal*, but there are several features that should be touched on for the double purpose of showing appreciation to the contributors, and of informing those members who were not fortunate enough to be there.

The Council meeting held on Feb. 6th was attended by forty-five persons, thirty-one being councillors. This makes it one of the largest and probably the most representative meeting ever held in any part of Canada. Councillors were there from twenty branches out of twenty-five.

The retiring president's dinner—always an outstanding event—was no less outstanding on this occasion. Mr. Beaubien entertained his councillors, committee

chairmen and past presidents to the number of fifty-five. A special feature was the address by A. F. G. Cadenhead, M.E.I.C., on "Canada's Need of Research", which appears in this *Journal*. Following the usual custom, all past presidents were called on by the president. Messrs. Porter, Cameron and Mackenzie acquitted themselves gracefully and effectively as past presidents always do.

## PROFESSIONAL SESSIONS

Many persons were of the opinion that better papers had never been presented at an annual meeting. All sessions were outstanding because of the timeliness of the subjects and the quality of the papers. It is believed that the information disclosed by these papers and the inspiration they provided for further thinking will aid materially in advancing the topics in the interests of the general public.

A noticeable feature about the authors was that they were mostly young men. It is a pleasant thought that so many young engineers have gone so far in their chosen fields, and that their careers are still mostly ahead of them. It is indeed a bright prospect for the future of the profession and for the Institute.

## CONVOCATION

An unusual feature of great colour and impressiveness was the special convocation held by the University of Manitoba for the purpose of granting to deGaspé Beaubien an honorary degree of Doctor of Science—the first such degree ever granted by Manitoba. Before a capacity audience and under the guidance of Dr. H. P. Armes, president of the University and E. P. Fetherstonhaugh, dean of Engineering and Architecture, Chancellor A. K. Dysart, in strict conformity with ancient custom, declared the retiring president of the Institute to be "Dr." deGaspé Beaubien *honoris causa* "with all the rights and privileges pertaining thereto".

In reply, Dr. Beaubien expressed his thanks, and spoke in some detail on the relationship of the universities to the professional consciousness of the engineer, and of the engineers' need to remain a professional man in spite of today's trends in labour and industry.

Engineers everywhere will be grateful to the University of Manitoba for the recognition it has given to an outstanding Canadian—a recognition which the profession itself has accorded for many years.

## SPECIAL SPEAKERS

The addresses of the luncheon and dinner speakers have already appeared or are printed in this issue of the *Journal*. Each made a fine contribution to the success of the meeting. John S. Galbraith, M.E.I.C., spoke on "The Community and the Engineer" at the first luncheon and, at the second luncheon, George Spence took as his subject "Post War Projects for the Prairies".

## AT THE ANNUAL DINNER

Premier Stuart S. Garson of Manitoba speaks on the design of a tax structure.

Head table: His Honour Lieut.-Gov. R. F. McWilliams, Mme de Gaspé Beaubien, President H. P. Armes of the University of Manitoba, Mrs. Stuart S. Garson and A. G. F. Cadenhead.

President E. P. Fetherstonhaugh acknowledges the honour of the presidency.

Dr. Beaubien hands over the reins of office to Dean Fetherstonhaugh, while Premier Garson, on the left, and Lieut.-Gov. McWilliams, on the right, applaud.

R. A. H. Hayes of Montreal receives the R. A. Ross Medal.

Dean E. P. Fetherstonhaugh of Winnipeg and J. A. Wilson of Ottawa are presented, by Mrs. R. F. McWilliams, with Julian C. Smith Medals "for achievement in the development of Canada".

## SPEAKERS AND AUTHORS

Dr. deGaspé Beaubien acknowledges the honorary degree of Doctor of Science from the University of Manitoba.

In the receiving line at the annual dance. President and Mrs. Fetherstonhaugh, Past-President Beaubien, W. E. Bonn and Mrs. Bonn (in the foreground), of Toronto.

Mayor Garnet Coulter welcomes the 550 guests to the banquet tendered by the City of Winnipeg, on the occasion of the annual meeting.

John S. Galbraith of Ottawa speaks on Community Planning and the Engineer at the first luncheon.

George Spence of Regina tells of Post War Projects for the Prairies at the second luncheon. To the left is Mrs. A. E. Macdonald, convener of the Ladies' Committee.

Left—Robert Peterson of Saskatoon presented a well illustrated paper on the application of soil mechanics to the construction of earth dams.

Right—Prof. M. S. Coover of Ames, Iowa, vice-president of the American Institute of Electrical Engineers, and Hon. E. F. Wil'is, Minister of Public Works of Manitoba.

## SIDE GLANCES

W. E. Bonn, Toronto; Vice-President R. A. Spencer, Saskatoon; J. A. Vance, Woodstock, Ont.; General Secretary Dr. L. Austin Wright and Prof. M. S. Coover of Ames, Iowa, vice-president of the A.I.E.E.

At the Council meeting: H. J. Ward, Alex. Love, L. F. Grant, C. E. Sisson. In foreground, Carl Stenbol.

Chairman T. H. Kirby of the Winnipeg Branch presided at the first luncheon.

Professor G. H. Herriot, Winnipeg; C. Hay and W. P. Cheney of Regina.

Miss F. Thompson, Vice-President C. K. McLeod and Miss M. McLaren, all of Montreal.

The arrangements for registration were planned and carried out with the utmost in efficiency.

C. V. Antenbring, chairman of the Registration Committee discusses a fine point with R. A. Sara, chairman of the Publicity Committee.

Geo. E. Cole, president of the Association of Professional Engineers of Manitoba chats with Major Patrick A. O'Connor, D.E.O., M.D. No. 10, Winnipeg.

Caught on the steps: C. Chagnon and G. Molleur from Montreal; A. E. Paré from Quebec and L. Daoust of Winnipeg.

J. T. Dymont and Mrs. Dymont of Winnipeg.

Professor I. M. Fraser of Saskatoon discusses rehabilitation with General G. R. Turner of Ottawa.

At the dinner on Thursday, Stuart S. Garson, Premier of Manitoba, spoke on "The Importance of Design in a Tax Structure". All three addresses were excellent. The short address of welcome given by R. F. McWilliams, Lieutenant-Governor of Manitoba, was particularly appropriate. It also appears in this *Journal*.

#### COMPLIMENTARY BANQUET

There is no record of any municipal corporation having previously welcomed the Institute with a complimentary banquet. The City of Winnipeg on Wednesday had as its guests for dinner five hundred and fifty engineers and their wives. With Alderman H. C. Morrison in the chair, and Mayor Garnet Coulter as speaker, the engineers were made to feel very welcome in "the gateway to the West". It was indeed a splendid gesture of welcome and because of it, many persons will have taken away with them a new appreciation of Winnipeg and a desire to return again.

#### THE ANNUAL DINNER

Always the outstanding event of the annual meeting, the annual dinner again added lustre to the Institute's history. The attendance of almost six hundred taxed the hotel facilities to the limit, but the hotel staff performed miracles of skill and patience to the end that no one was neglected and all voted the service to be excellent.

At head table, besides the president and Mme. Beau-

bien and the president-elect and Mrs. Fetherstonhaugh, there were the Lieutenant-Governor and Mrs. McWilliams, the Premier and Mrs. Garson, the Minister of Public Works and Mrs. Willis, and representatives of sister societies such as the American Institute of Electrical Engineers, (Vice-President M. S. Coover and Mrs. Coover of Ames, Iowa), the Chemical Institute of Canada (President A. F. G. Cadenhead and Mrs. Cadenhead, of Shawinigan Falls), the Canadian Institute of Mining and Metallurgy (A. A. Mackay of Montreal, president), the Dominion Council of Professional Engineers (P. Burke-Gaffney of Winnipeg, vice-president, and Mrs. Burke-Gaffney), the Association of Professional Engineers of Manitoba (George E. Cole of Winnipeg, president), Association of Professional Engineers of Saskatchewan (J. M. Patton of Regina, president), Royal Architectural Institute of Canada (Professor M. S. Osborne of Winnipeg, vice-president, and Mrs. Osborne), Canadian Construction Association (J. B. Stirling of Montreal, past-president) Canadian National Railways (W. R. Devenish, of Winnipeg, vice-president), Canadian Pacific Railway Company (W. A. Mather, of Winnipeg, vice-president, and Mrs. Mather).

#### PRESENTATION OF PRIZES

The medals and awards of the Institute were a feature of the after dinner programme. As the citations were

(Photo Winnipeg Tribune)

Dean E. P. Fetherstonhaugh reads the citation which accompanied the conferring of the honorary degree of Doctor of Science upon de Gaspé Beaubien. Seated in the foreground is His Honour Lieutenant-Governor R. F. McWilliams, while standing on the right is Mr. Justice A. K. Dysart, Chancellor of the University.

read by J. W. Sanger, the following members were presented to Mrs. R. F. McWilliams, who very graciously made the presentations:

Gzowski Medal—W. Griesbach, M.E.I.C.; Plummer Gold Medal—Dr. Wilfred Gallay; Keefer Medal—M. V. Sauer, M.E.I.C.; Ross Medal—R. A. H. Hayes, M.E.I.C.; Julian C. Smith Medals—Dean E. P. Fetherstonhaugh, M.E.I.C., and J. A. Wilson, M.E.I.C.

#### INDUCTION OF NEW PRESIDENT

The last item on the evening's programme was the induction of Dean E. P. Fetherstonhaugh into the chair of the presidency. He was conducted to the chair by Past-Presidents Porter and Cameron where retiring President Beaubien received him and handed over the gavel and the authority. It was a rousing reception that greeted the new incumbent of office. Dean Fetherstonhaugh would be well received anywhere, but in Winnipeg his home city, he was greeted with an enthusiasm that was a warm and stirring tribute. Those from outside Winnipeg were glad to join with the Winnipeggers in this demonstration to a fine gentleman.

#### RECEPTION AND DANCE

Following the dinner, President Fetherstonhaugh and Mrs. Fetherstonhaugh, Past-President Dr. and Mrs. deGaspé Beaubien, and T. H. Kirby, chairman of the branch and Mrs. Kirby, received the members and guests in the Crystal Ballroom. This was followed by dancing, a diversion that was appreciated by a very large number. Unlike the professional sessions, this activity was not monopolized by the younger people, proving that the style in professional topics may change from year to year, but the style in amateur dancing, remains constant as far as the individual is concerned no matter what its vintage.

To the members in Winnipeg, other members are deeply grateful for an enjoyable and profitable experience. They will look forward with pleasurable anticipation to being guests again in that hospitable city.

#### THE STUDENTS

A noticeable feature of all meetings was the presence of a large number of students. They took a prominent

part in carrying out arrangements, and they attended professional sessions. A special issue of the university paper, the *Manitoban*, was prepared entirely by the engineering students, and distributed free to the meeting. A special "Convention Issue" of *The Slide-Rule* was also prepared for the meeting. This is the only literary magazine published by any engineering faculty in Canada, and reflects great credit on Manitoba students. The quality of the material is excellent, and proves that the paralysis of creative literary ability from which the profession is supposed to suffer has been overcome at Manitoba.

#### "MURIEL'S ROOM"

Descending (or ascending—as you wish) from the professional to the social, no account would be complete without referring to the social centre that has come to be known as "Muriel's Room". These arrangements were carried out entirely by friends of the Institute, and carried out excellently. The opportunity to

meet between and after professional discussions, to renew old and make new friendships, is one of the precious values of Institute meetings. "All work and no play makes Jack a dull boy", and "Men cannot live by bread alone" seem to be appropriate and justifying references. Certain it is that these friends have gone a long way to lighten an otherwise heavy programme. The Institute is indeed grateful to them.

(Photo Winnipeg Tribune)

Studying the agenda of the annual meeting are shown: seated in the centre, Past-President S. G. Porter, Calgary; around him from left to right, Dr. L. Austin Wright, general secretary; Retiring President de Gaspé Beaubien and Incoming President Dean E. P. Fetherstonhaugh.

# SAID AT THE ANNUAL MEETING

## Abridgements of Speeches of Particular Interest

### President Arnes Opens Convocation

Mr. Chancellor, Your Honour:

The Convocation of the University this afternoon has been assembled for the purpose of honouring a distinguished member of the profession of engineering on the occasion of the gathering from all parts of Canada of professional engineers in Winnipeg. I have much pleasure in extending to the many engineers attending the Annual Meeting of The Engineering Institute of Canada the greetings and welcome of The University of Manitoba, and in conveying to them the cordial wishes of the members of the University for the successful attainment of the objectives of their sessions.

The universities have a close and intimate connection with the profession of engineering, the members of the Institute and of other professional bodies being almost exclusively graduates of the universities. In Canada it is the universities that have undertaken the training of the engineer to enter the practice of the profession. The debate as to whether technology should find a place in the universities fortunately never disturbed the minds of those responsible for the development of our Canadian institutions, despite the fact that, in some other countries, the entry of technical studies was vigorously resisted.

In our own University, the departments of engineering were among the earliest to be established, being preceded only by those of mathematics and the fundamental sciences. The University of Manitoba, through its departments of engineering, has contributed a share to the growth and development of Canada, and particularly of this central region of the country, by the training of well qualified men to assume the direction of construction and the utilization of natural resources. I venture, on this occasion, to express the hope that The University of Manitoba may be able, in the near future, to extend its work in education by opening instruction in branches of engineering that hitherto have found no place in its curriculum.

In the field of original investigation in engineering the universities have a clear task and duty—the task of providing, for those men who may be especially adapted to research, a training in methods and a development of abilities that will ensure the supply of men who will carry forward the work of discovery and of the extension of knowledge and of its application for the benefit of mankind. Some research may best be done in the universities, some types best in public institutions such as the National Research Council's laboratories, and some in industry itself. On the universities, however, devolves the task of the initial training of young research workers. The Engineering Institute, and the other groups of engineers in Canada, have a clearly defined place in maintaining and advancing the standard of education and research. May the universities bespeak the interest and influence of these professional bodies in the furthering of their efforts.

The engineer who will shortly become an alumnus of the University, and the first to be admitted to the degree of Doctor of Science, will be presented to you by a brother engineer, the Dean of the Faculty. May I only say, in opening this Convocation, that The University of Manitoba deems it a high privilege to be able to honour the distinguished president of The Engineering Institute of Canada.

I now declare this Convocation open for the conferring of the degree of Doctor of Science.

### Dr. Beaubien on Professional Consciousness

*From Convocation Address—February 7th, 1945*

Mr. President, gentlemen of the Senate, and gentlemen of the University of Manitoba:

My first words are to thank you for the honour you have conferred upon the engineering profession, as represented by The Engineering Institute of Canada, by awarding a Doctor's degree to its president.

As an unworthy incumbent of that high office, I take great pride in such a signal honour. May I tell you also that The Engineering Institute of Canada is deeply grateful for your courteous recognition of the services it has endeavoured to render to the country and to the engineering profession.

The industrial development of Canada, of which we have reason to be proud, has been brought about chiefly by the knowledge, ingenuity and labour of engineers. By their achievements, they have demonstrated the existence of very high professional idealism.

The problems of labour relations, resulting from the industrial development of these war years, have caused the enactment of labour protecting laws and numerous social measures which tend to divide society into groups with distinct interests, each with its own adherents and spokesmen. These laws have further occasioned a great number of utterances in Parliament, in labour circles, in political campaigns and in the press. These, by implication if not by direct statement, pictured the groups in turn, as in need of protection and greater remuneration. Public approval of these utterances, or its indifference, leave the groups with the conviction that they have been overworked. The result of these discussions is to dampen the incentive to hard work and to leave the impression that high return from one's labour may be enjoyed independently from his individual production.

Such constantly repeated ideas cannot but have effect upon our individual effort and, more specially, on the younger professional man whose occupations and pre-occupations of establishing himself prevent him from giving to these utterances the thought necessary to separate what is beneficial from what is fallacy.

There thus appears a threat, not only to the general welfare but, what is perhaps of more concern to you, in the University and to us in the Institute, a threat to professional achievement and idealism which can only come from hard work.

For those who have faith in humanity and its struggle to attain ever higher degrees of perfection, professional spirit is too precious to be abandoned; too precious for us not to strive to the utmost, so that it may endure and grow.

Our professional spirit is something for which we have a very high regard; without understanding it clearly, we know that it is something without which we would be left aimless, as a navigator is when he loses the star guiding his ship. It is something for which we have an attachment, the strength of which

we realize only when we fear to lose it. Few analyze it and still fewer attempt to define it.

Dr. W. E. Wickenden, in his admirable address "The Second Mile", delivered before the Institute in 1941, does not define professional spirit, but his paper contains the most attractive and satisfying description of it and what it will do, that it has been possible for me to find. I take the liberty to quote from it:

"What is the distinctive mark of the professional man? First, we may say that it is a type of activity which carries high individual responsibility and which applies special skill to problems on a distinctly intellectual plane. Second, we may say that it is motive of service, associated with limited rewards as distinct from profit. Third, is the motive of self-expression, which implies joy and pride on one's work and a self-imposed standard of excellence. And fourth, is a conscious recognition of social duty to be fulfilled among other means by guarding the ideals and standards of one's profession, by advancing it in public understanding and esteem, by sharing advances in technical knowledge, and by rendering gratuitous public service, in addition to that for ordinary compensation, as a return to society for special advantages of education and status."

Again I quote:

"By common consent, the quality most universal and indispensable among engineers is integrity; this is essentially something moral or idealistic. Ranking almost equal with integrity is devotion to duty; given a job, an engineer will see it through, come hell or high water; and so on through the whole catalogue of the engineer's distinctive virtues. Why is he so? Because a boss or a time-clock is policing his efforts? Or a money incentive drives him? Or hoped-for applause urges him on? Well, hardly! Because he has had a soldier-like training and indoctrination? In some small measure. Because he has a tradition to uphold? Yes, no doubt. Or is it because of something within himself to which he dare not be disloyal, and a faith between himself and his colleagues—unspoken perhaps—which he dare not betray?"

There does not appear to be much doubt that the urge to travel the second and voluntary mile is made up in large share of the sense of responsibility, responsibility to ourselves; to our work; to our profession; and to humanity generally.

With the present-day tendency in the evolution of thought in industry toward a lessening of this sense of responsibility, what will happen to future production and what will become of the young engineer of tomorrow and his professional idealism?

Already there is a move by the labour unions to take him willy-nilly into their organization. Can he maintain his professional spirit unimpaired while a member of a labour union? Some labour men think not. If the engineering profession and management in industry are to become the sole guardians of the sense of responsibility, what will happen when the young engineer is promoted to these positions of trusteeship from the ranks of labour unions?

Notwithstanding the fact that we are in the midst of a most terrific struggle, a struggle we are forced to wage in order to protect the way of life to which we are wedded; notwithstanding the example of heroism of our men under arms who, day and night, risk their lives in accomplishing a task so arduous as to be limited only by their physical endurance; notwithstanding that we have constantly before us the example of our men at the front who endure, and who receive a mere pit-

tance in comparison to what we are paid at home; notwithstanding that we have constantly before our eyes the devotion to duty of administrators and professional men who, alone, bear the bulk of responsibility; notwithstanding all this, the tendency to seek relief from responsibility is not only apparent but apparently increasing.

If this be the case now, what shall we find after the war? Is it not natural that relief from the anxiety of actual combat, and from worry for the lives of those dear to us, will tend to dampen our efforts? And this, in the period following the cessation of hostilities when so many new problems will have to be solved.

This growing tendency and these problems will require careful thought. The solution to the problem of production realized by the fear of unemployment and maybe hunger is only temporary and not the solution that we should strive to attain. Any temporary relief attained in this manner would tend to lower further our professional ideals.

Canada's effort in producing war material has been magnificent. With a population of something under 4 per cent of that of the Allies, we have contributed to the joint metal pool in the following proportions:

85 per cent of the nickel
20 per cent of the zinc
14 per cent of the copper
19 per cent of the lead
78 per cent of the asbestos
and 35 per cent of the aluminum

The production of these metals has necessitated the development of hydro-electric power, mines and refineries; this incidental effort is itself of no mean proportion.

With a population of barely twelve millions, Canada is maintaining about 1,000,000 men under arms and, while doing so, its industry has expanded and has produced a truly fantastic amount of war equipment, in addition to a very much increased agricultural production. To quote a few figures on our production of war material, we have made:

314.....	10,000-ton ships, delivered
368.....	Frigates, corvettes, mine sweepers
4,771.....	Service aircraft
9,949.....	Trainer aircraft
3,640.....	Tanks
2,175.....	Self-propelled gun mounts
30,881.....	Personnel and equipment carriers
9,242.....	Other armoured vehicles
707,103.....	Mechanical transport units

We have produced communication equipment instruments, machine guns and carbines, rifles and small arms by the millions and small arms ammunition by the billion rounds.

Let me further tell you that the quality of the material produced is as high as its volume. The new methods of manufacture developed in Canada, the number of new processes which originated here, the new products developed in the laboratories of the National Research Council and in those of our industries are evidence that our technicians have the imagination, the knowledge and the skill to continue to develop that industry at its accelerated rate.

This magnificent achievement is evidence of how willing our engineers have been to tread Dr. Wickenden's Second Mile. Unstintingly they have worked for our war effort, and for our country, without regard to time or labour. No better evidence of their high professional

spirit can be given than the achievements of our engineers.

This idealism is worth careful nursing, in order that it may endure, not only for our material advancement, but for its sheer beauty.

Unfortunately our inspiration and our sense of responsibility have led us to build engines of destruction. How beneficial it would be for Canada and for humanity if that same inspiration and sense of responsibility could allow us to create instruments for the production of commodities of which we are in sad need!

My remarks may induce those who are in a position to help, to give thought to a subject vital to our welfare. If, in the midst of their "round of tasks and duties", the professor and the engineer are thus persuaded to consider the maintenance of high idealism in the profession of engineering, my object will have been achieved.

The object of this short talk is not to determine what steps should be adopted to promote high professional idealism, but simply to urge that thought be given the subject.

The problem appears to be educational, and more within the scope of the university than that of the engineer. The engineer can help, however. How? That depends on local conditions which he, himself, can best work out.

## Welcome From Lieutenant-Governor

*His Honour R. F. McWilliams at the Annual Dinner*

But, Mr. President, in addition to the personal reasons which I have mentioned, I want to welcome you and your colleagues to the province of Manitoba with very special heartiness because of what you stand for.

The people of Canada have been engaged for many years in a stupendous undertaking—the building of a united nation out of most diverse elements and almost in defiance of geography. To accomplish what we have already achieved, we have required the leadership of two types of people above all others. We have needed statesmen, men of vision and courage and determination to build a nation in spite of all obstacles, and to create a united people in spite of all differences. And engineers, who had the skill and the courage to face what looked like overwhelming difficulties and achieve success. Through the skill and determination of your profession, we have built great transcontinental railways; we have opened waterways half way across the continent; we have harnessed the resources of Niagara and many other great rivers; we have opened the way into the vast hinterland while all the time building cities and industries and homes rivalling those of any other nation. For these achievements, we have to thank our engineers, and we, in Manitoba, which was for more than forty years an island in the vast sea of dis-

tance hundreds of miles from everywhere, have a very special reason for appreciating the service of those who have made it possible for us to be intimately connected with every other part of the continent.

And, Mr. President, in addition to all these personal and professional reasons for welcoming you to Manitoba, I want also to give you a very special welcome as one of the leaders of that great race which, from the very beginning of our history, has contributed so much to the up-building of this nation. Your people set themselves to the achievement of greatness in three intellectual fields—the church, the law, and in public life—and you have achieved great success in all of these fields. The names of Laurier, Cartier, Lafontaine, Chapeau, Lapointe, stand out as amongst the greatest names in Canadian history. In my own profession, men like Mr. Geoffrion and the late Mr. Lafleur rose to the leadership of the Bar of the Dominion though they had to win their successes in fields of law different to that in which they had been bred, and in a language that was not their native tongue. While your people won great successes in these fields, they made little effort to achieve eminence in those practical professional fields—banking, commerce, industry, engineering. Now I see great changes in Quebec. Your people are turning their attention to these newer fields, and the character and the ability which has won them such high places in the older professions will win for them similar eminence in the newer fields. You, Sir, are one of the leaders of the newer Quebec, and we welcome you because we see in this a force drawing our peoples closer together, breaking down the barriers that have separated us, and uniting all of us in a common determination to put the best that each of us has to contribute into a common effort to make of this country one of which we shall be most justly proud and to make the name Canadian honoured in every other land.

There seems to be a feeling in your province, if we may judge by newspaper talk, that there is an antagonism towards your province and your people in other parts of Canada. I cannot say how much of this feeling there is in other provinces, but I can and I do want to say to you that in the province of Manitoba there is no antagonism to Quebec and no antagonism to the French-Canadian people whether they live in Quebec or in any other part of Canada. We have but one complaint to make against you. In the early days of this province, you sent to us many able men who achieved high places in the life of this province. Our complaint is that you have not continued to do so, but have kept your best for yourselves. To you and your colleagues from the province of Quebec, of whatever race or creed, as well as to those from other provinces, we in Manitoba wish to extend the heartiest welcome we can give, and to express the hope that, having made this city the meeting place of your convention after many years of absence, you will feel that you want to come back to us soon and often.

# From Month to Month

## COLLECTIVE BARGAINING

The Minister of Labour's response to the request of the Committee of Fourteen for a separate order in council to control collective bargaining for the professions leaves the professions just about where they were. There has been no open denial of the request and yet no acceptance—just a statement to the effect that the professions will come within the jurisdiction of the present order, but will be recognized as a bargaining unit "in a proper case", this procedure to apply for an experimental period of six months "and thereafter until otherwise determined".

Just what the Committee of Fourteen or the Subcommittee of Three will do about it remains to be seen. At time of going to press the *Journal* is not aware of any decision having been reached, but understands there have been preliminary conversations between members of the sub-committee.

The Minister's letter addressed to the chairman of the Committee of Fourteen is as follows:

"Dear Mr. MacRae:

"The Wartime Labour Relations Board, after hearing your representations on behalf of the above named institutes and the representations of other organizations, finds that the cost of a New National Board and the necessary Provincial Boards to deal with professional employees would be substantial and that the proposal to include professional employees who influence the hiring or discharging of scientific personnel would not work out satisfactorily

"The Board recommends that the present Regulations be continued for a further period of six months and thereafter until otherwise determined, the Board meanwhile sub-dividing bargaining units so that employees engaged in a professional capacity may elect or appoint (as the case may be) bargaining representatives on their own behalf in a proper case. It is felt that this course will give professional employees an opportunity to acquire some experience in collective bargaining, if they so desire, and when they have this experience they will be in a position to decide as to what kind of collective bargaining they want. The Board will review its recommendation after the end of the six months' period. In my opinion, the procedure recommended by the Board should be given a fair trial and to this extent the Board's recommendation is adopted.

Yours sincerely,

(Signed) HUMPHREY MITCHELL.

## COSTS OF NEGOTIATIONS

So that members of professional and technical organizations may appreciate more fully what their societies have done for them in the study of and negotiations for collective bargaining, it may be useful to report that up to the end of 1944, the sum of \$1,490.00 has been spent by the committee of fourteen for legal advice, stenographic and other expenses. This does not include anything for the expenses of delegates, each organization assuming all costs that are related specifically to its own membership.

This common or cooperative cost has been distributed between societies as follows:

## News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

The Engineering Institute of Canada.....	\$ 470.00
Canadian Institute of Mining and Metallurgy	300.00
Dominion Council of Professional Engineers	200.00
Chemical Institute of Canada.....	200.00
Royal Architectural Institute of Canada....	100.00
American Institute Electrical Engineers (Canadian Section).....	100.00
Institute of Radio Engineers (Canadian Section).....	50.00
Canadian Society of Forest Engineers.....	50.00
Canadian Institute of Surveying.....	10.00
Junior Engineers, Ottawa.....	10.00
	<hr/>
	\$1,490.00

In addition, in the interests of the members, the Institute has incurred further expenses of approximately \$550.00, making the total cost to this organization \$1,020.00 up to the end of 1944.

Other organizations' experience will be similar to that of the Institute and when all are added together it will make a fair sum. It is evident that modern trends are going to raise the costs of maintaining a profession in Canada, and that the expenditures so far incurred are merely "a drop in the bucket".

## THE ARCHITECT-ENGINEER SITUATION

Several members have expressed an interest in seeing the plaintiff's factum in the case of the Association of Architects of Quebec versus Brian R. Perry. In the February *Journal* the factum of the defendant was published, but only quotations from the plaintiff's were cited. Both arguments would have been printed in the *Journal*, but that the paper restrictions made it difficult. The plaintiff's "plaint" is forty-five foolscap pages in length, double spaced.

The *Journal* would have been delighted to bring this document to the attention of every engineer, because it is an excellent exhibition of how issues can be confused, relevant facts ignored or submerged, and extraneous statements offered blandly as though they were of some importance. Incidentally, from the point of view of composition, it would have been comforting to engineers, who upon occasion are accused of falling short of perfection in such matters, to see the work of a member of one of the talking professions.

If enough members are interested in seeing this "masterpiece" it is believed that mimeographed copies can be obtained at cost through the Institute. Copies of the judgment too could be supplied on the same basis.

While it is desirable to keep members informed fully, it is unwise to discuss tactics publicly, and therefore there is little information to be given now. Members may be assured that those concerned are fully aware of the seriousness of the situation, and will take every means to preserve for the profession the rights to which it has always been entitled, and to maintain for the public the protection which it requires.

## ERRATUM

In the editorial appearing on p. 101 of last month's issue reference was made to a dictionary definition of "works", quoted by Mr. Justice Tyndale in his judgment. Unfortunately in the retyping for the *Journal* an important part of the definition was dropped; the words "a building" were omitted. It should have read according to the judge's written document, "Works—an architectural or engineering structure; a building, edifice."

Even though this reference is made simply to correct the previous error, it is difficult to refrain from contrasting the definition with the judge's decision. The engineers' act says "works" is in the field of the engineer. This definition says "works" is a structure, a building or an edifice that may be either or both architectural and engineering in nature, but the judge says a machine shop may not be designed by an engineer. It doesn't seem to make sense.

## TOO MANY ENGINEERS?

Every profession believes there are too many in it. It is a natural conclusion, because only a few in each profession seem to earn sufficient to satisfy their needs. Low incomes are attributed almost entirely to an excess of supply in relationship to demand, and hence the belief that the supply should not be increased too greatly.

To those who have worried about the earnings of the profession—and who hasn't?—it will be cold comfort to read the statement issued not long ago by the R.C.A.F., to the effect that a survey of 13,500 personnel in the force revealed that the largest group was interested in engineering upon discharge. The figure was 1,300. Multiply this by the factor that would relate it to the total personnel in the R.C.A.F. and we have the interesting total of 18,000.

This may not be a fair way of developing the total impact on the profession, because it is stated by the R.C.A.F. that in the group surveyed the majority was ground crew who had had some mechanical training. However, when account is taken of the higher educational requirements for air crew, it looks as though even more of them might be interested in the same calling, because of the easier approach they would have to admission to study.

Recently the Wartime Bureau of Technical Personnel made an interesting study of supply and demand for the profession of engineering. It is surprising to see how many persons go off the list each year because of retirement or the grim reaper. It is about equal to half the number of graduates produced each spring. Of course these Bureau figures are based on war conditions under which the supply has remained constant while the demand has increased; but even so the figures are not too alarming when translated to peace time conditions.

Out of 1,350 graduates each year in engineering and science, 1,200 have been going into the forces annually as technical personnel, in addition to which there are from three to four thousand in the forces in non-technical positions. This indicates that upon cessation of hostilities industry will have a tremendous back log of opportunities for engineers. To meet this it may be necessary for a few years to have an increased production from the universities. Under such circumstances the influx of greater numbers should be accommodated without fear of a supply beyond the demand.

There is no doubt but that as far as universities are concerned, the numbers entering upon demobilization

will be great, but not all who have expressed an interest will enroll. The real worry to the profession is not so much the number who will complete a university course but the greater number who will perhaps consider themselves to be engineers because of certain intensified training received in the services, and who will compete in the lower brackets with young graduates. This could be a really serious matter for all concerned.

## CO-OPERATION WITH QUEBEC CORPORATION

This number of the *Journal* is being mailed to those members of the Corporation of Professional Engineers of Quebec who have not as yet joined the Institute, in the hope that, through it, they may become better acquainted with Institute activities. The Corporation has already sent copies of its latest *Bulletin* to our members in the province of Quebec not registered with the provincial body.

This exchange of courtesies has the additional advantage of providing a more complete file of the publications for those who will in the next few weeks take advantage of the special privileges of joint membership provided in the recent agreement between the Institute and the Corporation.

Members of either organization who do not belong to the other are reminded that the privilege of admission without paying the entrance fee expires on April 21st. All have been sent the necessary application forms and it is hoped they will become joint members, thus effectively confirming the majority vote given, at the end of last year, in favour of co-operation.

## THE QUEBEC FEDERATION OF PROFESSIONAL EMPLOYEES IN APPLIED SCIENCE AND RESEARCH

The following article, which is reprinted from the February *Bulletin* of the Corporation of Professional Engineers of Quebec, gives the latest developments in the organization of a collective bargaining agency for engineers in this province.

"On January 12th last, the Corporation's Committee on Collective Bargaining studied the reports and findings of other committees on collective bargaining and thoroughly reviewed the situation in the light of the latest developments.

"The Committee then worded a resolution addressed to the Council of the Corporation, recommending that the 'Quebec Federation of Professional Employees in Applied Science and Research' be recognized as the appropriate body to cover the field of collective bargaining for professional employees. The resolution further recommended that Council favour the immediate setting into action of the Federation.

"The Corporation's Council, which had studied the Federation's constitution at an earlier date, approved on January 13th, the resolution of its Committee on Collective Bargaining.

"On January 31st a group of interested professional employees gathered and signed a memorandum of agreement, forming themselves into the association to be known as the 'Quebec Federation of Professional Employees in Applied Science and Research'. An Executive Board of five, composed as follows, was selected from among these first members: A. R. Colman, President; A. Clement, Vice-President; Marc

Boyer, Secretary-Treasurer; W. A. Nichols and J. D. Sylvester.

"The Federation is presently recruiting its members. It has prepared for distribution a very comprehensive memoir on collective bargaining. This memoir explains the value of collective bargaining procedure to the professions. It recounts the steps taken since April, 1944, by the several professional associations and societies. It explains the set-up of the Federation and it tenders an invitation to all concerned to join its membership.

"Although the inception of the Federation was fostered by the Corporation and by several professional societies, the Federation is an autonomous, self supporting entity. But the close affinity of its policy and purpose with that of the existing professional governing bodies and voluntary professional association naturally invites their co-operation."

### PRESIDENT'S MARITIME TOUR

The *Journal* presents herewith the itinerary for the president's tour of the Maritime branches and universities.

President Fetherstonhaugh will be accompanied by Mrs. Fetherstonhaugh and Dr. L. Austin Wright, general secretary. He will be glad to have with him for part or all of the journey any officers or members of the Institute who can see their way clear to make the trip. It is always appreciated by branches when the president includes in his party members of other branches. It is realized, of course, that the congestion associated with travelling at the present time may make it unusually difficult for persons to join the party.

#### PROPOSED ITINERARY

MONTREAL.....Lv. Monday April 9th 7.30 p.m.  
 SYDNEY.....Arr. Wednesday April 11th 7.30 a.m.

*Branch Meeting—April 11th*

SYDNEY.....Lv. Thursday April 12th 6.30 a.m.

*(If by motor—stopping at Antigonish to meet the students at St. Francis-Xavier University)*

HALIFAX.....Arr. Thursday April 12th 7.00 p.m.

*Branch Meeting—Friday—April 13th*

*Meeting with Students at Nova Scotia Technical College—April 13th*

HALIFAX.....Lv. Monday April 16th By motor

*Meeting with Students at Acadia University, Wolfville*

HALIFAX.....Arr. Monday April 16th By motor

HALIFAX.....Lv. Tuesday April 17th 7.15 a.m.

SACKVILLE.....Arr. Tuesday April 17th 11.58 a.m.

*Meeting with Students at Mount Allison University*

SACKVILLE.....Lv. Tuesday April 17th By motor

MONCTON.....Lv. Tuesday April 17th 5.05 p.m.

SAINT JOHN.....Arr. Tuesday April 17th 8.00 p.m.

*Branch Meeting—Wednesday—April 18th*

SAINT JOHN.....Lv. Thursday April 19th By motor

FREDERICTON.....Arr. Thursday April 19th

*Meeting with Students at University of New Brunswick*

FREDERICTON.....Lv. Thursday April 19th By motor

SAINT JOHN.....Arr. Thursday April 19th

SAINT JOHN.....Lv. Friday April 20th 10.30 a.m.

MONCTON.....Arr. Friday April 20th 1.15 p.m.

*Branch Dinner Meeting—April 20th*

*Regional Council Meeting—April 21st*

MONCTON.....Lv. Sunday April 22nd 2.10 a.m.

MONTREAL.....Arr. Sunday April 22nd 9.20 p.m.

### TO JUNIORS AND STUDENTS IN QUEBEC

Juniors and Students of the Institute residing in the province of Quebec who belong to the Corporation of Professional Engineers are reminded that they may, until April 21st, transfer to a higher class of membership in the Institute without having to pay the transfer fee. This is a result of the co-operative agreement entered into, on January 21st, by the Institute and the Corporation. The privilege expires after 90 days from the date of the signing.

The transfer fee, usually required, is as follows:

From Student to Junior.....	\$ 5.00
From Junior to Member.....	5.00
From Student to Member.....	10.00

Under the provisions of the agreement, Students and Juniors who belong to the Corporation may become full Members of the Institute, notwithstanding the other requirements of the by-laws, provided they apply within the prescribed time.

The necessary application forms have been sent to those who qualify for this privilege and, no doubt, the majority will want to take advantage of it.

### CO-OPERATION ABROAD

The Institute has always enjoyed excellent relationship with British Institutions. While the war has retarded certain developments along this line, it has expanded others. For instance, the exchange of membership privileges on a complimentary basis, whereby Canadians in the Old Country were welcomed by the headquarters of British Institutions, and their members in Canada were put temporarily on the membership lists of the appropriate branch of the Institute in Canada, has done much to improve the contacts between individuals, and maintain the warm relationship between societies.

A further proposal for exchange of benefits has just been made, whereby the publications of the Institution of Electrical Engineers are made available to members of the Institute at one-half the regular price charged non-members. The Council of the Institute has accepted this proposal heartily and is glad to extend similar privileges to members of the Institution.

So that members may take advantage of this offer, the following information on the British publications is provided:

#### *The Journal*

Issued in three parts annually. Part I (General) contains all material of general interest together with abstracts of all the papers accepted for publication in full in the other two parts. Each of these abstracts is designed to bring out the main points of the paper concerned for the benefit of those readers who have no specialized knowledge of the subject dealt with.

Papers appear in full, together with the discussions on them, in the other two parts, (Part II "Power Engineering" and Part III "Radio and Communication Engineering").

The contents of the various parts are as follows:

#### *Part I "General"*

(Volume commences in January. 12 monthly numbers)

- Addresses and Lectures of a general character
- Abstracts of all Papers in Parts II and III
- Progress Reviews
- Formal Proceedings of The Institution
- "Institution Notes"

Obituary Notices  
Council's Report  
Accounts, etc.

### Part II "Power Engineering"

(Issued every other month. Volume commences in February)

Power Generation, Transmission and Distribution  
Power Applications  
Meters and Instruments

Design of Machinery and Testing

Formal Proceedings of the Installations, Measurement and Transmission Sections

### Part III "Radio and Communication Engineering"

(Volume commences in March. Four quarterly numbers)

Radio and Television  
Telegraphy and Telephony  
Formal Proceedings of the Radio Section

Obtainable by members of The Engineering Institute of Canada, if ordered in advance, at the following special subscription rates:

Part I	10s. 6d. per annum, post free	} All three parts:- £1 11s. 6d. per annum, post free
Part II	15s. 9d. per annum, post free	
Part III	10s. 6d. per annum, post free	

(List price is £3 2s. 0d.)

Payments should be made through The Engineering Institute of Canada.

As new volumes commence in January it would be helpful if prospective subscribers would indicate their interest immediately.

The Institute is pleased and gratified that this splendid British Institution has taken the initiative in promoting an extension of co-operation. It appreciates and is grateful for the sentiment expressed by the Council of the Institute in its communication, as manifested in these quotations taken from it.

"The Council would like you to regard this offer as calculated to knit together still more closely sister Institutions which have in common the advancement of engineering science for the welfare of mankind."

"It is clear that the foregoing does no more than represent an earnest of the fuller interworking which we hope in time to bring about, but I feel it will be necessary to await the opportunity of an informal conference at first hand before the steps that will be required to put the policy more fully into being can be decided; a pleasure which must clearly await some amelioration of the conditions in which we find ourselves at present."

### OMISSION

#### Toronto Branch Annual Report

It has been brought to the attention of the Editor that the most important function in the list of activities of the Toronto Branch for the year 1944 was omitted from the report submitted for publication on page 98 of the February issue of the *Journal*.

In order to complete the record the following should be inserted in the report:

June 16—The Toronto Branch was honoured by having President and Mrs. de Gaspé Beaubien as guests for dinner at the Royal Canadian Yacht Club. The president addressed those assembled on the subject of the part the engineer should play in social affairs. The general secretary spoke briefly on the highlights of the work of the Institute. R. E. Hartz commented on the problems involved in collective bargaining from the point of view of the engineer.

### THE STUDENTS ARE SELDOM WRONG

The following delightful "appreciation" of the new president is taken from the special Convention Issue of the "*Slide Rule*" published by the engineering and architectural societies of the University of Manitoba, to coincide with the annual meeting of the Institute. So many members attending the meeting enjoyed the sketch that the *Journal* felt it should be made available to all members. It gives the students' appraisal of a man, and in such things the students are seldom wrong.

#### THE DEAN... AN APPRECIATION

University is not a place of bricks and mortar, of lordly buildings and spacious grounds. Without men, these are less than nothing. Dean Fetherstonhaugh is one of those men who make a University. There is something of the classical about him—a touch of old-fashioned dignity in the clean-cut suit, the starched collar a size too large, the neatly knotted tie. The tall, stooped figure of the Dean has passed through the halls of the various Engineering buildings, from office to library, from draughting room to laboratory during thirty-odd sessions. To-day, his carriage is reminiscent of the fine soldier who was awarded the Military Cross in World War I. His bearing, modest and courtly, is that of the scholar and gentleman.

The Dean's contributions to the University of Manitoba in the organization and development of a Faculty of Engineering much along the lines of his Alma Mater, McGill University, are too well known to need mention here. His efforts on behalf of Canadian science during the years he has served as a Member of the National Research Council of Canada, have been untiring. Recognition of Dean Fetherstonhaugh's splendid qualities of judgment and leadership has come in the form of his nomination as President-elect of The Engineering Institute of Canada—the highest honour of its kind that may be given a member of the Engineering profession in Canada.

Students who see the Dean first as a teacher and disciplinarian — a man with a reserve and austerity that convey an impression of unapproachability—are surprised to learn, on better acquaintance, that he has a sharp sense of humour, often coupled with a dry wit directed at himself. His laugh is short and is followed by a series of chuckles that leave his keen eyes sparkling and smiling. Students find in the Dean a mentor and counsellor who is willing to help them with their problems, never sparing his time and energy in making certain that all traces of doubt and confusion as to the solution are removed from their minds. Repeating his services to the veterans who returned to the University of Manitoba after the last war, the Dean has already given to the men, now coming back to University studies under the Veterans' Welfare Act, the benefit of his guidance and encouragement.

The Dean's many friends, both in and outside of the engineering profession, are impressed by his loyalty and sincerity. At a recent meeting the present President of The Engineering Institute of Canada, M. de Gaspé Beaubien, speaking before the students of the Faculty, paid his respects to his "dear friend, Fethers," saying that rarely had a man with "so soft and velvety a hand" come so far on the road to success. Here, in the very simplest of words, was expressed the admiration of one great man for another.

In private life, Dean Fetherstonhaugh is a keen golfer, a wide reader, particularly in the field of history, a lover of good music, and an artist with water colours.

He enjoys a privilege seldom given to Canadians—that of being a Fellow in the Royal Society of Arts.

In these few words we, the students of Engineering and Architecture, have tried to express a small part of that respect and admiration we feel for Dean Fetherstonhaugh. Of him it can be truly said,

*“And thus he bore without abuse,  
The grand old name of gentleman.”*

## WASHINGTON LETTER

### RESULTS OF THE CRIMEA CONFERENCE

The results of the Crimea conference at Yalta have been received with almost universal approbation. A substantial degree of unanimity has been reached on a number of points which prior to the conference were causing grave concern. There are good indications that a better understanding and increased cooperation will characterize relations with Russia. There was a full appreciation of the necessity of finding ways in which the economies of the United Kingdom and the United States can be made to work in with the Russian economy. The extremely strong position which Russia will occupy after the war was fully recognized and taken into account at the conference.

It is generally agreed that solutions for the problems of international security and international finance are of the utmost importance before the general groundwork can be laid for postwar plans either nationally or internationally. It would appear that considerable progress was made at the Crimea conference on both these problems. One of the first actions of President Roosevelt following the conference was an urgent call for immediate Congressional action on the Bretton Woods agreements. Coupled with the President's call was his own outline for a major programme for postwar economics. He called for an extension and a broadening of the Trade Agreements Acts; he expressed himself in favour of the reduction of trade barriers; he called for the establishment of a United Nations organization to deal with the problems of food and agriculture; he cited the need for the control of cartels and a general agreement covering the disposal of world surpluses; the Export-Import Bank will probably have its activities extended; further conferences are envisaged on specific subjects such as petroleum, civil aviation, shipping and communications.

Also immediately following the conference, machinery has been put in motion for the Security Conference which is to take place at San Francisco next April. The President is making every effort to ensure successful American participation, and a strong bi-partisan American delegation under the chairmanship of Secretary Stettinius has been named. The delegation includes Cordell Hull, Senators Vandenburg and Connally, Representatives Eaton and Sol Bloom, Dean Virginia Gildersleeve of Barnard and Commander Harold Stassen, former Governor of Minnesota.

### THE 60-HOUR WORLD

As this is being written, the Inter-American Conference on War and Peace is being convened in Mexico City. This conference has been called by the Pan-American Union. The much travelled Secretary of State Stettinius arrived at the conference by plane from Brazil on his way back from the Yalta meeting. As confirmed at the Yalta meeting, the first meeting between the three Secretaries of State is scheduled to take place in London shortly after the San Francisco conference. The Reparations Commission which was

also established at Yalta is to have Moscow as its headquarters. Also as this is written, the UNNRA conference is taking place in Australia. The way in which history and geography have become combined in recent years is symptomatic. Casablanca, Washington, Tehran, Quebec, Yalta, Montreal, Hot Springs, Chicago, Atlantic City, Mexico City, Bretton Woods, all conjure up important mileposts in the progress of the war and in the growing understanding and cooperation of the peoples of the world. This is part of a new trend in the conduct of human affairs which is only partly due to the fact that we are living in what is coming to be known as the “60-hour world”.

Of particular interest to engineers is a recent British proposal for the construction of a 200-mile canal through Palestine, linking Acre with the Red Sea and passing through the Dead Sea. This proposal arises from the fact that the present Suez canal is inadequate for modern traffic purposes and that it reverts to Egypt in 1968. The proposed canal would be a tremendous undertaking, especially when one takes into account the fact that the Dead Sea is over 1,000 ft. below sea level.

Secretary of the Interior Ickes has recently written to the President making a bid for the postwar job of developing the water and power projects of the Nation. Secretary Ickes envisages a coordinated plan for harnessing the country's waterways in an ocean-to-ocean conservation scheme. He admits that the plan is a herculean one but he sees it as the nearest economic equivalent to war in the field of conservation. He stresses the necessity for regional development in its boldest outlines. He adds: “The programme must embrace entire areas, usually the basins of great rivers and their tributaries; it must provide for full and unified development of all of the resources within the region, and an ideal programme would call for simultaneous attack upon all phases of the job.”

### U.K.-U.S. EXCHANGES

Mr. William L. Batt, vice-chairman of the War Production Board and joint chairman of the Combined Raw Materials Board is also an honorary member of The Engineering Institute of Canada. Ever since the Keynes-Morgenthau discussions, the difficulties of the United Kingdom financial and trading position and the inter-dependence of the interests of the United States and the United Kingdom have been increasingly widely discussed. Mr. Batt has recently made an important speech on this subject in which he brings his engineering experience to bear. A member also of the Combined Production and Resources Board, he has been in close touch with the problem of improving manufacturing methods and effecting an interchange of technical experience. He cites two of England's most important exporting industries, textiles and coal, and compares English and American manufacturing practices in these two industries to the detriment of the United Kingdom. There is little gainsaying Mr. Batt on the two examples he has chosen. Recent U.K. missions in this country have admitted that England can profit greatly by what they have learned in this country. Mr. Batt might, however, have placed more emphasis on the two-way nature of such exchanges. The United States may have a better understanding of mass production techniques but England excels in quality production and understands the limitations of mass production. Despite a tremendous development in American shipbuilding practice, British costs are still very much lower than American costs. While it is true that the mass production of penicillin was developed in America, the discovery of penicillin itself was made in the United King-

mittee and a past councillor; Stewart Young (Regina), registrar of the Association of Professional Engineers of Saskatchewan, and a past councillor of the Institute; S. H. deJong, secretary of the Toronto Branch; H. B. LeBourveau, chairman of the Calgary Branch; C. P. Haltalin, vice-chairman, and T. E. Storey, secretary of the Winnipeg Branch, and J. W. MacDonald of Windsor, Nova Scotia, representing the Halifax Branch.

In welcoming the councillors and guests, President Beaubien expressed his gratification at seeing so many members who had come from distant parts of the country. Unfortunately, the trains from the east were late and several members of Council would not arrive in time for the morning session. He suggested that several items on the agenda, on which there would undoubtedly be considerable discussion, be held over until the afternoon. Agreed.

Following the usual custom, there was a roll call and the president extended a cordial invitation to guests to take part in all discussions.

*Rehabilitation of Members in the Armed Forces*—Recently the Council had decided to set up a committee to establish the policy of the Institute in regard to the rehabilitation of members in the active services and of members transferring from peace-time to wartime activities. The selection of the chairman had been left with the president and Mr. Beaubien announced that Major-General Howard Kennedy, Montreal, now demobilized, had accepted the chairmanship. In order to cover the field fully, General Kennedy was planning to have with him on the committee a high ranking Navy man, and a member of the Air Force, also industrialists and employers of engineers. This appointment was noted and unanimously approved.

*Community Planning*—The general secretary reported that a letter had been received from Mr. Forsey Page, president of The Royal Architectural Institute of Canada (R.A.I.C.), agreeing with the suggestions which had been made previously that the R.A.I.C. and the Engineering Institute should get together to assist in establishing a national organization concerned primarily with community planning.

In the discussions which followed contributions were made by Messrs. Vance, Young and the president, it being emphasized particularly by Mr. Young that in re-organizing the former Town Planning Institute, or in establishing a new organization, care should be taken that the membership was not restricted to a professional group. He pointed out that because of the many groups of persons who were interested in the subject it should be possible to arrange that all of them might become members of equal standing in such an organization. Mr. Young moved that the Engineering Institute join with the R.A.I.C. for the purpose of fostering community planning interests. This was seconded by Mr. Vance, and approved unanimously, it being left with the president to select the Institute's representatives on the proposed committee.

The general secretary reported that in conversations with Mr. John Galbraith, who was giving a paper during the annual meeting on the subject of community planning, Mr. Galbraith had suggested that it would be helpful if the Institute's approval of taking part in this activity were recorded in the form of a motion. Accordingly, the general secretary presented the following motion:

RESOLVED that this session of the annual meeting of The Engineering Institute of Canada held in Winnipeg on February 7th, 1945, wishes to place itself on record as acknowledging the responsibility of the profession and the Institute in the vital subject

of community planning. It recommends that the Council of the Institute establish immediately a committee to develop and administer a programme of activities whereby the Institute may make the maximum contribution to the solution of the many problems present in all parts of Canada. This programme should include encouragement and support of a planning institute at the national level, development of interest in local problems by each branch, and publicity on a local and national basis that will inform the public as to what is in its best interest, and of the engineer's concern for its welfare.

This resolution was approved by Council and it was moved by Mr. Armstrong that it be brought forward at the annual business meeting of the Institute the following morning. This was seconded by Mr. Patton and carried unanimously.

*Co-Operative Agreement in Quebec*—The general secretary reported that the co-operative agreement between the Institute and the Corporation of Professional Engineers of Quebec had been signed at Institute Headquarters on January 20th. Letters were being sent out to those members who do not at present belong to both bodies urging them to take advantage of the terms of the agreement and apply immediately for membership in the other body.

On the motion of Mr. Eadie, seconded by Mr. McLeod, it was unanimously resolved that the president be authorized to name the three representatives of the Institute on the committee called for in clause 9 of the agreement.

*Engineer in the Active Services*—The general secretary reported that since the question of the appointment of a chief engineer to a senior rank such as Brigadier or Major-General in the Army organization had been discussed by Council he had had conversations with certain Ottawa officials and they were all of the opinion that the Institute should make a strong endeavour to have such an appointment made that would be comparable to that in the Army Medical Corps, but that in view of the political situation no further action should be taken at the moment.

Colonel Grant, a member of the Institute's committee, made a comparison between the status of the engineer in the Canadian Army and in the United States Army. He thought that attempts should continue to be made to secure for the engineer in the Canadian Army the same high status that he enjoys in the United States Army. He was definitely of the opinion that the Institute should press for this improved recognition, but he also agreed that little could be done until the political situation was clarified.

*Canadian Standards Association*: On the motion of Mr. Sauder, seconded by Mr. McLeod, it was unanimously resolved that Dr. P. L. Pratley be nominated as the Institute's representative on the Main Committee of the Canadian Standards Association for a three year period commencing on April 1st, 1945.

*Association Representation on Council*: It was noted that Professor E. O. Turner, of Fredericton, had been appointed as the representative of the Association of Professional Engineers of New Brunswick on the Council of the Institute for the year 1945.

*Co-operation with British Institution of Engineering*: The general secretary presented a letter from the secretary of the Institution of Electrical Engineers which reads in part as follows:

"When in communication with you towards the end of March last year, I said that I hoped before long to write to you in more detail on the subject of co-operation between our Institutions. In the inter-

vening months this desire has been very much to the fore in the deliberations of my Council and those Committees which are concerned with these matters. Though the continuation of the war in Europe and the necessary restrictions which it brings in its train have prevented a fuller development of the interchanges which we both desire, I can now put forward one small step towards our closer co-operation."

"The Council have decided that members of sister Institutions overseas with whom The Institution has reciprocal arrangements for the exchange of visiting membership facilities, should be given the opportunity of obtaining copies of The Institution Journal and 'Science Abstracts' at the special reduced subscription rate, one-half of the price charged to the public."

"The Council would like you to regard this offer as calculated to knit together still more closely sister Institutions which have in common the advancement of engineering science for the welfare of mankind."

"It is clear that the foregoing does no more than represent an earnest of the fuller interworking which we hope in time to bring about, but I feel it will be necessary to await the opportunity of an informal conference at first hand before the steps that will be required to put the policy more fully into being can be decided; a pleasure which must clearly await some amelioration of the conditions in which we find ourselves at present."

Mr. McLeod expressed his pleasure at this further demonstration of co-operation with the British institutions. He moved that the offer be accepted immediately, and that the Institute extend similar privileges with regard to *The Engineering Journal*. This was seconded by Mr. Dickson and carried unanimously.

*A.S.C.E. Honorary Membership:* It was noted with gratification that at the recent annual meeting of the American Society of Civil Engineers, Dr. Arthur Surveyer, a past-president of the Institute, had been elected to honorary membership. There are now three past-presidents of the Institute who have been so honoured, Past-Presidents G. H. Duggan and J. M. R. Fairbairn having received a similar recognition on previous occasions. Council instructed the general secretary, on behalf of Council, to acknowledge to Dr. Surveyer the honour which had been done him.

*National Construction Council of Canada:* Some time ago the general secretary had been instructed to ask Mr. D. C. Tennant, the Institute's representative on the National Construction Council, for a review of progress made by the Council. Mr. Tennant also represents the Institute on the Toronto Reconstruction Council and on the Rehabilitation Committee, Department of Pensions and National Health.

The general secretary read a letter just received from Mr. Tennant giving a summary of the activities of these three organizations, and he was directed to refer the letter to the Institute's Committee on Professional Interests for consideration.

*Applications through Associations:* By virtue of the co-operative agreements between the Institute and the provincial professional associations, the following elections and transfers have become effective:

*Saskatchewan* (as of Jan. 18th, 1945):

*Member*—G. B. Alexander;

*Student to Junior*—D. Cramer;

*Students*—B. N. Burwell, J. L. Cook, G. A. Duery, W. H. Harper, A. Mowchenko, M. Nicolson, K. S. Sargent.

*New Brunswick:*

*Junior to Member*—Y. Nadeau.

*Consideration of Quebec Applications:* In view of the co-operative agreement now effective between the Institute and the Corporation of Professional Engineers of Quebec, it was unanimously agreed that J. B. Stirling, R. S. Eadie and J. A. Lalonde be appointed a committee to discuss with the Corporation routines and procedures to be followed for applications for admission to the Institute from persons residing in the province of Quebec.

The Council adjourned for lunch at one fifteen p.m., and reconvened at two forty-five p.m. with the president in the chair.

*Death of Harry F. Bennett:* The president reported that he had been informed of the sudden death of Harry F. Bennett, in London, Ontario, on January 31st. He knew that this would be a serious blow to many people in the Institute and that it would be almost impossible to replace him in the activities in which he had given leadership.

Many councillors expressed deep regret at this sad news and all agreed on the seriousness of the loss to the Institute. It was proposed and unanimously resolved that a message be sent to Mrs. Bennett and that Council record in the minutes of this meeting its sense of great loss. Accordingly, the following minute was approved:

The Council of The Engineering Institute of Canada has been shocked to learn the tragic news of the death of Harry F. Bennett, at London, Ontario, on January 31st, 1945, and desires to record in the minutes of this meeting some indication of its appreciation of the loyal and intelligent service which he has rendered the Institute and the profession, and also to convey to his wife and other relatives its sympathy in the great loss which they have suffered.

Few engineers have been as unselfishly interested in the welfare of the profession, particularly its younger members, as has been Harry Bennett, and few have devoted as much time and energy to that cause. His patient, kindly, intelligent leadership in such matters has encouraged hundreds of other engineers to join with him to raise the levels of the profession, and through this extended effort hundreds more of young engineers and prospective engineers have been given vital guidance and counsel that otherwise would not have been available to them. The monuments to his great work and to his personality are spread from coast to coast in the minds and hearts of those who knew him.

In an endeavour to extend into the future the effects of some of the things that he worked on so earnestly in the past, and to perpetuate his name in the annals of the Institute, Council proposes to establish immediately a prize for young men to be known as the Harry F. Bennett Prize.

Council speaks for all the members of the Institute in extending to Mrs. Bennett its most sincere sympathy. The loss which is so personal to her is shared to a lesser degree but still poignantly by all those engineers who were privileged to know him. He will be greatly missed in our midst.

*Employment Conditions (Collective Bargaining)*—The chairman of the Committee on Employment Conditions, R. E. Hartz, stated that a report of his committee was included in the annual report of Council for the year 1944. As the report was too long to present in detail he recommended that it be read in the annual report. He observed that the brief and the questionnaire issued last July still seemed to be quite sound and to cover the purposes reasonably well. He thought

it was still used by many people as the basis from which to start their thinking.

He reported that twenty different engineering organizations had been represented by the sub-committee of three which, on January 9th, had appeared before the Wartime Labour Relations Board in Ottawa. He explained the position of the trade union organizations and their opposition to the request of the professional societies for a new order. He pointed out that the brief presented by the sub-committee to the Board was printed in full in the January *Journal* and that further details would be given in the February *Journal*.

The president thought that Council was greatly indebted to Mr. Hartz for the excellent work which he had done for the Institute. He also expressed appreciation of Mr. Hartz' employers who had made it possible for him to devote so much of his time to the work. It was moved by Mr. McLeod, seconded by Mr. Dickson, and carried unanimously, that Mr. Hartz' progress report be accepted.

*Statement on Relations with Sister Societies*—Mr. Stirling, chairman of the Committee on Professional Interests, reviewed the situation that had been created a few months ago by a further endeavour to form a new overall engineering body. He outlined the history of the movement up to the time that a proposal was submitted to the Council of the Institute at Edmonton in October 1944. At that meeting Council had considered the proposal and had referred it to the Committee on Professional Interests with instructions to consult the provincial professional associations with which the Institute had co-operative agreements.

Mr. Stirling stated that his committee had met several times and that members from Nova Scotia, Quebec and Ontario had been present. From these meetings had emerged a document known as a "Statement of Principles and Policy of the Institute on Relations with Sister Societies." At the December meeting of Council it was agreed that the president would send this statement to all past-presidents, to vice-presidents and to councillors, asking for an expression of opinion, and that the chairman of the committee would send it to the associations with which the Institute had agreements, asking for approval, criticisms or suggestions.

Mr. Stirling now reported that a great number of replies had been received which he felt need not be presented in detail at this meeting. All replies, in general, endorsed the statement of policy. In view of the far-reaching effects of this statement, and the fact that some opinions had not yet been received, Mr. Stirling presented the following resolution which was moved by Mr. Armstrong and seconded by Mr. Vance:

WHEREAS the Committee on Professional Interests on December 16th, 1944, submitted to Council a draft of a proposed declaration of principles defining the relations of the Institute with other engineering societies—Canadian, British and American; and

WHEREAS, by direction of Council, the president has requested the past-presidents and the members of council to consider and pass upon this draft; and

WHEREAS, by direction of Council, the chairman of the Committee has requested the opinions of the presidents and secretaries of the five provincial associations having agreements with the Institute; and

WHEREAS all the past-presidents and all the councillors who have been heard from endorse the draft; and

WHEREAS the officers of the Quebec Corporation and the New Brunswick Association endorse the draft unqualifiedly, the Saskatchewan Association suggests an amendment that does not affect the principle, and

the Councils of the Alberta and Nova Scotia Associations have recorded certain reservations; and

WHEREAS the formulation of a generally acceptable long-term programme of co-operation with other engineering bodies is of great importance to the Institute and to the engineering profession in general, it is imperative that the draft be most carefully considered; and

WHEREAS the Committee on Professional Interests not having had an opportunity adequately to appraise the various opinions which, although preponderantly favourable to the draft, do vary in certain particulars;

THEREFORE the Committee on Professional Interests recommends that it now be instructed by Council

- (a) to confer further with such individuals or associations as have indicated reservations; and
- (b) as soon as practicable to formulate a final recommendation for submission to Council.

Dr. Gagnon inquired as to the relationship between this resolution and the Canadian Council of Engineers and Scientists which he believed had already been organized. He would like to know if the Institute statement indicated the intention of establishing a co-operative organization consisting only of *professional engineering* organizations in addition to the Canadian Council which was made up of engineers, non-engineers and members of other professions such as architects and chemists.

In reply Mr. Stirling explained that it was the discussion which had developed because of the proposal to establish the Canadian Council of Engineers and Scientists that had caused this statement to be prepared. The committee had thought that before the Institute took any action on the new proposal, the whole situation should be reviewed in relationship to the already established policy of the Institute and its broad interest in and prime concern for co-operation with *professional engineering* organizations.

Mr. Stirling explained further that the Committee on Professional Interests agreed that the Institute should proceed one step at a time, and, first of all, find out if the membership was agreeable to co-operating with strictly professional engineering societies, and then determine if it was agreeable to co-operating with organizations representing other professions, and in many instances, non-professional people as well. His committee believed that it would clarify the thinking if straightforward principles were agreed upon first.

Mr. Young thought that clause E of the statement covered the situation, and in response to his suggestion Mr. Stirling read the clause as follows:

"Council is prepared to consider as an experiment the formation of a committee representative of engineering bodies on which committee the members act only upon consent of the bodies they represent, and the chairman and the members change periodically, and the secretariat rotates annually among the headquarters of the constituent bodies."

At this point the president presented an outline of the history of the various movements which had brought engineers in Canada up to the present situation. He referred to the proposals made last fall at the meetings of the fourteen societies in Ottawa relative to a new society. He pointed out that at those meetings it had not been clearly indicated just what such a new organization could do that was not already being done. At one meeting, when a very full discussion took place, it appeared to be the opinion of the majority that the

proposal was not well supported and therefore, at the suggestion of the proposer, it was withdrawn. However, at the next meeting it was brought up again in a somewhat new form, and as there had been no opportunity to have an expression of opinion on the new proposal from the Council of the Institute, it was not possible for the Institute's representatives to express any opinion. However, the majority at that meeting had voted in favour of it, and it was this proposal which had prompted the Institute's committee to prepare a statement of principles.

Dr. Turner inquired as to the progress which had been made in forming the new council. The Association of Professional Engineers of New Brunswick had read in a bulletin of one of the associations that the new council had been formed. No specific inquiry or information had been sent to the N.B. Association but it had been agreed by the officers of that organization that the matter was of considerable concern to them and that developments should be watched closely particularly from the financial point of view.

In reply to Dr. Turner's inquiry, Mr. Stirling expressed his opinion that the position of this new development was rather confused, because several of the provincial associations and others had opposed the proposal. As far as finances were concerned, he had nothing definite to report inasmuch as the Institute had not been represented at the first meeting and therefore had not received a copy of the minutes, but he had been told informally that it was agreed that there would be an assessment of ten cents per member on all organizations participating.

Mr. Young stated that in Saskatchewan the Association was opposed almost one hundred per cent to this new set-up. In his opinion there were too many engineering organizations now.

Mr. Patton, supporting Mr. Young, stated that the Saskatchewan Association did not support the proposal. The Association had approved of the Institute's statement of principles but had suggested an amendment to clause E whereby the presidents of the various organizations would be able to take action in times of emergency. That was as far as his Association wanted to go.

Dr. Gagnon stated that he had understood that the new organization was simply an attempt to put in permanent form the committee of fourteen which had been brought together to discuss collective bargaining.

In reply, Mr. Stirling expressed the opinion that Dr. Gagnon had misunderstood the situation. It was not the opinion of the Institute Council that the new organization was only a continuation of the committee of fourteen, in that it had or would supplant that committee.

Mr. Muntz was of the opinion that every endeavour should be made to promote co-operation between societies. He thought, however, that in view of the many things that had to be kept in mind, Mr. Stirling and his committee would be quite able to handle the situation satisfactorily from the point of view of the members of the Institute.

At this point the motion was put to the meeting and carried unanimously.

*Automatic Transfer of Students and Juniors*—Mr. Hall, chairman of the Membership Committee, reported at length on a proposal which had been before Council previously and which had emanated originally from the Peterborough Branch. The matter had been discussed in some detail by Councillor Sills of the Peterborough Branch at the December meeting, at which time the subject was referred to the Membership Committee for report at the annual meeting of Council.

In the discussion which followed, Mr. Hall stressed the desirability of establishing an Admissions Committee which would examine all applications for membership and transfer and report to Council. In this way Mr. Hall believed that much of Council's time could be saved, and that a better examination of the applicant's qualifications could be obtained.

Mr. Armstrong questioned the desirability of eliminating transfer fees inasmuch as considerable time was now being spent by the Finance Committee in considering means by which income from fees could be increased.

In reply, Mr. Hall was of the opinion that the saving in time and expense at Headquarters in following up of overage Students and Juniors, and the increase in revenue due to prompt transfers would more than offset the loss from transfer fees. He pointed out that you could not transfer a person automatically if you insisted on a transfer fee. He also pointed out that in the medical and legal professions a person becomes a full member and does not have to pass through junior or other classifications first. At this point Mr. Hall asked for the opinions of councillors on the other points raised in his report, namely,

1. The elimination of Junior membership.
2. The appointment of an Admissions Committee.
3. Emphasis on the responsibility of branch membership committees.

Mr. Cameron agreed with the necessity of impressing upon the branch membership committee its responsibility. Such committees were made up of hard-working members in each branch, and he suggested that the proposals of Mr. Hall's committee might be submitted to the membership committee in each branch, as they were in an excellent position to discuss such subjects.

It was agreed that Mr. Hall's report be accepted as an interim report and that a revised edition would be prepared for publication in the *Journal* and presentation to the branches.

*Engineers and the Design of Buildings*—The general secretary outlined the most recent developments in the case of the Province of Quebec Association of Architects vs. Brian R. Perry, stating that in the opinion of the judge who had heard the case Mr. Perry had contravened the Architects' Act and therefore was guilty of the charge made by the association. Notice of appeal had been filed almost immediately. In Mr. Wright's opinion the judgment was not well founded. He explained that he had examined the evidence, the argument and the judgment, and agreed firmly with Mr. Perry and his counsel that there was good ground for appeal. He also reported that a meeting had been held at the Institute at which were present officers of the Corporation of Professional Engineers of Quebec and the Institute, as well as legal counsel and Mr. Perry. At this meeting the situation was reviewed in considerable detail and encouragement was given to Mr. Perry to proceed with the appeal. It was also agreed that in view of the seriousness of this judgment to the profession of engineering that both the Corporation and the Institute would support Mr. Perry in every way possible.

Mr. Wright stated that in the February number of the *Journal* considerable space would be devoted to this case so that members throughout Canada would be fully informed and would appreciate the seriousness of the situation.

Mr. Wright reported that it had been suggested that the Institute's Committee on Legislation should make a study of the professional engineers' acts of Quebec with the idea of recommending amendments that would do away with the anomalous position brought about

by the recent court decision. It was recommended that this committee consult with a similar committee already appointed by the Corporation. It was agreed unanimously that Mr. Poitras, chairman of the committee, should be so instructed.

In the discussion which followed, the opinions of persons from provinces other than Quebec were given and the implications of the decision discussed from the broad point of view. Mr. Carry suggested that rather than line the engineers and architects up on opposite sides it might produce better results if an endeavour were made to have private discussions which might lead to a compromise or some other satisfactory settlement. Mr. Wright explained that an endeavour along these lines had been made in Quebec but that the representatives of the architects refused to discuss future arrangements until the engineers had conceded the point which they were trying to make in their case against Mr. Perry. In other words, once they had everything they wanted they would be willing to discuss the future.

Mr. Chadwick informed Council that he had discussed this case with many firms of architects with which he did business and that, without exception, they had not approved the action of the provincial association of architects.

Mr. Brandon, Mr. Sauder and Mr. Vance also took part in the discussion from the point of view of conditions in their provinces. Eventually the discussion led to the conclusion that the Institute should continue its support of Mr. Perry and that the matter be left with the officers of the Institute as far as further details were concerned. This was moved by Mr. Chadwick, seconded by Mr. Sauder, and approved unanimously.

*Committee on Soils Tests*—Mr. Chadwick reviewed the events that had begun with the obtaining of certain samples of soil in and around Montreal for Dr. Terzaghi of Harvard University out of which had developed a continuing committee on the subject. He outlined in considerable detail the work which he thought could be done by his committee whereby technical information could be gathered from coast to coast for the guidance of the profession.

He thought that the committee in its final set-up should have a member from each province or perhaps from each district where it is known that there are clays or silts that could be sampled and classified.

The president thanked Mr. Chadwick for his report and suggested that he might put it in such form that it could be printed in *The Engineering Journal*.

Mr. Sauder emphasized the importance of the subject of soil mechanics in Alberta and Saskatchewan, particularly in connection with irrigation. He thought that every endeavour should be made to tie the universities in to the work of Mr. Chadwick's committee, pointing out, at the same time, that short courses had already been carried out on this subject at the Universities of Alberta and Saskatchewan.

*Proposal to Increase Annual Fees*—Mr. McLeod, as chairman of the Finance Committee, gave some of the history back of the Finance Committee's consideration of the subject of increased fees. He pointed out that the Institute's activities had grown so greatly that it was difficult to maintain the standard of service with the present income. Comparing the Institute, on a membership basis, with similar societies in the United States, he stated that the Headquarters staff was less than one half the size of what it should be. He also pointed out that the increase in membership, particularly among the Students and Juniors, gave the Institute increased opportunities for service which would require expenditure of funds.

The Finance Committee will recommend that the \$2.00 voluntary assessment, which is being collected this year, be maintained until the new Finance Committee has an opportunity to study the matter further and to bring proposals before Council. He explained that this information was given simply in the nature of a progress report, but that it was expected that the new Finance Committee would report in greater detail with definite recommendations at a subsequent meeting.

The general secretary announced that the first meeting of the new Council would be held on Thursday, February 8th, in the same room, at two thirty p.m.

The Council rose at six o'clock p.m.

\* \* \*

A meeting of the Council of the Institute was held at the Royal Alexandra Hotel, Winnipeg, on Thursday, February 8th, 1945, convening at three o'clock p.m.

*Present*: President E. P. Fetherstonhaugh in the chair; Past-President deGaspé Beaubien; Vice-Presidents J. E. Armstrong, G. L. Dickson, C. E. Sisson and R. A. Spence; Councillors H. L. Briggs, C. W. Carry, R. S. Eadie, J. W. D. Farrell, R. C. Flitton, E. V. Gage, P. E. Gagnon, G. G. Henderson, W. H. M. Laughlin, Alex. Love, E. B. Martin, A. W. F. McQueen, J. M. Patton, P. M. Sauder, W. L. Saunders, C. Stenbol, E. O. Turner and J. A. Vance; Treasurer R. E. Chadwick; Past Vice-Presidents E. V. Caton, L. F. Grant and E. P. Muntz; Past-Councillors H. E. Brandon, A. Jackson, J. G. Hall, H. J. Ward and Stewart Young; S. H. deJong, secretary of the Toronto Branch; C. P. Haltalin, vice-chairman of the Winnipeg Branch; J. B. Stirling, chairman, and W. G. Swan, a member of the Committee on Professional Interests, and General Secretary L. Austin Wright.

On behalf of Council, Past-President Beaubien extended a welcome to the new president, Dean E. P. Fetherstonhaugh, and assured him that he would receive from councillors the same splendid support which made his term of office so pleasant.

*Appointment of General Secretary*: On the motion of Mr. Gage, seconded by Mr. Sauder, it was unanimously resolved that L. Austin Wright be re-appointed general secretary of the Institute.

*Appointment of Treasurer*: On the motion of Dean Spencer, seconded by Mr. Vance, it was unanimously resolved that R. E. Chadwick be re-appointed treasurer of the Institute.

*Appointment of Committees*: On the recommendation of the Striking Committee, and with the approval of the chairman in each case, it was unanimously resolved that the following committees whose list appears in front of this issue be appointed for the year 1945.

*Chairmen of Committees*—On the recommendation of the Striking Committee, it was unanimously resolved that the chairman of Institute committees for the year 1945 be appointed as shown in front of this issue, and that they be asked to submit the names of the other members of their committees for approval by Council at the March meeting.

*Committee on Deterioration of Concrete Structures*: Following a somewhat lengthy discussion, it was agreed that the constitution of this committee and the work which it could do to advantage at the present time, should be reviewed and the subject presented again at the next meeting of Council.

*Committee on the Young Engineer*: In view of the sudden death of Harry F. Bennett, the chairman of this committee, it was agreed that it should be left in the hands of the president to canvass the situation and select a new chairman.

*Committee on the Engineer in the Active Services:* Colonel Grant advised the meeting that Dean Ellis felt that there were great advantages in having the chairman of such a committee located either in Montreal or Ottawa. Following some discussion, it was decided to leave the appointment of this committee until the next meeting of Council.

*Committee on the Engineering Features of Civil Defence*—Mr. Armstrong, chairman of this committee since its formation in June 1942, recommended that in view of changed conditions this committee should now be dismissed. This was agreed to, and the thanks of Council were extended to Mr. Armstrong and his committee for the work which they had done.

*Vote of Thanks to the University of Manitoba:* Several councillors expressed their appreciation of the special convocation carried out by the University of Manitoba for the purpose of conferring an honorary degree of Doctor of Science upon the president of The Engineering Institute of Canada. It was agreed unanimously that this was a most gracious gesture of welcome and recognition, and Council desired to send appropriate thanks to the president of the University for what had been done.

Accordingly, it was moved by Dr. P. E. Gagnon, of Laval University, Quebec, seconded by Dr. E. O. Turner, of the University of New Brunswick, Fredericton, and carried unanimously,

THAT the Council of The Engineering Institute of Canada is appreciative of the honour which has been conferred by the University of Manitoba upon the president of the Institute, and, through him, upon the profession of engineering. It is grateful to the University, not only for conferring the honour, but for the beautiful and impressive manner in which the ceremony was conducted. This event was one of the most colourful, and pleasing that has ever taken place at an annual meeting of the Institute. It will mark this meeting of the Institute in the minds of those who were privileged to be present.

Council takes this opportunity to express its thanks to the Chancellor, the President, and the Dean of Engineering, who combined to make this outstanding event possible.

*Vote of Thanks to Retiring Councillors:* Vice-President Dickson commented on the efficient way in which the business of the Institute had been handled during the past very successful and busy year. This was due principally to the work of the president and the chairmen of his committees, some of whom are now retiring. He took great pleasure in moving a vote of thanks and appreciation to the retiring president, the retiring vice-presidents and the retiring councillors. In seconding the motion, which was carried unanimously, Dean Spencer remarked that as far as the members in the west are concerned, they appreciated more than ever before the work that has been done by the president and the Council.

*Vote of Thanks to the Winnipeg Branch:* Vice-President Armstrong stated that it had been his privilege to attend a number of annual meetings of the Institute, but he had been unusually impressed by the way in which this meeting had been handled by the Winnipeg Branch. It gave him great pleasure to move a hearty vote of thanks to the officers, members and ladies of the Winnipeg Branch for their warm welcome, many courtesies and gracious hospitality and for the admirable arrangements made throughout. This was seconded by Mr. Love and carried unanimously.

*Tribute to Dr. J. B. Challies:* Mr. Stirling asked Council to note particularly that in the selection of

chairmen of committees for 1945 his name had been substituted for Dr. Challies as chairman of the Committee on Professional Interests. He pointed out that Dr. Challies' resignation from this committee marked a milestone in the long and remarkable career of that gentleman in Institute work. He noted that Dr. Challies had started first as a member of a committee, then had worked through every office of the Institute with the exception of that of general secretary, culminating in his election as president in 1938. Shortly after his retirement from the presidency he had accepted the chairmanship of the Committee on Professional Interests, and under his skilful guidance branches in several provinces had been aided in developing co-operative agreements with provincial professional associations. The agreements in Saskatchewan, Nova Scotia, Alberta, New Brunswick and Quebec were largely the result of the excellent leadership given by Dr. Challies. Mr. Stirling felt that Dr. Challies' resignation of the chairmanship of the committee should not be allowed to pass without some fitting recognition from Council.

Mr. Vance added his word of praise and appreciation of the work done by Dr. Challies. He regretted that the membership at large would never be able to fully appreciate all that Dr. Challies had done for the Institute, but he agreed with Mr. Stirling that Council should record its appreciation in the minutes of this meeting, therefore he moved:

THAT the Council of the Institute, observing Dr. Challies' retirement from the chairmanship of the Committee on Professional Interests, desires to place on record an expression of its appreciation of the great work done by him for the Institute and the profession. Council appreciates particularly that Dr. Challies' interest and support has been sustained over a long period of time and has expressed itself in many forms of service. The expanding success of the Institute has been due entirely to the self-sacrificing interest of its members, and therefore Council is indebted to him to an unusual degree. Council hopes that the Institute may continue to enjoy his support in whatever capacity he may choose to serve, and that it may have the benefit of his counsel and advice in the future as it has had in the past.

This was seconded by Mr. Armstrong and carried unanimously.

*Resolution to the Mayor and Council of Winnipeg:* On the motion of Mr. Eadie, seconded by Mr. Dickson, it was unanimously resolved that the following resolution be transmitted to the Mayor and Council of the City of Winnipeg:

The Council of The Engineering Institute of Canada at its first meeting of 1945 desired to express to the Mayor and Council of the City of Winnipeg its appreciation of their kindness and hospitality as manifested by the complimentary banquet tendered at the Royal Alexandra Hotel on the evening of February 7th.

The Institute holds its annual meetings in many parts of Canada, but the support given by the City of Winnipeg has not been exceeded elsewhere. The banquet was an outstanding feature of the programme and every one of the five hundred and fifty members and guests is greatly indebted to the city officials. Council agrees readily with the suggestion made by His Honour Mayor Garnet Coulter, and therefore looks forward to the privilege and pleasure of returning to this hospitable community within the not too distant future.

*Vote of Thanks to Industrial Organizations:* On the

motion of Mr. Sauder, seconded by Mr. Vance, it was unanimously resolved that the following resolution should be transmitted to the various industrial organizations who had co-operated with the Winnipeg Branch in promoting the social features of the programme:

Council desires to express its appreciation to the group of industries that has so generously assisted with the social features of the programme of the Fifty-Ninth Annual General Professional Meeting of The Engineering Institute of Canada.

This support and co-operation has assisted materially in making this one of the most outstanding annual meetings in the history of the Institute.

Council expresses the hope that the heavy programme of professional papers in combination with the social events will make a genuine contribution to the advancement of the profession both in Winnipeg and in the rest of Canada, and therefore to the industries themselves.

*Vote of Thanks to Speakers and Authors:* On the motion of Mr. Farrell, seconded by Mr. Laughlin, it was unanimously resolved that a hearty vote of thanks and appreciation be extended to the various speakers and authors who had contributed so much towards the outstanding success of the technical sessions and other functions.

*Thanks to the Hotel Staff and Management:* On the motion of Mr. Stenbol, seconded by Mr. Flitton, it was unanimously resolved that a message of thanks and appreciation be sent to the management and staff of the hotel for the excellent arrangements which had been made for the accommodation of the guests. Never had the Institute received better service or better food, which had contributed in no small measure towards the outstanding success of the meeting.

It was decided that the next meeting of Council would be held in Montreal on Saturday, March 17th, on which date it was expected the president could be present.

The Council rose at five o'clock p.m.

## ELECTIONS AND TRANSFERS

A number of applications were considered and the following elections and transfers were effected:

### Members

- Ball, J. Stewart, B.A.Sc.** (Univ. of Toronto), mech. & mtce. engr., Shell Oil Refinery, Montreal East, Que.
- Bohraus, Werner, Elec. Engr.** (Swiss Federal Inst. of Tech., Zurich), designing elec. engr., Ontario Paper Co. Ltd., Thorold, Ont.
- Eon, Louis Guy, Lieut. Colonel** (Quebec Tech. School), Cdn. Army Operational Research Group, Cartier St. School, Ottawa, Ont.
- Gussow, William Carruthers, B.Sc. & M.Sc.** (Queen's Univ.), Ph.D. (M.I.T.), res. engr., Aluminum Co. of Canada Ltd., Arvida, Que.
- Murray, Ralph Mills, Major, R.C.E.** (Univ. of N.B.), engr., design section, Directorate of Wks. & Constrn., N.D.H.Q., Ottawa, Ont.
- Raidel, Isaac Samuel, B.Sc. (Civil),** (Univ. of Man.), personnel training engr. & engr. consultant, MacDonald Bros. Aircraft Ltd., Winnipeg, Man.
- Robillard, Louis Alfred, B.Sc.** (Univ. of Mich.), genl. master mech., Shawinigan Chemicals Ltd., Shawinigan Falls, Que.
- Rodwin, Stefan, Mech. Engr.** (Univ. of Dantzig), chief engr., aircraft divn., Canadian Car & Foundry Co., Montreal.
- Stacey, Leonard Brown, B.A.Sc. (Elec.),** (Univ. of B.C.), dist. mgr., Packard Elec. Co. Ltd., Vancouver, B.C.
- Trueman, James Cobden, B.Sc. & M.Sc.** (McGill Univ.), chief designing engr., Dominion Bridge Co., Winnipeg, Man.

### Juniors

- Anderson, Thomas Tulloch, B.A.Sc. (Chem. Eng.),** (Univ. of B.C.), asst. supervisor, hydrate dept., Bayer ore plant, Aluminum Co. of Canada, Arvida, Que.

- Barber-Starkey, Joseph William Mainguy, Lieut. (E) R.C.N.,** (Royal Naval Engrg. Coll., Devonport), R.R. 1, Sidney, B.C.
- Stann, Daniel Alexander, Elect. Lieut., R.C.N.V.R., B.Sc. (Elec.),** (Univ. of Man.), on Cdn. cruiser overseas.

### Affiliate

- Kelly, Ernest A., mgr.,** Sault Structural Steel Co. Ltd., Sault Ste. Marie, Ont.

### Transferred from the class of Junior to that of Member

- Langston, John Francis, B.Sc. (Civil),** (Univ. of Alta.), petroleum engr., General Petroleums Ltd., Calgary, Alta.
- Pope, Francis Robert, B.Eng. (Mech.),** (McGill Univ.), asst. supt., Western Clock Co. Ltd., Peterborough, Ont.

### Transferred from the class of Student to that of Member

- Dupuy, Harry Edward Glen, B.Eng. (Mech.),** (McGill Univ.), mgr., Babcock-Wilcox & Goldie-McCulloch, Ltd., Winnipeg, Man.
- Mason, George Anthony Ritchie, B.Sc. (Elec.),** (Univ. of Alta.), Central Alberta Sanatorium, Calgary, Alta.
- Pepall, James Edward, B.A.Sc. (Chem.),** (Univ. of Toronto), asst. alumina plant supt., Aluminum Co. of Canada, Arvida, Que.

### Transferred from the class of Student to that of Junior

- Baxter, John Frederick, B.Eng. (McGill Univ.),** junior engineer, Barranca refinery, International Petroleum Co. Ltd., Barranca-Bermeja, Colombia, S.A.
- Bishop, Percival William, B.Sc. (Civil),** (Univ. of N.B.), transitman, C.P.R., Oliver, B.C.
- Brett, John Edward, B.Eng. (McGill Univ.),** consulting engr., 4180 Melrose Ave., Montreal.
- Findlay, Allan Cameron, F/O, R.C.A.F., B.Eng. (McGill Univ.),** Engr. Officer, Aircraft Mtce., R.C.A.F., Sidney, B.C.
- Smith, Robert Lovelace, B.Sc. (Elec.),** (Univ. of Man.), mfg. engr., Northern Electric Co. Ltd., Montreal.
- Stopp, Frank Sidney, B.Eng. (Mech.),** (McGill Univ.), engr., Longueuil plant, Dominion Engineering Works, Ltd., Montreal, Que.
- Strachan, Jack Lyon, B.Sc. (Elec.),** (Univ. of Man.), engr., Defence Industries, Ltd., Montreal, Que.
- Valiquette, Pierre Francis, B.A.Sc., C.E. (Ecole Polytechnique),** business agent, Shawinigan Water & Power Co. Ltd., Montreal, Que.

### Admitted as Students

- Church, James Walter** (Queen's Univ.), 556 Johnson St., Kingston, Ont.
- Fead, John William Norman, 10835-86th Ave.,** Edmonton, Alta.
- Garland, Hedley Robert, (Nova Scotia Tech. Coll.),** 319 Spring Garden Road, Halifax, N.S.
- Goodwin, Martin Jerome, (McGill Univ.),** 3515 Durocher St., Montreal.
- Holyoke, Donald Ralph, (Univ. of N.B.),** 323 St. John St., Fredericton, N.B.
- Jones, Owen James, (Univ. of Alta.),** Coleman, Alta.
- Lantz, Gerald Gordon, B.Sc. (Elec.),** (N.S. Tech. Coll.), Fairview, N.S.
- Meurling, Alric Fritiof, (Univ. of N.B.),** Marysville, N.B.
- Nelson, Leslie William, (Univ. of Alta.),** 11153-Sask. Drive, Edmonton, Alta.
- Roshko, Anatol, (Univ. of Alta.),** 11135-84th Ave., Edmonton, Alta.
- Winterbourne, John Anderson, B.Sc. (Elec.),** 60 Cambridge St., Halifax, N.S.

### Students at the University of Manitoba

- Kato, Yoichi, 149 Claremont Ave.,** Winnipeg, Man.
- Klassen, Harold, 165 Cathedral Ave.,** Winnipeg, Man.
- McLean, Donald Hugh, 221 Marion St.,** Norwood, Man.
- Nunn, Edwin Charles, 109 Lansdowne Ave.,** Winnipeg, Man.
- Oldfield, Allan Norman, 819 Ingersoll St.,** Winnipeg, Man.
- Ostevik, Sigurd Torleif, 429 Furby St.,** Winnipeg, Man.
- Phillips, Herbert Frederick, 88 Imperial Ave.,** St. Vital, Man.
- Shabaga, William, 859 Bannatyne Ave.,** Winnipeg, Man.
- Zaharuk, Peter, 73 Furby St.,** Winnipeg, Man.

# Personals

Relatives and friends of members in the active forces are invited to inform the Institute of news items, such as locations, promotions, transfers, etc., which would be of interest to other members of the Institute and which should be entered on the member's personal record kept at Headquarters. These would form a basis of personal items in the *Journal*.

**Dr. C. B. Thorne**, M.E.I.C., vice-president and technical director of Canadian International Paper Company, has retired from active direction of the bleached sulphite operations of the company's mills at Hawkesbury, Ont., and Temiskaming, Que., after continuous service of more than 40 years with the company and its predecessors. He had joined the old Riordon Paper Company in 1903 soon after his arrival in America from Norway.

Dr. Thorne enjoys an international reputation and is distinguished in the fields of research and invention as well as mill operation. In 1934 he was invested by King Haakon of Norway with the rank of Knight Commander of the St. Olav Order. In 1938 the Technical Association of the Pulp and Paper Industry of the United States awarded him its gold medal, its highest mark of merit, in recognition of the part he played in the formation of the Association and his contributions to the science of pulp manufacture.

Dr. Thorne will still reside in Hawkesbury where he expects to devote himself to research in his chosen field of cellulose chemistry and its industrial applications. He will remain a vice-president of the company.

**E. R. Jacobsen**, M.E.I.C., assistant director general of the Commonwealth of Australia War Supplies Procurement, has recently been elected to membership in the American Branch of the Newcomen Society of England.

**L. E. Mitchell**, M.E.I.C., is the newly elected chairman of the Halifax Branch of the Institute. He graduated from Mount Allison University in 1930 with a B.A. degree and from the Nova Scotia Technical College in 1932 with a B.Sc. in mechanical engineering. He joined the staff of the Halifax refinery of the Imperial Oil Limited on graduation and has been in the employ of this company and its South American subsidiaries ever since. Mr. Mitchell served for a period of six years with the International Petroleum Co. Ltd. in Peru and the Tropical Oil Company in Colombia and is at present chief engineer of the Halifax refinery.

**H. L. Clifford**, M.E.I.C., who has been with the Quebec Shipyards Ltd. at Quebec as general manager for the past year, has returned to his position of general superintendent with Dufresne Engineering Company Limited, Montreal.

**Alan K. Hay**, M.E.I.C., has recently resigned his position as engineer to the Ottawa Suburban Roads Commission to accept an appointment as superintendent of the Federal District Commission.

**D. D. Whitson**, M.E.I.C., has recently returned to his former position in the City of Toronto, Department of Buildings, after serving as chief structural engineer for the Works and Buildings Branch, Naval Service, Department of National Defence, Ottawa.

**W. E. Seely**, M.E.I.C., is at present employed by Noorduyn Aviation Ltd., Montreal, as engineering change co-ordinator. He was formerly serving as a flying officer in the Royal Canadian Air Force.

## News of the Personal Activities of members of the Institute

W. A. Newman, M.B.E., M.E.I.C.

**W. A. Newman**, M.B.E., M.E.I.C., formerly chief mechanical engineer of the Canadian Pacific Railway, has been named head of the new department of research set up by the railway recently. The new department will delve into all matters of railway operation and will concern itself with the elimination of waste of both effort and material and the development and improvement of facilities and service in the post-war period.

**J. L. Bieler**, M.E.I.C., has been appointed Director of the Industrial and Engineering Development Division of Robert A. Rankin and Company, consulting industrial and chemical engineers, Montreal. This new Division will direct the company's efforts in the establishment and rehabilitation of industry, with respect to placement, construction, and effective development.

Mr. Bieler graduated from McGill University in mechanical engineering in 1923 and became associated with the Bailey Meter Co. of Cleveland, Ohio, working in both Cleveland and Montreal until 1925. In the following year he joined the staff of Industrial Combustion Engineers in London, England, eventually becoming chief engineer of the company. In 1928 he returned to Canada, joined the engineering staff of Dominion Oilcloth and Linoleum Co., Montreal, and later became chief engineer. In August 1940 he was named chief of the Fuse Division in the Ammunition Production Branch, Department of Munitions and Supply, Ottawa. From June 1943 until his present appointment he was in the engineering department at Williams and Wilson Ltd., Montreal, dealing with new developments, and pulp, paper and hydraulic equipment.

**Euclide Paré**, M.E.I.C., has recently been appointed chief engineer of the hydraulic branch of the Department of Lands and Forests of the Province of Quebec at Quebec. A graduate of the Ecole Polytechnique in the class of 1931, he joined the Department in 1936.

**A. G. MacKay**, M.E.I.C., is at present employed by the Nova Scotia Construction Company at Halifax. He was formerly superintendent of Anglin-Norcross Limited at Halifax.

**C. K. S. Macdonell**, M.E.I.C., of the Ontario Department of Highways, has been transferred from Huntsville to Sudbury.

**J. P. Fraser**, M.E.I.C., has been appointed assistant chief engineer of the British Columbia Electric Railway Company of Vancouver. He was with the Manitoba Power Commission until 1940 when he left to take the position of superintendent of generating plants with the British Columbia Electric Railway Company. In 1943 he was made superintendent of the operating division in charge of generating stations and substations, which position he held until his recent promotion.

**W. R. Way**, M.E.I.C., formerly assistant general super-

**Harry G. Stead**, M.E.I.C., is the newly elected chairman of the London Branch of the Institute. Born at Wilton Grove, Ont., he received his education at London Central Collegiate and London Technical School. In 1923 he entered the employ of E. Leonard & Sons Limited in London, Ont., as an apprentice draftsman and four years later was made mechanical draftsman. He worked as chief draftsman with the firm from 1931 until 1938 when he was promoted to chief engineer, in charge of design estimates and all engineering work. He is now president and chief engineer of the recently re-organized company.

Mr. Stead joined the Institute as a Junior in 1938, transferring to Member in 1943.

J. P. Fraser, M.E.I.C.

W. R. Way, M.E.I.C.

Harry G. Stead, M.E.I.C.

intendent of the operating department of the Shawinigan Water & Power Company, has been promoted to the position of general superintendent, filling the vacancy caused by the retirement of C. R. Reid, M.E.I.C.

**Lt.-Col. H. L. Sherwood**, M.E.I.C., formerly district engineer officer for Military District No. 11, Victoria, B.C., has been re-elected chairman of the Victoria Branch of the Institute. Graduating from the Royal Military College in 1903, he was employed with the construction department of the Canadian Pacific Railway until 1914 when he went overseas with the Canadian Railway Construction Corps. In 1917 he was promoted to major. From 1919 until 1923 he was on the staff of the Department of National Defence Headquarters, Ottawa, as a permanent force officer of the Royal Canadian Engineers. During the next six years he served as district engineer officer, M.D. 3, Kingston, Ont., and from 1929 until 1936 occupied the same position in M.D. 10 at Winnipeg, Man. He was then transferred to M.D. 11, Victoria, where he served in the same capacity until his retirement in 1941. He was promoted to lieutenant-colonel in 1939.

Col. Sherwood joined the Institute as a Student in 1903, transferring to Associate Member in 1907. In 1941 he became a Life Member of the Institute.

**F. C. Morrison**, M.E.I.C., is at present in Montreal with the Dominion Steel and Coal Corporation Ltd. He was previously with the Dominion Coal Company Ltd., a subsidiary, at Halifax, N.S.

**Jacques Limoges**, M.E.I.C., formerly district engineer with the Department of Highways at Quebec, is at present with La Société d'Entreprises Générales, Ltée, at Amos, Que.

**John Leabourne Shearer**, M.E.I.C., has been appointed engineer to the Ottawa Suburban Roads Commission. He is a graduate of Queen's University and has had extensive experience in various branches of civil engineering including highways, bridge construction, drainage, sewerage, and water supply. From 1928 until 1933 he held various positions in western Canada and on the Pacific coast in connection with municipal engineering construction work of various types.

In 1934 he returned to Ottawa and was for two years in charge of construction of large relief sewers being built by the City of Ottawa under the engineering department. Following this he was employed by N. B. MacRostie, civil engineer, Ottawa, in drawing up reports on certain flood conditions in southern Ontario. After a short interval with Donald-Hunt Ltd., Montreal, and with the Aluminum Company of Canada Limited, Arvida, Que., he was for two years on the staff of the Ottawa Division of the Ontario Department of Highways. More recently he has been employed in the assessment department of the City of Ottawa.

**Norman Marr**, M.E.I.C., is the chairman of the Ottawa Branch of the Institute for the present year. Born at Walkerton, Ont., he graduated from the University of Toronto with the degree of B.A.Sc. in 1912. In 1922 he was the recipient of the degree of C.E. from the same institution. After graduation he was employed as assistant engineer with Messrs. C. H. and P. H. Mitchell, consulting engineers on construction of La Colle Falls hydro-electric development for the City of Prince Albert, Sask. From 1913 until 1918 he was assistant engineer with the Department of Railways and Canals in charge of construction of sections of the Trent Canal. For the next eight years he was with the Domin-

ion Water Power and Reclamation Service, Department of the Interior, Ottawa, as senior hydraulic engineer. He later became chief hydraulic engineer of the Dominion Water and Power Bureau in the Department of Mines and Resources at Ottawa. In 1941 he was appointed assistant controller.

Mr. Marr joined the Institute as a Student in 1909, transferring to Junior two years later. In 1916 he became an Associate Member and in 1928 transferred to Member.

**L. P. Cousineau**, M.E.I.C., has recently returned to the Dufresne Engineering Company Ltd., Montreal, and is at present assistant superintendent on the construction of the highway bridge at Ste. Rose, Que. He had been on loan to Quebec Shipyards Limited at Quebec for the past year.

**J. D. Fraser**, M.E.I.C., who has been with the Acadia Sugar Refining Company Limited at Dartmouth, N.S., is now employed by Moirs Limited at Halifax, N.S.

**Norman A. Eager**, M.E.I.C., is the chairman of the Hamilton Branch of the Institute for the present year. Born at Montreal, Que., he received his education at McGill University where he obtained the degree of B.Sc. in 1922 and at Cornell University where he received his M.C.E. the following year. Upon graduation he went with the Illinois State Highways as resident engineer and a year later was with the Canadian Vickers Limited in Montreal. He then became superintendent of construction with Church & Ross Company, contractors of Montreal. In 1926 he joined the Shawinigan Water & Power Company where he was engaged in structural engineering and later in power sales research work. In 1940 he went with the Burlington Steel Company, Hamilton, Ont., as assistant sales manager. Last year he was promoted to sales manager which position he now holds.

Mr. Eager joined the Institute as a Junior in 1925, transferring to Associate Member in 1934 and becoming a Member in 1940.

**Elzear N. Gougeon**, M.E.I.C., who was formerly employed by Quebec Shipyards Ltd. at Quebec is now with the Dominion Containers Ltd., Montreal, as production engineer.

**Major H. L. Hurdle**, O.B.E., Jr.E.I.C., has recently returned from overseas to attend a six months' staff course at the Royal Military College at Kingston, Ont.

**George Ross**, Jr.E.I.C., has taken a position in the sales and contract department of the Hamilton Bridge Company at Hamilton, Ont. He was formerly a squadron leader in the R.C.A.F. and has received the King's commendation for valuable services in the air.

**F/O Marcel Papineau**, Jr.E.I.C., has recently returned to Canada after completing his first tour of operations in England as a navigator.

**Raymond A. Frigon**, Jr.E.I.C., lecturer in mechanics of materials at Ecole Polytechnique, Montreal, has been made assistant engineer, Diesel Engine Division, Dominion Engineering Works Ltd. at Lachine, Que. Mr. Frigon is chairman of the Junior Section, Montreal Branch of the Institute, for the present year.

**G. K. Narsted**, Jr.E.I.C., who has been with the Aluminum Company of Canada Limited at La Tuque, Que., has been transferred to Aluminum Goods Limited at Toronto, Ont.

**S. D. Foote**, Jr.E.I.C., of the British American Oil Company Limited, has been transferred from Toronto to the Calgary refinery as resident engineer.

**F. S. Bestwick**, S.E.I.C., is at present employed by the English Electric Company of Canada, Limited, at St. Catharines, Ont.

**Wm. K. Champion**, S.E.I.C., has enlisted in the R.C.-E.M.E. and is in training at Barriefield, Ont. He graduated from Queen's University with a B.Sc. in 1944.

**T. A. Miller**, S.E.I.C., is now employed as an engineer with the Trans-Canada Airlines at Winnipeg, Man.

## Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**Harry Frederick Bennett, M.E.I.C.**

1888—1945

*"That life is long which answers life's great end"*

The engineer's training and daily work is usually of a character which encourages and develops in those who successfully follow the calling, a number of admirable qualities. Among these are sincerity, avoidance of pretence, a striving for excellence, consideration for the needs of others, and a desire to render service to fellow members of the profession and to the public.

By the unexpected death of Harry Frederick Bennett in London, Ontario, on the last day of January, 1945, the Institute has lost a prominent member whose life and career exemplified the truth of these observations. As a citizen, as a public servant, and in all his professional work, he gained wide esteem. He was greatly concerned with problems affecting the entry of the young engineer into the profession, the rehabilitation of returned men, and their future in engineering work. He had been active in furthering the Institute's discussions of these matters, and his efforts, with those of the committees over which he presided, had already yielded valuable results. It will not be easy to find an equally effective leader to take his place.

One of the Institute's most ambitious undertakings was the provision, through a wide-spread committee, of advice and counsel to high school students and their parents to the end that the youth of Canada might be assisted in choosing that vocation which most nearly

suiting its talents. From the beginning in February 1939, the committee has been under the chairmanship of Harry Bennett.

One of the principal accomplishments of the committee has been the preparation of a booklet "The Profession of Engineering in Canada", used as the basis for all preliminary counselling. This has been so well received that it has gone into a second edition and has been translated into French. It is now used by the Canadian Legion Educational Services and has been supplied in large numbers to the R.C.A.F., to be used in advising young men in advance of demobilization. It has gone to the principal of every high school in Canada, and over 25,000 copies have been distributed. This booklet is an achievement of Harry Bennett. It is a sign of his interest in young men and of his desire for a high status for the profession. It is an example of his industry, his foresight and his intelligence.

Harry Frederick Bennett was born at Saint John, N.B., in 1888. He graduated from the University of New Brunswick, in civil engineering, in 1908; in the same year he joined the staff of the Public Works Department of Canada at Saint John.

During the earlier years of World War I he served in the 9th Siege Battery, Canadian Artillery, in Saint John, later reverting from the rank of captain to that of lieutenant in order to go overseas with the 48th Howitzer Battery, Canadian Artillery.

After the war he returned to his position in Saint John. In 1924 he was appointed senior assistant engineer, being transferred to the Halifax district, where he remained until his promotion in 1930 to become district engineer at Sault Ste. Marie, Ont. In 1936 he was promoted to the position of district engineer of the more important district of London, Ontario, which he occupied until his death. This district extends from Port Colborne along the north shore of Lake Erie, along the Detroit river, Lake St. Clair, Lake Huron to Tobermory and down to Wiarton. He was in charge of the harbour development throughout this wide area, for which he had prepared extensive post-war plans.

Having joined The Engineering Institute of Canada as a Student in 1907, he became a Junior in 1914, an Associate Member in 1920, and a Member in 1935. He served as chairman of the respective Institute branches while at Saint John, Sault Ste. Marie and London, was a member of Council for several terms, and at the time of his death had just completed his sixth annual report as chairman of the Institute Committee on the Training and Welfare of the Young Engineer. He had recently been appointed chairman of a joint committee, known as The Canadian Committee for Student Guidance in Science and Engineering, on which there sit representatives of The Engineering Institute of Canada, the Canadian Institute of Mining and Metallurgy, and the Chemical Institute of Canada.

In addition to the many duties in connection with his professional work, he found time to write on technical subjects, and to enter effectively into the community life of the city where he lived. He was a director of the London Canadian Club, a past-president of the Current Topic Club, an active officer of the Metropolitan United Church, and regional coordinator for the London District during each of the last five Victory Loan campaigns.

Of sterling worth as a citizen and an engineer, the record of his life speaks for itself.

R.J.D.

**James Williams Tyrrell, M.E.I.C.**, died at his home in Bartonville, Ont., on January 16th, 1945. Born at

Weston, Ont., on May 10th, 1863, he received his preliminary education in the Weston schools and later attended the School of Practical Science, University of Toronto, graduating with a C.E. degree in 1889. He was subsequently made a Dominion Land Surveyor. Mr. Tyrrell engaged in private practice as a civil engineer and land surveyor in Hamilton, Ont., and in 1892 was appointed county engineer for Wentworth. He was in charge of several construction projects and engaged in the location of railways.

As a surveyor for the federal government Mr. Tyrrell had been in almost every part of Canada and had explored or surveyed as far as the Arctic Ocean. In 1893, under the auspices of the Canadian Geographical Survey, a department of the government, he and his brother explored the unknown barren lands of the northwest, situated west of Hudson Bay and north of the Saskatchewan river. In the following year he published a book "Across the Sub-Arctics of Canada" describing his experiences on the 3,200-mile trip by canoe and snowshoe. He had a wide knowledge of the people inhabiting the most northerly regions in Canada and of their customs and had occasionally lived several weeks among the Eskimos, whose language he spoke. His reports furnished valuable statistics to the government and his work in mapping out these northern tracts of land has proved of great worth.

Mr. Tyrrell lived for two years on Big Island in Hudson Strait and also surveyed the harbours of Labrador, the region around Great Slave lake and the mining area of northern Ontario. He was one of the first to stake out a claim in the Red Lake district which later proved to be one of the richest mining areas in the Dominion. He was president of the Tyrrell Red Lake Mines and until recently had been in charge of a mine in the Kirkland Lake area of which his brother was president. He was one of the pioneers in developing the Lake of Bays district in Muskoka as a mecca for summer residents.

Mr. Tyrrell had joined the Institute in 1896 as a Member becoming a Life Member in 1932.

**Major Duncan Seward Morrison, M.E.I.C.**, died at his home in Sydney, N.S., on December 12th, 1944. Born at Catalone, Cape Breton, on February 3rd, 1878, he received his education at Sydney Academy. Prior to graduating he enlisted and went to South Africa during the Boer War. He was invalided home towards the end of the campaign and on recovery joined the survey staff of the Dominion Coal Company. He remained with that company for 43 years. He took advantage of the early Government Mining Schools set up in the Nova Scotia coal fields, receiving one of the first mine manager's certificates issued by the province under their revised Mining Act.

With the Dominion Coal Company, Major Morrison became chief mine surveyor, field engineer, and assistant to both resident and mining engineers. During the first World War he was commissioned a captain and instructed to raise a field company of engineers. Qualifying for his majority in 1935 he organized the 9th Field Company at Glace Bay, which unit was among the first to be called in September, 1939. On loan from the company he was town engineer for the Town of Waterford while the sewer system and pavement were being installed and continued to act as consulting engineer for them up to the time of his death.

Major Morrison became a Member of the Institute in 1940.

# NEWLY ELECTED OFFICERS OF THE INSTITUTE

**J. E. Armstrong**, M.E.I.C., chief engineer of the Canadian Pacific Railway, Montreal, has been elected vice-president of the Institute for the province of Quebec. Born in Peoria, Ill., he graduated from Cornell University in 1908 and from that date until 1912 was assistant on the engineer corps of the Cleveland and Pittsburgh Division of the Pennsylvania Company at Cleveland, Ohio. In 1912 he joined the staff of the Canadian Pacific Railway at Montreal as an engineer and in 1928 became assistant chief engineer of the company. In 1938 he was appointed chief engineer. He has been engaged on many important works including the Quebec joint terminals, the waterfront development at Saint John, railway revision during the war, and the construction of the Toronto viaduct from 1924 until 1930.

J. E. Armstrong, M.E.I.C.

C. E. Sisson, M.E.I.C.

R. A. Spencer, M.E.I.C.

In 1927 Mr. Armstrong was a director in the American Railway Engineering Association and in the following year became second vice-president. In 1934 he was appointed president and with election to this office he automatically became chairman of the engineering division of the American Railway Association. In 1940 he was president of the Canadian Railway Club.

Mr. Armstrong joined the Institute as an Associate Member in 1917 becoming a Member in 1940. In 1942 he was elected a councillor of the Institute. He has served on the Finance Committee for the past six years, and is now the chairman.

**C. E. Sisson**, M.E.I.C., managing engineer at the Davenport Works of the Canadian General Electric Company in Toronto, is the newly elected vice-president of the Institute for the province of Ontario. Born at Cavan, Ont., he received his secondary education at Peterborough and taught school for a time, after which he joined the testing staff of the Canadian General Electric Company at Peterborough in 1901. He then took the electrical engineering course at the University of Toronto and graduated in 1905. After graduation he returned to the engineering staff of the C.G.E. at Peterborough with which company he has been continuously associated. In 1921 he moved to the Davenport Works, Toronto, where he assumed responsibility as works engineer. He was later promoted to the position which he now holds.

Mr. Sisson has been chiefly interested in transformers and has witnessed the development of this line of appar-

atus from its early stages of small units to the production of the largest and most complicated ratings built anywhere. He has been interested in the planning and development of the company's educational programme for the young engineer.

Mr. Sisson joined the Institute as a Member in 1919. He was chairman of the Toronto Branch in 1940 and councillor of the Institute in 1941-42.

**R. A. Spencer**, M.E.I.C., Dean of Engineering, University of Saskatchewan, has been elected vice-president of the Institute representing the western provinces. Born at Port Morien, N.S., he graduated from McGill University with the degrees of B.Sc. in 1914 and M.Sc. in 1915. After some early engineering experience with

Dominion Coal Company and Canadian Pacific Railway he spent more than three years overseas with the 1st Canadian Tunnelling Company and 7th Battalion Canadian Engineers. He held the rank of major and was awarded the Military Cross and Bar. At the end of the war he studied at University College, London, and London School of Economics and on his return was appointed professor of engineering at Dalhousie University, Halifax. In 1920 he worked as resident engineer with the St. Margaret's Bay Water Power Development and in the following year was appointed assistant professor of civil engineering at the University of Saskatchewan. In 1924-25 he was granted leave of absence to work with the Foundation Company of Canada.

From 1925 to the present time he has been professor of civil engineering at the University of Saskatchewan, Saskatoon, and has also carried on an extensive consulting practice. Last October he was appointed Dean of the College of Engineering.

Dean Spencer joined the Institute as a Student in 1907, transferring to Junior in 1913, to Associate Member in 1919, and becoming a Member in 1940. He was councillor of the Institute in 1937-38 and at that time served as chairman of the Committee on Membership and Management. From 1939 to 1944 he was chairman of the Board of Examiners and Education.

**John N. Finlayson**, M.E.I.C., is the newly elected councillor of the Institute representing the Vancouver Branch. Born in Merigomish, N.S., he graduated from McGill University with the degree of B.Sc. in 1908

J. N. Finlayson, M.E.I.C.

C. W. Carry, M.E.I.C.

J. McD. Patton, M.E.I.C.

and M.Sc. in 1909. He received the degree of LL.D. from the University of Manitoba in 1940. From 1908 until 1911 he was a lecturer in mathematics at McGill University and in 1910-1913 was with the firm of Waddell and Harrington, consulting engineers of Kansas City and Vancouver, as detailer, inspector and resident engineer on the erection of bridges, including 19 steel bridges for the Canadian Northern Railway between Vancouver and Kamloops. From 1913 until 1919 he was professor of civil engineering at Dalhousie University, Halifax, and at the same time carried on a private practice as consulting engineer, specializing in the design of steel and reinforced concrete structures and in arbitrations. He was professor of civil engineering at the University of Manitoba from 1919 until 1936 when he was appointed dean of the faculty of applied science and head of the department of civil engineering at the University of British Columbia, Vancouver.

Dean Finlayson joined the Institute as a Student in 1908, transferring to Associate Member in 1912 and to Member in 1919. He has served as chairman of the Winnipeg Branch.

**Charles W. Carry, M.E.I.C.**, has been elected councillor of the Institute representing the Edmonton Branch. Born in Winnipeg, Man., he graduated from the University of Manitoba with the degree B.Sc. (C.E.) in 1926 and M.Sc. (C.E.) in 1929. During his university years he had engineering experience with the Canadian Pacific Railway Construction and Maintenance of Way Departments. In 1926-27 he was lecturer in the department of civil engineering at the University of Manitoba. Mr. Carry joined the Dominion Bridge Company Limited at Winnipeg in 1927 and except for one short interval has remained in that organization since that time. From 1927 until 1932 he was at the Winnipeg plant as draftsman, designer, assistant to contract engineer, and plant engineer respectively. He was then moved to Manitoba Bridge and Iron Works Limited where he remained until 1935 on plant appraisal, estimating and sales. In 1936 he moved to Riverside Iron Works, Calgary, on engineering and sales. Two years later he transferred to the Standard Iron Works Limited at Edmonton where he is at present located as engineer on design and sales.

Mr. Carry joined the Institute as an Associate Member in 1939 becoming a Member the following year.

**J. McD. Patton, M.E.I.C.**, is the newly elected councillor of the Institute representing the Saskatchewan Branch. During 1912-13 he was employed as superintendent

of waterworks for the City of Regina. For the next three years he served as chief engineer for the Saskatchewan Water Commission reporting on the feasibility of diverting water from the Saskatchewan River to serve Regina, Moose Jaw and district. In 1916 he became assistant bridge engineer of the Department of Highways and Transportation and has remained with the department until the present time. Rapid expansion of the highway system has involved the design and construction of many new bridges and railway separation projects.

Mr. Patton's interest in the Institute started in 1917 when he became an Associate Member at the time of the establishment of the Saskatchewan Branch of the Canadian Society of Civil Engineers and has been sustained since that time. He transferred to a Member of the Institute in 1936. In 1937 he was vice-chairman of the Saskatchewan Branch at the time of the negotiations for a co-operative agreement with the Association of Professional Engineers of Saskatchewan. In 1940-42 he served as councillor on the combined executive of Saskatchewan Branch and the Association. In 1943-44 he was vice-chairman of the Saskatchewan Branch of the Institute and vice-president of the Association of Professional Engineers of Saskatchewan. For the current year he is serving as chairman and president respectively of the two organizations.

**J. W. D. Farrell, M.E.I.C.**, superintendent of water works for the City of Regina, Sask., has been re-appointed to the Council of the Institute representing the Association of Professional Engineers of Saskatchewan. Born at Smith's Falls, Ont., he received his education at the Moose Jaw Collegiate Institute and at Queen's University from which he graduated with his B.A. in 1912 and his B.Sc. in 1915. During the first world war he served with the Royal Canadian Engineers and with the Royal Flying Corps and the Royal Air Force. On his return to civilian life he entered the Department of Irrigation in Calgary as draftsman and in 1920 was made assistant superintendent of water works for the City of Regina. Four years later he was promoted to superintendent which position he holds at the present time. During the present war he served for a time as a major in the R.C.E.T.C. when he was stationed at Chilliwack, B.C., but he has now returned to his civilian occupation.

Major Farrell joined the Institute as a Junior in 1920, transferring to an Associate Member the following year and to a Member in 1935.

R. B. Chandler, M.E.I.C.

J. A. Vance, M.E.I.C.

W. H. M. Laughlin, M.E.I.C.

**R. B. Chandler**, M.E.I.C., general manager of the Public Utilities Commission of Port Arthur, has been elected councillor for the Institute representing the Lakehead Branch. Born at Stratford, Ont., he graduated from the University of Toronto as a B.A.Sc. in 1912. Upon graduation he went to Saskatoon as assistant city engineer. From 1914 until 1916 he was resident engineer with the Board of Grain Commissioners for Canada at Saskatoon and Calgary. He joined the staff of C. D. Howe & Company at Port Arthur in 1916 and was employed as a designing and supervising engineer until 1923 when he became a partner in the firm. He left the firm in 1933 and for two years was in private practice as a consulting engineer. In 1935 he was appointed general manager of the Public Utilities Commission of Port Arthur. Mr. Chandler has acted as consulting engineer on construction of important industrial plants including terminal grain elevators, warehouses and docks. In 1930 he made an investigation of grain handling facilities in Argentina.

Mr. Chandler joined the Institute as an Associate Member in 1917 transferring to Member in 1923. He has served as chairman of the Lakehead Branch.

**G. G. Henderson**, M.E.I.C., is the newly elected councillor of the Institute representing the Border Cities Branch. Born in Midland, Ont., he graduated from the University of Toronto in 1924 with the degree of B.A.Sc. in civil engineering. After graduation he entered the employ of the Canadian Bridge Company at Walkerville, Ont., and has been connected with the firm since that time. In 1939 he was made contracting engineer and in 1941 was appointed assistant general manager of the company.

Mr. Henderson joined the Institute as a Member in 1939. In 1942 he was elected vice-chairman and the following year chairman of the Border Cities Branch.

**J. A. Vance**, M.E.I.C., engineer and contractor of Woodstock, Ont., has been re-elected councillor of the Institute representing the London Branch. Born in the County of Oxford, Ont., he was educated at the University of Toronto. On the death of his father in 1914 he took over the contracting business and became responsible for the administration, engineering and construction of steel and concrete highway bridges. He is now the proprietor and engineer of the firm of J. A. Vance, contractor, at Woodstock. The business has grown to include the design and construction of factory buildings, sewers, dams and various concrete and steel structures.

Mr. Vance joined the Institute as a Student in 1914 transferring to Junior in 1919. He became an Associate Member in 1924 and a Member in 1939. He has been re-elected councillor for the London Branch each consecutive year since 1933.

**W. H. M. Laughlin**, M.E.I.C., has been elected councillor of the Institute representing the Toronto Branch. Born in Toronto, Ont., he is a graduate in engineering from the University of Toronto in the class of 1927. He has been with the Dominion Bridge Company, Limited at Toronto since his graduation, joining first as a structural designer and estimator and now occupying the position of designing engineer. He is also demonstrator in civil engineering at the University of Toronto.

Mr. Laughlin joined the Institute as an Associate Member in 1929 becoming a Member in 1940. He has always been active in the Toronto Branch. He has served as chairman of the Branch and has been a member of the executive committee for several years.

**Richard A. Low**, M.E.I.C., is the newly elected councillor of the Institute representing the Kingston Branch. Born in Ottawa, Ont., he received his early education in the Ottawa Public Schools and the Lisgar Collegiate Institute. His engineering education was interrupted by the first Great War and he served in the gauge laboratory, Imperial Munitions Board, from 1916 until 1918. Following the war he was engaged on government and railway surveys in various capacities and in 1922 joined the Topographical Surveys, Department of the Interior. He later transferred to the Chief Geographer's Branch but resigned in 1925 to further his education. He graduated from Queen's University in 1928 with a B.Sc. in civil engineering and joined the teaching staff of that institution in 1930, where he is now assistant professor of civil engineering. He holds the degree of Master of Civil Engineering from Cornell University.

Although Professor Low has been engaged in teaching for 14 years he has not neglected the practice of his profession and most summers are spent on engineering projects. He has worked in many capacities on geodetic, railway and highway surveys and construction jobs. He made the final location of the Quebec Chibougamou Railway and also located the south section of the Isle Maligne-Quebec transmission line for the Shawinigan Water and Power Company. Shortly after the outbreak of the present war he joined the gauge division, Depart-

ment of Munitions and Supplies in Ottawa, and served during its period of organization, returning to Queen's in the autumn of 1942. He has long been interested in planning, doing graduate work in this field and making several traffic surveys. He has been active in developing the work of the Kingston Town Planning Commission.

Professor Low joined the Institute as an Associate Member in 1929 becoming a Member in 1940. He has served as chairman and secretary of the Kingston Branch and has always been prominent in the branch activities being particularly interested in student members.

R. A. Low, M.E.I.C.

W. L. Saunders, M.E.I.C.

C. C. Lindsay, M.E.I.C.

**W. L. Saunders, M.E.I.C.**, has been elected councillor of the Institute representing the Ottawa Branch. Born at Goderich, Ont., he studied engineering at the University of Toronto. He was engaged in railway engineering from 1907 and in 1915 enlisted in the Canadian Expeditionary Force. He held the rank of lieutenant in the 6th Battalion of Canadian Railway Troops, serving in France from 1917 until 1919. For two years following his discharge he was employed as assistant engineer with the Canadian Pacific Railway in Saskatchewan on construction and maintenance. Since 1922 he has been with the Department of Highways of Ontario his present position being that of division engineer of the Ottawa Division.

Mr. Saunders joined the Institute as a Student in 1910, becoming a Junior in 1913, an Associate Member in 1920 and a Member in 1940. He has served as chairman of the Ottawa Branch.

**C. C. Lindsay, M.E.I.C.**, is one of the newly elected councillors of the Institute for the Montreal Branch. Born in Quebec City, Que., he studied at the Quebec Commercial Academy and at McGill University, graduating from the latter with his B.Sc. in civil engineering in 1915. Following his graduation he served overseas for four years with the Royal Canadian Engineers and the Royal Engineers. While in the field he was promoted to acting major and was later confirmed to his rank. He was awarded the Military Cross and Croix de Guerre Belge. On his return from overseas he organized the Divisional Engineers for Military District No. 5 (Quebec) and subsequently went on the reserve of officers. He has now been made Honorary Lieutenant-Colonel of the Royal Canadian Engineers, M.D. No. 4, Reserve Army.

Colonel Lindsay has had extensive experience in all phases of land surveying and general engineering, dating

from 1908, in the western provinces as well as in Quebec. From 1920 until 1924 he was mine superintendent for Bennett-Martin Asbestos & Chrome Mines at Thetford Mines, Que. For the next eight years he was in charge of properties and all surveys in the Saguenay district for Price Brothers and Company Limited. Since 1932 he has been in private practice in Montreal as a consulting engineer and land surveyor.

Colonel Lindsay joined the Institute as a Student in 1908, becoming an Associate Member in 1919 and a Member in 1940. In 1944 he served as chairman of the Montreal Branch of the Institute and as president of the Corporation of Professional Engineers of Quebec.

**R. C. Flitton, M.E.I.C.**, is one of the newly elected councillors of the Institute representing the Montreal Branch. He graduated from McGill University with the degree of B.Sc. in 1914 and during the following year worked with C. H. Topp and Company as assistant on waterworks and mining surveys on Vancouver Island. In 1916 he joined the staff of the British Munitions Co. Ltd., Verdun, Que., on tool designing and was later assistant to the superintendent in the blending and proofing (powder) department, in charge of laboratory proofs, and assistant to the superintendent of the 18 pr. shell forging department. In 1919, after three months as sales engineer with the Williams Manufacturing Co. Ltd., Montreal, he was appointed assistant to the superintendent of the William Hamilton Company Ltd., Peterborough, Ont. He was subsequently engineer, chief engineer and works manager of the same company. He is at present employed as superintendent of industrial shops at Canadian Vickers Limited, Montreal.

Mr. Flitton joined the Institute as a Junior in 1914, becoming an Associate Member in 1920 and a Member in 1940. For several years he served on the executive of the Peterborough Branch and was chairman of that Branch in 1929. He also served on the executive of the Montreal Branch.

**Adam Cunningham, M.E.I.C.**, has been elected councillor of the Institute representing the Saguenay Branch. Born in Edinburgh, Scotland, he was educated at the George Watson College. After an apprenticeship in pattern shop, machine and erecting shops, he served with the West End Engine Works, Edinburgh, manufacturers of paper making machinery, and received technical training at the Heriot Watt College. In World War I he served with the R.A.S.C., Mechanical Transport, in the Egyptian Expeditionary Force. On returning to civil life he completed his apprenticeship and studied

mechanical engineering at the University of Edinburgh, graduating with his B.Sc. with honours in 1923. From 1924-1936 he was employed as draftsman and mechanical engineer with Price Brothers and Company Limited at their Kenogami and Riverbend paper mills. After one year with the Ontario Paper Company Limited at Thorold, Ont., he returned to Price Brothers as plant engineer at Kenogami, Que., He was appointed chief engineer of the paper division last year.

Mr. Cunningham joined the Institute as a Junior in 1925, becoming an Associate Member two years later and a Member in 1940.

construction of the electric light system, Truro, N.S., and investigated and reported on a proposed hydro-electric development for Parrsboro, N.S. From 1915 until 1919 he was on active service in Palestine and France during which time he rose from the rank of lieutenant to that of major. After his return to Halifax in 1919 he joined the city engineer's staff and remained with the department until 1929 when he became manager of the Argyle Garage in Halifax. Major Doane was employed by the Standard Paving Wartime Limited at Halifax from 1931 until 1944 when he was appointed manager of the Halifax Public Utilities Commission.

R. C. Flitton, M.E.I.C.

A. Cunningham, M.E.I.C.

J. F. Wickenden, M.E.I.C.

**J. F. Wickenden, M.E.I.C.**, is the newly elected councillor of the Institute representing the St. Maurice Valley Branch. Born in France, he received his primary education in the United States. In 1917-18 he served in France with the 23rd United States Engineers. He holds a certificate from the Université de France (Toulouse), 1919, and the following year he graduated from McGill University with the degree of B.Sc. Mr. Wickenden did some early work in Canada on surveys for the Geological Survey of Canada and with the St. Maurice Forest Protection Association. He was employed with the Barrett Company Limited from 1923 until 1925 when he was appointed Montreal representative of the Asbestos Manufacturing Company, Limited. In 1926 he started a general contracting business in Three Rivers, Que., and had it incorporated as a limited company in 1939. This firm of which he is president is known as the John F. Wickenden Co. Limited, general contractors and engineers.

Mr. Wickenden joined the Institute as a Junior in 1921, becoming an Associate Member in 1929 and a Member in 1940. He has served as chairman of the St. Maurice Valley Branch.

**H. W. L. Doane, M.E.I.C.**, has been appointed to the Council of the Institute to represent the Association of Professional Engineers of Nova Scotia. Born in Halifax, N.S., he graduated from the Nova Scotia Technical College with the degree of B.Sc. in 1913. He also qualified as a Nova Scotia land surveyor. From 1912 until 1915 he was engaged in sewer design and construction at Springhill, Chester, Halifax, Lunenburg and Hazel Hill, N.S.; in waterworks design and construction at Kentville, Hazel Hill and Trenton, N.S., including the construction of a 1,000,000 gallon reservoir and attendant pipe lines. He assisted in the making of survey and the preparation of plans for and the engineering

Major Doane joined the Institute as an Associate Member in 1919 transferring to Member in 1923. He has been active in the Halifax Branch and has served before as a councillor of the Institute representing the Branch.

**Earle O. Turner, M.E.I.C.**, of the faculty of the University of New Brunswick, Fredericton, N.B., has been re-appointed to the Council of the Institute representing the Association of Professional Engineers of New Brunswick. Born at Harvard, Mass., he graduated with the degree of Bachelor of Science in civil engineering from the Massachusetts Institute of Technology in 1914. After some time spent in following his profession he became instructor of highway engineering at the Polytechnic Institute of Brooklyn. During the last war, Professor Turner served as a second lieutenant in the Air Service of the United States Army. On his return to civilian life in 1919 he was appointed to the staff of the University of New Brunswick as professor of civil engineering.

Professor Turner joined the Institute as an Associate Member in 1920 transferring to Member in 1937.

**A. A. Turnbull, M.E.I.C.**, has been elected councillor of the Institute representing the Saint John Branch. Born at Digby, N.S., he studied at Dalhousie University and at Nova Scotia Technical College, Halifax, from which he graduated with the degree of B.Sc. He has had much experience with hydro-electric construction, hydrographic survey and for 22 years has been working on telephone engineering and management. He is at present chief engineer of the New Brunswick Telephone Company Limited at Saint John, N.B. During World War I he served overseas as lieutenant in the 4th Battalion, Canadian Machine Gun Corps. At the outbreak of the present war he re-organized an

A. A. Turnbull, M.E.I.C.

N.P.A.M. Engineer Unit and went active as O.C. 1st (B) Fortress E. & M. Co., Royal Canadian Engineers. At the request of industry he was returned to civil occupation.

Major Turnbull joined the Institute as a Junior in 1920, transferring to Associate Member in 1926 and becoming a Member in 1940. He is a past-chairman of the Saint John Branch of the Institute and a

past-president of the Association of Professional Engineers of the Province of New Brunswick.

**Arthur E. Flynn, M.E.I.C.**, the newly elected councillor of the Institute representing the Halifax Branch, is professor in the department of mining engineering at the Nova Scotia Technical College. Born in England, he received his preparatory education in the United States but returned to England for specialized training at the Finsbury Technical College and the Royal School of Mines. By 1912 he had won his degrees, A.R.S.M. and D.I.C. His early professional experience was gained

in England, Germany, and Spain. Then the development of Cobalt, Ont., attracted him to that district. While there, he designed and built the mining laboratory of the Haileybury School of Mines in which he was one of the first instructors. After two years spent in mining pyrites at Goudreau, Ont., and a year with the Hardinge Company at York, Pennsylvania, he was offered the chair of

mining engineering at the Nova Scotia Technical College. His service to Nova Scotia has not been confined to teaching. For five years he acted as development engineer in the provincial Department of Natural Resources and in many other ways, notably by extensive research in the utilization of minerals, he has played an important part in developing the mineral industry of the province. He has contributed many invaluable papers and discussions on the subjects in which he is an authority.

Mr. Flynn joined the Institute as a Member in 1940. He is a past-chairman of the Halifax Branch.

A. E. Flynn, M.E.I.C.

## INSTITUTE PRIZE WINNERS

**Edward Phillips Fetherstonhaugh, M.C., M.E.I.C.**, Dean of the Faculty of Engineering and Architecture, University of Manitoba, Winnipeg, is one of the recipients for 1944 of the Julian C. Smith Medal awarded by the Institute for "achievement in the development of Canada". The citation read upon presentation of the medal to Dean Fetherstonhaugh at the annual dinner is as follows:

"For more than twenty years Edward Phillips Fetherstonhaugh has been Dean of the Faculty of Engineering and Architecture at the University of Manitoba. During that time he has taken a leading part in the progress of engineering education in Canada, particularly in the regions west of the Great Lakes. His services to his country during World War I were recognized by the award of the Military Cross (1916) and by Mention in Despatches (1918). Keenly interested in establishing and maintaining the status of the engineering profession in Canada, he has been active in the affairs of The Engineering Institute of Canada and the Association of Professional Engineers of Manitoba.

"As a consultant, his services have been in request by governments, federal and provincial, and by municipal and public service authorities. As an outstanding electrical engineer he has been an active member of the National Research Council and has served on many of its working committees.

"An honours graduate of McGill University in 1894, he came to Manitoba in 1907, and during his long resi-

dence in the province of his adoption, has won the confidence and respect of his many students, his colleagues, and of the public. He has shown throughout that broad outlook which makes so strongly for national unity and progress. His achievements are now being recognized by the Council of The Engineering Institute of Canada by awarding to him a Julian C. Smith Medal."

**John Armistead Wilson, M.E.I.C.**, Director of Air Services, Department of Transport, Ottawa, is one of the recipients of the Julian C. Smith Medal of the Institute for 1944. The citation which accompanies the award reads as follows:

"The technical branches of the Dominion Civil Service require for their operation and development a number of engineers who must possess, in addition to professional knowledge and experience, a full measure of organizing ability and foresight. John Armistead Wilson is an outstanding example of this type of Civil Servant. Born in Scotland, educated at St.

J. A. Wilson, M.E.I.C.

Andrews University, he entered the Department of Naval Service, then being formed, in 1910.

"His long service with the Dominion Government has covered the years during which aviation in Canada, at first based on the Civil Aviation Act of 1918 (which Mr. Wilson drafted), has grown from very modest beginnings to its present stature.

"After organizing the Canadian effort in connection with the Empire system of communication by airship, beginning in 1927, Mr. Wilson was largely concerned with the activities which led to the establishment of the Trans-Canada Airway and the construction of the necessary airfields, so that in 1937 it was possible to arrange for airmail, passenger and express services from coast to coast. In that year he became one of the Directors of Trans-Canada Air Lines Corporation, and later took charge of the Civil Aviation Branch, which, under his direction, has undertaken the construction of more

construction, water power development, large bridge construction and industrial plant construction.

**James E. Gill**, Department of Geological Sciences, McGill University, Montreal, is one of the recipients of the Leonard Medal for 1944 for his paper "Zinc Deposits in the Federal Area" written jointly with Dr. P. E. Auger. Born at Nelson, B.C., he studied at the University of British Columbia. In 1921 he received his B.Sc. in mining engineering at McGill University and in 1925 his Ph.D. in geology at Princeton University. Dr. Gill was instructor and assistant professor at the University of Rochester, Rochester, N.Y., from 1925 until 1929. Since that date he has been assistant and associate professor at McGill University. His field experience included mining and geological work in many areas. From 1929 to 1936 he was a partner with W. F. James as a consultant. From 1936 to the present time Dr. Gill has been in general consulting practice on

E. P. Fetherstonhaugh, M.E.I.C.

W. Griesbach, M.E.I.C.

James E. Gill

than 200 airports for war purposes in Canada, Newfoundland and Labrador.

"In January 1941, Mr. Wilson was appointed Director of Air Services in the Department of Transport. Air transportation in Canada as it exists to-day owes much to his vision and energy during the long pioneer period. The Council of The Engineering Institute of Canada desires to mark the value of his services by the award of a Julian C. Smith Medal."

**Walter Griesbach**, M.E.I.C., chief engineer of the Foundation Company of Canada Limited, Montreal, has been awarded the Gzowski Medal of the Institute for 1944 for his paper "Construction of Shipshaw No. 2 Power Development" which appeared in the April 1944 issue of *The Engineering Journal*.

Born at Collingwood, Ont., he graduated from Queen's University with the degree of B.Sc. in 1912. Upon graduating he became attached to the Department of Public Works of Canada, and while with the department he was assistant engineer and resident engineer on breakwater construction and in charge of surveys of various harbours and rivers. He joined the staff of the Foundation Company of Canada Limited in 1918 as office engineer and became chief engineer of the company in 1928. Besides being responsible for all the engineering work in the construction of the Shipshaw power development, Mr. Griesbach has been closely associated with all work carried out by the company in the past fifteen years in the field of harbour

properties in various parts of Canada, Labrador, and the United States.

**P. E. Auger**, Bureau of Mines, Quebec, is one of the recipients of the Leonard Medal for 1944 for his paper "Zinc Deposits in the Federal Area" written jointly with Dr. J. E. Gill. Born at Ste-Croix de Lotbinière, Que., he received his degrees at the following institutions: B.A. at Laval University in 1929, B.Sc. in chemistry at Laval University in 1933, B.Sc. in geology at Queen's University in 1936, D.Sc. in geology at Massachusetts Institute of Technology in 1939. In 1933-34, Dr. Auger was instructor in physics and physical chemistry at Laval University and since 1939 has been geologist for the Quebec Bureau of Mines. In 1942 he became lecturer in economic geology at Laval University and in 1944 assistant professor of economic geology.

**Wilfred Gallay**, consulting chemical engineer, Ottawa, has been awarded the Plummer Medal for 1944 for his paper "Plastics in Engineering" as published in the February 1944 issue of *The Engineering Journal*. Born in Hawkesbury, Ont., and brought up in Calgary, Alta., he received his primary education in Calgary followed by normal school and two years of teaching in Alberta schools. He graduated from McGill University with degrees of Bachelor of Arts (first class honours in chemistry), Master of Science and Doctor of Philosophy. He was awarded the Moyse Travelling Fellowship and studied further at the University of Leipzig and the

P. E. Auger

W. Gallay

W. V. Sauer, M.E.I.C.

Kaiser Wilhelm Institute for Physical Chemistry at Berlin.

For twelve years up to July 1944, Dr. Gallay was head of the section on colloids and plastics of the National Research Council laboratories at Ottawa. He is now engaged in chemical consultant practice, specializing particularly in the field of plastics and related materials. He has published about 50 papers in various phases of theoretical and applied chemistry and is the inventor of several patented processes. He has lectured widely in Canada and the United States.

**Max V. Sauer, M.E.I.C.**, is the first recipient of the Keefe Medal of the Institute for his paper "St. Lawrence River Control and Remedial Dams—Soulanges Section" which was published in the December 1943 issue of *The Engineering Journal*.

His graduation from Toronto University was followed by ten years of design and construction work in the Niagara Falls district with the Ontario Power Company and the Niagara Falls Power Company (Niagara Falls, N.Y.). During the latter part of this time he was mechanical engineer for the Ontario Power Company. This was followed by five years as engineer of design at Winnipeg on the construction of the Greater Winnipeg Water District Aqueduct. Another five-year period was spent as hydraulic engineer of design for the Hydro-Electric Commission of Ontario, during which period the Queenston and Nipigon developments were built. Following this he was hydraulic engineer for

the Winnipeg Electric Company on the general layout and estimates for the Seven Sisters development. Mr. Sauer was hydraulic engineer of design on the Beauharnois development from its beginning, and later became hydraulic engineer and general superintendent of generating stations for the Montreal Light, Heat & Power Consolidated, which position he is now occupying with the Quebec Hydro-Electric Commission.

**R. A. H. Hayes, M.E.I.C.**, acting chief engineer, Aluminium Laboratories Limited, Montreal, is the first recipient of the Ross Medal of the Institute for his paper "Electrical Equipment at Shipshaw", published in the April 1944 issue of *The Engineering Journal*.

A native of New Brunswick, Mr. Hayes is a graduate of Mount Allison and McGill Universities. He has been associated with engineering, design and construction of several hydro-electric plants in eastern Canada, on transmission line design and construction and power cable engineering. In 1938 he joined the electrical engineering department of Aluminium Laboratories Limited. When the urgencies of war created the need for rapid construction he transferred to the Aluminum Company of Canada to assist in the scheduling, expediting and co-ordination of the Arvida expansion. He later returned to Aluminium Laboratories as electrical engineer during the design and engineering of the Indian reduction plant in 1941. When Shipshaw became active, the Laboratories were responsible for the design and engineering of this power project and Mr. Hayes was

R. A. H. Hayes, M.E.I.C.

C. F. Morrison, M.E.I.C.

A. A. Hershfield, S.E.I.C.

appointed assistant chief engineer. In addition to this he assumed responsibility for the co-ordination of the complete undertaking and in this capacity made his contribution towards the record time in which the Shipshaw power development was brought into operation.

**Carson F. Morrison**, M.E.I.C., associate professor of civil engineering, University of Toronto, is the first recipient of the Canadian Lumbermen's Association Prize of the Institute for his paper "Modern Timber Engineering" which appeared in the October 1943 issue of *The Engineering Journal*.

Born at File Hills, Sask., he attended the University of Saskatchewan graduating with the degree of B.E. (civil) in 1925. He studied further at McGill University and received his M.Sc. degree in structural engineering in 1927. During vacations he was with the Saskatchewan Department of Highways and the Dominion Bridge Company at Winnipeg and Toronto. Mr. Morrison was on the staff of the University of Alberta in 1927 leaving there the following year to join the staff of the University of Toronto. Since 1941 he has been doing consulting engineering work (structural) particularly in the timber engineering field. During summer of 1944 he was associated with the Forest Products Laboratories, Ottawa, on a research project concerning the use of glued laminated timber members in the general construction field.

**André Leclerc**, S.E.I.C., has received the Ernest

André Leclerc, S.E.I.C.

Marceau Prize of the Institute for 1944 for his paper "Influence de la vitesse d'essai sur la résistance des matériaux". Born in Montreal, he studied the classical course at the Collège André Grasset, Montreal, graduating in 1939 with his B.A. degree with honours. He then studied engineering at the Ecole Polytechnique of Montreal where he graduated in 1944 with the highest honours. He received the Lieutenant-

Governor's medal for heading his class throughout the course as well as the medal of the Ecole Polytechnique Alumni. Upon graduation he joined the staff of the Dominion Rubber Company Limited in the industrial engineering department at St. Jérôme, Que., where he is now plant chemist.

**Allan A. Hershfield**, S.E.I.C., is the recipient of the John Galbraith Prize of the Institute for 1944 for his paper "Plywood: A Structural Material for Aircraft". Born at Winnipeg, Man., he attended high school there and entered the University of Toronto in 1940, graduating in 1944 as a Bachelor of Applied Science in mechanical engineering. During the summer of 1943 and 1944 he worked on the engineering staff of Massey-Harris Co., Limited (aircraft division), Weston, Ont., on the famous "Mosquito" Bomber contract. It was during that period that he became interested in plywood and its uses. On graduation he entered the employ of Canadair Limited of Montreal in the aircraft design office and was transferred by them last November to Douglas Aircraft Co. Inc. of Santa Monica, California, for an indefinite period of training.

**James L. Belyea**, S.E.I.C., is the recipient of the Martin Murphy Prize of the Institute for 1944 for his paper "The Cathode Ray Oscillograph and its Applications in Industry". Born at Saint John, N.B., he attended Saint John High School, winning the City Corporation Gold Medal and the Lord Beaverbrook Scholarship on matriculation. During summer vacations he was engaged by the New Brunswick Electric Power Commission, Saint John Dry Dock & Shipbuilding Co. Ltd., and as an instrumentman with the Airways Branch of the Department of Transport. He graduated from the University of New Brunswick in 1944 and is now in the Royal Canadian Navy. This is the second consecutive year that Mr. Belyea has been the recipient of this award.

J. L. Belyea, S.E.I.C.

## ANNUAL FEES

Members are reminded that a reduction of one dollar is allowed on their annual fees if paid before March 31st of the current year. The date of mailing, as shown by the postmark on the envelope, is taken as the date of payment. This gives equal opportunity to all members wherever they are residing.

# News of the Branches

## EDMONTON BRANCH

G. H. MILLIGAN, Affil.E.I.C. - *Secretary-Treasurer*

The general meeting of the Edmonton Branch was held in the Medical Building, University of Alberta, on January 18th, 1945.

This meeting was held in conjunction with the Refresher Course in Soil Mechanics and Concrete Testing being carried on at the University, and those attending the course were visitors at the meeting. Approximately 25 members and 125 visitors were present.

The chairman of the Edmonton Branch, B. W. Pitfield, opened the meeting welcoming the visitors to the Branch. Professor I. K. Morrison was called on to introduce the speaker of the evening, Dr. N. McLeod of the Asphalt Division of the Imperial Oil Company. Professor Morrison mentioned that Dr. McLeod was a graduate of the University of Alberta in chemical engineering, had obtained his Master's Degree in chemistry at the University of Saskatchewan, and his Doctor's degree in civil engineering at the University of Michigan.

Dr. McLeod opened his address by illustrating with a map the route of three highways over the Andes in Peru, over which he had travelled and taken coloured films. After a few remarks regarding the conditions in the country, Dr. McLeod showed the films and carried on a running commentary as they were shown. Among other things of interest were the almost insurmountable mountain passes through which the highway had been built, and the extremes in temperature within very short distances due to the rapid change in elevation attained by the highway. The speaker also mentioned the Inca and Pre-Inca civilizations, traces of which were amply illustrated by the films, and gave a short archaeological background for these. Altogether three reels of films were shown and it is felt that they were among the most interesting pictures of this sort seen by the Branch.

Dr. McLeod was tendered a vote of thanks by Professor R. G. Hardy, and the meeting adjourned to the University cafeteria where refreshments were served.

## HALIFAX BRANCH

S. W. GRAY, M.E.I.C. - *Secretary-Treasurer*  
C. D. MARTIN, M.E.I.C. - *Branch News Editor*

The annual combined banquet of the Halifax Branch of the Institute and the Association of Professional Engineers of Nova Scotia was held at the Nova Scotian Hotel on January 18. A total of 227 attended this function. L. E. Mitchell, chairman of the Halifax Branch of the Institute was chairman for the first section of the meeting and J. R. Kaye, president of the A.P.E.N.S., for the second part.

During dinner orchestral selections were enjoyed, as were several songs sung by everyone present.

Guests at the head table were: Colonel F. W. W. Doane, a senior member of the E.I.C. and A.P.E.N.S.; Professor C. C. Coffin, representing the Chemical Societies; Mr. J. H. Whitford, president of the Nova Scotia Architectural Society; Mr. S. A. Willis, vice-president Nova Scotia Mining Society; Dr. C. B. Weld, representing the Nova Scotia Institute of Science; Mr. S. W. Gray, secretary-treasurer of E.I.C. and A.P.E.N.S.

After making a presentation of honorary life mem-

## Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

berships to J. S. Misener, L. H. Wheaton, J. H. Winfield, and C. H. Wright, Mr. Kaye then introduced the guest speaker, J. A. Hanway, K.C., chairman of the Nova Scotia Board of Public Utilities.

Mr. Hanway paid a fine tribute to the engineers before he told, in his own inimitable way, of some of his early experiences as a young lawyer.

K. L. Dawson was master of ceremonies for the entertainment that followed. Harry Cochrane provided a splendid programme of entertainment consisting of singing, dancing and excellent specialties.

In conclusion the Master of Ceremonies expressed thanks to the Banquet Committee, and also to the following firms who helped to make this one of the best joint banquets ever held: Canadian Westinghouse Co. Ltd., Foulis Engineering Sales Ltd., Foulis & Bennett Electric Ltd., Imperial Oil Ltd., D. C. Keddy, Moloney Electric Co. of Canada Ltd., National Iron Corporation, W. H. Noonan, Northern Electric Co. Ltd., Nova Scotia Light & Power Co. Ltd., Wm. Stairs Son and Morrow Ltd.

\* \* \*

The regular monthly dinner meeting of the Halifax Branch was held at the Nova Scotian Hotel on Thursday, February 22, 1945. The attendance was 76 and included several students of the senior class of the Nova Scotia Technical College who were guests of the Branch.

Chairman L. E. Mitchell, introduced the special guests and the speaker of the evening, Edward D. Brown, plant superintendent of Canadian Industrial Minerals Limited, at Walton, N.S.

Mr. Brown's subject was **Steep Rock Lake Pumping**. Since Mr. Brown was mechanical and electrical superintendent at Steep Rock Iron Mines he was exceptionally well qualified to speak on such a topic. With the aid of blackboard illustrations and sketches, he first talked on the general aspects of the job and then covered the pumping operations in detail. Following this he showed a very enlightening colour film of the project. Both the film and the talk were very much enjoyed by all present. Keen interest was in evidence throughout, especially when Mr. Brown described how the numerous difficulties were overcome.

H. F. Ryan moved a hearty vote of thanks to Mr. Brown for his willingness and co-operation in the giving of his time for a very instructive evening for those in attendance. This motion was seconded by J. P. Messervey. The applause which followed indicated in no uncertain terms that Mr. Brown had done an excellent job.

The meeting was concluded by the showing of a technicolour sound film entitled **The Life Line of the Nation** which portrayed the role of the American railroads in wartime.

## HAMILTON BRANCH

W. E. BROWN, M.E.I.C. - *Secretary-Treasurer*  
L. C. SENTANCE, M.E.I.C. - *Branch News Editor*

The annual meeting and dinner of the Hamilton Branch was held on Thursday, January 11, at the Scottish Rite Club, with sixty-six members and guests in

attendance; H. A. Cooch, retiring chairman, presided.

At the conclusion of the dinner W. E. Brown, secretary-treasurer, reported on the activities of the Branch throughout the year. R. J. Schofield presented the report of the Nominating Committee, the new executive being announced as: Chairman—Norman Eager, Vice-Chairman—A. R. Hannaford, Secretary Treasurer—W. E. Brown, Councillor—Alex Love, Executive Committee—H. J. A. Chambers, E. T. W. Bailey, E. G. Wyckoff and G. L. Vollmer.

Alex Love outlined to the assembly the decision of the Institute to impose a voluntary levy of \$2.00 for the purpose of raising funds for secretarial assistance in connection with rehabilitation work.

The speaker of the evening, Dean C. R. Young, head of the Faculty of Applied Science and Engineering at the University of Toronto, was introduced by H. J. A. Chambers.

Dean Young spoke on **Trends in Engineering Education**. From his long experience and observations in the field of engineering education, Dean Young noted that a relatively small percentage of engineering graduates followed their chosen profession throughout life. A large proportion forsook engineering for administrative, economic and commercial positions. While such statistics indicated that an engineering education forms an excellent background for numerous other fields of endeavour, Dean Young felt that even greater advantages would accrue from an increase in the time allotted to liberal arts subjects.

Such a change forms the basis of major trends in engineering education to-day. While curricula at the University of Toronto had formerly devoted only six per cent of study time to liberal phases, plans were afoot for a reduction of strictly technological training to 71 or 72 per cent. A course of liberal arts study in such subjects as modern economics and political trends has been introduced and enthusiastically received by students, Dean Young stated.

"The well-rounded professional man must be able to use English correctly and effectively." The importance of such training had not been overlooked in composition of modern curricula for engineering schools.

Dean Young observed that the majority of notable developments in the last few years were directly traceable to physicists. A great need was felt for small selected groups of competent engineering students to undergo intensive scientific training in order to keep pace with such advanced developments.

At the conclusion of Dean Young's talk, a vote of thanks was moved by E. R. Eaton.

H. A. Cooch, retiring chairman, handed over the gavel of office to his successor, N. Eager, who conducted the remainder of the meeting. Neil Metcalf moved a vote of thanks to the outgoing officers and executive.

### MONTREAL BRANCH

L. A. DUCHASTEL, M.E.I.C. - *Secretary-Treasurer*  
HYMAN H. SCHWARTZ, S.E.I.C. - } *Branch News Editors*  
ELI L. ILOVITCH, S.E.I.C. - }

The activities of the Montreal Branch were reviewed by its retiring chairman Lieut.-Col. C. C. Lindsay at the annual business meeting held on Thursday evening, January 26th. He paid high tribute to the various committees for their efforts in making the past year so successful, and especially to those who helped arrange the agreement between the Quebec Corporation of Professional Engineers and the E.I.C.

At the conclusion of his speech Col. Lindsay called upon John B. Stirling, the newly elected chairman, to take over his office. Other officers elected were: J. A.

Beauchemin, vice-chairman; J. J. H. Miller, G. N. Martin, D. Anderson and C. C. Lindsay. Others on the executive committee whose terms of office expire next year are M. S. Macgillivray, J. Benoit and L. H. Burpee. L. A. Duchastel continues as secretary-treasurer.

The highlight of the evening was an address given by de Gaspé Beaubien, C.B.E., president of the Institute. He discussed the conditions which he observed during his trans-Canada tour. Mr. Beaubien told the members that the industrial progress, since the outbreak of war, has been tremendous in this country, not only in the quantity of items produced, but in their high quality and low cost. Many articles, materials and new techniques for the manufacture of old articles have been developed in Canada. The appearance and efficiency of our factories are comparable to the best in the world.

In concluding his remarks Mr. Beaubien praised the fine relations, trust, understanding, and mutual respect that exists between labour and engineers. For this reason, and because of the necessity of maintaining full production now and in the post-war era, the speaker called upon engineers to take an even greater interest in public affairs and in the education of their fellow citizens.

Col. Lindsay thanked the speaker for his timely and interesting address.

\* \* \*

**The 12,500 K.W. Steam Electric Station of the Nova Scotia Light & Power Co. Ltd.** was the subject of a paper presented by J. T. Farmer and J. W. MacDonald before the Montreal Branch on Thursday evening, February 1st, 1945.

Mr. Farmer spoke first on the necessity for building this plant during the war period. He pointed out that it was only because there were no new hydro-electric power development sites available in the area that the project was carried out. Now it is possible to use more of the water storage without the risk of not having enough water left to generate needed power.

A series of slides was shown, along with a running commentary, by J. W. MacDonald. Mr. MacDonald was resident engineer on the job and was able to take photographs illustrating the different stages of construction. Those present were shown pictures of the crib-work and how it was laid in place. Among the other interesting slides was one depicting a section of the station showing the process from delivery of coal to production of kilowatts.

A discussion period followed. C. D. Bailey, was chairman of the meeting at which there were 75 members present.

\* \* \*

A lecture on diesel-electric rail cars and locomotives for general railway and industrial yard use was given to the Montreal branch by Ira I. Sylvester on February 8th. Mr. Sylvester discussed the machinery that goes into diesel-electric locomotives and the problems of design that each unit entails. With the aid of charts and graphs, he showed how the high efficiency, long hours of availability, low operating and service costs are creating ever increasing demands for diesel electrics.

Diesel-electric locomotives in the 2,000 h.p. plus class have definitely established a place for themselves in the long range transportation field, the speaker stated, and are giving steam locomotives strong competition. However in 300 to 1,500 h.p. yard-locomotive class, the diesel-electrics rule supreme, practically eliminating all orders for steam locomotives.

An interesting discussion of the problems of diesel-

electric operation followed the meeting, which was presided over by H. F. Finnemore.

Illustrated copies of the lecture may be obtained by writing to I. I. Sylvester, Canadian General Electric Company, Montreal.

\* \* \*

**The Manufacture of Beet Sugar** was the lecture given to the Montreal Branch on Thursday evening, February 15, 1945, by Mr. Marshall R. Allen, General Manager of the Quebec Sugar Refinery, St. Hilaire.

After mentioning a few of the construction problems involved, the audience was given a verbal picture of the process from the raw beets to the finished sugar. The factory has four floors above the ground floor and most of the operations flow through process by gravity. Since the process equipment for the whole factory is synchronized, it is in the slicing room on the third floor that the controls are located for regulating the production of the factory.

The beets are washed and sorted after which they are sliced and weighed in batches for further processing. The pulp is then passed through a continuous diffusion battery for extraction of the raw juice which is passed through various tanks and filters for further processing. In the final operation, the sugar is granulated after which it is stored for packing and distribution.

Mr. Allen mentioned that it is possible to produce crystals of any size and that he personally had made a crystal as large as his fist. Every ton of beets yields about 250 pounds of sugar, 90 pounds of molasses and about 100 pounds of pulp which is used as livestock feed. The speaker mentioned that it is impossible to tell the difference between cane and beet sugar, and of last year's world production of 30 million tons, 19 million were cane and 11 million tons were beet sugar.

There were 130 present at the meeting.

#### Junior Section

"The success of our organization, The Engineering Institute of Canada, depends entirely on the generous and voluntary contributions of time and good-will from our members and our too small a staff," said Jack Sylvester, retiring chairman of the Junior Section of the Montreal Branch, at the annual meeting held on January 29th with an attendance of more than 100. After his welcome address he called on R. A. Frigon to read the minutes of the previous annual meeting.

The following members slated by the nominating committee for 1945 were elected by acclamation: R. A. Frigon, chairman; A. Gervais, vice-chairman; T. S. McMillan, secretary. The results of the election held for councillors are as follows: P. E. Salvat, J. M. Rousseau, J. E. Brett.

A most interesting film entitled **Bridging San Francisco Bay** was presented. From the sinking of the foundations of the towers to the construction of the suspended portion and of the cantilever span arc, the audience, composed mostly of students, admired the courage and skill of the bridge erectors.

Albert Clement reported on the progress accomplished by the Committee for the Welfare of the Young Engineer. This committee is at present busy with collective bargaining. R. A. Frigon, chairman of the Committee on the Development of the Young Engineer, told the audience that courses in calculus and soil mechanics have been organized.

Thanking everyone for the support and encouragement extended to him during his term of office, Jack Sylvester, retiring chairman, called on R. A. Frigon to take the chair and proceed with the meeting. A few

words by the new chairman ended the evening's official business. Refreshments were served.

#### OTTAWA BRANCH

C. G. BIESENTHAL, Jr. E.I.C. - *Secretary-Treasurer*  
R. C. PURSER, M.E.I.C. - *Branch News Editor*

On the evening of January 31, 1945, at the invitation of W. B. Timm, director of the Mines and Geology Branch of the Bureau of Mines, members of the Ottawa Branch visited the new physical metallurgical research laboratories.

W. L. Saunders, past-chairman of the Ottawa Branch of the Institute, opened the meeting after which Dr. G. S. Farnham, chief metallurgist, spoke briefly on the part the laboratories are playing during the war. He also emphasized their post-war role in assisting Canadian industry to keep abreast of technical developments in other countries.

\* \* \*

At a noon luncheon on February 14, 1945, Huet Massue of Montreal, gave an address on **The Heating of Dwellings**. Mr. Massue, who is statistical engineer of the Shawinigan Water and Power Company, explained that the heating of Canadian homes by electricity is not yet practically and economically feasible under present known and proved methods. However, he told the meeting that research is being carried on by many power companies and divisions of government along these lines.

The electric heating of private dwellings would increase the power requirements of retail customers about tenfold. In the case of many provinces, power required to heat homes would exceed even the entire potential power resources of the province. Moreover, by present heating methods, cost of installation of electrical heating equipment in a house would almost equal the total cost of the house itself.

Generalized electric heating would require rates altogether too high for the ordinary house owner to pay. As time went on more and more electricity would be used for heating but it would only be as auxiliary to coal, oil, or gas. Some homes in the immediate vicinity of power plants have been entirely heated by electricity, but these are experimental rather than practical. Factors against it were the magnitude of the power requirements, the investment needed to bring the power to the consumer's premises, the limited time during which the full capacity of the installation would be used, and the high cost of heating which would result.

#### QUEBEC BRANCH

LEO ROY, M.E.I.C. - - - *Secretary-Treasurer*  
ROGER DESJARDINS, Jr. E.I.C. - *Branch News Editor*

Le 18 décembre 1944, le maire de Québec reçut les membres de la Section de Québec dans la salle du conseil municipal. L'assistance se composait de soixante-huit membres.

A cette occasion, le maire exposa à la section les projets d'amélioration que la ville de Québec a préparés pour lui permettre de maintenir chez elle, après la guerre une activité économique susceptible d'assurer à la population des conditions de vie raisonnables.

Son Honneur le maire, développa plusieurs idées démontrant la nécessité urgente de la construction d'habitations ouvrières qui devrait se faire immédiatement après la guerre. Il exposa le projet de maisons à multiples logements où les loyers seraient à un prix abordable pour les ouvriers. Son Honneur fit aussi un

exposé substantiel des principaux projets d'après-guerre suivants:

1. Réalisation d'un port franc pour la ville de Québec et établissement d'une zone industrielle.
2. Eclusement de la rivière St-Charles et détournement des rivières Lairet et St-Michel.
3. Elimination des traverses à niveau et construction de ponts.
4. Prolongement de boulevards existants jusqu'aux limites de la cité.
5. Construction d'une usine principale de pompage pour l'égout collecteur.
6. Construction de routes pour dégager le quartier populaire du centre de Québec.

\* \* \*

Le 15 janvier 1945, monsieur Joseph Risi, docteur ès-sciences, professeur de chimie organique à la Faculté des Sciences à l'Université Laval donna aux membres de la section une causerie intitulée: **Le bois comme matériau d'ingénieur.** L'assistance se composait de 58 membres.

Le Dr Risi démontra que le bois n'avait pas été utilisé à sa pleine capacité avant la guerre, mais, depuis cette période, la rareté des métaux a forcé les nations mondiales à lui trouver des qualités jusque-là inconnues. A l'heure actuelle, il existe plusieurs méthodes permettant l'amélioration permanente des propriétés du bois. Le Dr Risi nous exposa les procédés modernes pour obtenir:

1. Le bois pressé en direction perpendiculaire aux fibres.
2. Le bois laminé au moyen d'adhésifs spéciaux résistant à l'eau.
3. Le bois imprégné obtenu en traitant le bois dans l'autoclave avec substances ignifuges.
3. Le bois imprégné obtenu en traitant le bois dans l'autoclave avec substances ignifuges.
4. Le bois comprimé obtenu en appliquant à chaud sur le bois laminé et imprégné une forte pression hydraulique provoquant une résinification totale au sein des fibres de bois.
5. Le papier comprimé, procédé semblable au précédent appliqué au papier.
6. Le contreplaqué moulé, matière pour la construction navale et aéronautique.
7. Divers produits forestiers plastiques en appliquant l'une des méthodes de résinification précédente aux déchets forestiers, sciures de bois et autres.

Selon le procédé employé, on obtient un bois pratiquement incombustible, ou résistant aux insectes et aux pourritures, ou résistant à l'eau, l'humidité, acides et bases diluées, ou du bois très dense et très dur se travaillant bien à la machine, ou du bois dont les qualités mécaniques, poids pour poids, surpassent même celles des métaux légers. A la fin de sa conférence, le Dr Risi fit voir de nombreux échantillons préparés en partie au laboratoire des produits forestiers à Ottawa, en partie au laboratoire du Ministère des Terres et Forêts de Québec, à Duchesnay.

\* \* \*

Le 22 janvier 1945, le président de l'Institut, M. de Gaspé Beaubien, rendit visite à la section de Québec.

Au cours de l'après-midi, M. Beaubien visita la Faculté des Sciences de l'Université Laval. Il y rencontra le personnel de la faculté et les étudiants, à qui il adressa la parole. Le soir, le conseil et les membres le reçurent à un dîner au Club de la Garnison. Invité à dire quelques mots, M. Beaubien fit part des impressions reçues lors de sa visite aux différentes sections de l'Institut, réparties par tout le Canada. Il insista surtout sur le fait que l'ingénieur peut, par sa formation, aider à concilier les intérêts des ouvriers et des patrons, ayant

la confiance des deux groupes. Il recommanda à l'ingénieur de s'extérioriser davantage pour faire valoir son point de vue. M. Louis Trudel résuma les activités de l'Institut durant l'année écoulée. M. A. R. Décaray adressa aussi la parole.

\* \* \*

On Monday, January 29th, Mr. R. Dupuis, past-chairman of the branch, presented Mr. H. N. Bronson who gave an address entitled **Training—Yesterday, To-day and To-morrow.**

After describing briefly the past and present practices used for training, Mr. Bronson discussed the problems that will confront the industry in that field.

It is one of the duties of industry to proceed with a carefully planned training programme. Only by training will it be sure to acquire a competent personnel and future supervisors. This training programme must be such that it gives an even chance to all employees.

The speaker discussed the role of the supervisors in this training programme. He then pointed out the importance of tables, forms, reports to be made by the foremen. Photos or films are a good way to help train employees and to prove one's points. Mr. Bronson asked Mr. Armstrong, a training supervisor of the B.T.Co. to show the audience two short films on training.

Mr. L. Buteau expressed on behalf of the audience their thanks to the speaker.

\* \* \*

Le 12 février 1945, la Section de Québec avait le plaisir d'avoir comme conférencière, mademoiselle Rachel Audet, éclairagiste de la Compagnie Quebec Power. Cent trente-cinq personnes assistaient à la réunion.

La conférence de mademoiselle Audet avait comme titre: **Divers aspects de l'éclairage domestique.**

La conférencière exposa l'importance d'une filerie adéquate et d'un bon éclairage électrique pour la maison moderne. Les scientifiques ont prouvé que le fait de voir et celui de mieux voir dépend de plus ou moins de lumière. Grâce à l'illuminomètre, on peut, en se basant sur des spécifications établies par des experts, recommander telle ou telle quantité de lumière artificielle pour telle ou telle tâche usuelle. La conférencière fit ressortir les nombreux avantages d'une bonne illumination en plus d'une quantité suffisante de lumière. Elle exposa un grand nombre de moyens pour arriver à cette fin: abat-jour et diffuseurs permettent de masquer les sources lumineuses et de faire converger une partie des rayons vers le plafond des appartements en donnant une meilleure réflexion de la lumière vers les objets à éclairer. Une bonne illumination peut être considérée comme une des nécessités fondamentales de la vie quotidienne et met en valeur les meubles, les tentures, les boiseries et tous les accessoires décoratifs d'une maison. Une filerie adéquate évite un nombre incalculable d'ennuis et conséquemment coûte moins cher. Un bon éclairage aide et protège la vue tout en diffusant une lumière qui, bien qu'artificielle, s'apparente quelque peu à l'illumination gaie et riante du soleil.

Mademoiselle Audet nous fit voir une série de projections lumineuses où on comparait les pièces mal éclairées de différentes maisons avec les mêmes pièces améliorées, grâce à un bon éclairage. La conférencière donna les commentaires appropriés à chacune des vignettes. Une seconde série de projections illustra l'emploi d'une illumination adéquate dans différentes nouvelles constructions pourvu d'un éclairage artificiel idéal. La conférencière expliqua avec détails les moyens employés pour obtenir dans chaque cas l'illumination artificielle suffisante.

## SAINT JOHN BRANCH

L. O. CASS, M.E.I.C. - - *Secretary-Treasurer*  
G. W. GRIFFIN, M.E.I.C. - *Branch News Editor*

The annual joint supper meeting of the Saint John Branch of the Institute and the Association of Professional Engineers of New Brunswick was held in the Admiral Beatty Hotel on January 25th. Eighty members and guests were in attendance to hear a talk on **Shipshaw** given by R. A. H. Hayes, assistant chief engineer of Aluminium Laboratories Ltd., Montreal.

The joint supper followed the annual meeting of the Association at which officers for the coming year were elected. C. D. McAllister, chairman of the branch, who presided at the supper, announced the officers elect as follows: A. S. Gunn, Moncton, president; G. M. Brown, Saint John, vice-president; E. C. Percy, Moncton, R. M. Richardson and C. G. Clark, both of Saint John, new members of council.

The chairman announced that, because of ill-health, C. C. Kirby found it necessary to relinquish the duties of Treasurer-Registrar of the Association and had tendered his resignation after five years in office.

A toast to the Institute was proposed by F. P. Vaughan and responded to by A. A. Turnbull. The toast to the Association was proposed by the new president, A. S. Gunn and responded to by Prof. E. O. Turner.

Mr. Hayes, with the aid of lantern slides and moving pictures, covered the history and development of Shipshaw from start to finish. After dealing briefly with early efforts to develop power in the vicinity of Shipshaw he proceeded to explain the gigantic hydro-electric development as it stands to-day and gave many interesting figures regarding it. Speaking of the excavation, he said that there had been a total earth excavation of 3,225,000 cubic yards and 2,620,000 cubic yards of rock removed to make way for the construction of the various works.

In order that these huge quantities of materials might be made available to the power shovels it was necessary to use 3,260,000 pounds of dynamite and the total rock drilling to accommodate the explosive equalled 840 miles.

Other interesting figures given by the speaker included over eight million cubic yards of concrete which was reinforced with 8,000 tons of reinforcing steel. The combined capacity of the various mixing plants was 6,500 cubic yards per day. Into these mixers 10 to 25 carloads of cement went daily together with the output of rock crushing plants with a daily capacity of 8,000 tons. As much as 30 million feet of lumber was used on the project. The average number of men working daily on the construction was 3,960, the peak number employed being close to 10,000. To maintain the necessary labour meant a turnover of nearly 50,000 men. The quantities of food required to feed the workers were tremendous and called for batteries of butchers, cooks and waitresses in order to provide a constant supply of meals for the employees, Mr. Hayes reported.

A vote of thanks to the speaker was moved by G. A. Vandervoort and seconded by G. G. Murdoch.

\* \* \*

The potential valuable asset which New Brunswick has in her forests was portrayed by Dr. C. P. Burchill, president of The New Brunswick Forest Products Association, when he addressed a meeting of the Saint John Branch in the Admiral Beatty Hotel on February 15th. Dr. Burchill was introduced by C. D. McAllister, chairman of the Branch.

"Vigilance and eternal vigilance," was the keynote stressed by the speaker in expressing the belief that the citizens of not only New Brunswick but other parts of the Dominion were as yet not sufficiently aroused on the vital matter of forest conservation.

In stressing vigilance, Dr. Burchill was referring to what he called the problem of the future, that of preservation of the forest lands, as follows: Intelligent and profitable utilization of our forest lands, control from fire and insects and proper forest management.

Speaking of the New Brunswick forests, the speaker said that the province would have to bear the consequences if forest products were allowed to dwindle away. Timber on approximately 75,000 acres was being lost annually as a result of forest fires, he stated. Many of these fires were undoubtedly caused by lightning and he advocated that a broad system of forest roads be considered to eliminate much of the delay encountered in getting forces to the scene of the fires after discovery.

"Insects are also responsible for a great amount of our timber loss," Dr. Burchill pointed out. "Recent figures reveal that about 70,000 cords of pulpwood timber alone are destroyed by insects each year. This amazing total is sufficient to supply pulp mills of this province, at their present rate of production, for the next 100 years."

Reviewing the part wood had played in the war, Dr. Burchill voiced the opinion that, "it had saved the day." As a measure of its importance Germany had considered it more necessary than oil as evidenced by the plans that country had made to gain control of the world's forests, the speaker declared as he spoke of the pre-war wood crusade activities carried on in Czechoslovakia, Norway, Roumania, Jugoslavia, Russian occupied Poland, Latvia and later Russia. Germany had acquired a network of forest and timber plants throughout Europe and had then attempted the same policy on this continent with the view to making wood the raw material on which Hitler planned to found the Nazi world hegemony, he said.

The further importance of wood was emphasized by the speaker in enumerating only a few of the great variety of uses found for wood during the war. These products, he said, included explosives, rayon, cellophane, plastics, plywood for all purposes and in the production of the famous Mosquito aircraft.

Dr. Burchill concluded his talk with the declaration that New Brunswick has a valuable asset in her forests and exhorted that the wealth be developed for the use of the future. C. C. Kirby thanked the speaker for his interesting talk.

As a fitting and appropriate conclusion to the address two films were shown. They were entitled **To-morrow—Timber and Lifeline of the Nation**, the latter depicting the vital part the railroads play in the existence of a nation at war.

## SASKATCHEWAN BRANCH

STEWART YOUNG, M.E.I.C. - *Secretary-Treasurer*

The regular monthly meeting of the Saskatchewan Branch of the Institute with the Association of Professional Engineers was held in the Kitchener Hotel, Regina, on Friday evening, January 19, 1945. The meeting was preceded by a dinner at which the attendance was 35.

Immediately following the meeting two films were shown, entitled respectively, **Radio Front Line** and **The Strategy of Materials**.

The twenty-eighth annual meeting of the Saskatchewan Branch was held in the Hotel Saskatchewan, Regina, on Friday, February 16, 1945, at 3.00 p.m. with an attendance of 22. After welcoming the members, Chairman J. McD. Patton, called for the minutes of the last annual meeting on February 18, 1944, and a special general meeting on May 19, 1944. These minutes, on motion of D. A. R. McCannell and H. I. Nicholl, were confirmed.

The secretary presented the report of the Executive to December 31, 1944, showing a total membership of 227 and a bank balance of \$26.24. The report was adopted on motion of J. G. Schaeffer and H. S. Carpenter.

H. I. Nicholl, convenor of the Papers and Meetings Committee, presented the report of his committee, which also functions for the Association of Professional Engineers. The report was received, on motion of F. C. Christie and F. H. Smail, with expressed appreciation and thanks to the committee for their work during the past year. Six meetings were held with an average attendance of 46.

The report of the Saskatoon Section, showing six meetings held with an average attendance of 47, was presented by N. B. Hutcheon and adopted, on motion of D. A. R. McCannell and J. W. D. Farrell. It was noted that the average attendance in Saskatoon was greater than in Regina.

D. A. R. McCannell reported for his committee on Student Guidance, stating that the activities of the committee had been enlarged to include representatives of most of the branches of engineering.

### SAULT STE. MARIE BRANCH

T. F. RAHILLY, Jr., E.I.C. - *Secretary-Treasurer*

A general meeting of the Branch was held at the Algo Men's Club, Bay Street, on the evening of Friday, February 2, 1945, when members of the Branch were dinner guests of the Algoma Steel Corporation, Ltd. After the dinner a paper entitled **Beam and Column Design** was presented by W. H. M. Laughlin, chief designing engineer, Ontario Division, Dominion Bridge Company, Toronto.

The paper stressed particularly the advantages of wide flange beams over the conventional "I" Beams when used as beams or columns. The talk was illustrated by lantern slides. Mr. Laughlin also had with him and demonstrated an S.R.-4 portable strain indicator and strain gauge which can measure strains in a structural member as low as one millionth of an inch.

Twenty-seven members of the Branch were present. Sixty people were at the dinner and seventy attended the meeting. G. W. MacLeod acted as chairman.

### TORONTO BRANCH

S. H. DEJONG, M.E.I.C. - *Secretary-Treasurer*  
G. L. WHITE, A.F.I.E.C. - *Branch News Editor*

At the joint meeting of the Toronto Branch of the Institute with the Toronto Section of the A.I.E.E. on Friday, January 26th, A. Frampton, Hydro-Electric Power Commission of Ontario, presented a paper on

**The New T.V.A. Hydro Plants-Mechanical and Electrical Features** by H. J. Petersen, head mechanical design engineer, and R. A. Hopkins, head electrical engineer, both of Design Department, Tennessee Valley Authority, Knoxville, Tennessee.

### WATTS BAR DAM

The paper discussed two of the Tennessee Valley Authority projects deemed typical in many respects of the new plants designed and constructed by T.V.A. The Watts Bar Dam was selected as exemplifying the main river, low head plant. Located on the Tennessee River some 128 river miles below Knoxville, it has a drainage area of 17,310 square miles, 400,000 cfs being the maximum recorded flow, and was designed for a maximum flow of 550,000 cfs and for a total storage of 1,132,000 acre feet. The 2,490 ft. long and 97 ft. high dam has a concrete spillway section, a concrete non-over-flow section and at one end an earth embankment. Discharge over the spillway is controlled by 23 radial gates, each 40 ft. wide by 32 ft. high. The five turbines are each rated 42,000 hp. at 52 ft. head at 94.7 rpm. They are designed to yield best efficiency under a 57 ft. head and are built to operate under a maximum head of 63 ft. Turbine guarantee includes deliverance of 30,000 hp under a minimum head of 40 ft. The turbines are of the Kaplan adjustable-blade propeller type with runners 19' 6" diameter. Four of the Watts Bar generators are connected by pairs to two transformer banks with 15 kw. 1,000,000 kva. breakers and one generator to an individual transformer through a motor operated disconnect. Three phase transformers have been used for straight two winding transformations and are rated 30,000 kva. self-cooled, 40,000 kva. forced air-cooled. The 161 kv. windings are shielded against surge voltages, the neutrals are insulated for 46 kv. and grounded through 100 ohm. reactors.

### APALACHIA

The second plant is a tributary medium head type. Apalachia Dam is located on the Hiwassee River and is connected to the power-house 12 miles downstream by a tunnel. The dam having a storage capacity of only 61,250 acre-ft., is primarily a power project. The dam is of the straight concrete gravity structure, 150 ft. high and 1,250 ft. long, with an overflow spillway in the river channel which has a capacity of 150,000 high cfs. and is controlled by 10 32-ft. wide by 23 ft. radial gates. The intake tunnel is, excepting for 6,000 ft. of solid rock, lined for a distance of eight miles with concrete. A 66 ft. differential surge tank, also concrete lined, with a 16-ft. internal riser is at the end of the tunnel. The power-house contains two vertical shaft turbines of the Francis type, each rated 53,000 hp. at 360 ft. head and 225 rpm. The maximum head for this plant is 442 ft., best efficiency is specified for heads between 375 and 440 ft. Each generator is rated 37,500 kw. and since the flywheel effect is 13,200,000 lb. ft. sq. the speed rise is limited to not over 30 per cent above normal with full load rejection and gate closure in 3.6 seconds. Each generator is connected to a 154 kv. bus through a three phase transformer. The ratings of these transformers is 35,000 kva. self cooled, 48,000 forced air-cooled.

## BOOK REVIEWS

### ENGINEERING DRAFTING PROBLEMS

By Kenneth E. Quier. Harper & Brothers Publishers, New York. 16 pp., 80 plates, printed on ledger paper and punched for a standard notebook. Price \$2.50.

The problems are carefully selected to cover both the elements of engineering drafting and professional problems in mechanical, civil, chemical, and electrical engineering. The entire course content of the ASTP course in engineering drawing (AST-001, 406) is incorporated, including jigs and fixtures, punch and die work, cams and gears, springs, and lofting principles applied to airplane fuselage and ship contour lines. The problems are organized topically, and hence the workbook can be used with any standard text in engineering drawing. For brief and concentrated courses it can be effectively used without an accompanying text. The order of development is progressive and logical. Engineering Drafting Problems is a thoroughly professional text, designed to prepare the student directly for drafting positions in industry. Emphasis is placed upon increasing his ability to visualize objects in three dimensions. The author is a practising engineer, who does consulting work in addition to his teaching.

### REINFORCED CONCRETE WATER TOWERS, BUNKERS, SILOS, AND GANTRIES

By W. S. Gray. Second (revised) Edition. 226 pp. 183 illus. London Concrete Publications, Ltd. Price 10s.; by post 10s. 7d.

Post-war schemes for a more general supply of water, particularly in rural districts, will call for many more water towers of varying heights and capacities. New developments in power stations, gasworks, collieries, and the heavy industries will result in the erection of bunkers, silos, and other storage structures together with suitable handling plant.

To engineers called upon to design these structures this convenient book will be of considerable use. The first part deals with elevated tanks of various shapes—circular, rectangular, conical, and the less common (in Great Britain) Intze tank. Methods of calculation of sections and reinforcement are given with examples taken from actual practice. The storage of hot liquids gives rise to many problems for the designer, and the treatment of this subject should be of assistance.

The second part deals with bunkers and some of the ground bins and pits met with in schemes for the storage and handling of various industrial materials, from the heaviest ores to the lightest coke. The author's treatment is practical rather than theoretical, and is illustrated by many actual examples.

After dealing with the calculations (and giving new tables) for the design of silos by Janssen's and Airy's formulae and the wind stresses in the legs of towers with and without braces, the author includes a section on the actual construction of the types of structure dealt with earlier in the book. This contains many practical hints which the young engineer should lay to heart.

The last section, on gantries, deals with a type of structure which is coming into more frequent use.

### STATICALLY INDETERMINATE STRUCTURES

By R. Gartner. London Concrete Publications, Ltd. Price 5s.

The author begins this book of 96 pp. by explaining what are statically indeterminate structures and how they may be made determinate by imaginary cuts or

## Book notes, Additions to the Library of The Engineering Institute, Reviews of New Books and Publications

hinges inserted in the members. Equations are then derived connecting the deflections of the primary case with those in which the structure is acted on by  $n$  unknowns assumed as unity. The relation between the virtual work done by the external forces and the work done by the internal forces is then found. These are used in one example to find the moments at the supports of a continuous beam of four spans. A valuable comparison is made between taking the moments and the supporting forces as the unknowns. Another example deals with two-hinged frames, and this is followed by the determination of the most economical shape of frame to carry certain loads. The next section deals with continuous beams and fixed points, and this is followed by examples of structures in which there is only one unknown in each equation of deflections.

A considerable portion of the book is devoted to building frames; there is one section on frames with pitched roofs and column footings fixed. Another treats in great detail multi-story single span frames and three-span single-story frames under wind load. An interesting section dealing with the amount of possible error due to the choice of the unknowns brings this useful book to an end.

## BOOK NOTES

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet all of these books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

### AERODYNAMICS

By L. R. Parkinson. Macmillan Co., New York, 1944. 112 pp., illus., diags., charts, tables, 8½ x 5½ in., cloth, \$2.25.

This introductory work presents briefly both elementary and advanced phases of the science of flight. Beginning with the

theoretical consideration of atmospheric properties and airflow over surfaces, the author continues with practical discussion of lift and drag, stability and airplane performance. The final chapter explains the construction and use of wind tunnels.

### ALIGNMENT CHARTS, Construction and Use

By M. Kraitchik. D. Van Nostrand Co., New York, 1944. 94 pp., charts, tables, 9¼ x 6 in., cloth, \$2.50.

The opening section of this book provides a review of the algebra, analytic geometry, and determinants necessary for an understanding of the methods of chart construction. The representation of various equations is then discussed and illustrated by means of exercises. Applications are made to the fields of chemistry, engineering, manufacturing and investments. Some of the charts given are ready for use.

### CLOUDS, WEATHER and FLIGHT

By T. C. Gillmer and H. E. Nietsch. D. Van Nostrand Co., New York, 1944. 161 pp., illus., diags., charts, maps, tables, 11¼ x 8½ in., cloth, \$3.75.

The contents of this book represent a development of the basic physical laws of the atmosphere into the principles of air mass analysis and forecasting. Part I covers this material generally for the layman. Part II considers the application of the study of meteorological conditions to aviation, with a special chapter on weather hazards. Part III discusses gliding and soaring flight. The book is copiously illustrated and has a glossary of meteorological terms.

### COMBUSTION ON WHEELS, an Informal History of the Automobile Age

By D. L. Cohn. Houghton Mifflin Company, Boston, 1944. 272 pp., illus., tables, 8 x 5 in., cloth, \$2.75.

The subtitle, "An Informal History of the Automobile Age", is an apt one. In narrative form the author describes the rise of the automobile from an infrequent curiosity to its present position as the product of a tremendous industry. Its impact, both beneficial and otherwise, on all aspects of American life is fully discussed with serious intent, although the general touch is light. Many humorous anecdotes and two groups of photographs provide further interest.

### ÉCOLE POLYTECHNIQUE FÉDÉRALE, Publications du Laboratoire de Photo-Elasticité, No. 1. Etude expérimentale et théorique de la repartition des tensions dans les poutres encastrées.

By M. Robert. S. A. Leemann Frères & Cie., Stockerstrasse 64, Zurich, 1943. 144 pp., illus., diags., charts, tables, 9 x 6 in., paper, 9 Sw. frs., 5.80 rm.

The distribution of internal stresses in a fixed beam is described in detail as determined from three transparent models. The theoretical calculations are verified by experiment with photo-elastic methods and cover a varying set of conditions. Numerous tables and plates and a bibliography are appended.

### ECONOMICS AS APPLIED TO PRODUCTION AND FACTORY ORGANIZATION

By A. H. Huckle. Mitre Press, Mitre St., London, E.C.3, 1944. 139 pp., charts, diags., tables, 8¾ x 5½ in., cloth, 15s.

This book presents a general review of the method of achieving economic co-ordination of the departmental activities throughout a manufacturing organization. Planning procedures are given for estimating machine and labour requirements, for establishing factory layouts and production routing, and for tool and gauge control. Sales budgeting, purchasing, costing and other financial problems are also considered.

### ESTIMATING BUILDING COSTS

By C. F. Dingman. 3 ed. McGraw-Hill Book Co., New York and London, 1944. 401 pp., illus., diags., tables, 7 x 4 in., fabrikoid, \$3.00.

This practical handbook analyzes construction projects into component operations and establishes the cost price to assign to each. The present edition, after a lapse of thirteen years, has been considerably revised, particularly in the methods of earth handling and moving and of concrete handling and finishing. Entirely new chapters on plumbing and heating have been added.

### FATS AND OILS, an Outline of Their Chemistry and Technology

By H. G. Kirschenbauer. Reinhold Publishing Corp., New York, 1944. 154 pp., illus., diags., tables, 9¼ x 6 in., cloth, \$2.75.

A brief, simple survey is presented of the origin, methods of extraction, chemistry and processing of fats and oils derived from plants and animals. Nearly half the book is devoted to the technology of production and refining and to the uses of fats and fatty derivatives in various industries. It is especially designed

(Continued on page 211)

# PRELIMINARY NOTICE

of Applications for Admission and for Transfer

FOR ADMISSION

March 5, 1945.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described at the April meeting.

L. AUSTIN WRIGHT, General Secretary.

\*The professional requirements are as follows:—

**A Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupillage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

**A Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examination of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

**A Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

**An Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

**ANDERSON—DAVID ADDIE**, of 87 Bellwood Ave., Ottawa, Ont. Born at Stratford, Ont., Dec. 5th, 1893. Educ.: I.C.S. course; 1911-12, shift operator in power house, Ontario Hydro Elec. Power Commn., Kitchener & Niagara Falls; 1913-20, i/c power house, 2,000 h.p. hydro elec. for Assoc. Gold fields, also i/c erection of first head frame & installn. of mining machy.; 1921-24, constrn. supt., erection & installn. of 15,000 h.p. elec. steam turbines & boilers, Tampico Light, Heat & Power; 1925-26, travelling elect. supervisor for mtce. of several plants, Eagle Oil Co., Tampico, Mexico; 1926, carried out survey of elect. stations of Guanhatto Power Co., covering 3 states in Mexico, etc.; 1927-33, asst. erecting engr., Cdn. Genl. Elec. Co., supervin. of final adjustments on wind tunnel, installn. for National Research Council, etc.; 1933 to date, works engr., Electric Reduction Co. of Canada, Ltd., Ottawa, Ont.

## LIBRARY NOTES *(Continued from page 207)*

for students in the branches of industrial chemistry utilizing the products discussed.

### HANDBOOK FOR SHIPWRIGHTS

By H. F. Garyantes. McGraw-Hill Book Co., New York and London, 1944. 602 pp., illus., diags., charts, tables, 9 x 5 $\frac{3}{4}$  in., cloth, \$5.00.

This comprehensive training guide is intended to explain to the student or mechanic the fundamentals of the work of the shipwright in connection with steel hulls of present-day design. It begins with a preview of mathematics and geometry. Several chapters are devoted to ship's lines, tools, ropes, fastenings and the effects of welding, shoring, fairing and staging. In the rest of the book a sequence of operations is carried through from the laying of the keel to the launching of the ship.

### HIGH-SPEED COMBUSTION ENGINES: Design, Production, Tests

By P. M. Heldt. (12 ed. of *The Gasoline Motor*) publ. by the Author, Nyack, N.Y., 1944. 776 pp., illus., diags., charts, tables, 8 $\frac{1}{2}$  x 5 $\frac{1}{4}$  in., cloth, \$7.50.

This standard work, now in its 12th edition, provides a comprehensive reference book for engineers as well as a textbook for students. The separate working parts of the high-speed combustion engine are covered in detail, including chapters on the carburetor and ignition equipment not previously included. Theory, design principles, production practice and operation are all given consideration, and two chapters are devoted to engine tests and the thermodynamic laws.

### HIGHER SURVEYING

By A. L. Higgins. Macmillan and Co., New York and London, 1944. 463 pp., illus., diags., charts, tables, 9 x 5 $\frac{3}{4}$  in., cloth, \$5.00.

The student is assumed to be acquainted with such elementary operations as chain surveying, levelling, traversing and plane tabling. On this basis the author proceeds to deal successively with engineering surveys, photogrammetry, field astronomy, geodetic surveys, and finally with the errors which are inherent in surveying practice and how they may be controlled. A series of practical questions and problems is included.

### PEACE, PLENTY AND PETROLEUM. (Science for War and Peace Series.)

By B. T. Brooks. Jacques Cattell Press, Lancaster, Penna., 1944. 197 pp., maps, charts, tables, 7 $\frac{3}{4}$  x 5 $\frac{1}{4}$  in., cloth, \$2.50.

Following a brief historical survey of the American petroleum industry, the author devotes several chapters to the importance of petroleum in our industrial economy with particular reference to war needs. Petroleum substitutes are discussed, and the geographical distribution and political implications of petroleum deposits are thoroughly covered. The author emphasizes the steady decrease in new producing areas in the United States and discusses the problems arising in connection with the increase in our need for foreign oil.

### METALS AND ALLOYS DICTIONARY

By M. Merlub-Sobel. Chemical Publishing Co., Brooklyn, N.Y., 1944. 238 pp., 8 $\frac{3}{4}$  x 5 $\frac{1}{2}$  in., cloth, \$4.50.

Over 10,000 useful metallurgical terms are contained in this reference volume: definitions of metallurgical terms; compositions, properties and uses of all important commercial alloys; physical constants and properties of the chemical elements; brief descriptions of machinery and processes used in modern metallurgy; etc. Many trade names are included.

### RADIO'S 100 MEN OF SCIENCE, Biographical Narratives of Pathfinders in Electronics and Television

By O. E. Dunlap. Harper & Brothers, New York and London, 1944. 294 pp., illus., 8 $\frac{3}{4}$  x 5 $\frac{3}{4}$  in., cloth, \$3.50.

The brief biographies in this readable book cover a wide field. The first section is devoted to pioneers of electricity, from Thales of Miletus to Mahlon Loomis. The second section traces developments in radio and electronics from Hughes's invention of the microphone to the present day. The sketches are good and are in many cases based on personal acquaintance. Nearly one-half of the men are living. Portraits of almost all of them are included.

### ROCKET RESEARCH, History and Handbook

By C. P. Lent. Pen-Ink Publishing Co., New York, 1944. 102 pp., illus., diags., charts, tables, 9 $\frac{1}{4}$  x 6 in., stiff cardboard, \$5.00.

The early history and present status of the development of rocket and jet propulsion are well presented in this small volume. The author covers both theory and practical application, including descriptive material on the various types of weapons brought out by the war. The text is illustrated by more than one hundred photographs and diagrams, and some 150 American and British patents are listed.

### SHEET METAL, Theory and Practice

By J. C. Butler, drawings by L. O. Genereux. John Wiley & Sons, New York; Chapman & Hall, Ltd., London, 1944. 173 pp., illus., diags., charts, tables, 11 $\frac{1}{4}$  x 8 $\frac{1}{4}$  in., cloth, \$3.00.

This concise, practical self-instruction guide gives methods for handling successfully tools and machines, material allowances, blueprint reading, soldering, fluxes, welding and riveted assembly as used in sheet-metal shop practice. The material was originally prepared as a training programme in marine sheet-metal work, and the emphasis is on marine applications.

### SOLVENTS (Monographs on Applied Chemistry, Vol. 4)

By T. H. Durrans. 5th ed. rev. & enl., D. Van Nostrand Co., New York, 1944. 202 pp., diags., charts, tables, 8 $\frac{3}{4}$  x 5 $\frac{1}{4}$  in., cloth, \$6.00.

The first part of this book deals with scientific fundamentals: solvent action, solvent power, plasticising solvents, solvent balance, viscosity, vapour pressure and evaporation, rates, inflammability and toxicity. The second part deals comprehensively with individual solvents, mainly with the view of facilitating intelligent use of them in the cellulose-lacquer industry. A table of solubilities and a dictionary of trade names are appended.

## NOTICE

Technical personnel should not reply to any of the advertisements for situations vacant unless—

1. They are registered with the Wartime Bureau of Technical Personnel.
2. Their services are available.

A person's services are considered available only if he is—

- (a) unemployed;
- (b) engaged in work other than of an engineering or scientific nature;
- (c) has given notice as of a definite date; or
- (d) has permission from his present employer to negotiate for work elsewhere while still in the service of that employer.

Applicants will help to expedite negotiations by stating in their application whether or not they have complied with the above regulations.

## SITUATIONS VACANT

GRADUATE CIVIL OR MECHANICAL ENGINEER wanted. See page 53 of the advertising section.

DRAUGHTSMEN AND ENGINEERS, Mechanical, electrical and concrete draughtsmen and designers wanted by pulp and paper company. Apply to Box No. 2890-V.

GRADUATE MECHANICAL ENGINEER for post-war position, age about 35 with production and executive experience required by internationally-known firm of manufacturers of steel building products, to act in senior plant position in U.S.A. Successful candidate must be adaptable, desirous of co-operating in development of new products and production of same, and preferably with some experience in handling labour. Present purpose is to establish contact with suitable applicant with a view to prompt action when regulations permit. Apply to Box No. 2901-V.

## ENGINEERING STAFF REQUIRED IMMEDIATELY

BY A LARGE  
PULP AND PAPER COMPANY  
IN THE  
NIAGARA PENINSULA DISTRICT  
*Permanent Employment for  
Suitable Men*

### A CHIEF DESIGNING ENGINEER

to take charge of Draughting Office. Mechanical and Civil preferred. Must have Pulp & Paper Mill experience.

### A MECHANICAL DRAUGHTSMAN

preferably with Pulp & Paper Mill experience but not essential. Must have good industrial plant experience.

### A STRUCTURAL DRAUGHTSMAN

with good industrial plant experience.

Applicants must be available in accordance with Regulations P.C.246, Part 3, Jan. 3, 1943, administered by the Wartime Bureau of Technical Personnel.

Address replies to Box 2909-V, Employment Service Bureau, The Engineering Institute of Canada, 2050 Mansfield St., Montreal, P.Q.

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

POST-WAR POSITION IN ENGLAND for an experienced executive with sales engineering background, preferably including export work, with a well-established, internationally-known firm of steel building products manufacturers. Senior position overseas. Desirable age limit 37-42 years. Position will require ability, tact, vision, enthusiasm and hard work. Present intention is to establish contact now with suitable applicant, although overseas move will not be made till war conditions permit. Some months of familiarization with future duties would be arranged for at a U.S.A. point. Apply to Box No. 2900-V.

ELECTRICAL SALES ENGINEER for western firm specializing in engineering sales and service of all types of electric machinery and similar equipment. The position would be permanent and on a salary basis. Applicants should state: training, experience, age, nationality and availability. Apply to Box No. 2911-V.

## SITUATIONS WANTED

UNIVERSITY GRADUATE with 20 years' varied experience in mechanical, structural and chemical engineering on design, construction, maintenance, operation and management of pulp and paper mills, railroads, steamships and public utilities available on short notice for senior responsible position. Apply to Box No. 423-W.

MECHANICAL ENGINEER, J.E.I.C., J.A.S.H., & V.E., B.S.C. 1936. Age 30, married. British nationality; Canadian citizenship. Experience includes four years on design, test work and sales engineering with manufacturers of complete line of fans and air handling equipment, as well as domestic and commercial heating and air conditioning equipment; one year lecturer and demonstrator in mechanical engineering at leading Canadian University; two years engineer in charge of grey iron foundry in large metal industry; two years on industrial ventilation and dust control problems, including design, experimental and development work principally on gas and dust scrubbers. Ontario location preferred. At present employed and on military postponement, but services available under regulation PC 246 Part 3, administered by W.B.T.P. Apply to Box No. 1484-W.

CHEMICAL ENGINEER, seven years' experience on production and inventory control; distillation, solvents, analysis. Available under W.B.T.P. regulations. Now residing in Montreal. Apply to Box No. 1827-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., R.P.E. (Ont.) 35 years of age, 10 years' general contracting experience; 6 years sales engineering and executive experience with manufacturer of construction materials. At present holding commission in R.C.A.F. Works and Buildings branch, desires contacts in construction field for employment in near future. Apply to Box No. 2471-W.

GRADUATE ENGINEER, M.E.I.C., R.P.E. (N.B.) with 30 years practical experience in design and construction of industrial plants, reinforced concrete, steel, timber, steam heating, water supply installation, sewerage, wharves and docking facilities, quantity and cost estimates. At present holding position of responsibility, seeks position of responsibility with industries which contemplate building or expanding. Apply to Box No. 2472-W.

CIVIL ENGINEER, executive, M.E.I.C., recently completed tropical contract, seeks new connection Canada or abroad. Twenty-five years' engineering and executive experience. Clean record and best of references. Available immediately. Apply to Box No. 2474-W.

ELECTRICAL ENGINEER, M.E.I.C., P.E.Q., 37, married; experienced in industrial plant design, layout, alterations and construction, application of motors and control, also considerable mechanical experience. City of Montreal preferred, presently located in Ontario, available on one month's notice. Apply to Box No. 2475-W.

## FOR SALE

Tyco compensated aneroid barometer reading to 5,000 ft. or 31" of mercury. Apply to Box No. 57-S.

## WANTED

TRANSIT—Advertiser will pay moderate price for used transit in serviceable condition; any good standard make, stadia cross-hairs not essential but half of full vertical circle desirable suitable for reasonably close levelling work. Also extensible levelling rod and few steel shod transit pickets. Apply to Box No. 58-S.

# FARM ELECTRIFICATION—A NEW SCIENCE

J. W. TOMLINSON

*Assistant General Superintendent, Manitoba Power Commission, Winnipeg*

Paper presented at the Fifty-Ninth Annual General Professional Meeting of The Engineering Institute of Canada, at Winnipeg, Man., on February 7th, 1945.

Canada's economy depends upon half the population living in rural areas and we must find ways and means of keeping the standard of living in rural areas not too far behind that of towns and cities if we are to keep some of the younger generation in the rural areas. It is becoming evident that central station power is the most powerful single instrument in raising the standard of living on a farm. Apart from all the common uses which come to our minds such as lighting, radio, refrigeration and power for a dozen jobs around the farm-yard, electric power makes automatic pressure water systems feasible, which in turn make modern plumbing possible. It has been reliably estimated by farm rehabilitation authorities that, where adequate electric power is available on the farm, every dollar spent upon farm rehabilitation will get double the results.

In the next decade, the "other half of the population" is going to get electric service. While there will be a place in this programme for individual wind-electric plants, gasoline and oil engine plants, etc., for the vast majority, central station power is the final answer. The sooner governments, manufacturers and utilities get their engineers together to devise ways and means of accomplishing this, the less money will be wasted on inadequate alternatives which will not satisfy but will impede the final plan which depends so much on high saturation of the farms in any area to make it practical.

Bringing the multiple benefits of central station electrical service to Canadian farms is so different to serving towns and cities, that it should be treated as a separate specialized branch of electrical engineering.

It was more or less natural that rural electrification should have been begun by extending city feeders out into the surrounding farm areas. This has served a very useful purpose as a demonstration or test to show the rural population the many very beneficial uses for electricity on the farm. However, now that this stage is past and farm electrification is recognized as a necessity rather than a luxury, having farm electrification handled by city utilities who have, by necessity, adopted city standards and methods of construction, can become a great handicap.

There are several major differences between these two branches of power distribution. They are closely related, but while they may be sisters, they are not twins. First there is the problem of economics, or financing. In the past, annual revenues have been called upon to pay 6 per cent interest, provide a replacement or sinking fund to pay off the debt in twenty years, and establish a depreciation reserve to assure that, at the end of twenty years, the system will still be as good as new. This may have been justified in part when the industry was experimental but it gives to the next generation a complete system, free, without debt, and generally good for at least another twenty years.

It would appear that the average life of distribution equipment is well over twenty-five years. If the borrowed money is paid off in twenty-five years so that

a new system can be financed at that time, the next generation should be satisfied, even if the old system is worn out or obsolete. This type of financing would call for less than half the return on the dollar invested; thus lines could be extended twice as far per dollar revenue. We sincerely hope that utilities will revise their financing for farm electrification. City revenue has been able to stand the strain, whereas rural electrification cannot, and still be practical.

Another difference is that types of equipment ideal for farm lines are often radically different from those required for city feeders; for example, hardware, anchoring, transformers, oil circuit breakers, span lengths, etc. The 150-ft. span, while ideal where houses are 50 ft. apart, just means higher first cost and more poles to straighten, fire guard, and replace, when used on farm lines. The size of conductors used on farm lines was influenced for many years by the sizes made and stocked for city or town use. In cities, we deal with load currents of hundreds of amperes, on farms we deal with fractions of amperes. In cities network, capacity results in short circuits of hundreds of thousands of kva.; in farm networks, impedance of transformers and lines generally limits the fault capacity to one or two thousand kva. In cities or even towns, one mile of primary will serve about one hundred customers. On farm lines in the prairie provinces, one mile will, on the average, serve two customers.

The types of construction crews and their equipment, even the mental processes of the engineers, inspectors and management are different, and cannot readily be changed to incorporate the fundamental differences between city and rural distribution.

The above are cited to show that these two "sisters," while related, are vastly different, and that farm electrification cannot successfully be handled by slightly modified city methods. To make it a success in the prairie provinces, or anywhere where saturation is only two customers per mile, every utility intending to serve farm load should delegate an engineer, preferably a junior engineer, to study the subject, especially the results of experiments already conducted by others. He would thus prepare himself to attend a conference of as many specialists in this line as possible to pool experiences and draw up uniform standards so that the best overall results can be obtained at the least cost. In the above mentioned type of farm electrification, there is no margin for error; both the utility and customer will suffer unless most of the weaknesses are eliminated at the start.

In our study of farm electrification as a post-war programme for Manitoba, we have concluded that it is very necessary to keep an open mind. Every suggestion, no matter by whom it is made, or how revolutionary, must be considered in the light of the needs of farm electrification. Necessity is the mother of invention and a cheaper way will always be found to do things if we cannot afford the method in vogue. For this reason, I would like to pass on to those interested in this specialized line a few necessities, and in some cases possible solutions.

NEW CONDUCTORS

The first requisite for farm line conductors is high tensile strength, the second is durability; (low resistance is a prerequisite for a "conductor"). We have two low cost metals, copper and aluminum which are good conductors, but neither has high tensile strength. Steel is a relatively poor conductor but has high strength and durability. To combine some of these characteristics, composite conductors have been used wherever longer spans were desirable.

TABLE I  
PHYSICAL CHARACTERISTICS OF CONDUCTORS

Metal	Strength Tensile psi.	Moduli of Elasticity psi.	Weight 1,000,000 CM per 1000 ft.	Resistance 1 CM ft.	Temp. Coeff. Per deg. F.
Steel	180,000	30,000,000	2640	111,007	0.000,0064
Copper	65,000	16,000,000	3027	10,692	0.000,0093
Aluminum	26,000	10,000,000	920	17,002	0.000,0128

If the reinforcing material were similar to the current carrying material in respect of modulus of elasticity, coefficient of thermal expansion, corrosion resistance, and electro-chemical potential, no difficulty would be experienced. The characteristics of the metals at present in general use in conductor design are shown in Table I. Dissimilar mechanical characteristics, such as moduli of elasticity, and temperature coefficient result in variable internal stress distribution. In this respect, there is less difference between copper and steel than between aluminum and steel so that, physically, C.C.S.R. (copper cable steel reinforced) is better than A.C.S.R. (aluminum cable steel reinforced).

The corrosion problem where two electro-chemically dissimilar metals are in contact has received much study and research by experts in all countries, and is still an important factor in the planning of long life projects, but in prairie farm country the atmosphere is relatively pure and we can rest assured that other factors unless improved will wear out the conductor before corrosion causes failure. However, in coastal

areas or factory districts where contamination exists, ordinary steel reinforced cables will not last twenty-five years without seriously reducing the factor of safety. In Europe where both A.C.S.R. and C.C.S.R. have been used for ten years, the evidence is that the corrosion problem is more serious with A.C.S.R. than with C.C.S.R. American experience with A.C.S.R. has been satisfactory as far as corrosion is concerned, so perhaps this hazard has been overemphasized.

A more prominent hazard to the long life of transmission line conductors is vibration fatigue. Because of excessive temperature variation in Canada, the position of metals in the temperature coefficient tables is more important than their position in the electro-chemical series. Theoretically, when two metals are rolled, stranded, or clamped together they should have the same temperature coefficient of expansion so that they share the tension properly at all temperatures; otherwise at low temperatures one metal tends to assume all the tension, thereby becoming overstressed. Obviously the ideal conductor would have the strength, elasticity and temperature coefficient and durability of steel, and the conductivity per unit cost of aluminum. *An alloy approaching this should be the aim of modern metallurgy.* The prize would be worth the effort since half a million miles of this conductor could be used in Canada alone in five years after the war.

Copperweld conductors have achieved a method of making a composite copper-steel conductor which defies the temperature co-efficient and corrosion problem, but the fabrication costs are so high that the cost to the utility is around 300 per cent of the base metal cost.

Aluminum has always enjoyed a decided advantage in weight for equivalent conductivity and has been widely used in spite of its lack of durability. Its high temperature coefficient causes the aluminum strands (in A.C.S.R.) to assume all the tension at low temperatures. Because of its low tensile strength, the aluminum becomes stressed beyond its elastic limit, even though a liberal factor of safety was allowed for the overall cable in the design. The breaks occur at ties and clamps where the aluminum is subject to both bending and

tensile stress. The same phenomenon applies to C.C. S.R. to a lesser degree, but copper is more ductile, which relieves the overstress, and is also less subject to crystallization after bending.

In assuming a factor of safety for composite cables, it should be assumed that the cable is strung and clamped at say 90 deg. F., then cooled to 30 deg. F. (below zero) and then analyze the tension in each metal, and apply the factor of safety to the one most highly stressed.

Wartime use of steel as a transmission line conductor has opened our eyes to the possibilities of this low cost, high strength, durable conductor for use wherever higher resistance is permissible. Again we were slow to see its possibilities mainly because town and city feeders and city distribution voltages required low resistance. Investigation of steel as a conductor has brought to light that the resistance varies with type of steel, method of rolling, drawing, and galvanizing. Certain types show resistance as much as 20 per cent less than others, but are not obtainable in Canada at the present time.

#### CHOICE OF SPAN LENGTH

Table II gives pertinent data and the relative costs of conductor for a mile of farm line, using various types of conductors.

It should be remembered, however, that there are other costs in a mile of line, such as poles, labour, hardware, etc., and since certain conductors are more suitable than others for longer spans, it is sometimes good economy to invest more in conductors to save poles and labour. Table III is a comparison of costs for various numbers of poles per mile. When the number of poles is reduced below fifteen per mile, line design based upon 35-ft. poles is necessary to obtain adequate ground clearances.

A tremendous number of poles will be required for the post-war farm electrification construction on this continent and it will be well to conserve poles by choosing conductors suitable for longer spans. In the past, the ruling span for rural lines has been approximately 300 ft. The number of poles required can be reduced about 25 per cent by using a ruling span of 375 ft. The span lengths used in the design of rural lines has two governing factors, the strength of poles and the allowable sag for clearances.

Using 30-ft. Class 6 poles, a maximum span of 485 ft. is indicated by the strength of the pole (safety factor 2.0—see Table IV). However, to maintain adequate clearances on 30-ft. poles, a rural conductor with a tensile strength of 3,000 lb. is required. The sag should preferably be based on an optimum final sag at 45 deg. F. (mean temperature between -30 deg. F. and 120 deg. F.) which is determined by the apex of the sag—tension parabola. At this point the variations of tension and sag are most uniform. This, however, is controlled

by two limits—(a) The ice loading condition which must not stress the conductor to more than 60 per cent of its ultimate strength, and (b) Initial stress at zero fahrenheit without ice loading must not exceed 30 per cent of ultimate strength.

This second limit is designed to prevent vibration and should be effective where all spans are nearly equal. There seems to be a critical ratio of sag to span length where vibration starts, regardless of tension. If some spans are shorter than the ruling span for which the line is designed, the conductors tend to vibrate at lower temperatures. In Manitoba, cold weather lasts long enough to break strands in short spans with certain types of conductors during the first winter after erection.

When longer spans are used on wood poles, a smaller coefficient of expansion is a distinct advantage since the variation in sag will be less. Thus steel has the advantage over copper, and both are better than aluminum.

Wherever vibration is a possibility, triangular configuration of the conductor is desirable, since it has been proved beyond doubt that smooth body conductors are more subject to vibration.

With the abundant post-war supply of aluminum, it behooves the aluminum metallurgists to produce an alloy which has a higher strength and can be hard drawn, even if some weight and conductivity are sacrificed. Otherwise the above considerations and shortage of poles will tend to discourage its use.

TABLE IV  
CLEARANCE AND ALLOWABLE SAG USING  
30-FT., POLES

Span length, ft. . . . .	200	250	300	350	400	450
Required clearance, ft. . . . .	18.5	19.0	19.5	20.0	20.5	21.0
Allowable sag, ft. . . . .	6.0	5.5	5.0	4.5	4.0	3.5

#### CHOICE OF VOLTAGE

Long study and experience has proved that 7200/12480 volt transmission is the most economical for thinly distributed loads up to 300 kva. and distances up to thirty miles. Table V shows the uniformly distributed load which can be transmitted various distances with different percentages of allowable regulation. Until these are tabulated, it is very difficult to realize the vast difference between 2300/4160 wye, and 7200/12480 wye systems. The ratio for single phase lines is nine to one, making it possible to transmit nine times as far at 6900 volt, single phase.

These charts are very handy in laying out farm networks to determine how far to extend three phase trunks or low resistance conductor single phase trunks, and which branches can be steel wire or other relatively high resistance conductors.

Assuming all the farms in an area will finally take service and that a good load building programme has

built up the average consumption to 200 kwh. per month, the diversity should result in an average demand per farm of 1.0 kw. for branch lines, and 0.75 kw. for trunk lines, and a totalized demand of 0.5 kw. on substations. On this basis, if a farm line has a density of two customers per mile, 3/13 steel wire (copper equivalent No. 16) can be extended six miles from a 6900 volt substation with only 3 per cent voltage drop in the line.

If the same branch line were served at 2300 volts, the conductor would have to be equivalent to No. 6 B & S. Reference to Table II shows an increase in conductor cost of over \$100 per mile.

### GROUNDING

Based upon present practice, it seems a foregone conclusion that farm lines will be single phase grounded vertical type. Necessity for economy dictates star connected substations and distribution transformers in order to keep the voltage class down to the minimum. Long experience in rural electrification serving towns and villages has indicated that the overall safety is greater when all grounds are inter-connected. This results in a common neutral system, and when applied to farm electrification will cover large areas within which considerable variation of ground resistance is to be expected.

The net ground resistance of the common neutral which is safe for farm lines is a very important question. The relative safety of a grounding system is generally judged by how much potential can or will be built up on the neutral; but the hazard is actually due to the potential gradient between any two points between which a person or animal can come in contact.

The Rural Electrification Administration in the United States recognizes that the problem is one of potential gradient and has made studies and tests to evolve methods of controlling the gradient, both by reducing the resistance of ground rods and by "spread

electrodes" to reduce the gradient where resistance is high. The hazard from high resistance earth contact or earth return path depends upon possible potential gradient under short circuit conditions. By covering the ground wire down the pole the problem becomes one of potential gradient in the earth surrounding the electrode. Figure 1 shows the decrease in gradient obtained by spreading three ground rods in a 10-ft. triangle. There is no gradient within the triangle, and much less per foot outside the triangle than when a single electrode with the same resistance is used.

All regulations, safety codes, and approved practices are based upon conditions in towns and cities where conditions are entirely different. The National Safety Code (U.S.A.) calls for individual electrode resistance below 25 ohms, but does not specify the net resistance of common neutral systems, which is the true criterion.

Fig. 1—Potential gradient curve.

Fig. 2—Map showing geological formation of soils and subsoils of Manitoba.

It is generally accepted that if the product of net resistance in ohms of the common neutral return multiplied by the ampere rating of the line sectionalizing fuse or oil circuit recloser is below 150, the system would be acceptable. However, since many different utilities will be engaging in farm construction in areas of varying soil conditions, suitable regulations should be drafted by rural electrification engineers, governing standards for grounding.

In studying this problem in Manitoba, we have come to the conclusion that accurate soil survey data is necessary to determine areas where various types of construction and grounding are adequate. Figure 2 is a Department of Agriculture map showing the geological formation of the soils and subsoils of Manitoba. Ground tests during the past twenty years, supplemented by additional tests recently, indicate that except for small local areas this map shows the subsoil conditions accurately enough so that we can predict that in agricultural areas the ground resistance will fall in three groups.

(a) Approximately 30 per cent of the farm area where single 10-ft. iron rods will average less than 10 ohms. Three rods per farm will average less than 5 ohms.

(b) Approximately 27 per cent of the farm area where single rods will average less than 25 ohms and three rods will average less than 10 ohms.

(c) Approximately 43 per cent of the farm area where single rods will likely average over 25 ohms.

We find that area (a) contains approximately 15,600 farms and will involve over 10,000 miles of farm line. In this area it is obvious that the earth return will be of much lower resistance than the line neutral and will actually transmit the major part of the return current. Under these conditions, magnitude and duration of hazardous potentials would be reduced far more by duplicate electrodes at the farm than by stringing a high cost neutral wire, several miles long, which may be broken, torn down, or burned off in any one of a hundred or more spans.

Statistics indicate that there are over one thousand miles of actual single wire rural lines in use in various parts of the U.S.A. and Canada, which have given perfectly satisfactory service. This type of line is only satisfactory where ground resistance is low and where ground contact can be relied upon.

In area (b), the choice lies between interconnecting the electrodes at various farms by running a continuous low resistance neutral or by installing multiple spread electrodes at the farms and substation to bring the resistance down to five ohms.

Area (c) requires a continuous low resistance neutral and if low common neutral resistance cannot be obtained by multiple or treated electrodes, it may be necessary to isolate the primary neutral.

Fig. 3—Farm service pole.

Fig. 4—Standard farm line pole.

In attempting to evaluate the claim that ground rods alone cannot be relied upon during dry cycles and winter conditions, we find that in the flat prairie country in areas (a) and (b), even when the top soil is too dry to grow a crop, the subsoil is still quite moist. Frost often penetrates five feet in Manitoba, that is why a 10-ft. rod is used. Our studies also revealed that even if the ground rod resistance doubled when the ground was frozen there is very little hazard from potential gradient in the ground around the rod since frozen earth is an excellent insulator, so that potential gradient does not appear on the surface where persons or animals can contact it. Statistics also show that line and transformer faults very rarely occur in the winter, due to the absence of lightning storms and tree troubles.

In considering the above hazards it should be kept in mind that wherever farm animals have received electrical shock and a thorough investigation has been made it has seldom been found that primary current was involved. In almost every case the potential came from 115 volt wiring. In many cases it was traceable to defective wiring due to excessive moisture and in some cases due to lightning damage at some previous time.

The presence of moisture, ammonia fumes and exposure to lightning makes city wiring standards inadequate for use on the farm. Metallic covered wiring such as conduit and flexible armoured cable were devised for and have served well in cities, but are most unsatisfactory on the farm, except possibly in the house. Conduit service entrances, designed to prevent theft of energy in cities, are neither desirable nor necessary on farms. They are not desirable because of moisture condensation in outbuildings and susceptibility to undetected lightning damage. They are not necessary since metering on the pole, instead of inside each building, is much more economical and practical where several buildings are served.

Non-metallic outlet boxes and switch covers would complete the safe, rustless farm wiring installation. New, simple wiring regulations are required, drawn up

by committees who understand both the special hazards and the need for economy and ruggedness in farm wiring.

#### STANDARDIZATION

The results obtained by the Rural Electrification Administration in the U.S.A. by standardization of pole line hardware transformers, metering, etc., are well known. The need for standardization in Canada is realized by both manufacturers and utility men. The difficulty in the past has been that growth of utilities has been spasmodic and unpredictable. However, although farm electrification has been proceeding for some time in various parts of Canada the big programmes will be a post-war feature.

This gives us a golden opportunity to get together while we are waiting and by all using similar items, we will get a much better product for the same cost, or the same standard at a lower cost to the people of Canada.

In spite of past experience, the prairie provinces have great faith in co-operation. Perhaps it is because we are all faced with what is considered an impossible problem, that we have got along so well. Standardization of a rural type distribution transformer, has resulted in both publicly and privately owned utilities obtaining a much better transformer, both electrically and physically, at a lower price. A combination meter and thermal switch box has been developed for erection on the service pole at approximately half the prewar cost of meter box and main switch. Interchange of practical field experience has reduced to a minimum the overall cost of the farm line and service installation. Continued interchange of actual experience with test areas will ensure the utilities of minimum operating costs and, the people of the prairies, maximum service per dollar expended.

The development of a low cost single pole oil circuit recloser for small loads and line voltages up to 15 kv. is proving to be one of the most outstanding contribu-

Fig. 5—Proposed Manitoba Farm Electrification Service area, tributary to Manitoba Power Commission extended network.

tions to rural electrification. Operating reports to date indicate that 92 per cent of all rural line trip-outs are handled by these three shot reclosers without lockout. This means that one of the largest operating expenses, going over lines replacing blown fuses on branch lines, will be greatly reduced and the customer will get much better service without duplicate lines or loop feeds. Many wartime developments in the field of plastics, alloys, wireless communication and power operated construction equipment, when released, will be received with an open mind by farm electrification engineers. It is our duty to keep the standard of service and safety as high as possible consistent with sound economics,

but it is not necessarily our duty to make it so safe or so high a standard that its use is denied to 50 per cent of the population. Highways are safer and better with two traffic lanes, but farm roads are not built that way, and although relatively dangerous, are better than no road at all.

The foregoing description of some of the problems of rural electrification, does not by any means exhaust the list. They are illustrative only. We must view all obstacles as challenges and not accept any difficulty as impossible of solution if we are to prove that the benefits of central station electric service are to be extended to the vast rural areas.

## DISCUSSION

PROFESSOR ANDREW STEWART<sup>1</sup>

As a non-engineer, interested in the problems of farm electrification, Professor Stewart found Mr. Tomlinson's paper encouraging as giving so much evidence of careful investigation and enquiry. His comments would relate to some general aspects of the problem, some of which the author had touched on in his opening section.

(1) Referring to the statement that "in the next decade, the 'other half of the population' is going to get electric service", Professor Stewart, in speak-

<sup>1</sup> Department of Political Economy, University of Alberta, Edmonton.

ing to public audiences on the subject of farm electrification in Alberta, would like to be able to make a positive statement to the effect that the 'other half of the population' would get electric service in the next ten years, but he did not feel that he could take responsibility for such a statement. His reasons were as follows. In the first place, the available information suggests that the mileage of farm line constructed in 1945 will be small because of acute material shortages. Secondly, some of the shortages may well extend into 1946 and 1947. Thirdly, it will take time to develop the organization necessary to undertake a full-scale programme of line construction. Fourthly, even with a full programme under way in the pro-

vince of Alberta it does not seem reasonable to expect that more than 3,000 farms will be connected in only one year. Fifthly, in view of the uncertainties of the post-war period it seems advisable to discount the most optimistic predictions.

(2) Professor Stewart did not share the author's view that "for the vast majority, central station power is the final answer". He believed that, in any general scheme of farm electrification on the prairie provinces, the individual farm plant will occupy a more important place than Mr. Tomlinson's statements imply.

He felt that a programme of complete electrification would take longer than ten years, so that there will be many farmers who may not expect to be served with central station power for at least that period of time. In Professor Stewart's opinion, there is no reason to discourage them from installing farm plants. By this means they will get substantial immediate advantages; and, as long as conditions are such as to favour extension of farm lines, there will be a ready market for used or reconditioned plants.

Second, under present conditions and under conditions which can reasonably be expected, there appear to be many areas in the prairie provinces in which, after considering all advantages and disadvantages, the balance of advantage still lies with the farm plant. He thought it somewhat misleading to refer, by inference, to the farm plants as "inadequate alternatives which will not satisfy but will impede the final plan". A study of farm plants in Alberta, made during the summer of 1944, indicated quite clearly that farmers with plants were particularly anxious to get central station power, provided the cost to them was not entirely out of line with the cost of energy from the plant.

The same study indicated that the calculable cost of energy from the farm plants may not be much, if any, higher than the cost of central station power *under average conditions*. The cost of energy from the wind plant compares quite closely with an estimated average cost for central station power. There are the disadvantages of more limited and less regular service. There appears to be a tendency for farmers to install both a wind tower and an engine. In this combination plant the wind charger is used as the main source of power, and the engine as the auxiliary. This makes for a high investment per farm, but operating costs, including overhead costs, are low per unit of energy consumed. The costs per kwh. for the combination plant compare quite favourably with the cost of central station power. There is the disadvantage of more time and care in the operation and maintenance of the plant.

Professor Stewart remarked that if all farmers connected to the lines are to be brought under uniform rates, the averaging process obscures the difference in costs of serving particular customers. But for purposes of wise decision it is essential to recognize these differences; and, in devising a programme of expansion, to consider whether there is any justification for extending the lines into areas where the additional cost per farm is necessarily relatively high. Looked at in this way, there appear to be many areas in the prairie provinces in which the individual farm plant is to be preferred.

(3) The author's position with regard to financing seemed to Professor Stewart a sound one; as far as it went.

The stockholders who put up the capital to build

a plant in a competitive industry do not expect a return which will (a) yield them interest, (b) maintain the plant through a depreciation reserve; and (c) at the same time enable them to withdraw their original investment, otherwise than by the disposal of their claims over the assets of the business.

However, in regard to farm distribution lines there may be a tendency to underestimate the risk. It is easy after the preparation of an estimate of costs to lose sight of the numerous points at which the estimate is built on what are nothing better than informed guesses. In Mr. Tomlinson's type of farm electrification there may be "no margin for error". (second last paragraph, page 214) but there is inevitably a large error of estimate. Professor Stewart pointed out that if the community is going to insist that a programme of farm electrification be undertaken, the main question is, who is going to carry this unavoidable risk.

PROFESSOR J. W. PORTEOUS, M.E.I.C.<sup>2</sup>

Professor Porteous found the paper very interesting, but one point in connection with Fig. 1, "Potential Gradient Curves", was not quite clear to him. In the case of the single grounding rod, distances are measured from the rod itself while for the triple electrode case, distances are measured from a point midway between two electrodes on the arc of a circle. He would like to see plots of the gradients in various directions near the rods. If his interpretation of the method of measurement was correct he felt that though there would still be a definite advantage for the triple electrode it would not be nearly as great as would appear from the figure.

He would support Mr. Tomlinson's plea for standardization as regards the standard size for transformers, it would obviously be uneconomical to use 5 kva. transformers if the farmer's load were going to be only 800 watts, but on the other hand it would be uneconomical to install 2 kva. transformers and then find that most farmers after realizing the usefulness of electric power would wish to build up their loads to values greater than the installed capacity.

J. W. STAFFORD, M.E.I.C.<sup>3</sup>

Mr. Stafford wished to discuss Mr. Tomlinson's paper only inasmuch as it pertains to conductors. He remarked that varying degrees of variable internal stress distribution in a composite cable are of little importance providing the degree and proportion of stress is known. Unknown quantities are the only ones which can jeopardize a particular design. Known values of stress can be and are taken care of in the recommended values of sag and tension which the manufacturer supplies with his product. Such being the case he considered that there can be no distinction between composite cables of copper and steel or aluminum and steel. So that, on the basis of internal stresses alone, it cannot be said that one cable is physically better than another.

In connection with corrosion, he thought that Mr. Tomlinson would agree that proper engineering records of the progressive effect of atmospheric corrosion on transmission lines are difficult to find. His paper infers that after twenty-five years there may

<sup>2</sup> Department of Electrical Engineering, University of Alberta, Edmonton.

<sup>3</sup> Electrical Conductor Division, Aluminum Company of Canada Limited, Toronto, Ont.

be a serious reduction in the factor of safety of steel-cored cables due to attack on the steel core. Any such progressive rate of attack on the core is almost impossible to determine without dismantling the conductor. However, records of performance of A.C.S.R. lines installed over twenty-five years have not borne out the statement. Mr. Tomlinson had referred to conductor failures in Europe but Mr. Stafford would like to mention that the corrosion problems experienced with some European aluminum cables were, following their failure, found to be due to the composition of the metal used. Some of these cables contained as much as 4 per cent. copper, and others which had been installed near Amsterdam and manufactured by Siemens-Schuckert were alloys of iron and aluminum. Since these two alloying constituents have decidedly detrimental effects on the corrosion resisting properties of aluminum alloys, it was to be expected that corrosion troubles were in some cases severe. In general the higher the purity of a metal, the greater its resistance to atmospheric corrosion. In this same respect Mr. Stafford found it interesting to note that experimental aluminum alloy conductors have been installed on the Duck Cove line of the New Brunswick Electric Power Commission, St. John, N.B., since 1929 under severe salt fog conditions and, when inspected in 1941, were found to be in excellent condition with no sign of corrosion whatsoever. Canadian and American practice has been to produce the aluminum strands of A.C.S.R. from wire bars having an aluminum content of not less than 99.50 per cent. He therefore, heartily agreed with Mr. Tomlinson that the corrosion hazard had been overemphasized, but recognized that there are certain geographical areas where, due to local conditions, one conductor or type of conductor will have a better life expectancy than will its competitor.

To progress to the problem of vibration fatigue in conductors, he pointed out that the degree of remoteness in the temperature coefficient tables of two metals which go to make up a composite cable has no bearing on the endurance limit of the cable or its constituents. The endurance limit in fact is a measure of the maximum loading which a material can withstand without failure under 50,000,000 cycles of completely reversed stress. A clearer picture of the comparison between the fatigue characteristics of various conductor metals would be obtained by examining the ratios of fatigue strength to ultimate strength of the materials. This "fatigue ratio" then gives a comparison of the "durability" of the material in question; the larger the ratio, the more durable the material. Test results for steel, copper and aluminum as used in conductor material show the following values: steel — 30 per cent.; copper — 31 per cent.; aluminum — 33 per cent.

For the actual behaviour of the constituent parts of a composite cable under varying tensions, one must examine the stress-strain curves for the cable derived by test. With a homogeneous cable, this is not necessary, since all values can be obtained by simple calculation when the initial and final Young's modulus for the material is known. With a composite cable, however, there is no direct academic means of making such calculations since resistive forces due to different stranding lays and number of layers are set up, for which allowance cannot be made with any degree of accuracy. Also composite cables have a varying initial modulus which precludes any attempt at accurate calculation. Mr. Stafford did not wish to

dwell upon cable calculations, but for a concise and accurate treatise upon the subject, would recommend a paper by Mr. M. E. Noyes presented before the Distribution Section of the Overhead Systems Committee of the National Electric Light Association in St. Louis, 16th February, 1931, entitled "Mechanical Behaviour of Overhead Conductors Under Change of Stress".

He proceeded to touch briefly upon the choice of span length and in connection thereto with new developments in the conductor field. He did not entirely agree with Mr. Tomlinson's statement that the first requisite for farm line conductors is high tensile strength, the second, durability. Tensile strength is important only for obtaining the maximum *usable* span while still maintaining the limits of allowable sag. He said maximum *usable* span advisedly, because our eastern provinces, while faced with the same problem of electrifying their rural areas, are not always able to take advantage of long span construction because of right-of-way limitations. Average spans for most rural electrification installations in the province of Quebec for example probably do not exceed 250 ft. He would say, therefore, that the prime requisite for rural conductors is *low cost* based upon *usable* tensile strength. "Durability", by which term he assumed that Mr. Tomlinson meant the degree of the ability of a conductor to withstand design conditions, must also be tempered by cost.

In connection with new aluminum alloys for electrical conductors, he found it interesting to note that two such are now in the development stage. One is a heat-treatable alloy, the other is non-heat-treatable. In comparison with A.C.S.R., C.C.S.R. and copper-weld conductors, both new alloys show considerable promise as conductor material for both high and low tension lines from the standpoint of ultimate strengths, endurance limits, resistance to corrosion and last but not least, of cost.

In conclusion Mr. Stafford wished to express his thanks to Mr. Tomlinson for a very apt and able presentation of a timely subject of extreme interest to all engineers.

GÉRALD MOLLEUR, M.E.I.C.<sup>4</sup>

Mr. Molleur would like to ask how the problem of interference with telephone lines presents itself in the prairies, and how it is solved, or intended to be solved, in view of the proposed extensive use of common grounded neutral type of distribution line at 6.9 kv.

He wished to point out that in the province of Quebec, this problem is not so much of a technical nature as of a psychological nature. Rural telephone lines there belong to small companies or co-operatives which have been operating for a good many years, and in many instances, long before any power lines were built in their area.

The maintenance on these lines had been neglected in many places, but the customers were quite satisfied with the service received. So, when a distribution line was built, with the result of interference with telephone service, the blame was laid entirely on the power company. In general it had been very difficult to convince the telephone people that the trouble was due to the poor condition of their line. In several cases, some of the power companies had willingly gone to the extent of paying part or even the full cost of

<sup>4</sup> Quebec Hydro-Electric Commission, Montreal.

restoring these rural telephone lines to proper condition.

These difficulties had resulted in limiting the common grounded neutral type of distribution in the province of Quebec mostly to 2.3 kv., where used at all. Mr. Molleur did not actually remember any specific cases of 6.9 kv. line of this type.

The problem is further complicated by the fact that the rural roads are relatively narrow.

F. T. GALE, M.E.I.C.<sup>5</sup>

Mr. Gale regretted that engineers had not explained the economic side of the rural electrification problem to the people outside of the profession. The public is quite content to leave volts and reactances to our own judgment, but when it comes to dollars and cents, that is another matter. He therefore urged the importance of explaining, to those interested, the part their dollar is to play. This task should not be left to less competent persons.

He remarked that low cost lines have been designed to deliver power to the farmer's yard, and that the following is a breakdown of the cost that would sound reasonable to the man who is putting up the money:

In Alberta, estimates and experience indicate that about \$600 in material and labour is required to build the lines when the farms are three-quarters of a mile apart, which is an average in the province. He could produce material invoices, pay sheets, freight charges, etc., that are irrefutable. This \$600 figure includes everything from a share of the main substation down to the meter in the farm-yard, but does not include any share of the main line and plant that might normally be charged against it.

It is the engineer's duty to point out to those concerned that this initial figure of \$600 represents labour and material in the farm line alone and includes nothing for existing plant. It should also be explained how the monthly charge for service and energy is dependent upon the construction costs. The Alberta rate might be taken as an example.

The company's present monthly charge to the farmer is \$5.00 net including 20 kwh., with excess energy at 2c. This might seem high but Mr. Gale believed that the following breakdown would give its justification:—

1. 2¾ per cent. for depreciation (most business men would tell us this is rock bottom—a single storm could wipe out our depreciation reserve and then we would be in the soup—) Anyway, assume 2¾ per cent. as a bottom figure on \$600; this is \$1.38 a month.
2. Operating charges, including such things as maintenance and ordinary repair of line and equipment, meter reading, and billing, general office and management, say approximately \$2.00 per month. We believe that this figure can be justified, but may be reduced, or even increased a few cents. (The Manitoba preliminary report estimated operating costs at \$1.99).
3. Losses on energy supplied. It is now known that these losses can amount to 40 per cent. It can be shown that losses could amount to \$1.00 per customer per month, basing the cost of power at approximately \$25.00 per hp.-year—nearly the same price the city of Toronto pays the Ontario Hydro. Since this \$1.00 per month is

based on assumption and enough definite load data are not available, to be safe, 75c per month may be allowed.

4. The cost of money. Suppose money for building these lines can be obtained for 4 per cent., that is another \$2.00 per month. To lower this to 3 per cent would bring the monthly cost down by only 50c.

Then we have:

Depreciation .....	1.38
Operation .....	2.00
Losses .....	.75
Cost of capital .....	2.00

Or a total of .....\$6.13  
per month.

And the cost of the 20 kwh. is not included. It is to be understood that these are general figures, but none the less close enough to indicate that any supplier of electricity cannot break even with a \$5.00 monthly minimum and minimum use. How then can the farmer be supplied, as is his just right? A subsidy is suggested — but in Alberta, where the farm population is more than 75 per cent. of the total, the farmer would be paying the lion's share, taking from one pocket to put in another, and further, since the very nature of his business makes it necessary for him to sell on the open market and buy on a protected market, industry's share of the subsidy would be borne by him in increased cost of the things he buys. How much better it would be to keep the farmer in his present position of being able to pay his own way.

Mr. Gale's experience in dealing with the farmer shows that he does not want a hand out. In the Company's particular test area, the farmers were asked for a contribution of \$100.00 and before asking for it its necessity was explained in much the same way as has just been roughly outlined. Every farmer was glad to put up the money. An interesting sidelight to this was that an organizational meeting was held to explain these costs a few days before the provincial election. One party's chief platform plank was to take over the power companies and to give all farmers power at no initial cost.

Without a subsidy, the alternative suggested is to give him as cheap power as it is possible to do so, and promote the use of electricity so that he can improve the quality and quantity of his produce to the extent that he not only supports the plan himself, but in doing so supplies himself with the amenities that go so far in making his place a home.

Mr. Gale again suggested that we as engineers have a duty to explain these things in addition to making our plans on economical and efficient lines.

J. W. SANGER, M.E.I.C.<sup>6</sup>

Mr. Sanger observed that the author had made a contribution which will be of considerable value to engineers assigned to post-war rural electrification programmes. Not unexpectedly, he had confined his paper to the electrification of farms and had presented its problems to us as a new science.

Complete farm electrification on a provincial wide basis, in an area which is predominantly grain producing, undoubtedly presents many opportunities for

<sup>5</sup>Engineer, Calgary Power Company Limited, Calgary, Alta.

<sup>6</sup>Manager, Winnipeg Hydro-Electric System, Winnipeg, Man.

the distribution engineer to do things on a scale and in a manner not attempted heretofore. However, the technical problems will not be entirely new as many of them have been the subject of a considerable amount of investigation and practical experiment in Canada and the United States during the past ten years.

Mr. Sanger thought that, in Manitoba, the most important question is the challenge to management in the matter of promoting by every means possible the highest consumption of energy for which farm income can economically be allocated. It is the extent to which this may be accomplished that will determine the starting point for the distribution engineer. There are pressing needs to get started on the job with the least possible delay. He noted that farm income is now at its peak, consequently there will be required a minimum of effort to obtain customers who are prepared to invest their money in electrical equipment and merchandise. On the other hand, all line materials and electrical appliances are in short supply and are likely to remain so until several months after the termination of the war in Europe. Altogether, farm electrification as an immediate post-war development has many uncertainties and until the situation is clarified the distribution engineer cannot make his final plans. It is for this reason that the Government of Manitoba proposes to make a test installation for 1000 farm services when the necessary equipment, merchandise and labour are available.

In Mr. Sanger's opinion there does not appear to be any good reason why the history of the growth of domestic load in Winnipeg cannot be used as a criterion of what might be accomplished in the rural parts of the province. It is true that the difference between urban and rural rates must be taken into consideration, but our present conception of standard rural rates would be radically changed if there could be any assurance of eventually obtaining public acceptance of the completely electrified rural home. The electric iron, radio, washing machine, refrigerator and water pump are expected to be standard equipment on the farm but the extent to which the electric range and water heater will be used cannot be forecast closely enough to be of any value. As these two home appliances together represent a monthly consumption of at least 500 kwh., too much weight cannot be placed on their importance in the general scheme.

The author had paid particular attention to the problem of grounding and it might be suggested that at some future time a whole paper be devoted to this subject. It is difficult for the urban engineer to reconcile himself to dispensing with the neutral conductor. His urban experience with the corrosion of ground rods and the drying out of soil under conditions of persistent fault currents makes him somewhat hesitant to approve of this practice. However, the practice should not be condemned until there is ample evidence that low resistance grounds cannot be maintained with reasonable certainty.

The author's reference to the methods of financing rural electrification projects in the past indicates something which might better be called improper accounting. The creation of capital reserves in excess of the total loss by wastage of the capital properties is nothing more than a pre-payment for which credit is received by someone at some future time. The point which Mr. Tomlinson wishes to make, and with which

most people agree; is that ultra-conservatism in accounting may become a serious handicap in establishing minimum rates for service at the time when it is most necessary to promote the highest utilization of energy.

Mr. Sanger regretted that the limitation on the length of his paper did not permit Mr. Tomlinson to open up the subject of operating costs and revenue. These matters had been dealt with fully in the 1942 report of the Manitoba Electrification Enquiry Commission but there still remains plenty of room for further opinion and comment.

He felt that a discussion of the subject of the electrification of small communities and farms should begin with a clear statement of the main objective. If the objective is solely that of the profitable sale of power as a commercial enterprise, the tendency will be to serve the areas of least capital risk and exclude those which individually are commercially unattractive. On the other hand, if the objective is intended to include securing the greatest possible social and economic benefits for the area under consideration the general policy and scope of the plan would be radically changed. Uniform rates over the whole area would become almost essential and the relation between revenue and cost of supply must be placed on the widest possible collective basis. However, even under the most liberal plan, the exclusion of certain sub-marginal areas must be enforced, in which case it would seem that a reversal in policy has to be made from collective to individual consideration. In the past the problem of capital risk had been partly overcome by asking the prospective customer to pay all or part of the capital cost of extension. While this might appear to be a happy practical solution in certain individual cases, to attempt to apply it as a general policy would result in a limited coverage and subsequent disputes concerning the extent to which consumers are entitled to rebates on their capital investment in jointly used lines.

He would like to refer to the financial success of the Manitoba Power Commission which had now been operating for twenty-five years in a sparsely populated rural area. With the exception of Brandon, Portage La Prairie, Dauphin and Neepawa, the population of the towns in the area served by the Commission is in every case less than two thousand. Even under this condition of consumer scarcity, the Commission had been able to build up a completely self-sustaining system and establish uniform rates which permit all modern domestic appliances to be freely used. It is true that the Commission now receives a government subsidy of some \$130,000 per annum, but if this subsidy had not been received there would still have been an operating surplus in excess of \$250,000 for the year 1944.

The Manitoba Electrification Enquiry Commission recommended a rate for farm electrification similar to that which now prevails in the small communities served by the Power Commission. The question which naturally arose in the minds of those interested in the possibilities of farm electrification on a large scale is: with an investment of \$700 per farm for distribution circuits is it possible to make the system self-sustaining? If not, how much subsidy is required? The reply to this question may be found in the Enquiry Commission Report but Mr. Sanger would like to present it more concisely in the following manner:

In respect to customer saturation, the conditions in the farm electrification area may be assumed to vary between 60 per cent saturation and 1942 price levels (Condition A), and the most favourable condition (Condition B) which is based on 80 per cent saturation and 1939 price levels; the following indicates the approximate revenue requirements of the system.

For Conditions A and B, the system can be made self sustaining if the average annual revenue from each farm amounts to 13 per cent of the average capital cost of supplying each farm.

For Condition A, the energy consumption would require to be 330 kwh. per month, with a net monthly bill of \$8.64.

For Condition B, the energy consumption would require to be 260 kwh. per month, with a net monthly bill of \$7.38.

Now, let us compare the foregoing conditions with what is required under the proposed government subsidy of one-half the interest and sinking fund on the capital debt.

For Conditions A and B, the system can be made successful if the average annual revenue from each farm amounts to 7.5 per cent of the average capital cost of supplying each farm.

For Condition A, the energy consumption would require to be 120 kwh. per month, with a net monthly bill of \$4.86.

For Condition B the energy consumption would require to be 90 kwh. per month, with a net monthly bill of \$4.32.

All this may be condensed to the following statements:

At present-day price levels and without financial assistance from the government, the financial success of complete farm electrification in Manitoba requires extraordinary appliance sales efforts in order to attain an average monthly consumption of 330 kwh. It is difficult to see how this can be accomplished without general customer acceptance of the electric range and water heater.

With financial assistance from the government, estimated to be \$2.08 per farm per month, an average monthly consumption of 120 kwh. is required. It is possible that this may be attained without a high degree of success in the sale of ranges and water heaters.

The rate schedule on which the foregoing is based is as follows:

First 50 kwh. per month.....	8c per kwh.
Excess .....	2c " "
Prompt payment discount.....	10%

J. W. MacDONALD, M.E.I.C.<sup>7</sup>

Mr. MacDonald thought that some general remarks dealing with rural electrification in Nova Scotia might be of interest despite the fact that such conditions as topography, climatic conditions, and the size of the farm unit differ sharply from those pertaining to the test areas dealt with in the papers under discussion.

Nova Scotia Light and Power Company and its subsidiary companies, particularly the Avon River Power Company which serves the Annapolis Valley fruit district, have been building rural extensions during the past twelve to fifteen years in the better areas ad-

acent to trunk lines. Following passage of the Rural Electrification Act of Nova Scotia in 1936, a programme for extending lines to more sparsely settled districts was initiated.

Before being interrupted by wartime restrictions, the extension of rural lines had reached the point where service was available to probably 60 per cent of the farms within 10 miles of the company's trunk lines through the Valley district.

There are two special types of rural area served by the company in Nova Scotia. One is the already mentioned fruit growing district popularly known as the Annapolis Valley. Farmers in this area are specialists in the production of fruit, and almost the entire farm effort is devoted to the production of one crop: apples. While the apple growing industry does produce seasonal commercial loads at apple grading, processing and packing centres, farm operations relative to the production of this crop do not tend to make this type of rural customer a user of large quantities of electric energy.

The second special area served by the company is that bordering the sea. Because Nova Scotia is almost an island with an irregular coast line this area forms a relatively large portion of the province. It is settled by farmers of a special type; farmers who recover the fruits of their labour not from the land, but from the riches of the sea.

It is important to note that, with both these special classes of rural customers, the economic significance of electric service is not nearly so great as it is with customers in mixed farming or dairy districts. The average yearly kwh. consumption is, therefore, low. In a representative group of 712 rural customers analyzed in 1942 the average yearly consumption per customer was 500 kwh. In the extension of rural lines in the territory, this low revenue per customer must be offset by higher customer density.

During the three or four years immediately preceding the outbreak of war, rural electrification made good progress on a sound economic basis throughout most of the better farming districts of the province. Provincial legislation had been passed which provided, under the Rural Electrification Act, material aid toward electrification of sparsely settled districts and, in some areas, the provincial government through its Power Commission actually undertook the construction, operation and maintenance of rural distribution systems. In districts already served by privately owned utilities, these companies build and own the distribution property. The government's subsidy scheme which is still in force permits construction of an extension if there is an average of at least six potential customers per mile, and three contracts of \$2.50 monthly minimum bill are secured before building. The provincial government pays the difference between revenue received and potential revenue at five customers per mile. When the number of customers on an extension built under this so-called "Government-Aid" scheme reaches six per mile, then the extension becomes self-supporting.

The Avon River Power Company Limited built, before the outbreak of war, about 130 miles of rural line under this arrangement. Some 15 per cent of this property had become self-supporting when wartime restrictions prevented the addition of new customers. Had copper been available for house wiring, services,

<sup>7</sup> Nova Scotia Light and Power Company, Limited, Halifax, N.S.

etc., this percentage, it is felt, would have reached a higher figure in the ensuing two years.

Practically all rural extensions are 6900 volt grounded neutral, though a few districts are served from 2300 volt single phase extensions made from nearby town or village distribution systems.

Conductors are No. 4 A.C.S.R., or No. 6A, copper-copperweld carried on 30-ft. eastern cedar poles with an average spacing of 275 ft. Where customers are four or more spans apart, no secondary circuits are run. Instead a 1½ kva. rural type, or if necessary a larger standard type, transformer is used at each service.

Pre-war cost of this type of construction ran around \$500 to \$600 per mile of bare line (no transformers services or meters). The cost of digging and setting in Nova Scotia is relatively high on account of the almost regular incidence of rock and boulders, and the particular care which must be exercised in passing over apple orchards and around the many ornamental trees which line the highways.

In considering the immediate and post-war plans for further extension of rural service, increased cost of construction is a governing factor. At present, there is an acute shortage of eastern cedar poles in the Maritimes. To permit the company's programme to get under way next spring, a thousand or more Princess pines are being cut at present; these will be creosoted and used instead of eastern cedar. A second experiment is to be carried out on a smaller scale with native spruce, the butts of which are to be treated chemically. The use of such alternatives on a major scale in the future will, of course, depend on the supply and relative cost of eastern cedar.

Every effort is being made to keep the cost of construction low, and render possible the extension of electric service to the maximum number of farms.

The development of, and results derived from, the experimental extensions dealt with in the two papers just read will be followed with a great deal of interest by utilities in Nova Scotia.

#### THE AUTHOR

It is gratifying to those who have almost a full time job of rural electrification to know that others are taking more than a superficial interest in the subject. It is admitted that there are on the prairies some problems not applicable to all parts of Canada, and also that there exist some advantages, such as, abundant hydro power, not common to all. Further comments are invited from readers of the *Journal* so that the "happy medium" for which we are striving can be reached.

Professor Stewart's comments regarding usefulness of farm plants are correct in sparsely settled areas. That was the chief reason that, in Manitoba, the central station service area was clearly defined as early as 1941. However, it is found that farmers now

equipped with lighting plants are most anxious to get central station service. Experience in Manitoba leads to belief that the farmer wants more capacity than can be economically supplied from individual plants.

In connection with grounding and potential gradients, the paper only touched on this subject. In order to clear up Professor J. W. Porteous' question regarding the potential gradient curves, it might be pointed out that the area within the dotted lines (not a true circle) is an equi-potential area, there being no potential gradient within the area. As near as it has been possible to measure, the potential gradients in various directions are as uniform as the soil in the area. A full paper on this subject would be required to show that the advantage is as shown in the graph.

Mr. J. W. Stafford's analysis of conductor fatigue is interesting and helpful. Even if aluminum has a fatigue ration of 33 per cent, slightly higher than steel or copper, the fatigue tension is much lower and can easily be reached if A.C.S.R. conductor is strung at 100 to 120 deg. F. (summer sun) and then the temperature drops to 40 deg. F. below, at which time most of the tension is transferred to the aluminum on account of its higher temperature coefficient. The author is interested to know that the manufacturer's sag charts take this condition into account. One solution is a homogeneous conductor, the other is to string composite conductors in the winter time only.

There are several comments regarding the danger of reducing first costs below the safe minimum. The main object of the paper was to stress the need of making every dollar of capital money spent go as far as possible to reduce operating expenses. Elimination of transformer primary fuses in favour of automatic reclosers at sectionalizing points may increase first costs but will reduce costly fuse replacement trips. Spending capital money where it will do the most good is where the "science" or "engineering" comes into farm electrification.

Mr. G. Molleur asks a very pertinent question regarding telephone interference. This subject was omitted from the paper because it requires a whole paper by itself. An overall solution has not been found, but experience here and in the United States indicates that length of parallel permissible with a given type of telephone circuit depends to a large extent on wave shape (harmonics). We are fortunate in Manitoba in that the majority of farm telephone lines are owned and operated by the government and are fairly high standard. Little difficulty is experienced with three phase parallels, but single phase taps have to be limited in length, or steps taken to drain off residuals and/or harmonics either from the power line or from the telephone circuit, or both.

Mr. F. T. Gale's reminder that the utility's contribution should be sold to the public is very timely and is often overlooked. The position in Manitoba is fully covered in the Manitoba Electrification Enquiry Commission report.

# POST-WAR PLANS FOR RURAL ELECTRIFICATION IN ALBERTA

E. G. KELLY

*Superintendent of Construction, Canadian Utilities Limited, Calgary, Ont.*

An address delivered at the Fifty-Ninth Annual General Professional Meeting of The Engineering Institute of Canada, at Winnipeg, Man., on February 7th, 1945.

There is in Alberta, as in other provinces, a strong and persistent demand for central station service. Alberta is mainly an agricultural province, and the prosperity of our cities and towns depends principally on the prosperity of our farming communities. It is felt that, once the war is over and our sons return home, they will want jobs, not promises or the dole, but good creative work, work that will make this country a better place for them and the rest of us to live in. Our government has plans for the placing of many of these returned men on farms. Will these men be satisfied to stay on the farms if something is not done to make living conditions more agreeable for them? Farm electrification would help to do this.

## CONDITIONS AFFECTING RURAL ELECTRIFICATION SCHEMES IN ALBERTA

A general farm electrification scheme in Alberta, with our sparse population, could not be self supporting at first, and would require some outside assistance. Its object would be to build up the province by improving living conditions on the farms and providing employment for our returned men. The necessary assistance, or subsidy might be in the nature of a government grant towards construction, or a loan at low interest rates. It could be financed by holding up utility rates to the urban customers. Whatever method is used, any subsidy would eventually have to come out of the taxpayer's pocket. It is believed, however, that with simplified construction, standardized materials, economical management, by the education of the farmer in the practical use of electricity on the farm, and with an aggressive load building policy, such a subsidy could be kept low. To find how low is one of the objects of our test areas.

A farm electrification scheme, in itself, will not mean that new and larger generating stations must be built. There will be plenty of generating capacity available when the war is over; for example, if the Alberta Nitrogen Products, only one of the plants built for war purposes, were to close down, it, alone, would release enough capacity to serve 40 per cent of the farms in Alberta. While it is hoped that the general prosperity of the country will require new and larger generating stations, the production of power is not the immediate problem. The difficulty is to get the available power to the farm. It is not a question of generating cheap power. The smallest item in the total cost of furnishing electrical energy to the farmer is the cost of generating the energy. The high portion is the cost of delivering and servicing the comparatively small amount of energy required at the farm.

The first step towards a post-war farm electrification project in the province was a joint survey which has been made by Canadian Utilities Limited, the Calgary Power Company, and the University of Alberta. Eighteen areas were surveyed, each area being typical of some district so as to give as complete a picture of the province as possible. All specifications were drawn and cost estimates made by the two operating companies. The results of these surveys and the estimated costs are shown in the following table.

### SUMMARY OF EIGHTEEN SURVEYS

Total area surveyed.....	764 sq. mi.
No. of farms in area.....	1,451
No. of farms near proposed lines..	1,033
No. of probable customers.....	795
Total miles of transmission line...	588
Connections per mile.....	1.35
Miles of line per connection.....	.74
Total estimated cost.....	\$457,816.00
Aver. estimated cost per connection	575.00

(All estimates based on 1942 prices and include transformers, meters and services.)

### EXPERIMENTAL TEST AREAS

There are, in Alberta, some 100,000 farms. About 60 per cent of these farms are located within twelve miles of our existing medium and low voltage transmission lines. The large size of our farms and the sparse and scattered population makes it imperative, in order to make a general farm electrification scheme a possibility, to have a low capital investment per customer served. All frills must be eliminated, but, on the other hand, the lines must be as trouble-free as possible to keep operating and maintenance costs down. One advantage we have over the East is that our roads are straight, there is no rock with which to

Section 6900 volt farm lines experimental area No. 1

**Transformer pole showing transformer and meter box—6900V farm lines.**

contend, there are few or no trees, and ice loading conditions are not severe.

It is fairly easy to estimate construction costs, once the type of line and the area to be served are decided upon. It is far more difficult to estimate, with any degree of accuracy, the operating costs and revenue from a venture of this kind and to do this, the operating companies have installed three experimental or test areas. From these test areas, definite information and data will be obtained, covering construction costs, suitability of various materials and equipment, operating experience and operating costs. We shall be able to test various appliances as to their cost of operation and suitability for farm use. The data and information gathered from these areas will be available to all parties interested in forwarding farm electrification.

The first of these test areas is located near the village of Swalwell, some 70 miles north-east of Calgary. This is a rich dairy farming district. The area was installed by Canadian Utilities Limited, serves some 70 customers, and is now in full operation.

The second of these areas is located near the town of Olds, 60 miles north of Calgary, in a very good mixed farming district. It was installed by the Calgary Power Company and is the largest test area, serving some 110 customers. It is not yet in full operation due to the non-delivery of transformers.

The third area is located near Vegreville some 50 miles east of Edmonton. This is also a mixed farming district. This test area is partly in operation and will be completed by February 15th; it will serve some 50 customers and is being installed by Canadian Utilities Limited.

In building these two test areas at Swalwell and Vegreville, Canadian Utilities Limited have borne the

full cost of carrying the electrical service right into the farm yard at no cost to the farmer; the farmer, of course, having to pay for the wiring of his buildings. In addition, the farmers must provide free right of way where necessary to install lines on their property.

The Canadian Utilities' rate schedule for these test areas is:

Monthly minimum \$5.50 gross

\$5.00 net which minimum includes 20 kwh.

All energy used in excess of 20 kwh.—3 cents per kwh.

It will be noted that this rate schedule has a high minimum and a low step rate. It is simple and easily understood and, while the average rate will be high to the convenience user, it is to be remembered that the investment and cost of service is just as great for the small user as it is for the farmer who makes full use of the service. On the basis of 100 kwh. per month, this schedule is comparable with the rates in force in the smaller towns and villages in western Canada.

The Calgary Power Company, in installing their test area at Olds, have used a somewhat different procedure.

Each farmer is required to put up \$100.00 as a contribution towards cost of construction, the company bearing the balance. On the other hand, while maintaining the same minimum charge as Canadian Utilities Limited, they have given their customer a lower step rate of 2 cents pr kwh.

There are excellent arguments in favour of both methods. Time will tell which is the better.

In making the surveys, estimates, etc., or in the installation of the test areas, no financial assistance was received or requested by the two operating power companies from any governmental agency or department.

#### CONSTRUCTION OF LINES AND EQUIPMENT

The post-war scheme we have in mind is to locate small single phase unit substations along the existing lines at various points, stepping down to 6900 volts. From these substations lines would branch off in two directions using the equivalent of No. 6 copper as conductor for a distance of six to eight miles, depending on prospective load. From this main lead, we would branch up the side roads using a steel wire as conductor. Each substation would serve an area of approximately 96 sq. mi. and no farm would be a greater distance than 14 miles from the substation.

From the data gathered, we estimate that the diversified peak demand per farm customer will be 500 watts. On this basis, a 50 kva. unit substation would serve approximately 100 customers. If loads should be larger than anticipated, it would be a simple matter to change to larger units or to locate unit substations at closer intervals along the transmission line. The advantages of the small unit substations are:—it is possible to standardize as to size, spare units could be kept to a minimum, and due to their comparatively light weight, in case of damage, could easily be handled by a small crew without special apparatus. Each substation would be protected by fuse switches on the high side and single pole rural type reclosing oil circuit breakers on each main branch circuit.

The type of line we are building in these test areas is similar to that used by the Rural Electrification Administration in the States and by a number of companies in Canada, though some changes have been made to better suit our conditions. These farm lines will be single phase 6900 volts to ground. The phase wire is carried on a pin and insulator at the top of the

pole, and the solidly grounded neutral on a bracket at the side of the pole. The reasons for adopting this type of construction are: its simplicity and low first cost, which is very essential in a farm electrification scheme for this province; the operating experience with this type of line has been very good; the line can readily be changed to three phase by the addition of a cross arm if the necessity should arise; the number of insulators, lightning arresters, switches, etc., is only half that required for a single phase two wire line. Only where it is necessary to carry farm lines on existing transmission line poles, or where obstructions must be cleared, will cross arms be used.

The main lead in these test areas was built with No. 2 or 4 B. & S.—A.C.S.R. and all branch leads with No. 6 B.W.G. Grade 85 solid steel. We would have preferred a three strand steel for the branch circuits but it was not available.

We have chosen 6900 as our voltage to lessen the cost of insulators, transformers, switches, etc. With the short distances and small load this voltage, however, is high enough, to permit the use of a low cost conductor without excessive drop. It will be necessary to parallel rural telephone lines at many points; with this voltage there will be no trouble due to inductive interference if the telephone lines are in reasonably good order.

Poles are 30 and 35 ft. western red cedar, Class 6 A.S.A. specifications, and all poles are butt treated. Average span lengths are 350 ft. with 30 ft. poles and 425 ft. with 35 ft. poles. It is believed that, with special high strength conductors, which are not available at present, span lengths could be increased.

All hardware is  $\frac{1}{2}$  in. galvanized and patent expanding anchors in two sizes are used for guying. A small anchor (3500 lbs.) is used for short runs and light strains, a heavier anchor (8000 lb.) being used on heavier strains. The use of these anchors makes a considerable saving, particularly in labour, over the standard deadman anchors.

To simplify materials, only one size guy wire is used. Patent guy fittings are used in place of strain plates and guy hooks. These make a saving in both material and labour and are neater in appearance. Guy wires are bonded to the neutral, which avoids the use of strain insulators in the guys, and through the use of metal anchors, additional grounding is provided to the system.

Our original estimates were based on using  $1\frac{1}{2}$  kva. transformers, but at a meeting held in Calgary last spring, in an effort to standardize rural transformers in western Canada, a 3 kva. was chosen as standard. This transformer has a single primary bushing, is equipped with a co-ordinated gap and, due to its pivot feature, simplifies mounting with attendant savings. Transformers are not individually fused on the primary side but are connected direct to the line through the use of hot taps. Overload protection is given on the secondary side only. Sectionalizing switches are used on branch taps from the main circuit. Lightning arresters are installed only where considered necessary. We believe, by omitting the primary fuse switch at each transformer, we will avoid a great deal of operating trouble through fuse replacements in bad weather.

#### FARM TERMINALS AND WIRING

At each farm a service pole is set in the farm yard. On this pole a weatherproof cabinet is installed in which will be housed the meter and a no-fuse type

3 kva. transformer installation—6900V farm lines.

breaker. The cabinet will be sealed but the breaker can be operated from outside the cabinet and the meter read through a lucite window. The service leads are brought down the pole using service entrance cable, Type S.E. Style "A", 3 cond., No. 6 B. and S. After passing through the breaker and meter, the cable is carried back up the pole to a secondary rack and service is distributed to the various farm buildings. Meters with cyclometer dials are used, as they are easier for the farmer to read than the conventional dial type meter. The use of these service boxes with thermal switch will protect transformers from heavy overloads or short circuits on the farm secondaries, will prevent service calls for blown fuses and prevent farmers from plugging main fuses thereby causing interference to other customers, and will make for ease of meter reading. If a farm load should be increased, requiring greater transformer capacity, the secondary breaker can be changed at the same time. By having the meter and main switch out on the pole, theft is prevented and it makes for easier and less costly distribution to the various farm buildings.

As stated before, these are multi-grounded systems. A  $\frac{3}{4}$  in. by 8 ft. galvanized ground rod was used at all transformer and service pole locations. In addition, a combination spiral and rod ground was installed along the line so that the neutral will be grounded at least every two thousand feet. It is hoped to keep the overall ground resistance to below five ohms.

Particular attention was paid to the wiring of the farms in an endeavour to get the farmer to install as adequate a system as is possible under present labour and material shortage. No conduit or metal boxes were used in barns, or where subject to ammonia fumes. All

wiring systems were grounded at all points of local distribution, such as service switches, fuse cabinets, etc. This meant, in most cases at least, three grounded points on the farmer's premises. These grounds will, of course, be additional to any grounds installed by the company on its system. Local contractors do the farm wiring, and the company does not enter into any wiring contracts except in an advisory capacity. All services are three wire.

#### OPERATING RESULTS SO FAR OBTAINED

The Swalwell test area has not been in operation long enough to give us a great deal of information as yet, but what information we have gathered to date is of interest.

We are serving 73 customers. To serve this number of customers it took 33 miles of 6900 volt line, an average of 2.2 customers per mile; or 0.45 mile of line per customer. The total cost of the project was \$33,080 or an average cost of \$452 per customer. This district, as stated before, is mainly dairy farming and is better than average. In fact, from present indication, we believe that once the farmers can get all the appliances they need, it will be self-supporting. A small cheese factory located in the district will be of material assistance in doing this. Of the 56 farms connected as at January 1st 1945, which have been receiving service for a full month,

- 21 farms have milking machines ,
- 38 have some sort of electrically-driven pump
- 3 have feed grinders
- 5 have electropail water heaters.

The average kwh. consumption per farm was 117 kwh. and the average account including tax was \$8.55.

We have installed, at our substation feeding this district, a graphic voltmeter, a graphic ammeter, a 15-minute interval kw. demand meter, and a watt-hour meter. With this array of meters, we will be able to get the time and extent of peaks, the total kw. demand, power factor, kva. demand and line losses of the system. We are installing demand meters on some of the farms, also sub meters on a number of appliances in an endeavour to get all information possible.

The highest kw. demand registered to date was 44.4 kw., while the highest kva. demand was 49 kva. Presuming that these demands occurred at the same time, the power factor would be 90.5.

## DISCUSSION

PROFESSOR J. W. PORTEOUS, M.E.I.C.<sup>1</sup>

Professor Porteous remarked that Mr. Kelly had given us an excellent description of the work on a rural electrification project in Alberta. In his breakdown of the cost of power to the consumer he had pointed out that the actual cost of energy is the smallest item in the total. While this is quite true, it is by no means the least important. It is definitely desirable from the consumer's point of view to use as much electrical energy as is economical and in the rates for the excess power over a certain minimum, the cost of energy is going to be a more predominant factor.

If, for example, further development of wind electric plants made available larger sizes at not too great an

<sup>1</sup>Department of Electrical Engineering, University of Alberta, Edmonton.

Combination meter box open showing thermal breaker.

The average diversified peak demand per customer was 610 watts.

The voltage regulation under the present loads is very good. On a recent test, the voltage drop during the evening peak between the substation and our most remote customer was 3 per cent.

We are inaugurating a farm department and have employed an engineer, a returned man, who has been trained in agriculture, was raised on a farm, knows the farmers' problems and can talk their language. At present, we are training him in the utility business. His duties will be to call on the farmer and demonstrate what can be done with electricity on the farm, for we believe that if we wish to make farm electrification a success, we must see to it that the farmer gets full value for his electrical dollar.

increase in cost, the farmer would be in the position of being able to increase his consumption at very reasonable additional cost. The battery would seem to be the limiting factor at the present time, but it is reasonable to expect that more efficient propellers and very much smaller and lighter generators will be available in the post war era.

PROFESSOR ANDREW STEWART<sup>2</sup>

In regard to Mr. Kelly's useful paper, Professor Stewart remarks that the utilities in Alberta are to be commended for their interest and activity in connection with farm electrification; and particularly for the experimental work they have undertaken. The test areas, to which Mr. Kelly has referred, will help

<sup>2</sup>Department of Political Economy, University of Alberta Edmonton, Alta.

materially in advancing farm electrification in Alberta.

E. P. MUNTZ, M.E.I.C.<sup>3</sup>

As a consulting engineer, not connected with the electrical utility business, but interested as every Canadian must be in agriculture (which is our basic industry), Mr. Muntz wished to submit the following:

Obviously rural electrification on the Prairies has been retarded due to the high cost of services in thinly settled areas.

On the other hand, in parts of Canada where the density of rural population is much greater, the principal utility companies as well as the Ontario Hydro-Electric Power Commission, have been engaged upon comprehensive rural electrification programmes. Their execution has been delayed on account of the war. Nevertheless, very substantial progress has been made.

Extension of rural lines by the private utilities and the Commission is underway in Nova Scotia. In Prince Edward Island, a programme was commenced before the war to extend rural services considerably. Several hundred miles have been built in Quebec by private power companies without government assistance of any kind. The Ontario Hydro has also built at least a similar mileage in 1944; one half of the cost, however, has been assumed by the provincial government.

In British Columbia the area around Vancouver is very well supplied, though in general the service is of a suburban rather than of a truly rural nature. British Columbia appears also to be only slightly behind Ontario in percentage of customers served.

The papers just heard and the discussion following them have indicated what the Prairies are doing.

It appears then that plans are now underway in all the provinces for post-war programmes of rural electrification so that many more of our farmers very soon will commence to enjoy the advantages of low cost electricity.

The objective of all these plans must be to make available to Canadian agriculture better and cheaper electrical service than can be found anywhere else, so that electricity may make its maximum contribution to our basic industry and indirectly to the prosperity of the country at large.

Agriculture deserves and should get electrical services as soon as practicable and at the lowest possible rates.

The disadvantages incidental to providing services in the country where customers are not so far apart (i.e. more than 6 per mile) should be shared by the advantages of providing similar service in congested urban districts.

Mr. Muntz's impression was that, so far, the farmers have been given the benefit of existing transmission lines and power plants. Farm rates are bearing the cost of generating electricity and losses plus the cost of extensions only. This is a big step in the right direction.

However, in some areas, rural electrification is not closely integrated with a system serving the urban and industrial areas. It may be necessary to encourage extensions into such areas by some form of grants.

Where, as in the older provinces, electricity for all classes comes from common sources and generally through common facilities, the cost of rendering electrical services in rural areas can and should be shared

equitably by industrial, commercial and domestic users in urban districts.

It should be recognized that, for both social and economic reasons, all farms within reasonable distance of an electric utility system should be able to obtain electrical services at rates and under conditions which are reasonably comparable to the rates for urban users of electricity. Every enlightened electric utility system, whether privately or publicly owned is now using its best efforts to prepare so that this most desirable objective may be attained as soon after the termination of the war as possible.

In concluding Mr. Muntz wished to note again, as shown above, that the importance of rural electrification under the auspices of both public and private ownership is well understood by the utilities from coast to coast in Canada. If his remarks have helped to clear up any misapprehension on that point, he will feel that they have been justified.

#### THE AUTHOR

Referring to Professor Porteous' comments, the total cost includes interest on capital investment, depreciation, transmission and distribution line operation and repairs, management, new business expenses, meter reading and billing, etc., as well as generating costs. The smallest item of these costs with the modern steam or hydro-electric plant is the cost of generating this electricity. The high portion of the cost is the cost of delivering and servicing the comparatively small amount of power required at the farm. The author agrees with Professor Porteous' statement that it is definitely desirable that the energy rates over a certain minimum be kept low if we expect the consumer to make full use of electrical service on the farm.

As the class of service furnished by wind electric plants and by central stations are not comparable, the author did not feel it was within the scope of his paper to discuss these. The wind electric plants will fill a very definite need, particularly in those portions of the province where it is not feasible to extend transmission lines. With Professor Porteous the author agrees that there is great room for improvement in wind electric plants, particularly as applies to batteries.

With reference to Mr. Molleur's remarks (p. 222), there are certain standards of construction and operation of transmission and distribution lines in all the provinces of Canada with which utilities delivering electrical energy must conform. It is also necessary that certain minimum standards be set up for the construction of telephone lines. The author believes that it will be necessary for the electrical operating companies and the telephone companies to co-operate in setting up standards of construction if rural electrification is to progress in this country. One of our test areas was built in a district where the farmers had a co-operative single wire grounded telephone system which was very poorly maintained. Before building the power system, it was carefully explained to this telephone co-operative that the building of the farm lines would create considerable interference with their telephone system. This telephone co-operative is rebuilding its system and will put it in reasonably good shape so that there should be no further difficulties. It is to be remembered that if the farmers want electrical service, it cannot be all left to the supply companies and that the farmers must co-operate.

# THE ENGINEER IN ADMINISTRATION

C. R. YOUNG, M.E.I.C.

*Dean of the Faculty of Applied Science and Engineering, University of Toronto  
Past-President of The Engineering Institute of Canada*

**This paper was prepared at the request of the Institute's Committee on Industrial Relations as part of the plan of placing before the membership of the Institute matters that are related to the managerial and directional activities of the engineer.**

At an accelerated rate, the employment of engineers is extending into fields that are not strictly technological in character. Time was when it was considered almost treasonable on the part of an engineering graduate to be diverted from the specialized field for which he was trained in college. That attitude has radically changed, not only to the financial and social advantage of the engineer, but to the benefit of the engineering profession itself. The influence of engineers upon the economic and social structure of the country has been definitely enhanced through their expanding participation in administrative and business activities.

The war has done much to focus public attention upon the inherent qualifications which the engineer has for managerial and directional pursuits. In its recent report, the Committee on Engineering Education After the War set up by the Society for the Promotion of Engineering Education recognizes the phenomenal increase in the use of engineering graduates in the field of management and operation of industry. There is no area of responsibility for which the engineer is better suited by temperament and training.

It has long been recognized that the engineer is definitely in a preferred panel from which directional personnel may be drawn. President Karl T. Compton, of the Massachusetts Institute of Technology, reviewing in 1939 the results of a survey of the employment of 54,000 officials connected with 500 typical industrial companies in the United States, pointed out the significant fact that a scientific or technological background notably increases the chances of employment of young men in managerial capacities. Those who have received a sound training in the principles of management and administration in college have everywhere been heavily drawn upon to fill important positions in this field.

Appreciative of the inherent qualifications of the engineering graduate for executive and administrative work in industry, and of the fact that the prizes in private enterprise are generally in positions of this type, many of the ablest young men of this continent are attracted to the engineering schools to prepare themselves for such careers.

## EXTENT OF EMPLOYMENT OF ENGINEERS IN ADMINISTRATION

It is a matter of common knowledge that a large proportion of engineering graduates sooner or later find themselves in administrative or managerial positions. In its report covering the investigation of 1923-29, the Board of Investigation and Co-ordination of the Society for the Promotion of Engineering Education pointed out that while for very recent graduates about 16 per cent then found immediate employment in administrative, managerial, or sales work, when they had been five years out of college the proportion increased to 44 per cent, and when ten years out of college to 56 per cent.

A study made during the past year of the types of employment held by graduates of the Faculty of Applied Science and Engineering of the University of Toronto disclosed the fact, after making appropriate adjustments for the employment of graduates in the armed forces, that about 38 per cent of the entire graduate body is heavily engaged in administrative work and over 60 per cent are more or less concerned with it.

About a year ago the Junior Section of The Engineering Institute of Canada at Toronto conducted a survey of the nature of the employment of its members, all of whom graduated in the years 1931-42, inclusive. It was found that 50 per cent of them were engaged in administration, production, or sales work.

The experience of most, if not all, of the engineering colleges of this continent is that large proportions of their graduates occupy positions that are only slightly technological in character and may even be completely outside the technological field. Thus, approximately 50 per cent of the alumni of the Massachusetts Institute of Technology are in vocations that have no apparent correlation whatever with the specific field for which they were trained. The average level of success in this group is apparently about the same as in the technological group.

## NATURE OF ADMINISTRATIVE EMPLOYMENT OF ENGINEERS

So far as engineers are concerned, employment in industrial administration is by no means limited to the larger corporations. The oldest and best known of the engineering courses in the administrative field, that given at the Massachusetts Institute of Technology since 1915, is definitely shaped to prepare men to take positions with the smaller organizations and statistical studies indicate that the graduates in the course, which is known as Business and Engineering Administration, who rank in the highest tenth scholastically are in the medium or small-size companies by the tenth year after graduation. All of the graduates of this course in the highest tenth of the salary income have left the larger companies by the end of the eighth year after graduation. It is believed that the reason for this is that the number of administrative positions in the large companies is much smaller in proportion to the total number of men employed than would be the case in the medium or small companies where administrative, as well as executive, activities are frequently combined in a single person.

## INTEREST OF EX-SERVICE MEN IN BUSINESS AND ADMINISTRATION

Sample polls conducted by the Department of Pensions and National Health in October, 1943, indicated that more men in the Royal Canadian Air Force were interested in courses in Business Administration than in all other university courses combined. In the Navy and the Army the first choice was Commerce and Business Administration.

While many of those thus expressing themselves probably thought of a short training for comparatively junior or intermediate positions of a managerial or executive type, it would nevertheless appear that many others would wish to qualify themselves for greater responsibilities in this field. Men who on active service have witnessed the amazing effectiveness of science and technology, while themselves carrying great directional or executive responsibilities, will be particularly interested in post-war pursuits that will at the same time capitalize their respect for technology and will utilize their demonstrated capacity for management.

#### RELATION OF ADMINISTRATIVE EMPLOYMENT TO PROFESSIONAL PRACTICE

The question is sometimes asked whether an engineer who is engaged in administrative work is actually practising engineering. As President R. E. Doherty, of the Carnegie Institute of Technology, has pointed out, one type of administration that unquestionably does constitute engineering is the management of engineering operations by an executive whose decisions rest upon professional engineering qualifications, that is decisions that a lawyer or businessman is not competent to make. In the same category should be included the management or supervision of industrial production, necessitating the passing of judgment upon the specification, design, and cost of machine tools, and upon various aspects of the production plan, such as the flow of materials and products.

On the other hand, an engineer who assumes the responsibility of directing a business or industrial enterprise at the top level is engaged in the work of general management, since such activities may be, and often are, assumed by persons with a business or legal background. Since, as yet, there is no recognized *profession* of business and industrial administration, although the emergence of one seems probable, the engineer who is employed in general management is practising a quasi-profession. It may not be engineering or a profession but it is in no sense unfitting or inappropriate.

#### ATTITUDE OF INDUSTRIALISTS

Industry very generally recognizes the value of a basic scientific training for those who would undertake executive or administrative duties in it. Nevertheless, as was pointed out by S. A. Lewishon, then vice-president of the Miami Copper Company, in his notable book "The New Leadership in Industry", a background limited to such studies as physics, chemistry, mathematics, mechanics, metallurgy, and mining does not equip a man to act as a buffer between labour and capital. In the author's view the training given by our engineering schools does not adequately equip a man to practise so-called "human engineering". Industrialists have often found that the men who come from such schools are excellently prepared in technical subjects . . . in matters having to do with inanimate things . . . but woefully unprepared in the art of developing the human beings under them. During the last war a Mediation Commission, set up to investigate industrial unrest in communities of the western United States, reported to the President that:

"The managers fail to understand and reach the mind and heart of labour because they have not the

aptitude or the training . . . for wise dealing with the problems of industrial relationship."

The managers in this case were mostly engineers. Pursuing the matter further, Mr. Lewisohn remarks:

"Indeed, it appears that the training of the engineer solely in the reactions of dead matter, has tended to cripple his native capacity in handling human relations. A narrow technical education limited to the quantitative sciences does not help a man to assume the leadership of men. We have not yet come to the point in our social sciences where human reactions can be weighed or measured. Such a training retards the development of imaginative understanding so vital in human leadership."

Writing in the *Journal of Engineering Education* for November 1944, Mr. E. G. Bailey, chairman of the Bailey Meter Company, and vice-president of the Babcock and Wilcox Company, has this to say of the shortcomings of traditional university training of engineers for those who would engage in managerial pursuits:

"Many engineers have filled high executive positions very creditably, but the trend seems to have been that the great majority became so restricted to specialized engineering problems that they failed to grasp and advance in the fields of human leadership, judicial balance and economic concepts that are so necessary in industry to-day and will be even more so in the years to come. . . .

"The executive is supposed to grow or sprout out of the graduates of the engineering school or even from the ranks of the technician by some magic. The fact that more do not do so leads many to realize that there is something lacking in our engineering curricula of to-day. We find many lawyers, accountants, and men with general business education stepping into executive positions of corporations doing a strictly engineering line of business. Is there something gained by these professions, either in school or later experience, that gives them abilities which the engineer has not attained or has not had a chance to gain from our present curricula or training?"

#### PROVISION OF ADMINISTRATIVE TRAINING IN EDUCATIONAL INSTITUTIONS

There is a growing realization of the need for the giving of special attention to appropriate background training in the engineering colleges for managerial and administrative pursuits. In its recent report, the Committee on Engineering Education After the War of the Society for the Promotion of Engineering Education pointed out that one of the three important trends in engineering education is that leading to the preparation of men for careers in the operation and management of industry. Developments therein make opportune an increased attention to the production of industrial materials and of consumer goods and to the recruitment of the production personnel as distinct from research and planning personnel.

A thoughtful and independent observer, Professor H. J. Gilkey, of Iowa State College, points out that "from the field of design and construction the engineer is being urged and vitally forced into the fields of finance, management, economics, and politics".

Stimulated very largely by the pronounced success

of the course in Business and Engineering Administration, established twenty-nine years ago at the Massachusetts Institute of Technology, nineteen American engineering colleges offer fully accredited courses in fields pertaining to engineering administration, administrative engineering, management engineering, or industrial engineering. The reception of the graduates of these courses has in general been excellent, and it is the belief of the institutions offering them that demand for men trained according to the programmes mentioned will increase after the war.

Adopting an attitude that characterized the critics in the first years of the engineering colleges, when the wisdom of formal engineering education was being questioned, some persons have expressed doubts concerning the ability of any educational institution to teach the fundamentals of administration. The conservative English publication *Nature* takes issue with them in these words:

"We may indeed hope that further attention to the training of the administrator and manager, as part of our programme of educational reform will explode the superstition that business and administration cannot be taught in a university, and demonstrate that a university can provide those whose profession is to be industry or business with a three-year discipline in the fundamentals of the problems they will meet in their professional career. Thus we may ultimately provide both industry and Government Departments alike with administrators having sufficient scientific background to appreciate the scientific factors in the problems confronting them. . . ."

#### ADMINISTRATIVE SUCCESSES ENHANCE THE PROFESSIONAL STATUS

One of the reasons for the tardy recognition of engineering as a learned profession has been that engineers have only too seldom been brought into competition with men of other professions and callings on the same stage and under conditions in which the occupational factor does not count. So far, the engineer has sought to be judged on the basis of his performance within the rigid bounds of his own technological attainments. The moment he enters the field of management or administration, however, and becomes a contender with lawyers, or doctors, or men of business, he is presented with an opportunity of showing his ability to hold his own with the best of them. In many cases his habits of mind, his approach, his method, and his personal characteristics will reveal his superiority. Public recognition will follow, and with it a general enhancement of the status of the profession to which he belongs.

One cannot set aside the blunt realism of Sir Hugh Dowding, a famous chief of Fighter Command, in his observation on one of his officers who was relying for advancement on the excellence of his technical qualifications:

"This officer is a highly qualified engineer, a fact which has been a hindrance rather than a help to him throughout the whole of his service."

There should be frank realization of the fact that assignment to high responsibilities in non-technical spheres will come largely through demonstrated superiority in fields that have been traditionally regarded as the territory of others than engineers.

## BRITISH ENGINEERING EDUCATION AND TRAINING

A. P. M. FLEMING, C.B.E., D.ENG., M.I.E.E., M.I.MECH.E.

*Director of Research and Education, Metropolitan-Vickers Electrical Co., Ltd.*

In every phase of engineering, British practice for a century past has achieved world-wide renown. The high quality of British workmanship has been notable, and in the field of technical progress and invention, British engineers and scientists have been in the forefront. These two features — fine quality of workmanship and technical excellence — are fundamental features in the British methods of educating and training engineers, and it has become generally recognized throughout the engineering and manufacturing organizations that suitable training comprises a period of technical education in applied science, together with a period of practical experience in industry. Indeed it is now traditional in British engineering that practical experience should be an outstanding feature of a young engineer's training. This is in marked distinction to some foreign methods of training.

At the beginning of this century, the view was held by many prominent engineers that the appropriate training for an engineer was to proceed into a works at the earliest school-leaving age to work as an apprentice learning an engineering trade, and in the

evenings to attend technical classes for which widespread facilities were provided throughout the industrial parts of the country. Gradually and with the passing on of the older type of industrialist, this view changed, and increasingly more attention was paid to the technical side of an engineer's training. Men who had taken degree courses in the engineering faculties of the universities were absorbed into industry and appropriate short courses of practical experience provided for them.

To-day the engineering profession is extremely democratic in that, in comparison with most other professions, there are several alternative ways of acquiring professional status. For instance, a boy may leave the elementary school at the school-leaving age and commence a trade apprenticeship training which will continue to the age of 21 years. The able and ambitious boy on such an apprenticeship may, by evening study and in some cases supplementary part-time day release by the employer, pursue courses of technical instruction which will lead him through the successive stages of the National Certificate Courses

in Engineering to a high technical level, and in the meantime he will have acquired a very complete practical training and experience. Alternatively, he may extend his period of general education in the secondary or public school until he has acquired such a standard as will enable him to proceed, if he so desires, to a university. Should he at this stage go into a works instead, he can, in the larger organizations, follow a special apprenticeship, usually of about four years' duration, during which — again by part-time day or evening technical courses — he can equip himself for professional engineering. If, having qualified for entrance, he decides to go to the university, on the completion of the course and having obtained a degree, he goes into a works for a period of practical training of two years' duration. There are still other alternatives; he may, for instance, enter a works for one year before going to the university and do a second year of practical training after he had obtained his degree. In some schemes there is rather more intimate sandwiching of the technical and practical periods of training. It will be observed, however, that in all these methods, practical experience still claims a prominent part of the total time spent in training.

With regard to the technical side of an engineer's training, this may be obtained either at a university or full-time day technical college, or by part-time study. The student who has attained a satisfactory level of general education at the age of, say, 18 to 19, may proceed to an applied science faculty of the university, with or without a preliminary short period of training in works, which would not normally be of more than one year's duration. At the university he spends from three to four years in study which comprises a knowledge of the fundamental sciences underlying engineering and the application of these sciences in practice. After graduation he may continue with a post-graduate course leading to a higher degree, or he may proceed into industry to obtain practical experience over a period of not less than two years.

Alternatively, having reached a satisfactory level of general education, instead of proceeding to the university he may enter works and spend a period of not less than four years in practical training as an apprentice, and during this period — by part-time day or evening study — he can take advantage of the many facilities available to acquire a really sound technical education through well-organized courses leading to the Higher National Certificate set up jointly by the Board of Education and the professional engineering institutions.

Or again, on leaving the elementary or junior technical school, he may enter industry as a trade apprentice, and by a longer period of part-time study ultimately proceed through the National Certificate Courses and attain a satisfactory technical qualification.

The practical training, except in the case of the boy who enters a works from the elementary school or from the junior technical school and who is primarily interested in learning an engineering trade, is of a special character. It is recognized that the young

man whose general education is up to university entrance level is suitable for training for the technical staff positions in the industry, and the practical training provided for him is designed to give a wide engineering experience in the various phases of manufacture, — works production, drawing office, testing, inspection, and other aspects of manufacture, and in some cases, research, engineering design, and commercial work. It is sufficient to enable such a student to determine for himself the eventual branch of engineering employment for which he feels himself best fitted. Similarly, for the more fully technically-equipped trainee from the university the practical course is designed for the same purpose but occupies about half the time.

At the end of the combined course of practical and technical preparation, the trainee may take up a junior position in the organization manufacturing engineering plant and apparatus, or, alternatively, in operational work, consulting practice, or maybe teaching. Whatever sphere he chooses, in a profession so essentially technical in character it is very necessary for him to maintain contact with technical developments, and this means the study of current technical literature, the proceedings of the engineering professional institutions, and in some cases attending special part-time advanced technical courses. In the large engineering organizations advanced courses are provided for the young engineer who has had some initial experience in one or other of the main broad divisions — works' management, design, research, and selling. By such means the able and ambitious trainee can be provided over a period of years with a range of practical experience which will equip him for promotion to the higher executive ranks of his profession.

The professional status of the young engineer is achieved when he secures entry to his professional institution — the Institution of Electrical Engineers, the Institution of Mechanical Engineers, or the Institution of Civil Engineers. The entrance requirements demand a background of practical training and experience, and technical qualifications obtained either through the university or part-time technical college courses already referred to, or by the Institution's own examination. The conditions of admission are established under the guidance of experienced engineers, and the standards maintained in accordance with progress in engineering science.

In the future the position may be altered by the raising of the school-leaving age and by the provision of part-time day continuation education up to the age of 18 years. These educational reforms will provide a broader foundation for those who wish to prepare for a professional career, as distinct from those who desire to become artisan workers. The increasing national interest in technical education will lead to the setting up of more widespread facilities for technical study and to more advanced courses. The growing developments in research open up new possibilities for engineers who have had suitable training in physics and have the interest and capacity to pursue a research career.

# CANADIAN ENGINEERS' PART IN THE WAR

GENERAL THE HONOURABLE A. G. L. McNAUGHTON, C.B., C.M.G., D.S.O., M.E.I.C.  
*Minister of National Defence, Ottawa*

Address delivered before the Montreal Branch of The Engineering Institute of Canada at the Mount Royal Hotel, Montreal, on Thursday, February 22nd, 1945

MR. CHAIRMAN, PAST-PRESIDENTS OF THE INSTITUTE,  
LADIES AND GENTLEMEN:

Both my wife and I count it a very happy privilege to be with you here tonight; and I deeply appreciate the opportunity which you have given me to speak to you briefly on this occasion.

It is now something more than three years since last I came before a gathering of The Engineering Institute of Canada to carry to you, and through you to the members of our profession throughout the Dominion a message and an appeal—a deeply serious appeal indeed for the circumstances which then conditioned our lives and compassed in our future were very grave—grave and dangerous, almost beyond the mind of man, to conceive and understand.

At that time the Canadian Forces overseas had grown to a Corps and every effort was being concentrated on the great task which lay ahead. Day by day, new convoys came to us across the North Atlantic bringing to us additions to our strength as fast as ships could be found and made available to transport the men and the supplies we needed most.

The anxious days of the battle of Britain were then past. Through these for more than two long years we had stood on guard in that ancient citadel of freedom against the ever present menace from across the narrow waters of the English Channel where the Nazi hordes were mustered in all their might in France and Belgium and Holland and northward to Denmark and along the Scandinavian coast.

By then we could feel that Britain was a bridge-head reasonably secure in which the vast potential forces of the North American continent could be assembled. We could lift our eyes from the immediate pressing problem of defence and contemplate again the time when we might strike back in the continent of Europe itself—when we could meet the enemy there again in open battle and seek a decision which would bring about his final defeat and give us peace once more. We could lift our eyes and give our thoughts to the plans and preparations that needed to be made. We could think out what we should do in order to make the best use of all the great abundant advantages we had—or could have, if we had the wit to turn them to account.

And what were these great advantages which gave us faith and promise for the future?

## OUR RESOURCES FOR WARFARE

A great band of young Canadians highly educated and naturally familiar with mechanism in all its varied forms—intelligent, resourceful, full of initiative and responsive to leadership.

A great home country in active process of bringing its vast natural resources into use and engineers skilled in the art and accustomed to the conduct of projects of the greatest magnitude.

A mass production industry of great variety, flexible and most comprehensive which could take a new prototype or design and rapidly turn it out in any numbers

needed and with the high precision that is required in the weapons and apparatus of modern war.

We had industrial leaders of vision and resource and experience trained in the hard school of a pioneer country. Many of them had been abroad before the war and knew the problems which we faced. To them the science of war production was no black art or mystery and they had no inferiority complex to deter them from undertaking something new and different.

Raw materials in abundance were to be found for the looking. We had a background knowledge of science in our universities, and wide experience in engineering and in research and in development of many kinds; and in all a people willing to devote their labours without stint to the great cause we all must serve.

## REQUIREMENTS FOR THE ATTACK

What we needed for the European attack was the most highly mechanized army which could be created, equipped and trained in the limited time available before this great endeavour could be launched. Certainly a year was available, more probably two. We needed armour and engines for employment in the field. We needed new and better mechanical vehicles to give us facility for rapid movement and to transport great masses of equipment over great distances. We needed new and better weapons of greater power and range and more precision in the accuracy with which they could be directed on the vital points within the enemy's dispositions. We needed new and better propellents for our guns. We needed new explosives of more intense character to shatter the enemy's fixed defences of concrete and steel and to penetrate the heavy armour of his tanks and other fighting vehicles. We needed better cameras and optical equipment to detect and locate his works for defence and offence, and overcome his camouflage. We needed better gear to tack his aircraft and bring effective gunfire against them in the few split seconds that they might be engaged. We needed docks and wharves to turn an open beach into a port and bridges to cross the many large rivers that lay across the path of invasion into Germany. We needed landing craft and amphibious vehicles to facilitate the landing and the negotiation of streams and swamps and other water obstacles. We needed to ceaselessly experiment with all this new gear to work out and evolve the form of organization and the methods which could best be used.

We could spend material in the most generous profusion to bring about the enemy's defeat and it was right to do so to save the precious lives entrusted to our care.

Much of this great work of experiment and development had gone on in the Canadian Army as opportunities were made throughout the period of the battle of Britain. There had been the closest co-operation with the various British authorities and, with their encouragement, progress of considerable value had been achieved in many lines which we had undertaken as our share in the general effort.

This was the reason for which I came back to visit

Canada in January 1942, and it was the reason for the appeal I made to this Institute at your annual meeting on February 6th in that year.

To-night I have the opportunity to tell you something of what has since been accomplished by our engineers and scientists, by our business men, by departments of the Government, by the executives and organizers, by Canadian labour and by all who rallied to the call and bent their minds and efforts to give our army and the armies of our Allies the tools of war that were required from Canada.

#### REMARKABLY EFFECTIVE CONTRIBUTION

A year ago the conduct of our army overseas passed from my hands to others and I returned to Canada. For some months I had the opportunity of moving about to visit the research and other establishments which had been set up and to see something of the developments which had been made or were in process. Later I was again called back to the Ministry of Defence, where once again these matters come to me day by day so that I may know what is being done. So I think that I can speak with some measure of authority on the results which have been gained and from that intimate knowledge I say to you: the engineering profession in Canada, and your associates in scientific research and development have made a most remarkable effective contribution in manufacturing and in other related sphere to our army which landed in Normandy last summer on D-day and which is now with others so gallantly engaged along the Rhine in what may well turn out to be a part of the opening phase of the decisive operations for the final defeat of Germany. You have made as well great contributions to our First Canadian Corps in Italy. Great contributions have also gone to the British armies everywhere. To the forces of India and of Australia and of the other Dominions. To the United States in fair return for the many great new inventions and devices they have contributed to us.

#### SOME OF THE ACCOMPLISHMENTS

The catalogue of the things done in Canada which are of outstanding importance and significance is very long indeed but security still bars anything but the most general reference.

There is all that has been done in *radar* to give delicate precise gear to track the enemy's aircraft and his ships at sea; to direct our guns on land, in the coastal forts, and on our ships against these targets. We had an early start in this for, in 1938, when the National Research Council was asked from Britain to take up this task, we found we already had a strong nucleus of well-skilled workers who had been engaged in studies of the ionosphere and of the cathode ray compass. Canadian designed and built radar sets have gone in great numbers to every fighting service and to every ally in our cause.

There is our optical industry built around a small nucleus which was also in existence within the National Research Council before the war. Our binoculars, dial sights, prism periscopes, etc., are of the highest quality and everywhere most sought after.

There are shells for medium guns designed by Canadians with greatly increased range—more than two-fold greater explosive and a lessened total weight such that five of the new and better shells can be carried in place of only four of the older poorer type.

There are long-burning time fuses of remarkable accuracy for ranging and other use. These fuses were

first made here in Canada and the wonderful high precision they showed was a very welcome surprise to all.

There is the Canadian method of doing air-burst ranging which is now the standardized procedure for the whole British Army. The range tables and the charts and the intricate difficult calculations on which they were based were done by young Canadians who rank high in the science of ballistics.

There are the new Canadian armour-piercing shells which have given the British anti-tank guns the extra margin of performance to penetrate the new heavily armoured German tanks and self-propelled guns. For this, tungsten was required which formerly came only in limited quantities from China and Portugal and a few other places. Our Mines Branch was asked to find tungsten in Canada. In the summer of 1942 they covered the country with prospectors. They quickly found and reported deposits running in one case alone into several hundred thousand tons which could be economically worked. We will have the benefit of this long after the war has ceased and we can use the carbide to tip our lathe tools and face our gauges.

There are new explosives and propellents which first took form in Canadian university laboratories and new methods of making others of higher power which have opened their use to give greatly increased effect from aircraft bombs.

There are new methods for rapid construction of airfields which have found their place in the assault from north-west Europe to far-away Burma. These were first developed in England by Canadian engineers—members of this Institute—in association with technical experts from the Canadian oil industry.

There are new methods for mining and for clearing minefields invented and perfected by Canadian engineers and the Canadian Armoured Corps. Some of these have found another use in the United States technique for clearing out the Japanese in the Pacific.

There are the outstanding contributions made by the Canadian medical profession for the care and welfare of our men in the field and in the treatment and cure of those who become sick or wounded. Better clothing, better shelter, remedies for seasickness and countless other aids and preventatives of one dread ailment or another.

There is the Canadian process for the extraction of metallic magnesium, the lightest structural material known to industry. It gives a product of such purity that corrosion is no longer a bar and the costs are down to a point that the uses in the arts are widening both for war and for peace.

There are our Canadian radio signal sets of varied types, in which remarkable increases in efficiency have been obtained. Equally remarkable has been the Canadian simplifications in design and operation. These wonderful new sets have gone not only to our own and the British Army but we have contributed also substantial numbers to Russia.

Not the least part of the Canadian contribution has been the perfection in packaging to ensure the safe arrival of all sorts of gear complete in every component which, after it leaves our ports and is transported by ship half round the world, may find its way up the Burma road or across the Himalayas by air into China or elsewhere into some far desert or jungle or other place, there to be assembled and perhaps be put immediately into action against an enemy. The constant thought for the "user" and the care for his

convenience and interest which has marked our Canadian war industry is, I think, something of which we all may be very proud. In these things it is the little details that count.

There are our Canadian contributions to defence in chemical war which are ready should this method be used by the enemy. There are our developments of new chemical warfare materials as a deterrent to warn off the German from any such thought. There are our contributions to smoke and to flame which were worked out by Canadian engineers in collaboration with the Petrol Warfare Department in England and perfected here in Canada and in the United States.

Automatic sights for coast defence—new machine carbines—new rifles—new pistols, new mortars—new guns—new forms of bridging—new motor vehicles of very many types for many varied uses.

#### MASS PRODUCTION HAS BEEN ACHIEVED

And these things of which I speak are not mere samples or prototypes of experiment and test, for they have now been manufactured in immense quantities, and flow out from our factories here across the world wherever they are required for military operations.

On the second day I was at the Ministry of National Defence, I was told that, ex officio, I was a member of a certain Board, and I was told that I should join a meeting then in progress of which I had not previously heard. I went there with some reluctance as an extra unwelcome task, only to find that the first five items on the agenda were requests from Britain for things which we had proposed in the Canadian Army before I left the United Kingdom as projects for development and which had since been carried to completion by our own officers here in Canada; which had then been tested by the War Office and found to be so satisfactory and to represent such

substantial improvements that they wished to introduce them into the services forthwith.

The demands were for quantities measured by scores of millions of dollars and I was almost reconciled to my new duties as a Minister to find that I had a part in seeing to it that authority for production was given very promptly.

There is much else of which I may not yet speak. The list of these developments made by young Canadian engineers and scientists is very, very long and there is romance and achievement in every line. I hope a full account will be published some day when the war is over so that you all may know the names of your fellow members whose brain children are these marvellous contributions to our war effort.

#### IN CONCLUSION

I end now, and I thank you once again for the pleasure you have given my wife and myself in having us with you to-night and for the privilege I have had of bearing tribute to the work of the Canadian engineers in and for our army.

For that army I say "Thank you" to all of you who have worked so hard to give us the newer and the better weapons and equipment so that our men might outmatch the enemy on the field of battle.

That army of ours is equipped with the best there is, it has been denied nothing that is required, it is properly reinforced to carry through our just part in the battles still ahead, it is highly trained and skilled in all the arts of war, there is youth in the ranks and youth in command, it is under wise determined leaders, it will be fully maintained until victory is achieved.

And so, we go forward into the future with every confidence in the ultimate result.

### NOTICE TO STUDENTS

Student members of the Institute who are about to leave the university, whether definitely or only for the summer season, are requested to inform Headquarters of their new address, so that the *Journal* may be forwarded to them.

This is particularly important in the case of those who live in fraternities or boarding houses during the scholastic year. With present restrictions on the use of paper, it is imperative that no copies of the *Journal* go to waste.

Don't forget to inform us of your new address when returning to college in the Fall. Headquarters will change your mailing address as often as necessary provided you supply the information.

All changes should be recorded with the General Secretary, 2050 Mansfield St., Montreal 2.

# From Month to Month

## A REHABILITATION SERVICE TO MEMBERS

For almost two years officers of the Institute have been hoping to establish a real employment service for members being discharged from the active service forces. From the original conception of the idea, through surveys, consultations and committee meetings, the project has developed to the point where funds are now available and a suitable director has been selected.

The new director of rehabilitation and personnel services is Major Donald C. MacCallum recently discharged from the army because of wounds. Major MacCallum received his early education in Montreal at Lower Canada College and Westmount High School, entering McGill on a C.P.R. scholarship and graduating in mechanical engineering in 1938.

At McGill he was president of the Engineering Undergraduate Society, permanent president of his class, a member of the Students' Executive Council, the Scarlet Key Society, the Martlet Society and the honorary society Phi Epsilon Alpha.

During vacations and after graduation he was employed by the C.P.R. Angus Shops, the Consolidated Mining and Smelting Co. at Trail, B.C., and the Canadian Ingersoll Rand Co. at Sherbrooke.

In July 1940 he enlisted with the 27th Canadian Armoured Regiment (Sherbrooke Fusiliers) and served as

lieutenant and captain for three years, in Canada, Newfoundland and England. After a short experience in Africa he transferred to the 12th Canadian Armoured Regiment (Three Rivers) as captain and major in Italy when he was wounded by shell fire in June 1944, at Lake Trasimeno near Florence. He was hospitalized in Montreal, England and Canada being discharged in Montreal on March 14, 1945.

Major MacCallum is excellently fitted to his new work both by experience and disposition. With the support of the advisory committee upon which Major General Howard Kennedy acts as chairman it is expected an excellent service will be established. Already many completed questionnaires have been received and a study of each individual case is underway.

Under authority of Council a letter was sent in March to all members in the services, informing them of the Institute's interest in their post-war occupations, and inviting them to make use of the service. The letter reads as follows:

The officers of The Engineering Institute of Canada are deeply interested in the rehabilitation of members who are serving in the armed forces. They would like

## News of the Institute and other Societies, Comments and Correspondence, Elections and Transfers

to secure now certain information that will indicate the best means by which assistance can be rendered to those who may desire it, upon their return to civil life.

The members of the Institute at home are proud of their fellow members who, to the number of more than a thousand, have dedicated themselves to the national cause and have brought great honour and distinction to the profession. They will be happy to lend a hand to those who may wish it.

If you think the Institute can be of assistance to you, please give us the information called for on the accompanying form. Any additional details that you think would be helpful will be appreciated. Perhaps there is something the Institute can do that is not related solely to your demobilization. If so, tell us about it.

The membership is now about 7,000, reaching into every corner in Canada. Such an organization should be a great potential for service to the man in uniform. Tell us what you would like to do and every effort will be made to do it.

In order to do the best job possible, Council has set up a special committee, under the chairmanship of Major-General Howard Kennedy, M.E.I.C., representative of the three services and of

industry, which will have charge of the activity. The full time services of another member of the Institute are being secured to be devoted entirely to this undertaking.

We realize that our mailing list may not be up-to-date in every detail. Therefore, if you know of any member in uniform who has not received a letter similar to this, we would be glad to have his name and address, or to have you inform him of our interest.

Please remember that the Institute is yours. You have the right to expect assistance from it. You may be certain that a sincere effort will be made to meet your demands.

We join with all members of the Institute and with all Canadians in wishing you the best of luck and quick return to your home.

Yours sincerely,

E. P. FETHERSTONHAUGH,  
*President.*

L. AUSTIN WRIGHT,  
*General Secretary.*

Major-Gen. Howard Kennedy,  
M.E.I.C.

Major Donald C. MacCallum,  
M.E.I.C.

The recent decision of the Wartime Labour Relations Board (National) relative to an application from certain non-professional employees of the Bell Telephone Company has been taken by some engineers as establishing a precedent that affects the principles of collective bargaining in relation to the profession. A perusal of the official decision does not seem to reveal any reference to engineers.

In the first place the employees of the telephone company did not include engineers in the group for which they were asking accrediting. A letter from the Chief Executive Officer of the Board to the Institute says: "In answer to your question, I would state that the applicants did not request the inclusion of engineers in the bargaining unit for which certification was sought" and "In view of the foregoing, it is obvious that it was neither the intention of the applicants nor of the Board that engineers be included".

In the light of these statements it is difficult to see how the ruling can serve as a precedent for recognition of any engineers' bargaining agency already formed or to be formed. All it does is recognize the bargaining unit for certain telephone company non-professional employees.

The failure of the group to ask for the inclusion of engineers may be significant but it does not seem reasonable to state that because of this omission, some other bargaining agency has been recognized as representing engineers.

In all likelihood the "federations" in Ontario and Quebec will be recognized by the Board when they apply for accrediting. In fact any agency that can prove that any appropriate group of engineers has selected it as its representative will probably be accredited. That is the spirit of the order-in-council, a fact that seems to have been overlooked by many.

No agency will be accredited unless it can prove that it has been properly chosen by the workers concerned, and then only to represent those particular workers. Every new group of workers will require a separate application to the Board for the accrediting of its chosen agency. There will be no blanket rulings. The employees decide who shall bargain for them, and they may select an outside agency such as a trade union, or a "federation", or they may choose one or more of their own fellow-workers. Up to now the leaning as disclosed in discussions seems to be toward the latter procedure, but so far as can be seen no group of engineers has yet named to the Board any bargaining agency.

The Minister of Labour's recent ruling that professional workers shall come under order 1003 for a period of six months, so that they may acquire collective bargaining experience, will mean nothing if during that time no engineers organize themselves, apply for accrediting and undertake bargaining negotiations with their employers. Six months is not very long for a matter of this kind, and it will pass without any action being completed.

The Minister's stand that the professional worker must have collective bargaining experience before his case is decided, is not unlike a municipality telling a man who is building a house in a new section of the town that they cannot tell him what they will do in the event of a fire until he actually has a fire. Surely the experience of others and the particular needs of the case will govern. Why can't a constructive decision be made on that basis?

Recently there has been a noticeable development in Canada to make available to practising engineers, short courses of instruction on the subject of Soil Mechanics. The *Journal* has been informed of such courses already completed at the Universities of Alberta and Saskatchewan, and more recently of one to be given at Toronto. Another course is now underway under the auspices of the Junior Section of the Montreal Branch, with the Ecole Polytechnique furnishing the laboratories.

The Toronto course runs from May 14th to 18th and is being given by the Department of Civil Engineering. It will consist of a series of illustrated Lecture-Demonstrations. Two sessions will be held each day, in the mornings from 10 a.m. to noon, and in the afternoons from 2.00 p.m. to 4.00 p.m. Summaries of each lecture will be provided. Facilities may be made available for those who so desire to perform laboratory tests themselves, possibly on one or two evenings. An informal dinner will be held at the conclusion of the course.

## PROBABLE ARRANGEMENT OF SUBJECTS

Monday	14th May—	a.m.	*Introductory Addresses. The History of Soil Studies.
		—p.m.	*Surface Geology of Eastern Canada.
Tuesday	15th May—	a.m.	Soil Classification.
		—p.m.	Water and soil.
Wednesday	16th May—	a.m.	Compaction of Soil; Stabilized Soils.
		—p.m.	Groundwater and Underground Flow.
Thursday	17th May—	a.m.	Shear Strength of Soils. Stability of Banks.
		—p.m.	Bearing Capacity; Load Tests Consolidation and Settlement.
Friday	18th May—	a.m.	Soil Sampling; Indicator Tests.
		—p.m.	Some Achievements of Soil Mechanics. (Evening) Informal Dinner.

All lectures, other than those marked thus\*, will be given by Robert F. Legget, Associate Professor of Civil Engineering, University of Toronto.

## REGISTRATION

Application for enrolment in the course is to be made on the enclosed registration form which should be returned promptly to The Director, Department of University Extension, University of Toronto, Toronto 5, Ontario. No applications can be accepted after April 30th.

A registration fee of \$10.00 will be charged for the course. This fee will cover the entire course, and includes also the cost of the informal dinner. Remittances must accompany applications.

Final details will be mailed to all those enrolled in the course on or about May 1st.

# WARTIME BUREAU OF TECHNICAL PERSONNEL

## Monthly Bulletin

### SCIENCE STUDENT'S REGULATIONS

The visits to Canadian universities, referred to in the previous month's report, were completed during the month of February, making it possible to make a complete report covering all the twenty-three institutions involved. A total of 1,282 graduating students were interviewed individually by representatives of the Bureau and of these 815 were referred to representatives of the technical branches of the Navy or Army or both to be considered for technical appointments. The great majority of the 467 who were not found eligible for reference to the Armed Forces were in too low a medical category to meet the requirements for reinforcement officers. A few had already served and received their discharge and a limited number were disqualified because of the fact that technically they are considered of enemy alien origin. This latter technicality applies to students who are refugees from European countries; but it should be pointed out that there was no sign among these men of any lack of sympathy with the Allied cause.

In connection with the desire of the Department of National Defence to secure from among graduating science students a certain number of candidates who might be selected for training as infantry reinforcement officers, 478 of those in suitable medical category expressed interest in such an opportunity of seeing service in the Armed Forces. These men are all needed for essential technical activities, but the need for potential infantry officers is most important. Therefore, it is felt to be proper that the Department of National Defence should be given every facility to consider for infantry officer training such of these men as are not selected for technical appointments.

It was found at the expiration of the period allowed by public notice for recording needs of essential civilian undertakings that slightly over one thousand openings existed for employment of this year's science graduates. It is obvious, therefore, that the experience of previous years will be repeated in 1945 in that the supply of newly graduated technical personnel will not be equal to the current demand.

In co-operation with the Employment Service and Unemployment Insurance Branch of the Department and with the university authorities, the necessary steps were taken to provide permits for useful summer employment for undergraduates in science and engineering. In this connection, the Bureau made available at the universities a comprehensive list of such openings, which will be followed by a supplementary list at a later date.

### SUPPLY AND DEMAND

As an indication of the continued need for high output of artillery ammunition, an announcement of the Minister of Munitions and Supply drew attention to the fact that severe restrictions in the use of steel had to be continued. In order to maintain both quality and quantity of production, the various explosives and ammunition plants concerned have had to keep their engineering and scientific staffs at full strength. This situation has also resulted in a continued need for inspecting officers on the staff of the Inspection Board of the United Kingdom and Canada.

Other typical industries which have been under con-

tinued or renewed pressure due to war production needs, and which normally use considerable numbers of technical persons, are those involved in the production of tires and aluminum.

The recorded needs for technical persons in civilian undertakings continue at high level. The number of individual openings covered by standard inquiries (as received from month to month) was 677 as at the end of February. In addition, openings specifically reserved for, or of particular interest to, ex-service personnel numbered somewhat over 400. Under the Science Students Regulation, employers engaged in high priority undertakings have registered requests for a further 1,000 technical persons from the graduating class of 1945. As against these needs the numbers available or likely to become available will continue to show a substantial deficit until there is a greater flow of technical personnel back to civil life from the Armed Forces.

### AIDS TO RESEARCH

It will be gratifying to Canadians to learn that there are signs of an increasing interest in research in this country. Tangible evidence of this is the installation of an electron microscope by at least four different organizations—the University of Toronto, the National Research Council, McGill University and the Shawinigan Chemicals Co.

Papers presented at annual meetings of the Institute by C. J. Mackenzie, president of the National Research Council and A. F. G. Cadenhead, director of research of Shawinigan Chemicals Limited, gave a rude shock to many engineers who had not appreciated Canada's low attainment in this field, particularly from the industrial angle. The enterprise of these four institutions will be encouraging to all who appreciate the value and the need of an expansion in Canadian research.

The new electron microscope is much larger than the familiar light microscope, standing six and a half feet high and weighing about twelve hundred pounds. Instead of rays of light and glass lenses it uses a beam of electrons and electromagnetic lenses. Since electrons can move freely only in a vacuum the whole "optical" system of the microscope has to be sealed and evacuated.

The versatility of the electron microscope is shown by the fact that it will provide magnifications ranging from that of a low-power light microscope to fifty times higher than the best obtained with the highest power of an ordinary microscope. This makes it possible to study minute organisms and particle structures which are beyond the range of ordinary microscopes.

The first commercial electron microscopes on this continent were made in 1940. Since then the number in use by industrial, government and college research laboratories has grown until to-day there are more than seventy in service. Experience already gained by these investigators has proved the instrument's value and it has been credited with important contributions to science and technology in the fields of chemistry, metallurgy, textiles, agriculture, medicine and food processing.

Interest in this new research tool is so great that Canadian and American scientists have formed the Electron Society of America to aid in the exchange of information on microscope techniques and experimental results.

## BEHAVIOUR OF SUSPENSION BRIDGES

The following report from Dr. P. L. Pratley was presented to Council at the March meeting. The Board upon which Dr. Pratley represents the Institute was established shortly after the spectacular collapse of the Tacoma Narrows bridge and largely because of that disaster which indicated strongly the need of most exhaustive studies of the behaviour of suspension bridges.—Ed.

To the President and Council,  
The Engineering Institute of Canada.

In March 1943 you were good enough to sponsor my appointment to membership in the Advisory Board for the Investigation of Long-span Suspension Bridges, organized by the Public Works Administration of the United States Government in Washington, D.C., following the reports on the collapse of the Tacoma Narrows bridge. I conceive it as only proper that some report of my activities in this connection should be rendered from time to time, and only the fact that there has been so little that could be reasonably released for such purposes has delayed my submitting an earlier memorandum. Even now, my report will be merely a general statement of progress, outlining the operations of the Board and my personal relationships thereto.

The Board consists of some 27 members under the chairmanship of Mr. F. E. Kelley of the P.W.A. and includes most of the outstanding practising engineers of the United States in this special field, together with several prominent representatives from the academic, laboratory and directive spheres. I am the sole Canadian representative.

Besides the Executive Committee of five members, and two other five-member committees on Finance and Publications, there are three large working committees, known as "Field Observations," "Model Studies," and "Interpretation and Analysis". I have been assigned to two of these, namely, Field Observations and Interpretation and Analysis. The latter has been the more active, as the former has been faced with the difficult problem of designing, producing and installing certain recording instruments, the manufacture of which cannot rate as a war interest.

The Committee on Interpretation and Analysis, under the chairmanship of Mr. Conde B. McCullough, assistant chief engineer of the Oregon State Highway Commission, has concerned itself with the collection, compilation and classification of data regarding existing suspension bridges—and some non-existing,—their design and behaviour, and with mathematical studies of varying degrees of complexity, concerning such questions as vibration, rigidity, energy absorption, the effect of towers, side-spans, stays, continuity of construction, and bracing systems. As might be normally expected, differences of opinion are found to exist regarding the relative importance of this or that approach or viewpoint, the various physical factors and even the objectives, and much interesting interchange of correspondence has eventuated.

Very valuable academic treatises have been produced on some of the above questions, particularly on the study of vibration distortions, modes and frequencies, and on the distribution of energy among the contributory parts of a suspension bridge structure as vibratory movement takes place. The development of the energy differential equations for a conservative system, and the use of Fourier series

for expressing the shape of the vibration curves, have given rise to sundry "pretty" algebraic treatments, and correspondingly convenient formulæ.

Several efforts to establish useful practical criteria of stability under vertical and horizontal loadings have been made—some empirical and others analytical in nature—and the discussion on the value, the applicability and the weaknesses of these proposals has been stimulating.

What the final outcome of the investigation will be cannot yet be envisaged; what direction it will take cannot be foreseen; what degree of finality will attach to the findings cannot be even remotely conjectured; but to those actively participating in the studies, the experience is most fascinating and will surely prove to be valuable to the profession.

No call has been made on the appropriation set apart by the Council for possible financial outlay in this connection as, up to the present, no expenses beyond postage for a rather voluminous correspondence have been incurred.

Respectfully submitted,

(Signed) P. L. PRATLEY, D. ENG.

## LETTERS ABOUT SALARIES

Recently the *Journal* has received several letters complaining of the remuneration given to engineers and making suggestions as to methods of improvement.

The Publication Committee has examined the communications and proposes printing them in the *Journal*, but in the meantime has asked the Committee on Employment Conditions to consider them and to submit its comments and suggestions, also for inclusion in the *Journal*. In this way it is hoped that the authors of the letters may have adequate and helpful answers.

There is no topic that prompts sharp discussion like salaries, but while admitting there is need for improvement in many places, it should not be assumed that all employers are poor pay. Many engineers are sweeping in their condemnation of employers, but on the other hand there are thousands who admit that their remuneration is reasonably adequate and that they are satisfied.

In examining the situation to discover why some engineers are badly paid, generalities should be avoided. It will be found that the fault lies with the individual employer—or perhaps with the individual employee, and not with the whole group.

## GOVERNMENT COMMITTEE ON PAYMASTER MINES DISASTER

Dean C. R. Young, M.E.I.C., past-president of the Institute, has been appointed chairman of a Committee appointed by the government of the Province of Ontario to investigate technical matters connected with the recent serious accident at the Paymaster Consolidated Mines, Limited, Porcupine Camp, resulting from the breaking of a hoisting cable and the fall of a cage in shaft No. 5. The other members of the Committee, all of the University of Toronto, are: Professor E. A. Allcut, M.E.I.C., head of the Department of Mechanical Engineering, Professor T. R. Loudon, M.E.I.C., head of the Department of Civil Engineering, Professor L. M. Pidgeon, head of the Department of Metallurgical Engineering, and Professor V. G. Smith, of the Department of Electrical Engineering.

## TRENDS IN EDUCATION

### ENGINEERING AND BUSINESS COURSE AT TORONTO

Recognizing that an ever increasing proportion of engineering graduates find their life work in business or administration and that further development of the qualifications of the engineer in this field is opportune, the Faculty of Applied Science and Engineering of the University of Toronto has established an undergraduate course in Engineering and Business, effective with the commencement of the regular session in September, 1945. The pronounced interest expressed by men in the armed forces in courses in business and administration, often accompanied by an equal interest in technology, has given special point to the introduction of the course at this time.

The course commences in the second year, students being admitted to it after having completed the first year in any of the regular courses, except Architecture. The second year has as high a scientific-technological content as the second year of any of the traditional engineering courses. It is rather closer to the second year in Mechanical or Electrical Engineering than any other second year, but a differentiation had to be made in order to provide a logical sequence of studies in the entire four-year programme.

In the third year of the course about 33 per cent of the time is assigned to subjects in the field of accounting, statistics, applied economics, and industrial management. In the fourth year, about 46 per cent of the time is devoted to these subjects, with the addition of business policy, engineering economics, and engineering law. In each of the four years of the course, an additional 6 per cent of the time is devoted to liberal or humanistic-social studies.

Of the total time of the four years of the course, about 29 per cent is devoted to non-technological studies, including therein the liberal studies as well as those belonging to the business and administrative field. The course is therefore 71 per cent scientific-technological in character, as compared with 57 per cent in the group of nineteen American colleges that offer degree courses in the general field of engineering administration.

Another basis of judgment that is perhaps more appropriate exists in the fact that since the traditional undergraduate courses in such branches as Civil, Mechanical, or Electrical Engineering in the University of Toronto contain 88 per cent of scientific-technological material, the new course in Engineering and Business is 81 per cent standard, judging it purely from the point of view of science and technology.

While consideration was given to the device of lengthening the undergraduate course to five years for students who would register in Engineering and Business, with the first four years as they are in the traditional engineering courses and the fifth year devoted to business and administration, it was felt that for the present at least it would be better to conform to the four-year undergraduate programme. That is the normal policy recognized by the Society for the Promotion of Engineering Education in the report of its Committee on Engineering Education After the War.

## PUBLICATIONS OF AMERICAN ENGINEERING SOCIETIES

Exchange arrangements exist between The Engineering Institute of Canada and the founder engineering societies of the United States, whereby members of the Institute may secure the publications of the American societies at special rates which in most instances are the same as charged to their own members. A list of these publications with the amounts charged is given below, and subscriptions may either be sent direct to New York or through Headquarters of the Institute.

	<i>Rate to E.I.C. Members</i>	<i>Rate to Non- Members</i>
<b>AMERICAN SOCIETY OF CIVIL ENGINEERS</b>		
Proceedings, single copies . . . . .	\$ 0.50	\$ 1.00
Per Year . . . . .	4.00*	8.00†
(Plus 75c to cover foreign postage)		
Civil Engineering, single copies . . . . .	.50	.50
Per Year . . . . .	4.00	5.00
(Plus 75c. to cover Canadian postage: \$1.50 foreign postage)		
Transactions, per year . . . . .	6.00‡	12.00¶
(Other publications 50 per cent reduction on catalogue price to E.I.C. members.)		
* If subscription is received before Jan. 1st, otherwise \$5.00.		
† If subscription is received before Jan. 1st, otherwise \$10.00.		
‡ If subscription is received before Feb. 1st, otherwise \$8.00.		
¶ If subscription is received before Feb. 1st, otherwise \$16.00.		

<b>AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS</b>		
Electrical Engineering, single copies . . . . .	\$ 0.75	\$ 1.50
Per Year . . . . .	6.00*	12.00*
(* Plus postage 50c.)		
Transactions—annual, bound . . . . .	6.00*	12.00*
(* Plus postage \$1.00.)		
(The single copy price for Electrical Engineering includes postage charge.)		

<b>THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS</b>		
Mechanical Engineering, single copies . . . . .	\$ 0.50	\$ 0.75
Per Year . . . . .	4.00*	6.00*
(* Additional postage to Canada 75c., Outside United States and Canada, \$1.50.)		
Transactions, bound, published annually, about March 1st (price of current volume) (Other publications, same rate to E.I.C. members as to A.S.M.E. members.)	10.00	15.00
Journal of Applied Mechanics—Quarterly publications.		
Dates of issue: March, June, Sept., Dec. . . . .	4.00*	5.00*
(* Plus postage 25c.)		

<b>AMERICAN INSTITUTE OF MINING AND METALLURGICAL ENGINEERS</b>		
Mining and Metallurgy, single copies . . . . .	\$ 0.50	\$ 0.50
Per year . . . . .	3.00*	3.00*
(* Plus \$1.00 postage.)		
Metals Technology, single copies . . . . .	1.25*	1.25*
(* Plus 10c. postage.)		
Per year . . . . .	7.00*	7.00*
(* Plus 80c. postage.)		
Transactions, per volume . . . . .	5.00*	5.00*
(* Plus 50c. postage.)		
Technical publications: Supplied at 1c. per page, with a minimum charge of 25c. for single copies, or at a subscription rate per year of . . . . .	2.50	2.50

Subscriptions to the above publications are payable in U.S. funds.

L. AUSTIN WRIGHT, *General Secretary*,  
2050 Mansfield Street, Montreal.

# BUY VICTORY BONDS

## MORE ABOUT CIVIL SERVICE SALARIES

Two things have caused a recent revival of general interest in the subject of salaries paid by governments — municipal, provincial and federal — to their engineers.

The federal civil service has secured from the Treasury Board authorization for a substantially increased schedule for certain engineers to be employed on post-war projects. After months of futile endeavour by various departments to secure engineers to work on the post-war programme, the Board has at last seen the light, or at least a flicker.

With a situation that could not be denied and that could not be ignored, the purse strings were loosed to a limited extent and to a limited few. There has been no widespread breakdown in the much criticized policy of the government, but just a slight breach in the wall forced by sheer necessity.

For post-war work only, and so far as the *Journal* can discover, in the Department of Public Works only, a new scale has been established. Four new classifications have been created "Engineer Grade 1, 2, 3 and 4" as shown in the following tabulations. The top salary is only \$4,200 but the responsibilities sound much higher. It is doubtful if men with these qualifications will be secured at a starting salary of \$3,600 with a top of \$4,200 when industry is paying that much for young men back from the war who had almost no experience when they enlisted.

The qualifications for "Engineer Grade 4" sound like the general superintendent of a large contracting firm. The Institute survey showed that contractors pay such persons from \$6,000 to \$8,500, and for the best men even higher. It is not likely that the government will get much choice at the prices offered. The specification is  
Engineers — Grade 4:—

"Duties: To have complete charge of several projects and to be responsible for the work of the engineers assigned to each together with their assisting staff; to represent the District Engineer in contacts with representatives of public bodies and Members of Parliament; to carry on technical correspondence and to perform other responsible work as directed by the District Engineer."

Another feature that cannot pass unnoticed is that older employees of the department doing the same work are not eligible for the new salaries. There appears to be underway the creation of an impossible situation wherein senior engineers with years of service will be asked to instruct and oversee the work of new men who will be working for them at substantially higher salaries. Just how anyone knowingly could set up a situation like this is difficult to understand unless eventually it is intended to make the new scale applicable to the present employees. Decency, fair play and business sagacity would indicate there was no other way out of it, but where the Treasury Board is concerned such factors may be considered of less importance than they are elsewhere.

Just to emphasize the ridiculousness of the situation, examine the following tabulation. When the boss gets \$900 a year less salary than the man working under him, something is likely to happen — and should.

### *New Scale for Post War Projects*

Engr. Grade 1 .....	\$1,800 — 2,400
" " 2 .....	2,400 — 3,000
" " 3 .....	3,000 — 3,600
" " 4 .....	3,600 — 4,200

### *Comparable Scale for other Engineers*

Junior Engineers .....	\$1,800 — 2,160
Asst. Engineers .....	2,220 — 2,700
Senior Asst. Engr. ....	2,820 — 3,300

For years, the Institute has been pleading for decent wages for government engineers. The new scale even in its limited application is helpful, not because it provides any relief to existing employees, but because it is an admission of the inadequacy of the regular scale. Perhaps it is the thin edge of the wedge, and reform will follow. Is it too much to hope that these professional men will be paid a living wage — not because competition has forced it in an isolated case, but because decency demands it, good business prompts it, and the men have earned it?

### MONTREAL SHOWS THE WAY

Usually, municipalities pay poorer wages to engineers than do other government bodies. A survey made last year by the Corporation of Professional Engineers of Quebec showed that the City of Montreal was no exception. At the time of the 1944 strike of Montreal municipal employees, the engineers did not walk out, but they did ask for some amelioration of their financial conditions. C. C. Lindsay, president of the Corporation of Professional Engineers, and deGaspé Beaubien, president of the Institute, in response to a petition from the employees, together visited the municipal authorities on behalf of the engineers; also the employees at a meeting held at the Institute established "Le Comité des Ingénieurs Municipaux" to represent them.

The committee studied the problem and presented to the Executive Committee of the City of Montreal a brief full of sound arguments and sensible proposals. The result was that a new scale was established that marked a definite advance toward fair wages. The old and new scales are given below.

<i>Engineer</i>	<i>Old</i>	<i>New</i>
Grade 1 .....	\$1,800 — 2,040	\$2,400 — 2,520
" 2 .....	2,100 — 2,400	2,700 — 3,180
" 3 .....	2,460 — 2,820	3,300 — 3,780
" 4 .....	2,880 — 3,300	.....
" 5 .....	3,360 — 3,780	3,900 — 4,500
Section Engineer ..	3,300 — 3,600	4,200 — 4,800
Group Leader .....	3,900 — 4,500	5,100 — 5,700
Asst. Supt. ....	3,900 — 4,800	4,200 — 4,800
		5,100 — 5,700
Superintendent ....	5,700 — 6,300	5,700 — 6,600
		6,900 — 7,500
Asst. Director ....	6,600 — 8,000	7,500 — 9,000

The new scale has meant a lot to the employees. Previously 36 per cent were paid between \$2,000 and \$3,000. Under the new scale only 1.5 per cent are at that low level, but 50 per cent are getting from \$3,000 to \$4,000 as opposed to 35 per cent under the old scale. Twenty per cent are now between \$4,000 and \$5,000, instead of 12 per cent, and from \$5,000 to \$9,000 there are now 29 per cent, whereas formerly there were only 16 per cent.

This new schedule removes Montreal from the bottom of the ladder and places it above the provincial and federal governments as an employer. Perhaps this will encourage others to do something, for it is nothing of which to be proud to be known as the payer of the poorest wages—nor is it good business.

## IN BRITISH COLUMBIA

A new scale of salaries has been agreed upon recently for the public works engineers in British Columbia. While the scale is still not anything to be overly enthusiastic about, it does go a considerable distance along the road to proper recognition.

One factor that holds back the setting up of a really proper salary scale in British Columbia is that the salary paid the Deputy Minister is low, and that sets the ceiling. The same is true in the federal field, and in all the provinces. There seems to be a need for recognizing that a professional man should be paid what he is worth, instead of an arbitrary figure of something less than the Deputy Minister. Perhaps the deputies should get more, particularly when their profession is related to the work being done by their departments as in law and engineering.

## IN OTHER PROVINCES

The Province of Quebec still pays shameful wages to the majority of its engineers. For a time last year, due to the efforts of the Corporation of Professional Engineers, it was thought that some increase was to be authorized generally, but to-day things are just where they were. The *Journal* is informed that a few increases authorized in 1944 were cancelled when the government was changed later that year. It is too bad that professional employees working industriously and loyally should be the victims of political chance. Such things must react eventually to the detriment of employer and employee alike.

In Ontario, there is also a move on to improve conditions, prompted largely, the *Journal* is informed, by the Association of Professional Engineers. Ontario engineers are more fortunate than those employed by other provinces, but that still leaves a large margin for improvement. It is to be hoped that shortly this margin will disappear.

## GENERALLY

All in all there seems to be the beginning of a move in the right direction. Large bodies move slowly, but enough time has passed that some progress should be visible — much more than can be seen at present. It is everyone's wish that the present interest in recognition of the profession may be both widened and accelerated shortly.

## WASHINGTON LETTER

### LEND-LEASE AND POST-WAR ECONOMY

The bill providing for the extension of the Lend-Lease Act for a further year and a clean-up period until June of 1949 has been passed in the House by an overwhelming majority. The bill has now gone to the Senate and it is not expected that it will encounter any difficulty. The Act was extended, however, only after considerable controversy in Committee and after an amendment had been adopted banning Lend-Lease as a postwar measure and the use of Lend-Lease funds for any purpose of postwar "relief, rehabilitation or reconstruction." Congressional pressure for this amendment was probably increased as a result of the announcement of the French Lend-Lease Agreement for just under three billion dollars, considerable portion of which was for long term capital equipment. It is true that France agreed to pay cash over a period of thirty years for this equipment. It is also true that France agreed to pay cash for that portion of the remainder which is not delivered before the ter-

mination of the life of the Act. Clause 3 (c) of the Lend-Lease Act was invoked in an unprecedented manner to facilitate the French Agreement.

There are two major economic considerations underlying American trade and export policies. On the one hand, very considerable pressure is developing for a large increase in American exports. The goal of full employment does not seem to be realizable except in terms of at least a three-fold expansion in normal export levels. The maximum pre-war export trade occurred in the year 1929 at something over 5 billion dollars. U.S. export trade, after a serious slump to about one and a half billion, rose to just over three billion in 1939. During the war, the normal export level has been maintained fairly well and to this has been added about thirty-five billion dollars worth of Lend-Lease over the last three years. At first sight, the goal of increasing normal U.S. export trade in the order of three or four times should not be too difficult, at least for a year or so in the postwar period. Gold and dollar reserves held in the U.S. by outside countries is at present standing at about twenty billion dollars. This is approximately four times what they were at the end of the first world war. In addition, extensive credits will probably be made available. French credits under the Lend-Lease agreement will approximate three billions. The Russians are still discussing the possibility of a six billion dollar credit and British credit requirements may also be in the same order. Credits will also probably be extended to China, the Netherlands, and to some of the smaller nations. Additional financing will also be possible through the International Bank and the Monetary Fund, if the Bretton Woods proposals are accepted, and through the Export-Import Bank. Coupled with these financial considerations, the world wide demand on U.S., particularly for capital goods, tools, and machinery, will be tremendous. Not only will the requirements of reconstruction and rehabilitation be very large, but the world-wide capacity for producing heavy and capital goods has been very much reduced by the war and little in the way of repair or replacement has been possible over the last five years. On the other side of the picture, however, there is an increasing awareness that exports cannot be continued indefinitely except insofar as they are balanced by imports. There is also the growing realization that American capacity to produce the type of goods which will be required is inadequate unless serious inroads are made on domestic requirements. The pressure for export trade may be great in this country but pressure directed to the maintenance of the standard of living and the supply of civilian goods and services will probably be even greater. There has been manifested recently an increasing public alarm lest the domestic economy suffer in order to take care of foreign countries. It can be argued that the only way of absorbing the devastation of war without disrupting national economies is to spread the load evenly over all economies concerned. This would mean that devastated countries would be built up at the expense of those countries which had been more fortunate. This is a proposition which unfortunately cannot easily be sold to the man in the street. As a result of these growing pressures in respect to exports, War Mobilization Director Byrnes has set up a new Inter-Agency Committee to be known as the War Export Control Committee. This is a high level committee, chaired by Crowley of F.E.A., with Clayton, Assistant Secretary of State, Conway of W.S.A., Krug of W.P.B., Somerville

of the War Department, Strauss of the Navy Department and Jones of W.F.A. as members.

#### COMPLEXITY OF REHABILITATION PROBLEM

The interdependence and inter-relation of the problems of the world become more obvious as the situation becomes more complex. Tied in with the whole question of international trade and international finance, the following are some of the matters which are exercising authorities here in Washington. The drastic deterioration of economic and social conditions in the reoccupied countries continues to give grave concern. President Roosevelt has sent Judge Rosenman on a special mission to return the Law mission visit to this country some months ago on the question of civilian supplies for the relief of Europe. Rosenman is also reputed to be preparing a report on the credit and financial aspects of rehabilitation. It is expected that the Export-Import Bank will have its functions considerably enlarged. Within the near future a concentrated attempt may be made to repeal the Johnson Act which would clear the way for the granting of credits to debtor countries from the last war. Difficult policy decisions will have to be made with respect to the disposal of surpluses and the currency and exchange problems involved. Bretton Woods proposals are still subject to widespread debate. Preparations are being rushed for the Security Conference at San Francisco. The war has demonstrated, beyond any question, the tremendous productive capacity of the modern industrial age. The mere engineer is left somewhat bewildered by the complications of keeping this productive machinery going once the over-riding necessities of destructive war have been removed.

#### POST-WAR MERCHANT FLEET

Shortly after the signing of the French Lend-Lease Agreement it was announced that a large item for charter and cargo vessels had been eliminated from the agreement. The whole question of the future of the vast American merchant marine fleet is also occupying a very important place in postwar planning and thinking. The fleet is now estimated to consist of well over 5,000 ships totalling fifty-five million tons. This is a fleet about five times the size of the prewar merchant marine of the United States and is in excess of the combined prewar fleets of the five leading maritime countries of the world. About thirty of the fifty-five million tons represent over-age vessels and Liberty ships, all of them too slow or too costly for postwar competition. The remaining twenty-five thousand tons comprise something over two thousand ships, including the new Victory ships, which are fast and economical in design. In the case of the obsolete fleet, the problem of disposal is of major magnitude. The use to which the modern fleet can be put will be tied up with export policies and with the effect that such use might have on the economies of other mercantile nations. The most significant consideration of all, of course, will be the question of what these ships will bring back to the shores of the United States.

#### THE LIBERATOR BOMBER

The Ford Motor Company recently announced the delivery of the 8,000th Liberator bomber from the Willow Run plant. The Ford announcement went to some pains to point out the difficulties which had been encountered with respect to design and engineering changes. More than 1,000 master changes had been made since production commenced in 1942 and, on an

overall basis including minor changes, alterations over a period of more than a year averaged about 200 daily.

#### SYNTHETIC RUBBER'S FUTURE

A recent survey of the rubber situation reports that the government-owned synthetic plants at present in production represent a total investment of about \$750,000,000 and are capable of producing about a million tons of synthetic rubber per year. This is about the equivalent of the expected available natural rubber production once the plantations are restored to their prewar level. This, however, will take some years after the end of the Japanese war. The pent-up demand for rubber will probably take care of both sources for the immediate postwar period but a five to ten year period of competition between synthetic and natural rubber is expected before consumption is large enough to take care of the full output of both sources.

#### THE REMAGEN-LUDENDORFF BRIDGE

It is too bad that the exigencies of war do not permit time for scientific investigations, but it would have been extremely interesting to have had an analysis from a design point of view of the extent of the damage to the Remagen-Ludendorff bridge prior to its capture, and an analysis of its functioning during the ten days prior to its final collapse. Having regard for the nature of the span, I was intrigued to read in the earlier reports that only the central span was down. Subsequent photographs corrected this preliminary piece of information.

March 21st, 1945.

E. R. JACOBSEN, M.E.I.C.

#### CORRESPONDENCE

##### An Appreciation

Dr. L. Austin Wright, Secretary, March 5, 1945.  
The Engineering Institute of Canada,  
Montreal, Canada.

My dear Dr. Wright

I would like to compliment you on *The Engineering Journal*. The story about Steep Rock, in four chapters, in the January issue is fascinating. I have passed it on to some of my friends, professors of mathematics, who declare the Steep Rock series to be as interesting as a first class detective story. The series of articles about Shipshaw in the April, 1944, issue were just as good.

What I like about the Institute and its *Journal* is its catholic nature. Some of us like to, nay have to, specialize narrowly. In doing so there is danger of losing the broad perspective. You know, here, to the south of the border, we have broken down into a large variety of engineering societies with their respective journals. This process, with us, is still going on. This may be all right, but as variety is the spice of life, I hope the Institute is not going to succumb to this same tendency. To me, anyway, you publish the most readable engineering journal on the North American continent. More power to you. If I have one criticism, it is this. I wish you would see to it that the *Journal* gets at least into all the engineering libraries in the U.S.A.

Very sincerely yours,

(Signed) J. A. VAN DEN BROEK

Professor, Engineering Mechanics, University of  
Michigan, Ann Harbor, Mich.

## Engineers at the Front

Chief Engineer's Branch,  
H.Q. 2nd Cdn. Corps,  
B.L.A., C.A.O.

Secretary,  
The Engineering Institute of Canada,  
Montreal, Que.

Dear Sir:—

I have just received your letter stating that my wife had sent you my address overseas. I arrived at this H.Q. on January 14th to take up a staff job which goes under the questionable title S.O.R.E. — Staff Officer Royal Engineers.

Thank you very much for your kindness in remitting my fees during service overseas. I should very much like to keep my subscription to your excellent *Journal* and I think that by now my wife will have told you so.

The country in these parts could be country in any land — Canada, U.S.A., England — but the weather is definitely not up to the par to which we are accustomed. At least at home we have either heat or cold while here we are at just that stage of chilly dampness which is most uncomfortable. Heavy woollen socks and sweaters are a heaven-sent blessing and the only thing to combat the weather.

The feats of bridging and road work which have been accomplished by the Engineers would gladden the heart of any civil engineer. The British Bailey Bridge is one of the neatest, simplest and most efficient bridges which I have ever seen and yet it is divisible into man pack loads so that working parties can transport it into areas where transports cannot get for tactical reasons. Some of the high level bridges in Holland would be worth touring.

Repairing and construction of roads is another great headache. It is inconceivable how many lorries an army puts on the roads daily and maintenance alone presents a great problem.

Yours sincerely,

(Signed) (MAJOR) GEOFFREY DEWAR.

### Need of Revision in Professional Legislation

Saint John, N.B.  
March 21st, 1945.

The Editor,  
*The Engineering Journal*,  
Montreal.

Dear Sir:

No doubt the recent decision in the case of the Province of Quebec Association of Architects vs. Brian R. Perry, being adverse to the rights of engineers in such matters, will cause some perturbation among other engineers throughout the Dominion.

I believe those engineers who do not practise in the province of Quebec will have nothing to fear from the judgment.

The Engineering Institute of Canada deserves credit for having foreseen and provided for such a contingency when its committee drew up the terms of the "Model Act"\* for registration of engineers in 1919. The Institute, being the "father" of registration, cannot be blamed for overlooking even such an

\*See *Engineering Journal*, May 1919, p. 411.

apparently remote possibility as one professional body taking action against the livelihood of the members of another on a technicality. The "Model Act" contained provision, in its definition of the practice of engineering, for the design and construction of buildings in the nature of industrial work. All provinces except Quebec incorporated some such provision in the definitions in their respective Acts.

It will be wondered why the Quebec Act omitted it. It is well known that the "Civil Engineers' Act" of Quebec does not follow the "Model Act" of the E.I.C. except for a few administrative details. The writer has always understood this to be because those engineers who were in the driving seat at that time in P.Q. thought that it would be easier to obtain amendment to the old Quebec Act than to have it repealed in favour of an entirely new form. It is, of course, unfortunate that the definition clause was not amended at the same time. The Institute had nevertheless given the lead but it was up to the provincial authorities to make use of their guidance.

Perhaps the moral of the present situation is that in national council there is greater strength than in sectionalism. Those who have seen something of the confusions and vexations arising from the present variations of the provincial acts, and there are very many, appreciate that such troubles arise in almost direct proportion to the variation of those acts from the "Model". The time is now ripe for a new "Model" upon which all can agree, including Quebec.

Yours very truly,

C. C. KIRBY, M.E.I.C.

### Electric Heating

23 Java Street,  
Ottawa, Ontario.  
February 16th, 1945.

Mr. L. Austin Wright,  
The Engineering Institute of Canada,  
Montreal, Quebec.

Dear Mr. Wright:—

Mr. Massue, on Wednesday, February 14th, delivered his intensely interesting address on "Electric and Other Methods of Heating" to the members of the Ottawa Branch.

A great part of his address had to do with the impracticability of electrically heating large numbers of dwellings, and his conclusions are so nearly similar to those which it was my privilege to set down on paper for Mr. C. A. Magrath, the Fuel Controller during the other Great War, that it occurs to me you would perhaps think it worth while to print in the *Journal* the memorandum which I made for Mr. Magrath so many years ago.

I take pleasure in sending you herewith a copy of the memorandum mentioned above.

Believe me,

Yours sincerely,

(Signed) JOHN MURPHY.

❖ ❖ ❖

Electric heating, with energy from hydro-electric plants, is a problem which the public seems to like to discuss. But the Fuel Controller is of opinion that the substitution of electrical energy for fuel in dom-

estic heating cannot play an important part in solving Canada's fuel problems. There are three reasons for that conclusion: First, although the potential capacity of our water-powers is enormous, they are insufficient to electrically heat our present homes — to say nothing of future growth, and at the same time to meet our light and power requirements; secondly, the tremendous cost of the power plant and of the power-transforming and transmitting equipment — all of which would of necessity be in use at the same time in cold weather, and none of which would be needed for heating in warm weather — puts electric heating beyond practical consideration; and, thirdly, because the proposal to use electrical energy for heating is based upon unsound scientific principles. When electrical energy is to be transmitted from one point to another, wires of ample dimensions are employed so that the resistance losses—analogueous to friction losses in a water-piping system — shall be reduced to a minimum. Electrical energy is a high grade type of energy, which should not be wasted. But in the ordinary electric heater the heating element is in the form of resistance, and all the electrical energy in question is thus "degraded" from a high type of energy to a low type.

It requires about 25 horse-power of electrical energy to heat a well-built eight-room house. Ottawa, with a population of about 100,000 had some 25,000 buildings of all types. To electrically heat 20,000 houses, for example, each needing 25 horse-power, at the same time would entail a power plant and transmission installation of 500,000 horse-power; this is 25 per cent more power than the total capacity of the three large power companies at Niagara Falls, Ontario, and it is about five times as much energy as is normally available from the whole of the Ottawa river at Ottawa and Hull.

To obtain for one hour 25 horse-power in the form of mechanical energy from coal in a steam-power plant, requires in plants of 1,000 to 2,000 horse-power, the consumption of about 100 pounds of coal. But to obtain the equivalent of 25 horse-power for an hour from a coal-burning furnace, in the form of heat, only requires the consumption of less than 10 pounds of coal — even when 50 per cent of the heat is lost "up the chimney." Therefore, by making proper use of power from water falls, more than ten times as much coal can be saved by replacing steam engines by electric motors, as could be saved by replacing coal furnaces by electric heaters.

If we had so much water-power, developed and undeveloped, that there was no economical use for it, now or prospectively, there might be some excuse for advocating electric heating. But when ten times as much coal can be saved at every point where electric motors replace steam driven machines, as could be saved by the same amount of energy used for electric heating, our conservation efforts should be centred on the electric power question — not on the electric heating question.

The connection of electric heaters to new power plants which have spare capacity, tends to create conditions most difficult of correction later on when the power becomes needed for more economical operations. In this respect it is analogueous to the exportation of power in the early days when there was no demand for it in Canada. When the use of power — or the enjoyment of any privilege — is once established, the

attempted revocation of that use or privilege may be attended by very difficult and complicated consequences.

As an instance of what may be accomplished in the conservation of coal by using electricity to take the place of mechanical energy created from coal, it might be pointed out that in Montreal, at the instigation of the Fuel Controller, some 43,350 tons of coal were saved during the twelve months ending March 31, 1919, as the result of an arrangement whereby the Montreal Tramways Company purchased power from the Montreal Light, Heat and Power Company as an auxiliary supply. Similar arrangements have been made with twenty-seven other users of coal in the Montreal district, effecting an additional saving of over 1,200 tons yearly. In other parts of Quebec province over 25,000 tons were similarly saved last year.

The municipal corporations of Montreal and of Winnipeg had opportunities to effect yearly coal savings of about 30,000 tons and 10,000 tons, respectively, by purchasing power on the one hand for pumping water at Montreal, and, by selling power in the other case to the street railway at Winnipeg; but as these municipalities did not take advantage of the situations arising out of the Fuel Controller's appeals for conservation, those possible savings cannot now be recorded.

## MEETING OF COUNCIL

A meeting of the Council of the Institute was held at Headquarters on Saturday, March 17th, 1945, at nine-thirty a.m.

*Present:* President E. P. Fetherstonhaugh (Winnipeg), in the chair; Past-President deGaspé Beaubien (Montreal); Vice-President J. E. Armstrong (Montreal); Councillors R. S. Eadie (Montreal); R. C. Flitton (Montreal), E. V. Gage (Montreal), P. E. Gagnon (Quebec), J. A. Lalonde (Montreal), C. C. Lindsay (Montreal), R. A. Low (Kingston), P. E. Poitras (Montreal), W. L. Saunders (Ottawa), J. F. Wickenden (Three Rivers), W. S. Wilson (Toronto); Treasurer R. E. Chadwick (Montreal); S. R. Frost, chairman of the Toronto Branch, and J. B. Stirling, chairman of the Montreal Branch and chairman of the Committee on Professional Interests; General Secretary L. Austin Wright, and Assistant General Secretary Louis Trudel.

*Rehabilitation of Members in the Armed Forces*—The general secretary reported that the voluntary assessment proposal to meet this additional expense was being well received by the members. Less than one per cent of those who had paid their fees to the end of February had cancelled the item from their account. A total of \$2,685.00 had been collected for the fund from about one third of the members who had paid their fees up to that time. In several instances members had contributed amounts well in excess of the minimum mentioned on the account.

He went on to point out that the real difficulty seemed to be in finding the right person for the position. The opening has been advertised in the *Journal* both on the editorial page and on the employment page, and he had spoken about it to almost every branch in Canada, and yet the number of persons applying was very small, and most of them did not have the complete combination of qualifications that was being sought.

*Community Planning*—The general secretary reminded Council that at the meeting in Winnipeg a

resolution had been passed stating the Institute's interest in advancing the subject of community planning and that in response to instructions from the Council he had informed the president of the Royal Architectural Institute of Canada that Council was agreeable to co-operating with that organization in order to establish a central organization for the work. He reported that no reply had been received as yet and that therefore no further progress had been made.

The general secretary read a resolution from the Association of Professional Engineers of Saskatchewan supporting the Institute in its policy. It reads as follows:

"Whereas advances in mechanical progress consequent upon the war will have a tremendous impact on the ways of Community life after the war and; whereas the vast majority of Canadians live in Communities both urban and rural and; whereas the use of land conditions Community environment and; whereas the physical structure of a community is conditioned by the economic base of the community, the municipal tax structure, the municipal system of assessment, the land use and subdivision plan and the regulations which govern the height, bulk, spacing and use of buildings and structures built upon the land and; whereas the scope of community planning embraces consideration of all these aspects of community development and; whereas the art of bringing these phases of community development and organization into their proper relationship is a function of engineering: it is therefore resolved that the Association of Professional Engineers of Saskatchewan in annual session is in full accord with the policy of The Engineering Institute of Canada, declared at the annual meeting of the Institute held in Winnipeg, Manitoba, February 7 to 9, 1945, to promote and stimulate public interest in proper community planning and development throughout Canada, and wishes at this time to request the Institute in co-operation with other authorities to take whatever action is necessary to have A Community Planning Institute of Canada established with the least possible delay and in order that all spheres of government in all parts of Canada may participate and in order that all may receive the benefit of the accumulated knowledge of each."

Again urging the necessity of the Institute taking action, the general secretary recommended that a further endeavour should be made to meet with Messrs. Bunnell and Page and other interested parties in Toronto without further delay. There was a long discussion in which Messrs. Low, Frost, Gagnon, Chadwick, Lalonde, Flitton, Poitras and Wickenden participated, out of which came a resolution moved by Mr. Eadie and seconded by Mr. Low, and carried unanimously as follows:

THAT the Toronto councillors, with power to add to their number, be appointed as a committee to recommend to Council the make-up of the committee on community planning authorized by the annual meeting, and that they also contact Mr. Bunnell and the Royal Architectural Institute of Canada with a view to furthering the establishment of a community planning Institute.

*Co-operative Agreement in Quebec*—On the motion of Dr. Gagnon, seconded by Mr. Lindsay, it was unanimously resolved that Messrs. J. B. Stirling, J. A.

Lalonde and André Benoit be appointed as the Institute's representatives on the joint committee provided for under clause 9 of the agreement between the Institute and the Corporation of Professional Engineers of Quebec for the advancement of co-operation. It was noted that the Corporation representatives on this committee were Messrs. J. A. McCrory, P. E. Poitras, and A. D. Ross.

*Employment Conditions*—The general secretary presented an interim report from the Committee on Employment Conditions, which referred to the following subjects:

(1) The recent decision of the Wartime Labour Relations Board that professional workers would be included under Order in Council 1003 instead of having a new order for themselves as requested by the committee of fourteen. Mr. Hertz' committee acknowledges a letter from the Minister of Labour which they interpret to mean that engineers may remain as professional units for purposes of bargaining under P.C. 1003 with the right to choose their own bargaining agency, and without trade unions being able to include them against their own wishes in an overall contract.

(2) The joint sub-committee of three has acknowledged the Minister's letter and informed him that before a final reply was made the situation would be carefully studied again. The sub-committee proposes to meet in Ottawa early in April for this purpose.

(3) Reference is made to the Quebec Federation of Professional Employees, stating that the organization has been launched and is now seeking members. The report also states that the board of the Federation has decided to reconsider the constitution under which it is operating. This relates principally to the recommendation of Mr. Hertz' committee that membership in the Federation, as far as engineers are concerned, should not be restricted to members of the Corporation of Professional Engineers.

In the discussion which followed Mr. Lalonde inquired as to whether or not the official support of Council had ever been given to the proposal to establish the Quebec Federation of Professional Employees.

The general secretary referred to a report presented by the committee at the December meeting of Council in which it was stated that the committee recommended supporting the idea of a co-operative group operating a collective bargaining agency for the benefit of all properly qualified professional workers who desired to be included irrespective of whether they belonged to an organization or not. Under these conditions it was recommended that Council would even be prepared to share in the initial financing.

Mr. Wright pointed out that there was a clause in the present constitution of the Federation by which that organization refused to bargain for any professional engineers who were not members of the Corporation. It was because of this clause that Mr. Hertz' committee had not recommended to Council the entire approval of the Federation proposal. The committee felt that such a restrictive clause would tend to develop additional bargaining organizations to include those who did not belong to the Corporation and would therefore establish a multiplicity of bargaining agencies, whereas the best results would be obtained if the field were limited to one.

Mr. Armstrong raised the point as to where draughtsmen fitted in under Order in Council 1003. He stated that in many offices there were large numbers of draughtsmen, some graduates of universities

and others not eligible for membership in the Institute or licensing bodies and therefore not eligible for the Federation. He wanted to know if it was the intention of the Federation to bargain for such people or would they be bargained for by a union if they desired collective bargaining.

Mr. Lindsay suggested that such persons could be taken in as students of the Corporation and in this way become eligible for membership in the Federation.

Eventually it was agreed that the Committee on Employment Conditions would be asked to report again to Council on this point.

*Engineers and the Design of Buildings*—Mr. Armstrong reviewed the situation with reference to the case of the Quebec Association of Architects versus Brian Perry. He explained the Institute's special interest in the court decision and in future developments. On account of the national character of the Institute it was felt that it had a special responsibility in following the case closely and giving support to Mr. Perry and the Corporation. To this end Past-President Beaubien had arranged a meeting of the president and president-elect of the Corporation, Messrs. Lindsay and Poitras, with Messrs. Beaubien, Armstrong, Chadwick and Wright. Unfortunately, on the day of the meeting Mr. Beaubien was ill and could not attend.

At the meeting the whole situation was reviewed and the Institute's interest explained. Mr. Armstrong reported to the meeting that the Institute desired to work closely with the Corporation and with Mr. Perry in the appeal of the court decision and with the Corporation in the action necessary to have the professional engineers' act amended. While at the moment he could not commit Council to financial expenditures he was confident that the Institute was prepared to carry a substantial portion of the costs, and at the same time to appoint representatives who would work with the Corporation throughout the deliberations in determining the future action.

Mr. Armstrong reported that the outcome of the meeting was that it was agreed that the Institute would appoint three representatives to work with three similar representatives of the Corporation to accomplish these ends.

*Deterioration of Concrete Structures*—The general secretary read a letter from R. B. Young relative to the work of the Committee on the Deterioration of Concrete Structures. In this letter Mr. Young pointed out that the field was a very wide one and because of the expense involved he thought the Institute should select some portion of the field and confine its activities to that. He recommended further that a small temporary committee be appointed to survey the field and bring in a recommendation as to a course of action. If the committee recommends further activity it should be instructed to select a particular problem or problems "which it believes could best be studied in Canada and suggest how the work might be carried out".

Mr. Chadwick agreed with the contents of Mr. Young's letter. He pointed out that there were already many organizations doing this class of work and he thought the Institute should be certain to determine that it could make a contribution to the subject before undertaking any further activities.

The president inquired as to whether or not it would meet the Institute's requirement if the committee's functions were restricted to reporting the results of the work of the many committees already engaged in the subject.

Mr. Armstrong pointed out that Mr. Young's letter goes farther than that and in order to bring the matter before Council for action, he moved the adoption of Mr. Young's recommendation relative to the appointment of a small interim committee to survey the situation. This was seconded by Mr. Eadie and approved unanimously.

After further discussion it was agreed unanimously that the interim committee be appointed as follows:

R. B. Young, Convenor, Toronto.  
E. Viens, Ottawa.  
A. G. Fleming, Montreal.  
J. A. McCrory, Montreal.

*Committee on the Young Engineer*—The president pointed out that it had not been easy to find some person to recommend as chairman of the Committee on the Training and Welfare of the Young Engineer made necessary by the death of Harry Bennett. He reported that, on his behalf, the general secretary had made inquiries in several directions, including deans of engineering and other members of the joint national committee, but that up to the present time there was nothing definite to report.

The general secretary reported on a letter and a conversation which he had had with Mr. Kirkconnell of Ottawa, secretary of the joint national counselling committee, in which Mr. Kirkconnell had stated that both he and Mr. Greene, the other member of the committee, had agreed that the person selected by the Institute should also head up the joint national committee. He had expressed the hope that an appointment could be made quickly so that the work could be continued.

The general secretary announced also that a letter had been received from the chairman of the University of Toronto Alumni Counselling group stating that they were interested in knowing the Institute's appointment as they desired to co-ordinate the activities of their group with those of the joint national committee.

Some names were suggested by councillors and eventually it was proposed by the president that these people be interviewed by Vice-President Armstrong and the general secretary, and that if negotiations could not be completed that the matter be left for final selection and decision with the president, the vice-president and the general secretary. This was approved unanimously.

*Grading of Skilled and Unskilled Labour*—The general secretary reviewed the discussion which had taken place at the meeting of Council in Winnipeg on February 8th relative to an inquiry from Councillor Stenbol. At that meeting it was decided that the matter be left with the president to select a small committee to consider the subject and the appropriateness of the Institute as a body taking action on it. He reported that on the instructions of the president he had reported the situation to a prominent industrialist in the Montreal area asking his advice as to Institute policy.

Mr. Wright read a letter which he had received in reply to this inquiry. The letter reviewed the developments in considerable detail and pointed out that job rating in relationship to skill and quantity of work had been before large employers of labour for a long time and that these factors were behind the job and man rating systems used now in the United States and Canada, particularly in the heavy industries.

While acknowledging the essentiality of the study, the letter stated "it is more an administrative problem

than an engineering problem and in our opinion does not require the qualifications which we look for in an engineer." The letter went on to state that in the United States these rating systems were used even by some of the labour unions in their appeals to the labour boards for adequate differentials in rates of wages.

The letter disclosed certain other information which it was felt would be helpful to members of Council and the general secretary was instructed to pass this on to Mr. Stenbol.

Council acknowledged the competence of the author of the letter to advise the Institute. In the discussion which followed the thought was expressed by some councillors that engineers should be interested in job ratings, but it was the more general opinion that while there was no reason why they, as employers, should not be interested in the subject there was no indication that as a profession they had any particular responsibility to it. Eventually it was moved by Mr. Chadwick and seconded by Mr. Flitton that the Engineering Institute should not inaugurate any activity in this field. This was approved unanimously.

*Memorandum from Toronto Branch*—Mr. Wilson asked Mr. Frost as chairman of the Toronto Branch, to report on a memorandum that was in the course of preparation by the Toronto Branch executive. Mr. Frost explained that some time ago the Toronto Branch had appointed a committee on policy. The committee's findings were largely concluded and it was expected that a final memorandum would be ready for Council shortly. He outlined the form which it was going to take and the field which it covered, and, after a general discussion, it was agreed that the Committee on Professional Interests would meet with the executive of the Toronto Branch at an appropriate time to discuss the subjects in detail, after which the memorandum would be prepared for presentation to Council. This was agreed to unanimously.

The Council adjourned for lunch at one-thirty p.m. and reconvened at three o'clock with the president in the chair.

*Financial Statement*: It was noted that the financial statement to the end of February had been examined and approved.

*Resignation of Vice-President E. B. Wardle*: The general secretary read a letter from Vice-President E. B. Wardle, in which he stated that in view of ill health and his inability to participate in meetings of Council, he was submitting his resignation as vice-president. Council was greatly disturbed to receive such a report, and while regretting the conditions that made it necessary, agreed to Mr. Wardle's submission.

In accordance with the by-laws, which provide that a vacancy in the office of vice-president shall be filled until the following annual election by the senior councillor from the zone in which the vacancy occurs, Mr. E. V. Gage, as such senior councillor, was appointed vice-president for the balance of 1945.

The vacancy in the office of councillor will now be filled until the next annual election, by a corporate member chosen by Council from a list of nominees to be submitted by the executive of the Montreal Branch.

*Public Works Administration of the U.S. Government*: Mr. Wright reminded Council that in 1943 an invitation had been received from a group of engineers in the United States asking the Institute to appoint a representative to a committee being formed to

investigate the behaviour of long-span suspension bridges. With the invitation had been a suggestion that Dr. P. L. Pratley would be a very acceptable representative. Dr. Pratley had accepted the appointment and he now presented a progress report which the general secretary read to the meeting. The report was accepted and the general secretary was directed to express to Dr. Pratley Council's thanks and appreciation and to print the report in the *Journal* for the information of all members. (See p. 242).

*Association Representation on Council*: It was noted that the following representatives of provincial associations of professional engineers had been appointed to the Council of the Institute for the year 1945:

Nova Scotia Association—H. W. L. Doane, Halifax, N.S.

Saskatchewan Association—J. W. D. Farrell, Regina, Sask.

Quebec Corporation—E. Lavigne, Quebec, Que.

*Student Prize Memberships*: It was noted that at the annual student nights of the Toronto and Montreal branches the following students had presented papers and, in addition to cash prizes from the branch, had received Student membership in the Institute for one year, including the subscription to *The Engineering Journal*:

*Toronto Branch*

D. E. Becks  
R. T. Cavanagh  
H. H. Todgham

*Montreal Branch*

L. A. Dion  
D. Noiseux  
P. J. Robinson  
G. H. Y. Slader.

*The Engineering Institute of Canada Prizes*: On the motion of Past-President Beaubien, seconded by Vice-President Gage, it was unanimously resolved that The Engineering Institute of Canada Prizes, consisting of \$25.00 in cash, awarded annually to each of eleven Canadian engineering schools, be continued for a further period of five years.

Mr. Wilson explained the activities of the Toronto Branch, with particular reference to the Students Night, at which prizes are provided by the branch. He explained that this year the sum of \$50.00 for prizes had been made available by a member of the executive who was particularly interested in student matters. This had made it possible to extend the prize list well beyond what was normally possible.

*Wartime Bureau of Technical Personnel*: The general secretary reported on a meeting of the Advisory Board of the Wartime Bureau of Technical Personnel held in Ottawa on March 16th. He referred at some length to complaints which had come to the Institute both from employers and employees on the operations of the Bureau. He had reported these cases to the Bureau so that the record might be checked. The various complaints were dealt with by the Advisory Board.

The examination of the cases from the viewpoint of the Bureau, revealed a different picture from that which had been reported to the Institute.

The Board discussed these matters at considerable length and decided that the organizations sponsoring the Bureau should endeavour to give the Bureau addi-

tional favourable publicity. It was emphasized that the restrictive nature of the Selective Service regulations was certain to cause dissatisfaction with some people, but if those persons and organizations who knew the whole story gave the Bureau the proper publicity it would offset the unfavourable comments made by those who chafed under the restrictions.

Mr. Wright pointed out that the restrictions were not made by the Bureau. They were part of the Selective Service acts and all the Bureau had to do with them was to follow instructions. The scale of priorities for industries was not established by the Bureau and therefore it had no choice in the matters of which complaint had been made.

Mr. Wright suggested that any further complaints that came to Headquarters should be reported in detail so that the Bureau would be given an opportunity to defend itself and at the same time the person making the complaint could be corrected if it was found that he was in error.

*Annual Meeting:* The general secretary read a letter from Mr. Fred Seibert, the chairman of the Winnipeg annual meeting committee, reporting that the business of the committee was practically completed and now that all accounts were paid it was evident that there would be a substantial surplus. Mr. Seibert reported that the committee was returning this to Headquarters.

Council expressed appreciation of the excellent work done by the Winnipeg Branch. The president reported that according to everything he had heard in Winnipeg the local members had enjoyed extremely the meeting and the preparations for it and that they hoped the Institute would be back again before too many years had passed. He also reported that interest in the Institute had been increased materially both at the university and with the other engineers.

The president reported to Council that the next meeting would be held in Moncton on Saturday, April 21, during his visit to the maritime branches. If any members of Council could accompany him on all or part of the trip he would be delighted to have their support. In any event he hoped that there would be a good representation from the other provinces at the Council meeting.

The Council rose at five o'clock p.m.

## ELECTIONS AND TRANSFERS

A number of applications were considered and the following elections and transfers were effected:

### Members

- Barratt**, Philip S., B.A.Sc. (Civil), (Univ. of B.C.), engr. dftsman., Cons. Mining & Smelting Co. of Canada Ltd., Trail, B.C.  
**Cunningham**, John, (Glasgow & West of Scot. Tech. Coll.), mgr., North Western Dredging Co. Ltd., Vancouver, B.C.  
**Ford**, Ernest Arthur, B.Sc. (Civil), (Univ. of Man.), asst. contract engr., Dominion Bridge Co. Ltd., Winnipeg, Man.  
**Hansen**, Harold Edward, B.Sc. (Chem. Eng.), (Univ. of Sask.), asst. supt., British American Oil Co. Ltd., Calgary, Alta.  
**Stiles**, Edwin Milo, C.E. (Thayer Sch. of Civil Engrg.), chief engr., Cons. Mining & Smelting Co. Ltd., Trail, B.C.

### Juniors

- Barker**, Frederick George, B.Eng. (Chem. Eng.), (McGill Univ.), fluoride plant supervisor, Aluminum Co. of Canada Ltd., Arvida, Que.

### Transferred from the class of Student to that of Member

- Smith**, Wilfrid Ewart, Elec. Lieut., R.C.N.V.R., H.M.C.S. "Poundmaker," c/o F.M.O., St. John's, Nfld..

### Admitted as Students

- Barron**, J. Leonard (McGill Univ.), 221 Clarke Ave., Montreal 6, Que.  
**Cavanagh**, John Richard, 2/Lt., B.A.Sc. (Univ. of Tor.), Officers' Mess, A-5, C.E.T.C., Petawawa, Ont.

- Cottingham**, David P., B.Sc. (Elec.), (Univ. of Man.), 527 King St., Peterboro, Ont.  
**Dickie**, James Edwin, Douglas Hall, McGill Univ., Montreal.  
**Fielding**, George Parker (N.S. Tech. Coll.), 41 Elliott St., Dartmouth, N.S.  
**Gregory**, John (Univ. of Alta.), 11011-80th Ave., Edmonton, Alta.  
**Horgan**, Frank Joseph, Jr., (Univ. of N.B.), 607 Campbell St., Fredericton, N.B.  
**Hughes**, Robert Bruce Chalmers, B.A.Sc. (Elec.), (Univ. of B.C.), 309 Park St., N., Peterboro, Ont.  
**Madryga**, Alexander, B.Sc. (Univ. of Tor.), 422 Donegal St., Peterboro, Ont.  
**MacKay**, Donald Akerley (N.S. Tech. Coll.), Pine Hill Residence, Halifax, N.S.  
**MacPherson**, Ritchie, B.Eng. (Chem.), (Univ. of Sask.), Laurentide Inn, Grand'Mere, Que.  
**McCarter**, Donal Clayton, B.A.Sc. (Mech.), (Univ. of B.C.), 264 Hunter St., Peterboro.  
**Moore**, Harold James, B.Sc. (Univ. of Tor.), 4239 Oxford Ave., Montreal 28.  
**Owers**, Leonard E. A. (Univ. of Tor.), Elm Avenue, Scarborough, Ont.  
**Robinson**, Patrick John (McGill Univ.), 3434 McTavish St., Montreal, Que.  
**Szkolnicki**, Teddy John (McGill Univ.), 538 Prince Arthur St., W., Montreal.  
**Tanton**, Roy Fraser (N.S. Tech. Coll.), 88 Cedar St., Halifax, N.S.  
**Weyman**, Charles Edward (Univ. of N.B.), 59 Lansdowne St., Fredericton, N.B.

## STUDENTS AT ECOLE POLYTECHNIQUE

- Asselin**, Louis André, 6074 Briand St., Montreal, Que.  
**Desroches**, Raymond, 4623 Hotel de Ville, Montreal, Que.  
**Huppé**, Lucien, 1811 St. Andre Street, Montreal, Que.  
**LeBlanc**, J. Roger, 3724 St. Hubert St., Montreal, Que.  
**Martin**, Jean-Paul, 6361 Molson St., Montreal, Que.  
**Matte**, Paul, 3420 Parc Lafontaine, Montreal, Que.

## STUDENTS AT QUEEN'S UNIVERSITY

- Brisson**, Robert Joshua, 164 Barrie St., Kingston, Ont.  
**Dick**, William, Box 152, Cardston, Alta.  
**Fenton**, Stuart William Cameron, 185 William Street, Kingston, Ont.  
**Oattes**, Merle Ebert, Carleton Place, Ont.  
**Stone**, Morton R., 112 Goulburn Ave., Ottawa, Ont.  
**Sullivan**, Harry Morton, 18 Findlay Ave., Ottawa, Ont.  
**Zabek**, Valerian, 211 University Ave., Kingston, Ont.

## STUDENTS AT UNIVERSITY OF TORONTO

- Becks**, Douglas Edwin, 21 Grenville St., Toronto, Ont.  
**Cavanagh**, R. T., 88 Rosedale Heights Drive, Toronto, Ont.  
**Davidson**, Gordon Petrie, 329 Fairlawn Ave., Toronto, Ont.  
**Lount**, Albert Murray, 238 Dufferin Ave., Brantford, Ont.  
**Morrish**, Robert Roy, Cherrywood, Ont.  
**Paget**, Claremont E., 16 Glengrove Ave. W., Toronto, Ont.  
**Todgham**, Herbert Harvie, Jr., 126 George St., Toronto 5, Ont.  
**Weir**, Robert Archibald, 170 Geoffrey St., Toronto, Ont.

## STUDENTS AT UNIVERSITY OF MANITOBA

- Beverly**, William McGregor, 326 Waverley St., Winnipeg, Man.  
**Kuzyk**, Fred Theodore, Poplar Point, Man.  
**MacLean**, Ronald James, 270 Ashland Ave., Winnipeg, Man.  
**Stocker**, William Alexander, 327 Winchester St., Winnipeg, Man.  
 By virtue of the co-operative agreement between the Institute and the provincial associations of professional engineers, the following elections and transfers have become effective:

## ALBERTA

### Member

- Dingman**, Charles Willard, chief petroleum engr., Home Oil Co. Ltd., Calgary, Alta.

### Transferred from the class of Junior to that of Member

- Collier**, David Barr, B.Sc. (Civil), (Univ. of Alta.), engr., North-western Utilities Ltd., Calgary, Alta.  
**Corey**, Berton Hatfield, B.Sc. (Univ. of Alta.), asst. mining engr., Dept. of Natural Resources, C.P.R., Calgary, Alta.  
**McEachern**, Archibald Calvin, C.E. (Univ. of Sask.), supt., Coast Construction Company, Vancouver, B.C.

### Transferred from the class of Student to that of Junior

- Lawrence**, Norman Alexander, B.Sc. (Civil), (Univ. of Alta.), Lieut., R.C.E., No. 1 Canadian Workshop and Park Co., C.A.O.S.

## NOVA SCOTIA

- Ganter**, Ernest Linwood, E.E. (Polytechnic Institute, Brooklyn), elec. engr., Can. Gen. Elec. Co. Ltd., Sydney, N.S.
- Gould**, W. Murray, B.Eng. (Mech.), (N.S. Tech. Coll.), president, Standard Construction Co. Ltd., Halifax, N.S.
- Newcombe**, Stanley Allen, B.Sc. (Elec.), (N.S. Tech. Coll.), acting equipment engr., Maritime Telegraph & Telephone Co. Ltd., Halifax, N.S.
- Reynolds**, James Russell, B.Eng. (Mech.), (N.S. Tech. Coll.), Command. Officer, R.C.N.V.R., asst. res. naval engr. overseer, Halifax Shipyards Ltd., Halifax, N.S.
- Stairs**, Henry Gerald, 115 Inglis Street, Halifax, N.S.

*Transferred from the class of Student to that of Member*

- Malloff**, William, B.Sc. (Mech.), (Univ. of Sask.), mech. engr., Foundation Maritime Limited, Walton, N.S.

## QUEBEC

### Members

- Bertrand**, Rene, B.A.Sc., C.E. (Ecole Polytechnique), engr., divn. of streets, City of Montreal, Que.
- Crepeau**, Armand Charles (Laval Univ.), consltg. engr., Sherbrooke, Que.
- Colman**, Arthur R., B.A.Sc. (Univ. of Toronto), outside plant standards engr., Bell Telephone Company of Canada, Montreal, Que.
- Douglas**, James Bruce, B.A.Sc. (Univ. of Toronto), chief engr., West Aeronautical Devices Inc., Montreal, Que.
- Gilbert**, Marc, B.A.Sc., C.E. (Ecole Polytechnique), M.Sc. (Mass. Inst. Tech.), consltg. engr., Quebec, Que.
- Granger**, John Maxwell, B.A.Sc. (Mech.), (Univ. of B.C.), chief, mech, inspr., R.C.A.F., R.C.A. Victor Company, Montreal, Que.

- Haberl**, Herbert William (Carnegie Inst. Tech.), protection engr., Quebec Hydro-Electric Commn., Montreal, Que.
- Hawkes**, John Milton, B.Sc. (Queen's Univ.), chief engr. & production mgr., Pepsi-Cola Co. of Canada Ltd., Montreal, Que.
- Laniel**, Joseph Albert, B.A.Sc., C.E. (Ecole Polytechnique), dist. engr., Dept. of Public Works, Canada, Rimouski, Que.
- Larnder**, Ivor Tulk Chesson, B.Eng. (Civil), (Univ. of N.Z.), designing engr., Fraser Brace Engrg. Co. Ltd., Montreal, Que.
- Michaud**, Joseph Adolphe, B.A.Sc., C.E. (Ecole Polytechnique), woodland supt., Consolidated Paper Corpn., Ltd., Grand Mere, Que.
- Milne**, James Michael, B.Sc. (Mech.), (Queen's Univ.), steam engr. & safety engr., Donnacona Paper Co. Ltd., Donnacona, Que.
- Morrisette**, Roméo (Ecole Polytechnique), mayor & consltg. engr., Cap-de-la-Madeleine, Que.
- Sorgius**, Henry, B.A.Sc., C.E. (Ecole Polytechnique), supt. woods operations, Consolidated Paper Corpn. Ltd., Shawinigan Falls, Que.
- Spencer**, Walter Hutchins, B.Sc. (Elec. & Mech.), (McGill Univ.), asst. engr., right-of-way divn., Quebec Hydro-Electric Commn., Montreal, Que.
- Stearns**, Eugene, C.E. (Univ. of Vienna), president & managing director, Concrete Engineering Limited, Montreal, Que.
- Trudeau**, Alphonse, B.Sc. (McGill Univ.), gen. supt., Atlas Construction Co. Ltd., Ste. Anne de Bellevue, Que.

## SASKATCHEWAN

*Transferred from the class of Student to Junior*

- Smith**, Will, National Light and Power Company, Moose Jaw, Sask.

# Personals

Relatives and friends of members in the active forces are invited to inform the Institute of news items, such as locations, promotions, transfers, etc., which would be of interest to other members of the Institute and which should be entered on the member's personal record kept at Headquarters. These would form a basis of personal items in the *Journal*.

**Air Vice-Marshal G. O. Johnson**, M.C., M.E.I.C., has been appointed to the post of Air Officer Commanding in Chief of the R.C.A.F. overseas to succeed Air Marshal L. S. Breadner whose retirement became effective April 1st. Air Vice-Marshal Johnson joined the Royal Flying Corps in 1917 and was promoted to captain the following year. He was a fighter pilot with a record of 12 planes. He joined the Canadian air force when the armistice was signed and in 1920 took command at Camp Borden. Since then he has been continuously engaged in aviation becoming assistant director of the Royal Canadian Air Force in 1923 and successively holding the posts of assistant director of civil air operations, director of air operations and acting senior air officer with headquarters at Ottawa. He organized the Western Air Command but was recalled to Ottawa in 1939 when he was made a member of the air council and placed in charge of organization and training for the British Commonwealth Air Training Plan which was completed on March 31st last. Up to January, the plan had graduated 122,000 aircrew and employed approximately 15,000 planes. In 1940 Air Marshal Johnson was appointed to the newly created post of Deputy Chief of the Air Staff and two years later was made air officer commanding No. 1 Training Command, Toronto. He transferred to Halifax as air officer commanding Eastern Air Command in 1943, later becoming its air officer commanding in chief.

## News of the Personal Activities of members of the Institute

**Brigadier Fraser F. Fulton**, O.B.E., M.E.I.C., who has been holding a technical appointment at Canadian Military Headquarters in London, England, since 1943, has been promoted from the rank of colonel. A member of the Royal Canadian Corps of Signals here before the war, he at once went on active service and has been overseas since 1940. He was later attached to headquarters in London and is credited with being the organizer of the Canadian Army's first radio-locator system.

**Major-General G. R. Turner**, C.B., M.C., D.C.M., M.E.I.C., has recently been appointed Inspector General of the Army for Western Canada, succeeding Maj.-Gen. R. O. Alexander who has retired. General Turner leaves the post of special assistant to the Deputy Minister of Veterans Affairs to take the inspector-generalship. At the outbreak of the present war he went overseas with the 1st Division and from that time until he went on special duty in the United Kingdom in 1943 he handled major problems of administration and supply. He returned to Canada in September 1944.

The following members of the Institute have recently been mentioned in dispatches for gallantry overseas:

**Col. George Earle Wight**, R.C.A.M.C., Montreal, Que.

**Lieut.-Col. A. Scott Rutherford**, R.C.E., Montreal, Que.

**Capt. (A/Major) J. F. G. Beaudet**, R.C.E., Montreal, Que.

**Frederick Palmer, M.C., M.E.I.C.**

**Frederick Palmer, M.C., M.E.I.C.**, who has spent the last eight years as Canadian Government Trade Commissioner in Australia has been selected to go to Chungking, China, for the purpose of investigating the possibility of Canadian trade with China. Previous to his going to Australia, where much of his work was associated with Australia's war effort, he had served as a Canadian Government Trade Commissioner developing Canada's export trade in Holland, Italy, Norway, Sweden, Denmark, Finland and Great Britain. A native of Belfast, Ireland, he received his engineering training at Nova Scotia Technical College graduating with the degree of B.Sc. in 1913. Mr. Palmer was on active service overseas from 1916 until the end of the war, serving as a lieutenant in the heavy artillery and being awarded the Military Cross.

**H. E. Smith, M.E.I.C.**, now holds the position of production manager for The Silex Company at Hartford, Conn.

**Major J. Colin Kemp, D.S.O., M.C., M.E.I.C.**, has been appointed managing director of a newly formed Canadian subsidiary of George S. Armstrong & Co. Inc., industrial engineers and management consultants. The Canadian subsidiary, located in Montreal, is known as George S. Armstrong & Co. (Canada) Ltd. Mr. Kemp's own practice is now consolidated with the new company, but he will continue to serve as a director on the boards of a number of Canadian corporations.

**J. A. Lynch, M.E.I.C.**, has been recently released from the R.C.A.F. with which he was serving as a flight-lieutenant. He has taken a position with the mechanical engineering division of the National Research Council in Ottawa, Ont.

**C. P. Haltalin, M.E.I.C.**, has been elected chairman of the Winnipeg Branch of the Institute. Born in Winnipeg, Man., he graduated from the University of Manitoba with the degree of B.Sc. (E.E.) in 1929. For three years after graduation he worked on substation design, transmission lines and water power calculations with the Winnipeg Electric Company. From 1932 until 1934 he was engaged in design layout and installation of electric pumping equipment and electric boilers with the same company. In 1934, he became assistant engineer which position he still holds.

Mr. Haltalin joined the Institute as a Student in 1927, transferring to Associate Member in 1934 and becoming a Member in 1940.

**Flight-Lieutenant Walter L. Rice, M.E.I.C.**, has recently been transferred to the headquarters of the newly formed No. 1 Air Command at R.C.A.F. Station at Trenton, Ont. The new command is an amalgamation of the former No. 1 Training Command with headquarters in Toronto and the former No. 3 Training Command with headquarters in Montreal. F/Lt. Rice has been waterworks and sanitation engineer officer in the Construction and Engineering Division of No. 3 Training Command for the past three years and will carry on in that capacity for No. 1 Air Command. Prior to enlisting in the R.C.A.F. he was employed by Defence Industries Limited, Montreal, on the design of waterworks and sewage treatment facilities and is a regular employee on leave from the City of Toronto Works Department.

**Victor Michie, M.E.I.C.**, who has been located in Newfoundland as inspecting engineer with the Department of Munitions and Supply is now with War Assets Corporation in Montreal as chief of construction and engineering department.

**James W. Hughes, M.E.I.C.**

**James W. Hughes, M.E.I.C.**, electrical engineer with the Canadian Pacific Railway at Toronto, Ont., has been elected president of the Toronto Railway Club for 1945. Mr. Hughes is a past-president of the Canadian Railway Club of Montreal.

**F. Jno. Bell, M.E.I.C.**, has been appointed vice-president and manager of C. A. Parsons of Canada Limited, the newly formed branch of C. A. Parsons & Company Limited, builders of steam turbines and heavy electrical apparatus, with works at Newcastle-on-Tyne, England. Mr. Bell, who is widely known in engineering and industrial circles throughout Canada, has been the Canadian representative of the company since 1924. At one time he also represented other British engineering firms including Messrs. Braithwaite and Company Engineers Limited, London, Eng. He was president and general manager of the Canada Wire and Cable Company, Toronto, and subsequently held the same offices in the Leaside Munitions Company, Leaside, Ont. Mr. Bell later became vice-president of the St. Catharines Steel and Metal Company at St. Catharines, Ont.

**Colonel Norman J. W. Smith, M.E.I.C.**, has recently been promoted from the rank of lieutenant-colonel and is at present connected with the D.C.E. (Works), H.Q. First Canadian Army, Canadian Army Overseas.

**Professor R. W. Angus**, HON.M.E.I.C., who retired last June as head of the department of mechanical engineering at the University of Toronto, has been awarded honorary membership in the American Waterworks Association. At the banquet of the Canadian Section, held last month, the certificate of honorary membership in the parent body was presented by Samuel F. Newkirk, Jr., president of the Association. The citation read as follows:

"Robert W. Angus, Professor Emeritus of Mechanical Engineering, University of Toronto; a member of the Association since 1917; recipient of the Fuller Award in 1942; distinguished as a teacher of engineering and as a leader among engineers, within and beyond the boundaries of the Dominion of Canada."

**Lieut.-Col. W. E. Phillips**, C.B.E., D.S.O., M.C., M.E.I.C., has been named chairman of the Board of Governors of the University of Toronto. As president of the government project, Research Enterprises Limited at Leaside, Ont., and director of various industrial, financial and mining corporations. Col. Phillips has rendered invaluable service to the war industry of Canada.

**Ernest Lavigne, M.E.I.C.**

**Ernest Lavigne**, M.E.I.C., has been appointed to the Council of the Institute to represent the Corporation of Professional Engineers of Quebec. Born in Quebec City, Que., he graduated in civil engineering from the Ecole Polytechnique in 1916. In 1918 Mr. Lavigne was employed as an assistant engineer with the Department of Public Works and Labour at Quebec and three years later went into private practice. Since 1926 he has held the position of Fire Commissioner of the Province of Quebec, at Quebec.

Mr. Lavigne joined the Institute as a Student in 1913, transferring to Junior in 1917. In the following year he transferred to Associate Member, becoming a Member in 1945.

**Yvon De Guise**, M.E.I.C., formerly senior engineer in the hydraulic service of the Department of Lands and Forests at Quebec, has been appointed assistant to M. V. Sauer, M.E.I.C., hydraulic engineer and general superintendent of generating stations, electrical department of the Quebec Hydro-Electric Commission at Montreal.

A graduate of the Ecole Polytechnique in 1937 and of the Canadian General Electric Company's Test Course in 1939, Mr. De Guise has also been lecturing at the Ecole Polytechnique since 1943 on hydraulic structures and elementary water-power engineering.

**P. E. Poitras, M.E.I.C.**

**Paul-Emile Poitras**, M.E.I.C., is the newly elected president of the Corporation of Professional Engineers of Quebec. Born at Mascouche, Que., he graduated from the Ecole Polytechnique, Montreal, in 1915. After being employed successively with the Inspection Board, the Dominion Bridge Company and the Canada Cement Company he joined the staff of the Steel Company of Canada Limited, Montreal, as an engineer in 1920. He later became mechanical engineer in charge of the engineering department, a position which he still holds.

Mr. Poitras joined the Institute as a Member in 1937 and for the past few years has been active in the affairs of the Montreal Branch, serving on the executive committee. Last year he was elected one of the councillors of the Institute for the Montreal Branch.

**Albert Chartier**, M.E.I.C., is now the Director of Industrial Training and Welfare, Plessisville Foundry, Plessisville, Que. His former position was that of Employment Officer and Industrial Mobilization Surveyor, Department of Labour, at Montreal.

**J. E. B. Cranswick**, M.E.I.C., has recently been appointed manager of the Edmonton office of Canadian Westinghouse Co. Limited. He was formerly sales engineer.

**Ralph Allingham**, M.E.I.C., of White Plains, N.Y., was recently named general construction superintendent of the Wilputte Coke Oven Corporation of New York, N.Y. He had been with Semet-Solvay Engineering Corporation, New York, for the past eight years and was superintendent of construction at the time of his resignation.

**E. V. Gage**, M.E.I.C., has been appointed vice-president of the Institute for the province of Quebec to finish the term of office of E. B. Wardle who has resigned on account of ill health. Born at Pearcecton, Que., Mr. Gage graduated from McGill University with the degree of B.Sc. in 1915. Upon graduation he joined the firm of the late A. F. Byers, M.E.I.C., engineer and contractor, and has been with the company ever since. On the death of Mr. Byers, a few years ago, Mr. Gage became president of A. F. Byers Construction Company Limited, Montreal.

Mr. Gage joined the Institute as a Student in 1914, becoming an Associate Member in 1919 and a Member in 1940. He has been active in the Montreal Branch for many years and in 1943 was elected a councillor of the Institute representing the Branch.

Col. I. Leonard, D.S.O., M.E.I.C.

H. G. Stead, M.E.I.C.

Col. H. A. McKay, O.B.E., M.E.I.C.

**Colonel Ibbotson Leonard**, D.S.O., M.E.I.C., who has been president and general manager of E. Leonard & Sons Limited of London, Ont., since 1923 will continue as a director in the firm which has been recently transferred from the Leonard family to a new company consisting largely of employees of the old firm. Col. Leonard is a graduate of the Royal Military College and McGill University and served with distinction during the first world war.

**H. G. Stead**, M.E.I.C., who has been with E. Leonard & Sons Limited since 1923, has been appointed president of the new firm. In 1937 he was appointed chief engineer and he will continue in that capacity in addition to his duties as president.

**Colonel H. A. McKay**, O.B.E., M.E.I.C., has been appointed vice-president of the new company and will assume the duties of general manager. He has recently completed four and one-half years active service with the Royal Canadian Engineers in the present war. Prior to this, he was manager of a steel fabricating company for several years.

**L. F. Giaque**, M.E.I.C., has severed his connection with the B. Greening Wire Co. Ltd., Hamilton, Ont., and is now employed by the Spruce Falls Power and Paper Co. Ltd., Kapuskasing, Ont., as mechanical engineer.

**Lieut.-Col. W. S. Wilson**, M.E.I.C., has been given command of the University of Toronto Contingent, Canadian Officers' Training Corps. Col. Wilson, who has been second-in-command for the past ten years and Officer Commanding the Second Battalion since its formation in 1940, succeeds Lieut.-Col. Madill who has just vacated the post. Col. Wilson holds the position of assistant dean and secretary of the Faculty of Applied Science and Engineering, University of Toronto. He is a councillor of the Institute.

**Dr. W. C. Gussow**, M.E.I.C., formerly employed by the Aluminum Company of Canada at Arvida, Que., is now with the Shell Oil Company as senior geologist for Eastern Canada and Newfoundland.

**A. J. S. Taunton**, D.S.O., M.E.I.C., formerly a group captain in the R.C.A.F., has been appointed to the Department of Veterans Affairs as welfare officer at M.D. 10, Winnipeg, Man.

**Squadron Leader J. W. Lucas**, M.E.I.C., has been released from the R.C.A.F., and has returned to the Test-

ing Laboratories of the Department of Public Works at Ottawa where he was employed before his enlistment in 1941.

**L. J. Ehly**, M.E.I.C., has accepted a position in the pavement department, city engineer's office, City of Vancouver, B.C. He was previously with the Department of Transport of Canada at Lethbridge, Alta.

**C. G. Carroll**, M.E.I.C., formerly an officer in the Royal Canadian Air Force at R.C.A.F. Headquarters and Western Air Command Headquarters, has been made educational adviser of the Wartime Bureau of Technical Personnel at Ottawa, Ont.

**C. J. Chaplin**, M.E.I.C., who has held the position of timber mechanics officer in Forest Products Research (Department of Scientific and Industrial Research), England, for more than twenty years has resigned and will return to Canada shortly.

**Squadron-Leader J. S. Motherwell**, M.E.I.C., has been released from the R.C.A.F. and has accepted a position in the engineering department of the Powell River Company, Powell River, B.C.

**J. E. Clark**, M.E.I.C., who has been serving as a flight-lieutenant in the R.C.A.F. received his discharge in January and has returned to his former position of telephone engineer with the plant engineering department of the Bell Telephone Company at Kingston, Ont. While overseas, Mr. Clark was attached to the Royal Air Force on radar duties in England, Egypt, Cyprus and with the 8th Army in Tunisia, Sicily and Italy.

**Major Jacques Déry**, Jr.E.I.C., has recently returned to Montreal from Holland where he was fighting in the Second Survey Regiment. He has been overseas for five years and was wounded last summer in Normandy.

**Lieutenant (E) A. Meade Wright**, Jr.E.I.C., of *H.M.C.S. Prince David*, who returned home in February, has been mentioned in dispatches in recognition of service during the successful invasion of the south of France last August. Lieutenant Wright has been with combined operations since the landings in Sicily in 1943. In March he married Miss Joan Moon of Halifax, a daughter of Thomas Moon, M.E.I.C. He is now taking a special course in Washington, D.C. Lieutenant Wright is a son of Dr. L. Austin Wright, general secretary of the Institute.

# Obituaries

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

Raymond Stirling Kelsch, M.E.I.C.

**Raymond Stirling Kelsch, M.E.I.C.**, a pioneer in the development of the telephone and electric lighting, died at his home in Montreal, Que., on February 4th, 1945. Born at Chicago, Ill., on May 19th, 1862, he attended the Armour Institute of Technology.

After working a short time as telegraph operator he joined the American District Telegraph Company as manager of their main office in Chicago. In 1891 he was transferred to the American District Telephone Company's main office as manager. In the same year when the American District Telephone Company and the Bell Telephone Company consolidated to form the Chicago Telephone Company he was made division superintendent. In 1885 Mr. Kelsch resigned to join the Chicago Arc Light & Power Company as superintendent of their southern district and three years later was made general superintendent and chief engineer of the company. In 1892 the company was bought by the Chicago Edison Company and Mr. Kelsch remained with the reorganized Edison company for the next five years. He resigned as superintendent of high tension power houses, underground systems and shops to come to Canada. In 1897 he accepted the position of general superintendent and chief engineer of the Lachine Rapids Hydraulic and Land Company at Montreal. He supervised the erection and operation of their hydroelectric power house and distributing light and power system. When the company was purchased in 1903 by the Royal Electric Company, the original Montreal Light and Power Company, Mr. Kelsch resigned and opened an office as consulting engineer. He was immediately retained as consulting engineer of the Royal Electric Company by its president, H. S. Holt, who later became Sir Herbert Holt, to consolidate the several plants and properties of the company with the Lachine Rapids and Land Company. This later became the Montreal Light, Heat and Power Consolidated. He was retained permanently by that company since that date until his death.

Since its inception in 1911 he had been a commissioner of the Electric Service Commission of Montreal, being appointed to represent the various utilities that used the municipal conduit system. He pioneered in

**Elect. Sub/Lieut. Harry C. Tilbury, Jr., E.I.C.**, has been appointed to the Directorate of Electrical Supplies, Naval Service Headquarters, Ottawa.

**H. E. Blachford, Jr., E.I.C.**, formerly technical assistant of the Canadian Electrical Association, has been with the Inspection Board of United Kingdom and Canada for the past three years. He now holds the position of inspection officer on tanks at Montreal, Que.

**Claude Bourgeois, Jr., E.I.C.**, is now employed as junior production engineer with Dominion Containers Limited in Montreal. He was previously with Canadian Celanese Limited at Drummondville, Que.

**Robert W. Phillips, Jr., E.I.C.**, formerly an officer in the Canadian Navy, has recently been discharged and has returned to the Bailey Meter Company, Montreal, where he was previously employed.

**F. C. Read, Jr., E.I.C.**, of Dominion Tar and Chemical Company Limited, has been transferred from Sydney, N.S., to the Toronto plant.

**Elect. Sub/Lieut. M. M. Uloth, Jr., E.I.C.**, has been with the Directorate of Electrical Engineering, R.C.-N.V.R., for the past year and is at present on the electrical overseeing staff in Montreal. He was previously connected with the Canadian General Electric Company as junior engineer at Peterborough, Ont.

**Arthur Ainlay, Jr., E.I.C.**, has recently accepted a position with Canadian Westinghouse Co. Ltd. at Hamilton, Ont. He was formerly technical assistant engineer with the Inspection Board of United Kingdom and Canada at Montreal.

**Paul-Emile L'Heureux, Jr., E.I.C.**, who has been with the Department of Highways at Beauceville, Que., is at present employed in the engineering department of the City of Montreal.

**Robert A. Kerr, Jr., E.I.C.**, is now a maintenance engineer in the cable division of the Northern Electric Co. Ltd. in Montreal. He was formerly with the Nichols Chemical Company as works engineer of the sulphuric acid plant at Valleyfield, Que.

**Major John J. Denovan, S.E.I.C.**, overseas with the Canadian Technical Liaison group, has recently been promoted to his present rank. He graduated from Queen's University in 1940 with the degree of B.Sc. (Mech.).

**A. C. Smith, S.E.I.C.**, recently left the staff of the Commonwealth Plywood Company, Ste. Therese, Que., to join Fred Mannix & Company Limited at Calgary, Alta.

**Walter Arthur Runge, S.E.I.C.**, is now employed at Turbo Research Limited, Research Enterprises, at Leaside, Ont. He was formerly with Canadian Hanson and Van Winkle Co. Ltd. of Toronto.

**C. Robert Matthews, S.E.I.C.**, who has been in the engineering department of the Wayagamaek Division, Consolidated Paper Co. Ltd. at Three Rivers is at present working for Canadian Celanese Limited, Drummondville, Que., as a junior engineer.

**Donald C. McWhirter, S.E.I.C.**, is now employed by the Goodyear Tire & Rubber Company at New Toronto, Ont., as a development and production engineer.

the design of steam and hydro-electric properties and had installed plants in many parts of Canada. In 1906 he promoted and directed in Montreal the largest electrical exhibition ever held in Canada. He invented the white background for curling rink ice as well as a number of electrical devices. He retired in 1926 but was retained by several light, power and industrial companies in a consulting capacity until the time of his death.

Mr. Kelsch joined the Institute as a Member in 1908. He served as a councillor from 1908 until 1910.

**Group Captain David Gabb Williams, M.E.I.C.**, was killed on November 23rd, 1944, when the aircraft of which he was a passenger crashed near Calgary, Alta.

Born in England on October 28th, 1911, he received his education in Edmonton, graduating from the University of Alberta with the degrees of B.Sc. and M.Sc. in electrical engineering in 1933 and 1935 respectively. Since 1935 he had been an officer in the Royal Canadian Air Force. He served as Signals Officer with the Western Air Command at Vancouver and during the past few years had been stationed at various other points throughout Canada. He was transferred to Calgary in the summer of 1944.

Group Captain Williams joined the Institute as a Student in 1933, transferring to Associate Member in 1940 and becoming a Member in the same year.

**Harry Cleophas Brown, M.E.I.C.**, died after a short illness in Toronto, Ont., on February 21st, 1945. Born at Amherst, N.S., on July 2nd, 1890, he attended St. Francis Xavier University and McGill University from where he graduated in 1917 with the degree of B.Sc.

Following graduation he enlisted with the Canadian Engineers and served in France with that unit. On his return from overseas he was engaged on electrical power design with the Hydro-Electric Power Commission of Ontario and in 1920 was employed by the Wayagamack Pulp and Paper Company on electrical sub-station and mill design. From 1921 until 1923 he was with the Belgo Canadian Pulp and Paper Company as electrical engineer in charge of design, construction and operation. For the two years following he was employed at Cornerbrook, Nfld., by the Newfoundland Power and Paper Company as electrical engineer responsible for design and purchase of equipment for the new substation and paper mill. He was also in charge of electrical construction of the same plant for Sir W. G. Armstrong Whitworth Co., general contractors. During 1924-25 he held this dual position, working with each of the above companies. From 1925 until 1928 he was in charge of the Hydro-Electric Power Station at Deer Lake, Nfld., and also had under his jurisdiction all transmission lines and electrical maintenance and operation at the large paper mill at Cornerbrook. In 1929 Mr. Brown joined the staff of the manufacturing department of the International Paper Company in New York, N.Y., and in the following year was made chief electrical engineer with the company. During the preparation for the World's Fair held in 1939 and 1940 he was connected with the engineering division of the World's Fair Inc. at New York. In 1941 he went with the Union Bag and Paper Corporation at Savannah, Georgia, and two years later was employed by the Crossett Paper Mills, Crossett, Arkansas, with which firm he was associated at the time of his death. He was in charge of post-war planning.

Mr. Brown joined the Institute as an Associate Member in 1925 becoming a Member in 1940.

**Harry Ernest Huestis, M.E.I.C.**, died in Quebec City on February 8th, 1945, after a brief illness. Born at Grand Pré, N.S., on January 31st, 1873, he attended Mount Allison University, Sackville, N.B., and later attended McGill University, Montreal, from where he graduated with the degree of B.A.Sc. in civil engineering in 1896. For several years after graduation he was engaged as an engineer on railway construction. In 1919 he was employed by the Bedford Construction Company at St. John, N.B., and in 1923 became associated with the Quebec Harbour Commissioners at Quebec City. He remained with this harbour until the time of his death when he held the positions of chief engineer and assistant general manager.

Mr. Huestis joined the Institute as an Associate Member in 1905 becoming a Member in 1940.

**James Macdonald Gilchrist, M.E.I.C.**, died at Montreal on February 20th, 1945. Born at Cambridge, N.B., on December 21st, 1879, he received his preliminary education at Cambridge. At 18 years of age he joined the Canadian Army and served as a corporal with the Second Contingent in South Africa. On his return from the Boer War he entered the University of New Brunswick graduating in 1908 with the degree of B.Sc. in civil engineering. He later received his C.E. For the next few years he practised as an engineer chiefly in Quebec and Northern Ontario.

During the first world war he served as a lieutenant in the R.N.V.R. For three years he was in command of a sub-chaser in the North Sea and took part in the raid on Zeebrugge. When trouble arose in Egypt he was transferred there. He was placed in command at Port Said taking part in the policing of the Suez Canal and participating on behalf of the British Forces during the strike in Egypt. In 1919 he returned to Canada and for several years worked on various construction projects in Quebec and Northern Ontario. During the present war he was engaged on construction of air bases in Quebec and Newfoundland.

Mr. Gilchrist joined the Institute as a Student in 1908, becoming an Associate Member in 1914 and a Member in 1940.

**John Robert Rostron, M.E.I.C.**, died at his home in London, Ont., on November 12th, 1944. Born in Stockport, England, on December 13th, 1867, he received his preliminary education there, later attending Victoria University at Manchester and the Manchester Technical College. From 1883 until he came to Canada 30 years later he was employed in engineering work, connected principally with railways. He joined the staff of the city engineer's department in London, Ont., in 1915 and remained a valued member of that staff until his retirement in 1937. Many fine bridges in the city of London stand as monuments to his professional ability.

Mr. Rostron joined the Institute as an Associate Member in 1921 becoming a Life Member in 1937. He was a charter member of the London Branch at the time of its inauguration in 1921 and served as chairman in 1926 as well as a member of the executive committee for several years.

**2nd/Lieutenant René Edmond Brandt, S.E.I.C.**, died at Kingston, Ont., on December 10th, 1944. Born at Pointe aux Trembles, Que., on May 31st, 1923, he attended McGill University graduating with the degree of B.Eng. (Mech.) in 1944. Upon graduation he enlisted in the Corps of the Royal Canadian Electrical and Mechanical Engineers.

Lieutenant Brandt joined the Institute as a Student in 1943.

## HAMILTON BRANCH

W. E. BROWN, M.E.I.C. - - *Secretary-Treasurer*  
L. C. SENTANCE, M.E.I.C. - - *Branch News Editor*

On Thursday, February 22nd, the regular monthly meeting of the Hamilton Branch was held in the Science Lecture Room, McMaster University. Forty-eight members and guests were in attendance.

L. C. Sentance introduced the speaker of the evening, Mr. H. Little, vice-president and sales manager of R. & M. Bearings, Canada, Ltd. Mr. Little chose as his topic **Ball Bearings**.

Mr. Little dealt at some length with the development of bearings, from the first crude wooden roller to the present day high precision anti-friction bearings. On the North American continent metric sized bearings are used almost exclusively and the dimensions of these bearings have been effectively standardized by the Annular Bearing Engineers' Committee. No such standardization, however, has been accomplished with regard to load ratings of anti-friction bearings and nearly all manufacturers base catalogue ratings on different life factors. Mr. Little demonstrated, however, that even after having reduced the catalogue ratings to a common life expectancy, allowable loading as designated by various manufacturers were found to vary by more than 100 per cent.

Mr. Little's remarks served as introduction for two sound films, produced by the New Departure Division, General Motors Corporation. These films were entitled **The Manufacture of Ball Bearings and Micro Instrument Bearings, Their Care and Handling**. These films depicted the various manufacturing operations attendant upon quantity production of modern ball bearings. The second film in particular stressed the great length to which the manufacturer had gone in order to ensure dimensional accuracy and cleanliness. Such care as exercised by the manufacturer forcibly pointed out to the users of such bearings the necessity for equally strict control of conditions attending the handling and mounting of such bearings in the users' equipment.

Subsequent to the showing of these films, Mr. Little answered numerous questions.

The meeting adjourned at 10 p.m. for the customary refreshments.

## LAKEHEAD BRANCH

J. I. CARMICHAEL, M.E.I.C. - - *Secretary-Treasurer*  
R. B. CHANDLER, M.E.I.C. - - *Branch News Editor*

On February 12th at the regular monthly dinner meeting members of the Lakehead Branch were addressed by Mr. E. M. Proctor of James Proctor & Redfern, consulting engineers, Toronto, on the subject of **Modern Municipal Sanitation**.

Members of the City Councils of Fort William and Port Arthur were guests at the function. S. T. McCavour, chairman of the Branch, presided.

Introduced by S. E. Flook, city engineer of Port Arthur, the speaker dealt with his subject under four divisions,—Water Supply; Sewage Disposal; Garbage Collection and Disposal; and Street Cleaning.

In his remarks on Water Supply Mr. Proctor said that water, as a solution of oxygen, salts, etc., causes trouble for the sanitary engineer. The important part of that solution was oxygen. At 39 degrees Fahrenheit

## Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

water reaches its heaviest state. In a lake it reaches this temperature twice a year, in the spring and in the fall. When this occurs, the heavy water on top sinks to the bottom transposing the water on the bottom to the top, thus keeping the lake fresh.

This creates a problem for sanitary engineers as the transposition churns the bottom of the lake, causing trouble in a city's water supply. Mr. Proctor pointed out that movement in northern lakes is a boon in comparison to lakes of the southern states, which frequently become stagnant because equal temperatures prevent a changeover.

"Lake Superior is perhaps one of the most ideal lakes for hardness of water," he said. "The hardness maintains at 80 degrees and water is clear and cold. If it was any softer it would not be very palatable. Lake Huron registers 100, Lake Erie over 100 and Lake Ontario about 120."

The nearer the water gets to the seaboard the harder it becomes, taking on salts from the surrounding watersheds. Salt and alkali cause trouble to piping in modern sanitation. Therefore chemicals are added to remove same.

Odorous waters are counteracted with the addition of chlorine, which kills off the gas-forming particles causing the odour. A peculiar point of chlorination, the speaker asserted, was that while it kills off the odour it remains tasteless in the water.

Typhoid fever, he said, is almost unknown in modern cities. The disease, a scourge in the old days, is almost non-existent now. The disease of goitre, which was water borne, has been greatly alleviated with iodized salt.

The sewage disposal plant removes suspended solids by screening. The effluent is discharged to large bodies of water where dilution enables the oxygen in the water to further clarify it. "Unless you get back the oxygen in the water you have an unstable problem," he said. This was determined by the B.O.D. method, the biochemical oxygen demand.

In the sludge digester, the sludge is cooked to speed the bacterial reaction. "Nature does not take the sludge out of your lakes," Mr. Proctor maintained. "When sewage is dumped into your lakes it must settle somewhere and every day of the year that it is running down your river into the lake it is collecting."

In disposing of sludge, some municipalities take it out in the open and let it dry in sludge beds. Some place glass over them and dry it quicker. The modern method, he said, is to take the sludge to the incinerator to burn it. Frequently the dried-out sludge is used as fertilizer on the city's boulevards or sold to farmers.

Modern incinerators burn all the municipality's garbage without using fuel. In Toronto no coal or oil was used. A law making residents wrap garbage in paper was the reason.

A series of slides showing mechanical equipment and charts in connection with municipal sanitation were shown.

The speaker was tendered a vote of thanks by Walter H. Small, Mayor C. W. Cox, Port Arthur, and

Acting Mayor Hubert Badanai, Fort William, welcomed Mr. Proctor to the Lakhead.

R. B. Chandler, councillor of the Institute, gave a resumé of the Annual Meeting at Winnipeg which was attended by six Lakehead Branch members.

### LETHBRIDGE BRANCH

T. O. NEWMAN, Jr. E.I.C. - - *Secretary-Treasurer*  
A. G. DONALDSON, M.E.I.C. - *Branch News Editor*

A very interesting and informative address was delivered to the local branch of the Institute, February 23rd, by Mr. D. D. Morris, general superintendent of the Alberta Nitrogen Products Limited. Because of the nature of the industry a description in general terms only could be given.

The plant commonly called the Ammonia Plant, actually consists of four operating plants: the gas production plant, the ammonia plant, the nitric acid plant and the nitrate plant.

The gas production plant produces purified hydrogen and nitrogen. The hydrogen is obtained from the reaction of natural gas and steam while the nitrogen is obtained from the air by burning out the oxygen with natural gas.

The ammonia plant is the largest and most important on the site. It divides itself naturally into five main sections, namely: compression section, CO<sup>2</sup> purification section, CO purification and Cu liquor regeneration section, synthesis section and the refrigeration section. In the compression section are located five of the largest compressors on the North American continent, being six stage and each driven by a 2500 Hp. synchronous motor producing pressures up to 5200 lbs. per sq. in.

The nitric acid plant produces nitric acid from the reaction of ammonia with air and water passing over a suitable catalyst. Unfortunately a secondary reaction takes place which cuts down the production of HNO<sup>3</sup>. This complicates the procedure necessitating the close control of reaction conditions. The corrosive nature of the product makes necessary the use of stainless steel for most of the equipment.

The ammonia nitrate plant consists of three main sections: neutralization and concentration section, crystallization section and drying and packing section. from the reaction  $\text{HNO}_3 + \text{NH}_3 = \text{NH}_4 \text{NO}_3$ , heat is produced. This heat is used in many ways throughout the plant. Practically all of this product now goes into the manufacture of fertilizer.

It is interesting to note the amount of power and materials used at this plant in comparison with the city of Calgary. Electrical power consumption is equal to approximately 115 per cent of that of the city. Natural gas about 30 per cent on a year round basis and water approximately 150 per cent. The amount of chlorine used daily is equal to that used by the city of Montreal.

### MONTREAL BRANCH

L. A. DUCHASTEL, M.E.I.C. - - *Secretary-Treasurer*  
HYMAN SCHWARTZ, S.E.I.C. - - }  
ELI L. ILOVITCH, S.E.I.C. - - } *Branch News Editors*

On Thursday evening March 1, Mr. W. J. Davidson, director of engineering of General Motors Corporation, gave a lively and fascinating talk to the Montreal branch on some of the services rendered by the Motor Industry in War.

The speaker told the audience that he was in France when the Germans invaded that country, and that

his observations led him to believe that France fell, not because of treachery or sabotage, but rather because of "bad national management over a period of years" which allowed the country's war equipment to become "scandalous". He then described the effects of German air power during that period, and spoke of the problems involved in the compilation of the first lend-lease orders.

In early 1941 he was recalled to the United States to head the Automotive Ordnance Section of G.M.C., the department that designs and develops war equipment for the United Nations. The most pressing problems of the time, he said, were what to build, how many units of each, delivered when and where. Because of the urgency of the situation it was decided to adapt commercial motor products for war vehicles instead of designing and building special-purpose units. This did not give the best possible product, but it did give good units in immense quantities. Mr. Davidson then went on to explain how diesel engines designed for locomotives were successfully used in trucks, tanks, landing ships and amphibious craft.

The war materials produced by the automotive industries are used in every land, sea and air battle. Mr. Davidson related incidents and revealed many interesting features of the General Sherman tanks, the new United States super battleships, the British floating wharfs, the landing craft and the ducks ("trucks that float").

In concluding his address, Mr. Davidson paid tribute to the 300 manufacturers' representatives who went into the field to teach the service men how to handle and maintain their new war machinery, and who collected invaluable data for use in new designs. He appealed for continued research so that our technical superiority over the enemy would be maintained in the post-war era.

An Army-Navy film showing the dramatic sea battle that occurred during the landings on Leyte followed the address.

I. I. Sylvester thanked the speaker. R. E. Heartz presided at the meeting.

---

Four hundred persons assembled at a banquet held in the Mount Royal Hotel, on February 22nd, 1945, in honour of General A. G. L. McNaughton, C.B., C.M.G., D.S.O., M.E.I.C., Minister of National Defence.

After the dinner the chairman of the meeting, John B. Stirling, called upon Dr. Fairbairn who, with a few very appropriate compliments, introduced the General as the speaker of the evening.

In opening his address General McNaughton recalled to the members the previous occasion that he had spoken to them. It was during a dangerous period in the history of Canada and the democratic nations. The Battle of Britain was drawing near to its victorious ending and the Canadian Army was standing guard against an invasion which the Germans never dared attempt. Even while this was happening plans were being formulated for our invasion of the continent of Europe. The United Kingdom was to be the spring board for the attack. It was decided then to keep the loss of life at a minimum by expending any amount of material required to gain the objective. Such an invasion therefore required armour, mechanical vehicles, more powerful explosives, weapons of greater accuracy, airplanes, ships, landing craft, optical instruments, communication equipment and immense quantities of other kinds of materials; but

# MONTREAL BRANCH SOCIAL EVENING

General the Honourable A. G. L. McNaughton, M.E.I.C., the guest speaker, is seen here with J. B. Stirling, chairman of the branch.

(Right) Past-President J. M. R. Fairbairn introduces the guest speaker.

(Below) At the head table, from left to right: Mrs. McNaughton, Lt.-Col. C. C. Lindsay, Lt.-Col. T. D. K. Rooney, D.E.O., M.D. 4, Mme. J. A. Beauchemin, J. E. Armstrong.

Mrs. J. M. R. Fairbairn, Past-President A. J. Grant, Beaudry Leman, M.E.I.C., president of the Banque Canadienne Nationale who asserts that he is "an engineer who has gone wrong".

J. A. Lalonde tells Mrs. Rooney about co-operation in the engineering profession.

From left to right: W. G. M. Shepherd, Mrs. S. Rutherford, W. S. Lea, Mrs. G. Rutherford.

"Et voilà pourquoi votre fille est muette"! L. P. Cousineau explains to the young lady.

above all, an army well-trained in the techniques of modern warfare.

Fortunately, in this country most raw materials required for war purposes were to be had for the seeking, the speaker stated. In addition there were many skilled engineers and industrial leaders with pioneering instincts who were ready to serve. In order to co-ordinate Canada's productive capacity with that of the British and Allied Nations, General McNaughton returned to Canada.

In reviewing the successful events since D-day the General stated that the scientists, doctors and engineers of Canada gave "a most effective help . . . and made great contributions to the War Effort." The records he saw as Commanding Officer of Canada's Army and as Minister of Defense verify this. Some of the items he mentioned were Canadian developed and Canadian mass-produced time fuses, armour piercing shells, tungsten carbides for tools, techniques for air-field construction, optical and radio devices, and tropical proof packaging paper. In the chemical field we have explosives, gases, flame throwers, also new drugs to combat the sufferings of the wounded. There are many more developments which must still be kept secret.

The General spoke briefly of the great service rendered by the National Research Council. He pointed out that experiments on the Cathode Ray Compass, Ionosphere, radar and optical glass were conducted in the Councils laboratories as early as 1938. A very efficient method for the extraction of magnesium was developed here. The National Research Council is a small organization but it is a nucleus on which scientists and engineers can base their efforts.

As Minister of National Defence, General McNaughton expressed the thanks of the Service Men to the engineers and industrialists for the "newest and best equipment in the world." "The Army is not denied anything," he concluded. "It is fully reinforced. It will be fully maintained."

Mr. de Gaspé Beaubien in thanking the speaker spoke in French, and then in English as follows:

"General, we thank you for coming to us; for your very inspiring address; for having carried so high the ideals of the profession.

"But there is something for which we may not have the authority to thank you, and something for which we have in our hearts a very warm feeling of gratitude towards you, that is, the care you have taken of our boys and for the pains you have taken to make and mould a Canadian Army. Your efforts have been tireless through the drudgery of long years of training, facing always the uncertainty of if and when that enormous effort could bear fruit. We now can judge your far-sightedness. We now see, by the success of our troops, how thoroughly that training was done. And for that, General, we hold a very warm place in our hearts for you."

An excellent musical performance by the Rotary Club Review, a group of twenty-five talented amateur players, rounded out this social evening.

#### OTTAWA BRANCH

C. G. BIESANTHAL, Jr. E.I.C. - *Secretary-Treasurer*  
R. C. PURSER, M.E.I.C. - *Branch News Editor*

A joint meeting of the Ottawa sub-section of the American Institute of Electrical Engineers with the Ottawa Branch of The Engineering Institute of Canada, was held at the auditorium of the National Research Council, Sussex Street, on the evening of

Tuesday, February 20. The speaker was J. L. McKeever, general engineer, Peterborough Works, Canadian General Electric Company, who gave a technical lecture on the Amplidyn Machine.

Mr. McKeever pointed out that the device has found extensive application in the control of turrets on aircraft and warships, and is being used for various peacetime services, such as in the control of paper and steel mills, electric arc furnaces, and mine hoists. It ensures better control, conserves manpower and materials and speeds production.

"The aim of all electrical engineers," said Mr. McKeever, "is better control of electrical energy, making such control easier, faster and more accurate. This machine is a major step in that direction."

The speaker was introduced by B. G. Ballard, chairman of the local section of the American Institute, and was thanked by Norman Marr, chairman of the Ottawa Branch of the Engineering Institute.

A new idea in the history of the Ottawa Branch was carried out at a noon luncheon meeting at the Chateau Laurier on March 8th. This was the presentation of a report on the Winnipeg annual meeting by W. L. Saunders, who attended as the Branch's special representative. Mr. Saunders is a past-chairman of the Ottawa Branch and is at present councillor to the Institute.

Mr. Saunders gave a complete report of the activities at the meeting, with brief comments upon the papers and addresses presented, as well as other features of the programme. He included a personal touch to his account by referring to a portion of his trip west which was made by motor car from Kenora to Winnipeg. On this section he visited a part of Manitoba east of Winnipeg that he used to ride over on horseback and cover on foot 38 years ago during the construction of the Transcontinental Railway. At that time it was being freshly settled by newly arrived immigrants from different parts of Europe and the country was being opened up by means of corduroy roads, the settlers using oxen entirely for draft purposes.

"To-day these same settlers and their children are living in well built homes on farms that are largely cleared of bush, using all modern equipment, including horses and motor vehicles," said Mr. Saunders. "I later found on arriving in Winnipeg that the children of many of these immigrants having received their primary education in the little log school houses, had now graduated from University and were taking their part in the development of the west."

Mr. Saunders made special reference to the outstanding contribution toward the success of the annual meeting by the Engineers' Wives Association of Winnipeg. He also spoke of the many activities in Winnipeg of this organization in connection with the war effort and commended the idea of a similar organization for other branches.

#### PETERBOROUGH BRANCH

ERIC WHITELEY, Jr. E.I.C. - *Secretary-Treasurer*  
J. F. OSBORN, Jr. E.I.C. - *Branch News Editor*

The March 1st meeting of the Peterborough Branch was addressed by A. C. Northover, whose paper **The Design of a City** dealt comprehensively with the technical basis of city planning.

The speaker elaborated on the various studies carried out by city planners in analyzing and solving a

community's practical problem and in making provision for its evolution along orderly and efficient lines. The scope of the paper included: street layout with traffic capacity and pavement width studies embracing volume and density traffic surveys, origin and destination counts and cordon counts. Mass transit studies were analyzed and the design of transit service was discussed. The pure city planning study, including the land area use map, neighbourhood unit, playgrounds, utility services, was thoroughly developed. The master plan was described and illustrated.

The data accumulated by planners is translated into a master plan or map for convenience. The plan should include information on:

- Future through streets
- Parking areas
- The routing of through traffic
- Future transit route designed to expand or retard local growth
- Subway or expressway recommendations

The results of the analysis of present facilities and future facilities to serve present growth and to encourage or retard future growth both residential and industrial

- The expense of removal of blighted areas
- Future recreational centres
- Investigation of results of commercial decentralization
- Group housing sites
- Proper siting of buildings
- Utility service extension

The speaker demonstrated that growth of a city by random, unco-ordinated development leads to blighted areas, congestion and ultimate losses of great magnitude when the time comes that past mistakes have to be corrected. The engineer's role in the post-war future was emphasized. The responsibility of slum clearance and improved urban living conditions lies not only with capital and labour but also, more than ever before, with the engineer, who in his intermediate position has been far too lax and disinterested in the social results and effects of his creations.

In conclusion, Mr. Northover suggested that the design basis of a city is highly technical and, therefore, those best fitted to alter the city are not doctors, lawyers, and business men, but the men who have the knowledge to make and carry out a satisfactory design.

There was present a number of representatives from the Peterborough City Planning Committee, of which Mr. Northover is a member, as well as a number of other guests. A lively discussion period followed the paper, and the general opinion seemed to be that a systematic appraisal of the problems facing the city of Peterborough should be made as soon as possible.

### SAINT JOHN BRANCH

L. O. CASS, M.E.I.C. - - *Secretary-Treasurer*  
G. W. GRIFFIN, M.E.I.C. - *Branch News Editor.*

Man's quest through the ages to discover means of reducing friction between moving bodies and his realization that "nothing rolls like a ball" was outlined by Mr. Harry M. Little of R. & M. Bearings (Canada) Ltd., before a supper meeting of the Branch on March 8th.

Fifty members were present at the meeting which

was held in the Admiral Beatty Hotel. C. D. McAllister, branch chairman, presided.

After his review of anti-friction measures down the ages, Mr. Little dealt with the manufacture of ball bearings supported by moving pictures showing all phases from the arrival of the raw material at the plant to the finished bearing. A second film showed the making and care necessary in handling ball bearings for micro instruments such as aircraft instruments, bombsights, autosyn motors, etc.

Both films were produced by the New Departure Division of General Motors Corporation of America.

The chairman announced that the Branch would have as guests at its April meeting, President E. P. Fetherstonhaugh and party.

### TORONTO BRANCH

S. H. DE JONG, M.E.I.C. - - *Secretary-Treasurer*  
G. L. WHITE, A.M.I.E.I.C. - - *Branch News Editor*

The Annual Student Night of the Toronto Branch was held in the Debates Room, Hart House, on February 15th. The Engineering Institute prize at the University of Toronto for 1945 was presented to Mr. Wermer Buchholz by H. E. Brandon, Hydro-Electric Power Commission of Ontario. The three speakers, their addresses, and the prizes which they won were as follows:

H. H. Todgham—"Continuously Moving Forms"—First Prize.

D. E. Becks—"Cavitation of Marine Propellers"—Second Prize.

R. T. Cavanagh—"Metallurgical Testing by Electronic Means"—Third Prize.

The Judges were: A. H. Hull, C. E. Hawke and R. F. Moore, president of the Engineering Society, University of Toronto.

At the meeting held in Hart House on March 1st the members of the Toronto Branch heard an interesting address by Arthur J. Boase on reinforced concrete design in South America.

The speaker, who was introduced by J. M. Breen, is manager of the Structural Bureau, Portland Cement Association. Last summer, while on leave as special editorial representative of the *Engineering News-Record*, he spent three months in Brazil, Argentina and Uruguay.

In the Brazilian cities, particularly Rio de Janeiro and Sao Paulo, building was found to be very active and characterized by the construction of numerous large reinforced concrete office and apartment buildings, many of them of great height.

At Buenos Aires in the Argentine, building rivals that in Brazil, while in Montevideo, Uruguay, it is active, but on a smaller scale than elsewhere. At present Argentina is engaged in a vast military expansion programme.

In all the cities visited reinforced concrete was the only material being used on the projects seen under construction. Careful enquiry indicated that this has been true for many years owing primarily to the shortage of structural steel. There is a scarcity of all building materials and a shortage of labour and of designing engineers. Transportation is entirely inadequate, there being a shortage of roads and of shipping. Fuel is very scarce.

There are other reasons for the exclusive use of reinforced concrete. The first firms of designers and constructors in South America were German, Italian

and French. These engineers had developed their design theories and had applied them widely in their own countries long before the use of concrete had become general in the Western hemisphere. These firms were equipped both to design and construct and were able to supply very economical buildings. There are now also many firms of independent architects and engineers active in securing commissions, which helps to stimulate economy.

The reinforced concrete codes are favourable to the use of reinforced concrete. They permit many things unheard of in United States practice though the unit stresses and specified design loads do not differ greatly from those used here.

The fact that reinforced concrete is an economical type of construction in South America does not mean that it is cheap. Material costs are high and labour, though cheap, is inefficient. Concrete costs about \$40 per cu. yd. in Brazil, the materials costing 80 per cent and the labour 20 per cent.

The engineering colleges are relatively small, and few in number. The laboratory courses, if any, are very limited and draughting room work is held to a minimum. This means that much time is devoted to intensive training in mathematics and mechanics. Generally from five to six years are required for graduation. The graduates generally have a good command of foreign languages, particularly French, German and English. They are able mathematicians and are quite conversant with the latest theories of structural design.

The combination of modern theory and generous building codes results in light construction. Light floor systems using 1 and 2-way slabs with and without filler tile are commonly used. Thin shell roof construction is in common use, especially in Argentina. The pre-stressing of reinforcing steel is just starting and the process is being thoroughly studied.

The address was illustrated by slides showing examples of ingenious construction. After Mr. Boase had answered many questions, which were evidence of the interest aroused by his able presentation, a very hearty vote of thanks was moved by R. B. Young.

#### VANCOUVER BRANCH

J. G. D'AOUST, M.E.I.C. - *Secretary-Treasurer*  
P. B. STROYAN, M.E.I.C. - *Branch News Editor*

On Thursday, February 22nd, about fifty members including ten student members of the Vancouver Branch met in the auditorium of the Medical Dental Building for the Annual Students' Night.

A. Peebles, chairman of the Vancouver Branch, welcomed the members and students and introduced Harold Graves, S.E.I.C., President of Student Chapter of the Institute at the University of British Columbia. Mr. Graves took charge of the meeting and presented the speakers in turn.

W. G. Grumble, S.E.I.C., addressed the meeting, taking as his subject **Landing Floats for Pleasure Craft** and dealt very capably with the advantages and disadvantages of the different types of float anchorages commonly used in the Pacific coast tidal waters. Details of construction, comparative costs and other interesting items showed the speaker's knowledge of his subject.

The second speaker was F. E. Turley, S.E.I.C., whose subject was **Contracting and the Young Engineer**. Mr. Turley developed his theme logically, commenting on the different ways of entering the con-

tracting business, and more particularly on the art of staying in business. The principles underlying the scientific preparation of estimates were laid down, with the rather philosophic observation that, in spite of all these principles, the successful bidder was usually the one who had left out one of the larger items thus attaining the doubtful honour of being hailed as the lowest bidder. The speaker then explained in detail how to organize a job so as to come out with a profit—

“Out of the mouths - -”

The third and last address was given by D. A. Fraser, S.E.I.C., speaking on **Replacement Derrick Landing Wharf at Esquimalt**, a structure involving the placing of concrete in deep water by the open caisson method. Details of the methods of placing sub-aqueous concrete indicated the obvious advantages of the tremie pipe for such work. The design and construction of the caissons brought out many interesting features of the job, as did the description, illustrated by blackboard sketches, of the main features of the job.

C. E. Webb, past Councillor for the Branch, complimented the speakers on their able presentations of the subjects and congratulated the Student Chapter of the University of British Columbia on the large and active membership.

#### WINNIPEG BRANCH

A. T. McCORMICK, M.E.I.C. - *Secretary-Treasurer*  
V. W. DICK, M.E.I.C. - *Branch News Editor*

The annual meeting of the Winnipeg Branch, postponed from February 8th on account of the Fifty-ninth Annual Meeting of the E.I.C. held in Winnipeg, was held on February 15th, 1945, at the University of Manitoba.

The retiring chairman of the Winnipeg Branch, T. H. Kirby, pointed out the highlights of the past year that culminated in the Annual General and Professional Meeting of the Institute and the appointment of Dean E. P. Fetherstonhaugh as president of the Institute.

F. V. Seibert, chairman of the Winnipeg Annual Meeting Committee, gave an interim report on the Annual Meeting indicating an outstanding success on all counts.

A feature of the evening was the presentation of the Engineering Institute student prizes donated by the Winnipeg Branch for the best summer thesis submitted in the electrical and civil engineering fields. Branch Councillor H. L. Briggs made the presentation, the electrical award going to E. M. Scott, for his thesis on “Operation and Construction of a modern Oil Circuit Breaker”. The Civil award was won by W. C. Porter for his thesis on “Description of Seismic Exploration”.

Two films were then shown **Making and Shaping of Steel** by the United States Steel Company, and **The Canol Oil Project** by the United States Army Public Relations Branch, after which the meeting adjourned.

On Thursday, March 1st, a joint general meeting of the Winnipeg Branch of the Institute and the A.P.E.M. was held in theatre “F” at the University of Manitoba, Broadway. The chairman was Lt.-Col. Geo. E. Cole, who introduced the speaker, W. D. Hurst, city engineer and commissioner of buildings.

The subject of the address was **The Organization**

**and Work of the City of Winnipeg Engineering Department**, which covered the history of the engineering department from 1874 to the present day, indicating the progressive enlarging of the department with its various responsibilities and duties.

In 1924 the following separate departments were amalgamated with the engineering department and placed under the city engineer: water works operating, plumbing and sewer, machine shop, building inspection, and quarries. In 1926 the duties of the department of street commissioner were divided, the city engineer being made responsible for sprinkling and oiling of streets, removal of snow and ice, sanding of sidewalks, and investigation of claims against the city in connection with accidents on the streets.

Details of the present organization were then given under the following headings: (1) executive, (2) clerical and accounting, (3) water works and sewerage, (4) roads and streets, (5) inspections, (6) design, (7) shops. The chief executive officers are the city engineer, and the deputy city engineer, and Mr. Hurst indicated that an executive assistant engineer would be required in the near future.

Some interesting facts and figures were given for the various departments, one of these being the city quarry comprising 27 acres of first-class limestone rock, the area of the property being 107 acres. The yearly production has been as high as 69,000 yards and has averaged 12,000 cu. yds. for the past ten years. The city gravel pit at Bird's Hill consists of 61 acres of first-class gravel and sand. The average yearly production for the past ten years has been 22,000 yards with a peak of 37,000 yards in 1930.

The central mixing plant on Ross Avenue provides the cement concrete used by the city. The average yearly production for the last ten years has been 10,000 yards, with a maximum production of 41,000 yards in 1931. The municipal asphalt plant which was the first city-owned plant in America, produces binder and surface asphaltic mixtures, the average production being 11,350 tons per year for the last ten years.

In the past the city's construction organization has bid as an agent of the city in competition with private firms, but in recent years it has had no real competition on street and lane pavements, and in a lesser degree with sewers and watermains, and this work has been delegated to the department without calling for tenders. The total value of local improvements carried out in 1944 amounted to \$430,912.

Interesting details of duties involved in the divisions of inspection and design were given, probably the most arduous job being that of Engineer of Inspections who is responsible for seeing that buildings are con-

structed and maintained to the standard set by the building and plumbing by-laws. Details of city operated shops were also given, the most important being the machine shop, electric and gas welding shop, blacksmith shop, carpenter shop, paint shop, garage and tools and plant storage buildings.

Mr. Hurst brought his address to a close by describing the new incinerator plant for the city, which is in the design stage and is expected to be completed by the end of 1946 or shortly afterwards. Illustrations of various designs of incinerators were shown on the screen and proved of great interest. A lively discussion followed after which a vote of thanks to the speaker closed the meeting.

#### STUDENT SECTION

*Reported by D. G. MAXWELL, M.E.I.C.*

At a luncheon gathering of the engineering students on January 22nd, Professor Milton S. Osborne of the Department of Architecture of the University of Manitoba, gave a very enlightening and stimulating talk on **Town Planning**. Professor Osborne has had a great deal of experience in this work in the cities of Chicago and New York, and as Special Projects Planner of the Metropolitan Town Planning Commission for Greater Winnipeg.

The highlights of the address centred around the post-war plans for Winnipeg. It is hoped that there will be a centrally located section near the present Parliament Buildings, containing all civic offices. This would facilitate business transactions, especially for visiting business men.

It is planned to have each district a self-supporting community separated by main traffic arteries. This would make it unnecessary for children to cross streets carrying fast moving traffic to get to school.

Another plan to ensure the safety of the children is to have a small park accessible from every home without crossing a street. To do this the usual plan of cross streets would be altered so that only every second cross street would be continuous. With central heating, and modern homes containing a garage, the lanes to the rear of each house could be eliminated. The lots would be made smaller and this extra space used to make small parks or playgrounds.

The speaker stated that submerged cross-town highways are the most desirable but that they are not practical here because of the large initial and maintenance costs.

A large number of students attended, and all felt that here was an important post-war work and one of great interest to all citizens.

### BOOK NOTES

Prepared by the Library of the Engineering Institute of Canada

### ARCTIC MANUAL

- By Vilhjalmur Stefansson, New York, Toronto, Macmillan, 1944, 556 pages, illustrated, cloth, price \$3.50.*
- Prepared under the direction of the chief of the Air Corps, U.S. Army with a special introduction and index. This is an all-important picture of the arctic as it really is. There is realistic advice on how to survive when stranded in that generally misunderstood region. The text originated for practical use. It begins

with a discussion of the changing attitudes since the days of the Greeks. The author goes into details of the physical geography, climate, weather, light, animal and insect life, vegetation, shelter (how to build as well as how not to build a snow house), food (and game laws) and drinking, clothing and personal equipment, health, diet, dangers of monoxide poisoning, travel on land, over water and over ice. The book presents a fascinatingly broad general view of the living and working conditions in the arctic which differ so greatly from those to which most of us have been accustomed.

### **ROCKETS, The Future of Travel Beyond the Stratosphere**

*By Willy Ley, New York, Viking Press, Toronto, Macmillan, 1944, 287 pages, illustrations, tables, diagrams, cloth, price \$4.50.*

This book is the scientific record of the efforts made thus far in history to escape from this planet and to walk upon the moon and a discussion of the likelihood that this supreme ambition will be achieved. The idea of interplanetary travel is old, dating back at least to the ancient Greeks, but it was not until science discovered that rockets could propel themselves in a vacuum that the subject was advanced from the realm of mere wishing to a subject of practical experiment. Serious investigation in the field of space travel with rockets began about twenty years ago, and the author has been identified with the research since its inception, having completed and launched rockets, and having written learned theses on the science of rocket propulsion. In the present book he translates into popular terms the history and the practice of man's journey of the future. Complete bibliography of books and pamphlets is included at the end of the book.

### **WORKSHOP TECHNOLOGY, PART I, AN ENGINEERING COURSE**

*By W. A. J. Chapman, London, Edward Arnold & Co., Toronto, Longmans, Green & Co. C/1943, 303 pages, illustrated, tables, diagrams, cloth.*

Fifteen years ago artisan professions were neglected by educationalists, by writers and by public thought. A state of affairs which led to a dearth of suitably qualified prospective workers. That the artisan is worthy of a reasonable social position, that the work he does calls for high skill and training is indicated. Written for the men who do such work and for those who aspire to it, the fundamental principles underlying workshop processes are clearly explained. The work covered in this volume is approximately that of the first two years of a part-time course in technical colleges and includes most of the material necessary for the City and Guilds Inter-Examinations in Machine Shop Engineering.

**The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet all of these books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.**

### **AIR COMPRESSORS, Their Installation, Operation and Maintenance**

*By E. W. F. Feller. McGraw-Hill Book Co., New York and London, 1944. 460 pp., illus., diags., charts, tables, 8½ x 5¼ in., cloth, \$4.50.*

This handbook is intended for operating engineers and manufacturers interested in the selection, operation and maintenance of air compressors. The various types and designs are described, their performance discussed, and much practical information is presented in convenient form.

### **ANNUAL REPORT ON THE PROGRESS OF RUBBER TECHNOLOGY, Vol. 7, 1943**

*Edited by T. J. Drakeley, published by W. Heffer & Sons, Ltd., Cambridge, England, for the Institution of the Rubber Industry, 12 Whitehall, London, S.W.1, 1944. 129 pp., 9½ x 7 in., paper, 12s. 6d. (4s. 6d. to members).*

This annual contains excellent reviews of developments in various fields: production, chemistry and physics, synthetic rubber, compounding, fibers and textiles, vulcanized rubber, tires, belting, hose and tubing, cables and electrical insulation, footwear, mechanical goods, flooring, surgical goods, solvents, sponge rubber, hard rubber, works processes, and machinery. Each report includes a bibliography. Name and subject indexes are provided.

### **ASPHALTS AND ALLIED SUBSTANCES, 2 Vols.**

*By H. Abraham. 5th ed. D. Van Nostrand Co., New York, 1945. 2,142 pp., illus., diags., charts, tables, 9¼ x 6 in., fabrikoid, \$20.00.*

After seven years this comprehensive work on the asphalts has been thoroughly revised and brought up to date. The history of the asphalts, their chemistry and origin, the varieties and occurrences are described, as well as those of pitches, tars, etc. Manufactured products and their uses are treated at length. Methods

of testing are given fully. There are a large bibliography and a list of patents.

### **CHAMBER'S TECHNICAL DICTIONARY**

*Edited by C. F. Tweney and L. E. C. Hughes, rev. ed., with supplements. The Macmillan Co., New York, 1944. 975 pp., diags., charts, 8¼ x 5¼ in., cloth, \$6.00.*

This dictionary defines terms used in pure and applied science, in engineering and construction, in manufacturing and the skilled trades. The new edition has been revised and a supplementary list of nearly a thousand definitions added. It is the best work of its kind now on the market.

### **COST ACCOUNTANTS' HANDBOOK**

*Ronald Press Co., New York, 1944. 1,482 pp., charts, tables, 7½ x 4¾ in., cloth, \$7.50.*

This excellent handbook covers thoroughly the methods of cost accounting in manufacturing industries. The fundamental principles and the methods that cost accountants have worked out are presented and fully illustrated. In addition to its usefulness to cost accountants, the volume will be very useful to the engineering and production staffs and to managers.

### **DEMOCRACY UNDER PRESSURE, Special Interests vs. the Public Welfare**

*By S. Chase. Twentieth Century Fund, New York, 1945. 142 pp., tables, 8 x 5¼ in., cloth, \$1.00.*

In this report to the Twentieth Century Fund Mr. Chase discusses the drift toward monopoly in business, agriculture and labour that is growing in America, and its effect upon post-war adjustment. He names the leading pressure groups, tells why they exist, how they operate and what they want, and discusses their significance in our future.

### **ENAMEL BIBLIOGRAPHY AND ABSTRACTS, 1928 to 1939, inclusive, with Subject and Co-author Indexes**

*Compiled by E. H. McClelland, edited and published by The American Ceramic Society, Columbus, Ohio, 1944. 352 pp., tables, 11 x 7¾ in., cloth, \$5.00.*

This compilation provides full references to the literature published during the period 1928-39, with excellent abstracts. The arrangement is by authors, with an extensive, detailed subject index. The bibliography is a model for such works.

### **ENGINEERING CONTRACTS AND SPECIFICATIONS**

*By R. W. Abnett. John Wiley & Sons, New York; Chapman & Hall, Limited, London, 1945. 188 pp., diags., tables, 8¾ x 5¾ in., cloth, \$2.25.*

Upon the basis of experience both as a teacher and a contractor, the author has attempted to present in compact form some of the legal and business aspects of the engineering profession. The legal considerations in construction work are summarized, the types of contracts are described and the essentials of each type discussed. Examples of each type are shown. Bidding procedure is described. A chapter is devoted to specification writing.

### **ENGINEERING MATHEMATICS**

*By H. Sohn. D. Van Nostrand Co., New York, 1944. 278 pp., diags., charts, tables, 9¼ x 6 in., cloth, \$3.50.*

This book is intended for engineering students who have completed the study of the elementary calculus and for graduate engineers seeking to bolster their present knowledge of mathematics. Determinants and matrix theory, Fourier series, differential equations, vector algebra, and vector calculus are important subjects dealt with in the text. The theory and solution of algebraic equations in general are effectively covered.

### **HISTORICAL GEOLOGY, the Geologic History of North America**

*By R. C. Hussey. McGraw-Hill Book Co., New York and London, 1944. 491 pp., illus., maps, 8½ x 5¼ in., cloth, \$3.50.*

The geologic history of North America and its inhabitants throughout some two billion years is presented with emphasis on broad panoramas of important events. The beginning chapters discuss fossils, the concept of evolution, the origin of the earth and the geologic time scale. Succeeding chapters carry the development of this continent from the archeozoic era through the geologic history of man. The book is profusely illustrated.

### **INTERMEDIATE AERODYNAMICS**

*By R. W. Truitt. Pitman Publishing Corp., New York and Chicago. 1944. 227 pp., illus., diags., charts, tables, 9¼ x 6 in., cloth, \$3.75.*

The important elements necessary for the accurate application of aerodynamics are presented with sufficient descriptive material to emphasize their practical use. Thorough mathematical explanations are given for problems relating to the airfoil, drag, stability, load factors, propellers, slots and flaps. A glossary of aeronautical terms is appended.

**MacRAE'S BLUE BOOK AND HENDRICK'S COMMERCIAL REGISTER, 52nd Annual Ed. 1944-45**

*MacRae's Blue Book Co., Chicago and New York, 1945. 3,736 pp., illus., 11 x 8 in., cloth, \$15.00.*

The major part of this standard annual buyers' guide is a comprehensive alphabetical list of products, with the manufacturers arranged alphabetically under each product. In some of the larger classifications there is a geographical arrangement first, then alphabetical. Preceding this section is a complete alphabetical file of manufacturers giving full addresses, capital ratings and local distributors. A three hundred page list of trade names is included at the back of the volume.

**METALLOGRAPHY OF MAGNESIUM AND ITS ALLOYS, a translation from the German by the technical staffs of F. A. Hughes & Co. Limited and Magnesium Elektron Limited of "Metallographic des Magnesiums und seiner technischen Legierungen"**

*By W. Bulien and E. Fahrenhorst. F. A. Hughes & Co., Limited, Abbey House, London, N.W.1, England, 1944. 117 pp., illus., tables, 9½ x 6 in., cloth, 15s.*

This, the first book devoted solely to the metallography of magnesium and its alloys, appeared in Germany in 1942. The translation is by the staffs of British producers of the metal. The book opens with a short description of polishing and etching technique, which is followed by a description of the alloy constituents and impurities that are discernible in micrographs. The remainder of the book discusses 225 micrographs that are presented and the information that they reveal as to the nature of the alloy, its pretreatment and its faults. To the references in the original edition, the translators have added a list of non-German references.

**MILLING MACHINE OPERATIONS**

*By L. E. King. The Macmillan Co., New York, 1944. 123 pp., illus., diagrs., tables, 8½ x 5½ in., paper, \$1.75.*

A guide for apprentices and students in shop courses, intended to teach the performance of various milling machine operations.

**MODERN GAS TURBINE**

*By R. T. Sawyer. Prentice-Hall, New York, 1945. 216 pp., illus., diagrs., charts, tables, 9¼ x 6 in., cloth, \$4.00.*

This work presents a good picture of the gas turbine as it exists today. The history of its development is given briefly, its fundamental theory explained and its applications discussed. Uses as a supercharger on diesel and air craft engines, in industry and in marine service are treated at some length. A chapter is devoted to gas-turbine locomotives and one to jet propulsion.

**THEORY AND APPLICATIONS OF ELECTRON TUBES**

*By H. J. Reich. 2 ed. McGraw-Hill Book Co., New York and London, 1944. 716 pp., illus., diagrs., charts, tables, 9 x 5¼ in., cloth, \$5.00.*

This book is intended to give, in one volume, a sufficiently thorough grounding in the fundamentals of electron tubes and associated currents to enable the student to apply these tubes to the solution of new problems. The basic principles are presented, with special attention to their application to industrial electronics, power control, electrical measurements and other fields of use. The new edition has been brought up to date.

**THEORY OF X-RAY DIFFRACTION IN CRYSTALS**

*By W. H. Zachariasen. John Wiley & Sons, New York; Chapman & Hall, London, 1945. 255 pp., diagrs., charts, tables, 8½ x 5½ in., cloth, \$4.00.*

This book aims to give a logical presentation of both the theory of crystal symmetry and the theory of x-ray diffraction in crystals.

**VIBRATION ANALYSIS**

*By N. O. Myklestad. McGraw-Hill Book Co., New York and London, 1944. 303 pp., diagrs., charts, tables, 8½ x 5¼ in., cloth, \$3.50.*

The first five chapters are written from the textbook point of view to provide an understanding of the various phases of the phenomenon of vibration. Important topics covered are undamped and damped vibrations of systems of one degree of freedom and vibrations of systems with more than one degree of freedom. The last chapter deals with applications to important practical problems, chiefly in the aeronautical field.

## NOTICE TO STUDENTS

Student members of the Institute who are about to leave the university, whether definitely or only for the summer season, are requested to inform Headquarters of their new address, so that the *Journal* may be forwarded to them.

This is particularly important in the case of those who live in fraternities or boarding houses during the scholastic year. With present restrictions on the use of paper, it is imperative that no copies of the *Journal* go to waste.

Don't forget to inform us of your new address when returning to college in the Fall. Headquarters will change your mailing address as often as necessary provided you supply the information.

All changes should be recorded with the General Secretary, 2050 Mansfield St., Montreal 2.

# PRELIMINARY NOTICE

of Applications for Admission and for Transfer

FOR ADMISSION

March 31st, 1945.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described at the May meeting.

L. AUSTIN WRIGHT, General Secretary.

\*The professional requirements are as follows:—

**A Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

**A Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examination of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

**A Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

**An Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

**ANDREWS—GEORGE THOMAS LESLIE**, of Blackdale, Man. Born at Winnipeg, Man. Educ.: B.Sc. (Elec.), Univ. of Man., 1932; 1934-36, surveying and mapping, levels and earthwork quantities, pipeline laying and pumping operations, plant constr. details and design for sodium sulphate development work, and 1936-37, dftsmn. and supervisor on sodium sulphate crystallization plant involving plant bldg. constr., plant equipment and lighting, plant operation and mtce., Oban Salt Co. Ltd., Oban, Sask.; 1937-39, engr. engaged in study of sodium sulphate plant operation, reports and proposals for extended plant operation and constr., East Crest Oil Co. Ltd., Calgary, Alta.; 1940-41, dftsmn., D.I.L. powder plant, Montreal, and 1941-44, mtce. engr. for acid and nitrocellulose depts. of D.I.L. smokeless powder plant, Valleyfield, Que. At present engaged in agriculture with a view to keeping home farm and continuing engrg. practice.

**ARMSTRONG—GEORGE EARNEST**, of Ottawa, Ont. Born at Mill-bridge, Ont., Oct. 22nd, 1909. Educ.: 1944, grad. of special electrical course at N.S. Tech. Coll., given to selected personnel in the Navy qualifying them for commissioned office. (Course approved by Council as meeting requirements for Junior); 1927-41, with the H.E.P.C. of Ontario as follows: 1927-29, lineman, constrn. dept., 1929-34, electrician, constrn. dept., 1934-39, electrician, operating dept., 1939-41, electrician foreman, operating dept.; 1941 to date, with the R.C.N.R., at present, Elect. Sub.-Lieut., Directorate of Elec. Engrg., Naval Service Hdqrs., Ottawa.

**ARSENAULT—JOSEPH CYRIL**, of 136 Pleasant St., Dartmouth, N.S. Born at Summerside, P.E.I., Jan. 31st, 1910. Educ.: 1928-31, St. Francis Xavier Univ., 1931-37, apprentice study with J. E. Harris, architect, and E. S. Blanchard, Charlottetown, P.E.I., on arch'tl. engr. design; 1939-45, Works Officer, R.C.E., Lieut. and Capt. on design and supervision of engr. works incl. fortifications, accommodation and outside services as elec. power, installn. and transmission, sewer and water supply; 1937-39, design and supervn. of refinery bldgs. and equipment, July and August, 1939, and April, 1945, to date, mtce. engr., maritime marketing divn., Imperial Oil Limited, Halifax, N.S.

References: J. A. Aitken, E. L. Baillie, C. Scrymgeour, J. F. C. Wightman, J. F. MacKenzie, W. S. Lawrence.

**BASTIN—DOUGLAS HALFORD**, of Vancouver, B.C. Born at Vancouver, March 10th, 1919. Educ.: B.A.Sc. (Elec.), Univ. of B.C., 1942; 1942-43, senior research asst. divn. of physics and elec. engrg., National Research Council; March, 1943, to date, Elect. Lieut., R.C.N.V.R., Naval Research Establishment, H.M.C.S. Stadacona, Halifax, N.S.

References: H. J. MacLeod, A. F. Peers.

**BATZOLD—JACK CARTER**, of Montreal, Que. Born at St. Thomas, Ont., Sept. 4th, 1909. Educ.: B.Sc., Queen's Univ., 1933; 1931-35, ap'tice, Aluminum Co. of Canada, Toronto; 1935-36, asst. plant supt., 1936-40, mines mech. engr., and 1940-43, chief engr., Demerara Bauxite Company, British Guiana; 1943-45, deputy manager, mining dept., Aluminum Co. of Canada, Montreal, Que.

# BUY VICTORY BONDS

## NOTICE

Technical personnel should not reply to any of the advertisements for situations vacant unless—

1. They are registered with the Wartime Bureau of Technical Personnel.
2. Their services are available.

A person's services are considered available only if he is—

- (a) unemployed;
- (b) engaged in work other than of an engineering or scientific nature;
- (c) has given notice as of a definite date; or
- (d) has permission from his present employer to negotiate for work elsewhere while still in the service of that employer.

Applicants will help to expedite negotiations by stating in their application whether or not they have complied with the above regulations.

## SITUATIONS VACANT

GRADUATE CIVIL OR MECHANICAL ENGINEER wanted. See page 64 of the advertising section.

MECHANICAL ENGINEER DRAUGHTSMEN wanted. See page 66 of the advertising section.

SALES ENGINEER wanted. See page 66 of the advertising section.

ENGINEERING STAFF required. See page 66 of the advertising section.

CHEMICAL, MECHANICAL, CIVIL ENGINEERS wanted. See page 68 of the advertising section.

STRUCTURAL ENGINEER wanted. See page 68 of the advertising section.

DRAUGHTSMEN AND ENGINEERS, Mechanical, electrical and concrete draughtsmen and designers wanted by pulp and paper company. Apply to Box No. 2890-V.

## Rehabilitation Employment

The Engineering Institute has established a department with the sole object of providing a rehabilitation service to members in uniform.

This department is now in operation and it is the intention to develop it to the point where it can render really valuable assistance to returning members. To this end a special committee has been established known as the Advisory Committee on Rehabilitation, under the chairmanship of Major-General Howard Kennedy.

A letter and questionnaire were sent in March to all members in the services, and already one hundred and fifty replies have been received. They indicate that the service can be of assistance to about two-thirds of the total. For this reason, it would be of great value to the committee, and therefore, to the returning members, if employers would inform the Institute of their probable post-war requirements.

It is appreciated that most firms have a comprehensive rehabilitation scheme for their own returning personnel. Naturally such proposals take precedence over all others but it is still hoped that there will be openings for the large number of returning members who will not have such advantages. All employers will be familiar with the work of the Wartime Bureau of Technical Personnel. The Institute service is not intended to replace this but rather to give to members an additional service on behalf of their fellow members, which it is believed will aid materially in assimilating them into civilian life.

It would facilitate the work of the committee if employers would furnish details of possible vacancies including:

1. Nature of work
2. Temporary or permanent
3. Salary range
4. Location
5. Experience required
6. Must position be filled immediately or can it wait for post-hostility discharge of candidate?

With this information, negotiations can be started now that should work out eventually to the advantage of everyone.

The Service is operated for the benefit of members of The Engineering Institute of Canada, and for industrial and other organizations employing technically trained men—without charge to either party. Notices appearing in the Situations Wanted column will be discontinued after three insertions, and will be re-inserted upon request after a lapse of one month. All correspondence should be addressed to THE EMPLOYMENT SERVICE BUREAU, THE ENGINEERING INSTITUTE OF CANADA, 2050 Mansfield Street, Montreal.

ELECTRICAL SALES ENGINEER for western firm specializing in engineering sales and service of all types of electric machinery and similar equipment. The position would be permanent and on a salary basis. Applicants should state: training, experience, age, nationality and availability. Apply to Box No. 2911-V.

GRADUATE MECHANICAL ENGINEER about thirty for a well-established concern engineering and manufacturing conveying equipment in their own plant. A working knowledge of mechanics and light structural steel, along with the aptitude for applying same, also the desire to learn the conveying business from the ground up is essential. This is a permanent position for the right man. Apply to Box No. 2942-W.

## SITUATIONS WANTED

ELECTRICAL ENGINEER, M.E.I.C., age 38, B.Sc. McGill. Widespread experience on electrical maintenance, radio and telephone engineering. Five years with the R.C.A.F. in the aeronautical engineering branch specializing on electrical work. Immediate experience before joining the R.C.A.F. was four years on electrical maintenance in paper mills, including experience with Harland and General Electric drives. Interested in maintenance, development or layout design of electrical equipment. Not available until release from the R.C.A.F. but wishes to make contacts for a post-war position. Apply to Box No. 12-W.

GRADUATE MECHANICAL ENGINEER, M.E.I.C., with 18 years' experience in iron industry; machine tools, steel cabinets, conveyors, etc., light metal and food processing industry, has held executive positions in charge of production, industrial engineering, designing, buying, selling, financing. An expert in cost accounting and lighting, a man with good ideas, tact, initiative and sound technical judgment, available immediately. Age 41, married, Canadian bilingual. Apply to Box No. 1730-W.

CHEMICAL ENGINEER, seven years' experience on production and inventory control; distillation, solvents, analysis. Available under W.B.T.P. regulations. Now residing in Montreal. Apply to Box No. 1827-W.

ENGINEER, M.E.I.C., R.P.E.(Ont.), presently employed as assistant engineer and chief draughtsman. Desires new connection due to contemplated staff reduction in a war industry. Extensive experience in structural steel and plate fabrication miscellaneous builders' iron work and reinforced concrete as engineer and draughtsman, estimating and sales. Apply to Box No. 2208-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., R.P.E. (Ont.) 35 years of age, 10 years' general contracting experience; 6 years sales engineering and executive experience with manufacturer of construction materials. At present holding commission in R.C.A.F. Works and Buildings branch, desires contacts in construction field for employment in near future. Apply to Box No. 2471-W.

GRADUATE ENGINEER, M.E.I.C., R.P.E. (N.B.) with 30 years practical experience in design and construction of industrial plants, reinforced concrete, steel, timber, steam heating, water supply installation, sewerage, wharves and docking facilities, quantity and cost estimates. At present holding position of responsibility, seeks position of responsibility with industries which contemplate building or expanding. Apply to Box No. 2472-W.

CIVIL ENGINEER, executive, M.E.I.C., recently completed tropical contract, seeks new connection Canada or abroad. Twenty-five years' engineering and executive experience. Clean record and best of references. Available immediately. Apply to Box No. 2474-W.

CIVIL ENGINEER, M.E.I.C., R.P.E.(Ont.), B.A.Sc., Toronto. Resident for past 12 years in U.S., New York, desires to return permanently to Canada. Thirty-two years' experience on design and construction of harbour works, piers, dry docks, quay walls, cofferdams, foundations, steel and concrete buildings. Specialist steel sheet piling, railway location and construction. Public utility appraisals, industrial engineering, sales engineering and promotional work including export sales, journalistic and advertising work. Foreign experience in China, West Indies, Alaska. Good organizer and executive. World War I veteran. Seeking administrative or supervisory opening or sound sales or business opening. Willing to travel. Apply to box No. 2476-W.

MECHANICAL ENGINEER, 41 with 17 years' experience in machine shop, production of precision parts, internal combustion engines, tool design, seeks responsible position; will consider association with reputable consulting engineers. Apply to Box No. 2480-W.

GRADUATE CIVIL ENGINEER, M.E.I.C., age 35, married, 6 years general office experience, 4½ years on maintenance, inspection and construction in oil refinery, 3 years supervising construction in tropics, 1½ years on structural steel and reinforced concrete design, piping and plant layouts. Desires field position, preferably on construction work. Location immaterial. Registered with W.B.T.P. and available May 1st. Apply to Box No. 2481-W.

# SOIL MECHANICS AS APPLIED TO P.F.R.A. PROBLEMS WITH SPECIAL REFERENCE TO THE PROPOSED ST. MARY DAM

ROBERT PETERSON, Jr., E.I.C.  
*Soil Mechanics Engineer, P.F.R.A., Saskatoon, Sask.*

Paper presented at the Fifty-Ninth Annual General Professional Meeting of The Engineering Institute of Canada, at Winnipeg, Manitoba, on February 8th, 1945.

**SUMMARY**—This paper deals briefly with the soils investigation in connection with P.F.R.A. water development projects and covers the progress to date on the proposed St. Mary dam. The field and laboratory work for this dam are not described in detail, but rather the typical results of laboratory tests are given and these results are then applied to the design.

## INTRODUCTION

Since the inception of the Prairie Farm Rehabilitation Administration (P.F.R.A.) in 1935, greater emphasis has been placed on a complete soil mechanics investigation of its engineering projects previous to construction. Consequently, a soil mechanics department has been gradually built up by acquiring the necessary field and laboratory apparatus. The standard field equipment consists of a truck-mounted rotary drilling machine (Fig. 1), a hand operated wash boring outfit, and various tools necessary to recover samples and determine the characteristics of soils in place.<sup>1</sup>

In addition to that required for routine classification tests, the following laboratory apparatus is in use: a direct shear machine, consolidation devices, triaxial shear machines, and equipment for both the Proctor and California methods of compaction.<sup>2, 3</sup>

In the investigation of a project, the preliminary examination of surface indications will give a trained observer some idea of the nature of the underlying soil. On the basis of this information, a tentative drilling and sampling programme is commenced which is modified and extended to obtain complete information on foundation and construction materials in the vicinity of the structure. While the drilling is being carried on in the field, the samples and the drilling logs are, at intervals, forwarded to the Soil Mechanics Laboratory located at the University of Saskatchewan. The routine classification tests are performed on representative samples of all soils received, but the number and type of tests to determine the physical properties are governed by the use for which the soil is intended in the structure. Considering the classification and general properties of the soil, a design is conceived, which is then checked by applying the soil test results in the various analyses.

## PROPOSED ST. MARY DAM

### GENERAL

It is proposed by P.F.R.A. to construct a dam on the St. Mary river, near Spring Coulee, Alberta, to store water for the purpose of irrigation in the area south and east of Lethbridge. The required height of dam is 186 ft. and, for this height, the crest length would be about 2500 ft. and the length at

the base, across the streambed, approximately 300 ft. A diversion conduit through the fill or a tunnel bypassing it will be necessary to divert the river during construction. Water for irrigation purposes will likely be taken from the reservoir by a tunnel, located about 90 ft. above the streambed, which will pass through the ridge that forms the south-east abutment of the dam. It is planned to provide spillway capacity by cutting down natural coulees around the north end of the dam.

A rolled fill earth dam was originally suggested, and subsequent investigations have indicated this to be the best and cheapest type for this site. The foundation bedrock has been explored with drill holes and the surface of the rock located beneath the proposed fill. Sources known to have sufficient quantities of both pervious and impervious soil for the dam have been located and samples taken. The samples from these proposed borrow pits have been tested and the results applied to the design of the fill section.

When the original cross-section was drawn up, it was planned to build a homogeneous fill consisting almost entirely of impervious glacial clay. This was reasonable at the time because it was known that enough clay to build the entire dam, consisting of approximately  $3\frac{1}{2}$  million cu. yd., was easily available, although little was known on the properties of this soil. The subsequent soil tests indicated that the impervious soil was not ideal for a homogeneous fill of the proposed height; consequently, the design was modified and pervious sections added. The dimensions of these pervious sections were kept to a minimum because of the comparatively high cost of sand, gravel, and rock. The resulting modified section is illustrated in Fig. 2. At the present time, although this section has been more or less adopted, there is some question about the type

Fig. 1—Truck-mounted drilling unit in operation.

Fig. 2 - Proposed dam section in river bed.

of compaction equipment required in the field to get sufficiently high densities in the impervious soil to assure the stability of the side slopes.

#### FIELD INVESTIGATION

Preliminary field work was carried on in 1939, and a thorough investigation of foundation and fill material was begun in 1941 under the direction of W. L. Foss, M.E.I.C., District Engineer in charge of the project, and the author. Dr. J. A. Allan, M.E.I.C., Consulting Geologist, inspected the site and advised as to the most advantageous location of drill holes. The greater part of the drilling and sampling was completed in 1942 but since then it has been necessary, on several occasions, to get additional samples and detailed information in the vicinity of structures as the design has developed.

The foundation exploration was carried out almost entirely by diamond drilling. However, some use was made of washboring and testpits to locate the position of the rock line and determine the condition of the weathered bedrock below its line of contact with the soil overburden. Diamond drill holes were spaced at intervals along the centreline and at other points beneath the fill where they seemed necessary—particularly in the streambed. Holes were also put down along the centrelines of proposed tunnels and at points where structures were to be located. The locations of diamond drill holes No. 8 to No. 19 are shown in a photograph (Fig. 3) that was taken looking downstream towards the centreline—indicated by a broken line. The following distances will aid in studying this photograph: Hole No. 9 to No. 13: 290 ft. (width of streambed), Hole No. 12 to No. 14: 670 ft., and difference in elevation between Hole No. 8 and No. 19: 90 ft. Figure 4 shows the northwest bank of the damsite looking along the centreline. In all, 43 diamond drill holes were put down, varying in depth from 30 to 220 ft., and giving a total footage of over 3000 ft.

With the exception of the preliminary drilling, where only a small diameter core was obtained, a 2-in. core was

recovered from all the diamond drill holes. The cores were placed in boxes of the type shown in Fig. 5 which were clearly marked to form a permanent record of the bedrock drilled through. When the drilling was completed, Dr. Allan examined the cores and on the basis of this inspection and the field drilling notes, he prepared logs of all holes. The cores are now in storage and can be examined by engineers and contractors as the need arises. The longest solid piece of core recovered was 5 ft. 10 in. in length and is shown in Fig. 6.

The foundation investigation indicated that bedrock, consisting of interbedded shale and sandstone, was overlain by varying depths of unconsolidated material. The dip of the rock strata was approximately 2.5 per cent in the upstream direction. In the streambed, bedrock outcropped below the centreline and along the edges, whereas in the central portion above the centreline, as much as 10 ft. of sand, gravel and disintegrated bedrock was found. On the banks, the bedrock was overlain by silt adjacent to the river bed, and by silty glacial clay at higher elevations and farther from the river. The depth of this overburden varied from zero to a maximum of 40 ft.

Permeability tests were made on the diamond drill holes by filling each completed hole with water and observing the time required for the water level in the hole to reach the ground water table. The results showed

Fig. 3—St. Mary damsite looking downstream towards centreline.

Fig. 4—North bank of site looking along centreline.

that the top portion of the bedrock was quite pervious but that the rock became more impervious with depth. This, of course, was to be expected because, in every hole, weathered and fractured bedrock was found for some distance below the contact with the overburden.

Dr. Allan describes the bedrock formation as follows:<sup>4</sup>

"The St. Mary River formation is of continental and fresh-water deposition. The rocks consist of an intimately interbedded thick series of buff to grey sandstones, clayey sandstones, calcareous sandstones, buff, grey and greenish grey shales, sandy shales and thin bands of carbonaceous shale and clayey shales. This alternating series of sandstones and shales grades one into the other. The sandstones are lenticular and only thin beds of massive sandstone occur. The shales are soft and friable and are poorly bedded. It is not possible to correlate any particular bed for any distance between diamond drill holes or on the outcrop. This is a good feature, because the strength of the rock is increased by this variable character of the sediment. No continuous unstable bed of uniform material over any large area has been observed. On the other hand, there are no prominent beds of hard or strong strata in this area.

"It must be understood that all the strata in the St. Mary River formation under the proposed dam are soft and are quickly weathered when exposed to the air. But if protected from air and water they are as durable as many rocks in older formations."

Preliminary work had indicated that the best source of impervious soil for the fill was from the high ground immediately north of the site. Consequently, this area was explored in detail and additional drilling was done in the vicinity to make certain that no other source had been overlooked in the original survey. The extent and depth of the soil in this area was determined by about 25 auger and wash bore holes, which varied in depth from 10 to 43 ft. The purpose of these holes was to determine the quantity of material available and to get small samples for soil classification tests. The soil was found to be a silty glacial clay, and laboratory classification tests indicated no appreciable variations from hole to hole and only slight variations with depth. Consequently, two testpits were dug to obtain large samples

for testing purposes. It was found that at least 4 million cu. yd. of glacial clay would be available in the area outlined by drilling if excavated to a maximum depth of 31 ft. With the exception of the topsoil, all the material appeared suitable for a rolled fill dam. Although the material was very well graded, it did not contain a high percentage of sand and gravel and was quite plastic.

A search for pervious fill material failed to reveal a sufficient amount in the immediate vicinity, but considerable quantities of sand and gravel were located along the river bed at distances varying from 3 to 10 miles from the damsite. It was roughly estimated on the basis of a few testpits at each deposit that at least 400,000 cu. yd. will be available. This is sufficient for the present proposed design.

Samples of the sand and gravel were taken with a view toward using it for both pervious fill and concrete aggregate.

It was evident that suitable large aggregate for rock toes and boulders for riprap were rather scarce. With regard to using the native sandstone for riprap, Dr. Allan pointed out that it is rather weakly cemented and therefore may not stand up to weathering. It may be possible, however, to use the harder varieties in the rock sections, but the placing of sandstone for riprap has been definitely eliminated. Small quantities of field stone and boulders strewn along the river were the only other sources of rock in the vicinity. Thus it became apparent that the bulk of the riprap might have to be imported.

The results of the field work seemed to indicate that the site was suitable for an earth dam of the required height. Although the foundation bedrock was thinly bedded, contained some soft layers, and was cracked and broken near the surface, it appeared that the removal of the undesirable material would expose a satisfactory foundation. A sufficient quantity of glacial clay was available at the site to construct the entire dam of this soil if tests showed it to be stable with reasonable side slopes. A limited quantity of sand and gravel was located but the haul was rather long. This fact would tend to favour a homogeneous earth section built entirely of the glacial clay.

#### LABORATORY SOIL TESTS

In this section the tests on the glacial clay only will be considered, because it was obvious from the beginning that this material rather than the sand, gravel or bedrock would present the greatest problems from the soil engineering viewpoint. The detailed laboratory pro-

Fig. 5—Box of rock cores.

cedures for the soil tests have not been given but may be found in A.S.T.M. Standards. The results of the routine classification tests have been tabulated and sufficient detail given on the physical tests, especially compaction tests, to show the significance of the results and their place in the design analyses.

When referring to soil densities, unless otherwise specified, the wet weight in lb. per cu. ft. has been given. The water content in every case has been indicated as a percentage of the dry weight.

(a) Classification Tests

- Field classification—silty glacial clay (glacial till)
- Specific gravity of soil solids, average—2.71
- Percentage of soluble solids, average—0.18
- Water content in borrow pit—
  - Minimum—6.0%
  - Maximum—15.0%
- Density in borrow pit, average—118 lb. per cu. ft.
- Liquid limit, average—35.3
- Plastic limit, average—14.5
- Plasticity index, average—20.8
- Shrinkage limit, average—9.9.
- Public Roads Soil Group—A-6-4

In Fig. 7 are shown the limits of grain size for both impervious and pervious materials; in both cases the limits given include the range of all the samples tested.

(b) Compaction Tests

The density required to ensure the stability of the glacial clay is the most important single consideration in the design studies of the proposed St. Mary dam; therefore, the compaction tests will be covered in detail.

The purpose of a compaction test is to determine not only the maximum density which will result for some particular degree of compaction, but also the water content at which this density can be attained with the least amount of work. The usual procedure is to begin with the soil dry and compact a sample using the chosen method of compaction. The water content at which this sample is compacted and the resulting density are then determined; this data gives one point on a curve which is eventually plotted showing the relationship between density and water content. To complete the curve, additional points are determined by adding moisture and recompacting the soil at the increased water contents. The water content at which

Fig. 7—Grain size curves showing limits of pervious and impervious materials.

the greatest density occurs, as indicated by the curve, is known as the optimum moisture content for that particular degree of compaction. It must be understood that both the optimum moisture content and the maximum density vary with the degree of compaction for any one soil. As the compaction and resulting density increase the optimum moisture content decreases.

For the St. Mary clay, laboratory tests were performed using five different types of compaction. The curves were determined in the same manner but the methods of compaction varied as follows:

The first method, which has been used in most laboratories, is known as Proctor's method.<sup>2</sup> It consists of compacting the soil in 3 layers into a cylinder whose volume is one-thirtieth of a cu. ft. Each layer is compacted by 25 blows of a 5.5 lb. tamper dropping a distance of 12 in.

The second method is a modification of the first; 25 blows of the same tamper are applied to each layer but the height of drop is increased from 12 to 18 in. This type of test is used by the United States Bureau of Reclamation (B. of R.) laboratories.<sup>5</sup>

The third type of compaction is obtained by using a static pressure of 2000 lb. per sq. in. on the soil in a similar cylinder rather than by the impact from a hammer. This was developed by O. J. Porter, Senior Testing Engineer, of the California Department of Highways.<sup>3</sup> It gives a higher density and lower optimum moisture content than either of the previous tests. Hereafter this test will be referred to as the California Method.

The fourth and fifth types are known as laboratory sheepsfoot compaction tests. The soil is compacted in a cylinder 12 in. in diameter and 10 in. deep, by a 3 in. diameter shaft which simulates the effect produced by a sheepsfoot roller. In one case a pressure of 500 lb. per sq. in. is used to force the foot into the soil whereas 1000 lb. per sq. in. is used in the other. In both cases the soil is tamped by the required number of penetrations to give complete coverage of the surface area.

The curves resulting from the previously described tests have been plotted in Fig. 8 and are self explanatory. The theoretical line of zero per cent air voids indicates that samples at these densities and corresponding water contents are completely saturated with water. The samples which were compacted did not reach complete saturation because of entrapped air; however, with the California Method almost complete saturation was obtained. It will be noted that curve No. 1, Proctor with 12 in. drop, shows a density of 134 lb. per cu. ft. at an optimum of 15.5 per cent of moisture; whereas, curve No. 3 of the California

Fig. 6—Sandstone core from St. Mary damsite.

FOOT PRESSURE 500 P.S.I.
- 5 FOOT PRESSURE 1000 P.S.I.

Fig. 8—Compaction curves.

Method indicates a density of 144.5 lb. per cu. ft. at a water content of 10.5 per cent. It was originally thought that curve No. 1 would give a satisfactory density in the earth fill but it is now felt that a wet weight approaching that of curve No. 3 will be required for reasons to be explained later.

In an attempt to arrive at the design of a sheepsfoot roller which would produce densities corresponding to the California compaction, tests No. 4 and No. 5 were carried out. These indicated that a foot pressure of 1000 lb. per sq. in. will give almost the required density. It is believed that if the test were performed in the field with an actual roller where impact would increase the compacting force, the densities would be higher than those given by curve No. 5.

In Fig. 9(a) and (b) compaction statistics are reproduced (Figs. XV to XIX inclusive) with the kind permission of O. S. Harper, Chief Engineer, U.S.B. of R., Denver, Colorado.<sup>5</sup> All the curves are for the Platte River Embankment material and in every case the dry density has been given.

In Fig. XIX is shown the effect of the number of blows on the density-water content curves for a soil compacted with the Proctor method and the 18 in. drop of the tamper. The number of blows was varied from 5 to 40 per layer; the standard number being 25. It will be noted that these tests were performed on the soil fraction passing the  $\frac{1}{4}$  in. screen. In Fig. XVIII similar curves were determined for the whole sample including the material coarser than the  $\frac{1}{4}$  in. screen.

Figs. XV, XVI, and XVII deal with sheepsfoot tests on the entire sample. Fig. XVI illustrates the pattern in which the sheepsfoot was used for the various coverages. In Fig. XV is shown the effect of coverage, which is defined in the figure, on the maximum compacted density and the optimum moisture content with a constant foot pressure of 200 lb. per sq. in. The coverage was varied from zero up to 200 per cent and the thickness of the compacted layers was 6 in. With a constant coverage of 50 per cent (Fig. XVII), the compacting pressure was varied from zero to 500 lb. per sq. in. by increments of 50 lb. per sq. in., and the variations in optimum moisture content and density determined.

The results of Figs. XVIII, XV, and XVII have been compared to study the relation between the Proctor

compaction, with the 18 in. drop, and the unit pressure and coverage required of a sheepsfoot roller in the field. It has been kept in mind, however, that this relation applies to one particular soil and that it may vary considerably with the soil type.

### (c) Shear Tests

The unit shearing strength ( $S$ ) of a soil, as given by Coulomb's equation, is made up of two parts, the cohesion ( $C$ ) and the internal friction,  $P \tan \phi$ , where  $P$  is the normal unit stress on the failure plane and  $\phi$  is the angle of internal friction.

$$S = C + P \tan \phi$$

For sands and gravels,  $C$  is generally equal to zero and the shearing strength is made up entirely of internal friction; whereas, for clays and mixtures containing clay, the shearing resistance is made up of both cohesion and internal friction. The angle of internal friction,  $\phi$ , of cohesionless soils, varies with the density for different samples of the same material. In the case of clays the angle of internal friction varies not only with the density, but also with the water content, rate of load application and other factors. It is a known fact that, for some types of clay, a sudden application of load will give a  $\phi$  very nearly zero and that a slow application of load, which would allow consolidation under each increment, would give a  $\phi$  of 30 deg. Therefore, when attempting to determine the cohesion and angle of internal friction for clays, an effort must be made to adopt a testing procedure which will simulate loading conditions in the field. If the soil in the structure is to be loaded rapidly, a "quick test" should be used in the laboratory. In this type of test, the load should be applied at such a rate that failure of the sample will take place in about 10 minutes.

The cohesion and angle of internal friction of the St. Mary glacial clay were determined for water contents and densities corresponding to both the Proctor and California compaction, by two types of shear tests.<sup>2</sup> The first was the direct shear test in which the actual force to produce failure on a shear plane through the soil specimen was measured at varying normal unit stresses ( $P$ ). The second was the triaxial shear test in which a cylindrical sample was loaded to failure and the shearing stress ( $S$ ), and the normal stress ( $P$ ) were determined on the rupture plane by applying Mohr's stress circles.<sup>6</sup> The triaxial test is similar to the ordinary cylindrical compression test except that failure is produced by both axial and lateral loadings. The sample is enclosed in a rubber membrane and the lateral load is applied to its circumferential surface by a hydrostatic pressure; the vertical load is then increased until rupture occurs. A clearer picture will be had after studying Fig. 10 which shows soil specimens which have been tested in shear by both methods. The triaxial sample shown on the left was 2.8 in. in diameter and 8 in. high prior to testing, and the failure plane can be seen cutting diagonally through its upper portion. The two small samples on the right are direct shear specimens and are 2.5 in. in diameter and 1 in. high. The failure plane through the sample at the extreme right is clearly visible about mid-height, whereas the centre specimen has not been tested.

The average results of the shear tests have been plotted in Fig. 11, where the densities and water contents of the samples tested are also given. Curves No. 1 and No. 2 are for the direct shear and triaxial respectively, at the Proctor density. Similarly, curves No. 3 and No. 4 are for a density nearly equal to the Cali-

Fig 9 (a)—Data from U.S. B. of R. compaction studies.

Fig. 9 (b)—Data from U.S. B. of R. compaction studies.

fornia. Theoretically, the direct shear and triaxial should give the same results, provided of course that the samples were at the same density and at the same water content. The values from the direct shear are higher than those by the triaxial. This is due in part to the fact that the direct shear samples were drier than the triaxial samples in both cases. For purposes of design, the average results of the two methods have been applied for both the Proctor and California densities.

Average for Proctor:  $C = 1900$  lb. per sq. ft.  $\phi = 10^\circ 30'$ .  
 Average for California:  $C = 7660$  lb. per sq. ft.  
 $\phi = 23^\circ 45'$

Of special note is the tremendous increase in shearing strength which results when the California method of compaction is substituted for the Proctor method. The cohesion, i.e. shearing strength at zero normal unit stress, increases four-fold and the angle of internal friction doubles.

#### (d) Consolidation Tests

Consolidation tests have been performed on the impervious material to obtain the data from which to predict the total settlement in the earth fill. The soil was tested in the usual consolidometer devices following a standard procedure,<sup>2</sup> i.e. laterally confined samples were loaded and the total settlement recorded for each increment of load. To relate settlement and load, the results of these tests have been plotted on semi-log paper with void ratio as ordinate and consolidating pressure in tons per sq. ft. as abscissa. The void ratio is defined as the volume of voids per unit volume of soil particles in a soil mass. Void ratio,  $e$ , and settlement,  $\Delta H$ , are related as follows:

$$\Delta H = \left( \frac{e_1 - e_2}{1 + e_1} \right) H$$

$e_1$  is the void ratio of a sample at a pressure  $P_1$

$e_2$  is the void ratio of a sample at a pressure  $P_2$

$\Delta H$  is the settlement which occurs when the void ratio decreases from  $e_1$  to  $e_2$  due to a pressure increase from  $P_1$  to  $P_2$  on a sample or layer of thickness  $H$ .

In Fig. 12 are shown typical pressure void ratio curves which resulted from consolidation tests on

Proctor and California specimens. The sample for the Proctor compaction shown by curve No. 1 was placed in the consolidometer at a density of 134.3 lb. per cu. ft. and a void ratio of 0.42. It was saturated at a pressure of 0.025 ton per sq. ft. and some swelling occurred which resulted in a void ratio of nearly 0.44. The specimen was then loaded to a pressure of 9 tons per sq. ft. and, after sufficient time had elapsed for 95 to 100 per cent consolidation to occur at this maximum pressure, the load was removed by increments and the rebound curve determined. The same procedure was followed for the denser sample compacted by the California Method with the exception that it was saturated at a load of 0.5 ton per sq. ft. Neglecting the

effect of swelling due to saturation, and basing the calculation on the original height of sample, curve No. 1 gives a settlement of 4.8 per cent while curve No. 2 shows only 0.9 per cent for a pressure of 9 tons per sq. ft. Here again the desirability of a higher density than that given by the Proctor method is emphasized because only a small fraction of the settlement would be experienced.

#### (e) Comparison with U.S. B. of R. Soils

In view of the fact that this department had little data on soil compaction for high dams and there is not a great deal in existing publications, it was thought wise to obtain information on materials which have been successfully used by the Bureau of Reclamation in high dams. The B. of R. has kindly supplied a summary of the soil characteristics and densities obtained in 14 major dams recently constructed. A study of this information indicates that the St. Mary glacial clay

Fig. 10—Soil specimens showing shear planes.

CURVE	TYPE OF TEST	AVERAGE DENSITY	AVERAGE WATER CONTENT
1	DIRECT SHEAR-QUICK	1346 <sup>#</sup> / <sub>CUFT</sub>	15.5%
2	TRIAXIAL SHEAR-QUICK	134.6	16.45%
3	DIRECT SHEAR-QUICK	143.7	10.7%
4	TRIAXIAL SHEAR-QUICK	1426	11.6%

Fig. 11—Results of shear tests.

contains a much higher percentage of clay and silt than the impervious soils used in B. of R. dams. Unless a greater degree of compaction than the Proctor can be obtained, the St. Mary fill will be considerably less dense than the average of the U.S. dams, and much more compressible.

#### ANALYSIS AND DESIGN

Prior to the soil mechanics study of this project, a rolled fill was favoured rather than an hydraulic fill or some type of concrete dam. An earth dam was considered more feasible than a concrete dam for the following reasons: A large quantity of glacial clay to build the former was available at the site, whereas, the aggregate for concrete would have to be hauled at least 8 miles, making this type of structure too expensive. Some settlement could be expected in the foundation which made a flexible dam desirable. A rolled fill was favoured rather than an hydraulic fill because of the following considerations: The layout of the site and the location of materials assured easy placement by rolled fill methods. Recent developments in earth moving equipment have given rolled fill construction a definite advantage over hydraulic fill methods for dams of the yardage and dimensions required for the St. Mary site.

The soil studies definitely indicated that a rolled fill dam was the better solution because the available material was too high in clay, as well as deficient in sand and gravel, to be satisfactory for an hydraulic fill dam. The soil in the borrow pit was slightly below the optimum required for compaction and no difficulty in adding moisture to reach the ideal water content for rolling was foreseen.

All the analyses applied to the design of the dam section have not been given.<sup>10</sup> The results of the stability study of the upstream slope, the settlement analysis and the seepage analysis are briefly covered. The stability studies of both side slopes showed that rapid drawdown on the upstream side was the most critical condition, therefore the downstream slope will not be considered.

#### STABILITY ANALYSIS OF THE UPSTREAM SLOPE<sup>7</sup>

This slope might be checked for stability under any of the following conditions: (1) during construction with the reservoir empty, (2) reservoir filled with water, (3) immediately after or during sudden drawdown of the water level in the reservoir. Condition (3), which is equivalent to a load suddenly applied at a time when the soil is saturated, was found to be the most critical. The added load on the slope due to sudden drawdown is caused by an increase from the submerged weight of the soil to the actual wet weight. Under these circumstances the soil may not have time to drain and develop internal friction, therefore its shearing resistance will consist entirely of cohesion.

$$\text{VOID RATIO } e = \frac{\text{VOL. OF VOIDS}}{\text{VOL. OF SOLIDS}}$$

$$\Delta H = \left( \frac{e_1 - e_2}{1 + e_1} \right) H$$

2	144.3	11.32	145.2	10.69

Fig. 12—Consolidation test results.

A number of different methods have been used to check the upstream slope for sudden drawdown but only one will be covered in this paper. It is known as the circular arc method and is the simplest and probably the most reliable for clay soils. This method is frequently used for the analysis of clay slopes where the load is applied rapidly and the angle of internal friction of the soil in the quick test is low. The basic assumption of this theory is that the soil will fail by sliding along a surface closely approximating a circular arc. It is also assumed that failure occurs simultaneously along the rupture surface and the resistance of the soil consists entirely of cohesion, that is, the angle of internal friction is zero. The forces acting on the sliding segment of soil are, the weight of the material which tends to cause the slide, and the shearing resistance of the soil acting on the circular arc which tends to hold the soil in place. In Fig. 13, the forces affecting the stability of the soil segment can be examined. The moment tending to cause a slide is equal to the total weight of the soil segment ( $W$ ) multiplied by the horizontal distance ( $D$ ) from its centre of gravity to the centre of rotation ( $O$ ). The moment tending to resist a slide is equal to the product of the arc length ( $L$ ), the cohesion of the soil ( $C$ ), the radius of the arc ( $R$ ). A factor of safety ( $F$ ) is equal to the resisting moment divided by the overturning moment.

$$F = \frac{L \times C \times R}{W \times D}$$

In the case of the St. Mary clay, it was definitely felt that the possibility of excessive pore pressures occurring should be taken into account. With highly impervious materials which are slow to drain, pressures above hydrostatic are exerted on the soil particles by the pore water during the readjustment after sudden drawdown. These pressures tend to neutralize the normal unit stress ( $P$ ) on the rupture surface and decrease the internal friction portion of the shearing resistance. Thus, for the St. Mary clay, this consideration further justified the use of the circular arc method in which the angle of internal friction is neglected.

The details of the slope analysis are shown in Fig. 13 and the factors of safety are tabulated for both the Proctor and California densities. Three failure arcs were analyzed, No. I and No. II for the entire height of slope, and No. III for the upper portion of the slope

where the water level will fluctuate yearly. It is unlikely that the water level will ever be drawn down completely but it was thought prudent to investigate this condition with arcs No. I and No. II. To improve the factors of safety of the segments at Proctor densities, particularly along circles No. I and No. II, it was apparent that some type of counterweight near the toe of the slope would be beneficial. Therefore an analysis was carried out assuming a sandstone blanket on the lower portion of the slope. This material was considered to have a density of 125 lb. per cu. ft. and its shearing resistance was neglected. The factor of safety was increased on the three arcs by the sandstone layer; for No. I the increase was from 0.91 to 0.99. Therefore the slope would be unsafe if a density higher than the Proctor were not obtained, as common practice recommends a factor of safety of 1.5 for similar clay soils analyzed by this method. On each assumed failure arc the factor of safety was less than 1.5 for the Proctor density and greater than 3.0 for the California density.

#### SETTLEMENT ANALYSIS<sup>8</sup>

Based on the results of the consolidation tests, calculations were made to determine the total compression which might take place within the earth fill if it were rolled to the Proctor density. In this analysis it has been assumed that the fill consisted of 9 soil layers whose total thickness was 185 ft., with the layers infinite in all directions. The settlement of each layer due to its own weight was small and its magnitude was rather uncertain, therefore it has been neglected. The settlement,  $\Delta H$ , in each layer due to the weight of the superimposed layers was determined by the formula

$$\Delta H = \left( \frac{e_1 - e_2}{1 + e_1} \right) H$$

which has been explained under Consolidation Tests. The stress was assumed constant throughout the thickness of any layer and was taken as the stress at the centre of that layer. Therefore in calculating the loads due to the superimposed layers,  $P_1$  was taken as the stress at the centre of the layer due to its own weight and  $P_2$  the pressure at the centre of the layer due to the superimposed layers. The void ratios,  $e_1$  and  $e_2$ , corresponding to  $P_1$  and  $P_2$  were determined from curve No. 1, Fig. 12, under Consolidation Tests. The summation of the settlements in each layer gave a total compression of 6.2 ft. for the entire fill. The

$$F = \text{FACTOR OF SAFETY} = \frac{R \times L \times C}{W \times D} \quad W = w \times \text{AREA} \times \text{IFT.} \quad C = \text{COHESION}$$

ASSUME FOR  
 PROCTOR  $w = 135 \text{ lb. per cu. ft.}$   $C = 1900 \text{ lb. per sq. ft.}$   
 CALIFORNIA  $w = 143 \text{ lb. per cu. ft.}$   $C = 7660 \text{ lb. per sq. ft.}$

CIRCLE	F=FACTOR OF SAFETY			
	EARTH FILL WITH SANDSTONE SHOULDER		WITHOUT SANDSTONE SHOULDER	
	CALIFORNIA	PROCTOR	CALIFORNIA	PROCTOR
I	3.73	0.99	3.48	0.91
II	4.06	1.08	3.69	0.97
III	5.28	1.39	5.15	1.35

Fig. 13—Stability analysis of upstream slope.

settlement of the fill on the basis of the California density has not been calculated but, obviously, it would be a small fraction of that predicted above for the Proctor density.

The figure calculated is, of course, the total compression of the soil, and only a portion of this would ever become apparent at the crest of the dam because some settlement will take place during construction. Since the rate of consolidation depends entirely on the time for construction, the settlement at the crest is at present unpredictable. The total consolidation of 6.2 ft. is rather high but would not be objectionable in itself. The real danger would be the possibility of excessive pore water pressure building up due to the consolidation of this highly impervious material. Water pressure above hydrostatic in the body of the fill would cause a dangerous decrease in the shearing resistance of the soil.

SEEPAGE ANALYSIS

A seepage study using the flow net method was made on two proposed dam sections, one with an internal drain and one without. The purpose of this analysis was to determine the effect of the drain on the total quantity of seepage and on the position of the line of saturation. Flow net methods of studying seepage problems will not be discussed but interested readers are referred to the publication "Seepage Through Dams"<sup>9</sup>. In the seepage study illustrated in Fig. 14, it was assumed that the horizontal coefficient of permeability of the soil ( $K_h$ ) was 4 times the vertical coefficient of permeability ( $K_v$ ); that is, for a constant hydraulic gradient, the horizontal seepage velocity is 4 times the vertical. This assumption is not based on any tests for this particular material but rather on data which has shown that the horizontal coefficient of permeability of rolled fills varies from 2 to 10 times the vertical, depending on the method of construction.

In making a seepage analysis for the case in which  $K_h$  is greater than  $K_v$ , it is necessary to draw a flow net consisting of curvilinear squares on a transformed section, and then transfer the flow net back to the true section. The transformed section has the same vertical dimensions as the true section but the horizontal scale

of the former is reduced by the factor  $\sqrt{\frac{K_v}{K_h}}$ .

The analysis indicated that it would be advisable to use a graded filter drain extending into the dam as shown. This would result in the line of seepage passing well within the downstream slope, whereas it would intersect the slope if an internal drain were not used. In dams where the seepage line intersects the downstream slope, soil erosion and sloughing frequently result. The theoretical quantity of seepage is doubled by this type of drain but that will not be serious because the estimated seepage through the dam is small in either case.

From the preceding analyses, and a comparison with B. of R. soil properties, it was obvious that a higher density than the Proctor would have to be attained in the glacial clay, otherwise the design of the dam section would have to be modified.

DISCUSSIONS OF DESIGN MODIFICATIONS

Three alternatives to modify the design presented themselves:

- The first, to widen the sections of pervious material on either side of the clay core;
  - The second, to mix sand and gravel with the clay and build the entire section of a stabilized mixture;
  - The third, to increase the compacted density of the clay material to the range of California specifications.
- Considering the first alternative, there was no doubt

Fig. 14—Seepage analysis

Fig. 15—Sheepsfoot roller used by Army engineers. (Acme Photo)

that a satisfactory structure could be built using a clay core with pervious sand and gravel shoulders. However, this modification which would greatly increase the cost, due to the long haul of the sand and gravel, has not been seriously considered other than from the economical standpoint.

The second alternative of mixing sand and gravel with the clay has been investigated. A mixture of 50 per cent pit run material passing the  $\frac{1}{4}$  in. mesh and 50 per cent glacial clay was found to compact to a high density and its increased shearing strength would certainly ensure stability on the suggested slopes. However, consolidation tests indicated that the settlement would be reduced only slightly. If this alternative were adopted the cost would be greatly increased due to the additional work of mixing and the long haul of the coarse material.

The last alternative of increasing the compacted density to that of the California method was considered the best solution. The previous analyses have indicated that the side slopes of the present proposed design would be stable, and that there would be very little settlement. One question remains—Will it be economical and practical to get this increased density in the field using sheep's foot rollers?

#### DISCUSSION OF FIELD COMPACTION WITH SHEEPSFOOT ROLLERS

Studies have revealed that it will likely be possible to attain the California density in the field by using a sheep's foot with a pressure range of from 500 to 1000 lb. per sq. in. However, to be absolutely certain, a field test would have to be performed as little data is available on such a high degree of compaction for the type of soil under consideration. Until such time as a field test is carried out, it will be necessary to base decisions on laboratory tests and the following data from other sources.

Mr. O. J. Porter, who developed the California method, has stated that it is possible to obtain this density in the field by the use of sheep's foot rollers. His method has been the basis of control for the work done by the California Department of Highways since 1929 and also has been adopted on a number of U.S. Army Airports. Mr. Porter has designed a sheep's foot roller, illustrated in Fig. 16, which is capable of exerting unit pressures of 500 lb. per sq. in. empty and 1200

lb. per sq. in. when loaded with sand and water. The drum of this roller is 8 ft. in diameter and 10 ft. long, the feet of which are 18 in. in length. The total weight empty is 15 tons and when loaded is 37.5 tons. Densities equal to that of the California method have been obtained on various soil types using this machine. Mr. Porter feels that a roller exerting a pressure of 700 to 1000 lb. per sq. in. would give densities approaching that of the California for a soil such as the St. Mary clay.

The U.S. B. of R. has found that with 12 to 14 passes of a sheep's foot roller exerting a unit pressure of 488 lb. per sq. in., field densities comparable to that of the Proctor method with the 18 in. drop, can be obtained. The Bureau, apparently, has not used rollers heavier than about 500 lb. per sq. in.

Fig. 16—U.S. B. of R. standard sheep's foot roller.

because a sufficient density was attained with this degree of compaction for their soils. Plan and elevation views of the above mentioned roller are shown in Fig. 16.

The present trend is definitely toward sheepfoot rollers exerting higher unit pressures, particularly where stabilization of poor clay soils is required. The following are a few examples on recent dams:

On the Merriman cofferdam, which was constructed for the Board of Water Supply of New York, rollers exerting a unit pressure of from 438 to 642 lb. per sq. in. were used. (*Engineering News Record*, Vol. 127, Page 913, December 1941).

At the Denison dam in Texas, an earth fill 190 ft. in height, 7 passes of a sheepfoot exerting a unit pressure of 550 lb. per sq. in. were required. (*Civil Engineering*, Vol. 11, Page 478, August 1941).

On the Wappapello dam, sheepfoot rollers giving a unit pressure of 267 to 583 lb. per sq. in. were used. (*Civil Engineering*, Vol. 10, Page 588, September 1940).

At the Shand dam in Ontario, a field compaction test was made which resulted in the foot pressure of the sheepfoot roller being increased from 223 to 255 lb. per sq. in. (*Engineering Journal*, Volume 23, Page 170, February 1940).

On the Duncairn dam, a rolled fill 70 ft. in height which was constructed by the P.F.R.A., rollers exerting a maximum pressure of 200 lb. per sq. in. gave satisfactory densities.

Having assumed that it will be economical and practical to increase the degree of compaction, are there any objections to such a high density for this predominantly clay soil? Yes. There is a definite danger of swelling near the faces of the slopes and at the top of the dam. This can be overcome by reducing the compaction and hence the density as these points are approached, and by blanketing the slopes with a sufficient weight of gravel to prevent swelling under

any water conditions. A very practical problem exists in the possibility of swelling and expansion taking place in the top layer of the completed fill between construction seasons.

## CONCLUSION

The soil mechanics investigation resulted in the adoption of the original design with some modifications. This design is by far the most economical, making use largely of material close at hand. The outstanding point brought to light by the laboratory studies was the necessity of soil compaction, by heavy sheepfoot rollers, at a relatively low water content to obtain a stable fill.

## DISCUSSION

G. L. MacKENZIE, M.E.I.C.<sup>1</sup>

Before proceeding with any discussion of the paper I wish to emphasize that the project is still in the design stage, and subsequent tests and investigations might modify the design.

Mr. Peterson has indicated that the fill material available at the site is very impervious. His laboratory tests disclose that, in order to secure a stable fill with this material, it will have to be consolidated to a density of about 143 lb. per cu. ft. with a resulting factor of safety of approximately 3.73. This at first appears to be a high factor of safety, but an examination of the compaction curves in Fig. 8 shows that to attain this degree of compaction the water content must be maintained between the limits 9.7 and 11.3 per cent. This is a very narrow limit and, as this tolerance increases, the factor of safety will decrease.

The principal factors in the construction will be:

- (1) The control of the moisture content within the necessary narrow limits, and
- (2) The securing of this very high degree of compaction.

In connection with the moisture content, it has been recognized that the ideal method of applying water for construction of earth fills is by irrigation of the borrow pits. In this case however, the material is quite

impervious and I would be concerned about the possibility of securing the proper water content in this manner because I would suspect that both penetration and drainage would be slow and doubtful. It should be noted too that the analysis of the borrow material discloses an existing water content varying from 6 to 15 per cent. This being the case, some of the material is now above the desired optimum water content and it will have to be reduced. This will have to be done by mixing the fill with drier material, which might be an expensive operation and difficult to control.

In connection with the compaction, it would certainly appear necessary to perform an actual field test. It would have to be determined that a roller similar to that described by Mr. Peterson would provide the required compaction and in fact it would have to be demonstrated that it would not bog down on the fill. At the same time the cost of its operation could be determined.

I am willing to accept Mr. Peterson's laboratory conclusions as to the required density and that they are in accordance with the latest theories of soil mechanics. I am confident that, provided the moisture content limitations are not too restricted to be controlled in the field, and provided that the roller described can actually be operated in such plastic material, the design recommended by Mr. Peterson will be stable and the most economical of all the suggested alternatives.

<sup>1</sup>Supervising Engineer, P.F.R.A., Department of Agriculture of Canada, Regina, Sask.

With regard to the St. Mary dam, I think the important point brought out by the soils investigation is the possibility of treating the inexpensive fill material in such a manner that it can be used for practically the whole section. If compaction were limited to previously accepted methods, it appears that a substantial portion of the fill would have to consist of relatively expensive and scarce pervious materials. It is estimated that approximately \$400,000 can be saved by the suggested design, with earth fill at 25c per cu. yd. and pervious fill at 75c. Even if sufficient quantities of pervious fill were available, which is doubtful, it would have to be hauled about eight miles.

It may be asked whether a concrete dam may compare favourably with the proposed design. I may say that it is estimated that a concrete gravity structure would cost about \$750,000 more, with mass concrete at seven dollars per yard. In addition to cost, there are other factors which are not favourable to a rigid structure. The existence of lenses of comparatively soft shaly materials in the foundation rock may make for uneven settlement.

Since the above comparison in cost is based on the assumption that the presently proposed spillway can be eliminated, provision would have to be made to handle flood flows over the dam. This will entail the use of crest gates about five feet in height, since the reservoir cannot be allowed to rise more than three feet, due to the fact that the canal from the Belly river comes in at this elevation. A stilling basin at the toe of the dam to protect the river banks and bed may be quite expensive.

The young science of soil mechanics has relieved many a headache for the general engineer. Not many years ago, our so-called designs involving earth and earth foundations could be little more than guesses. Generally, we can now predict the behaviour of earth in many ways which were formerly not possible. It appears, however, that much remains to be done, and I am thinking at the moment of lateral or horizontal earth pressures.

Some structural problems involving lateral earth pressures are, of course, retaining walls and pipes or conduits buried in earth fills, as well as tunnel linings.

In a semi-infinite mass of soil, the pressure in a vertical direction at depth  $D$  is  $WD$  where  $W$  is the unit weight. From theory, the active and passive horizontal pressures at any depth  $D$  can be expressed in terms of the cohesion,  $C$ , and angle of internal friction  $\phi$ , of the soil. They are:

$$\sigma_a = \frac{-2C}{\tan(45^\circ + \frac{\phi}{2})} + \frac{WD}{\tan^2(45^\circ + \frac{\phi}{2})} \quad (1)$$

$$\sigma_p = 2C \tan(45^\circ + \frac{\phi}{2}) + WD \tan^2(45^\circ + \frac{\phi}{2}) \quad (2)*$$

where  $\sigma_a$  is unit active pressure and  $\sigma_p$  is unit passive pressure.

It is seen that the results of shear tests will permit an estimate of active and passive pressures. Both these values are developed on the assumption that shear failures are taking place within the soil mass, and are therefore states of stress during some movement or flow of the soil. More often we are interested in the

horizontal pressures existing when the soil is at rest, or in any case when movements are very small. Here is where the problem becomes difficult.

During the investigation of the feasibility of building a conduit under the dam for river diversion during construction, this matter of soil pressures was seen to be very important. While it was proposed to encase the lower half of the circular concrete pipe in rock, the upper half would be subjected to earth pressures. Owing to the delicate balance of moments, the magnitude of the horizontal pressure was extremely important.

Attempts were made in our laboratory to determine the horizontal pressures at rest, since deflections in the comparatively rigid pipe were small. The first test was made with the triaxial shear machine, wherein vertical and horizontal loads were applied in such a manner that no lateral deformation would take place in the sample. Vertical stresses were plotted against the ratio  $K_o$  of horizontal to vertical stress, and it was found that this ratio increased from 0.5 at a vertical stress of 20 lb. in<sup>2</sup> to 0.78 at 100 lb. in<sup>2</sup>, after which the value appeared to remain constant.

Other apparatuses were designed to attempt to check these values, but results were poor. One of the devices consisted of a thin walled cylinder about 3¼ inches in diameter and 1 inch high, open at both ends. This was packed with soil, a load applied on a disc at the top, and the expansion of the cylinder measured by means of metaelectric strain gauges cemented to the outside. Peculiar results were obtained. It appeared that the value of  $K_o$  decreased, rather than increased, with vertical stress. In fact values of  $K_o$  greater than 1 were obtained at low vertical loads.

I am inclined to accept the triaxial results, but there is no doubt that there is a need for the development of technique in determining values for a given soil under given conditions. Suppose that active, passive and horizontal pressures at rest are determined with reasonable accuracy. There still remains the problem of small movements of a structure against or away from, the soil. In other words, how far will the wall of a conduit, for instance, have to move to set up the ultimate passive pressure as given by equation (2)? In the case of fills, no doubt the degree of compaction immediately adjacent to the wall will have some effect. But even assuming uniform density throughout the mass, is it still possible to determine the relation between the magnitude of the movement of the wall against the soil, and the passive pressure set up?

W. F. RIDDELL, M.E.I.C.<sup>3</sup>

Compacted earth dams subject to a more or less constant head of water, so that soil conditions are reasonably constant, provide the most favourable condition for this type of structure, and will doubtless in future be more commonly used. Dams which are constructed for flood control purposes, and are subject to large summer draw downs, provide fairly long periods of time when the structure is subject to drying and freezing action from both sides. In the larger structures, such as the St. Mary dam, this action would not penetrate deep enough to be of any serious consequence, but, in smaller structures, this detrimental action might require special consideration lest rapid flooding in the spring season find a fatal weakness in some part of the structure, due to unexpected changes in soil conditions caused by drying and freezing, followed by rapid restoration of the water head.

\*Theoretical Soil Mechanics, Terzaghi.

The author states that, as a result of these laboratory investigations, they adopted the original design with some modifications, the inference being that a different design had been worked out previous to this analysis. It would be interesting to have the details of this design which was abandoned when they returned to what the author calls the original.

Inasmuch as it is practically impossible to reproduce and maintain laboratory conditions in the field when constructing an earth fill of this size, due to cloud bursts, normal precipitation, hot winds, variation in the moisture content and other characteristics of the material in place, etc., the question arises: to what extent should we allow the results of this laboratory analysis to govern our design?

Earth is not like steel, cement or concrete, or a manufactured article the uniform quality of which can be carefully controlled during manufacture.

When safety of life and property is involved, how much risk if any are we warranted in taking in order to reduce first cost?

The writer is suggesting these questions because they should be given very careful consideration before the design is finally approved.

R. M. HARDY, M.E.I.C.<sup>5</sup>

This discussion will be confined to one or two points concerning the laboratory shear tests and the question of the high proposed densities.

I am somewhat puzzled by the comparatively large variation in the angles of internal friction between tests reported in Fig. 11. Moreover, it is difficult to reconcile the high values of  $\phi$  for curves 3 and 4 with the statement that they are from "quick tests". Consolidation tests on this type of material usually require a time of the order of hours for the pore pressure due to a load increment on the sample to be dissipated. The disappearance of pore pressure within the shear test samples would require about the same time in the direct shear test and a longer interval in the triaxial test. Since internal friction can develop only as initial pore pressure decreases it is hard to understand the high values on internal friction cited as from "quick" tests.

The difficulty seems to arise from Mr. Peterson's definition of a quick test as one in which the load is "applied at such a rate that failure of the sample will take place in about ten minutes." It is submitted that a quick test should rather be defined as one in which the load is applied at such a rate that the pore pressure does not materially decrease during the test.

In our experience a definition based on an exact time limitation has no real meaning except as applied to a particular soil and a definite size of sample. For example, in the Soil Mechanics laboratory at the University of Alberta we have secured values of angle of internal friction from zero up to 30 deg. from triaxial tests run in about 20 minutes. These tests were on samples from the same alluvial deposit but having different percentages of clay particles. The one extreme is a "quick" test, the other a "slow" test.

Mr. Peterson's shear tests were run on compacted samples which, according to his Fig. 8, were not fully saturated. In this case it would be expected that the air in the voids would be compressed by a load increment, thus preventing the development of pore pres-

ures as great as if the sample were fully saturated. It would, therefore, be of interest to know the approximate percentage deformations at failure for the Proctor compacted samples as compared to the California compacted samples.

It is suggested that the pore pressure conditions in the samples from the two types of compaction may be quite different due to the variation in deformation characteristics of the two materials.

We would hesitate to compare the angles of internal friction for the two types of compacted samples before being reasonably sure that the pore pressure conditions during the tests are identical.

On the matter of the high densities proposed for the dam, of considerable importance, if they are used, would be the swelling pressures developed as the dam becomes saturated. These would not be objectionable provided the weight of the overburden at any point is sufficient to prevent swelling deformation. This leads to a consideration of the magnitude of the pressure that may be developed by a swelling soil.

We are, at present, running a series of tests in our Soil Mechanics laboratory attempting to measure the swelling pressures developed in local glacial clays as water is added to the soil at different moisture contents. These indicate that pressures of the order of 1 to 1½ tons per sq. ft. may be developed when water is added with the soil at a moisture content of less than about 12 per cent. With this type of soil compacted to the California density, the swelling pressures, however, would probably be at least double these figures.

Mr. Peterson recognizes that the high densities from the California compaction method cannot be used near the surface but it is submitted that some consideration should be given as to the minimum depth at which they can be safely used.

I am in general agreement with Mr. Peterson's theoretical analysis. It should be realized, however, that while such analyses have been used successfully as a basis for construction on other dams, experience is being extrapolated somewhat in designing a structure of the proposed dimensions using this type of soil and such high densities. A considerable amount of field work will therefore be justified on test strips to determine the efficacy of the design before construction of the dam is started. Such field tests under the circumstances would in no way discredit the excellent design procedure followed.

I. F. MORRISON, M.E.I.C.<sup>6</sup>

In this excellent and very interesting paper, there are one or two points upon which the writer would like to comment.

In Coulomb's equation, the author does not make clear that, when it is applied to a two-phase, water-soil, system, the normal unit stress  $P$  is the unit pressure acting on the soil skeleton and not the total pressure normal to a plane element at the point considered. The total normal pressure is the sum of the pressures on the water-phase  $P_w$  and on the soil skeleton  $P_s$ . Under constant load, it is constant, whereas the two pressures, of which it is the sum, are not. They vary with time and the coefficient of consolidation in accordance with the theory of consolidation.

To make this clear, Coulomb's equation should be written:

$$S = C + P \left( \frac{P - P_w}{P} \right) \tan \phi$$

<sup>4</sup>Consulting Engineer, Olds, Alta.

<sup>5</sup>Associate Professor of Civil Engineering, University of Alberta, Edmonton.

<sup>6</sup>Professor of Applied Mechanics, University of Alberta, Edmonton, Alta.

Obviously, in a shear (triaxial) test if the pressure  $P = P_w$ , then the second term in Coulomb's equation becomes null. This gives the impression that  $\tan \phi$  becomes zero and that, therefore,  $\phi = 0$ . But this is not so.

If one writes, however,

$$\frac{P - P_w}{P} \tan \phi = \tan \phi'$$

Then  $\phi'$  does become zero.

This is what happens in what is called a "quick-test".

A detailed mathematical treatment of the mechanical behaviour at sudden draw-down shows that the term which represents the friction  $P_s \tan \phi$  in Coulomb's equation applied to the soil at the sliding surface prior to draw-down is retained in the equation for  $S$  after draw-down of amount  $h_1$  feet, and that a third term  $wh_1 \tan \phi'$  is added. It is this third term which may be null depending on the time and the coefficient of consolidation.

For this reason the writer does not believe a proper analysis can be made by neglecting the fraction already present, if any, prior to draw-down as the author has done.

Krey shows that the centre of the critical sliding circle is dependent on both  $C$  and  $\phi$ , which would be different from the centre of the critical circle if  $C$  alone be considered. Besides, the friction circle should be used in the analysis. The danger due to sudden draw-down arises from the suddenly increased weight of the sliding mass and the seepage pressure. Partial draw-down increases the load in the upper part of the sliding mass without a corresponding increase in the lower part. For example, a draw-down only as far as the berm directly below point  $O_{II}$  would be more dangerous than a complete draw-down for the sliding circle II (Fig. 13).

The seepage pressure has been omitted in the above discussion for the purpose of simplification but that does not mean that it is unimportant.

#### THE AUTHOR

The response, both in the form of general interest and discussion, to the papers on soil mechanics presented before the annual meeting has been most gratifying.

The helpful criticisms and suggestions have already prompted the performance of further tests on the St. Mary glacial clay.

The point raised by Mr. Riddell in connection with frost heaving and drying out of the fill material in flood control dams is most important. The P.F.R.A. has experienced considerable difficulty due to shrinkage caused by drying in the clay fill materials of stock watering dams. On the larger type dam, pervious material or a stabilized mixture may be used in the dangerous zones, whereas in the case of the smaller dam where only clay soils are easily available, the use of sand and gravel would result in a greater percentage increase in the cost. Therefore it may be good engineering practice to construct the cheaper dam, even with a chance of failure due to these causes where the possibility of loss of life is nil and property damage is small, rather than to declare the project non-feasible due to high initial cost.

Referring to the design sections as questioned by Mr. Houston, the original section consisted almost entirely of compacted glacial clay except for rock riprap on the upstream slope and the rock section on the downstream slope. Modifications as a result of soil mechanics studies included the following: (1) A pervious sand and

gravel section replacing the glacial clay on the upstream slope in the zone of sudden drawdown. (2) The addition of a sandstone blanket on the upstream slope below low water level. (3) A sand and gravel blanket covering the entire downstream slope of the compacted clay fill. (4) The addition of a graded filter beneath the downstream portion of the fill. In addition to the above modifications, the laboratory studies indicated that special care in placing and compacting the clay fill would be required.

Like Mr. Houston, many engineers wonder what expense is justified in the field to attain the ideal placing conditions as determined in the laboratory. From the experience of the U.S.B. of R. on numerous projects constructed over a large area of the United States, it has been found that the conditions specified by laboratory investigation could be very nearly obtained. However there are a great number of variables, and each project is a problem in itself. In the case of a large earth fill in the United States a huge tent was used over the fill area to prevent soaking from rain during construction. On small P.F.R.A. dams it has been found that clay soils can be placed at water contents close to the optimum by irrigating the borrow pit and then by sprinkling on the fill during placing and rolling.

Like Professor Hardy, the author was inclined to question the high angle of internal friction which the shear tests indicated for the California density. However as pointed out by Professor Hardy, these shear tests are not true "quick tests" because full pore pressure was never developed. A true "quick test" on a cohesive material should give a very low apparent angle of internal friction. In the analysis for sudden draw-down, the value of the cohesion only was used and it was assumed that due to pore pressure the internal friction was zero. The value of cohesion as used in the design analysis has been found to be identical with that obtained from true "quick tests".

In connection with swelling pressures exerted by soil at the California density, it appears that the intensity of pressure varies greatly with small changes in the water content at which the soil was compacted. A test on a sample slightly above the optimum water content indicated a pressure of less than one tone per square foot, whereas a sample slightly below the optimum exerted over three tons per square foot.

The author would like to thank Professor Morrison for his clarifying remarks on the relationship between the stress in the soil water and the stress on the soil skeleton in a two phase system. Professor Morrison shows that the angle of internal friction  $\phi$  does not become zero but that the apparent angle of internal friction  $\phi'$  is zero for this case.

Possibly some internal friction should have been considered for a proper stability analysis, but in view of the fact that there is little published data on the application of the results of shear tests to dam design and further that the number and type of shear tests performed were limited, it was thought wise to use this simple and conservative method for sudden drawdown which takes no account of the internal friction portion of the shearing strength. Engineers of the U.S.B. of R. are of a similar opinion to that of Professor Morrison, that the method used is conservative and suggest that the actual pore pressure be measured to determine the effective normal pressure on the soil skeleton.

In conclusion, the author would like to thank the discussors for their valuable contributions and also the two chairmen, Professor R. F. Legget and Professor A. E. Macdonald, for their part in making the soil mechanics session a success.

# APPLICATION OF SOIL MECHANICS TO THE DESIGN AND MAINTENANCE OF PRAIRIE HIGHWAYS

G. B. WILLIAMS

*Materials Engineer, Highways Branch, Department of Public Works, Province of Manitoba, Winnipeg.*

Paper presented at the Fifty-Ninth Annual General and Professional Meeting of The Engineering Institute of Canada, in Winnipeg, Man., on February 8th, 1945.

Soil mechanics may be defined as that branch of science which deals with the performance of soil as a structural material. Under this heading much progress has been made in the study of stress distribution in soils; in measuring pressures to be provided for in the design of foundations, retaining walls, bridge abutments and massive earth structures. In the last ten years, the development of equipment to make the precise pressure and strength measurements has progressed rapidly. With these developments, original theories can be tested and practical applications made to the design and construction of foundations and earth structures. In the early 1920's, however, many of the theories regarding stresses in soils were controversial, and to follow the theory through to a practical application involved higher mathematics and assumptions out of the realm of most practising engineers.

In the field of highway engineering, the rapid growth of highway transportation forced highway organizations to begin soils investigations on a practical basis for immediate general use in their particular field. The beginning consisted of a series of co-operative surveys of existing roads under the following main headings:

1. Type and volume of traffic
2. Climatic conditions
3. Character and condition of subgrade
4. Type and condition of surface

The purpose of the surveys was to develop tests and standards whereby improved and more dependable road service could be obtained from the abundant and inexpensive road building materials. The immediate difficulty encountered in the surveys was a method of measurement and comparison for reporting data on subgrades. In one of the early co-operative studies; namely, "A Study of the Sand-Clay Topsoil Roads of Georgia," undertaken by Dr. Strahan in 1922, identification of the soils was by sieve analysis only. Similarly in 1920, on a survey of 1200 miles of roads in California, the subgrades were identified only by texture such as clay, loam, etc. on the U.S. Bureau of Agriculture grouping. The gradation was not a sufficient description of soils for comparison and further tests were needed which would indicate the important characteristics such as shrinkage, capillarity, plasticity, and drainage qualities.

The result of the combined efforts of many investigators was summed up and presented in a report by the Bureau of Public Roads in 1929 which recommended a standardized procedure for testing soils, and from the test values classified the soils into groups of similar performance.

The tests used to classify the soils are:

*Mechanical Analysis*—Grain size

*Physical Analysis*

Liquid limit

Plastic limit

Plasticity index

Shrinkage limit

Shrinkage ratio

Lineal shrinkage

} Plasticity

} Volume change

Field moisture equivalent—Moisture capacity  
Centrifuge moisture equivalent—Resistance to flow of water.

The fundamental principle of these physical tests is that as the moisture evaporates from a slurry of soil and water, the mass passes successively from a liquid, to a plastic, to a solid state. The arbitrarily chosen tests determine the moisture contents which approximate the limits of these stages. From experience it has been found that these limits vary with different soils. This fact serves to identify the soils for, if the limits of each stage as determined by the tests on two soils are the same, the physical characteristics of the soils are the same and they can be expected to react similarly when used in highway construction. The difficulty with these simplified soil tests is that the relation between the test and the actual structural strength of the soil is very complex, and they serve only to indicate the presence or absence of physical characteristics. Much work has been done on the measurement of actual strength of soils in pounds per square inch, the familiar yardstick for less abundant materials such as steel and concrete, but for soils the strength is not a fixed quantity and is governed by fluctuations in moisture content, density, and conditions of loading. Because of the many variables, the tests of structural strength are somewhat involved and the interpretation of the test results must be made with judgement as to how closely the conditions of the test compare to actual conditions in the particular design.

Because of the involved nature of the structural tests and the difficulties in using the values in general design, the approach of highway engineers to soil mechanics has been in identifying the soils and conditions as they exist in roads in service and applying the experience gained from past construction to new design. With the materials identified, the application of past experience may be made in a sound practical manner and the designer may use not only the experience in his own particular area but the knowledge gained in other areas, selecting intelligently the features which will apply to his own particular conditions.

In the above, the development and use of the soil tests for identification has been stressed; the description of the tests has been omitted as they are now A.S.T.M. standards and while simple in operation must be performed precisely as described for accurate results. Some highway departments have developed their own system of classification of soils with the view of simplifying the reporting of the many tests. Of these simplified classifications those in use in North Dakota, Wyoming and Kansas are well worth considering from the point of simplicity in use. The Public Roads Administration revised its original classification in 1943 to reduce the amount of testing necessary for identification. The principles in these newer classifications are the same as in the original, but the trend is to simplification of testing and reporting in order to facilitate the use of the tests by the engineer on construction.

As in the case of the soil tests, the descriptions of

these soil classifications, the limits of each soil group and basic construction recommendations for each group are published elsewhere and will not be repeated here.

### SOIL SURVEYS

In the design of a foundation for a building, a bridge or a dam, the area involved is relatively small. Elaborate subsoil investigations may be carried out to obtain an accurate picture of conditions. Very complete sampling is possible and extensive testing, duplicating the conditions existing on the small area, may be made. In highway work, the area concerned is narrow in width but in comparison is almost infinite in length. It stretches for miles through a variety of geological and topographical conditions. In order that the information can be obtained, the investigations must be simple both in field work and the laboratory.

The usual practice, and that which is used in the Manitoba Highways Branch, is to make auger borings 4 to 6 ft. in depth on normal fill sections, 4 ft. below grade on cut sections, and to the depth permissible by drainage features in borrow areas. The spacing of the borings depends on topography and soil conditions. In flat uniform country, the maximum spacing is 500 ft. and advantage is taken of existing cuts to observe the layer of soil in place; in rolling country, tops of hills, bottom of sags and points of change from cut to fill are examined. An experienced man soon learns to space his borings from observations of topography and vegetation changes. Samples of the type of soils encountered are taken to the laboratory for testing and classification. On the borings, the occurrence of each soil type and the depth of the layer are recorded. Frequent samples are taken to determine moisture content, and the density of the soils in place is determined. When the samples are identified, the soil profile is plotted from the record of the borings. Any special design features such as subcuts to remove frost heaving material, selection of areas of good material for borrow, shrinkage to be expected in construction, are noted and recommendations for the general design of surface and cross-section made. In some cases where the conditions are uniform, the profile is only plotted for sections requiring special treatment and a report is made on the whole project.

The main variant to this type of soil survey is that used in Michigan, Missouri and Indiana where the pedological soil survey is used. Where a province has been mapped for agricultural purposes, the areas shown as of the same soil type will have the same soil profile throughout. The depth of the various layers may change but the same sequence of soil layers exists in the profile. As the soil type is dependent upon the geological origin of the soil, climate and topography it is obvious that, in order that the same soils be developed in any two areas, they must have essentially the same geology, climate, and topography, and therefore engineering features of design adopted for the one area should hold for the second. This is the basis on which the pedological system is used by highway departments. In Michigan, a chart has been drawn up listing the basic recommendations for highway construction for each soil type occurring in the state. Thus, where the pedological soil types have been identified, the soil survey is merely a matter of locating boundaries and checking special conditions. It must be kept in mind that the Michigan State Highway Department has had a soils organization in operation since 1926, and had to accumulate fund of data to determine the basic recommendations and make this method of classification possible. There is no doubt that a great deal of

pertinent information can be obtained from the agricultural soil maps, where they are available, and by relating the engineering data compiled to these soil types, soil surveys can be much simplified.

### MEASUREMENTS OF STRUCTURAL STRENGTH OF SOILS

The measurement of the structural strength of soils has been mentioned, but in highway work the practice has not, at the present, been generally adopted. A census taken by the Highway Research Board in 1939 showed 44 states using the indicator soil tests and surveys, as described above, but only half of these using structural strength tests. This is not due to lack of importance of the structural tests but due to a lack of standardization in the testing procedure and the interpretation of the values in design.

The structural strength measurements in most common use are the shear tests and settlement tests. These have been used to good advantage in foundation design. In highway engineering, the use of these tests to date has been limited to the design of bridge abutments and high fills. The stability of a fill is a function of the height, width of base, and shear strength of soil both in the fill and below the fill. For average highway embankments the width required for traffic lanes, shoulders, and satisfactory slopes for safety, over-balances the possibility of shear failures. There are always however the exceptional cases where shear strength of the soil and possible settlement of the foundation are the governing factors. In the 1944 construction season, on one project the grade line selected required an 18 ft. cut on a knoll running into a 22 ft. fill through a swamp. The standard cross section of embankment on the highway was a 40 ft. width of grade and 4:1 slopes. With heights over 5 ft., however, the practice has been to steepen the slopes and use guard rail. For a given height, the degree to which it is safe to steepen the slopes is governed by the shear strength of the soils. In deciding on the slopes for this particular project, a study was made of some of the slope design formulae which have been published. In order to use these designs, the value of shear strength for the particular soil, a fine cohesionless blow sand, had to be assumed. The assumed values were interpolated from determinations made on similar materials by other departments but actually the whole design was based on an assumption of shear strength for the par-

Fig. 1—Stress-strain relation in shear tests.

Fig. 2—Typical compaction curves.

ticular soil. The department has now built a direct shear machine in order that similar design may be made more rationally in the future.

A number of points occur in the use of shear tests however, which make their application in design difficult. There are the mechanical limitations of the testing machine in duplicating field conditions. The influence of these limitations can only be determined by utilization of the tests and careful study of data obtained. The basic theory in the shear tests is by Coulomb and may be shown as follows:

$$S = P \tan \phi + C$$

$S$  = shear strength

$P$  = normal load

$\phi$  = angle of internal friction

$C$  = resistance due to cohesion

In the tests to determine shear strength, the soil sample is loaded with a normal load, and a shearing load is applied. From studies of reports by different investigators and some personal observations, it appears that the ultimate shear strength value obtained is largely dependent upon the rate of applying the shearing load. If large increments of load are applied, the value may be quite different from the result obtained where small increments are used. There is also difficulty in determining what constitutes a shear failure. As shown in Fig. 1, up to the ultimate value the stress increases with deformation. To use the ultimate shear value in design would not seem sound, as in some cases the deformation at this point would constitute failure. A further point of query on shear tests is in the expressing of the shear strength in relation to the area of sample tested. By the time the ultimate value is reached the deformation has reduced the area of sample resisting shear. Should the shearing load be expressed on the reduced area or on the original sample area?

These points of question do not lessen the value of the test, they merely emphasize the necessity for more investigation. The logical development of the structural tests would be parallel to the indicator tests previously described, that is, standardization of procedure, utilization of the tests in design and construction, and compilation of data on the service records of the completed projects. A sound start could be made in Manitoba by testing the soils and investigating the conditions where fills and bridge abutments have failed in the past. Much investigation has already been done, and other contributors to this discussion, engaged in foundation work, may clear up some of these points.

#### COMPACTION TESTS

An important development in soil mechanics has been the establishing of the relationship between mois-

ture content, density, and compactive effort. The practical application of this was first published by R. R. Proctor in 1933 from observations on dam construction in California. The relationship is essentially that for any one soil, using the same compactive effort throughout, the density increases as the moisture content increases up to a point termed optimum moisture. Increases in moisture content beyond this point cause the resultant density to be lower. This is shown in Fig. 2. If the compactive effort is increased, a similar shaped curve is obtained with a higher maximum density and lower optimum (Curve II in Fig. 2).

A standard method of compaction has been adopted by the A.S.T.M. and the degree of compaction obtained by the test was correlated to the densities obtained in construction by the equipment in use at that time. With improvements in equipment, however, more efficient compaction is now possible, and many state departments have modified the test to obtain higher densities and lower optimums, thus higher degree of subgrade support.

The use of the test determines in advance the density to be obtained in the field and the moisture content at which it can most economically be produced. At maximum density and optimum moisture, the soil has a maximum of solids and a minimum of air voids for the particular compactive effort, and offers the greatest resistance to penetration of water. In a series of laboratory experiments conducted on four type soils ranging from silty clay loam to a heavy gumbo clay, samples were compacted to the densities and moisture contents as shown in Fig. 3:

- A—Below maximum density and less than optimum moisture
- B—At maximum density and below optimum moisture
- C—At maximum density and optimum moisture
- D—Below maximum density and above optimum moisture

The samples were then subjected to a capillarity test and the data obtained are given in Table I.

The conclusions reached are as follows:

1. Samples compacted at less than optimum moisture, whether at maximum density or lower, absorb water freely and lose density.
2. Samples compacted at optimum moisture to maximum density resist absorption of water and retain density.
3. Samples above optimum moisture are not affected by capillarity but have lower density.

These data point out to the advantages of a well compacted subgrade, but also are evidence of the critical nature of moisture content. On a concrete

Fig. 3—Typical points of compactions for laboratory tests on compacted samples.

TABLE I  
EFFECT OF CAPILLARY ACTION ON TYPES OF SOILS AT THE DEGREES OF COMPACTION SHOWN IN FIG. 3

Soil type	Mech. analysis			Physical anal.		Point of compaction	Before capillarity		After capillarity	
	Sand	Silt	Clay	L. L.	P. I.		Moist. cont.	Density lb.-cu. ft.	Moist. cont.	Density lb.-cu. ft.
Clay loam L-247	10	68	22	34	..	A	10	106	24	98

						D	17	112	19	111

paving project, where the subgrade was a heavy gumbo clay similar to L-173 in Table I, the subgrade was compacted to a depth of one foot. On one section, when forms were in place, and the density of the subgrade measured to be 94 lb. per cu. ft. at 22 per cent moisture, a heavy rain covered the section with  $\frac{1}{2}$  in. of water. When the water could be drained off, the grade was examined and found to be soupy to a depth of  $\frac{1}{2}$  in. Below this layer, the density and moisture content remained unchanged. In contrast, on another section of highway where compaction was specified without moisture control, the embankment was constructed in hot, dry weather and compaction difficult to obtain. Under heavy construction traffic however, the top layer reached a density of 86 lb. per cu. ft. at 15 per cent moisture. Before the surface course was constructed, heavy rains occurred and through absorption, the density taken at identical location had dropped to 69 lb. per cu. ft. at 25 per cent moisture content. This condition of poor compaction at a high moisture content produced a very unstable grade.

The ideal condition would be, of course, to compact to such a degree that the optimum moisture was below the plastic limit. In this case the soil would be semi-rigid and thus would have greatly increased supporting power. Experience in highway construction in Manitoba has shown that the densities obtained with normal construction equipment range from 90 to 110 per cent of those obtained in the standard density test. The State of California determine maximum density and optimum moisture on a compaction test using 2000 lb. per sq. in. pressure but base the design on the density retained after immersion in water until swell is complete. In a recent issue of *Roads and Streets* an article was published on the use of a super sheepsfoot roller with an 8 ft. diameter drum, 10 ft. length, 18 in. depth of tamping feet and with a gross weight of 77,000 lb. This roller was used on airport construction to obtain a much higher degree of compaction than determined by the standard test. This procedure of compacting to extremely high densities should be studied carefully as, if after some years of service the soil did absorb moisture, the resultant swell would be serious. With rigid pavements this would be particularly serious as maximum expansion of the subgrade would occur at the joints where it is possible for surface water to enter the subgrade. According to the theory of the moisture-density relation this expansion should not occur. From

Fig. 4. if curve I represents the moisture-density curve at standard compaction, and II and III curves for the same soil with increased compactive effort, while the optimum moisture content decreases with increased compactive effort, the relation between the zero air voids curve and the peak density of each curve is quite constant. From this it would appear that the resistance to further moisture penetration would be the same for each maximum density and optimum moisture.

Conclusions reached from theoretical concepts are not always proved in construction, and the proper method of determining the permanency of compaction is by field observations. From laboratory studies, samples compacted at optimum moisture and maximum density when subjected to rapid cycles of drying and rewetting soon revert to the normal field density before compaction. In practice this condition can occur only on the slopes of embankments. Under the surface of the roadway where maximum support is required, on the basis of numerous observations over a six-year period, there is little possibility of a subgrade drying out to develop shrinkage. Such fluctuations in moisture content as have been noted are slow and not disruptive.

In northern climates, however, frost action must be considered in effecting the permanency of compaction. In a soil compacted to maximum density at optimum moisture, each solid particle is surrounded by a film of moisture and there is a minimum of air voids in the mass. In freezing, the water expands 9 per cent in volume which should swell the mass causing a density loss on thawing. What the action of freezing is on compacted soils is not clear to the author. The facilities of the department's laboratory do not permit investigation of this feature and, to date, the author has seen nothing published on the subject. A very thorough study of permanency of compaction has been made by H. G. Porter of Texas State Highway Department, but unfortunately he was not concerned with frost action. Field observations have been made on densities in constructed embankments. The results of one such series of observations are given in Table II.

Such data is too meagre to reach any conclusions on permanency of compaction but is presented here as being the type of data which should be collected in order to correctly evaluate the effects of compaction.

Fig. 4—The relation between compaction curves and zero air voids.

FROST BOILS

No paper on soil studies applied to highway construction would be complete without reference to the problem of frost boils. In this paper only one type will be considered. Problems involving free water may be cured by drainage. The type of drainage and location of the pipes is peculiar to each set of conditions, and solution can be determined only by observations and auger borings to determine water levels and seepage zones. The problem of frost boils from a soils angle has to do with certain soil types occurring in poorly drained areas. In an investigation conducted in Manitoba, from 1940-43, on numerous frost boils occurring in the Winnipeg area, the soil condition was found to be a pocket or layer of silty clay or loam occurring in the heavy gumbo clay. The action of the frost in these soils was observed in the field. After freeze-up in the fall of 1941, moisture contents were determined in the gumbo clay and silty clay layers. They were respectively 30 and 24 per cent. The frost penetration at that time was from 6 to 12 in., effectively eliminating the possibility of precipitation and run off water entering the soil. The same locations were examined in February 1942 when the frost penetration was 5 ft. At that time the silty layers were found to be laminated with fine ice layers 1/16 in. thick and spaced from 1/4 to 1/2 in. apart. The moisture content of the heavy clay remained at 30 per cent, but the ice laminated silty clay layer had increased to 39 per cent moisture. This is an increase, due to frost action, of 15 per cent moisture and for this soil changes it from a plastic to a liquid state. The moisture contents in the layers were confirmed by samples taken from the silt extruded from the frost boils occurring the following spring. These averaged 35 per cent. The heavy clay soils while frozen showed no indication of ice segregation or moisture increase.

The physical phenomena on which ice segregation is dependent, are as follows:

1. The ability of water particles in soil pores of relatively large diameters to freeze at, or slightly below, normal freezing temperatures.
2. The ability of water in the fine soil pores to resist freezing until the temperature is reduced to a point below that at which the water in the large pores freezes.
3. The ability of water particles, when freezing in the large pores, to draw to themselves unfrozen water from the finer capillaries, thus causing increases in volume.

The critical factor in the soil, which determines

whether ice layers will develop, is the pore space. The pore space must be small enough to have capillary properties. It must be large enough to have rapid capillarity and a flow from the small pores to the freezing water in the larger pores. There must be sufficient water reserve that the water from the fine pores may be replaced.

The soil condition described previously satisfies these requirements. The heavy gumbo clay has high ultimate capillarity, but resistance to flow is so great that water particles tend to freeze in the dispersed state. The layer of this clay below the silt acts as a reservoir while freezing action takes place in the silt layer. The pore space in the silt layer maintains the nice balance between capillary rise and flow necessary to build the ice layers.

From the description of the action, it is obvious that drainage would not be an effective remedy unless it were possible to lower the water table to such an extent that the gumbo layer could not furnish the necessary moisture for capillary action in the silt. In the level, poorly drained, areas adjacent to Winnipeg, improved surface drainage helps but cannot be depended on as a solution. A wet fall will leave the heavy clay in a saturated condition with water standing in the ditches. The only satisfactory solution is in identifying the frost heaving materials and removing them from the grade to a depth below frost penetration, or to such depth that the heave and subsequent boil action does not affect the surface. From observations made to date on frost boils, bituminous mats and base courses have been completely destroyed by frost action in silt layers at 30 in. depth below the surface. In none of the boils examined has the depth of silt layer been greater than this. On a concrete pavement, no detrimental frost action has been observed on a section where the silt is from 40 to 60 in. from the surface. On another concrete section, there has been heavy cracking of slabs over silt pockets from 30 to 35 in. from the surface. Because of variables in pavement design on the various sections, it is difficult to draw sound conclusions from these comparisons; however a standard has been adopted for new construction requiring removal of frost heaving soils to 4 ft. below grade line. The backfill used is a suitable clay soil. Backfills of permeable materials are not used because of the difficulty in obtaining drainage from the pockets. On a recent project, this standard required subcuts from prairie elevation, before starting embankment, of 2785 cu. yd. per mile. During construction of the embankment, a soils inspector was employed to ensure that silty material occurring in the excavation area was not placed in the embankment but used for flattening the slopes.

TABLE II  
OBSERVATIONS OF DENSITY AND MOISTURE CONTENT ON HEAVY CLAY SUBGRADE

Date	Dry density lb./cu.ft.	Moist. cont. %	Conditions
Oct. 1942	101	20	Embankment completed.
June 1943	90	27	The embankment was not protected with any type of surfacing over the winter.
Sept. 1943	91	27	Observations immediately preceding construction of the base course.
June 1944	98	24	The increased density is due to compaction by trucks hauling base course material.

From the experience to date, the most troublesome frost heaving soils range from a fine blow sand (100 per cent passing No. 10 mesh and 5 to 15 per cent passing No. 200 mesh) to silty loams and clay containing less than 10 per cent retained on a No. 10 sieve and less than 35 per cent clay.

As a maintenance problem on surfaced highways, the removal of silt pockets presents a difficult operation from the standpoint of cost and inconvenience to traffic. Some highway departments have been treating frost boils with chlorides, but little information is available on the effectiveness of the treatment, the quantity of chloride required, the duration of the treatment and the best method of application. In laboratory experiments at Purdue University, the addition of 1 per cent (by weight of dry soil) of chloride to silt soils prevented the formation of ice lenses, and the Highway Research Board has formed a committee to study this treatment. A number of state highway departments are co-operating in the study with experimental sections. In Manitoba, an experimental section has been under observation for two winters but, to date, results have not been entirely satisfactory. On this section, holes were drilled through the surface at spacings varying from 8 to 4 ft. centres and filled with 30 lb. of chloride. The section with holes at 4 ft. centres was better than the untreated portion, but some failures occurred. The experiment is being repeated and qualitative tests for chloride will be made on soil samples at various spacings from the chloride holes to determine the migration of the chloride. This treatment is well worth investigating as a possible solution for a difficult maintenance problem.

#### SURFACE DESIGN

In the original condition surveys undertaken by highway departments, it was early seen that an expensive high type of surface was poor economics and no solution for a poor subgrade. Unfortunately, within small limits, it is impossible to pick and choose subgrades. The engineer has to make the best of the soil conditions encountered. The obvious solution was to insert a foundation layer, the base course, on the prepared subgrade. The purpose of the base course is to distribute the load to such a degree that the subgrade is not overstressed. The base course must be a material of greater bearing than the subgrade soil and be constant in its support, i.e. a "stabilized" material which will not lose support through moisture absorption or frost action. Any material which supplies this function is suitable for a base course, and the action of compacting the subgrade is in itself a process of stabilization. The stabilization methods in use and the resulting types of base courses are numerous, and in this paper only a few with which the department has had experience, or has been investigating, will be mentioned.

#### STABILIZED GRAVEL BASE COURSE

This is the most common type of base course and is essentially a combination of granular material and binder soil. The granular material supplies internal friction, and the binder soil gives the cohesion which holds the granular particles in close contact so that the mass develops the maximum shear strength. This is the old practice of adding gravel to clay subgrades and clay to sand subgrades. With the advent of soil testing and the correlation of the tests to service records, it was soon realized that the grading of the combinations of granular and cohesive materials and the type of cohesive fraction of the mixture was most

important. Years of observation have resulted in the determination of grading curves and limits for the physical properties of the soil fines fraction to give best service. In rare cases, the subgrade is in itself a stable material and all that is required is compaction. Where the subgrade is a light soil, satisfactory for binder, careful scarifying and addition of granular material will provide the required base. However, the addition in uncontrolled quantities, of granular material to a clay subgrade unsuitable for binder will not produce a stable mat. On No. 1 Highway, 4000 cu. yd. per mile of relatively clean gravel were added to a heavy clay subgrade. This material was worked into the grade by traffic and scarifying. As a gravel road, the surface was satisfactory. This section was subsequently surfaced with a 4 in. bituminous mat. After two years, failures occurred and examination of the failures showed that the gravel crust varied in thickness from 1 to 4 in. at a moisture content of 5 per cent. The subgrade clay was at a moisture content of 30 per cent. Further examination showed gravel particles as deep as 18 in. but very little of the granular material which had been added was acting as an effective base course. In contrast, west of this section the subgrade soil is a sandy clay. The construction followed the same procedure, and at present there has been little maintenance. The examination through the grade showed the gravel portion to be confined to a layer 4 to 6 in. thick on top of the subgrade, well knit together and supplying real support. On clay subgrades, the base course should be a graded material including fines which will compact to form a mat. With the use of porous, open graded gravels or crushed stone, the clay subgrade works into the voids and acts as a lubricant destroying the internal friction on which this type of base depends for strength. The thickness of the base is reduced by the depth of clay penetration. This fact holds for the case of stage construction in which the granular layer is first used as a surface and, later, a higher type surface is constructed utilizing the granular layer as a base course. The use of the open graded gravel or crushed stone base is not practical in stage construction unless subgrade penetration does occur. The material containing no cohesive fraction cannot develop the internal friction unless confined and would displace under traffic, thus causing a loose surface.

As a base course on which some type of surface is constructed immediately, the open graded material is confined so that it develops its internal friction. To obtain the confining effect necessary, these bases have been trenched into the subgrade. This is poor practice as the base course becomes a reservoir for the collection of water seeping through surface cracks or at the edge of the surface treatment. The presence of this moisture softens the subgrade, further reduces the supporting power, and may cause serious frost heaving. These trenched sections can be improved by drainage through the shoulder by means of pipe, but to be effective the subgrade has to be perfectly shaped and remain so, and the pipes require constant maintenance. The best section is obtained by carrying the porous layer out to the slopes and surfacing the shoulders with a stabilized gravel layer. This extends the confining effect out beyond the edge of the pavement where the load occurs.

In the stabilized gravel base, the grading from coarse to fine provides a dense material with a minimum of voids. This material compacts to form a mat on the subgrade and there are no voids for the clay to penetrate. The cohesive fraction holds the granular particles together so that the shear strength can be developed

even in an unconfined state. Any confining influence of the surface, as occurring in open graded bases, enhances the strength of the stabilized mat. This type of base is ideal for stage construction as, by the use of deliquescent chemicals to retain moisture content, it will provide a good surface for light traffic. It is important to note that the use of the chemicals themselves will not stabilize a gravel surface. The chemicals will only retain the moisture so that the water films on the cohesive of the mix will be able to hold the granular material together. The surface mat must be properly graded and contain suitable soil fines for chloride treatment to be effective. The main criticism of this type of base is that, because of the fines contained, the base is subject to capillary action. The degree of capillarity is limited by the grading and the plasticity index of the mix. Under adverse conditions of a very wet subgrade, moisture content 30 per cent, the stabilized base will reach a moisture content of 4 per cent at which its shear resistance is low. It is difficult to obtain a comparison of the strength of the stabilized gravel at this moisture content, to the strength of the non-cohesive granular material. In comparative laboratory tests, the non-cohesive bases show to best advantage because, due to laboratory limitations, the non-cohesive material is rigidly confined in a container, a condition which is not duplicated on the road with the plastic subgrade and flexible surface. In addition, it is possible to waterproof the stabilized mixture by adding a small percentage of bitumen to the mix.

On Provincial Trunk Highway No. 1 West, a stabilized base course, waterproofed with an admixture of 1 per cent SC-1 asphalt, was constructed in 1939. The subgrade on the 39-mile section varies from a heavy clay to a fine sand and the moisture content in the base course has ranged from 1.6 to 3.0 per cent, averaging 2.3 per cent. At this moisture content, the base has a real shear strength even in an unconfined state. The Quebec Highway Department has used lignin (waste sulphite liquor) as an admixture in stabilized bases. In Manitoba, some laboratory experimental work has been done on lignin admixtures. From this work it appears that the addition of lignin gives an increased strength to the mixture in a dry state but, as it is soluble in water, the lignin has no water-proofing effect. At the normal moisture content of 4 per cent, the lignin treated mix showed no increase in strength over the untreated mix. The lignin admixtures may, as do the calcium-sodium chloride admixtures, have a beneficial effect on stabilized mixes, used as surface courses, in aiding moisture retention and thus preventing loss of fines. From our laboratory compressive strength determinations and field observations, however, there does not seem to be any particular advantage in these admixtures for base courses.

In the base courses described, the principle has been to supply granular material in order to provide internal friction. Other base courses are of a type in which a relatively small percentage of a stabilizing agent is added to the soil in place to change its characteristics. The stabilizing materials most commonly used are cement, asphalt, asphalt emulsions, tar, and resins. In Manitoba, these processes have not been used to date, but the development has been studied for possible future use. A brief description of some of the common treatments is given below.

#### SOIL CEMENT STABILIZATION

This type of stabilization is only suitable for certain types of soils. The limits of the soils as recommended by the Highway Research Board are as follows:

#### Grain Size

Passing No. 4 sieve . . . . . at least 50%  
Passing No. 40 sieve . . . . . 15-100%  
Passing No. 200 sieve . . . . . not more than 50%

#### Physical Tests

Liquid limit . . . . . not more than 40  
Plasticity index . . . . . not more than 18

The cement requirement ranges from 8 to 14 per cent by volume of soil and is determined by standardized tests—consisting in wetting and drying, and freezing and thawing—on cylinders at various cement contents. The cement and pulverized soil are mixed in place and water added to bring the mixture to the optimum moisture for compaction.

#### BITUMINOUS AND TAR STABILIZATION

The process in this type of stabilization consists of mixing cut back asphalts, asphalt emulsions or tar, into the subgrade. In cohesive soils, the action is to water-proof the material from capillarity. In granular soils, it provides cohesion. The soil is pulverized and water added to a predetermined optimum, usually lower than the standard test. The wet mixture is sprayed with asphalt or tar thoroughly mixed and compacted. The percentage of bitumens required is determined by stability tests and water absorption tests on samples containing various percentages of the stabilizing agent. The percentage varies greatly and is critical, as an excess will greatly reduce stability. This type of treatment is confined to loams and fine sand, the sands frequently requiring the addition of filler. Its use in heavier soils requires high percentages of bitumen and it is almost impossible to obtain the intimate mixture required. This type of stabilization is limited to areas where a hot, dry construction season can be depended upon, as the mixture of soil, water, and asphalt is slow to cure. In North Dakota it required six weeks for a 4 in. base to cure sufficiently for construction of the surface.

#### RESIN STABILIZATION

The water-proofing of soils with resins is a relatively new process. It has been used since the war by the U.S. Army for parade grounds and, it is thought, on some airports overseas. Some work was done on this treatment by one of the southern highway departments but little information is available on its performance. In the Manitoba Department laboratory, experiments were made with the resin Stabinol. One per cent by weight of dry soil, of the powdered resin added to loam soils was found to be very effective in water-proofing. No capillary action was observed in a treated sample over a period of six weeks, while complete slump of untreated samples occurred in one hour. In heavy clays treated with 2 per cent Stabinol, some capillarity and swelling of soils did occur. The use of the resin treatment will only be applicable to soils with low shrinkage characteristics. In order to compact the treated soil water must be added, and, to develop supporting value, the mixture must dry out during a curing period. From the observation of treated laboratory samples of clay, the cracking during the evaporation of moisture would destroy a base course.

The selection of the type of base course to be constructed is largely a matter of economics. In Manitoba, because of the available deposits of gravel the development has been towards granular stabilized bases. For post-war construction, however, the balance between shipping large quantities of gravel and using small quantities of the relatively expensive stabilizing agents will have to be made in selecting the type of base course.

As the mileage of highway construction increases and gravel resources diminish, the chemical and bituminous types will be more important.

#### DESIGN OF PAVEMENTS

The most controversial point in highway design at the moment is the relation between load, surface, base course, and subgrade. This is a straight problem in soil mechanics as the governing factor is the supporting value of the subgrade. The magnitude of the load is governed by law, and the surface and base course must be designed to ensure that the bearing value of the subgrade is not exceeded. From the advances made in measuring structural strength of soils in foundation engineering, the problem does not appear too difficult. To use these strength measurements in a design correlating load, surface, base and subgrade is, however, a most difficult problem as the distribution of the load to the subgrade and action of the subgrade in failure is complex. In addition, the relatively shallow depth involved in highway design is subject to variations due to weather which do not occur in foundation design. In studying this problem, some investigators have applied the Boussinesq theory of stress distribution in soils. This theory has been generally adopted for foundation work, and is based on the assumption that the soil is homogenous and semi-elastic. Actual stress measurements have indicated that the distribution given by this theory is reasonably accurate for foundations where the load is uniformly distributed by a rigid footing directly to the soil. In highway design the influence of surface and base layers, of entirely different rigidity, between the load and the subgrade has not been satisfactorily determined. These factors have limited the use of structural strength measurements of soil in design.

The practice in most highway departments is to adopt standard designs of surface and base course for the various soil types and conditions existing in the area. These standards are based on their experience as to what has been satisfactory in the past. The development of the soil tests has permitted more rational use of the experience in that the governing factor of the design, the subgrade soil, can be identified. With this identification, the knowledge and practice of other states and provinces can be evaluated for use in the particular soil conditions and climate concerned.

#### FLEXIBLE PAVEMENT DESIGN

Several states have adopted arbitrary tests on subgrades to use as a comparative rating of subgrade support. These tests are usually a measurement of the resistance to penetration of a point or, in field bearing tests, of the load required to produce a standard penetration of a steel plate. The California Highway Department has developed, and had in use for a number of years, a comparative rating test. This test rates soils on the basis of resistance to penetration of a 3-sq. in. plunger on a sample confined in a 6 in. diameter steel mould. The value is expressed as the ratio of the load determined on the sample to the load required for equal penetration in a sample of standard crushed stone. Curves have been developed, based on the California experience, for highway wheel loads relating the bearing ratios to thickness of surface and base course required. This test was adopted with modifications by the United States Engineering Department for the design of the many airports constructed during the war emergency. This test was adopted as being the most reliable, and, by extra polating from California highway experience, curves for wheel loads up to 75,000 lb. were developed.

From tests in our laboratory using the U.S.E.D. design for highway wheel loads, the total depth of base and surface required on gumbo clay is greater than 30 in.; in fact it runs off the prepared charts. This base course would not necessarily be all granular material, but selected borrow could be used in the lower layers and progressively better material towards the surface. The design requires a minimum 80 per cent California bearing ratio for the top 6 in. which would be a confined crushed stone or stabilized gravel. The California design is convenient for practical application; it is based on a sound soil mechanics concept in permitting the base course material to decrease in quality as depth from the load increases, but the method of rating materials is subject to criticism. Samples to be tested are compacted and soaked in water before determining the bearing ratio. This condition of test would be suitable for some particular condition but it is not applicable to general design. From our field observations this condition of saturation rarely occurs in Manitoba and, thus, the test would have to be modified for our use.

In the field bearing test, the values obtained are applicable only to the moisture and density conditions under which the test is conducted. The conditions existing at the time of the test may alter when the subgrade is surfaced and put into service. The use of a rigid plate in these bearing tests is also open to criticism as, on a cohesive subgrade, stress concentrations occur at the perimeter of the plate causing failure in punching shear. Actual pavement failures occur through deflection of the surface due to consolidation and plastic displacement of the subgrade when overloaded. If the test does not produce the same type of failure as the wheel load, it is not a satisfactory method of comparison.

The use of the various bearing tests by numerous highway organizations is compiling a wide range of data which will be valuable in future development of a rational design. The general practice at present is based on experience. The results of a co-operative study by the Highway Research Board, Bureau of Public Roads and Asphalt Institute on state practice in flexible pavement design, has been published in a wartime bulletin, December 1943. This bulletin gives recommended thicknesses for base and surface, under 10,000-lb. wheel loads, for each soil type in the Bureau of Public Roads classification.

#### RIGID PAVEMENT DESIGN

There is an impression among engineers that any surfacing problem is automatically solved with the construction of a concrete pavement. This is based on the rigidity of the slab giving a much higher distribution of load to the subgrade than is possible in a flexible surface. It does not follow that subgrade investigations can be ignored in concrete paving design. On the contrary, preliminary surveys are all the more important as trouble from poor compaction and failure to remove frost heaving materials is very expensive to correct once the pavement is laid. The rigidity, while providing load distribution, introduces other problems such as cracking occurring in slabs, which reduces the bearing area and increases subgrade pressures. With the rigid material, shrinkage cracks and stresses from temperature changes require provision of joints in design and constitute planes of weakness for possible failure. The condition is aggravated by surface water entering the subgrade through the joints and reducing subgrade support at the weakest plane.

The design of concrete pavements, as most other

phases of highway work, has developed from experience rather than mathematical theory. The experience has been supplemented by experimental test roads in which varying cross-section and depths of slab were used. Most highway departments have adopted certain standard sections of thickened edge or uniform slab design on the basis of what has been satisfactory in the past or is in use in other states. Where subgrade soil conditions are particularly poor, the usual procedure is to supplement the standard section with a base course. This has been found good practice on expansive clays to prevent mud pumping and distortion at joints. On clay subgrades, the California Highway Department specifies a 12 in. base course, with a minimum bearing ratio of 20 per cent under concrete pavements. On Manitoba highways 9-6-9 and 10-7-10, concrete sections have been used on clay subgrades without base courses. These sections have been satisfactory but the slabs are well reinforced with bar mats and all joints provided with dowels for load transfer between slabs. The reinforcement is insurance to hold the slab together if cracking develops.

Design formulae for concrete slabs do exist but, in these formulae, a value for the modulus of subgrade traction  $K$  is required for solution. Unless this subgrade value is determined, the use of the formula is based on an assumption. The inability to evaluate  $K$  has limited the use of design formulae. In airport design, where no past experience was available on the tremendous wheel loads to be provided for, evaluations of  $K$  had to be used and the development of field

bearing tests on this work will possibly clear up many uncertainties.

In selecting the type of pavement, with thorough soils investigation, a satisfactory design of either rigid or flexible type may be made. The selection rests on the comparative cost of the high type rigid surface to the cost of the light bituminous surface and heavy base course. The cost, in turn, is governed by the availability of materials. In poor soil areas where aggregates are not available, less material is required for concrete pavement and the cost is lower. On the other hand, for concrete, the type of aggregate is critical while, for base courses, gravel containing shale, clay and other materials making it unsuitable for any other purpose may be used. These material details are usually the governing factor in the type of design selected.

## CONCLUSION

In this paper, the development of highway design has been stressed as depending on past experience. This is an excellent criterion but it only holds for the conditions of service under which the experience was gained. In the future, loads and traffic conditions will change and to build only to present standards is not sufficient. In order that design for future traffic may be made, work on soil mechanics must progress in determining stress distributions involved in highway loadings. A wonderful opportunity is now available in this field through observations on the recently constructed airports.

## DISCUSSION

W. F. RIDDELL, M.E.I.C.<sup>1</sup>

Referring briefly to Mr. William's paper regarding the formation of ice in silt layers, the flow of moisture to the ice lenses forming in the silt is probably other than capillary flow. The adhesive and cohesive films of water surrounding and connecting the individual soil particles provide a most probable channel of flow at temperatures considerably below freezing and may even operate after apparent freezing of a considerable depth of "gumbo" below the silt layer.

R. M. HARDY, M.E.I.C.<sup>2</sup>

Mr. Williams' paper has been of particular interest in its description of the procedure being followed in Manitoba in dealing with soil problems on highway construction. The paper covers a lot of ground in a comparatively short space. A writer on soil mechanics making such an attempt sets himself a very difficult job. It is always comparatively easy to write a rather critical discussion of such a paper.

The following comments are submitted with a full realization of this point and are not intended to detract in any way from the merit of the paper.

In the section dealing with structural strength tests, the use of the term "settlement tests" to describe the "consolidation test" is unfortunate. This test merely attempts to determine the consolidation characteristics of a soil for use in Dr. Terzaghi's theory of consolidation. The process of consolidation is only one of several factors that may govern the actual settlement of a structure or embankment.

<sup>1</sup>Associate Professor of Civil Engineering, University of Manitoba, Winnipeg, Man.

<sup>2</sup>Associate Professor of Civil Engineering, University of Alberta, Edmonton, Alta.

Mr. Williams in his section on shear tests deals with the "direct" shear test. It will be unfortunate if the impression is created that some of the disadvantages of this type of test are inherent in all types of shear test equipment. There has been more work devoted to the development of shear test equipment for soils than to any other single soil test. Space will hardly permit even listing the various types that have been used. Two disadvantages inherent in the direct type of shear test are of particular significance. First, the method of holding the sample produces a non-uniform distribution of stress in the soil, which is quite indeterminate. This is most objectionable when a soil is tested that shows the characteristics indicated in his Fig. 1, in which there is a large decrease in shearing resistance after a maximum value is reached. All parts of the sample do not reach the maximum shearing stress at the same time and so what is called progressive failure results. Second, the exact stress conditions on an element of soil within the sample are never accurately known and cannot be controlled.

Both of these disadvantages are overcome in the type of shear test equipment known as the triaxial compression device. In a test run with this equipment the stress conditions are known, they can be controlled, and deformation of the sample can be measured with reasonable accuracy. Moreover, volume changes can be measured and, for cohesionless soils, critical densities can be determined. These latter are factors of considerable importance under some circumstances, and are not capable of determination in the direct shear test. The claim is frequently made that the triaxial test requires a much greater time than the direct shear test. In the Soil Mechanics laboratory of the University of Alberta we have run close to 200

"quick" triaxial shear tests on cohesive soils in the past three years. The average time per test is about one hour to secure the same data as one gets from a direct shear test.

It should be noted that Mr. Williams' comments regarding ultimate shear strength, rate of application of load and so forth in shear tests apply only to cohesive soils. They are not important factors within practical limits for tests on cohesionless soils. It should also be noted that the large drop in shear strength after reaching a maximum stress as indicated in his Fig. 1 is a rather extreme example. Such a large difference does not usually occur.

We are unwilling to agree with Mr. Williams that "there is little possibility of a subgrade drying out to develop shrinkage". There have been many examples in the west of damage to buildings due to soil shrinkage. Moreover, the writer knows of one case of a concrete runway recently constructed, for which cracking can only be explained on the basis of subgrade shrinkage. Until observations have been continued over a drought period, it is considered unwise to come to such a conclusion.

This writer is puzzled by Mr. Williams' Fig. 4 and his discussion pertaining thereto. These seem to be at variance with the curves in Fig. 8, of Mr. Peterson's paper\*. Mr. Williams' comments on this would be appreciated.

The section on Frost Boils is of particular interest. Mr. Williams explains the physical phenomenon of ice segregation along the same lines as C. A. Hogentogler in his well-known book "Engineering Properties of Soils".

The pioneer research on the mechanics of frost action was done on this continent by Dr. Stephen Taber of the University of North Carolina. His results were first published in the 1929 and 1930 volumes of the *Journal of Geology*. His is the accepted theory in Europe as well as on this continent. Benkleman and Olmstead of the Michigan State Highway Department have presented an alternative hypothesis applying to conditions with a fluctuating frost line where the surface is prevented by adjacent frozen ground from settling as the ground thaws from below.

Hogentogler's presentation differs from Taber's hypothesis in that, instead of the drops of water in voids of varying size having different freezing temperatures, it is the water adsorbed as thin films on the surfaces of the soil particles that has a lower freezing point than the water occupying the bulk of the void spaces. These adsorbed films are of the order of only a comparatively few layers of molecules in thickness. They are thus of a different order of dimension than average pore diameters. No physicist will admit a difference in freezing temperature for water at the centre of void spaces of different sizes in a soil.

Mr. Williams' conclusion for his frost boil example that the gumbo clay below the silt pocket acts as a reservoir to supply water to the silt is not a reasonable conclusion from Taber's hypothesis. The ice lenses can only form in the silt at a rate consistent with the flow of water through the clay. Moreover, for the same rate of penetration of the frost line precisely the same thickness of ice lenses would form in the clay as in the silt. To get ice segregation in the silt and not in the clay would require a slow penetration of frost

line through the silt and a much faster penetration through the deeper layer of clay, a thing quite inconsistent with all published ground temperature readings in frost areas. Taber's theory leads to the conclusion that the source of water for the growth of ice lenses is the silt bed itself. That is, it is either water bearing or the water is drawn from unfrozen silt adjoining the frost boil. This conclusion may suggest an alternative method for correcting the frost boil condition.

The factor of rate of penetration of the frost line is exceedingly important. It is the principal reason why the effects of frost action vary so widely from year to year. In a "severe" winter, with a cold spell early in the winter, the frost line penetrates relatively fast, resulting in very thin ice lenses near the surface. For this reason, contrary to popular opinion, our comparatively "severe" winters in western Canada result in less damaging frost action than ordinarily occurs in many parts of eastern Canada and the eastern States.

Sieve analysis, as a method of identifying soil types particularly susceptible to frost action, may be quite misleading for some soils. Dr. A. Casagrande after considerable study arrived at the conclusion that the critical grain size is about 0.02 mm., a size much smaller than the 200 mesh sieve. He has stated that considerable ice segregation can be expected in non-uniform soils containing more than 3 per cent, and in very uniform soils more than 10 per cent of grains smaller than 0.02 mm. It is of some practical importance to note that a well graded bank run gravel may be susceptible to frost heaving with a silt or clay content of only 3 per cent, a quantity of fine material simply making it appear as a "dirty" gravel.

Preliminary tests in our laboratory treating a silt with aerosol, a wetting agent similar to stabinol, show it is quite effective in preventing ice segregation in the zone of capillary saturation.

In conclusion we would like to point out that there are many problems involving frozen ground that still need investigation. Vast areas in northern Canada are underlain by permanently frozen ground—"permafrost". The stability of foundations for runways and buildings on permafrost is a matter worthy of some research by Canadians.

I. F. MORRISON, M.E.I.C.<sup>3</sup>

It is noted that no references are given in Mr. Williams' paper to the various sources from which a number of the statements have perhaps been drawn and it is, therefore, presumed that the author has presented them in modified or restated form and therefore assumes responsibility for their validity and accuracy.

In Fig. 1 of the paper, it is difficult to see the connection, on the graph, between the vertical line labelled  $S = P \tan \phi + C$  and the shear-stress deformation curve. It is suggested that it would have been better to omit the equation. In reference to Fig. 4 of the paper, the author refers to "the relation between the zero air voids curve and the peak density of each curve". It does not appear clear just what is meant by "relation" nor is any explanation offered as to whether this is so for all cases. For it would appear that this is intended to be a generalization.

In the section on Frost Boils, the part which describes the physical phenomena appears to contain some obscurities which the author might well clear

\*Soil Mechanics as Applied to P.F.R.A. Problems with Special Reference to the Proposed St. Mary Dam, by Robert Peterson, J.E.I.C., p. 274.

<sup>3</sup>Professor of Applied Mechanics, University of Alberta, Edmonton, Alta.

up in subsequent discussion, and one gets the impression that perhaps he has attempted to deal with a rather involved subject by methods not adequate for a carefully written explanation of the physical phenomena with which he is dealing.

What, for instance, is meant by "water particles"? On what evidence does the author base his statement that water in the fine soil pores resists freezing? And just what is meant by the freezing of the water particles in the dispersed state?

Such statements do not appeal to the writer as conducive to clear thinking. Perhaps the author can set him right on these points.

J. A. WILSON, M.E.I.C.<sup>4</sup>

Mr. Wilson felt that a knowledge of soil mechanics was of vital importance to many civil engineers engaged in highway and airport work, and its discussion at the meeting had been most timely. He traced the development of Canadian airports through the various stages of the turf field, which was unusable in wet weather, to the pavements laid for the trans-Canada service on the main city airports, and its enlargement in the Commonwealth Air Training Plan.

The present pavements were built to carry only the weight of lighter types of aircraft up to, say 30,000 lb. The future pavements must provide for all-out weights of up to 90,000 lb. for domestic services and, in the case of trans-oceanic service, up to 140,000 lb. This means that the pavement on many of the principal airports in Canada must be strengthened in the near future. It will also require to be lengthened in many cases. The expenditure would inevitably be heavy, running into several million dollars across the Dominion. It was essential, before construction work started, that there should be a sure basis on which to calculate the bearing strength of the airport soils. The pavement was only as strong as the sub-soil on which it rests.

Reference had been made in the discussion to the well known California formula which apparently was the basis on which United States engineers were working at present. The engineers of the Department of Transport are not prepared to accept this formula as a satisfactory basis for practical work, though it might be satisfactory for conditions existing in California. Experience had proved that, under Canadian conditions, it did not provide a satisfactory basis for practical application.

Further study and research on this important problem was an urgent necessity and Mr. Wilson was delighted that so much attention was already being paid to it, and that so much practical work had been done by the highways departments, the Canadian universities and other bodies.

The engineers of the Department of Transport would be glad to contribute from their practical experience in the building of the numerous airports in all parts of Canada which had been constructed during the war, and would be prepared to cooperate with other organizations in any programme of research which could be organized.

#### THE AUTHOR

The paper presented under the title suggested by the Programme Committee was rather all embracing

<sup>4</sup>Director of Air Services, Department of Transport, Ottawa, Ont.

and it was necessary to touch on some subjects more lightly than their importance warranted. Some statements and opinions made in the paper are naturally drawn from a number of publications and are presented as the author's summation of his reading. As such they are subject to criticism and it has been received.

The critical discussion is fairly well confined to structural strength of soil, compaction, and frost action, and I propose to reply by subject rather than individual discussions.

#### STRUCTURAL STRENGTH TESTS

In reply to Professor Morrison's query regarding the vertical line in Fig. 1 of the paper, it might be explained that the line is dimensional indicating that the magnitude of the shear is equal to  $P = \tan \phi + C$ . As far as I know this is quite correct but as Professor Morrison is far more conversant than I with the theory of shear stress in soils it may be inaccurate.

Professor Hardy has pointed out that the disadvantages regarding shear tests stated in the paper do not apply to all types of shear test equipment or to cohesionless soils. The experience of our department in this work is practically negligible and the direct type shear machine was selected for a start because it is a simple piece of apparatus, it could be made to fit the standard size laboratory samples (4 in. dia.) used in other equipment such as compaction, capillarity, and penetration tests, and the relatively large diameter sample would permit testing samples containing coarse particles. The triaxial compression device referred to by Professor Hardy is generally accepted as being a more accurate type of test, but most equipment in use will only handle samples up to 2½ in. dia. From such information as I have obtained, the ratio of length : diameter for triaxial test samples should be 3:1 necessitating a very elaborate machine for triaxial tests on the 4 in. sample.

#### COMPACTION DATA

My statement with regard to the compaction curves in Fig. 4 is, from the discussions, obviously not clear. The relationship between peak densities for each optimum and zero air voids line referred to is that the percentage of air voids in each case would be the same. As stated in the paper it was a generalization and as such is rightly to be criticized as I have no data to substantiate it. In fact the compaction tests shown on Fig. 8 of Mr Peterson's paper show differently. It would have been more correctly stated as a supposition on my part.

#### FROST ACTION IN SOILS

My statement of the physical phenomena, on which ice segregation is dependent, was arrived at from reading publications of C. A. Hogentogler, H. F. Winn, F. B. Mullis, V. R. Burton, A. C. Benkleman and Stephen Taber. I cannot shift the responsibility for the statement on to any of these authors as, what I have stated is my interpretation of their information which I believed fitted the soil conditions and frost action I had observed.

My interpretation does not satisfy either Professor Morrison or Professor Hardy, and the latter has been kind enough to point out in his discussion where I have erred.

# METALLURGY AND MACHINE DESIGN\*

H. L. LEXIER, Jr.:E.I.C.

*Metallurgical Engineer, Physical Metallurgy Research Laboratories, Metallic Minerals Division, Bureau of Mines, Mines and Geology Branch, Ottawa*

**SUMMARY**—Modern metallurgy offers many methods of overcoming objectionable stresses in structural or machine parts without having to resort to large factors of safety or "over-design". These methods are reviewed and a brief description is given of the equipment used nowadays for the experimental determination of stress distribution.

In the past, structural and machine design was conducted by employing many empirical formulæ in conjunction with large factors of safety. Modern machinery with its high speeds and high loads has caused us to seek more accurate and more economical means of designing and testing such machinery. In particular, we must be certain that once the parts are put into service there will be neither a design nor a metallurgical failure.

Formerly, much uncertainty existed as to the stresses set up in service and the properties of the materials used. Consequently, large factors of safety (or factors of ignorance) were introduced, with resultant large increases in weight.

We know today that it is not necessary to use expensive high-strength alloy steels or greatly increased sections to cover up for lack of knowledge of what a part will stand in service. It is now possible to chart accurately the distribution of stress over an entire component, or most engineering structures, whether it be made of steel, aluminium, magnesium, or some other material. Consequently, weight can be saved, or cheaper materials used, in the manufacture of any structure because it is possible to specify the proper amount and distribution of material in any part to make it the strongest and most durable design. It has always been realized that the shape of any part and the material from which it is made go hand in hand in determining its performance in service.

The purpose of this article is to discuss briefly some of the problems—generally in the scope of the metallurgist—which confront the designer, and at the same time point out how many of these problems may be overcome by co-operation with the metallurgist. Obviously, few designers are competent metallurgists and, of course, the reverse is also true; thus, the need for this co-operation is stressed. Furthermore, it is desired to present a brief description of several of the new instruments and machines now available to the designing and metallurgical engineers which enable them to develop and prove new designs with an accuracy never before possible. These two subjects, it may be seen, are closely allied.

## FATIGUE

Despite the fact that improvements in the shape of a part can be accomplished, machine parts which are subjected to repeated loads may fail in fatigue unless the factors which are known to reduce and to extend fatigue life are thoroughly understood. Failed parts are usually returned to the metallurgist for examination, with the implication that the part failed because of a metallurgical defect. In the great majority of cases, failure was attributed to fatigue and the metal was found to be quite sound. Thus the study of fatigue has been thought to be a metallurgical function. In reality, it should be a joint responsibility

of the metallurgical, design, production, and inspection departments. Their understanding of the phenomena of fatigue will serve to circumvent failure of parts from this cause.

Although the over-all design of a part may be satisfactory, it is the small, often overlooked features of design which cause failure. Let us briefly examine some of the factors which may cause a crankshaft, a railroad axle, a spring, or a gear, to fail after a relatively few hours of service.

The life of rapidly moving machine parts is greatly reduced by decarburized, rough, scratched, or nicked surfaces; poorly designed fillets; sharp corners; keyways, etc. These sharp edges act as points of local stress concentration, and thus the ability of the metal to withstand a repeated stress is lowered considerably even though the part may have been designed on the basis of the endurance limit<sup>1</sup> of the material. The factors mentioned above cause the local stress to rise above the endurance limit, and failure results in a relatively short time. Highly stressed springs, in particular, are sensitive to surface imperfections, and formerly springs were very carefully polished. Now, however, shot-peening is replacing this treatment with remarkable results.

It has been generally accepted that parts whose surfaces are in a state of residual tensile stress have a lower fatigue strength than those which are unstressed, and that when these surfaces are in a state of residual compressive stress the fatigue strength is raised to a very marked degree.

Surface tensile stresses are introduced by many factors. The heat which is created by machine polishing, milling, turning, or grinding is often sufficient to leave the surface in a condition of tensional stress. The surface of a gear tooth which has been improperly ground is often left in a state of tensional stress. Fatigue cracks will form on the side of the tooth loaded in tension since this stress is added to the residual stress. Soon the tooth will weaken and the gear fail, not because of poor design, but by failure to consider what may happen to the gear during the time it ceased to be "a blueprint" and became an integral part of a moving mass of machinery.

There are, of course, many excellent ways of introducing surface compressive stress or converting existing surface tensile stresses to compressive stresses. The most widely used method is that of shot-peening<sup>2</sup>, which consists of peppering the surface of the part with hundreds of small shot which "cold works" the metal. Only a thin layer near the surface is affected and it is left in a state of compressive stress. Crankshafts, connecting rods, springs, gears, axle shafts, and many more parts too numerous to mention have had their fatigue life extended by shot-peening. Shot-peening often eliminates grinding and polishing. It also serves to smooth out surface imperfections, etc., and thus offsets the stress concentrations due to those causes. More and more applications are being found for this treatment, and designing engineers and research labor-

<sup>1</sup>Endurance limit is the highest stress which will not cause failure no matter how often repeated.

<sup>2</sup>Other methods are: cold rolling, cold drawing, nitriding, and other types of case hardening.

Fig. 1—Photograph of Avery pulsator fatigue tester and strain-recording instruments used at the Bureau of Mines' physical metallurgy research laboratories, Ottawa. Capacity, up to 20 tons.

atories are thoroughly investigating its possibilities.

It may be seen that fatigue life may be decreased or increased, depending upon the treatment a part receives during the production cycle. Obviously, it is a duty of the metallurgist and designer to assure themselves that life-destroying features are not introduced by the production department and furthermore, to introduce wherever possible life-extending features as the case demands.

There is, unfortunately, too little correlation between the fatigue strength of a material as determined by the conventional fatigue specimens, and machine parts made from this material. A fatigue machine nowhere duplicated on this continent has been installed at the Physical Metallurgy Research Laboratories in the Bureau of Mines at Ottawa (Fig. 1). This machine is capable of determining the fatigue life of large machine parts as well as of conventional fatigue specimens. Thus, it is hoped to establish a better correlation between the two. Another type of machine of similar capacity will be installed.

It has been proved in actual field trials that stress concentrations (such as occur as a result of surface imperfections), peculiarities of contour, thermal treatments, etc., greatly affect performance, a fact often overlooked by part designers. It is possible, by employing large fatigue machines such as that shown in Fig. 1, to shorten the testing time from a matter of weeks to a few days. Large crankshafts, axles, connecting rods, etc., can be accommodated in these machines. Thus, by varying certain design features, or surface finish, etc., the effect of these on service life can be learned in a short time.

#### INTERNAL STRESS

It has been pointed out above that internal stress can be beneficial or detrimental. In most metal components, internal stresses are undesirable, although sometimes they are intentionally produced in order

to counterbalance stresses of opposite sign which are produced in service, e.g. in gun tubes (autofrettage). In parts subjected to repeated stresses, internal stress can combine with the applied stress to either increase or decrease the actual maximum stress.

If a part contained internal stress of the same sign as those produced in service, early failure could occur. Obviously, then, designing and metallurgical engineers must be foresighted enough to plan the various operations which will be performed on the part while it is still on the drawing board, in order to prevent, if possible, creation of stresses which will not be of benefit in the function of the part. There are so many factors which are capable of producing internal stress from the time the part begins to take shape, either by casting, forging or machining, until it is placed in service, that each operation must be carefully considered as to its effect on the final shape and service of the part.

In general, internal stress may be produced by temperature changes, allotropic volume changes, and working of the metal.

Proper pouring temperatures, mould conditions, etc., will help to produce a good casting. However, optimum pouring and cooling conditions will not produce a good casting if the original design had poorly proportioned sections, sharp corners, etc., which cause unequal cooling and result in high internal stresses, shrinkages, and so on.

A tool or part made from deep-hardening alloy steel and hardened, undergoes extensive volume changes during this process. These changes often result in high internal stresses being set up, which sometimes are relieved by tempering and at other times are unrelieved because the high hardness is required. In order to minimize these stresses, the designer must proportion the sections so as to obtain as equal a cooling rate as possible. Sharp corners, inadequate fillets, etc.,

Fig. 2—Photograph of two SR-4 strain gauges.

Fig. 3—Testing a Belleville spring at the Bureau of Mines' physical metallurgy research laboratories, using SR-4 strain gauges and strain indicator.

must be absent, because these represent points of high stress concentration. Furthermore, the heat treatment specified and the material selected are important since they, too, determine the extent of the internal stresses. Design, heat treatment, machining, etc., go hand in hand, and as such are a responsibility to be shared by the design, metallurgical, and production departments.

Ignorance as to the magnitude and distribution of internal stress has been dissipated to a considerable extent by the use of new techniques for measuring these stresses. Among the methods currently used are photoelasticity, X-ray diffraction, strain gauges, and brittle lacquers. These techniques are briefly described later in this article.

It is seen that internal stresses, when they are of an unfavourable kind, can result in lowered tensile and yield strength, and lowered fatigue life. They may also cause stress ("season") cracking, quench cracking, and grinding cracks. Warping during machining also results from internal stresses.

#### SELECTION OF MATERIAL

One of the first problems the designing engineer encounters is that of the material he is to use in his design. Many machine parts or structures have failed, not because of bad design, but because too little attention was paid to the kind of material selected and its subsequent processing.

A few of the more important considerations which the designer and metallurgist must observe in selecting material are as follows:

(1) The climate in which a machine or a structure is to operate is an important consideration in the selection of a metal. It is not too well known among engineers that certain steels and zinc base alloys have very poor impact properties at low temperatures. Obviously they would be unsuited to withstand rough operation in climates such as northern Canada or Russia. Similarly, certain metals

undergo "creep" when under stress at high temperatures. An understanding of this phenomenon is particularly important in power boiler design.

(2) In selecting a material from which a component is to be made, the engineer must decide upon the heat treatment to be given to it. Far too often this is either overlooked or becomes a routine affair, when in reality the greatest significance should be attached to it. Steel, for example, can be normalized, quenched and drawn, austempered, martempered, etc., to give exactly the same tensile strengths, but many of its other properties such as yield, impact and fatigue strengths will be widely different. Improvement in heat treatment technique when properly applied can result in lower manufacturing costs and a better, more uniform product.

(3) The design of welded structures involves many problems besides selection of the proper material. The flux and welding rod to be used, welding technique, preheat temperature, jiggling, cooling rate, heat treatment, etc., all influence the strength of the base metal and of the weld itself. The welds must be clean, sound, tough, as free from high internal stresses as possible, and be properly shaped to have good fatigue properties if subjected to repeated stresses.

(4) Many parts are subjected to corrosive liquids, gases, etc. Under this action, metals weaken and eventually fail, particularly if subjected to repeated stresses. Some metals are, however, more resistant to corrosive action than others. Those that are attacked can be protected. Corrosion is a broad field and the designer should seek adequate information when designing components which are subject to corrosive action.

(5) Certain materials have decided advantages over others for particular applications. For example, in the manufacture of springs certain steels have a decided tendency to decarburize during heat treatment. Since a decarburized surface is detrimental to the life of a spring, such a feature must be recognized in the original specification.

Fig. 4—Dynamic strain recorder used at the Bureau of Mines' physical metallurgy research laboratories.

Fig. 5—Angle bracket being sprayed with stress-coat.

(6) Grain size of materials such as steel and aluminium is particularly important in certain parts. For example, steel with large grain size has lower impact strength, particularly at low temperatures.

The above factors are only a few of the many involved. Not just "any old thing" will do, but careful thought must be given to the choice of the metal from which machines are constructed.

#### EXPERIMENTAL DETERMINATION OF STRESS DISTRIBUTION

As mentioned above, strain gauges, brittle lacquers, photo-elasticity, and X-ray diffraction are techniques used to ascertain the distribution and magnitude of stress in bodies which either contain locked-up stresses or are subjected to external loads which cause stresses. These convenient and practical engineering tools are of very great value in producing designs, which formerly involved considerable guesswork. With the information obtained, engineers can accurately strengthen highly stressed parts or reduce safely the weight of lightly stressed parts.

#### STRAIN GAUGES

The SR-4 electrical strain gauge, which is the most widely used of the gauges of this type, was perfected in its present state by Prof. A. V. DeForest and A. C. Ruge of Massachusetts Institute of Technology. This gauge makes it possible to measure the stresses in a part or structure with an accuracy never attained before. These stresses may be caused by static, impact, or repeated loading and the gauges are used with equal facility for all conditions.

Figure 2 shows such gauges. The gauges consist of a fine resistance-wire supported on paper or plastic

and then cemented firmly to the spot where the strains are to be measured. The gauge adheres so firmly to the metal that as the metal is strained the wire follows the movement linearly. Thus, if the metal is strained in either tension or compression, the cross-section of the resistance-wire is changed and the resistance changes correspondingly. These changes in resistance are recorded by a special type of Wheatstone bridge, as shown in Fig. 3. This Wheatstone bridge can be used only for static or slowly applied loads. For impact loads or rapidly moving parts, amplifying and oscillograph equipment is required. A photograph of this equipment is shown in Fig. 4.

The usual procedure is to cement gauges to the part being studied and load it statically to duplicate service conditions, or actually put the part in service and measure the stresses with dynamic recording equipment. This latter method is being used extensively in the aircraft industry. The gauges are placed on all stressed structures (wings, fuselage, etc.) and the stresses recorded while the plane is in flight. The information thus obtained enables the designers to make the necessary corrections in design.

Crankshafts, connecting rods, bridges, cranes, hoists and springs are a few of the structures studied by this method. Figure 3 is a new design of Belleville spring which was studied in the Bureau of Mines' Physical Metallurgy Research Laboratories, at Ottawa. Gauges were cemented both in the tangential and radial direction on the top and bottom of the spring. The stress distribution was ascertained while the spring was subjected to various loads.

These gauges have also been used at the Bureau of Mines' Physical Metallurgy Research Laboratories to measure residual stresses such as those caused by quenching, improper drawing, or annealing; stresses caused by cold drawing of bar and tubing; stresses in welded structures; and so on. It is evident, then, that

Fig. 6—Angle bracket after loading. Note cracks in lacquer. Direction of stress is at right angles to cracks.

this gauge is materially assisting metallurgical and designing engineers in their efforts to improve old designs or develop new ones.

#### BRITTLE LACQUERS

Brittle lacquers, commonly sold under the trade name of Stresscoat, are used in ascertaining the over-all distribution of stress in any structure. The method consists of spraying the part or assembly with a coating of brittle lacquer. When the part or assembly is loaded, the points of maximum strain are indicated by the local cracking of the lacquer. Since the lacquers are made to give varying degrees of strain sensitivity, fairly good quantitative measurement of strain is possible by selecting the proper lacquer. A calibration strip, coated with the same lacquer, determines the strain sensitivity of the lacquer.

Brittle lacquers thus present an over-all picture of the distribution of stress in any body. The part used need not be the actual structure, but may be a cast model. By determining the location and approximate magnitude of the stresses, which incidentally are at right angles to the cracks, more accurate determination of stress with electrical strain gauges may then be made at the critical areas indicated by the lacquer. Figure 5 is a photograph of the equipment for conducting tests using this technique. The photograph shows a bracket which was sprayed with Stresscoat at the Bureau of Mines' Physical Metallurgy Research Laboratories. After drying, the bracket was loaded incrementally and watched to determine the manner and the positions in which the cracks formed. Figure 6 is a photograph of the bracket, showing the cracks formed in the lacquer.

Stresscoat represents the fastest method now available for obtaining a complete stress pattern of a loaded part. It is somewhat difficult to obtain quantitative results, but if used in conjunction with strain gauges both qualitative and accurate quantitative results can be obtained.

#### PHOTO-ELASTICITY

By constructing a scale model of a newly-designed part, in some suitable transparent material such as celluloid, and examining it under load by polarized light, the regions of high stresses are clearly outlined. The determination of stress concentrations is facilitated by the use of photo-elastic models of parts where stress concentrations are suspected. Thus nuclei for possible fatigue failures can be discovered and the design altered to remove them.

#### X-RAY DIFFRACTION

This technique has been used of late to measure stresses in metal. By measuring the distance between atomic planes in metal aggregates oriented at different angles, under certain circumstances it is possible to determine the stresses at the surface. In unstressed metal a particular interatomic spacing will be obtained for all orientations. If, however, the metal is in a stressed condition this condition will no longer exist.

This is a non-destructive method of measuring residual stresses and has applications which no other method can offer.

There are many more instruments and machines available to the designing engineer in his search for the optimum design of a structure. Among them are radiographic equipment, the stroboscope, mechanical testing machines, vibration testing machines, and so on. It is notable that, in the field of mechanical testing, the trend is toward testing dynamically rather than statically. All of these instruments and machines are finding increasing use with designing and metallurgical engineers.

If the designer would seek information from the metallurgist as to the proper specification of a material and the metallurgist would seek precise data from the designer on the service requirements to which the material would be subjected, many design problems would reach a more satisfactory conclusion.

# RADIO FOR OVER-LAND LONG-DISTANCE TELEPHONE SERVICE

SIDNEY T. FISHER, M.E.I.C.

*F. T. Fisher's Sons, Limited, Consulting Engineers, Montreal, Que.*

Paper presented before a joint meeting of the Toronto Branch of The Engineering Institute of Canada and the Toronto Section of the Institute of Radio Engineers, on November 30th, 1944.

**SUMMARY**—In recent years, development of ultra-high-frequency radio technique and apparatus has progressed at such a rapid rate that the use of radio instead of wire lines for commercial telephony for long distances over land areas is an immediate practical possibility. This paper discusses in a descriptive way the recent technical advances and their application to over-land telephony. As a typical example, an outline is given of a radio system that would provide telephone service between Ottawa and Halifax.

## INTRODUCTION

Engineering papers can be divided into two classes: those which are descriptive of that which has been accomplished, and those which make proposals for what should be done. The first class are exact in nature, and can be properly termed scientific, since they deal with problems which have been investigated and solved, with works which have been constructed and whose performance has been measured, or with researches which have been undertaken and whose results are known precisely. The engineer is fortunate who delivers a paper of this sort. Neither his conclusions nor his motives are open to question, since his only aim is to enlighten his fellow engineers by adding his knowledge to theirs. The subject of the present paper is to make a new proposal. It has been stated that the world cannot progress without imagination, and the following paragraphs paint a possibly somewhat imaginative picture of what could be accomplished by the application of some of the engineering ideas now current to a practical and pressing Canadian problem.

The theoretical and practical development of radio has now advanced to the point where the generation-old idea that ordinary telephone and telegraph communication could be carried by radio waves instead of by copper wires strung on wooden poles, has become an immediate practical possibility. Wire communication has a long and honourable history. Morse in America, and Wheatstone in England, were operating commercial telegraph systems more than one hundred years ago. The telephone was in commercial use nearly seventy years ago. Fifty years ago, radio transmission was demonstrated in practical form. Thirty years ago, radio telephony in a practical form was demonstrated. It is twenty years since radio has been a familiar accessory in almost every home, and yet the fact remains that in over-land telephony and telegraphy, an industry which overshadows by a huge amount any of the other uses of radio, we still employ almost exclusively wire-line techniques. Radio is used for trans-oceanic communication both by telephone and telegraph, for transmission to and from airplanes, and has played a very large part in all phases of military operations in this war. It is used for broadcasting, and in some rather specialized and not very extensive applications — in point-to-point transmission, and police and other mobile services, for example — but it is not yet used for the great bulk of telephone and telegraph communications.

An outline of the technical and economic possibilities of doing this in the light of present knowledge

and engineering technique follows. It is not proposed to discuss the specialized transmission and modulation techniques which have been evolved during the war, even if we were free to do so. The subject is large enough without the necessity of speculating on the added help some of these new ideas might be to us. It might be mentioned that any figures or data given are derived from sources which are generally available.

## FOR A CANADIAN PERSONALITY

In any subject involving Canada, it should be realized that engineers must take into account the peculiar nature of the Canadian terrain, climate, geography, and distribution of population. Engineers are likely to be internationalists, and to assume that what is done in the United States, or Great Britain, or Russia, or Germany, is of general application to our conditions. Canadians are somewhat forced into this view because of the relatively small amount of technical research done in this country. We are told that, per capita, Canada spends on research only about 1/3 as much as Great Britain, 1/6 as much as the United States, and 1/8 as much as the U.S.S.R. This means that nearly all our technical ideas come from abroad, and the natural inclination is to seize on them and to assume, for example, that American technique applies to Canadian conditions in the same way as it applies to American conditions. This is just not so. In Canada we should not be building houses of the same design, or with the same materials as are used, for example, in England. We should have different kinds of heating systems, different kinds of windows, and different kinds of roofs than are used, say, in the United States. We should wear different kinds of clothing than are worn in European cities. We require different kinds of radio sets in Canada than are required in the United States. Canada is a country with about the area of the United States, but one-tenth as many broadcasting stations, so that we have to contend with a quite different set of transmission problems. The influence of the two great nations on each side of us is to bring us into conformity with their habits and prejudices, even in remarkably small points. Progressive-minded engineers who wish to improve the Canadian economy must forever keep in mind that Canadian conditions require special thinking.

To build a house at latitude 60 deg. N. of the same design, and with the same materials intended for use at latitude 40 deg. N. is ill-advised, yet most of us have seen this done. At latitude 60 deg. N. with temperatures for long periods of the year down to the freezing point of mercury, there is likely to be 8 or 10 ft. of snow on the roof. Materials are not readily obtained locally, and are not easily worked by the local labour. The auxiliary purposes for which a house is used are likely to be widely different in the two localities because the trades practised are generally quite different. This is the kind of error into which Canadian engineering—engineering is meant in its

# WAVELENGTH- ÅNGSTROM UNITS

CYCLES  
Fig. 1—The electromagnetic spectrum.

broadest sense—is continually likely to fall. In some cases we cannot help ourselves—in many, however, we can.

### THE CANADIAN COMMUNICATION PROBLEM

A study of the distribution of population in Canada, gives an idea of the staggering transportation and communication problem which we face. The population of Canada is stretched out in a long ribbon, which is hardly anywhere more than 300 or 400 miles wide, and in most cases, much narrower. North of the Great Lakes the ribbon almost ceases. The ribbon is over 4,000 miles long. If we make a very rough approximation and say that the inhabited part of Canada is 250 miles wide by 4,000 miles long, we come to an area of 1,000,000 square miles, and this represents a square 1,000 miles to a side. If Canada were contained in such a square, then ignoring the empty areas of the country, and considering only the inhabited portions, the whole of the population could be contained at its present density in the area of the provinces of Saskatchewan and Manitoba, and our communication and transportation problems would be a small fraction of what they are now.

It becomes apparent that communication systems designed for use in densely inhabited areas, such as Europe and the United States, are far from suitable for Canada. Some additional factors are also apparent. The per capita income of Canada is very much lower than that of the United States, and in addition weather conditions are very much more severe in Canada. In the east we have heavy snow fall and bad icing; in the centre and west we have very low temperatures; and in the far east and far west we have high velocity gales combined with any, or all, of the other hazards. Such rigorous climatic conditions as prevail generally in Canada make outside construction of any kind both more difficult and more subject to outage than in the United States.

It is apparent that, of all the nations on earth, this country is more in need than most of low-cost communication, not unduly subject to attack by the weather. The very life blood of Canada is its transportation and communication facilities. The channels of trade have to be kept open along a long narrow ribbon, and low-cost, efficient communication, specifically adapted for our needs, can do more in the author's opinion to enhance the economic and industrial efficiency of this country than any other single factor. Geographically, Canada is an anomaly. We trade, and strive for national unity in a direction

which is contrary to geography and every natural barrier. Starting under this initial handicap, it is apparent that special methods must be devised to permit us to operate with the same community of interest and national unity which other countries achieve by geography.

### THE SOLUTION: RADIO-TELEPHONY

The question then comes up—what can radio do for communication in this country which wire lines cannot, or do not do? To get the correct answer, it is necessary to examine some of the technical points in a certain amount of detail, and it will be apparent that the conclusions arrived at, while applying to Canada in a very strong degree, are applicable to other countries also, perhaps with less force but nevertheless with sufficient force to be of serious interest.

### RADIO WAVES AND THEIR WAY OF PROPAGATION

The first question we must answer is what kind of radio waves we are talking about. Figure 1 shows the spectrum of electromagnetic waves. This chart, which is one of the simplest and most useful presentations which physics offers, shows the scale of electromagnetic radiation between the frequencies of  $10^4$  cycles and  $10^{22}$  cycles per second. Below this band of frequencies exist the non-radiated electric waves used in speech and power transmission. It has been remarked by a layman that the communication engineer appears to know only one word—"frequency"—since this occurs so often in his conversation. This is rather an illuminating remark because the fact is that all the phenomena with which communication engineers work centre around the frequency at which the phenomena take place. To talk about radio engineering problems without first specifying frequency is like discussing a horse without mentioning its age.

The frequencies used in ordinary radio transmission extend, from say 30 kilocycles to 30 megacycles. Above this band lies what is ordinarily referred to as the ultra-high-frequency spectrum. This begins at around 30 megacycles, and we have reason to believe that, at the present time, it extends usefully to around 30,000 megacycles, or a wave length of one centimetre. Above the ultra-high-frequency spectrum, as the frequency increases we have electromagnetic radiation which manifests itself first as heat, then as light, and so on through X-rays up to the highest-frequency waves known, which for want of a better name have been called cosmic rays.

The waves in the radio spectrum itself show a very

marked change in properties as the frequency changes. Aside from the secondary questions of circuits, component apparatus, and antennas, we are primarily concerned with the way in which the propagation of these waves changes with frequency. There are four different ways in which a wave radiated from a transmitting antenna may reach the receiving antenna. These are shown in Figure 2. One path is along the surface of the ground, partly within the ground itself, and partly in the air layer immediately above the ground. A wave which is thus guided by the ground surface is the most important mode of transmission of the low-frequency end of the radio spectrum up to, say, 1.5 or 2 megacycles. A second way in which the energy can reach the receiver is in the case where the wave is propagated upwards from the transmitting antenna, and is reflected from one or more of the ionized layers existing in the rarified regions of the atmosphere from 30 to 200 miles above the earth's surface; such a path is shown in Figure 3. These layers, known as the Heaviside or Kennelly layers, reflect the wave to earth again. Any wave may undergo several such reflections, and this mode of propagation is that chiefly occurring for waves between about 2 megacycles and about 30 megacycles. Above 30 megacycles the reflected wave becomes of little importance, and the energy is received chiefly from two paths, one a direct path between the transmitting and receiving antenna, and the other the path due to reflection by the ground between the two antennas.

only with a logarithmic base for frequency, but we also have to consider the problem of how many cycles are available in any band. For this reason, the number of channels available for transmission at the low frequencies is very much restricted, and this point, together with the high power necessary, the large antennas required, the difficulty of achieving directional effects, and the complete lack of secrecy since the waves are transmitted to very long distances, makes this band of frequencies quite unsuitable for the purpose we have in mind.

Fig. 3—Diagram illustrating propagation of radio waves by reflection from the ionized layers of the atmosphere. At frequencies lying between about 1.5 megacycles and 30 megacycles an additional path of propagation of a radio wave is by reflection from the ionized conducting layers of the atmosphere lying at heights from 30 to 200 miles above the earth's surface.

Fig. 2—Diagram showing various ways of propagation of radio waves. A radio wave may be propagated between a transmitting and a receiving antenna along the surface of the ground, by the direct path between the two antennas, by reflection from the ground between the two antennas, or by any combination of these paths.

FREQUENCIES AND THEIR USES

The usefulness of different frequencies for any single service therefore varies widely. The low frequencies are very useful for long-distance permanent service, and are very largely employed for trans-Atlantic communication, for aerial navigation systems, and similar purposes. They suffer somewhat from auroral storms, but provide stable communication, although this is achieved at a very high cost. Very large amounts of power must be used in order to overcome the natural noise level existing at these frequencies, and very large antennas must be employed to radiate this power with any degree of efficiency.

Although the chart of the frequency spectrum indicates equal band-widths for equal frequency ratios, this is not quite how the problem works out in practice. The chart is based on a logarithmic scale, but in actual transmission systems we are concerned not

The middle band of frequencies, from 550 kilocycles to 1550 kilocycles is employed for local and regional broadcasting, and consideration of Fig. 4 shows why this is so. In the lower end of the broadcast, wave transmission is almost entirely by the ground. At the very upper limit some sky-wave transmission occurs in the day-time, although over the whole band there is sky-wave transmission at night. We therefore have the condition that ground attenuation, which is quite high for these frequencies, restricts the range of a station rather sharply in the day, and at night the range is even more restricted by interference between the ground wave and the sky wave. As soon as a point in the field of a station is reached where the sky wave becomes an appreciable part of the ground wave, then fading results, since the phase angle of the sky wave is continually changing and cancels out to a greater or lesser degree the ground wave.

At the lower frequency end of the broadcast band, excellent transmission is obtained to fairly long distances if the ground conductivity is high, and we have a situation in western Canada, for example, where a 50 kw. transmitter near the lower end of the band is heard in the day time for distances of close to 1,000 miles. Where ground conductivity is poor, however, this is not true and again we have the illustration of a 50 kw. broadcast transmitter located in the Maritimes where satisfactory transmission above 100 miles is not obtained. In the upper end of the broadcast band, ground attenuation is always high, and these frequencies are suitable only for local service, either night or day.

Above the broadcast band, say between 2 and 30 megacycles, lies a band of frequencies largely employed for commercial communication, such as aircraft and aircraft ground stations, ships, trans-oceanic telephones, etc. These waves are characterized by being transmitted almost entirely by one or more reflections from the Heaviside layers. It is to be seen from Fig. 4 that, for any distance, a particular frequency must be chosen and that this frequency must be changed for day or night service, summer or winter, and for the year, so that continual skilful care is needed to keep transmission reliable and satisfactory. Certain diffi-

Fig. 4—These charts, prepared from information published by the Bureau of Standards, show the limits of distance over which practical radio communication is possible, and assume a received signal strength varying from 100 microvolts per meter at 0.1 megacycle down to 1 microvolt per meter at 10 megacycles. These charts are for the year 1941, and are accurate for the temperate zone. For noise-free radio telephone reception the distances should be decreased by a factor of about 5 to 1. These charts are based on 1 kw. radiated power.

Fig. 5—Chart showing the variation of noise levels over the radio spectrum. Since the signal-to-noise ratio in any transmission system is most important, accurate knowledge of the noise existing over the radio frequency spectrum is of prime importance. The man-made noise curves shown are somewhat conservative, and in carefully chosen sites with the use of directional antennas and elimination of nearby noise sources, noise conditions could be obtained 10 times better than those shown.

culties are encountered transmitting across the sunset and sunrise lines, and taken all in all, this band of frequencies is suitable only for service where long-distance transmission is required, and skilful operation must be available to provide reliability over a large fraction of the time. Continuous reliability is not available on any basis in this band.

From 30 megacycles up, radio transmission becomes almost like transmission of light. The similarity becomes greater the higher we go in frequency, until above 100 megacycles the similarity is very striking indeed. The band below 100 megacycles contains various services at the present time. Frequency-modulation broadcasting is here, police and other mobile systems, some television, etc. At the lower part of this band, from 30 to 100 megacycles, some sky-wave reflection is obtained, which causes fading at some distances, and causes freak transmission to great distances occasionally. Noise conditions improve as the frequency is increased and, due to the reduction in antenna size, directional systems are possible without undue cost. The power required for transmission at a certain signal-to-noise ratio steadily decreases as the frequency is increased, but at the same time refraction effects decrease so that, at the upper part of the band, transmission is sharply limited to line-of-sight paths.

Figure 5 shows noise conditions which are encountered over the spectrum. It must be realized that the limiting factor in any kind of electrical transmission system is noise. This is not immediately apparent, but is a basic principle which is generally true. The signal-to-noise ratio is the chief figure of merit for any transmission system, and a consideration of the noise levels in any path determines, in the final count, the usefulness of that path as a medium of communication. This figure shows that, at low frequencies, path noise is relatively high, but decreases

rapidly with frequency, reaching a minimum somewhere between 10 and 100 megacycles. Man-made noise is shown for urban and suburban conditions, but values at least ten times lower than those shown can be obtained by careful selection of sites, location of antennas, use of directional antennas, etc., so that these curves could be drawn in at voltage values ten times lower. The receiver noise is at a low value, somewhere in the neighbourhood of 10 megacycles, and climbs rapidly as the frequency is increased. These curves are drawn for the present state of the art, and no doubt will be improved by a large degree through further development. It will be seen that, at the present time from a noise standpoint, frequencies between 100 megacycles and 500 megacycles are indicated as the best, and rather extensive trials which have been made indicate that this is so. Since noise is the most important single factor in reliable systems, particularly those which may have long telephone circuits connected to either terminal, then it is important to take advantage of every possibility of reducing noise, and the adoption of frequency modulation rather than amplitude modulation is of considerable importance.

Frequency modulation means that the intelligence is added to the transmitted wave by varying the frequency rather than the amplitude of the carrier wave. Frequency modulation improves the signal-to-noise ratio above that obtained with an amplitude-modulation system.

The difficulty encountered, when these frequencies lying above 100 megacycles are used, is that transmission is not readily obtained over the horizon. Figure

Fig. 6—Curves showing the signal range which may be expected of stations transmitting in the ultra-high-frequency band.

Fig. 7—Cross-sectional view of receiving type triode designed for operation at frequencies above 1000 megacycles.

6 shows the effect graphically. Although these curves were drawn up for a frequency of 46 megacycles, they apply rather accurately to the region around 100 megacycles also.

#### THEORY OF HIGH-FREQUENCY TRANSMISSION

Above 100 megacycles, the theory and practice of radio engineering differ markedly from the technique at more familiar frequencies. In this band, for example, lumped circuits disappear, and we must deal with circuit elements in which inductance, capacitance, and resistance are inextricably interwoven. The physical dimensions of circuit elements, including tubes, may be of the same order as that of the generated waves, so that these circuit elements can no longer be regarded as non-radiating, and it is necessary to think about fields rather than flow of current in conductors. The time of motion of the electrons in the tubes becomes a considerable fraction of a cycle, and may determine the upper frequency at which a tube operates.

One of the most fundamental concepts in electrical engineering is the flow of electrical current in a conductor. At low frequencies, the current distributes itself uniformly much as a direct current would. At higher frequencies the skin effect increases, and at frequencies of the order of 1000 megacycles the current does not penetrate more than a few thousands of an inch inside the conductor. The electrical current has therefore become a surface phenomenon in that it does not flow in the conductor, but on the conductor.

This has an important effect upon the radio engineer's thinking. Conductors have simply become boundaries within which the waves are propagated, and between which they exist. Instead of currents or charges or voltages he must think of electric and magnetic fields. In the usual picture he learned in school, electric and magnetic fields are sorts of

branches which emanate from the currents and voltages which can be measured in the circuit, but when he considers the band lying in the neighborhood of 1000 megacycles, it is difficult to avoid the conclusion that he should consider no longer as fundamental the metal conductors, which now form only the boundaries for the phenomena; he now must think rather of the space which is enclosed by these conductors.

This begins to make electrical effects in this region much more like light waves, which we usually consider as passing through a medium, with the boundaries acting as generators, reflectors or absorbers, but boundaries only. We ordinarily think of light as a phenomenon taking place in a medium which will transmit light, not as something that takes place along mirrors or along other boundary surfaces. Something of what is meant can be seen from considering the most elementary of electrical circuits, a source of alternating current connected to a loop of wire. We have been taught that the current circulating in the loop sets up electric and magnetic fields. One way to look at this is that the current at every point in the wire gives rise to a changing magnetic field, and this in turn induces an electric current at every other point of the loop. The result is to require a certain amount of the applied voltage to be used in overcoming the field to permit current to flow. Clerk-Maxwell in his original analysis of electromagnetic phenomena drew the conclusion that electric and magnetic fields are not propagated instantaneously in the space surrounding the charges and current which cause them, but that these fields travel away from their sources with the velocity of light.

If the current source in the loop has a frequency of the order of 1000 megacycles, then for a loop of any possible dimensions an appreciable part of a cycle is required for the magnetic field to be set up by one part of the loop, travel to another part, and induce an electric field there. At ordinary frequencies, if this loop has no ohmic resistance, then it will consume no power because it will be a pure inductance with the phase of current and voltage at right angles. At 1000 megacycles, however, due to the short wave length, the induced electric field will be to some degree in phase with the current in the part of the wire in which this field is induced, so that power is

Fig. 8—The Klystron velocity-modulated oscillator shown here provides an efficient source of high-power oscillations at frequencies of the order of 3000 megacycles.

Fig. 9—The Magnetron is used as a power generator of frequencies at the extreme high end of the ultra-high-frequency band, and consists basically of a cylindrical cathode within a segmented cylindrical anode.

dissipated. This power must be radiated, and we have a condition where all circuit elements, however small, radiate energy freely. It is somewhat as though we were building a device for conducting heat in a complicated pattern through thermal conductors, such as copper rods; and in this case the surfaces of all the conductors would radiate heat continuously.

We have therefore arrived at a rather odd situation. At these frequencies, circuits in the usual sense hardly exist, because it is difficult to build anything small enough to be a circuit. Nevertheless, compared to a wave length, the circuits are large, and therefore the loss by radiation is also large. The communication engineer in other words is faced with a problem, really, of insulation.

Since these waves do not readily penetrate metal, the way to design circuits so that leakage of energy by radiation will not be excessive, is to build them so that the circuit is self-enclosed, and this gives rise to the resonant-cavity technique. Resonant cavities have an exact analogy to inductance-capacity circuit used at ordinary frequencies, and the exact way in which the equivalents are obtained need not detain us here.

At ordinary frequencies we can transmit power on a pair of parallel or twisted wires, or on a system composed of a rod concentric within a tube. As the frequency goes to the order of 1000 megacycles it is possible to dispense with the inner rod conductor, and employ simply a hollow tube. This effect occurs when the diameter of the tube is such that the waves will fit into it transversely. If we think of the wave guide, as it is now called, in a rectangular form, the picture becomes somewhat less puzzling. Two sides of the guide form the plates of a condenser, for example, between which the electric field is propagated. The other two sides are of such a length that they represent a high impedance connection between the two condenser plates, so that we have the phenomenon of electric wave energy being transmitted with high efficiency through a hollow pipe, and this despite the fact that it is difficult to detect any current flowing in the metal of the pipe itself.

A logical conclusion can be drawn that it should be

Fig. 10—In the Magnetron a high-frequency current is generated by the paths which the electrons emitted by the cathode follow under the influence of an axial magnetic field combined with a radial electric field.

possible to remove the pipe and still have the energy flowing through the core, and this is indeed possible, and has formed part of our modern ultra-high-frequency technique, where electric energy is now transmitted through a rod of solid dielectric metal, and neither an inner or an outer metallic conductor is employed. If it seems that this is an extraordinary way for electricity to behave, one should refer to the analogy of light being transmitted through a quartz rod; and this example is a much better introduction to electrical engineering at these frequencies than is the usual background of direct-current and low-frequency alternating-current phenomena.

#### THE THERMIONIC VACUUM TUBE

With these general remarks about this region, let us consider what is, here in a greater degree than in any other part of the spectrum, a basic device—the thermionic vacuum tube. There are three general types of modern ultra-high-frequency vacuum tubes. First, the triode, such as shown in Figure 7. This tube is rather a simple mechanical development from the ordinary filament-grid-plate vacuum tubes with which we are all familiar. Electrons are emitted by a disc cathode, pass through a disc grid ordinarily made of fine wire mesh, and are collected by the anode. The anode is made positive with respect to the cathode,

Fig. 11—Front view of 40 watt FM transmitter and receiver with auxiliary equipment intended for use at frequencies above 100 megacycles.

Fig. 12—The robust form in which directional antennas at high frequencies can be designed as exemplified by this 50 megacycle antenna. The total height is about 60 ft., and the construction is entirely of galvanized steel angle.

and the grid is ordinarily made negative so that the electrons, being negatively-charged particles emitted by the cathode, are drawn to the anode, and their flow is interrupted or regulated by variation of the negative voltage on the grid. As can be seen from this figure, the spacing between the elements has been made very small in order to reduce the time required for passage of the electrons, and tubes such as this operate up to frequencies of several hundred, or even several thousand megacycles in some applications.

The second class of tubes is the velocity-modulated type ordinarily known by the tradename "Klystron." Figure 8 shows one of these tubes. These tubes make use of the transit time instead of, as in the case of the triode, trying to reduce it. Electrons emitted by the cathode are alternately retarded and accelerated by the first group of grids they pass through, due to the alternating voltage between these grids and the cathode. When they pass through the second group of grids, the bunches of electrons induce an alternating field in the area enclosed by the grids and its associated resonant cavity, and part of this field is tapped off and fed back to the grids so that continuous oscillations are sustained. The result is that we have an efficient generator of very high frequency waves, in which the transit time of the electrons has ceased to be a limitation.

The third method of producing oscillations at these frequencies is the magnetron. This is shown in Figures 9 and 10. Structurally, the magnetron consists of a cylindrical anode, and a concentric cathode. The anode is usually divided into several segments by means of longitudinal cuts. A direct-current potential is applied between anode and cathode, and a magnetic field is applied parallel to the electrode axis. The oscillatory circuits are attached between the anode segments. The theory of the operation of the magnetron is complex, and depends upon the path followed by the electrons emitted by the cathode under the influence of the crossed electric and magnetic fields. The electron on leaving the cathode describes approximately a circular path and returns to the centre of

the tube, and for some values of magnetic and electric fields the electron just grazes the anode segment. The pattern of electron paths within the tube is therefore a four-leaf rosette, and the motion of the electrons produce a field whose wave length for practical values of magnetic field is very short, and waves of lengths as short as one centimetre can be generated at high efficiency.

To the engineer working in this field, the vacuum tube becomes more than just a valve that shuts on and off a current under the influence of a voltage applied to a control electrode. The current flow of a tube must be looked at rather as due to the motion of charges, and it is the integrated effect of all the induced currents due to all the charges which must be considered. The engineer working in these frequencies finds himself thinking about electron paths, electron velocity, transit time of electrons, and motion of space charges, rather than looking on the tube as a switch or a variable impedance.

#### MODERN ULTRA-HIGH-FREQUENCY RADIO EQUIPMENT

It is of interest to consider some of the developments actually available today, of radio equipment in the band from 100 to 1000 megacycles. Figure 11 shows a 50-watt transmitter and receiver, with power supply and auxiliary equipment, which is available on the market today and operates between 100 and 200 megacycles. This unit employs frequency modulation with a swing of  $\pm 50$  kilocycles. It transmits an audio wave flat within 1 db. from 200 to 12,000 cycles. It is designed for continuous unattended operation, and demonstrates to what a thoroughly practical point the development of ultra-high-frequency equipment has been brought. A complete range of equipment units are available. Antennas, transmission lines, emergency power supply equipment, etc., have all been developed in complete, practical, and robust form.

An ever-present consideration in the use of these frequencies is that transmission can take place only on line-of-sight paths. This may appear to be a serious handicap at first glance, but a study of the geographical features of this country indicate that it is not serious. The routing of radio circuits should be thought about in somewhat the same terms as the routing of a railroad. Just as the railroad must seek essentially zero-slope paths, so must a ultra-high-frequency radio system seek essentially line-of-sight paths. When it is necessary for a railroad to cross a valley at right

Fig. 13—At frequencies of the order of 100 megacycles simplified directional antennas become possible, and the cost and amount of land required for a site are both reduced.

Fig. 14—Map showing a possible route for a radio network between Ottawa and Halifax.

angles, then a bridge is built. When a radio system must reach a point without sufficient elevation, then towers must be built. The parallel can be developed to considerable lengths.

In some terrain and under some climatic conditions it will, however, be undesirable to seek line-of-sight paths. This will be particularly true in mountainous country, and in country where roads, railroads, and habitations are very sparse, or lacking altogether. In this case we have an almost ideal solution in the frequency band below 100 megacycles where considerable refraction around moderate obstacles and the curvature of the earth is obtained. Certain forms of interference are experienced to a minor degree of frequencies between about 30 and 50 megacycles. This interference is due chiefly to reflection under certain conditions from the upper ionized layers of the atmosphere. From about 50 megacycles to about 100 megacycles such interference either does not exist or is negligible, and this band of frequencies provides great facility in choice of sites in country where hilltop locations are impractical.

#### EXAMPLE OF A POSSIBLE RADIO ROUTE

Figure 14 shows, the kind of radio route which could be suggested, using ultra-high-frequency unattended equipment. This would reach from Ottawa to Halifax, with 10 repeater stations, and would provide a circuit with signal-to-noise ratio, distortion, transmission variation, and outage due to weather, of extraordinarily good quality. It is interesting to note how readily a satisfactory route can be devised between two terminal points chosen at random.

It will be seen that the route follows practically the shortest path possible, and that the over-all route being about 800 miles, the average distance between repeaters is about 80 miles. This illustrative example was chosen at random, and was not suggested because the terrain was unusually favourable. Figure 15 shows the series of vertical contours between the repeater stations, and based on previous experience and some calculation, it has been determined that the transmission over this group of contours will be satisfactory in every way.

The antennas at all points would probably be the same, and would be chosen from among three types. The first type is a diamond-shaped antenna in a horizontal plane. There will be four antennas required at each repeater point, and these will be strung on twelve 30-ft. wooden poles. The antennas will be about 40

ft. to the side, and will consist of a single No. 6 copper-weld conductor. Each antenna would be connected to the equipment house, which would normally be located in the centre of the group, by an open-wire transmission line. These antennas would have a gain of the order of 15 db. over a single dipole, and take advantage of the features of low cost, extreme ruggedness, simplicity of construction, high gain, and non-critical adjustment.

Several other antenna forms are simple, cheap, and effective. The most conventional of these is a series of half-wave radiating elements disposed so as to give the maximum gain in the direction required. Such structures can be built of steel angle and welded or riveted with no complications about accuracy of spacing, insulation, etc. A conventional form which such directional antennas have frequently assumed requires only a single insulator, and antennas of this sort could be designed for any frequency required. In the upper

Fig. 15—Contours of the route shown in Fig. 14.

half of the band the antennas are so small that they can be readily enclosed completely so that icing and other weather conditions impose no hazards whatever.

Alternate forms are possible. One is in the case where a wave guide is used as a transmission line using a horn radiator. This is a simple metal structure much like an acoustic horn, and of the same order of dimensions. It provides an efficient and directional radiator. Another form of directional antenna is the parabolic reflector, and this is useful particularly on the upper end of the band where the source of energy in the reflector is a dipole of very small dimensions. Such reflectors can be constructed either from solid sheet metal, or from wire mesh, and when the frequency is very high are small enough to be completely enclosed if this is so desired. The design, construction, and installation of any of these forms of antennas is a straightforward operation requiring no extensive research, experimentation, or field adjustment.

A cost estimate of the whole system which is outlined above can be arrived at to a fair degree of approximation, and it is estimated that the whole cost of the system will lie between \$300,000 and \$350,000. This includes equipment, engineering, construction of buildings and antennas, cost of land, clearing of sites, construction of power lines and road, and maintenance equipment spares for one year's operations. It includes the carrier terminal equipment for four telephone and four telegraph channels. It will be recognized that such a cost is only a fraction of that which would be involved in the construction of similar facilities by

existing methods. It should also be noted that the capacity of this system could be expanded from four telephone and four telegraph channels to a very large number of channels at an additional cost involving only terminal equipment and installation, and very little for construction and engineering.

Maintenance and operating costs on this system would be rather low. Since no operating personnel would be required, and only two or three maintenance men, the labour cost of operating would be very small. Maintenance on buildings and antennas similarly should be small over a ten or fifteen year period. All in all, the maintenance and operating costs will be only a fraction of conventional circuits consisting of open wire lines, repeater stations with attendants, etc.

A system such as the hypothetical one described could be used for all the needs of our commercial communication systems. It is suitable for transmission of voice-frequency telephone channels, carrier-telephone channels up to a very large number of circuits, possibly as many as 100, for the transmission of programmes for broadcasting service, and for transmission of all types of telegraph service, either on carrier channels or not. It would be suitable for specialized telephone as well as public telephone service; for example, for flight control in airline operations, etc. The example given has been worked out in some detail because it is felt to be of the utmost importance to demonstrate that the general application of ultra-high-frequency FM radio to commercial communication problems is now a matter of practical possibility.

---

## THE FUTURE OF COPPER

What will be the prospective position of copper in the post-war world? What will its competitive place be in relation to plastics and the newly developed metals and their alloys?

Since pre-historic times, copper has served man in an ever-widening variety of uses, because it alone combines the qualities of strength, malleability, electrical and thermal conductivity and resistance to the corrosive action of atmosphere, sea water, and other chemical media.

Immediately prior to, and during the war, when the "red metal" was almost entirely diverted to the manufacture of war materials, substitutes were born of necessity, many of which have proved highly successful, and are undoubtedly here to stay. Will they replace copper? Not according to a recent extensive survey conducted in the United States by one of the great producers of copper among some hundreds of its biggest customers! These, representing the automotive, electrical, building construction, hardware, machinery and equipment, metal working and other industries, actually expect to use a great deal more copper than ever in the period immediately after re-conversion. Because most of the firms contacted have branches here, the outlook is similar for Canada.

The machinery and equipment industry was taken as an illustration, including three over-all types:—

1. Machinery and equipment for general industrial purposes.
2. For particular industrial purpose.
3. Specialized machinery and equipment employed in the manufacturing processes of individual industries.

In the first or general group, those concerns who service the public utility and processing industries look for a marked development in business during and after re-conversion. This would indicate a stepped-up demand for muntz and naval brass sheet and admiralty and copper tube used in condensers and heat exchangers. Miscellaneous equipment for compressors, pumps,

valves and such items as bearings, expansion joints, gaskets, gears, lubricating devices, industrial screen cloth, etc., will consume copper and brass. Brass and bronze rod will find extensive use in valve stems and brass tube for pump liners. Light and power companies expect heavy replacements that will entail the use of alloy tube for steam condenser units and special copper alloy wire and copper bus bar for power installations. Gas and water utilities indicate their intention to employ copper tube for service lines.

Machinery and equipment manufactured for particular industrial purposes, will show a decided increase over pre-war levels, the two chief outlets being welding and metallizing equipment and air-conditioning and refrigeration equipment, both of which will capitalize on the essential properties of copper and copper base alloys. Great strides made in the art of welding and metallizing, as in the repairing of machinery by bronze welding, building up of worn surfaces by metal spraying, and fabrication and assembly of metal products by fusion welding, all point to a substantial demand for welding rods of every type. Air conditioning and refrigeration equipment for commercial use, immediately prior to the war, showed signs of becoming one of the most important outlets for copper and brass. The thermal conductivity and resistance to corrosion of copper will very likely make it first choice in the construction of condensing and heat exchange units. Present post-war plans of leading manufacturers of machinery and equipment for office and laundry use, for construction, mining, excavating and metal working as well as for public service, and fire-fighting purposes, are based on the continued use of copper and copper base alloys.

Among the outstanding uses of copper and brass for machinery and equipment are those in the special industrial fields. Agricultural, chemical, petroleum, pulp and paper and textile industries, to mention only a few, will specify copper and copper-rich alloys, wherever resistance to corrosion, thermal conductivity and workability are prime requisites.

### FIRST REPORT ON REHABILITATION

Now that the rehabilitation service has been set up, it is proposed to issue a report every month, through the *Journal*. In this way members both at home and overseas may be kept in touch with what will shortly become one of the Institute's most pressing activities.

As reported previously, a letter and questionnaire have been sent to every member in uniform. The replies are now being received at the rate of about six a day, and make very interesting reading. The pattern is not exactly that which was anticipated. In fact it shows that the need of this service is greater and the complexities more numerous than had been foreseen.

It is gratifying to see that the proffered service is welcomed. Almost all returned questionnaires or accompanying letters express appreciation, even from those whose postwar plans are satisfactorily completed. It is indeed encouraging to carry on the work under such circumstances.

The type of assistance which is required is indicated by the following analysis:

The number of questionnaires received to date is 224. Classified as follows:

- (1) *Those who require no assistance*—78
  - (2) *Asking for assistance:*
    - (a) Those who have prewar positions to return to but are undecided about returning to them or are definitely unwilling to do so:
      - (i) undecided ..... 16
      - (ii) unwilling ..... 41
      - 57
    - (b) Those who have graduated since the beginning of the war and have immediately entered the services, or temporary war work:
      - (i) entered the services on graduation ..... 14
      - (ii) temporary war work .... 22
      - 36
    - (c) Interested in further education (not included in above):
      - (i) desiring post-graduate courses ..... 28
      - (ii) undergraduates wanting to finish ..... 4
      - (iii) desiring refresher courses. 21
      - 53
- \* TOTAL ..... 146

The services of the members from whom answers have been received are:

- 24% in Navy
- 47% in Army
- 29% in Air Force

41% have seen overseas service.

More than 90% have served or are serving in a technical capacity.

7% hold rank higher than Lieut.-Col. or equivalent.

\* From these figures it is seen that sixty-five per cent, or about two-thirds of the replies contain a request for information or assistance.

25% hold the rank of Major or Lieut.-Col. or equivalent.

63% hold commissioned rank up to and including Captain (Army) or equivalent.

5% hold non-commissioned ranks.

The requests for information and assistance are so varied that it will be some time before all can be answered. However, all are in hand and every effort will be made to keep up to date with replies. Already several placements have been made.

### RECOMMENDATIONS

It appears that at least one-third of the members in uniform, or between four and five hundred engineers, are going to require new positions after demobilization. It is therefore suggested that from the point of view of both employer and prospective applicant for employment, contact could usefully be established now. This can be arranged easily if companies that may be able to employ more engineers would make known to the Institute the number and type of persons they expect to be able to use. In this way preliminary negotiations may be started quickly which will be helpful to the man still in the service. It will be comforting to him to know that there are places that are interested in employing him after demobilization. Too, it is quite possible that in individual cases demobilization might be expedited if useful employment is awaiting discharge. Members who have openings for employment now or who expect to need men later are asked to communicate with the rehabilitation officer at Headquarters.

### PRESIDENT VISITS MARITIMES

The traditional hospitality of the Maritimes was amply exhibited to Dean Fetherstonhaugh and Mrs. Fetherstonhaugh during their two weeks visit there. It is encouraging to see the increasing activity in the smaller branches and the general enthusiasm throughout. No presidential tour has prompted larger attendances at meetings or offered more diversions of a social nature.

The officers of all branches co-operated to establish new records for almost every function and to provide a programme full of interest and activity. As this was the first trip to that part of Canada by the president and Mrs. Fetherstonhaugh, arrangements were made to show them a great deal of the country, in the time available between meetings.

The presence at some or all of the branch meetings of officers from other branches was a pleasant feature. J. B. Stirling chairman of the Montreal Branch and of the Committee on Professional Interests, at Halifax and G. A. Gaherty of Montreal, a member of the Finance Committee, at Saint John and Fredericton, and Geo. A. Dickson throughout the tour, were very welcome visitors. The addition of such members to the president's party is a manifestation of the national character of the Institute.

Following established custom the president spoke to

*Left to right (seated): Mrs. L. E. Mitchell, Mrs. E. P. Fetherstonhaugh, Mrs. P. A. Lovett, Mrs. J. R. Kaye, Mrs. S. W. Gray.*

*Left to right (standing): Mrs. C. Scrymgeour, Mrs. G. J. Currie, Mrs. E. C. O'Leary, Mrs. H. A. Ripley, Mrs. K. A. Forbes, Mrs. F. H. Sexton, Mrs. J. W. March.*

engineering students at all universities, emphasizing the need of an efficient utilization of time both in college and in professional practice. He also presented the Institute prize at Nova Scotia Technical College and the University of New Brunswick.

At the branches the president spoke on the trends in engineering education, pointing out the desirability and the proposals to include more of the humanities, and also the difficulties of finding a sufficient place for them in an already crowded curriculum. His prominent position in the educational world and his study of the subject enabled him to give a very clear picture of what is ahead.

The tour started with the president's departure from Winnipeg on Friday, April 6th. During his stay of a day in Montreal he and Mrs. Fetherstonhaugh were guests at a luncheon given by Past-President deGaspé Beaubien and Madame Beaubien at their home. At Montreal he was joined by the general secretary and the group departed on the night of April 9th, going direct to Sydney, Nova Scotia. At Moncton, George L. Dickson, vice-president for the maritime provinces, joined the party.

At Sydney there was an inspection trip through the steel plant in the morning and a visit to the Naval Station Protector No. 2 in the afternoon, where the party, after looking over the plant, was entertained at tea by Capt. J. McCullough. Commanders Orde, Wells and Killop also took part in showing the Naval Station to the visitors.

The branch meeting was a dinner held under the chairmanship of Murray Cossitt, but upon the announcement of the branch election results was concluded under the chairmanship of J. A. Macdonald, the newly elected chairman.

The number in attendance was the largest that has participated in a Sydney meeting for a long time and attests strongly to the active policy initiated by the secretary-treasurer of the branch, S. G. Naish.

The following day the party left by train, arriving in Halifax that evening where they were met by officers of the branch and the Association of Professional Engineers of Nova Scotia and J. B. Stirling, chairman of the Montreal Branch and chairman of the Institute's Committee on Professional Interests.

The next day, Friday, was devoted almost entirely to attendance at the meeting of the Council of the Association, to which the president's party had been invited. J. R. Kaye, president of the Association, pre-

sided. At noon the president left the council meeting to speak to the students of Dalhousie, St. Mary's College and the Nova Scotia Technical College in the auditorium of the latter institution. Dr. F. H. Sexton, president of the college, presided. President Fetherstonhaugh presented The Engineering Institute of Canada Prize to John William Powers, S.E.I.C.

The branch dinner was held that night, under the chairmanship of Lawrence E. Mitchell, the chairman of the branch. Distinguished guests at the head table included Rear Admiral L. Murray, Air Vice-Marshal Morfee and Brigadier White, representing the three services, Mayor J. A. Lloyd and J. B. Stirling. A feature of this meeting was the presence of thirteen graduates of the University of Manitoba who had the opportunity of a short interview with the president at the conclusion of the dinner. While the men were dining at the Nova Scotian Hotel, Mrs. Fetherstonhaugh and the wives of the executive were dinner guests of Mrs. Percy Lovett at the Lord Nelson Hotel.

On Saturday morning there was a tour of the harbour arranged by E. L. Cousins, which proved to be one of the most interesting features of the whole maritime trip. In the afternoon officers of the branch drove the party down the coast as far as Chester, returning to Queensland, meeting the other members of the branch executive and their wives at the Seabreeze Hotel, where a shore dinner was enjoyed by everyone. There were twenty-eight present.

On Sunday a tea was given at the home of Mr. and Mrs. G. J. Currie, and in the evening the group gathered again at the home of Mr. and Mrs. S. W. Gray.

Monday morning, the president and party, in company with Mrs. S. W. Gray, Mrs. C. Scrymgeour and L. E. Mitchell, drove to Wolfville where a meeting was held with the students at Acadia University. The chair was occupied by Acting Dean Bernard Cain. President F. W. Patterson and Professor M. S. Macphail were also present. Lunch at the Cornwallis Inn at Kentville preceded the visit to Acadia.

The following morning, Tuesday, April 17th, the party entrained for Sackville, N.B., where they were met by Dr. H. W. McKiel, dean of engineering of Mount Allison University. After a short inspection of the art gallery and other buildings, the president and the general secretary spoke to the students, Byron Kerr, president of the Engineering Society, acting as chairman, and Dr. McKiel introducing the speakers.

From there the party motored to Moncton, making train connections which brought them to Saint John the same evening where they were joined by G. A. Gaherty of Montreal and M. Donald of Halifax. At noon on Wednesday the executive of the branch entertained the party at luncheon at the Admiral Beatty

*Left to right: J. B. Stirling, Rear-Admiral L. Murray, President Fetherstonhaugh, L. E. Mitchell, Mayor J. A. Lloyd, Brigadier D. A. White, G. L. Dickson and J. R. Kaye. Others at head table not in picture: S. W. Gray, Air Vice-Marshal A. L. Morfee and the general secretary.*

Hotel, and the afternoon was spent at an informal meeting with the Council of the Association of Professional Engineers of New Brunswick discussing affairs of common interest. Mr. A. S. Gunn, president of the Association, presided.

On Wednesday night the branch meeting was held, to which the ladies were invited. It was a dinner meeting at the Admiral Beatty Hotel under the chairmanship of C. D. McAllister. Head table guests included His Worship Mayor McKenna, Capt. Heenan representing the Navy, and Colonel Durward the Army. There were three toasts, one to the city, proposed by John N. Flood and responded to by the Mayor; one to the ladies proposed by T. C. Macnabb, responded to by Mrs. E. P. Fetherstonhaugh, and one to the Institute proposed by A. A. Turnbull and responded to by the president.

On Thursday morning, accompanied by officers of the branch and their wives, the group was motored to Fredericton where luncheon was had with the students, and Milton F. Gregg, president of the University of New Brunswick, and members of the staff. Fred Davidson, president of the undergraduates society, was in the chair. At the same time, Mrs. Fetherstonhaugh was entertained by wives of members at the home of Mrs. B. H. Hagerman.

After lunch, the president and the general secretary spoke to the students, Dr. E. O. Turner introducing the visitors, and also introducing Vice-President Dickson and C. D. McAllister, chairman of the Saint John Branch, both of whom addressed the meeting briefly. The Engineering Institute of Canada Prize was presented to Ottis Logue, S.E.I.C., by President Fetherstonhaugh. The afternoon was concluded at the home of Dr. and Mrs. E. O. Turner where tea was served to the visitors, members of the staff and officers of the undergraduates society. The party returned to Saint John the same evening.

On Friday, the 20th, the president and entourage arrived at Moncton at noon, and in the afternoon the President and Mrs. Fetherstonhaugh were motored out to see the famous "magnetic hill" which still remains one of the nation's greatest illusions.

The branch dinner was held at the Brunswick Hotel, the ladies being present. Unfortunately the chairman of the branch, A. S. Donald, was absent from the city, but in his place Vice-President George L. Dickson acted very acceptably. Mr. Dickson introduced the visiting councillors, A. A. Turnbull from Saint John, J. A. Russell from Sydney, P. A. Lovett, A. E. Flynn from Halifax and L. E. Mitchell, chairman of the Halifax Branch. The Hon. Michael Dwyer was also present and, at the chairman's invitation added considerable merriment to the occasion.

On Saturday morning a regional meeting of Council was held in the Brunswick Hotel with councillors present from all maritime branches. The meeting carried on into the afternoon and at its conclusion the councillors were joined by officers of the branch and their wives and all motored to Buctouche where a most delightful oyster and chicken dinner was enjoyed. A feature of the dinner was the description of the proposed Petitcodiac tidal power development given by Geoff Parsons, president of the Moncton Board of Trade. Mr. Parsons circulated copies of preliminary plans which aided considerably in following his description.

From Buctouche the party returned by motor to Moncton where the president, Mrs. Fetherstonhaugh and the general secretary entrained for Montreal.

## PROPOSALS FOR CHANGES IN ADMISSION AND TRANSFER PROCEDURES

The following report was presented in draft form at the February meeting of Council in Winnipeg at which time the chairman was asked to complete it for final presentation. In its present form it was discussed at the April meeting of Council in Moncton and is being published herewith so that members may be informed.

All members are invited to make comments which should be addressed to the chairman, John G. Hall, 711 C.P.R. Building, Toronto 1, Ontario.

At Council Meeting held in Winnipeg on February 6th, last, your Membership Committee submitted a report dealing with the automatic transfer of Students and Juniors. After considerable discussion, it was agreed that the report with suitable revisions should be published in the *Journal* and that members of the Institute be urged to comment on the various recommendations.

At the December 1944 meeting of Council, Mr. H. R. Sills presented a recommendation from the Peterborough Branch dealing with this matter and your Membership Committee was asked to study the problem and report to Council.

In the past it has been difficult to get Students and Juniors to transfer to higher grades as soon as they were eligible. In addition to the extra work placed on the already overburdened Headquarters staff, the Institute has been losing badly needed revenue.

In considering the various recommendations, three particular points were kept in mind, namely the reputation of the Institute, the reduction of work at Headquarters and the financial return. Although all three are important, the reputation of the Institute should always take precedence.

### STUDENTS

1. (a) Students should be automatically transferred to the grade of Junior two years after graduation without the necessity of making formal application or paying transfer fee.

(b) In the case of non-graduates present by-laws should still apply.

### JUNIORS

2. (a) Six years after graduation, or at age 33, whichever comes first, each Junior should be sent an application form for transfer to Member and all particulars available referred to the branch in question for careful investigation and report to Council. If Council decides he is eligible, he should be notified of his transfer to grade of Member without payment of transfer fee. The suggestion has been made that when the above time limit has been reached, a Junior, considered ineligible for the grade of Member, should pay full membership dues and remain a Junior, but your Committee does not consider this equitable.

It is recommended that an adequate period be allowed for the person in question to submit his application and for the branch to complete its appraisal form before the case is considered by Council.

(b) In the case of non-graduates present by-laws should still apply.

(c) It has been proposed also that the grade of Junior should be eliminated. This was discussed at the February Council meeting, but as it is a radical step, it was decided that the matter should be referred to the membership at large for comment.

This proposal would simplify our classifications and might assist in negotiations with the various pro-

vincial associations which have different entrance qualifications. In the medical and legal professions there is nothing similar to our grade of Junior. Should the grade of Junior be eliminated, it would probably be advisable to increase the duration of Student grade to three years.

#### ADMISSIONS COMMITTEE

3. (a) As mentioned in a previous report to Council, your committee strongly recommends the appointment of an Admissions Committee, or Standing Membership Committee, the chairman of which should be a member of Council. This committee should carefully review all applications and present them to Council in three lists:

- i—Those which meet requirements;
- ii—Those which do not meet requirements;
- iii—Borderline cases.

Only those in Class-iii should be considered individually by Council, while those in Class-1 and Class-ii should be considered as a whole unless some member of Council desires further information regarding any particular case.

The value of this arrangement was very clearly demonstrated at Winnipeg where a great deal of Council's time was taken up discussing details of several borderline cases which could have been saved for more important matters, had such a committee collected all details and submitted proper recommendation.

(b) In the past, your committee has stressed the importance of branch reports on applications and the use of appraisal forms already approved by Council. It is believed Branch Membership Committees, which usually act for one year only, should be instructed upon their appointment regarding careful investigation of each application and proper use of the appraisal forms.

After comments have been received from members and branches, your committee will be pleased to give the question further consideration to make a final report.

Yours sincerely,

(Signed) JOHN G. HALL, *Chairman*  
*Membership Committee*

## ENGINEERS' COUNCIL FOR PROFESSIONAL DEVELOPMENT

### A Message to Each Engineer from the Chairman

Everett S. Lee

The semi-annual meetings of Engineers' Council for Professional Development have just been completed and I hasten to tell you of the work. I am sure you will be pleased with the progress for good, even in these busy times of high pressure of war production work in which the engineers are so effectively engaged.

Our committee chairmen met the first day of our two-day meeting. President A. R. Cullimore, chairman of the Committee on Student Selection and Guidance presented his report of full activity. Work in guiding returning veterans is in substantial progress. Though there are many agencies engaged therein, President Cullimore's committee feels that fully 75 per cent of this work in community projects is done by high school people. Thus our efforts as in the past for young engineering students will be continued through the high schools. This will be of particular interest to

local coordinated Engineering Councils to progress this work effectively. To this end President Cullimore asked approval to print 25,000 more copies of "Engineering as a Career."

The second of President Cullimore's projects is that of the Measurement and Guidance Project in Engineering Education which is being progressed by Dr. K. W. Vaughn of the Carnegie Foundation. This work promises to give us test data for the evaluation of the engineering student. The initial test results from some 10,000 entering engineering students into 26 collegiate schools will be the subject of a report to be issued soon. ECPD is proud to have been instrumental in starting this work and to be associated with it when in the future it should have lasting benefit, as it already has had present benefit.

Dr. D. B. Prentice reported for the Committee on Engineering Schools. This is the committee which is responsible for the accrediting of collegiate curricula and whose contributions throughout these past twelve years has been so substantial. Now, following their request, the committee has set itself up to accredit technical institutes. This work has now started. We in ECPD feel that with the growing opportunity of the technical institute the accrediting programme will provide the basis of an orderly evaluation of the place of the technical institute graduate. This is of fundamental importance to the engineering profession.

Dr. Prentice also reported that the "Guide" for academic credits for war-connected educational experience was in circulation and that it has been a great success. This allows an evaluation for credit of the many courses given during these war years. The magnitude of this project was enormous. Under the auspices of the American Council on Education, ECPD contributed both in material and in means. We are proud also to have been associated with this most worthy enterprise.

You are all interested in the status of the engineering schools today. The last paragraph of Dr. Prentice's report is most interesting. I am quoting it completely:

Enrolments at engineering colleges are very low, not over a third, counting freshmen, of five years ago. Nearly sixty per cent of the students are freshmen so that above this class, present enrolment is approximately twenty per cent of pre-war, with senior class registration down to one-sixth. In spite of this condition, most engineering schools are carrying on their programmes with little reduction from normal. Smaller classes will more than offset other disadvantages so that graduates of these years, it is believed, will be as well trained as under ordinary conditions.

This is a statement to bring hope to you in spite of dire conditions. And until college graduates are again entering our profession normally, the load usually carried by the younger engineers will have to be carried by the returning veterans. This is a logical situation which we can make as effective as the normal situation if we give our attention to it.

Dr. Pohl's report of the Committee on Professional Training told of the Junior Reading List which has been prepared. A large edition has been printed. You can obtain a copy from ECPD, at a nominal charge. You will want a copy.

We are all looking forward with great interest to the ECPD Manual for Junior Engineers which Dr. W. E. Wickenden is writing for us. This will be the

Engineer's Handbook of the Engineering Profession. In the hands of the student, the professor, the employer in industry it will give a coordinated picture of the engineering profession and the part each engineer plays in it. This is one of our future gems, and you will hear much more of it in the days to come.

Dean Dougherty could not be present to give the report of the Committee on Professional Recognition but the report of the committee was presented by George Stetson. This is the committee under the chairmanship for these previous years of Charles F. Scott, beloved of all engineers. His death last winter took from us a great friend. His presence everywhere brought enthusiasm for the engineer and the engineering profession. Dean Dougherty's committee plans to continue the work which Dr. Scott has pressed forward with such vigour.

Mr. Boughton reported for the Committee on Employment Conditions for Engineers. His report is a résumé of the actions in the respective Societies. As these have been printed in the Societies' journals they are familiar to you. I will not repeat them. But I will say this. Wherever I go engineers ask me what stand ECPD has taken on collective bargaining. The answer is ECPD has not taken action on this subject. When I am asked my thoughts, I say, I trust each engineer will study to the very end the ramifications of collective bargaining and all that it entails and all that it involves before he enters it from his accustomed position of freedom of action. If he finds it advantageous and worth the amount of freedom he gives up together with the complexity he assumes by entering therein, why well and good, but it is my firm conviction from study and thought that he will be in infinitely better position if he puts his energies into bringing about a realization of the true position of the engineer and of the engineering profession so that he will enjoy the freedom which is rightfully his by reason of the fundamentality of his contributions. The engineer has a most convincing statement to make of his position. Let him make it with conviction and with courage. I am confident he will be accorded the place which the profession justifies. May the engineer look upward to better ways.

Dr. Jackson reported for the Committee on Principles of Engineering Ethics that the work of writing a Canons is progressing. The "Faith of the Engineer" published last year has been most enthusiastically received.

The second day of the meeting was reserved for the Executive Committee of Council. The necessary routines of committee appointments were accomplished. The reports of the committees of the previous day were studied and accepted. A budget was adopted. This was for some \$18,000. The work for the next six months and looking into the next year was established.

You will be interested particularly in some of the actions. You will be interested in the work of the Consultative Committee on Engineering of the War Manpower Commission. Appointed by Mr. McNutt in the fall of 1943 we appeared in Washington to plead for the engineer. We showed the need to the nation that he be continued in his collegiate training and industry. We did not get all we asked but we were told that we did bring a picture of the engineer and his contributions to the war which was received with favour and regard. And now Mr. McNutt has asked that the Engineers' Council for Professional Develop-

ment appoint a representative to the Citizens' Federal Committee on Education which he is setting up in the Federal Security Agency. The other two professions so recognized are the American Medical Association and the American Bar Association. I well remember hearing many times from my engineering associates—why do we not have recognition such as accorded the doctors and the lawyers. I say we have it and we can continue to have it if the engineers will give some of their time to the doing of these things. This is important and it must be progressed with vigour. This is a necessary part of recognition and the more it is recognized and practised the greater will be the participation of the engineers therein. This is a condition which engineers must recognize if they are to have accrue to themselves the position for which they are eager.

And yet we do have that position by virtue of the accomplishments of those who have preceded us and who have given of their time and thought and energies to these things. Let each engineer ask himself how much time he has or he is giving to the progression of the engineering profession. If it is meager then there is still time for him to do more.

I call upon each engineer to give thought and study and time to the opportunity through the ECPD for the advancement of the profession. Will You Help!

EVERETT S. LEE, *Chairman,*

Engineers' Council for Professional Development.

P.S. I have written the above just as though each engineer knows what ECPD is and what it is doing. In the event you do not know of ECPD I will say it is a conference organized to enhance the professional status of the engineer through the cooperative efforts of the following national organizations, concerned with the professional, technical, educational, and legislative phases of engineers' lives.

American Society of Civil Engineers  
American Institute of Mining and Metallurgical Engineers  
The American Society of Mechanical Engineers  
American Institute of Electrical Engineers  
The Engineering Institute of Canada  
The Society for the Promotion of Engineering Education  
American Institute of Chemical Engineers  
National Council of State Boards of Engineering Examiners

ECPD operates by developing procedures to be recommended to the sponsoring organizations, and administering such procedures as are approved, functioning through standing committees on Student Selection and Guidance, Engineering Schools, Professional Training, and Professional Recognition, or through such new committees as may be established.

The objectives of ECPD are to coordinate and promote efforts to attain higher professional standards of education and practice, greater solidarity of the engineering profession, and greater effectiveness in dealing with technical, economic and social problems.

\* If you have any questions regarding ECPD, or wish any of the publications, if you will write to Engineers' Council for Professional Development, 29 West 39th Street, New York 18, New York, or in Canada to The Engineering Institute of Canada, 2050 Mansfield Street, Montreal, your communication will be received and answered.

(National Film Board Photo)

The Advisory Board, Wartime Bureau of Technical Personnel, meets in an office in the Department of Labour at Ottawa.

*Left to right (seated):* Dr. L. A. Wright, general secretary, The Engineering Institute of Canada, representing the E.I.C.; Dean D. S. Ellis, Dean of Faculty of Applied Science, Queen's University, representing the universities; Mr. Alex E. MacRae (chairman), consulting engineer and patent attorney, Ottawa, representing the Provincial Professional Associations; Dr. Paul E. Gagnon, Professor of Chemistry, Laval University, representing the Chemical Institute of

Canada; Mr. E. J. Carlyle, general secretary, Canadian Institute of Mining and Metallurgy, representing the C.I.M.M.

*Left to right (standing):* Mr. J. M. Dymond, chief executive officer, Wartime Bureau of Technical Personnel; Mr. M. F. Goudge, Department of Mines and Resources, representing the Canadian Institute of Mining and Metallurgy; Mr. H. W. Lea, director, Wartime Bureau of Technical Personnel; Mr. I. S. Patterson, general personnel adviser, Wartime Bureau of Technical Personnel. Mr. L. C. Jacobs, director of construction, Department of Munitions and Supply, Ottawa, representing The Engineering Institute of Canada.

## WASHINGTON LETTER

### THE PRESIDENT IS DEAD

News over the last month of great and stirring events has helped soften the shock and sadness of the President's passing. He was a man of crises, accustomed to wresting victory from disaster. The last month has seen the world which he served so well move ever closer to the goals he expended his life to achieve. Not his the fault if we fail now. His death was of a piece with his life. It was swift and incisive, and had all the elements of drama and superb timing. Anti-climax he could not have stood. At the peak of his power and prestige, he takes his certain place among the great of history.

In two fundamentals he changed the outlook of his people. Creating opportunity from despair, he re-oriented the economic domestic life of the United States towards greater social responsibility. In international affairs, he turned the eyes of his people towards the broader horizons of world responsibility and leadership. Leading his country out of mortal danger, first domestic and then international, he was himself an era.

So far forward has he carried his country that his causes may well fare better in hands of other men less prescribed by jealousies, more schooled by necessity in the arts of compromise, more persuasive by virtue of enforced humility. President Truman has shown himself a worthy successor and a good disciple. There has been a noticeable and heartening closing of the ranks, both in a domestic and in an international sense.

### STIRRING EVENTS

Since the last letter was written the Rhine has been crossed in great force. Most of Germany has been overrun. Berlin and Vienna have fallen. Iwa, Okinawa, and Ie are taken, and much of Tokio is in ruins. Russia repudiated the Japanese pact. The Japanese war cabinet resigned. The Pan-American Treaty of Chapultepec has been signed. The Lend Lease Act has been extended for

another year. Before he resigned, Mr. Byrnes issued a stirring and forward-looking report. No fewer than eighteen bills are at present before Congress in implementation of the recommendations of this report. Top vacancies in the important posts of War Mobilization and Reconstruction, Federal Loan Administration, Export-Import Bank have all been well and happily filled. Tough, hard-hitting, highly efficient General Clay has been named Eisenhower's deputy in charge of civil affairs in occupied Germany. (A long standing friend in supply matters, I had occasion to write him our congratulations on three counts at once. He was also recently awarded the Legion of Merit and the Distinguished Service Medal). Plans for the vitally important San Francisco Conference have moved forward in spite of setbacks and some disappointments. At Mr. Truman's request, Marshal Stalin has sent Commissar Molotoff. At one crucial point in preliminary negotiations, the cheerful optimism and drive of Secretary Stettinius stood all in good stead. Said he, "We shall not succeed if every road block or land mine on the road to peace throws us into a panic and, conversely, if every hundred years of clear going makes us think there is nothing more to worry about."

### GRIM WINTER AHEAD

It is most important, however, that the stirring developments of the last month should not obscure the extremely difficult job remaining to be done in Europe, quite apart from the Pacific. In many ways, the very speed of the occupation of Germany makes the position much more difficult. Our situation in Germany will now be the same as it was in other occupied countries. We, and not the Germans, will have to shoulder the responsibility for the maintenance of life and the continuance of essential services and relief. We will have to do this under conditions much less favourable than those obtaining before we took over, desperate though they may have been. There are some who hint that

the speed and extent of the German withdrawal may be a kind of political sabotage calculated to throw an almost impossible problem into the lap of the United Nations. With typical German thoroughness, the problem will be further complicated by a ruthless, well-organized and carefully planned underground sabotage movement. It was no doubt with these facts in mind that General Eisenhower wrote his recent letter to the President on the postponement of V-E Day. Officials returning from Europe all bring the same story. Irrespective of the military situation next winter will be desperately difficult. It will be far the worst winter that Europe has so far experienced. Coal, food, and transportation will all be critical and probably below subsistence requirements. I was talking recently to the head of the Netherlands Mission. Conditions discovered in reoccupied Holland are quite beyond the reach of the imagination of those of us who are fortunate enough to enjoy the security of countries removed from the actual ravages of war. Food is not the first requirement of the unfortunate Netherlands. General starvation has gone beyond that point and the great need is for blood transfusions before people are able to begin to return to any semblance of normal diets. Vast tracts of land flooded with salt water will take years to recuperate. Dikes and canals have been destroyed and the barges which carry the life of Holland have been sunk or confiscated. Hardships are even worse than those visited on Holland after the Spanish Wars, and the terrible question is "How many will not survive the next few weeks?" Far from ceasing with V-E Day, the responsibilities of the more fortunate members of the United Nations will in many regards increase and become more difficult—more complicated. It will be an immense task to obtain the appropriations, the supplies, and the help in sufficient quantities for countries suffering the worst ravages of war, and to obtain this help from more fortunate countries who, by virtue of their very position, will be bending their efforts to return to civilian production and to put wartime controls and restrictions behind them.

#### WILLIAMSBURG

In lighter vein and by way of exemplifying contrast, it was possible recently for me to spend a day revisiting colonial Williamsburg. It was the week before Easter and the cherry blossoms, apple and flowering quince, and, best of all, the redbud, were in the height of their glory. The sense of interdependence and inter-relation of British and American history and customs and tradition which one feels on visiting Williamsburg and its historical surroundings such as Yorktown, Jamestown and Richmond, seemed stronger than ever. The foyer of the delightful Williamsburg Lodge is dominated by an excellent life-size oil portrait of Prime Minister Churchill. After a few minutes pleasant walk, one can be standing in the Great Hall at William and Mary College, the central building of which was designed by Christopher Wren. Much of Williamsburg is restoration but this original Wren building is still extant and is still in active use. Along one wall of the Great Hall are portraits of the Randolph family. It is presumed that this may be an early branch of the American ancestors of Mr. Churchill. The remains of several of the most illustrious members of this family lie buried under the crypt of the chapel. His American connections enable Mr. Churchill to see a great need and meet it by a bold stroke of imagination which sweeps aside the many difficulties. He recently made a proposal for a common or joint citizenship for the peoples of the United States and the United Kingdom.

It was with very deep regret that I had to be out of Washington on the day of the President's funeral. My wife tells me that the funeral procession and the silent sorrow of the great crowds was very impressive. It so happens that I was returning to Washington at the time that the President's funeral train was about to leave for Hyde Park, and we were due to pass just outside Washington. Just before Baltimore I went and stood on the observation platform at the rear of the train. It was after 10.00 o'clock at night. At each station, both sides of the tracks were guarded by soldiers spaced at about ten paces. Behind them were crowds of silent people just waiting to see the train go by carrying the President on his last ride. The sight was repeated over and over again all the way into Washington. At each small crossing and way-station there would be guards and more crowds. The funeral train was in two sections. The first section carried the press and some officials. After the first section had passed, we watched the block signals, and finally saw the poles light up from the approaching headlights of the President's train. We slowed almost to a stop to let it pass. It also was travelling comparatively slowly for the benefit of the crowds. It was a beautiful train of some twelve or fifteen matched black cars drawn by two of the largest type diesel electric locomotives, also black and highly polished. While the train carried the official party and leading members of the government and the services, the curtains were drawn in nearly all the carriages except the last. This was the President's carriage, and it was the one he used as his office when travelling. This was fully lighted and the curtains were all up, and the rear of the carriage was open. Armed guards representing all the services attended. The flag-draped coffin sat at the very end of the carriage. I shall always remember that scene, and the patch of light diminishing into the night dominated by the brilliant splash of colour made by the draped Stars and Stripes.

E. R. JACOBSEN, M.E.I.C.

April 24th, 1945.

#### MEETING OF COUNCIL

A regional meeting of the Council of the Institute was held at the Brunswick Hotel, Moncton, N.B., on Saturday, April 21st, 1945, convening at ten o'clock a.m.

*Present:* President E. P. Fetherstonhaugh (Winnipeg) in the chair; Vice-President G. L. Dickson (Moncton); Councillors A. E. Flynn (Halifax), P. A. Lovett (Halifax), E. B. Martin (Moncton), J. A. Russell (Sydney), A. A. Turnbull (Saint John), and General Secretary L. Austin Wright.

There were also present by invitation—Past President H. W. McKiel (Sackville); A. S. Gunn (Moncton), president of the Association of Professional Engineers of New Brunswick; L. E. Mitchell, chairman of the Halifax branch; V. C. Blackett (Moncton), past-councillor and secretary-treasurer, and A. Gordon, member of the executive of the Moncton Branch.

In welcoming the councillors and guests, President Fetherstonhaugh invited everyone present to take part in the discussions. He felt that regional meetings of council were very helpful as they gave the councillors in the different parts of the country an opportunity to attend and to assist in the deliberations.

*Rehabilitation of Members in the Armed Forces—*

The general secretary reported that since the last meeting of Council, in accordance with authority previously given by Council and with the approval of the Finance Committee, Major D. C. MacCallum had been engaged as Rehabilitation and Personnel Officer of the Institute. After four and a half years' service overseas, Major MacCallum has just been released from the Army because of wounds. There has been a good response to the questionnaire — about 2/3 of those replying have indicated that they would appreciate some help and advice from the Institute in getting rehabilitated.

*Community Planning*—The general secretary reviewed the situation with regard to the Institute's interest in community planning. At the last meeting of Council the Toronto councillors had been appointed a committee to recommend to Council the makeup of the committee on community planning authorized at the annual meeting of the Institute in Winnipeg, and they were also asked to contact Mr. Bunnell and the Royal Architectural Institute of Canada, with a view to furthering the establishment of a community planning Institute.

Mr. Turnbull and Professor Flynn reported on the activities in Saint John and Halifax in connection with this work, and it was unanimously agreed that something should be done quickly to get engineers interested and active in the work of community planning. No report had yet been received from the committee appointed at the last meeting, so that no further action could be taken at this time.

*Cooperative Agreement in Quebec*—The general secretary reported on the number of applications which had been received under the terms of the recently completed cooperative agreement between the Institute and the Corporation of Professional Engineers of Quebec. One hundred and thirty-two applications had been received from members of the Corporation for membership in the Institute and 303 from members of the Institute for membership in the Corporation. Also under the terms of the agreement, 108 Students and Juniors of the Institute who were members of the Corporation had applied for transfer to the class of Member in the Institute.

*Employment Conditions*—The general secretary presented a report from R. E. Heartz, chairman of the Committee on Employment Conditions, in which the committee reaffirmed its report to council of December 16th, 1944, regarding support in the establishment of a collective bargaining agency in each province.

The general secretary explained that the Council of the Institute had declared its willingness to support the Federation and even aid it financially, provided its membership was open to all professional workers, whether they belonged to any organization or not.

The committee concluded its report by confirming its previously expressed opinion on the interpretation of the Minister's ruling, namely, that if engineers wished to bargain they may vote separately and therefore cannot be included with or outvoted by labour.

The general secretary read a letter from Alex. E. MacRae, chairman of the committee of fourteen, in which he discussed the possibility of the newly formed joint organization superseding the committee of four-

teen on matters related to collective bargaining. He was of the opinion that it "would seem a rather inefficient and expensive procedure to have two committees duplicating their efforts in considering this particular matter, and particularly since they represented substantially the same groups."

Mr. MacRae was of the opinion that the position of the Institute with reference to the new council should be clarified. He suggested that to avoid unnecessary duplication of meetings and expenses perhaps the committee of fourteen "would be disposed to shift its responsibility to the Canadian Council."

There was a prolonged discussion, in which it was pointed out that as the committee of fourteen and its committee of three had been duly appointed to carry on the work of collective bargaining it seemed wise to ask the committee of three to continue to function along the lines for which it was created. It was pointed out that up to the present time the new council had had no authority from the fourteen societies to take over this work.

Professor Flynn inquired as to whether or not the committee of three had been set up only to handle the brief on collective bargaining, and Mr. Gunn stated that as far as the New Brunswick Association was concerned they would prefer to have the committee of three continue with whatever work there was on collective bargaining, representing the committee of fourteen.

Mr. Turnbull, referring to the comment of Mr. Gunn, made the following motion—That the Engineering Institute of Canada go on record as approving of the continuation of the committee of three as presently constituted to deal with collective bargaining. This motion was seconded by E. B. Martin and after further discussion was carried unanimously.

*Engineers and the Design of Buildings*—The general secretary stated that there was nothing further to report on this at the present time. The Institute had expressed its desire to cooperate, and a committee of six—three from the Institute and three from the Corporation of Professional Engineers of Quebec—had been appointed to consider the various matters as they come up, including the appeal in the Brian Perry case and the amendments to the Engineers' Act. There would not be much publicity in regard to the work of the committee, but the general secretary felt that the councillors should know that the matter was in competent hands and would be prosecuted as vigorously as possible.

*Deterioration of Concrete Structures*—The general secretary reported that Mr. R. B. Young had accepted the chairmanship of the interim committee to survey the situation and make recommendations as to what action, if any, the Institute should take. The committee hoped to meet shortly and would report to council in due course.

*Committee on the Young Engineer*—The general secretary reported that there had been many discussions as to a suitable person to replace Harry Bennett as chairman of the Committee on the Training and Welfare of the Young Engineer. One member who seems to be well qualified for the work has been approached, and he has been very much interested in the proposal. However, he is a very busy man and questioned whether he would be able to give the

necessary time to the work of this important committee. He was giving the matter serious consideration, and would let council have his answer at an early date.

*Montreal Branch Councillor*—On the motion of Prof. Flynn, seconded by Mr. Russell, it was unanimously resolved that upon the recommendation of the Montreal branch executive Mr. C. A. Peachey be appointed councillor for the Montreal Branch until the next annual election to replace Mr. V. E. Gage who had recently been made Vice-President.

*Alberta Association Representative on Council*—It was noted that Mr. P. M. Sauder had been reappointed as the representative of the Association of Professional Engineers of Alberta on the Council of The Engineering Institute of Canada for the year 1945.

*Committee on Professional Interests*—The general secretary explained that when this item was put on the agenda it was expected that Mr. Stirling, the chairman of the committee, would be at the meeting. Unfortunately, although Mr. Stirling had been with the president in Halifax, he had had to return to Montreal before the Council meeting.

The president explained that he and the other officers had been fortunate in being able to meet with the councils of the associations in Nova Scotia and New Brunswick. He was very grateful to the associations for having made these meetings possible. He pointed out that the Institute was not represented on the new council which had been set up by certain other organizations in January, and that, if the meeting so desired, the matter could be discussed now even without a report from Mr. Stirling.

There was a general discussion in which the opinions of various provincial organizations were given and it was evident that there was still a substantial difference of opinion, particularly between professional engineering organizations, on the justification of the new body. Past-President McKiel believed that a definite protest should be made by the Institute and by the associations on the procedure taken at the meeting in Ottawa at which the decision was made to launch the new council.

Mr. Turnbull believed that any difference of opinion between the nine professional engineering organizations in Canada was likely to defeat some of the purposes which were in the interests of the profession. He did not favour the setting up of another organization although he believed that something might be gained by establishing a committee which could study the whole situation or be available for emergencies. He thought that the provincial professional organizations and the Institute would be quite capable of handling any matters which developed involving the profession of engineering.

After further discussion it was agreed that, inasmuch as there was no definite proposal before the meeting from the Committee on Professional Interests the matter should be left in abeyance until the next meeting of Council.

*Technical Institutes*—Further consideration was given to the advisability of establishing technical institutes across Canada. This subject had first been considered at a meeting of Council in February 1944, where, after lengthy discussion on a memorandum prepared by Dean C. R. Young, which had been cir-

culated in advance, Council recorded its approval in the following resolution:

That the Council of the Institute approves of the principle of establishing a number of technical institutes in Canada in accordance with the memorandum submitted by Dean C. R. Young . . . and that the Institute request its branches in the various provinces to bring the need for some action in this matter to the attention of the provincial departments of education.

Every branch of the Institute had been circularized on the subject and in not one instance had a reply been received which did not favour the establishing of such institutes. In most instances the branches set up organizations which have actively pursued this subject ever since.

From the discussion at this latest meeting of Council it was evident that all present recognized the need for such technical Institutes, and on the motion of Mr. Lovett, seconded by Professor Flynn, it was unanimously resolved that Council reaffirm the opinion expressed at the February 1944 meeting.

*Membership Committee*—In the report of the Membership Committee presented to the annual meeting of council, certain recommendations had been made which were so far-reaching in their effect that it had been decided that the report should be printed in the *Journal* and distributed to the branches with a request for comment. In view of certain suggestions which have been made, Mr. Hall, the chairman of the committee, had been asked to revise the report somewhat, and the general secretary now presented the revised edition of the report, which he read to the meeting.

The report presents three definite recommendations for consideration: (1) automatic transfer of Student and Juniors—(2) possible elimination of the class of Junior—(3) appointment of an admissions committee.

The complete report will be printed in the *Journal* and distributed to branches and councillors, and while the recommendations are not now before council or the membership in final form, they are definitely in the minds of some of the members, and it has been thought that it would be helpful if this regional meeting of council had an opportunity of discussing the recommendations and making any suggestions or enquiries.

The general secretary outlined the situation in regard to the automatic transfer of Students to the class of Junior. In the case of university graduates this would present no difficulty. Most of the Students would be glad to be transferred in that way.

The elimination of the class of Junior would be a little more difficult to bring about. Some of the provincial Associations had already eliminated that classification.

Mr. Turnbull suggested that if the Junior classification was eliminated it might be desirable to have another classification, possibly called Associate Member, to which graduates could be elected until such time as they had had the required professional experience to qualify them for full membership in the Institute.

The general secretary pointed out that as the Associate Membership classification had been eliminated in 1940, if it were now revived the Institute would be going backwards instead of forward. Possibly what Mr. Turnbull had in mind was that we

might suggest another name for the Junior classification.

Mr. Mitchell was of the opinion that there should be some classification which would cover the period during which young engineers would be expected to acquire the necessary experience between the time of graduation and when they can become full Members.

There was considerable discussion on the suggested elimination of the Junior classification, during which it was pointed out that if the Junior classification was eliminated it would not be necessary to discuss the question of automatic transfer from the class of Student to that of Junior. There would, however, appear to be some difficulty in providing for automatic transfer from the class of Student to that of Member.

As it was apparent that all the business could not be completed before lunch, the meeting was adjourned at 12.40 and reconvened at 1.40 p.m. with the president in the chair.

Continuing the discussion on the report of the Membership Committee, Council considered the desirability of appointing an Admissions Committee which would carefully review all applications and present them to Council in three lists, as follows:

- i—Those which meet requirements
- ii—Those which do not meet requirements
- iii—Borderline cases.

Only those in Class—iii should be considered individually by Council, while those in Class—i and Class—ii should be considered as a whole unless some member of Council desires further information regarding any particular case.

The general secretary was very much in favour of this Admissions Committee, and wondered, if such a committee were appointed, if the list of applications that is now sent out to councillors every month could be eliminated. Would the councillors be willing to give up the prerogative that is theirs of voting on each individual application, and leave the decision to the committee? The list would be published in the *Journal* as usual, and the branches would still have the opportunity of going over the applications and making their recommendations.

Dean McKiel pointed out that if such a change in procedure were made, Council would still make the final decision on all applications when they were presented to a council meeting.

Following some further discussion, it was unanimously agreed that it was the general feeling of this meeting that the possibility of this new method of handling applications should be investigated. It was noted that after the report had been circulated and comments received from members and the branches, the committee would give the matter further consideration and would make a final report to Council.

*Annual Meeting 1946*—On the motion of Mr. Lovett, seconded by Mr. Turnbull, it was unanimously resolved that the invitation of the Montreal branch to hold the 1946 annual meeting in Montreal be accepted.

*Conference of Undergraduates*—At the last meeting of Council, consideration had been given to ways and means whereby the Institute could do more for the undergraduates. It has been suggested that it might be possible, at the time of the Institute annual meeting, to hold a conference of representatives of the engineering undergraduate societies of the various

universities. The general secretary, acting on council's instructions, had communicated with the undergraduate societies and although to date response had been received from only two—Nova Scotia Technical College and University of New Brunswick, they were both very strongly in favour of the proposal. This progress report was accepted, and it was agreed that the general secretary should continue his negotiations.

*Harry Bennett Memorial*—At the annual meeting of Council held in February in Winnipeg, it had been decided that a special prize or fund should be established to commemorate the name and work of Harry F. Bennett, who had been chairman of the Institute's Committee on the Training and Welfare of the Young Engineer. Since then there had been some correspondence between officers of the Institute, but no definite recommendation had yet been made. It was suggested that it might be desirable to appoint a committee to gather ideas and see what form this memorial should take. Following some discussion, it was agreed that it should be left with the president, in consultation with other officers, to select a chairman for such a committee and to report back to the next meeting of Council.

*Committee on the Engineer in the Civil Service*—The general secretary read a letter regarding the new salary structure for professional, scientific and technical workers in the Civil Service, and suggesting that it might be possible to arrange for a further communication from the Engineering Institute to the Minister of Finance urging action on the improvement of salary conditions for engineers and professional workers in the Civil Service.

The general secretary presented a draft of a resolution which might be presented to the Minister. Following some discussion, on the motion of Mr. Lovett, seconded by Mr. Russell, it was unanimously resolved that the Institute's Committee on the Engineer in the Civil Service should be asked to take this matter up with the Minister of Labour.

*American Society of Civil Engineers—Column Research Council*—The general secretary read a letter from the chairman of an "organizing committee" of the A.S.C.E. inviting the Institute to participate in the formation of a proposed Column Research Council, and to name three representatives, to work with those from other organizations.

Following some further discussion, on the motion of Mr. Russell, seconded by Mr. Dickson, it was unanimously agreed that Mr. Pratley be approached and if he consents to act, that he, in consultation with the president, be asked to name the other two representatives.

*City of Montreal—List of Electors*—The general secretary pointed out that the Engineering Institute, as a property owner in the City of Montreal, may be entered on the voters' list and record its vote through a representative duly authorized by a resolution bearing the seal of the Institute. Such representative must be an officer or an employee of the Institute. To comply with this requirement, on the motion of Prof. A. E. Flynn, seconded by Mr. P. A. Lovett, it was unanimously resolved that L. Austin Wright, general secretary of The Engineering Institute of Canada, be appointed as the authorized representative of the Institute to vote on its behalf in the City of Montreal.

## ELECTIONS AND TRANSFERS

A number of applications were considered and the following elections and transfers were effected:

### Members

- Brock**, Thomas Leith, B.A.Sc., M.A.Sc. (Univ. of B.C.), i/c publications dept., Aluminum Laboratories Ltd., Kingston, Ont.
- Brusset**, John Albert, Mining Engr. (Nat. Sch. Mines, St. Etienne, France), vice-pres. and managing dir., West Canadian Collieries Ltd., Blairmore, Alta.
- Callaghan**, John Clinton, B.Sc. (McGill), works mgr., Canada Works, Steel Co. of Canada, Hamilton, Ont.
- Diamond**, Randalphe William, B.A.Sc. (Univ. of Toronto), gen. mgr., Consolidated Mining & Smelting Co., of Can. Ltd., Trail, B.C.
- Dyck**, Jacob Edward, B.Sc. (Mech.), (Univ. of Sask.), statistician, indus. engrg. dept., Aluminum Co. of Canada, Ltd., Arvida, Que.
- Keay**, John Alexander Dishington, gen. supt., Northern Construction Co., & J.W. Stewart Ltd., Vancouver, B.C.
- Kellett**, James Edward, B.Sc. (civil), (Univ. of Man.), senior asst. engr., Dept. of Public Works, Canada, Winnipeg, Man.
- Kraft**, Ferdinand, Diplom-Ingenieur & Doctor-Ingenieur, (Tech. Univ. of Darmstadt), i/c Kipawa Mill Research Dept., Temiskaming Mill, Canadian International Paper Co., Temiskaming, Que.
- Lambert**, Lorne C., B.Sc. (mech.), (Queen's Univ.), dust control engr., Aluminum Co. of Canada, Ltd., Arvida, Que.
- Lyall**, James Russell, sr. designing dftsman., City of Vancouver, B.C.
- Mason**, George Meredith, B.A.Sc. (Univ. of Toronto), technical director, Arvida Works, Aluminum Co. of Canada, Ltd., Arvida, Que.
- McGillivray**, Donald Lachlan, Lt. Comdr. (E), B.Sc. (chem. Engr.), (Queen's Univ.), Staff of Director of Naval Engrg. Development, N.S.H.Q., Ottawa, Ont.
- Monk**, Angus Orr, B.Sc. (elec.), (Queen's Univ.), Lieut. Col. (T.S.O.I.) A.D.M.E., Arm't. Group, D.M.E., N.D.H.Q., Ottawa, Ont.
- Nasmith**, Douglas Forbes, B.A.Sc. (Univ. of Toronto), new products development engr., Aluminum Co. of Canada, Ltd., Arvida, Que.
- Pawlikowski**, Joseph, M.Sc. & Elec. Engr. (Inst. of Technology, St. Petersburg, Russia), D.Eng. (Institute of Technology, Warsaw, Poland), asst. professor, Ecole Polytechnique, Montreal, Que.
- Scott**, Ainsworth David, B.Eng. (civil), (McGill), office of the second asst. engr., Jamaica Government Railroad, Kingston, Jamaica.
- Stewart**, Robert Alexander, B.Sc. (Elec.), (Univ. of Man.), engr., City of Winnipeg Hydro Electric System, Winnipeg, Man.
- Walsh**, Geoffrey, Brigadier, C.B.E., D.S.O., B.Eng. (McGill), Chief Engineer, 1st Canadian Army Overseas.
- Williams**, Charles Reginald, vice-pres. & engr., Dickie Construction Co., Ltd., Toronto, Ont.
- Youell**, Leonard Lynde, B.A.Sc. (Univ. of Toronto), steam engr., engrg. div., development dept., The Solway Process Co., Hopewell, Va., U.S.A.

### Juniors

- Dupuis**, John Joseph, (N.S.Tech.), Elec. Sub-Lieut., R.C.N.V.R., St. Anselme, West Co. N.B.
- Henderson**, Ian Balfour, B.Sc. (civil), (Univ. of Man.), dftsman, Port Arthur Division, C.N.R., Winnipeg, Man.
- Hobbs**, David Haydn, B.Eng. (chem.), (McGill), Aluminum Co. of Canada, Ltd., Arvida, Que.
- Honeywell**, William Robert, B.Sc. (mining), (Queen's), asst. supervisor, fluoride plant, Aluminum Co. of Canada, Arvida, Que.
- Jones**, Robert John, B.Eng. (McGill), Lieut. (E), staff of Director of Ship Repairs, Royal Canadian Navy, N.S.H.Q., Ottawa, Ont.
- King**, James Malcolm, B.A.Sc. (Univ. of Toronto), metallurgist, Canadian General Electric Co., Peterborough, Ont.
- Lewis**, Ronald Wilfred James, B.A.Sc. (Univ. of Toronto), asst. supervisor, ore plant, Aluminum Co. of Canada, Ltd., Arvida, Que.
- Marlatt**, Charles Douglas, Elec. Sub. Lieut. (N.S. Tech.), R.C.N.V.R., Vancouver, B.C.
- McKinnon**, William John, B. Eng. (mech.), (McGill), junior engr., Dominion Oilcloth & Linoleum Co., Limited, Montreal, Que.
- McQuire**, Ralph D., B.Sc. (Queen's), chem. engr., supervisor of hydrate dept., Aluminum Co. of Canada, Ltd., Arvida, Que.
- Miller**, John Joseph, B.A.Sc. (Univ. of Toronto), tech. asst. to ore plant supt., Aluminum Co. of Canada, Ltd., Arvida, Que.

- Ott**, Thomas Edward, B.Sc. (C.E.), (Tri-State College, Indiana), stress engr., Fleet Aircraft Limited, Fort Erie, Ont.
- Segalowitz**, Kalman, B.C.E. (Coll. City of N.Y.), asst. supervisor, project staff, engrg. dept., Canadian Car & Foundry, Fort William, Ont.
- Sick**, Arthur Emil, (N.S. Tech.), Elec. Sub. Lieut. R.C.N.V.R., H.M.C.S. Cornwallis, Victoria, B.C.
- Simard**, Laurent, B.A.Sc. (Laval), asst. supervisor, fluoride plant, Aluminum Co. of Canada, Ltd., Arvida, Que.
- Tanner**, Charles Jewell, B.Sc. (mining), (Queen's), asst. supervisor, Aluminum Co. of Canada, Ltd., Arvida, Que.

### Transferred from the class of Junior to that of Member

- Gordon**, Harold Cowan Morton, B.Sc. (mining), (McGill), pres. & genl. mgr., Acadia Coal Co., Stellarton, N.S.
- Ross**, Arthur LeBreton, B.Eng. (McGill), plant engr., Pickering Works, Defence Industries Limited, Ajax, Ont.
- Ross**, Donald, B.Sc. (civil), (Univ. of Alta.), supervising inspector, Department of National Defence, Edmonton, Alta.

### Transferred from the class of Student to that of Member

- Buhbis**, Nathan Simon, B.Sc. (C.E.), (Univ. of Man.), engr. water works & sewerage, Water Works, Winnipeg, Man.
- Duncan**, George Paterson, F/O., B.Sc. (C.E.), (Univ. of Man.), navigation instructor with R.C.A.F., Charlottetown, P.E.I.
- MacDonald**, Arthur Lamond, Major, B.Eng. (elec.), (N.S. Tech.), inspector of elec. engrg., Inspection Board of the United Kingdom and Canada, Ottawa, Ont.
- Suthren**, Joseph William, B.Eng. (mech.), (McGill), sr. supervisor of ammunition production, Canadian Industries Limited, Brownsburg, Que.
- Tait**, Eric, B.Eng. (civil), (McGill), structural design engr., G. Lorne Wiggs & Co., Montreal, Que.

### Transferred from the class of Student to that of Junior

- Blanchard**, John Rust, B.Eng. (McGill), bleachery chemist, International Paper Co., Temiskaming, Que.
- Cunningham**, Robert Auld, B.Sc. (C.E.), (Queen's), asst. to res. engr., plant design & Mtee. work, Sorg Pulp Co., Port Mellon, B.C.
- Duncan**, Frederick Robert, Second Lieut., R.C.C.S., B.Eng. (elec.), (McGill), Officers' Mess, Vimy Barracks, Kingston, Ont.
- Hughes**, Gordon L., B.Sc. (mech.), (Univ. of Sask.), project engr., Frost & Wood Co., Limited, Smith's Falls, Ont.
- Kane**, Redmond John, Lieut. (SB) (E), R.C.N.V.R., B.Eng. (civil), (McGill), c/o Fleet Mail Office, Halifax, N.S.
- Moseson**, Stanley Gustav, B.Sc. (civil), (Univ. of Alta.), engr., Fred Mannix & Co., Ltd., Calgary, Alta.
- Preboy**, Joseph William, B.Sc. (mining), (Univ. of Alta.), asst. engr., Eldorado Mining & Refining Co., Port Radium, N.W.T.
- Simpson**, Jack Lloyd, Lieut., R.C.E., B.Sc. (civil), (Univ. of Alta.), engr. works officer, No. 13, E.S. & W. Coy., A-20, C.A.S.C., T.C., Red Deer, Alta.
- Tivy**, Robert Harrison, B.Sc. (E.E.), (Univ. of Man.), Elect. Lieut., R.C.N.V.R., Gyro Base Mtee. Officer, H.M.C.S., "Scotian", c/o F.M.O., Halifax, N.S.

### Admitted as Students

- Billinkoff**, Louis, (Univ. of Man.), 335 Notre Dame Ave., Winnipeg, Man.
- Cameron**, Alwyn James, (Univ. of N.B.), 64 Portledge Ave., Moncton, N.B.
- Carthew**, Charles William, (Queen's Univ.), 551 Johnson St., Kingston, Ont.
- Cyr**, Reno Joseph, (Univ. of N.B.), Beaverbrook Residence, Fredericton, N.B.
- Julson**, Oliver Melvin, (Univ. of B.C.), 210 London St., Peterborough, Ont.
- Landauer**, Fred, (McGill Univ.), 5852 Sherbrooke St., West, Montreal, 28, Que.
- McDougall**, Roderick Lorne, (Univ. of Alta.), 11146 - 89th Ave., Edmonton, Alta.
- Morgan**, George Walter, (McGill Univ.), 17 Pagnuelo Ave., Outremont 8, Que.
- Nicholls**, John Henry, (Univ. of Alta.), 11019 - 84th Ave., Edmonton Alta.
- Ritchie**, Wendell Philip Jones, (Univ. of N.B.), 145 George St., Fredericton, N.B.
- Roberts**, William Raymond, (Queen's Univ.), 7 Richmond Ave., Kitchener, Ont.

### Students at Mount Allison University

- Black**, Gerald MacLean, Campbellton, N.B.
- Black**, Raymond Ernest, Campbellton, N.B.
- Bowser**, Reginald Burton, Brunswick House, Sackville, N.B.
- Clawson**, Ernest Alexander, 227 Pownal St., Charlottetown, P.E.I.
- Gidney**, Samuel John, Mink Cove, N.S.

Glickman, Saul, 55 Charlotte St., Sydney, N.S.  
 Herdman, Robert, 1 Marell Ave., Corner Brook, Newfoundland.  
 James, Willard Murray, Sunny Brae, West. Co., N.B.  
 Jost, Roland Marton, Yarmouth South, N.S.  
 MacDonald, William Earle, Beech St., Sydney Mines, N.S.  
 Maitland, Henry Crooks, Mt. Allison University, Sackville, N.B.  
 Pinsent, Ralph H., c/o Mrs. W. Greene, Sackville, N.B.  
 Wiles, Albert Vaughan, 35 Robic St., Amherst, N.S.  
 Wilson, William Maxwell, Brunswick House, Mt. Allison, Sackville, N.B.

*Students at Laval University*

Amyot, Bruneau, 23 Fraser St., Quebec, Que.  
 Babinéau, Guy, 166 Garnier St., Quebec, Que.  
 Chabot, Yvon, c/o Laval University, Quebec, Que.  
 Fournier, Jean-Paul, 312 St. John St., Quebec, Que.

Grenier, Pierre, 142 Brown Ave., Quebec, Que.  
 Latouche, Marcel, 14 Ave. Royale, Courville, Quebec, Que.  
 Lavallée, Paul-Henri, Faculté des Sciences, Université Laval, Quebec, Que.  
 Ouellet, Aimé, 46 Sheppard Ave., Quebec, Que.  
 Perron, Gilles A., Ste. Marie, Beauce, Que.  
 Piche, Gerard Arthur, 67 Marguerite Bourgeoys Ave., Quebec, Que.  
 Santerre, Georges-Albert, 146 de Longueuil St., Quebec, Que.  
 Swift, Charles G., 101 Cascades Ave., Shawinigan Falls, Que.  
 Trudel, Lucien, 147 Blvd. de l'Entente, Quebec, Que.

*Students at University of Toronto*

Collings, Dana Buxton, 76 Willingdon Blvd., Toronto, Ont.  
 Craibbe, Harold Kenneth, 43 Eastwood Road, Toronto, Ont.  
 Horton, Graydon Thring, 3 Willecks St., Toronto, Ont.  
 MacDonald, Donald Hugh, 101 Simcoe St., N., Oshawa, Ont.  
 Venton, Donald Maxwell, Drawer E, Bowmanville, Ont.

## Personals

Relatives and friends of members in the active forces are invited to inform the Institute of news items, such as locations, promotions, transfers, etc., which would be of interest to other members of the Institute and which should be entered on the member's personal record kept at Headquarters. These would form a basis of personal items in the *Journal*.

**Dr. A. E. Cameron**, M.E.I.C., Deputy Minister of Mines for Nova Scotia, was elected president of the Canadian Institute of Mining and Metallurgy at the annual meeting held in Quebec last month. A native of Ottawa, Dr. Cameron is a graduate of McGill University and was associated with the University of Alberta for 18 years. He served as councillor of The Engineering Institute of Canada last year, representing the Nova Scotia Association of Professional Engineers.

**Wm. L. Campbell**, M.E.I.C., who has been vice-president of the Brown Company, producers of purified cellulose, of Berlin, New Hampshire, is now in the Food Technology Department, Massachusetts Institute of Technology, at Cambridge, Mass.

**Colonel H. R. Lynn**, M.E.I.C., is at present technical and military adviser to the British Petroleum Warfare Department in the United States. Enlisting at the outbreak of the war with the Royal Canadian Engineers, commanding the 1st Battalion, R.C.E., overseas, he later, with the authority of General McNaughton, became associated in the design and development of flame weapons from the period of their conception to the present time. His field of operation is almost world wide. He returned from the Aleutian Islands some months ago and proceeded overseas on special work returning to America recently. Colonel Lynn is director of Lynn MacLeod Metallurgy Limited, Lynn MacLeod Engineering Limited, at Thetford Mines, Que., and other associated firms.

**Douglas F. Hamelin**, M.E.I.C., has resigned his position with the Department of Transport, Civil Aviation, at Lethbridge, Alta., to open a water supply company in that city to be known as Western Water Wells. Mr. Hamelin has been with the Department of Transport as a water supply engineer for four years in the development of water supply for the aerodromes throughout Manitoba, Saskatchewan and Alberta. This also included a preliminary investigation of water supply conditions within the Arctic Circle along the Mackenzie River. Previously he had been attached to the Prairie Farm Rehabilitation Administration staff in Regina for five years.

## News of the Personal Activities of members of the Institute

**P. F. Peele, M.E.I.C.**

**P. F. Peele**, M.E.I.C., is the newly elected chairman of the Calgary Branch of the Institute. Born at New Westminster, B.C., he graduated from the University of British Columbia with the degree of B.A.Sc. in 1924. Upon graduation he became associated with the Canadian General Electric Company and has been with the company since that time. He was first employed in the testing department at Peterborough, Ont., later becoming sales engineer at Vancouver, B.C. In 1928 he was transferred to the Calgary office as sales engineer, which position he holds at the present time.

Mr. Peele joined the Institute as an Associate Member in 1924, transferring to Member in 1940. He was secretary-treasurer of the Calgary Branch in 1940-41 and served on the Executive last year.

**J. Knox Davidson**, M.E.I.C., has recently been admitted to active membership in the American Institute of Chemical Engineers.

**Colonel J. P. Carrière**, M.E.I.C., has been promoted from the rank of lieutenant-colonel and now holds the position of deputy chief engineer of the 1st Canadian Army in Europe.

**C. H. Wright**, M.E.I.C., maritime district manager of

Canadian General Electric Co. Ltd., has retired after 45 years service with the company. A graduate of McGill University—class of 1896—where he majored in science and engineering and secured his B.Sc. with honours, Mr. Wright spent his immediate post-graduation years in the service of Renfrew Electric Co., Royal Electric Co. and Terminal Railways, Montreal. He became associated with the Canadian General Electric Co. Ltd. in 1900, being engaged first in general installation work and later in the office. In 1906 he was transferred to the agency department—now the apparatus department—as sales engineer. He was appointed manager of the company's Ottawa office in 1907 and district manager at Halifax the following year.

Mr. Wright has always been keenly interested in Institute affairs. He represented the Halifax Branch on the Council in 1926, and is also a past-chairman of that Branch. He is a past-president of the Association of Professional Engineers of the Province of Nova Scotia.

C. H. Wright, M.E.I.C.

**C. A. Morrison, M.E.I.C.**, succeeds C. H. Wright, M.E.I.C., as district manager at Halifax of the Canadian General Electric Co. Ltd. A native of Arthur, Ont., Mr. Morrison graduated from the University of Toronto in electrical engineering in 1927. After a period of service in the operating department of the Hydro-Electric Power Commission of Ontario and as a lecturer in the department of engineering physics at the University of Toronto, Mr. Morrison joined the Canadian General Electric organization in 1930. He entered the company's lighting service department, became lighting service engineer, Montreal, in 1931, and was appointed manager of the lamp division, Montreal, three years later. He remained in the latter position until his recent appointment.

**W. Taylor-Bailey, M.E.I.C.**, has been elected a director of the Montreal Tramways Company. Mr. Taylor-Bailey, who is vice-president and general manager of Dominion Bridge Co. Limited, is also a director of Royal Bank of Canada, National Breweries Limited, Wabasso Cotton Co. Ltd., Dominion Bridge Co. Limited, Robt. Mitchell Co. Ltd., Fairchild Aircraft Ltd., Dominion Engineering Co. Ltd., National Drug and Chemical Co. of Canada Limited.

**C. V. Dunne, M.E.I.C.**, who has been resident engineer with the Naval Service, Works and Buildings, Department of National Defence at Sydney N.S., is now employed by the Standard Gravel & Surfacing Co. Ltd., contractors, at Calgary, Alta.

**D. A. S. Laing, M.E.I.C.**, has been released from the R.C.A.F. with which he was serving as a flight-lieutenant. He has taken a position with the Phillips Electrical Works Limited at Brockville, Ont.

**T. Stanley Glover, M.E.I.C.**, who has been serving with the Wartime Bureau of Technical Personnel for the past three years, has joined the staff of Ferres Advertising Service, Hamilton, Ont. A graduate of the University of Toronto, Mr. Glover has had 15 years experience in the direction of industrial advertising accounts. By agreement with the company with which he is presently associated, his services will be retained by the government in an honorary and advisory capacity.

C. A. Morrison, M.E.I.C.

**J. A. Wilson, M.E.I.C.**, Director of Air Services, Department of Transport, Ottawa, has been awarded the McKee Trans-Canada trophy for 1944. This trophy is awarded yearly for outstanding contributions to Canadian aviation. The selection committee of award for the trophy recommended Mr. Wilson for the award "in recognition of his long service, energetic support and whole hearted efforts in the development of civil aviation and for his untiring endeavours in behalf of the Royal Canadian Air Force in the selecting, surveying and constructing of aerodromes in the prosecution of Canada's war effort and the development of the British Commonwealth Air Training Plan".

**C. A. Peachey, M.E.I.C.**, has been appointed councillor of the Institute to succeed E. V. Gage, M.E.I.C., who has become vice-president upon the resignation of E. B. Wardle. Born in London, England, Mr. Peachey graduated from the University of Toronto in 1927. Upon graduation he became associated with the Northern Electric Co. Limited in Montreal and has remained with the company since that time. His position now is that of works manager of the electronics division. He joined the Institute as an Associate Member in 1937 becoming a Member in 1940.

Neil B. Hutcheon, M.E.I.C.

**Neil B. Hutcheon**, M.E.I.C., has been elected chairman of the Saskatchewan Branch of the Institute. Born in Rose-town, Sask., he graduated from the University of Saskatchewan with the degrees of B.Sc. (Mech. Eng.) and M.Sc. in 1933 and 1935 respectively. He spent the two years after graduation in research work at the University of London, University College, London, Eng.,

returning in 1937 to the University of Saskatchewan, Saskatoon, as assistant professor in mechanical engineering, which position he still holds.

**Lieutenant-Colonel W. A. Capelle**, M.E.I.C., who is attached to the Headquarters Engineering Staff, 1st Canadian Army overseas, has recently been mentioned in dispatches for gallantry in action.

**Philip S. Barratt**, M.E.I.C., of the Consolidated Mining & Smelting Co. of Canada Ltd., has recently been transferred to Kimberley, B.C., as assistant superintendent of construction and maintenance for the Sullivan Mine. He was formerly engineering draughtsman at the plant at Trail, B.C.

**Flight-Lieutenant G. H. Kimpton**, M.E.I.C., has been released from the R.C.A.F. and has accepted a position with Stevenson and Kellogg Limited, management engineers, at Montreal, Que. Previous to his enlistment he was employed by the Oxygen Company of Canada.

**W. J. Johnson**, M.E.I.C., of the Department of Public Works of Canada at Ottawa, who has been on loan to the Winnipeg district office since August 1943, has returned to his work at headquarters.

**Sub/Lieutenant C. B. Britnell**, M.E.I.C., junior engineer in the Toronto district office of the Department of Public Works of Canada has been promoted to assistant engineer. He is at present on active service in the R.C.N.V.R. and upon his return will be attached to the Ottawa district office.

**G. W. Griffin**, M.E.I.C., has been appointed secretary-treasurer and registrar of the Association of Professional Engineers of New Brunswick. C. C. Kirby, M.E.I.C., will continue as secretary emeritus.

**J. Knox Davidson**, M.E.I.C., who recently returned from Australia to the Electric Reduction Co. of Canada Ltd., Buckingham, Que., where he was formerly assistant manager, has resigned from the company. He has accepted a position with Mainguys Limited of Montreal as development engineer.

**R. L. Morrison**, M.E.I.C., has recently taken a position with Fleet Aircraft at Fort Erie, Ont. He was formerly employed by Messrs. Airspeed (1934) Limited at Portsmouth, Eng., and for a time was on loan from the company to the Royal Air Force as technical adviser on the maintenance and operation of aircraft.

**Cuthbert Poirier**, M.E.I.C., has returned to the Department of Highways of the Province of Quebec. He is at present at Ville Marie, Que., in the capacity of division engineer for the counties of Temiscamingue and Rouyn-Noranda.

**L. H. Wheaton**, M.E.I.C., has completed his work with the Department of Munitions and Supply at Halifax and has returned to his former position as construction engineer with the Department of Highways and Public Works, Halifax, N.S.

**H. A. Dixon**, M.E.I.C., chief engineer of the Canadian National Railways, recently retired on pension. Mr. Dixon has been in the service of the C.N.R. for the past 42 years, joining the company as a draughtsman in 1903 and shortly afterwards becoming resident engineer. After serving in a supervisory capacity over engineering activities across the west he advanced to the position of chief engineer of the western lines of the railway. In 1940 he was appointed to chief engineer of operation for the system with headquarters in Montreal.

**James McMillan**, M.E.I.C., has been elected president of the Association of Professional Engineers of Alberta. He has been with the Calgary Power Company since 1927 becoming purchasing agent in 1931, supervising system substations and switching structures, which position he still holds. Mr. McMillan has been active in the Calgary Branch of the Institute and has served successively as secretary-treasurer, vice-chairman and chairman. Last year he was elected councillor of the Institute to represent the Branch. He has also served as councillor of the Association of which he is now president.

**Norman B. Eagles**, M.E.I.C., is at present employed as assistant city electrical engineer, Moncton, N.B. He was formerly engineering instructor, No. 35, E.F.T.S., R.A.F., Neepawa, Man.

**J. W. Sanger**, M.E.I.C., chief engineer, City of Winnipeg Hydro-Electric System, was elected national chairman of the Navy League of Canada Sea Cadet Committee, at the annual convention in Hamilton in March.

**Nicholas L. Hartmann**, M.E.I.C., has accepted a position with Canadair Limited, Cartierville, Que., in the tool and process department. He was formerly with Federal Aircraft Limited at Montreal.

**Fernand Dugal, Jr.**, E.I.C., is now employed as shop engineer, tank arsenal, Montreal Locomotive Works, Montreal. He was previously manager of Jacques Cartier Industries Limited, Longueuil, Que.

**Lieut. (E) H. U. Ross, Jr.**, E.I.C., is now at the Royal Canadian Naval College in British Columbia where he is instructing naval cadets in marine engineering. Before joining the R.C.N.V.R. he was employed with the Frobisher Exploration Company Limited at Ottawa.

**E. Allan Harvey, Jr.**, E.I.C., formerly a flight-lieutenant in the R.C.A.F., has returned to civilian life and is now employed with Canadair Limited, Cartierville, Que., on installation design with respect to instruments and automatic pilot.

**F/O Marcel Papineau, Jr.**, E.I.C., has been awarded the Distinguished Flying Cross. A graduate of the Ecole Polytechnique he was on the staff of the Noranda Mines Limited at Noranda, Que., until his enlistment in 1941.

# Obituaries

**Jacques Drouin, Jr.**, E.I.C., of Mathews Conveyer Company Limited, has been transferred from Port Hope, Ont., to Montreal, Que.

**C. R. Jacobs, Jr.**, E.I.C., is at present employed by the Kuehne Chemical Company, Elizabeth, New Jersey, in the capacity of chemical engineer in charge of plant design and process changes. He was formerly located at the Belvedere, N.J., plant of the Hercules Powder Company as an inspector for the Inspection Board of the United Kingdom and Canada.

**Elec./Lt. R. J. Beaudry**, S.E.I.C., is now stationed at Naval Service Headquarters in Ottawa. He is engaged in electrical remote power control research and applications and also applications of radar to fire control. Lieutenant Beaudry has been in the R.C.N.V.R. since his graduation from Queen's University in 1944 and has just returned from service overseas.

**D. H. Sands**, S.E.I.C., is at present employed by the Northern Electric Company Limited at Montreal in the capacity of junior mechanical engineer.

**W. B. Scott**, S.E.I.C., has enlisted in the Canadian Army, R.C.E., and is at present stationed at Petawawa, Ont. Since his graduation from McGill University last year he had been employed in the engineering department of the Cornwall Division of Howard Smith Paper Mills, Limited.

**Lieut.-Col. C. H. Drury**, S.E.I.C., of Montreal, who is with the First Canadian Army overseas has been made an Officer in the Order of the British Empire.

**André Aird**, S.E.I.C., has recently been released from the R.C.A.F. and has accepted a position in the street lighting division, engineering department, City of Montreal.

(Canadian Army Overseas Photo)

**Captain O. J. F. Rankin**, S.E.I.C., is shown above in the fault control office of the signals control branch of the First Canadian Army headquarters overseas.

*The sympathy of the Institute is extended to the relatives of those whose passing is recorded here.*

**Lorne McKenzie Arkley**, M.E.I.C., professor of mechanical engineering at Queen's University for 22 years, died at his home in Toronto, Ont., on March 19th, 1945.

Born at Leeds, Que., on August 31st, 1875, he graduated from McGill University with the degree of B.Sc. in 1900, receiving his M.Sc. in 1910. He spent two years with the Harbour Commissioners of Montreal as assistant mechanical superintendent and had five years engineering experience with such firms as E. I. Dupont & Company, Wilmington, Del., Wm. Wharton Jr. & Co., Philadelphia, Pa., and Westinghouse, Church, Kerr & Co. of New York. From 1905 until 1910 Professor Arkley was assistant professor of mechanical engineering at Swarthmore College, Pa., when his work included the establishing of a mechanical engineering course and the fitting up of a laboratory. He was also director of the night school of machine design of the Franklin Institute in Philadelphia. In 1911 he joined the staff of the University of Toronto as senior lecturer in mechanical engineering. He later became assistant professor of the department and remained with the University for nine years. In 1920 he was appointed professor of mechanical engineering at Queen's University, Kingston, which position he held until his retirement in 1942. Professor Arkley had done considerable work as consulting engineer in heating, ventilating, power plant design and operation, having written a number of papers on heating and ventilating problems.

Professor Arkley joined the Institute as a Student in 1899, transferring to Associate Member in 1906 and to Member in 1914.

**F/O Bruce Sherwood Corbett, Jr.**, E.I.C., of the 62nd Squadron, R.A.F., India Command, was killed on active service on November 8th, 1944. Born at Montreal, Que., on April 12th, 1914, he received his preliminary education at Edmonton. He graduated from the University of Alberta with his B.Sc. in civil engineering in 1936, and in the following year received the degree of M.A.Sc. from the University of Toronto where he did post-graduate work in mine ventilation.

In 1938 he was employed as assistant to the ventilation engineer at the Froid Mine, International Nickel Company, at Copper Cliff, Ont., and in the following year became underground surveyor and stope engineer. In 1941 he enlisted in the Royal Canadian Air Force. After more than a year in the aeronautical division at Ottawa, he re-mustered to air-crew and received his wings at Uplands in 1943. After service with the Coastal Command in Ireland, F/O Corbett was posted to the Far East in June, 1944, where he was pilot of a Dakota air-craft carrying supplies to British troops in Burma. On November 8th he took off on a supply-dropping operation to British patrols in enemy territory when he was shot down by Japanese fighter planes and perished with all his crew.

F/O Corbett joined the Institute as a Student in 1936, transferring to Junior in 1941.

## BORDER CITIES BRANCH

F. J. RYDER, M.E.I.C. - *Secretary-Treasurer*  
J. G. HOBA, Jr.E.I.C. - *Branch News Editor*

On January 9th, 1945, a meeting of the Branch was held at the Prince Edward Hotel, at which time R. C. Manning, chief engineer of the Canadian Institute of Steel Construction, gave a very interesting illustrated lecture on the **Canadian Universal Trestle**, in connection with the Bailey Bridge.

The regular meeting of the Branch was held on Friday, February 16th, at the Prince Edward Hotel, when J. L. McKeever, engineer in charge of the general engineering division of the engineering department, Canadian General Electric Company Limited, Peterborough, Ont., presented a paper entitled **The Amplidyne Machine**. Mr. McKeever's illustrated lecture showed the control and regulation of speed, voltage, current, and power over a wide range; the control of tension and torque to maintain product, and uniformity in winding, drawing, and other similar operations; acceleration and deceleration to vary the production of high-inertia machines. Mr. McKeever's lecture was well received, and great interest was shown by the excellent attendance at the meeting.

On Friday, March 16th, the regular meeting of the Branch was held at the Prince Edward Hotel, at which time W. D. Wollcott, presented a paper on some phases of arc welding. Mr. Wollcott has been associated with the Hydro-Electric Power Commission of Ontario as inspecting engineer for about 27 years, and in this capacity he has been in close contact with and a leader in the development of new welding and testing techniques. Mr. Wollcott, who supplemented his talk with slides, pointed out the various ways of checking welds and discussed very thoroughly the welding of ferrous materials.

## CALGARY BRANCH

A. B. GEDDES, M.E.I.C. - *Secretary-Treasurer*

The Calgary Branch of the Institute were guests of the Chemical Engineers of Canada at the Palliser Hotel on April 7th. Approximately 100 members attended the joint meeting under the combined chairmanship of P. F. Peele, branch chairman of the E.I.C. and R. Berkoff, branch secretary of the Chemical Engineers.

Two films were shown. The first, "From the Ground Up" showed operation at the Alberta Nitrogen Plant, and other similar plants. This film was very instructive and interesting. The manufacturing of TNT and the care with which this explosive was handled was brought out very finely in picture form. The filling of shells of all sizes, from the small anti-tank rifle shells to the depth charge used by the Navy, was gone into very thoroughly. The film also showed how these war-time plants can be of use in peace-time, and will be of great benefit to peace-time agriculture.

The second film "Synthetic Rubber," shown through the courtesy of the Goodyear Tire & Rubber Co. Ltd., was of great interest. Goodyear's accidental finding of the vulcanizing properties of natural rubber, and the similar properties of synthetic rubber in comparison with natural rubber were brought out. Self-sealing bullet proof gasoline tanks for use on aircraft were explained.

## Activities of the Twenty-five Branches of the Institute and abstracts of papers presented

These two films were thoroughly enjoyed by 100 members present, and showed what great things chemistry is doing towards winning this war.

## HAMILTON BRANCH

W. E. BROWN, M.E.I.C. - *Secretary-Treasurer*  
L. C. SENTANCE, M.E.I.C. - *Branch News Editor*

On Thursday, March 22nd, 1945, members and guests of the Hamilton Branch met at McMaster University on the occasion of the annual Students' and Juniors' Night.

Three papers were to have been presented in the annual Branch competition, but unfortunately, two of the participants were unable to be present, S. W. McKnight, on account of military duties and I. M. MacDonald, because of sickness.

Dr. A. Wingfield introduced the speaker of the evening and sole competitor for the Branch prize, T. J. Boyle, Jr.E.I.C., design engineer, Hamilton Bridge Company. Mr. Boyle chose for his subject **The Design of A Tubular Conveying Gallery**.

Mr. Boyle outlined the unusual problem with which he had been confronted in the design of an inclined tubular conveyor gallery, 8 ft. in diameter and made of 3/16 in. thick steel plate. The conveyor was to be continuous over one support with two spans of 91 and 77 ft. respectively and the effective thickness of material was to be considered as 1/8 in., 1/16 in. being the nominal corrosion allowance.

Mr. Boyle dealt in some detail with the main features of the problem, namely, structural strength required to withstand live and dead loads, wind loads, the effects of corrosion, elastic instability, maintenance and the effect of temperature variation.

With regard to a problem arising from the possibility of elastic instability, Mr. Boyle investigated thoroughly the possibilities of applying the results, both theoretical and experimental obtained by Dr. S. Timoshenko and Mr. L. H. Donnell of the University of Michigan. The experimental data previously mentioned have been obtained in the course of tests on simulated aircraft structures, and published prior to the outbreak of war. Mr. Boyle indicated that since the beginning of the war a very considerable amount of work has been done in connection with the problem of elastic instability in aircraft structures and that at the present time data exist which could be applied directly to the design of the tubular conveyor gallery. These data, however, for security reasons, have not yet been made generally available.

The problem presented by concentrated moments and shears at the centre support was solved by the use of circular reinforcing rings at this section. Adequate expansion joints were provided at both ends of the structure in order to accommodate temperature movements.

At the conclusion of his talk Mr. Boyle answered numerous questions.

An interesting sound picture entitled "Life-Line of the Nation" was presented through the courtesy of

the Association of American Railroads. The film dealt with the response of the American Railroads to the heavy demands of wartime traffic.

J. T. Thwaites entertained the assemblage with interesting side lights on his recent trip to England.

N. Eager, branch chairman, presided. The attendance was 42.

\* \* \*

Friday, April 13th, marked the occasion of the annual joint meeting of the Toronto Section of the American Institute of Electrical Engineers, and the Hamilton Branch of the Institute. For the first time, the newly formed Hamilton sub-section of the American Institute of Electrical Engineers joined the other groups.

N. Eager, chairman of the Hamilton Branch of the Institute called the meeting to order. At the conclusion of his introductory remarks, Mr. Eager relinquished the chair in favour of A. W. Murdock, chairman of the Toronto Section A.I.E.E.

Mr. E. M. Coles, vice-president and director of engineering, Canadian Westinghouse Company, welcomed the gathering on behalf of the company, and introduced the speaker of the evening, Mr. F. K. Fischer.

Mr. Fischer, central station steam engineer, Westinghouse Electric and Manufacturing Company, Philadelphia, Pa., spoke on **Trends in Electric Power Generation.**

The speaker opened his discourse with a historical review of steam turbine development, from the original low pressure, low temperature, non-condensing turbine up to present day high pressure, high temperature condensing reheat and regenerative cycles. The increase in overall efficiency in a period of approximately forty years may be illustrated by the fact that latest modern stations are generating power at a rate of 1 k.w.h. for 10,000 b.t.u. while 30,000 b.t.u. per k.w.h. was common at the beginning of the century.

By use of slides, Mr Fischer outlined advantages to be gained by each of the following factors: increase in pressure, increase in temperature, regenerative feed water heating, reheating cycles, improved condensing apparatus.

The majority of machines now ordered in the United States are for 850 lb. and 900 deg. F. steam conditions. For topping turbines 1250 lb. and 950 deg. F. is the most popular condition. In this connection turbine manufacturers have, over the past two years, made impressive progress in standardization of ratings, and steam conditions.

Many advances have been made in hydrogen cooling of turbo-generators. All new and projected machines 20,000 kw. and over will employ high pressure (15 P.S.I.) hydrogen systems and many 15,000 kw. units will be similarly equipped.

Existing materials and heat cycles have practically limited the steam plant to its present development. Further increases in efficiency can be obtained but appear in general to require uneconomical refinements. The gas turbine has received much publicity over the last few years and the war has given great impetus to its development. At the present time this type of primemover constitutes a very real threat to the reciprocating engine, especially in the air. Mr. Fischer felt, however, that in its present stage of development it might find a place as standby or auxiliary to present steam control station equipment, but will not seriously compete for a number of years.

At the conclusion of his talk, Mr. Fischer answered numerous questions. Upon adjournment, refreshments were served to the 150 members and guests present.

## MONTREAL BRANCH

L. A. DUCHASTEL, M.E.I.C. - *Secretary-Treasurer*  
HYMAN SCHWARTZ, S.E.I.C. } - *Branch News Editors*  
ELI L. ILOVITCH, S.E.I.C. }

Dr. L. O. Grondahl, director of research and engineering, Union Switch and Signal Co., Swissvale, Pa., addressed the Montreal Branch on March 8th, 1945. The subject was **Train Communication.**

Train telephonic communication was developed as a means of increasing efficiency and economy of train operation and secondarily as a safety device. It facilitates exchange of information between both ends of a long train especially when visibility is poor. It is a particularly useful timesaver in switching in yards. It is also possible to converse between different trains up to 10 miles apart or between train and station up to 100 miles apart.

The inductive type of train communication, Dr. Grondahl stated, uses the track as ground and the electrical transmission lines alongside the track to close the circuit. The signal is sent out at 5700 cycles, travels along the electric wire and is picked up by the receiver. This system of contact requires about 500 watts for transmission and about 250 watts for reception of messages. In answering a question from the floor, the speaker mentioned that regular train generated power at 32 volts is used. This type of communication is favored over radio for three reasons (a) secret conversation is possible, (b) no licensing is required, (c) radio transmitting towers are not needed. Several American railroads have these systems in operation today and are planning extensions to this equipment.

D. J. MacDonald was in the chair. There were 125 members present.

\* \* \*

"The manufacture of front line metal aircraft is the sheet metal worker's dream and the production man's headache," Mr. David Boyd, general manager of Victory Aircraft told the members of the Montreal Branch at the meeting held on March 22nd. Although Mr. Boyd's illustrated lecture dealt with the **Aircraft Industry** in general, many of his remarks concerned the Lancaster Bomber. The leading problems of the industry, from an engineering viewpoint, are: the manufacture of thousands of formed sheet metal parts; the draughting and fabrication of double curvature members; the assembly of these parts to accurate contours, especially external (aerodynamic) surfaces; and the maintenance of the proper relative position and interchangeability between large sub-assemblies, as fuselage, wing and tail sections, engines, gun turrets and control-surface units.

The tooling for aircraft production is complicated by the requirements which call for many thousands of different parts but only a few hundreds of each, and the constant stream of modifications which must be incorporated into the aircraft to keep it from becoming obsolete. Aircraft engineers have adopted all the methods used by other industries for forming metals and have developed some of their own, Mr. Boyd stated.

He then discussed in considerable detail the capabilities and limitations of the rubber hydro press and

of the drop hammer. Assembly jigs and interchangeability gauges, up to twenty-five feet in length, are built on the "milk stool" principle, i.e., standing on three legs. They are structurally rigid and stable in themselves, are not affected by uneven floors, are accessible to workers, economical and easily transported.

The "drawings" for engine nacelles, fairings and other double curvature components are made from full scale loftings which are photographed. These photographs are then reproduced on the metal so that repetitive layouts are eliminated. Three dimensional templates obtained from solid mock-ups are extensively used.

Mr. Boyd made the lecture very stimulating by his keen wit and by his disclosure of many interesting facts of the Lancaster Bomber. He also discussed briefly the problems of labour and material supplies, the tremendous war expansion and post-war role of the industry.

Mr. Scheunert presided.

\* \* \*

L. P. Cabana, superintendent and sanitary engineer, Division of Sanitation, Department of Health, City of Montreal, addressed the Montreal Branch on March 5th, 1945. Mr. Cabana, who is also professor at the Montreal Technical School, spoke on **Pollution Hazards in a Water Supply System.**

"The Department of Health wages an unending war against death brought about by water-borne diseases," said Mr. Cabana. All our city water supply comes from the St. Lawrence River, and though it appears to be crystal clear, it may contain deadly disease germs. Since all Montreal reservoirs are exposed to the atmosphere, and since there is then no protecting coat of ice, the maximum pollution of our water supply occurs in the summer. Samples of water are taken daily at different points in the city to make sure that this contamination is not a health hazard.

Cross connections are not permitted in Montreal, though dangerous situations may occur through connections with sprinkler systems, condensing units and during repair work on mains. Whenever possible where cross connections exist, double check valves are used, Mr. Cabana stated.

A blocked pipe may pollute the water supply by permitting water to be back-siphoned into the supply main. Fixtures should be designed, Mr. Cabana went on to say, so that no possible cross-connection may occur. All good modern plumbing fixtures have an integral air gap built in. That is, the overflow level is at least  $\frac{1}{2}$  inch below the fixture supply outlet. This advantage is lost however when a rubber hose is connected to the faucet and allowed to lie in the fixture because a dangerous connection then exists.

C. J. DesBaillets, was chairman of the meeting. There were 85 members present.

#### NIAGARA PENINSULA BRANCH

J. H. INGS, M.E.I.C. - - - *Secretary-Treasurer*  
J. L. McDougall, M.E.I.C. - *Branch News Editor*

On March 1st, a Branch meeting was held at the Welland House, St. Catharines, to which all local members of the Association of Professional Engineers of Ontario were invited. The speaker was Lieut.-Col. T. M. Medland, Director of Public Relations for the Association and his subject was **The Association and Its Accomplishments.** He was introduced by Don

Bracken, chairman of the Branch. The attendance was 82.

Col. Medland outlined the history of the Association and its growth to the present membership of 3,650 with an additional 2,500 student members. The changes in the Act that were made in 1937 helped promote this growth. This year the Association is pressing for certain additional amendments so that mining and chemical engineers will be included.

The speaker explained recent developments in collective bargaining. In 1944, P.C. 1003 made collective bargaining compulsory in all war industries. This is a Dominion ordinance and is effective for the duration of the war. However, six provinces have made the order applicable to all industry under provincial control. This development has posed a question for engineers: should they allow the labour unions to represent them or should engineers press for a separate bargaining agency of their own? At present, those registered engineers who are classed as employees have the power to set up their own bargaining agencies. In Ontario the Federation of Employee Professional Engineers and Assistants is being organized for this purpose.

Col. Medland mentioned the salary schedule that has been drawn up by the Association and also the Technical Service Council, which, besides acting as an employment agency, assists engineers to plan their professional careers.

There are various ways in which the individual engineer can help improve the status of the profession. He should use his seal on engineering plans and reports, should display his certificate in his office and should help promote the proper use of the term "Engineer."

At the conclusion of his address, Col. Medland answered a number of questions and explained the advantages of joining the Federation. The vote of thanks was proposed by P. Buss. Refreshments were served at the conclusion of the meeting.

#### OTTAWA BRANCH

C. G. BIESENTHAL, Jr., E.I.C. - *Secretary-Treasurer*  
R. C. PURSER, M.E.I.C. - *Branch News Editor*

At a largely attended noon luncheon at the Chateau Laurier on March 21st, J. A. Wilson, director of air services, Department of Transport, and recent recipient of the Institute's Julian C. Smith Medal, was the speaker. He spoke on the **Development of Civil Aviation in Canada.**

Whatever may happen to the Alaska Highway or to the Canol project, the airway system to the Yukon and Alaska will surely never be wasted, was one prophecy made by Mr. Wilson. After the war in the Pacific is over it may be expected to assume an important place in the shortest air route to Japan. Hitherto such route has been by way of Honolulu but in the future the Alaska route will shorten this distance a great deal.

Another prophecy was that we may well look forward to the time when every youngster will want to learn to fly just as now he wants to learn to drive a car. With this there will come a tremendous expansion in aerodrome systems as well as in plane manufacture for civilian purposes. Not every aerodrome will need to be a million dollar one and there is no reason why every community in the country cannot have a landing strip for its local use, if only for small planes.

Regarding the domestic future of the plane Mr.

Wilson said that if the country is prosperous aviation will prosper. If not, progress will be slow. The Trans-Canada Airways are already doing a wonderful job and there is no reason why they should not grow. There is now trans-Atlantic service and in the future it is hoped to have trans-Pacific service and a route to the Caribbean area as well as others. Canada is naturally interested in that sphere when personnel and materials are available, Mr. Wilson remarked.

As for services into the northern portions of Canada these will depend largely upon the mining industry. Should this become prosperous enough the "ski and float" idea will give way to wheeled planes with adequately constructed aerodromes and regular services uninterrupted by change of seasons.

The speaker stated that it was difficult to hazard a guess as to what we might have in the way of civil aircraft for transportation a few years after the war. There might be, he said, from 200 to 300 large craft capable of carrying from 40 to 50 passengers each, a larger number of smaller planes and a considerable number of the much-disdained "puddle jumper." We now have the "know how" he said. Indeed the country might even look forward to supplying a small export market.

Mr. Wilson related briefly the events leading up to and including the recent Chicago conference on civil aviation at which representatives of 54 nations debated the subject of post-war aviation. The Canadian convention, he said, was easily the most complete and most thoroughly worked out at the conference and was taken as the basis of further discussion. The conference, although deadlocked on the freedoms of the air, succeeded in paving the way for a permanent convention which when finally put into effect will do much toward setting uniform standards for application in all countries of the world.

There is one thing, however, Mr. Wilson said, that should be guarded against and that is over-optimism. "There is so much optimism regarding post-war aviation, that there is a danger that we may wish to go ahead too rapidly." Reasonable progress only should be looked for. "Air power, like sea power," he said in conclusion, "for effective development, must be based on sound peace time uses."

\* \* \*

At a noon luncheon on April 6th, the members of the Branch listened to an illustrated talk on **Rural Electrification** by Morris J. McHenry, of the Hydro-Electric Power Commission of Ontario. Mr. McHenry outlined some of the plans of the Commission toward the extension of this important service in Ontario after the war.

"The Commission will undertake the early completion, as soon as conditions imposed by the war permit, of sufficient rural power lines to serve all the farms in the province which can be practically brought within reach of its service," he said.

According to Mr. McHenry, the Commission proposes to reach the ultimate development in two stages. The first stage takes the form of a five-year plan to be carried out in the early post-war years. This plan calls for the construction, during the five-year period, of approximately 7,300 miles of distribution line with service equipment to supply 58,000 new customers, including 32,000 farmers.

The estimated cost of this construction programme is \$22,500,000 of which 50 per cent will be provided

by provincial subsidy. The Commission estimates that the execution of this plan will create a market for wiring and electrically operated equipment totalling approximately \$40,000,000. With other necessary outlays the figure will reach the neighbourhood of \$63,000,000 or an average of over \$1,000,000 a month for five years.

The plan, it is estimated, will entail the installation of a large number of household appliances including: 18,800 electric ranges, 58,000 washing machines, 7,000 water heaters, 90,000 electric irons, 25,000 electric refrigerators, and 95,000 radios. For farm installations there will be specialized farm devices as 5,500 electric grain grinders, 3,100 milking machines, 7,500 water pumps, and 2,300 milk coolers.

A flourishing agriculture is the basis of Canadian prosperity, the speaker reminded his audience. Manufacturing, commerce, financial institutions, and industrial labour are all definitely interested in the question as to whether the farmer is to make a "go" of it or not. It is therefore, from every point of view, sound business to give the farmer the fullest possible support in his endeavours to improve his position productively and to better that home environment which provides such an important background to the efficient carrying out of his daily tasks.

Mr. McHenry illustrated his talk with lantern slides showing the growth of rural electrification up to the present and also some of the many uses to which it is put on the farm of today. The luncheon was largely attended. Norman Marr, chairman of the Branch, presided.

\* \* \*

An illustrated address on the army design of vehicles was given at the noon luncheon on April 19th by R. E. Jamieson, Army Engineering Design Branch, Department of Munitions and Supply. Mr. Jamieson is professor of civil engineering, McGill University and has been on loan to the Dominion Government since 1941.

His address dealt with the design of army tanks, transport trucks, and other types of vehicles used by the army.

## TORONTO BRANCH

S. H. DE JONG, M.E.I.C. - *Secretary-Treasurer*  
G. L. WHITE, Affil.E.I.C. - *Branch News Editor*

On March 15th, 1945, the Toronto Branch and the American Society of Mechanical Engineers held a joint meeting in the Debates Room at Hart House.

The speaker of the evening, R. E. Jamieson, Director-General, Army Engineering Design Branch, Department of Munitions and Supply, was introduced by J. Hall. His subject was **Problems of Army Engineering**.

The Army Engineering Design Branch of the Department of Munitions and Supply was formed in 1941 for the purpose of ironing out many of the problems in the design of equipment, and to co-ordinate production with Canadian industry to assure the greatest production possible to meet the requirements of the army.

It was necessary to prepare basic specifications and to build test models. These models had to be tested before industry could proceed with production. Complex difficulties had to be solved for the manufacture of tanks, wheeled vehicles, signals, radar, and other army equipment by Canadian manufacturers.

Mr. Jamieson said there was much information regarding the development production programme which he was not free to divulge, and that a great many special features of the design of the equipment being produced could not be made public until after the war.

Canadian industry has contributed considerably to the design of tanks and other vehicles. At first, tanks were manufactured in accordance with British design. Slides were shown indicating many improvements in the later models now being manufactured.

The manufacture of pins for tank tracks was outlined by the speaker. Through the high degree of control in manufacture, and the constant testing, which is done by impact method, a great saving has resulted in the production, and charts shown illustrated that failure of pins has been reduced to a negligible proportion.

The use of armour plate for carrier hulls, and the development of welding armour plate, instead of riveting, was described. The Department of Munitions and Supply was the first to take the stand that welded hulls would not require to be stress relieved to avoid reduction in strength. The development of the method of welding this kind of steel is considered to be an outstanding achievement. One important feature of it is in the elimination of the hazard to occupants caused by flying rivets.

Wheeled vehicles form the greatest output of Canadian industry for the army. In the production of this class of equipment, attention is given to actual performance in battle and on the testing grounds in relation to calculated performance. The production of motor vehicles for arctic regions has required considerable investigation and development, to produce special batteries for starting in low temperatures. These investigations have also resulted in the design of equipment to automatically dilute the oil in the crank case with gasoline for low temperature starting.

A brief outline of the conservation programme and the use of synthetic rubber was discussed. Special specifications had to be prepared, and control of manufacture exercised, in order to gradually increase the amount of synthetic rubber used for production of tires. Accelerated tests were required before it was possible to proceed with production. Tires produced from synthetic rubber are now considered to be as good as tires produced before the supply of crude rubber was lost.

Very interesting slides were shown of the various classes of trucks used by the army, such as mobile laundry units, workshop lorries to house machine shops, trucks for carrying generator equipment, and troop carriers.

Professor E. A. Allcut and Professor C. F. Morrison thanked the speaker on behalf of the A.S.M.E. and the Institute respectively.

## Library Notes

### BOOK REVIEW

#### NEW ARCHITECTURE AND CITY PLANNING: a Symposium

*Edited by Paul Zucker. New York, Philadelphia Library, c1944. 694 pp., illus. Reviewed by Stewart Young, M.E.I.C.*

New Architecture and City Planning is a 700-page discussion by various writers—sociologists, editors, architects, a few engineers, and others—on subjects, some of which are either related to or deal directly with community planning. The book is not a text-book, but rather a source of general information and inspiration, especially to those persons engaged in the field of architecture.

The editor, Paul Zucker, has very ably arranged the contents in six sections under general headings, as follows: (1) Specific Building Types. (2) New Materials and New Construction Methods. (3) Housing. (4) City and Regional Planning. (5) The Problem of a New Monumentality. (6) Education. In the pre-ample, Mr. Zucker states the book to be an attempt at "traffic regulation of visions, guided by experience".

Of interest to the engineering profession are the nearly 200 pages in section IV, on City and Regional Planning, covering such subjects as: The Sociological Basis of City Planning, Highways—the Framework of the City and Regional Plan, the Influence of Public Utilities on City and Regional Planning. This section should be read by every town, city, county and highway engineer in Canada and by the senior executive officers of all public utilities.

### ADDITIONS TO THE LIBRARY

#### TECHNICAL AND NON-TECHNICAL BOOKS

##### A.S.T.M. Standards, 1944; Part 3—Non-Metallic Materials—General:

*Philadelphia, American Society for Testing Materials, c1945. 9½ x 6½ in.*

##### Aeroplane Production Year Book and Manual (2):

*M. M. Williamson and G. W. Williamson, editors. Lond., Paul Elek (Publishers), 1945. 5¾ x 8½ in. 40/-.*

### Book notes, Additions to the Library of The Engineering Institute, Reviews of New Books and Publications

#### Aircraft Servicing Manual:

*T. G. Preston and G. W. Williamson. Lond., Paul Elek (Publishers), 1945. 5½ x 8¾ in. 10/6.*

#### Commercial Methods of Analysis:

*Foster Dee Snell and Frank M. Biffen. New York, McGraw-Hill, 1944. 5½ x 8½ in. \$6.00.*

#### Testing of Weighing Equipment:

*Ralph W. Smith. Wash., Government Printing Office, 1945. 5¼ x 7¾ in. 75c. (National Bureau of Standards Handbook H37).*

#### Thesaurus of English Words and Phrases:

Authorized revision to 1941:

*Peter Mark Roget. Toronto, Longmans, Green, 1945. 6 x 8 in. \$1.80.*

#### Whitaker's Almanack:

*77th volume 1945. Lond., Whitaker, 1944. 5 x 7½ in. 10/-.*

### PROCEEDINGS, TRANSACTIONS, Etc.

#### American Society of Civil Engineers:

*Transactions, Volume 109, 1944.*

#### Connecticut Society of Civil Engineers Incorporated:

*Annual Report, 60th, 1944.*

#### Institution of Mechanical Engineers:

*List of Members, Petition, Royal Charter, By-Laws, etc., 1944.*

### REPORTS, TECHNICAL BULLETINS, ETC.

#### Canada—Civil Service Commission:

**BOOK NOTES**

The following notes on new books appear here through the courtesy of the Engineering Societies Library of New York. As yet all of these books are not in the Institute Library, but inquiries will be welcomed at headquarters, or may be sent direct to the publishers.

**ADSORPTION**

*By C. L. Mantell. McGraw-Hill Book Co., New York and London, 1945. 386 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, \$4.50.*

Practice, rather than theory, is the keynote of this new approach to the subject of adsorption written from the viewpoint of industrial procedure, the designing engineer, and the operator of equipment. Emphasizing its unit operation aspects, the book covers adsorption in industry and discusses such varied fields as refining operations, air conditioning, elimination of toxic materials, etc. Fuller's earth, activated clays, activated carbons, silica gel, aluminum oxide base materials, and other commercial adsorbents are dealt with.

**AIRCRAFT VIBRATION AND FLUTTER**

*By C. R. Freberg and E. N. Kemler. John Wiley & Sons, New York; Chapman & Hall, London, 1944. 214 pp., diagrs., charts, tables, 8½ x 5½ in., cloth, \$3.00.*

In non-technical language, with a minimum of mathematics, this book explains the fundamentals and general phases of vibration and flutter affecting both stationary wing and rotating wing aircraft. The material is arranged to give practical aid in problems of aircraft testing and analysis. Engine isolation and sound-proofing are dealt with in an early chapter. There is a bibliography.

**AIRCRAFT YEAR BOOK for 1944, 26th Annual Edition**

*Edited by H. Mings. Lancia Publishers, 10 Rockefeller Plaza, New York, 1944. 727 pp., illus., diagrs., tables, 9 x 5¼ in., cloth, \$6.00.*

The new edition of this annual publication of the Aeronautical Chamber of Commerce of America reviews the events of the year, both in military and civil aviation, and the work of American manufacturers. Associations, government bureaus and other organizations interested in aviation are listed, with their officers. Statistics, records, etc., are tabulated.

**ANALYSIS OF DRILL-JIG DESIGN**

*By J. I. Karash. McGraw-Hill Book Co., New York and London, 1944. 333 pp., illus., diagrs., charts, tables, 8½ x 5¼ in., cloth, \$3.00.*

The author presents a systematic approach to the problems of tool design, using drill jigs as a specific case study and outlining fundamental principles that apply in varied degree to all tool design problems. The process of design is analyzed into a clear-cut procedure, stressing the essential decisions, their proper sequence, and basis of fact for arriving at decisions. Specific examples are used throughout.

**COMING AIR AGE**

*By R. M. Cleveland and L. E. Neville. McGraw-Hill Book Co., Whittlesey House Dept., New York and London, 1944. 359 pp., illus., tables, 8¼ x 5½ in., cloth, \$2.75.*

This book presents a logical outline of the new developments and problems that can be expected in the aviation world of tomorrow. Beginning with a discussion of the probable status, both technical and financial, of the industry when the war ends, the

book goes on to discuss the geography of the air, freedom of the air, airlines, and sky freighting. The giant plane, helicopter, rocket ship, and new power sources, as well as the more typical craft of the predictable future are described. The question of air-age education is considered from both a national and international viewpoint.

#### ENGINEERING FOR DAMS, 3 Vols.

By W. P. Creager, J. D. Justin and J. Hinds. John Wiley & Sons, New York; Chapman & Hall, London, 1945. 929 pp., illus., diags., charts, tables, 9¼ x 6 in., cloth, \$16.50.

This work aims to provide a compendium of modern practice in dam building that is sufficiently detailed to meet the needs of engineers well as students. Volume one discusses general design, including the investigation of dam sites, choice of type, foundation preparation and protection, hydraulic model studies, flood flows and spillways. Volume two deals with concrete dams of all types. Volume three treats of earth, rock-fill, steel and timber dams. Bibliographies occur throughout the work. The authors have had the assistance of a number of other well-known hydraulic engineers.

#### HANDBOOK OF MINERAL DRESSING, Ores and Industrial Minerals

By A. F. Taggart. John Wiley & Sons, New York; Chapman & Hall, London, 1945. 1,939 pp., diags., charts, tables, 8½ x 5½ in., cloth, \$15.00.

This is the successor to the author's well-known "Handbook of Ore Dressing". It deals with the processes, largely mechanical, involved in the concentration of metalliferous ores and the beneficiation of industrial minerals. The work has been thoroughly revised and to a large extent rewritten. New sections have been added, and the whole work brought up to date. The book is an important addition to engineering handbooks.

#### HIGH-FREQUENCY INDUCTION HEATING

By F. W. Curtis. McGraw-Hill Book Co., New York and London, 1944. 235 pp., illus., diags., charts, tables, 8½ x 5¼ in., cloth, \$2.75.

The industrial applications of induction heating are explained. Heating procedures and principles and the constructional features of industrial heating coils are described in detail, and fixture design and process handling equipment are outlined broadly. The book is intended to simplify the application of induction heating and to assist in the installation of equipment for specific operations.

#### MODERN SYNTHETIC RUBBERS

By H. Barron. 2 ed. revised and enlarged. D. Van Nostrand Co., New York, 1944. 355 pp., illus., diags., charts, tables, 8¾ x 5½ in., cloth, \$6.50.

The primary purpose of this book, which appeared in 1942, was to awaken Great Britain to the growing importance of synthetic rubber. It presented a systematic account of the new material, considered historically, scientifically and technically, as revealed in the literature. The present edition has been thoroughly revised to take account of developments since 1942, especially those resulting from work in the United States.

#### PERSONNEL RELATIONS

By J. E. Walters. Ronald Press Co., New York, 1945. 547 pp., charts, tables, 9½ x 6 in., cloth, \$4.50.

This book endeavors to set forth both principles and practice in the field of present-day personnel relations. It includes the varying phases of personnel relations as they are determined and influenced by workers in labor unions; managements; the government; individual employees; labor-management co-operation; and personnel relations techniques and procedures. The author's further intent is to present personnel relations from positive democratic viewpoints of those actively concerned. The material is based on the author's extensive personal experience plus outside collaboration.

#### PIONEERING THE HELICOPTER

By C. L. Morris. McGraw-Hill Book Co.; New York and London, 1945. 161 pp., illus., diags., maps, 8¼ x 5½ in., cloth, \$2.75.

The author became Chief Test Pilot for Sikorsky Aircraft in 1941 and held that position during the next three years. His story is an interesting, personal one, showing the steps by which success has been reached and discussing future possibilities. A readable account, which will correct various misconceptions.

#### PORT TERMINAL OPERATION

By E. H. Lederer. Cornell Maritime Press, New York, 1945. 430 pp., illus., diags., charts, tables, 9¼ x 6 in., fabrikoid, \$5.00.

Taken from practical experience, the material presented in this book contains a large amount of exact information useful for any one actively engaged in the field. It describes the latest equipment, its use and maintenance, administration and paper work, railroad and warehouse facilities, stowage methods and stowage factors, stevedoring, lighterage operation and harbor craft. The book was prepared as a training manual for both peacetime and wartime civilian use.

#### PRODUCTION ENGINEERING IN THE AIRCRAFT INDUSTRY

By A. B. Berghell. McGraw-Hill Book Co., New York and London, 1944. 307 pp., diags., charts, tables, 9 x 5¾ in., cloth, \$3.00.

A practical text embodying principles, illustrated by specific cases, questions, and answers, for the solution of common problems encountered in the aircraft industry. The author explains the application of principles of estimating new contract costs, budgeting and scheduling direct labor hours, controlling work in process through the use of time standards, work simplification, material saving, statistical and graphical reports, etc. An appendix contains a glossary and many useful data tables.

#### PRODUCTION-LINE TECHNIQUE

By R. Muther, with a foreword by E. H. Schell. McGraw-Hill Book Co., New York and London, 1944. 320 pp., illus., diags., charts, tables, 9 x 5¾ in., cloth, \$3.50.

This book is designed for industrial executives who are considering the application of production-line methods to their manufacturing operations. Particularly, its purpose is to present the possibilities of the production line in the medium-sized plant, which heretofore has operated on a job-lot basis. Based on first-hand field investigations of current practices, this book explains the fundamentals of production lines, compares them with job-lot manufacture and shows how production lines are set up and operated. Their advantages and limitations are pointed out.

#### REPORT OF THE URBAN PLANNING CONFERENCES at Evergreen House, 1943, under the auspices of The Johns Hopkins University

Publ. by Johns Hopkins Press, Baltimore, Md., 1944. 245 pp., illus., maps, diags., 9½ x 6 in., cloth, \$2.75.

This interesting volume presents the results of a series of six conferences held under the auspices of Johns Hopkins University and participated in by many experts. The subjects discussed were the basic directives in urban planning, geographic, population and economic; transportation, railroads, highways, air transportation; housing, health, recreation and welfare; the governmental framework and other processes of urban planning.

#### STEAM BOILER YEARBOOK AND MANUAL (III edit.)

Edited by S. D. Scorer. Payl Elek, Ltd., Africa House, Kingsway, London, W.C.2., 1945. 569 pp., illus., diags., charts, tables, 8½ x 5½ in., cloth, 30s.

The first part of this annual publication presents a descriptive review of current British practice in steam-boiler engineering. The second part contains abridgments of the principal steam-boiler papers published during the past year, grouped under the following five headings: fuel utilization; combustion appliance developments; feed water and steam problems; fire side problems; modern practice and developments. A book review section has been added to Part I in the present edition.

#### PROPOSED NEW STANDARDS

##### CANADIAN STANDARDS ASSOCIATION: CANADIAN ELECTRICAL CODE, Pt. IV

Proposed new CSA Standards dealing with suppression of Radio Interference.

Preparatory committees of the Canadian Electrical Code, Part IV, are now completing a series of new C.S.A. tentative standards dealing with tolerable limits of radio interference and methods of measurement.

It is anticipated that the various provinces will, in the near future, consider the adoption of C.E. Code, Part IV, in a similar manner to that in which they dealt with C.E. Code, Parts I and II.

The following tentative standards are expected to be published in the near future and will be useful to Canadian manufacturers in designing and producing "interference free" electrical apparatus. These standards are similar to those of foreign countries which now have or are contemplating legislation to prohibit interference. The implications of this action, in relation to foreign trade, will be obvious to Canadian manufacturers.

(Continued on page 338)

# PRELIMINARY NOTICE

## of Applications for Admission and for Transfer

April 30th, 1945.

The By-laws provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to the Secretary any facts which may affect the classification and selection of any of the candidates. In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, they should be promptly communicated.

**Communications relating to applicants are considered by the Council as strictly confidential.**

The Council will consider the applications herein described at the June meeting.

L. AUSTIN WRIGHT, General Secretary.

\*The professional requirements are as follows:—

**A Member** shall be at least twenty-seven years of age, and shall have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupillage in a qualified engineer's office or a term of instruction in a school of engineering recognized by the Council. In every case a candidate for election shall have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years. The occupancy of a chair as an assistant professor or associate professor in a faculty of applied science or engineering, after the candidate has attained the age of twenty-seven years, shall be considered as professional responsibility.

Every candidate who has not graduated from a school of engineering recognized by the Council shall be required to pass an examination before a board of examiners appointed by the Council. The candidate shall be examined on the theory and practice of engineering, with special reference to the branch of engineering in which he has been engaged, as set forth in Schedule C of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Sections 9 and 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard. Any or all of these examinations may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five or more years.

**A Junior** shall be at least twenty-one years of age, and shall have been engaged in some branch of engineering for at least four years. This period may be reduced to one year at the discretion of the Council if the candidate for election has graduated from a school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-three years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

Every candidate who has not graduated from a school of engineering recognized by the Council, or has not passed the examination of the third year in such a course, shall be required to pass an examination in engineering science as set forth in Schedule B of the Rules and Regulations relating to Examinations for Admission. He must also pass the examinations specified in Section 10, if not already passed, or else present evidence satisfactory to the examiners that he has attained an equivalent standard.

**A Student** shall be at least seventeen years of age, and shall present a certificate of having passed an examination equivalent to the final examination of a high school or the matriculation of an arts or science course in a school of engineering recognized by the Council.

He shall either be pursuing a course of instruction in a school of engineering recognized by the Council, in which case he shall not remain in the class of student for more than two years after graduation; or he shall be receiving a practical training in the profession, in which case he shall pass an examination in such of the subjects set forth in Schedule A of the Rules and Regulations relating to Examinations for Admission as were not included in the high school or matriculation examination which he has already passed; he shall not remain in the class of Student after he has attained the age of twenty-seven years, unless in the opinion of Council special circumstances warrant the extension of this age limit.

**An Affiliate** shall be one who is not an engineer by profession but whose pursuits, scientific attainment or practical experience qualify him to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as reference does not necessarily mean that their applications are endorsed by such members.

## FOR ADMISSION

**BEGLEY—WILLIAM MACDONALD**, of Toronto, Ont. Born at Windsor, Ont., Jan. 10th, 1912. Educ.: B.Sc., Detroit Inst. Tech., 1937; 1937-40, student course, Can. Gen. Elec. Co., Peterboro, Ont.; 1940-41 mech. & elec. design Amalgamated Elec. Co., Toronto; 1941-42, elec. mtce., Research Enterprises Ltd., Toronto; 1942 to date, group supervisor of equipt. & elec. group of aircraft engrg. dept., Massey-Harris, Weston, Ont.  
References: M. Powell, A. L. Malby, J. Clark Keith, H. R. Sills.

**BROOKS—JOHN ALFRED**, of Shawinigan Falls, Que. Born at Sarnia, Ont., Aug. 9th, 1920. Educ.: B.Sc., Queen's Univ., 1942. 1942-43, chemist, Defence Industries Limited, Nobel, Ont.; 1943-45, shift supervisor, and at present supervisor of personnel & operations, Canadian Resins & Chemicals, Shawinigan Falls, Que.  
References: C. G. de Tonnancour, D. S. Ellis, A. L. Clark, C. Morris, R. A. Low.

**BURGESS—JOHN ADAM**, of Outremont, Que. Born at Aboynne, Aberdeenshire, Scot., March 24th, 1889. Educ.: Robt. Gordon's Tech. Coll., Aberdeen, (evening classes), 1908-1911; day courses at same college in engrg., subjects leading to B.O.T. engrg. surveyorship examinations. Ap'ticeship & two years work in shops, Strath Engrg. Works, Aberdeen, 1906-15; engr. on steamships from junior to chief engr., 1915-22; instructor in marine engrg. subjects at N.S. Tech. Coll., Hlf., 1924-25; asst. to supt. of Cdn. Gov. Merchant Marine, 1926-28; struct. dftsmn., St. John Drydock & Shipbuilding Co., St. John, N.B., 1929-31; foreman on constrn. & later boiler house foreman, Shell Oil Refinery, Mtl. East, 1932-34; asst. to mech. supt., 1934-35, and 1936 to date supt. i/c of engrg. services, W. C. Macdonald Inc., tobacco mfrs.
